debug ip rtp header-compression through debug ipv6 icmp

I

debug ip rtp header-compression

To display events specific to Real-Time Transport Protocol (RTP) header compression, use the **debug ip rtp header-compression**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip rtp header-compression

no debug ip rtp header-compression

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Examples

The following is sample output from the **debug ip rtp header-compression**command:

Router# debug ip rtp header-compression RHC BRI0: rcv compressed rtp packet RHC BRI0: context0: expected sequence 0, received sequence 0 RHC BRI0: rcv compressed rtp packet RHC BRI0: context0: expected sequence 1, received sequence 1 RHC BRI0: rcv compressed rtp packet RHC BRI0: context0: expected sequence 2, received sequence 2 RHC BRI0: rcv compressed rtp packet RHC BRI0: context0: expected sequence 3, received sequence 3 The table below describes the significant fields shown in the display.

Table 1: debug ip rtp header-compression Field Descriptions

Field	Description
context0	Compression state for a connection 0.
expected sequence	RTP header compression link sequence (expected).
received sequence	RTP header compression link sequence (actually received).

Related Commands

Command	Description
debug ip rtp packets	Displays a detailed dump of packets specific to RTP header compression.

debug ip rtp packets

debug ip rtp packets

To display a detailed dump of packets specific to Real-Time Transport Protocol (RTP) header compression, use the **debug ip rtp packets** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip rtp packets

no debug ip rtp packets

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Examples

The following is sample output from the **debug ip rtp packets**command:

Router# debug ip rtp packets
RTP packet dump:
 IP: source: 171.68.8.10, destination: 224.2.197.169, id: 0x249B, ttl: 9,
 TOS: 0 prot: 17,
 UDP: source port: 1034, destination port: 27404, checksum: 0xB429,len: 152
 RTP: version: 2, padding: 0, extension: 0, marker: 0,
 payload: 3, ssrc 2369713968,
 sequence: 2468, timestamp: 85187180, csrc count: 0
The table below describes the significant fields shown in the display.

Table 2: debug ip rtp packets Field Descriptions

Field	Description
id	IP identification.
ttl	IP time to live (TTL).
len	Total UDP length.

Related Commands

Command	Description
debug ip rtp header-compression	Displays events specific to RTP header compression.

debug ip scp

To troubleshoot secure copy (SCP) authentication problems, use the **debug ip scp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip scp no debug ip scp

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Command HistoryReleaseModification12.2(2)TThis command was introduced.12.0(21)SThis command was integrated into Cisco IOS Release 12.0(21)S.12.2(22)SThis command was integrated into Cisco IOS Release 12.2(22)S.12.2(25)SThis command was integrated into Cisco IOS Release 12.2(25)S.12.2(18)SXDThis command was integrated into Cisco IOS Release 12.2(18)SXD.

Examples

The following example is output from the **debug ip scp** command. In this example, a copy of the file scptest.cfg from a UNIX host running configuration of the router was successful.

```
Router# debug ip scp

4d06h:SCP:[22 -> 10.11.29.252:1018] send <OK>

4d06h:SCP:[22 <- 10.11.29.252:1018] recv C0644 20 scptest.cfg

4d06h:SCP:[22 -> 10.11.29.252:1018] send <OK>

4d06h:SCP:[22 <- 10.11.29.252:1018] recv <0K>

4d06h:SCP:[22 -> 10.11.29.252:1018] recv <OK>

4d06h:SCP:[22 -> 10.11.29.252:1018] recv <OK>

4d06h:SCP:[22 -> 10.11.29.252:1018] recv <EOF>
```

The following example is also output from the **debug ip scp** command, but in this example, the user has privilege 0 and is therefore denied:

```
Router# debug ip scp
4d06h:SCP:[22 -> 10.11.29.252:1018] send Privilege denied.
```

Related Commands

Command	Description
ip scp server enable	Enables SCP server-side functionality.

debug ip sctp api

To provide diagnostic information about Stream Control Transmission Protocol (SCTP) application programming interfaces (APIs), use the **debug ip sctp api**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp api no debug ip sctp api

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

Usage Guidelines

In a live system, the debugging messages for performance, state, signal, and warnings are the most useful. These show any association or destination address failures and can be used to monitor the stability of any established associations.

The **debug ip sctp api** command should not be used in a live system that has any significant amount of traffic running because it can generate a lot of traffic, which can cause associations to fail.

Examples

The following example shows SCTP calls to the API that are being executed and the parameters associated with these calls:

		debug ip sctp			
*Mar	1	00:31:14.211:	SCTP:	sctp send:	Assoc ID: 1
*Mar	1	00:31:14.211:	SCTP:		stream num: 10
*Mar	1	00:31:14.211:	SCTP:		bptr: 62EE332C, dptr: 4F7B598
*Mar	1	00:31:14.211:	SCTP:		datalen: 100
*Mar	1	00:31:14.211:	SCTP:		context: 1
*Mar	1	00:31:14.211:	SCTP:		lifetime: 0
*Mar	1	00:31:14.211:	SCTP:		unorder flag: FALSE
*Mar	1	00:31:14.211:	SCTP:		bundle flag: TRUE
*Mar	1	00:31:14.211:	SCTP:	sctp send s	successful return
*Mar	1	00:31:14.211:	SCTP:	sctp receiv	/e: Assoc ID: 1
*Mar	1	00:31:14.215:	SCTP:	_	max data len: 100
*Mar	1	00:31:14.215:	SCTP:	sctp receiv	ve successful return
*Mar	1	00:31:14.215:	SCTP:	Process Ser	nd Request
*Mar	1	00:31:14.951:	SCTP:	sctp_receiv	ve: Assoc ID: 0

1

*Mar 1 00:31:14.951: SCTP: max data len: 100 *Mar 1 00:31:14.951: SCTP: sctp_receive successful return .

The table below describes the significant fields shown in the display.

Table 3: debug ip sctp api Field Descriptions

Field	Description
Assoc ID	Association identifier.
stream num	SCTP stream number.
bptr, dptr	Address of the buffer that contains the data, and address of the start of the data.
datalen	Length of the data that the application is sending (the datagram).
context	A value that is meaningful to the application. Returned with the datagram if the datagram ever needs to be retrieved.
lifetime	Not used.
unorder flag	Specifies that the datagram should be sent as unordered data.
bundle flag	Indicates whether the application wants the datagram to be delayed slightly, trying to bundle it with other data being sent.
max data len	Maximum length of data that can be receivedthe size of the receive buffer.

Related Commands

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
debug ip sctp congestion	Shows a list of all current SCTP associations.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.
show ip sctp errors	Shows error counts logged by SCTP.

I

Command	Description	
show ip sctp instances	Shows all currently defined SCTP instances.	
show ip sctp statistics	Shows overall statistics counts for SCTP.	
show iua as	Shows information about the current condition of an application server.	
show iua asp	Shows information about the current condition of an application server process.	

ø

debug ip sctp congestion

To provide diagnostic information about Stream Control Transmission Protocol (SCTP) congestion parameters, use the **debug ip sctp congestion**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp congestion

no debug ip sctp congestion

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

Usage Guidelines In a live system, the debugging messages for performance, state, signal, and warnings are the most useful. These show any association or destination address failures and can be used to monitor the stability of any established associations.

Debug commands other than those for performance, state, signal, and warnings can generate a great deal of output and therefore can cause associations to fail. These commands should be used only in test environments or when there are very low amounts of traffic.

Examples

The following example shows parameters used to calculate SCTP congestion:

Router# debug ip sctp congestion SCTP: Assoc 0: Slow start 10.6.0.4, cwnd 3000 SCTP: Assoc 0: Data chunks rcvd, local rwnd 7800 SCTP: Assoc 0: Free chunks, local rwnd 9000 SCTP: Assoc 0: Data chunks rcvd, local rwnd 8200 SCTP: Assoc 0: Add Sack, local a rwnd 8200 SCTP: Assoc 0: Free chunks, local rwnd 9000 SCTP: Assoc 0: Data chunks rcvd, local rwnd 7800 SCTP: Assoc 0: Data chunks rcvd, local rwnd 7000 SCTP: Assoc 0: Add Sack, local a rwnd 7000 SCTP: Assoc 0: Free chunks, local rwnd 9000 SCTP: Assoc 0: Bundle for 10.5.0.4, rem rwnd 14000, cwnd 19500, outstand 0 SCTP: Assoc 0: Bundled 12 chunks, remote rwnd 12800, outstand 1200 SCTP: Assoc 0: Bundling data, next chunk dataLen (100) > remaining mtu size SCTP: Assoc 0: Bundle for 10.5.0.4, rem rwnd 12800, cwnd 19500, outstand 1200 SCTP: Assoc 0: Bundled 12 chunks, remote rwnd 11600, outstand 2400 SCTP: Assoc 0: Bundling data, next chunk dataLen (100) > remaining mtu size SCTP: Assoc 0: Bundle for 10.5.0.4, rem rwnd 11600, cwnd 19500, outstand 2400 SCTP: Assoc 0: Bundled 12 chunks, remote rwnd 10400, outstand 3600

SCTP: Assoc 0: Chunk A22F3B55 ack'd, dest 10.5.0.4, outstanding 2300			
SCTP: Assoc 0: Chunk A22F3B56 ack'd, dest 10.5.0.4, outstanding 2200			
The table below describes the significant fields shown in the display.			

Table 4: debug ip sctp congestion Field Descriptions

Field	Description
cwnd	Congestion window values for destination address.
rwnd, a_rwnd	Receiver window values as defined in RFC 2960.
outstanding	Number of bytes outstanding.

Related Commands

I

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.
show ip sctp errors	Shows error counts logged by SCTP.
show ip sctp instances	Shows all currently defined SCTP instances.
show ip sctp statistics	Shows overall statistics counts for SCTP.
show iua as	Shows information about the current condition of an application server.

Command	Description
show iua asp	Shows information about the current condition of an application server process.

debug ip sctp init

To show datagrams and other information related to the initializing of new Stream Control Transmission Protocol (SCTP) associations, use the **debug ip sctp init**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp init no debug ip sctp init

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.2(4)T	This command was introduced.
	12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines All initialization chunks are shown, including the INIT, INIT_ACK, COOKIE_ECHO, and COOKIE_ACK chunks. This debug command can be used to see the chunks associated with any initialization sequence but does not display data chunks sent once the association is established. Therefore, it is safe to use in a live system that has traffic flowing when you have trouble with associations failing and being reestablished.

Examples

The following example shows initialization chunks for SCTP associations:

Router# debug ip sctp init *Mar 1 00:53:07.279: SCTP Test: Attempting to open assoc to remote port 8787...assoc ID is 0 *Mar 1 00:53:07.279: SCTP: Process Assoc Request *Mar 1 00:53:07.279: SCTP: Assoc 0: dest addr list: 1 00:53:07.279: SCTP: addr 10.5.0.4 *Mar addr 10.6.0.4 1 00:53:07.279: SCTP: *Mar 1 00:53:07.279: *Mar *Mar 1 00:53:13.279: SCTP: Assoc 0: Send Init 1 00:53:13.279: SCTP: INIT CHUNK, len 42 *Mar Initiate Tag: B4A10C4D, Initial TSN: B4A10C4D, rwnd 9000 *Mar 1 00:53:13.279: SCTP: 1 00:53:13.279: SCTP: Streams Inbound: 13, Outbound: 13 *Mar 1 00:53:13.279: SCTP: *Mar IP Addr: 10.1.0.2 *Mar 1 00:53:13.279: SCTP: IP Addr: 10.2.0.2 *Mar 1 00:53:13.279: SCTP: Supported addr types: 5 *Mar 1 00:53:13.307: SCTP: Process Init

Table 5: debug ip sctp init Field Descriptions

Field	Description
Initiate Tag	Initiation chunk identifier.
Initial TSN	Initial transmission sequence number.
rwnd	Receiver window values.

Related Commands

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
debug ip sctp congestion	Shows a list of all current SCTP associations.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.
show ip sctp errors	Shows error counts logged by SCTP.
show ip sctp instances	Shows all currently defined SCTP instances.
show ip sctp statistics	Shows overall statistics counts for SCTP.

I

Command	Description
show iua as	Shows information about the current condition of an application server.
show iua asp	Shows information about the current condition of an application server process.

debug ip sctp multihome

To show the source and destination of datagrams in order to monitor the use of the multihome addresses for Stream Control Transmission Protocol (SCTP), use the **debug ip sctp multihome**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp multihome no debug ip sctp multihome

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

Usage Guidelines

More than one IP address parameter can be included in an initialization (INIT) chunk when the INIT sender is multihomed. Datagrams should be sent to the primary destination addresses unless the network is experiencing problems, in which case the datagrams should be sent to secondary addresses.

```
<u>_!\</u>
```

```
Caution
```

The **debug ip sctp multihome** command generates one debug line for each datagram sent or received. It should be used with extreme caution in a live network.

Examples

The following example shows source and destination for multihomed addresses:

```
Router# debug ip sctp multihome
                      8787, d=10.1.0.2

Table 6: debug ip sctp multihome Field Descriptions

Field	Description
S	Source address and port.
d	Destination address and port.

Related Commands

I

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
debug ip sctp congestion	Shows a list of all current SCTP associations.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.
show ip sctp errors	Shows error counts logged by SCTP.
show ip sctp instances	Shows all currently defined SCTP instances.
show ip sctp statistics	Shows overall statistics counts for SCTP.
show iua as	Shows information about the current condition of an application server.
show iua asp	Shows information about the current condition of an application server process.

debug ip sctp performance

To display the average number of Stream Control Transmission Protocol (SCTP) chunks and datagrams being sent and received per second, use the **debug ip sctp performance**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp performance

no debug ip sctp performance

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

Usage Guidelines In a live system, the debugging messages for performance, state, signal, and warnings are the most useful. These show any association or destination address failures and can be used to monitor the stability of any established associations.

Once enabled, the **debug ip sctp performance** command displays the average number of chunks and datagrams being sent and received per second once every 10 seconds. Note that the averages are cumulative since the last time the statistics were cleared using the **clear ip sctp statistics** command and may not accurately reflect the number of datagrams and chunks currently being sent and received at that particular moment.

Examples

The following example shows a low rate of traffic:

Router# debug ip sctp performance

SCTP Sent: SCTP Dgrams 5, Chunks 28, Data Chunks 29, ULP Dgrams 29 SCTP Rcvd: SCTP Dgrams 7, Chunks 28, Data Chunks 29, ULP Dgrams 29 Chunks Discarded: 0, Retransmitted 0 SCTP Sent: SCTP Dgrams 6, Chunks 29, Data Chunks 30, ULP Dgrams 30 SCTP Rcvd: SCTP Dgrams 7, Chunks 29, Data Chunks 30, ULP Dgrams 30 Chunks Discarded: 0, Retransmitted 0 The table below describes the significant fields shown in the display.

Table 7: debug ip sctp performance Field Descriptions

Field	Description
SCTP Dgrams	Datagram sent to or received from the network.

Field	Description
Chunks	Includes data chunks and control chunks sent or received.
Data Chunks	Data chunks sent or received.
ULP Dgrams	Upper-layer protocol (ULP) datagrams, which are datagrams sent to or received from the ULP or application.

Related Commands

ſ

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
debug ip sctp congestion	Shows a list of all current SCTP associations.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.
show ip sctp errors	Shows error counts logged by SCTP.
show ip sctp instances	Shows all currently defined SCTP instances.
show ip sctp statistics	Shows overall statistics counts for SCTP.
show iua as	Shows information about the current condition of an application server.
show iua asp	Shows information about the current condition of an application server process.

debug ip sctp rcvchunks

To provide diagnostic information about chunks received with Stream Control Transmission Protocol (SCTP), use the **debug ip sctp rcvchunks**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp rcvchunks

no debug ip sctp rcvchunks

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification	
	12.2(4)T	This command was introduced.	

Usage Guidelines	The debug ip sctp rcvchunks co	ommand shows the following	g information about received chunks:
------------------	--------------------------------	----------------------------	--------------------------------------

- Whether the chunk is for a new datagram or is part of a datagram that is being reassembled
- Whether the datagram is complete after receiving this chunk
- If the datagram is complete, whether the datagram is in sequence within the specified stream and can be delivered to the upper-layer protocol (ULP)
- The selective acknowledgments (SACKs) that are returned to the remote SCTP peer
- The cumulative transmission sequence number (Cum TSN) that was acknowledged and the number of fragments included
- Whether the datagram is received by the ULP

/!\

Caution

The **debug ip sctp rcvchunks** command generates multiple debug lines for each chunk received. It should be used with extreme caution in a live network.

Examples

In the following example, a segmented datagram is received in two chunks for stream 0 and sequence number 0. The length of the first chunk is 1452 bytes, and the second is 1 byte. The first chunk indicates that it is for a new datagram, but the second chunk indicates that it is part of an existing datagram that is already being reassembled. When the first chunk is processed, it is noted to be in sequence, but is not complete and so cannot

be delivered yet. When the second chunk is received, the datagram is both in sequence and complete. The application receives the datagram, and a SACK is shown to acknowledge that both chunks were received with no missing chunks indicated (that is, with no fragments).

Router# debug ip sctp rcvchunks SCTP: Assoc 0: New chunk (0/0/1452/2C33D822) for new dgram (0) SCTP: Assoc 0: dgram (0) is in seq SCTP: Assoc 0: Add Sack Chunk, CumTSN=2C33D822, numFrags=0 SCTP: Assoc 0: New chunk (0/0/1/2C33D823) for existing dgram (0) SCTP: Assoc 0: dgram (0) is complete SCTP: Assoc 0: ApplRecv chunk 0/0/1452/2C33D822 SCTP: Assoc 0: ApplRecv chunk 0/0/1/2C33D823 SCTP: Assoc 0: Add Sack Chunk, CumTSN=2C33D823, numFrags=0 The table below describes the significant fields shown in the display.

Table 8: debug ip sctp rcvchunks Field Descriptions

Field	Description
0 / 0 / 1452 / 2C33D822	Stream number / datagram sequence number / chunk length, in bytes / chunk transmission sequence number.
Sack Chunk	Selective acknowledgment chunk.
ApplRecv	Application has received the chunk.
CumTSN	Cumulative transmission sequence number that is being acknowledged.
numFrags	Number of fragments, or missing chunks.

Related Commands

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
debug ip sctp congestion	Shows a list of all current SCTP associations.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.
show ip sctp errors	Shows error counts logged by SCTP.
show ip sctp instances	Shows all currently defined SCTP instances.
show ip sctp statistics	Shows overall statistics counts for SCTP.

Command	Description
show iua as Shows information about the current condi application server.	
show iua asp	Shows information about the current condition of an application server process.

debug ip sctp rto

To show adjustments that are made to the retransmission timeout (RTO) value when using Stream Control Transmission Protocol (SCTP), use the **debug ip sctp rto**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp rto no debug ip sctp rto

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification	
	12.2(4)T	This command was introduced.	

Usage Guidelines The **debug ip sctp rto** command shows adjustments that are made to the retransmission timeout value (shown as retrans in the command output) because of either retransmission of data chunks or unacknowledged heartbeats.

/!\ Caution

The **debug ip sctp rto** command can generate a great deal of output. It should be used with extreme caution in a live network.

Examples

I

In the following example, there is only one destination address available. Each time the chunk needs to be retransmitted, the RTO value is doubled.

Route	r# debug :	ip sctp r	to	
SCTP:	Assoc 0:	destaddr	10.5.0.4,	retrans timeout on chunk 942BAC55
SCTP:	Assoc 0:	destaddr	10.5.0.4,	rto backoff 2000 ms
SCTP:	Assoc 0:	destaddr	10.5.0.4,	retrans timeout on chunk 942BAC55
SCTP:	Assoc 0:	destaddr	10.5.0.4,	rto backoff 4000 ms
SCTP:	Assoc 0:	destaddr	10.5.0.4,	retrans timeout on chunk 942BAC55
SCTP:	Assoc 0:	destaddr	10.5.0.4,	rto backoff 8000 ms
SCTP:	Assoc 0:	destaddr	10.5.0.4,	retrans timeout on chunk 942BAC55
SCTP:	Assoc 0:	destaddr	10.5.0.4,	rto backoff 16000 ms
SCTP:	Assoc 0:	destaddr	10.5.0.4,	retrans timeout on chunk 942BAC55
SCTP:	Assoc 0:	destaddr	10.5.0.4,	rto backoff 32000 ms

len	Length of chunk, in bytes.
Tag	The identifier for an initialization chunk.
TSN	Transmission sequence number.
rwnd	Receiver window value.
num frags	Number of fragments received.
7 / 0 / 100 / 4F2D8236	(Data chunks) Stream number / datagram sequence number / chunk length, in bytes / chunk transmission sequence number.

Related Commands

I

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
debug ip sctp congestion	Shows a list of all current SCTP associations.
debug ip sctp segmentv	Shows every datagram that is sent or received and the chunks that are contained in each. This is the verbose form of the output, and it shows detailed information for each chunk type.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.
show ip sctp errors	Shows error counts logged by SCTP.
show ip sctp instances	Shows all currently defined SCTP instances.
show ip sctp statistics	Shows overall statistics counts for SCTP.
show iua as	Shows information about the current condition of an application server.
show iua asp	Shows information about the current condition of an application server process.

debug ip sctp segmentv

To show verbose diagnostics for every datagram that is sent or received with Stream Control Transmission Protocol (SCTP), use the **debug ip sctp segmentv**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp segmentv

no debug ip sctp segmentv

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

Usage Guidelines The **debug ip sctp segmentv** command provides the verbose form of the output for datagrams. For the simple form, use the **debug ip sctp segments** command.

Caution

The **debug ip sctp segmentv** command generates multiple lines of output for each datagram sent and received. It should be used with extreme caution in a live network.

Examples

The following output shows an example in which an association is established, a few heartbeats are sent, the remote endpoint fails, and the association is restarted:

Router# debu	g ip sctp segmentv

debug ip sctp signal

upper-layer protocol (ULP), use the debug ip sctp signal command in privileged EXEC mode. To disable debugging output, use the **no** form of this command. debug ip sctp signal no debug ip sctp signal Syntax Description This command has no arguments or keywords. **Command Default** No default behavior or values Command Modes Privileged EXEC **Command History** Release Modification 12.2(4)T This command was introduced. **Usage Guidelines** The **debug ip sctp signal** command can be used to see if the current associations are stable or not. Because it generates output only on state transitions, it is safe to use in a live environment. It still should be used with caution, however, depending on the number of associations being handled by the system and the stability of the network. The debug ip sctp state command is often used at the same time as the debug ip sctp signal command. Using the two commands together gives good insight into the stability of associations. Examples In the following example, a new association is requested and established. The peer then restarts the association and notes that the association failed and is being reestablished. The local peer then indicates that the association has failed because it has tried to retransmit the specified chunk more than the maximum number of times without success. As a result, the association fails (because of communication loss) and is terminated. The ULP requests that the association be attempted again, and this attempt succeeds. A shutdown is then received from the remote peer, and the local peer enters the shutdown acknowledge sent state, which is followed by the association being terminated. Again, another association attempt is made and succeeds. Router# debug ip sctp signal Router# debug ip sctp state <new assoc attempt> 00:20:08: SCTP: Assoc 0: state CLOSED -> COOKIE WAIT 00:20:15: SCTP: Assoc 0: state COOKIE WAIT -> ESTABLISHED 00:20:15: SCTP: Assoc 0: Sent ASSOC UP signal for CONFIGD ASSOC 00:21:03: SCTP: Assoc 0: Restart rovd from peer

debug ip sctp sndchunks

To show information about chunks that are being sent to remote Stream Control Transmission Protocol (SCTP) peers, use the **debug ip sctp sndchunks**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command. debug ip sctp sndchunks no debug ip sctp sndchunks **Syntax Description** This command has no arguments or keywords. **Command Default** No default behavior or values Command Modes Privileged EXEC **Command History** Release Modification 12.2(4)T This command was introduced. **Usage Guidelines** The **debug ip sctp sndchunks** command provides the following information: · Application send requests from the local SCTP peer · Chunks being bundled and sent to the remote peer • Processing of the selective acknowledgments (SACKs) from the remote peer, indicating which chunks were successfully received Chunks that are marked for retransmission Caution The debug ip sctp sndchunks command generates large amounts of data if there is any significant amount of traffic flowing. It should be used with extreme caution in live networks. **Examples** The following example shows output for the **debug ip sctp sndchunks** command for a case in which data chunks are being sent, with some of them marked for retransmission: Router# debug ip sctp sndchunks SCTP: Assoc 0: ApplSend, chunk: 0/10412/100/A23134F8 to 10.5.0.4 SCTP: Assoc 0: ApplSend, chunk: 5/10443/100/A23134F9 to 10.5.0.4 SCTP: Assoc 0: ApplSend, chunk: 5/10448/100/A231355C to 10.5.0.4 SCTP: Assoc 0: Set oldest chunk for dest 10.5.0.4 to TSN A23134F8

debug ip sctp state

To show state transitions in the Stream Control Transmission Protocol (SCTP), use the **debug ip sctp** statecommand in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp state

no debug ip sctp state

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

Usage Guidelines The **debug ip sctp state** command can be used to see if the current associations are stable or not. Because it generates output only on state transitions, it is safe to use in a live environment. It still should be used with caution, however, depending on the number of associations being handled by the system and the stability of the network.

The **debug ip sctp state** command is often used at the same time as the **debug ip sctp signal** command. Using the two commands together gives good insight into the stability of associations.

Examples In the following example, a new association is requested and established. The peer then restarts the association and notes that the association failed and is being reestablished. The local peer then indicates that the association has failed because it has tried to retransmit the specified chunk more than the maximum number of times without success. As a result, the association fails (because of communication loss) and is terminated. The upper-layer protocol (ULP) requests that the association be attempted again, and this attempt succeeds. A shutdown is then received from the remote peer, and the local peer enters the shutdown acknowledge sent state, which is followed by the association being terminated. Again, another association attempt is made and succeeds.

```
Router# debug ip sctp signal
Router# debug ip sctp state
<new assoc attempt>
00:20:08: SCTP: Assoc 0: state CLOSED -> COOKIE_WAIT
00:20:15: SCTP: Assoc 0: state COOKIE_WAIT -> ESTABLISHED
00:20:15: SCTP: Assoc 0: Sent ASSOC_UP signal for CONFIGD_ASSOC
00:21:03: SCTP: Assoc 0: Restart rcvd from peer
00:21:03: SCTP: Assoc 0: Sent ASSOC_RESTART signal
00:21:04: SCTP: Assoc 0: chunk 62EA7F40 retransmitted more than max times, failing assoc
00:21:04: SCTP: Assoc 0: Sent ASSOC_TERMINATE signal
```

00:21:04: SCTP: Assoc 0: state ESTABLISHED -> CLOSED <new assoc attempt> 00:21:04: SCTP: Assoc 0: state CLOSED -> COOKIE WAIT 00:21:04: SCTP: Assoc 0: state COOKIE_WAIT -> COOKIE_ECHOED 00:21:04: SCTP: Assoc 0: state COOKIE_ECHOED -> ESTABLISHED 00:21:04: SCTP: Assoc 0: Sent ASSOC UP signal for CONFIGD_ASSOC 00:21:04: SCTP: Assoc 0: Sent TERMINATE PENDING signal 00:21:04: SCTP: Assoc 0: state ESTABLISHED -> SHUTDOWN_ACKSENT 00:21:04: SCTP: Assoc 0: Sent ASSOC_TERMINATE signal 00:21:04: SCTP: Assoc 0: state CLOSED -> CLOSED <new assoc attempt> 00:21:04: SCTP: Assoc 0: state CLOSED -> COOKIE_WAIT 00:21:04: SCTP: Assoc 0: state CLOSED -> COOKIE_ECHOED 00:21:04: SCTP: Assoc 0: state COOKIE_WAIT -> CLOSED <new assoc attempt> 00:21:04: SCTP: Assoc 0: state COOKIE_WAIT -> COOKIE_ECHOED 00:21:04: SCTP: Assoc 0: state COOKIE_ECHOED -> ESTABLISHED 00:21:04: SCTP: Assoc 0: state COOKIE_CONFIED -> ESTABLISHED 00:21:04: SCTP: Assoc 0: Sent ASSOC_UP signal for CONFIGD_ASSOC The table below describes the significant fields shown in the display.

Table 12: debug ip sctp state Field Descriptions

Field	Description
CLOSED -> COOKIE_WAIT	SCTP endpoint sends initialization chunk and moves to the COOKIE_WAIT state to wait for acknowledgment and a state cookie from the remote endpoint.
COOKIE_WAIT -> COOKIE_ECHOED	SCTP endpoint returns the state cookie to the remote endpoint and enters COOKIE_ECHOED state.
COOKIE_ECHOED -> ESTABLISHED	SCTP endpoint enters ESTABLISHED state after receiving acknowledgment that the state cookie has been received by the remote endpoint.
ESTABLISHED -> SHUTDOWN_ACKSENT	SCTP endpoint enters SHUTDOWN_ACKSENT state after receiving a shutdown message and sending a shutdown acknowledgment to the remote endpoint.
SHUTDOWN_ACKSENT -> CLOSED	SCTP endpoint enters CLOSED state.

Related Commands

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
debug ip sctp congestion	Shows a list of all current SCTP associations.
debug ip sctp signal	Shows signals that are sent from SCTP to the application or ULP.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.

Command	Description
show ip sctp errors	Shows error counts logged by SCTP.
show ip sctp instances	Shows all currently defined SCTP instances.
show ip sctp statistics	Shows overall statistics counts for SCTP.
show iua as	Shows information about the current condition of an application server.
show iua asp	Shows information about the current condition of an application server process.
debug ip sctp timer

To provide information about Stream Control Transmission Protocol (SCTP) timers that are started, stopped, and triggering, use the **debug ip sctp timer** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp timer no debug ip sctp timer

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

Usage Guidelines Many SCTP timers should not be restarted after they have been started once. For these timers, the first call succeeds in starting the timer, and subsequent calls do nothing until the timer either expires or is stopped. For example, the retransmission timer is started when the first chunk is sent, but then is not started again for subsequent chunks when there is outstanding data.

∕!∖ Caution

The **debug ip sctp timer** command generates a significant amount of output. It should be used with extreme caution in a live network.

Examples

The following example shows the starting and stopping of various SCTP timers:

Router# debug ip sctp timer SCTP: Assoc 0: Starting CUMSACK timer SCTP: Timer already started, not restarting SCTP: Assoc 0: Starting CUMSACK timer SCTP: Timer already started, not restarting SCTP: Assoc 0: Timer BUNDLE triggered SCTP: Assoc 0: Starting RETRANS timer for destaddr 10.5.0.4 SCTP: Assoc 0: Starting RETRANS timer for destaddr 10.5.0.4 SCTP: Assoc 0: Starting RETRANS timer for destaddr 10.5.0.4 SCTP: Assoc 0: Starting RETRANS timer for destaddr 10.5.0.4 SCTP: Assoc 0: Starting RETRANS timer for destaddr 10.5.0.4 SCTP: Timer already started, not restarting SCTP: Assoc 0: Starting RETRANS timer for destaddr 10.5.0.4 SCTP: Timer already started, not restarting SCTP: Assoc 0: Starting RETRANS timer for destaddr 10.5.0.4 SCTP: Assoc 0: Stopping RETRANS timer for destaddr 10.5.0.4 SCTP: Assoc 0: Stopping RETRANS timer for destaddr 10.5.0.4 SCTP: Assoc 0: Starting RETRANS timer for destaddr 10.5.0.4

Table 13: debug ip sctp timer Field Descriptions

Field	Description
CUMSACK	Cumulative selective acknowledgment.
RETRANS	Retransmission.

Command	Description
clear ip sctp statistics	Empties the buffer that holds SCTP statistics.
debug ip sctp congestion	Shows a list of all current SCTP associations.
show ip sctp association parameters	Shows the parameters configured for the association defined by the association identifier.
show ip sctp association statistics	Shows the current statistics for the association defined by the association identifier.
show ip sctp errors	Shows error counts logged by SCTP.
show ip sctp instances	Shows all currently defined SCTP instances.
show ip sctp statistics	Shows overall statistics counts for SCTP.
show iua as	Shows information about the current condition of an application server.
show iua asp	Shows information about the current condition of an application server process.

debug ip sctp warnings

To display diagnostic information about unusual situations in Stream Control Transmission Protocol (SCTP), use the **debug ip sctp warnings**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sctp warnings no debug ip sctp warnings

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(4)T	This command was introduced.

Usage Guidelines In a live system, the debugging messages for performance, state, signal, and warnings are the most useful. They show any association or destination address failures and can be used to monitor the stability of established associations.

The **debug ip sctp warnings** command displays information on any unusual situation that is encountered. These situations may or may not indicate problems, depending on the particulars of the situation.

Examples

The following example shows some events and conditions that are flagged as warnings:

Router# debug ip sctp warnings

SCTP: Assoc 0: No cookie in InitAck, discarding SCTP: Assoc 0: Incoming INIT_ACK: inbound streams reqd 15, allowed 13 SCTP: Assoc 0: Incoming INIT_ACK request: outbound streams req'd 13, allowed 1 SCTP: Assoc 0: Remote verification tag in init ack is zero, discarding SCTP: Assoc 0: Remote verification tag in init is zero, discarding SCTP: Assoc 0: Rwnd less than min allowed (1500) in incoming INITACK, rcvd 0 SCTP: Assoc 0: Rwnd less than min allowed (1500) in incoming INITACK, rcvd 1499 SCTP: Rwnd in INIT too small (0), discarding SCTP: Rwnd in INIT too small (1499), discarding SCTP: Unknown INIT param 16537 (0x4099), length 8 SCTP: Assoc 0: Unknown INITACK param 153 (0x99), length 8 SCTP: Assoc 0: No cookie in InitAck, discarding SCTP: Assoc 0: No cookie in InitAck, discarding SCTP: Processing INIT, invalid param len 0, discarding...

debug ip sd

I

	To display all session directory (SD) announcements received, use the debug ip sd command in privileged EXEC mode. To disable debugging output, use the no form of this command.	
	debug ip sd no debug ip sd	
Syntax Description	This command has no arguments or keywords.	
Command Modes	Privileged EXEC	
Usage Guidelines	This command shows session directory announcements for multicast IP. Use it to observe multicast activity.	
Examples	The following is sample output from the debug ip sd command:	
	<pre>Router# debug ip sd SD: Announcement from 172.16.58.81 on Serial0.1, 146 bytes s=*cisco: CBONE Audio i=cisco internal-only audio conference o=din0@dino-ss20.cisco.com c=224.0.255.1 16 2891478496 2892688096 m=audio 31372 1700 SD: Announcement from 172.22.246.68 on Serial0.1, 147 bytes s=IMS: U.S. Senate i=U.S. Senate at http://town.hall.org/radio/live.html o=carl@also.radio.com c=224.2.252.231 95 0 0 m=audio 36572 2642 a=fmt:gsm The table below describes the significant fields shown in the display.</pre>	

Table 14: debug ip sd Field Descriptions

Field	Description
SD	Session directory event.
Announcement from	Address sending the SD announcement.
on Serial0.1	Interface receiving the announcement.
146 bytes	Size of the announcement event.
s=	Session name being advertised.
i=	Information providing a descriptive name for the session.

I

1

Field	Description
0=	Origin of the session, either an IP address or a name.
c=	Connect description showing address and number of hops.
m=	Media description that includes media type, port number, and ID.

Command	Description
debug ip dvmrp	Displays information on DVMRP packets received and sent.
debug ip igmp	Displays IGMP packets received and sent, and IGMP host-related events.
debug ip mbgp dampening	Logs route flap dampening activity related to MBGP.
debug ip mrouting	Displays changes to the IP multicast routing table.
debug ip pim	Displays PIM packets received and sent, and PIM-related events.

debug ip sdee

To enable debugging messages for Security Device Event Exchange (SDEE) notification events, use the **debug ip sdee** command in privileged EXEC mode. To disable SDEE debugging messages, use the **no** form of this command.

debug ip sdee [alerts] [detail] [messages] [requests] [subscriptions]

no debug ip sdee [alerts] [detail] [messages] [requests] [subscriptions]

Syntax Description

alerts	Displays new alerts that are reported to SDEE from IPS.
detail	Displays detailed SDEE messages.
messages	Displays error and status messages that are reported to SDEE from IPS.
requests	Displays SDEE client requests.
subscriptions	Displays SDEE client subscription requests.

Command Modes Privileged EXEC (#)

Release	Modification
12.3(8)T	This command was introduced.
12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Examples

Command History

The following is sample SDEE debug output. In this example, you can see which messages correspond to SDEE alerts, requests, and subscriptions.

Router# debug ip sdee alerts requests subscriptions 5d00h:SDEE:got request from client at 10.0.0.2 5d00h:SDEE:reported 13 events for client at 10.0.0.2 5d00h:SDEE:GET request for client 10.0.0.2 subscription IDS1720:0 5d00h:SDEE:reported 50 events for client 10.0.0.2 subscription IDS1720:0 5d00h: SDEE alert:sigid 2004 name ICMP Echo Req from 10.0.0.2 time 1021174067 5d00h: SDEE alert:sigid 2004 name ICMP Echo Req from 10.0.0.2 time 1021174071 5d00h: SDEE alert:sigid 2004 name ICMP Echo Req from 10.0.0.2 time 1021174072 5d00h: SDEE alert:sigid 2004 name ICMP Echo Req from 10.0.0.2 time 1021174072 5d00h: SDEE alert:sigid 2004 name ICMP Echo Req from 10.0.0.2 time 1021174072 5d00h:SDEE alert:sigid 2004 name ICMP Echo Req from 10.0.0.2 time 1021175127 5d00h:SDEE:missed events for IDS1720:0

٦

Command	Description
ip ips notify	Specifies the method of event notification.
ip sdee events	Sets the maximum number of SDEE events that can be stored in the event buffer.
ip sdee subscriptions	Sets the maximum number of SDEE subscriptions that can be open simultaneously.

debug ip security

To display IP security option processing, use the **debug ip security** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip security

no debug ip security

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Usage Guidelines The **debug ip security** command displays information for both basic and extended IP security options. For interfaces where **ip security** is configured, each IP packet processed for that interface results in debugging output regardless of whether the packet contains IP security options. IP packets processed for other interfaces that also contain IP security information also trigger debugging output. Some additional IP security debugging information is also controlled by the **debug ip packet** command in privileged EXEC mode.

<u>_/!\</u>
```

Caution Because the **debug ip security** command generates a substantial amount of output for every IP packet processed, use it only when traffic on the IP network is low, so other activity on the system is not adversely affected.

Examples

The following is sample output from the **debug ip security** command:

```
Router# debug ip security
IP Security: src 172.24.72.52 dst 172.24.72.53, number of BSO 1
    idb: NULL
    pak: insert (0xFF) 0x0
IP Security: BSO postroute: SECINSERT changed to secret (0x5A) 0x10
IP Security: src 172.24.72.53 dst 172.24.72.52, number of BSO 1
    idb: secret (0x6) 0x10 to secret (0x6) 0x10, no implicit
    def secret (0x6) 0x10
    pak: secret (0x5A) 0x10
IP Security: checking BSO 0x10 against [0x10 0x10]
IP Security: classified BSO as secret (0x5A) 0x10
The table below describes significant fields shown in the display.
```

Table 15: debug ip security Field Descriptions

Field	Description
number of BSO	Indicates the number of basic security options found in the packet.
idb	Provides information on the security configuration for the incoming interface.

Field	Description
pak	Provides information on the security classification of the incoming packet.
src	Indicates the source IP address.
dst	Indicates the destination IP address.

The following line indicates that the packet was locally generated, and it has been classified with the internally significant security level "insert" (0xff) and authority information of 0x0:

idb: NULL
pak: insert (0xff) 0x0

The following line indicates that the packet was received via an interface with dedicated IP security configured. Specifically, the interface is configured at security level "secret" and with authority information of 0x0. The packet itself was classified at level "secret" (0x5a) and authority information of 0x10.

debug ip sla error

To enable debugging output of Cisco IOS IP Service Level Agreements (SLAs) operation run-time errors, use the **debug ip sla error** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sla error [operation-number| ep-api| event-publisher]

no debug ip sla error [operation-number| ep-api| event-publisher]

Syntax Description

operation-number	(Optional) Identification number of the operation for which debugging output is to be enabled.
ер-арі	(Optional) Enables IP SLAs Event Publisher application programming interface (API) debug messages.
event-publisher	(Optional) Enables IP SLAs Event Publisher debug messages.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.4(4)T	This command was introduced. This command replaces the debug ip sla monitor error command.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the debug rtr error command.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the debug ip sla monitor error command.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the debug ip sla monitor error command.
	12.4(22)T	This command was modified. The ep-api and event-publisher keywords were added.
	12.2(33)SRE	This command was modified. The ep-api and event-publisher keywords were added.

Usage Guidelines

The **debug ip sla error** *operation-number* command displays run-time errors. When an operation number other than 0 is specified, all run-time errors for that operation are displayed when the operation is active. When the operation number is 0, all run-time errors relating to the IP SLAs scheduler process are displayed. When no operation number is specified, all run-time errors for all active operations configured on the router are displayed.

```
Note
```

Use the **debug ip sla error** command before using the **debug ip sla trace** command because the **debug ip sla error** command generates a lesser amount of debugging output.

The **debug ip sla error** command is supported in IPv4 networks. This command can also be used to enable debugging output for an IP SLAs operation that supports IPv6 addresses.

Examples

The following is sample output from the **debug ip sla error** command. The output indicates failure because the target is not there or because the responder is not enabled on the target.

Route	er#	debug ip sla	error		
May	5	05:00:35.483:	control	message	failure:1
May	5	05:01:35.003:	control	message	failure:1
May	5	05:02:34.527:	control	message	failure:1
May	5	05:03:34.039:	control	message	failure:1
May	5	05:04:33.563:	control	message	failure:1
May	5	05:05:33.099:	control	message	failure:1
May	5	05:06:32.596:	control	message	failure:1
May	5	05:07:32.119:	control	message	failure:1
May	5	05:08:31.643:	control	message	failure:1
May	5	05:09:31.167:	control	message	failure:1
May	5	05:10:30.683:	control	message	failure:1

Command	Description
debug ip sla trace	Traces the execution of an IP SLAs operation.

debug ip rtp header-compression through debug ipv6 icmp

secs over schedule period 60

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

debug ip sla trace

To trace the execution of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **debug ip sla trace**command in privileged EXEC mode. To disable trace debugging output, use the **no**form of this command.

debug ip sla trace [operation-number| ep-api| event-publisher]

no debug ip sla trace [operation-number| ep-api| event-publisher]

Syntax Description

operation-number	(Optional) Identification number of the operation for which debugging output is to be enabled.
ер-арі	(Optional) Enables IP SLAs Event Publisher API debugging output.
event-publisher	(Optional) Enables IP SLAs Event Publisher debugging output.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.4(4)T	This command was introduced. This command replaces the debug ip sla monitor trace command.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the debug rtr trace command.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the debug ip sla monitor trace command.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the debug ip sla monitor trace command.
	12.4(22)T	This command was modified. The ap-api and event-publisher keywords were added.
	12.2(33)SRE	This command was modified. The ep-api and event-publisher keywords were added.

Usage Guidelines

The **debug ip sla trace** *operation-number* command traces the execution of an IP SLAs operation. When an operation number other than 0 is specified, execution for that operation is traced. When the operation number is 0, the IP SLAs scheduler process is traced. When no operation number is specified, all active operations are traced.

The **debug ip sla trace** command also enables the **debug ip sla error** command for the specified operation. However, the **no debug ip sla trace** command does not disable the **debug ip sla error** command. You must manually disable the command by using the **no debug ip sla error** command.

All debugging output (including **debug ip sla error** command output) has the format shown in the **debug ip sla error** command output example.

Note

The **debug ip sla trace**command can generate a large number of debug messages. First use the **debug ip sla error** command, and then use the **debug ip sla trace** on a per-operation basis.

Examples

The following is sample output from the **debug ip sla trace** command. In this example, an operation is traced through a single operation attempt: the setup of a connection to the target, and the attempt at an echo to calculate UDP packet response time.

```
Router# debug ip sla trace

Command	Description
debug ip sla error	Enables debugging output of IP SLAs operation run-time errors.

debug ip sla trace mpls-lsp-monitor

I

To trace the execution of an IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation, use the **debug ip sla trace mpls-lsp-monitor**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sla trace mpls-lsp-monitor [operation-number]

no debug ip sla mpls-lsp-monitor

Syntax Description	operation-number	(Optional) Number of the LSP Health Monitor operation for which the debugging output will be displayed. The range is 0 to 2147483647.
Command Default	Trace debugging of IP	SLAs LSP Health Monitor operations is disabled.
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	15.1(1)S	This command was introduced. This command replaces the debug ip sla mpls-lsp-monitor command.
Usage Guidelines	mpls-lsp-monitor com To determine the IP SL show ip application co Router# show ip sla IP Service Level A Version: Round Trip The debug ip sla trace operations. When an op the operation number is all active LSP Health M This command also ena debug ip sla trace mpl manually disable the co The debug ip sla trace	As engine version, IP SLAs Engine 2.0 or 3.0, running on your Cisco router, use the ommand in privileged EXEC mode, as shown in the following example: application

Examples

The following is sample output from the **debug ip sla trace mpls-lsp-monitor** command:

Router# debug ip sla trace mpls-lsp-monitor

```
IP SLA Monitor MPLSLM debugging for all entries is on
*Aug 19 19:59: IP SLA Monitor MPLSLM(1):Next hop 10.10.10.8 added in AddQ
*Aug 19 19:59: IP SLA Monitor MPLSLM(1):Next hop 10.10.10.8 added in AddQ
*Aug 19 19:59: IP SLA Monitor MPLSLM(1):Next hop 10.10.10.8 added in AddQ
*Aug 19 19:59: IP SLA Monitor MPLSLM(1):Adding vrf red into tree entry 10.10.10.8

*Aug 19 19:59: IP SLA Monitor MPLSLM(1):Adding vrf green into tree entry 10.10.10.8
*Aug 19 19:59: IP SLA Monitor MPLSLM(1):Duplicate in AddQ 10.10.10.8
*Aug 19 19:59: IP SLA Monitor MPLSLM(1):Added Probe(s) 100005 will be scheduled after 26
secs over schedule period 60
```

Command	Description
debug ip sla error	Enables debugging output of Cisco IOS IP SLAs operation run-time errors.
debug ip sla mpls-lsp-monitor	Enables debugging output for Cisco IOS IP SLAs LSP Health Monitor operations in IP SLAs Engine 2.0.
show ip application	Displays global information about Cisco IOS IP SLAs.

debug ip sla trace twamp

To enable debugging output of Cisco IOS IP Service Level Agreements (SLAs) operation for Two-Way Active Measurement Protocol (TWAMP), use the **debug ip sla trace twamp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip sla trace twamp{connection [source-ip *ip-address*] | control{reflector | server} | session [source-ip *ip-address*]}

no debug ip sla trace twamp{connection [source-ip *ip-address*] | control{reflector | server} | session [source-ip *ip-address*]}

Syntax Description	connection	Displays communication messages between an IP SLAs TWAMP client and server.
	source-ip ip-address	(Optional) Debug IP Performance Metrics (IPPM) TWAMP connections for the specified source. Specify the source using the IP address of the client device.
	control	Displays communication messages between the IP SLAs TWAMP server and reflector.
	reflector	Displays communication messages sent by an IP SLAs TWAMP reflector to the TWAMP server.
	server	Displays communication messages sent by an IP SLAs TWAMP server to the TWAMP reflector.
	session	Displays communication messages between an IP SLAs TWAMP sender and reflector.
ommand Modes	Privileged EXEC	
	Release	Modification
Command History		

1

Use the **debug ip sla error twamp connection** command before using the **debug ip sla trace twamp connection** command because the **debug ip sla error twamp connection** command generates less debugging output.

Command	Description
debug ip sla error twamp	Displays exceptions during communication between the IP SLAs TWAMP client and server.

debug ip slb

To display debugging messages for the Cisco IOS Server Load Balancing (SLB) feature, use the **debug ip slb**command in user EXEC or privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip slb {all| asn [msid]| conns [*acl-number*]| dfp| firewallfarm| fragments| gtp| icmp| kal-ap| natpool| probe| reals| replication| route| sessions [asn| gtp| ipmobile| radius]| sticky gtp imsi| vservers}

no debug ip slb {all| asn [msid]| conns [*acl-number*]| dfp| firewallfarm| fragments| gtp| icmp| kal-ap| natpool| probe| reals| replication| route| sessions [asn| gtp| ipmobile| radius]| sticky gtp imsi| vservers}

Syntax Description	all	Displays all debugging messages for Cisco IOS SLB.
	asn	Displays debugging messages related to Access Service Network (ASN) load balancing.
	msid	(Optional) Displays debugging messages related to the ASN Mobile Station ID (MSID) sticky database.
	conns acl-number	Displays debugging messages for all connections being handled by IOS SLB, including Wireless Session Protocol (WSP) events and states.
		The optional <i>acl-number</i> argument references an IP access control list (ACL). This argument limits the information displayed based on the client IP address, real server IP address, or virtual server IP address:
		• For simple ACLs, IOS SLB checks the client IP address.
		• For extended ACLs, IOS SLB checks the client real and virtual IP addresses.
		For more information about ACLs, refer to the "Configuring IP Services" chapter of the <i>Cisco IOS IP Configuration Guide</i> , Release 12.2.
	dfp	Displays debugging messages for Dynamic Feedback Protocol (DFP).
		• To display debugging messages for the DFP agent subsystem, use the debug ip dfp agent command.
		• To display debugging messages for the general packet radio service (GPRS) DFP weight calculation, use the debug gprs dfp command.

٦

firewallfarm	Displays debugging messages related to firewall load balancing.
fragments	Displays debugging messages related to the IOS SLB fragment database.
gtp	Displays all GPRS Tunneling Protocol (GTP)-related packet handler, gateway GPRS support node (GGSN), serving GPRS support node (SGSN), and Network Service Access Point Identifier (NSAPI) debugging messages for IOS SLB.
icmp	Displays all Internet Control Message Protocol debugging messages for IOS SLB.
kal-ap	Displays all KeepAlive Application Protocol (KAL-AP) debugging messages for IOS SLB.
natpool	Displays debugging messages related to the IOS SLB client Network Address Translation (NAT) pool.
probe	Displays debugging messages related to probes.
reals	Displays debugging messages for all real servers defined to IOS SLB.
replication	Displays debugging messages related to IOS SLB stateful backup virtual server.
route	Displays debugging messages for all routing handled by the IOS SLB RADIUS framed-IP sticky database.
sessions [asn gtp ipmobile radius	Displays debugging messages for all sessions being handled by IOS SLB.
	• The optional asn keyword enables users to limit the information displayed to only ASN sessions.
	• The optional gtp keyword enables users to limit the information displayed to only GTP sessions.
	• The optional ipmobile keyword enables users to limit the information displayed to only Mobile IP sessions.
	• The optional radius keyword enables users to limit the information displayed to only RADIUS sessions.
sticky gtp imsi	Displays all debugging messages related to the IOS SLB GTP International Mobile Subscriber ID (IMSI) sticky database.

vservers	Displays debugging messages for all virtual servers defined to IOS SLB.
----------	---

Command Modes User EXEC or privi

User EXEC or privileged EXEC (#)

Release	Modification
12.0(7)XE	This command was introduced.
12.1(5)T	This command was integrated into Cisco IOS Release 12.1(5)T.
12.2	This command was integrated into Cisco IOS Release 12.2.
12.1(2)E	The natpool and replication keywords were added.
12.1(3a)E	The firewallfarm keyword was added.
12.1(7)E	The vservers keyword was added.
12.1(9)E	The sessions keyword was added.
12.1(11b)E	The route keyword, the <i>acl-number</i> argument, and the radius option on the sessions keyword were added.
12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.
12.1(13)E3	The gtp keyword and the gtp option on the sessions keyword were added.
12.2(14)ZA2	The ipmobile keyword was added.
12.2(18)SXE	The sticky gtp imsikeywords were added.
12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SRC	The kal-ap keyword was added.
12.2(33)SRC1	The asn keyword and the asn option on the sessions keyword were added.
12.2(33)SRE	The msid option on the asn keyword was added.
	12.0(7)XE 12.1(5)T 12.2 12.1(2)E 12.1(2)E 12.1(3a)E 12.1(7)E 12.1(9)E 12.1(11b)E 12.2(14)S 12.2(14)ZA2 12.2(18)SXE 12.2(33)SRC 12.2(33)SRC1

Usage Guidelines

I

This command displays debugging messages for IOS SLB. See the following caution before using debug commands:

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use debug commands during periods of lower network flows and fewer users. Debugging during these periods reduces the effect these commands have on other users on the system.

Examples

The following example configures a debugging session to check all IP IOS SLB parameters:

Router# **debug ip slb all** SLB All debugging is on Router# The following example stops all debugging:

Router# no debug all All possible debugging has been turned off Router#

The following example configures debugging to check IP IOS SLB replication used with stateful backup and displays the output from the send or transmit virtual server:

Router# debug ip slb replication *Mar 2 08:02:38.019: SLB Replicate: (send) update vs: VS1 update_count 42 The following example shows Cisco IOS SLB DFP debug output:

```
Router# debug ip slb dfp
SLB DFP debugging is on
router#

debug ip snat

To display information about IP packets translated by the IP stateful network address translation (SNAT) feature, use the **debug ip snat** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip snat [detailed]

no debug ip snat [detailed]

Syntax Descript	ion detailed	(Optional) Displays debug information in a detailed format.
Command Defau		
Commanu Derau	lt Disabled	
Command Mode	s Privileged EXEC	
Command Histor	ry Release	Modification
	12.2(13)T	This command was introduced.
Usage Guideline	member of the translation g backup translator of active translator to prepare duplic translator in the event of a	wo or more network address translators to function as a translation group. One group handles traffic requiring translation of IP address information. It informs the flows as they occur. The backup translator can then use information from the active ate translation table entries enabling the backup translator to become the active critical failure. Traffic continues to flow without interruption because the same as are used and the state of those translations has been previously defined.
	<u>^</u>	
Cau	• •	command generates a significant amount of output, use it only when traffic o other activity on the system is not adversely affected.
Examples	The following is sample ou	atput from the debug ip snat command:
	2w6d:SNAT(write2net):1 2w6d:SNAT(write2net):vo 2w6d:SNAT(Send):Enquer 2w6d:SNAT(write2net):1	

```
2w6d:SNAT (readfromnet):Enqueuing SYNC Message msg to readQ
2w6d:SNAT (Receive):Processed SYNC Message from Router-Id:0 for Router-Id:200's entry/entries
2w6d:SNAT (readfromnet):Enqueuing DUMP-REQUEST Message msg to readQ
try/entries
2w6d:SNAT(sense):Send SYNC message
2w6d:SNAT(sense):Enqueuing SYNC Message for Router-Id 100
2w6d:SNAT(write2net):192.168.123.2 <---> 192.168.123.3 send message
2w6d:SNAT(write2net):ver 2, id 100, opcode 1, len 68
2w6d:SNAT (readfromnet):Enqueuing SYNC Message msg to readQ
2w6d:SNAT (Receive):Processed SYNC Message from Router-Id:200 for Router-Id:200's
entry/entries
```

The table below describes the significant fields shown in the display.

Table 17: debug ip snat Field Descriptions

Field	Description
SNAT:	Indicates that the packet is being translated by the SNAT feature.
DUMP-REQUEST Message	Requests for entries after the SNAT router is active.

debug ip socket

To display all state change information for all sockets, use the **debug ip socket** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip socket

no debug ip socket

- **Syntax Description** This command has no arguments or keywords.
- Command Modes Privileged EXEC

Usage Guidelines Use this command to collect information on the socket interface. To get more complete information on a socket/TCP port pair, use this command in conjunction with the **debug ip tcp transactions** command.

Because the socket debugging information is state-change oriented, you will not see the debugging message on a per-packet basis. However, if the connections normally have very short lives (few packet exchanges during the life cycle of a connection), then socket debugging could become expensive because of the state changes involved during connection setup and teardown.

Examples

The following is sample output from the **debug ip socket** output from a server process:

Router# debug ip socket Added socket 0x60B86228 to process 40 SOCKET: set TCP property TCP_PID, socket 0x60B86228, TCB 0x60B85E38 Accepted new socket fd 1, TCB 0x60B85E38 Added socket 0x60B86798 to process 40 SOCKET: set TCP property TCP_PID, socket 0x60B86798, TCB 0x60B877C0 SOCKET: set TCP property TCP_BIT_NOTIFY, socket 0x60B86798, TCB 0x60B877C0 SOCKET: created new socket to TCP, fd 2, TCB 0x60B877C0 SOCKET: bound socket fd 2 to TCB 0x60B877C0 SOCKET: set TCP property TCP_WINDOW SIZE, socket 0x60B86798, TCB 0x60B877C0 SOCKET: listen on socket fd 2, TCB 0x60B877C0 SOCKET: closing socket 0x60B86228, TCB 0x60B85E38 SOCKET: socket event process: socket 0x60B86228, TCB new state --> FINWAIT1 socket state: SS_ISCONNECTED SS_CANTSENDMORE SS_ISDISCONNECTING SOCKET: Removed socket 0x60B86228 from process 40 socket list The following is sample output from the debug ip socket command from a client process:

Router# debug ip socket Added socket 0x60B70220 to process 2 SOCKET: set TCP property TCP_PID, socket 0x60B70220, TCB 0x60B6CFDC SOCKET: set TCP property TCP_BIT_NOTIFY, socket 0x60B70220, TCB 0x60B6CFDC SOCKET: created new socket to TCP, fd 0, TCB 0x60B6CFDC SOCKET: socket event process: socket 0x60B70220, TCB new state --> SYNSENT socket state: SS_ISCONNECTING SOCKET: socket event process: socket 0x60B70220, TCB new state --> ESTAB socket state: SS_ISCONNECTING SOCKET: closing socket 0x60B70220, TCB new state --> ESTAB socket state: SS_ISCONNECTING SOCKET: socket event process: socket 0x60B70220, TCB new state --> FINWAIT1 socket state: SS_ISCONNECTED SS_CANTSENDMORE SS_ISDISCONNECTING SOCKET: Removed socket 0x60B70220 from process 2 socket list The table below describes the significant fields shown in the display.
I

Table 18:	debug i	p socket	Field	Descriptions
-----------	---------	----------	-------	--------------

Field	Description
Added socket 0x60B86228 process 40	New socket is opened for process 40.
SOCKET	Indicates that this is a SOCKET transaction.
set TCP property TCP_PID	Sets the process ID to the TCP associated with the socket.
socket 0x60B86228, TCB 0x60B85E38	Address for the socket/TCP pair.
set TCP property TCP_BIT_NOTIFY	Sets the method for how the socket wants to be notified for an event.
created new socket to TCP, fd 2	Opened a new socket referenced by file descriptor 2 to TCP.
bound socket fd 2 to TCB	Bound the socket referenced by file descriptor 2 to TCP.
listen on socket fd 2	Indicates which file descriptor the application is listening to.
closing socket	Indicates that the socket is being closed.
socket event process	Processed a state change event occurred in the transport layer.
TCB new state> FINWAIT1	TCP state machine changed to FINWAIT1. (See the debug ip tcp transaction command for more information on TCP state machines.)

٦

Field	Description
socket state: SS_ISCONNECTED SS_CANTSENDMORE SS_ISDISCONNECTING	New SOCKET state flags after the transport event processing. This socket is still connected, but disconnecting is in progress, and it will not send more data to peer.
	Possible SOCKET state flags follow:
	• SS_NOFDREF
	No file descriptor reference for this socket.
	• SS_ISCONNECTING
	Socket connecting is in progress.
	• SS_ISBOUND
	Socket is bound to TCP.
	• SS_ISCONNECTED
	Socket is connected to peer.
	• SS_ISDISCONNECTING
	Socket disconnecting is in progress.
	• SS_CANTSENDMORE
	Can't send more data to peer.
	• SS_CANTRCVMORE
	Can't receive more data from peer.
	• SS_ISDISCONNECTED
	Socket is disconnected. Connection is fully closed.
Removed socket 0x60B86228 from process 40 socket list	Connection is closed, and the socket is removed from the process socket list.

Related Commands

Command	Description
debug ip tcp transactions	Displays information on significant TCP transactions such as state changes, retransmissions, and duplicate packets.

debug ip ssh

To display debugging messages for Secure Shell (SSH), use the **debug ip ssh** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip ssh [detail| packet]

no debug ip ssh

Syntax Description

detail	(Optional) Specifies SSH protocol, channel requests and information state changes.
packet	(Optional) Specifies information regarding the SSH packet.

Command Default Debugging for SSH is not enabled.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.0(5)S	This command was introduced.
	12.1(1)T	This command was integrated into Cisco IOS Release 12.1T.
	12.4(20)T	The detail and packet keywords were added.
	Cisco IOS XE Release 2.4	This command was implemented on the Cisco ASR 1000 series routers.

Usage Guidelines Use the **debug ip ssh** command to ensure normal operation of the SSH server.

Examples

The following example shows the SSH debugging output:

Router# debug ip ssh 00:53:46: SSH0: starting SSH control process 00:53:46: SSH0: Exchanging versions - SSH-1.5-Cisco-1.25 00:53:46: SSH0: client version is - SSH-1.5-1.2.25 00:53:46: SSH0: SSH SMSG PUBLIC KEY message sent 00:53:46: SSH0: SSH_CMSG_SESSION_KEY message received 00:53:47: SSH0: keys exchanged and encryption on 00:53:47: SSH0: authentication request for userid guest 00:53:47: SSH0: authentication successful for jcisco 00:53:47: SSH0: starting exec shell

The following example shows the SSH detail output:

Router# debug ip ssh detail 00:04:22: SSH0: starting SSH control process 00:04:22: SSH0: sent protocol version id SSH-1.99-Cisco-1.25 00:04:22: SSH0: protocol version id is - SSH-1.99-Cisco-1.25 00:04:22: SSH2 0: SSH2 MSG KEXINIT sent 00:04:22: SSH2 0: SSH2 MSG KEXINIT received 00:04:22: SSH2:kex: client->server enc:aes128-cbc mac:hmac-sha1 00:04:22: SSH2:kex: server->client enc:aes128-cbc mac:hmac-sha1 00:04:22: SSH2 0: expecting SSH2 MSG KEXDH INIT 00:04:22: SSH2 0: SSH2_MSG_KEXDH_INIT received 00:04:22: SSH2: kex_derive_keys_complete 00:04:22: SSH2 0: SSH2_MSG_NEWKEYS sent 00:04:22: SSH2 0: waiting for SSH2 MSG NEWKEYS 00:04:22: SSH2 0: SSH2 MSG NEWKEYS received 00:04:24: SSH2 0: authentication successful for lab 00:04:24: SSH2 0: channel open request 00:04:24: SSH2 0: pty-req request 00:04:24: SSH2 0: setting TTY - requested: height 24, width 80; set: height 24, width 80 00:04:24: SSH2 0: shell request 00:04:24: SSH2 0: shell message received 00:04:24: SSH2 0: starting shell for vty 00:04:38: SSH0: Session terminated normally The following example shows the SSH packet output:

```
Router# debug ip ssh packet
00:05:43: SSH2 0: send:packet of length 280 (length also includes padlen of 4)
00:05:43: SSH2 0: ssh receive: 64 bytes received
```

```
00:05:43: SSH2 0: input: total packet length of 280 bytes

1d07h: IPSUB_DP: [ms1:0:PROC:RED:50.0.0.3] Tx driver forwarding the packet 1d07h: IPSUB_DP: [Et0/0:0:PROC:RED:50.0.0.3] Packet classified, results = 0x14

Related Commands

Command	Description
show ip subscriber	Displays information about ISG IP subscriber sessions.

debug ip subscriber redundancy

To enable Intelligent Service Gateway (ISG) IP subscriber session debugging on a Cisco 7600 router, use the **debug ip subscriber** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug ip subscriber redundancy

no debug ip subscriber redundancy

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SRC	This command was introduced.

Examples

I

The following example shows that the **debug ip subscriber redundancy**command is turned on:

Router# **debug ip subscriber redundancy** IP subscriber redundancy debugging is on.

Related Commands

Command	Description
clear ip subscriber interface	Disconnects and removes all ISG IP subscriber sessions associated with a specific interface on a Cisco 7600 router.
clear ip subscriber slot	Disconnects and removes all ISG IP subscriber sessions associated with a specific hardware slot on a Cisco 7600 router.
show ip subscriber interface	Displays information about an ISG IP subscriber interface on a Cisco 7600 router.
show ip subscriber redundancy	Displays information about ISG IP subscriber sessions on a Cisco 7600 router.
show debugging	Displays information about the types of debugging that are enabled for your router.

debug ip tcp congestion

To display information about TCP congestion events, use the **debug ip tcp congestion** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip tcp congestion no debug ip tcp congestion

Syntax Description This command has no arguments or keywords.

Command Default Information from the New Reno congestion control algorithm is displayed.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	15.1(2)T	This command was introduced.

Usage Guidelines The **debug ip tcp congestion** command can be used to debug a performance problem on a TCP/IP network that you have isolated above the data-link layer. It also displays information related to variation in TCP's send window, congestion window, and congestion threshold window.

Examples

The following is sample output from the **debug ip tcp congestion** command:

Router# debug ip tcp congestion

*May 20 22:49:49.091: Setting New Reno as congestion control algorithm
*May 22 05:21:47.281: Advance cwnd by 12
*May 22 05:21:47.281: TCP85FD0C10: sndcwnd: 1472
*May 22 05:21:47.285: Advance cwnd by 3
*May 22 05:21:47.285: Advance cwnd by 3
*May 22 05:21:47.285: TCP85FD0C10: sndcwnd: 1475
*May 22 05:21:47.285: TCP85FD0C10: sndcwnd: 1478
*May 22 05:21:47.285: Advance cwnd by 9
*May 22 05:21:47.285: TCP85FD0C10: sndcwnd: 1487
.
.

*May 20 22:50:32.559: [New Reno] sndcwnd: 8388480 ssthresh: 65535 snd_mark: 232322 *May 20 22:50:32.559: 10.168.10.10:42416 <---> 10.168.30.11:49100 congestion window changes *May 20 22:50:32.559: cwnd from 8388480 to 2514841, ssthresh from 65535 to 2514841 For IOS TCP, New Reno is the default congestion control algorithm. However, an application can also use Binary Increase Congestion Control (BIC) as the congestion algorithm. The following is sample output from the **debug ip tcp congestion** command using the BIC congestion algorithm:

1

Router# debug ip tcp congestion

*May 22 05:21:42.281: Setting BIC as congestion control algorithm

Field	Description
Setting New Reno as congestion control algorithm	TCP is using New Reno as the congestion control algorithm.
TCP85FD0C10	TCP's control block identifier.
Advance cwnd	Increase in TCP's congestion window.
sndcwnd	TCP's send congestion window.
[New Reno]	Values reflected are those of TCP's New Reno congestion control.
ssthresh:	TCP's slow start threshold.
snd_mark	New value of one of New Reno's parameters.
10.168.10.10:42416:	Local address and port number for the TCP connection.
10.168.30.11.49100:	Foreign address and port number for the TCP connection.
congestion window changes	Change in TCP's send congestion window.

Table 19: debug ip tcp congestion Field Descriptions

Related Commands

Command	Description
ip tcp window-size	Alters the TCP window size.

debug ip tcp driver

To display information on TCP driver events; for example, connections opening or closing, or packets being dropped because of full queues, use the **debug ip tcp driver** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip tcp driver

no debug ip tcp driver

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Usage Guidelines The TCP driver is the process that the router software uses to send packet data over a TCP connection. Remote source-route bridging (RSRB), serial tunneling (STUN), and X.25 switching currently use the TCP driver.

Using the **debug ip tcp driver** command together with the **debug ip tcp driver-pak**command provides the most verbose debugging output concerning TCP driver activity.

Examples The following is sample output from the **debug ip tcp driver** command:

```
Router# debug ip tcp driver

TCPDRV359CD8: Active open 172.21.80.26:0 --> 172.21.80.25:1996 OK, lport 36628

TCPDRV359CD8: enable tcp timeouts

TCPDRV359CD8: 172.21.80.26:36628 --> 172.21.80.25:1996 Abort

TCPDRV359CD8: 172.21.80.26:36628 --> 172.21.80.25:1996 DoClose tcp abort

The table below describes the significant fields shown in the display.
```

Table 20: debug ip tcp driver Field Descriptions

Field	Description
TCPDRV359CD8:	Unique identifier for this instance of TCP driver activity.
Active open 172.21.80.26	Indication that the router at IP address 172.21.80.26 has initiated a connection to another router.
:0	TCP port number the initiator of the connection uses to indicate that any port number can be used to set up a connection.
> 172.21.80.25	IP address of the remote router to which the connection has been initiated.

I

Field	Description
:1996	TCP port number that the initiator of the connection is requesting that the remote router use for the connection. (1996 is a private TCP port number reserved in this implementation for RSRB.)
OK,	Indication that the connection has been established. If the connection has not been established, this field and the following field do not appear in this line of output.
lport 36628	TCP port number that has actually been assigned for the initiator to use for this connection.

The following line indicates that the TCP driver user (RSRB, in this case) will allow TCP to drop the connection if excessive retransmissions occur:

TCPDRV359CD8: enable tcp timeouts

The following line indicates that the TCP driver user (in this case, RSRB) at IP address 172.21.80.26 (and using TCP port number 36628) is requesting that the connection to IP address 172.21.80.25 using TCP port number 1996 be aborted:

TCPDRV359CD8: 172.21.80.26:36628 --> 172.21.80.25:1996 Abort The following line indicates that this connection was in fact closed because of an abnormal termination:

TCPDRV359CD8: 172.21.80.26:36628 --> 172.21.80.25:1996 DoClose tcp abort

debug ip tcp driver-pak

To display information on every operation that the TCP driver performs, use the **debug ip tcp driver-pak** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip tcp driver-pak no debug ip tcp driver-pak

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Usage Guidelines This command turns on a verbose debugging by logging at least one debugging message for every packet sent or received on the TCP driver connection.

The TCP driver is the process that the router software uses to send packet data over a TCP connection. Remote source-rate bridging (RSRB), serial tunneling (STUN), and X.25 switching currently use the TCP driver.

To observe the context within which certain **debug ip tcp driver-pak** messages occur, turn on this command in conjunction with the **debug ip tcp driver** command.

Caution Because the **debug ip tcp driver-pak** command generates so many messages, use it only on lightly loaded systems. This command not only places a substantial load on the system processor, it also may change the symptoms of any unexpected behavior that occurs.

Examples

The following is sample output from the **debug ip tcp driver-pak** command:

Router# debug ip tcp driver-pak TCPDRV359CD8: send 2E8CD8 (len 26) queued TCPDRV359CD8: output pak 2E8CD8 (len 26) (26) TCPDRV359CD8: readf 42 bytes (Thresh 16) TCPDRV359CD8: readf 26 bytes (Thresh 16) TCPDRV359CD8: readf 10 bytes (Thresh 10) TCPDRV359CD8: send 327E40 (len 4502) queued TCPDRV359CD8: output pak 327E40 (len 4502) (4502) The table below describes the significant fields shown in the display.

Table 21: debug ip tcp driver-pak Field Descriptions

Field	Description
TCPDRV359CD8	Unique identifier for this instance of TCP driver activity.
send	Indicates that this event involves the TCP driver sending data.

I

Field	Description
2E8CD8	Address in memory of the data the TCP driver is sending.
(len 26)	Length of the data (in bytes).
queued	Indicates that the TCP driver user process (in this case, RSRB) has transferred the data to the TCP driver to send.

The following line indicates that the TCP driver has sent the data that it had received from the TCP driver user, as shown in the previous line of output. The last field in the line (26) indicates that the 26 bytes of data were sent out as a single unit.

TCPDRV359CD8: output pak 2E8CD8 (len 26) (26)

The following line indicates that the TCP driver has received 42 bytes of data from the remote IP address. The TCP driver user (in this case, remote source-route bridging) has established an input threshold of 16 bytes for this connection. (The input threshold instructs the TCP driver to transfer data to the TCP driver user only when at least 16 bytes are present.)

TCPDRV359CD8: readf 42 bytes (Thresh 16)

debug ip tcp ecn

To turn on debugging of the TCP Explicit Congestion Notification (ECN) capability, use the **debug ip tcp** ecncommand in privileged EXEC mode. To turn off the debugging, use the **no** form of this command.

debug ip tcp ecn

no debug ip tcp ecn

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.3(7)T	This command was introduced.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
	Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.

Examples

The following example shows the messages that verify that the end hosts are connected and configured for ECN:

Router# debug ip tcp ecn
!
TCP ECN debugging is on
!
Router# telnet 10.1.25.31
Trying 10.1.25.31 ...
!
01:43:19: 10.1.25.35:11000 <---> 10.1.25.31:23 out ECN-setup SYN
01:43:21: 10.1.25.35:11000 <---> 10.1.25.31:23 congestion window changes
01:43:21: cwnd from 1460 to 1460, ssthresh from 65535 to 2920
01:43:21: 10.1.25.35:11000 <---> 10.1.25.31:23 in non-ECN-setup SYN-ACK

Before a TCP connection can use ECN, a host sends an ECN-setup SYN (synchronization) packet to a remote end that contains an ECE and CWR bit set in the header. This indicates to the remote end that the sending TCP is ECN-capable, rather than an indication of congestion. The remote end sends an ECN-setup SYN-ACK (acknowledgment) packet to the sending host.

In the example above, the "out ECN-setup SYN" text means that a SYN packet with the ECE and CWR bit set was sent to the remote end. The "in non-ECN-setup SYN-ACK" text means that the remote end did not favorably acknowledge the ECN request and that therefore the session is ECN capable.

The following debug output shows that ECN capabilities are enabled at both ends. In response to the ECN-setup SYN, the other end favorably replied with an ECN-setup SYN-ACK message. This connection is now ECN capable for the rest of the session.

Router# telnet 10.10.10.10

Trying 10.10.10.10 ... Open Password required, but none set ! !d20b: 10 1 25 34:11003 <---> 10 1 25 35:23 out

. 1d20h: 10.1.25.34:11003 <---> 10.1.25.35:23 out ECN-setup SYN 1d20h: 10.1.25.34:11003 <---> 10.1.25.35:23 in ECN-setup SYN-ACK Use the show tcp tcb command to display the end-host connections.

Related Commands

Command	Description
ip tcp ecn	Enables TCP ECN.
show tcp tcb	Displays the status of local and remote end hosts.

debug ip tcp ha

To display TCP high availability (HA) events or debugging information for TCP stack interactions between the active Route Processor (RP) and the standby RP, use the **debug ip tcp ha** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip tcp ha {events| transactions} [detail]

no debug ip tcp ha {events| transactions} [detail]

Syntax Description

events	Displays TCP HA failures.
transactions	Displays failed TCP stack interactions between the active RP and standby RP.
detail	(Optional) Displays detailed debugging information about successful TCP HA operations and useful informational messages or about successful TCP stack interactions between the active and standby RP.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(28)SB	This command was introduced.
	15.0(1)S	This command was integrated into Cisco IOS Release 15.0(1)S.
	Cisco IOS XE 3.1S	This command was integrated into Cisco IOS XE Release 3.1S.

Usage Guidelines

The **debug ip tcp ha** command is used to display TCP stateful switchover (SSO) events or debugging information for TCP stack interactions between the active RP and the standby RP. This is command is useful for troubleshooting SSO-aware TCP connections.

Use the **debug ip tcp ha** command with the **transactions** keyword to display failed TCP stack interactions between the active RP and standby RP. This form of the command displays failed TCP HA messages, RF redundancy-related client-application transactions, IPC client-application transactions, and In-Service Software Upgrade (ISSU) transactions.

Use the **debug ip tcp ha** command with the **transactions** and **detail** keywords to display successful TCP stack interactions between the active and standby RP. This form of the command displays successful TCP HA messages, RF redundancy-related client-application transactions, IPC client-application transactions, and ISSU transactions.

Use the **debug ip tcp ha** command with the **events** keyword to display TCP HA failures. This form of the command displays TCP HA failed encode or decode messages, system resources failures (such as memory allocation failures in the context of TCP HA), failed state changes, and failures that occur when SSO is enabled or disabled.

Use the **debug ip tcp ha** command with the **events** and **detail** keywords to display successful TCP HA operations and useful informational messages. This form of the command displays successful TCP encode or decode messages, state changes, and operations that occur when SSO is enabled or disabled.

Examples The following is sample output from the **debug ip tcp ha** command with the **transactions** and **detail** keywords. The following output shows packet flow from the active to the standby RP for an established TCP SSO connection:

*Feb 19 23:28:23.324: TCPHA: Sending pkt msg, conn_id = 39, seq no = 2727115707 *Feb 19 23:28:23.324: TCPHA: Sending pkt msg, conn_id = 396, seq no = 2959469308 *Feb 19 23:28:23.324: TCPHA: Sending pkt msg, conn_id = 41, seq no = 1270243395 *Feb 19 23:28:23.932: TCPHA: Sending pkt msg, conn_id = 42, seq no = 974255741 *Feb 19 23:28:23.932: TCPHA: Sending pkt msg, conn_id = 475, seq no = 3059612402 *Feb 19 23:28:24.544: TCPHA: Sending dummy pkt to standby; cid=109, size=19 *Feb 19 23:28:42.976: TCPHA: Recd IPC msg len 24, type 3 *Feb 19 23:28:43.172: TCPHA: Recd IPC msg len 79, type 2 *Feb 19 23:28:43.172: TCPHA: Recd IPC msg len 79, type

debug ip tcp intercept

To display TCP intercept statistics, use the **debug ip tcp intercept** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip tcp intercept

no debug ip tcp intercept

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Examples The following is sample output from the **debug ip tcp intercept** command:

Router# **debug ip tcp intercept** A connection attempt arrives:

INTERCEPT: new connection (172.19.160.17:61774) => (10.1.1.30:23)
INTERCEPT: 172.19.160.17:61774 <- ACK+SYN (10.1.1.30:61774)
A second connection attempt arrives:</pre>

INTERCEPT: new connection (172.19.160.17:62030) => (10.1.1.30:23) INTERCEPT: 172.19.160.17:62030 <- ACK+SYN (10.1.1.30:62030) The router resends to both apparent clients:

INTERCEPT: retransmit 2 (172.19.160.17:61774) <- (10.1.1.30:23) SYNRCVD INTERCEPT: retransmit 2 (172.19.160.17:62030) <- (10.1.1.30:23) SYNRCVD A third connection attempt arrives:

INTERCEPT: new connection (171.69.232.23:1048) => (10.1.1.30:23) INTERCEPT: 171.69.232.23:1048 <- ACK+SYN (10.1.1.30:1048) The router sends more retransmissions trying to establish connections with the apparent clients:

INTERCEPT: retransmit 4 (172.19.160.17:61774) <- (10.1.1.30:23) SYNRCVD INTERCEPT: retransmit 4 (172.19.160.17:62030) <- (10.1.1.30:23) SYNRCVD INTERCEPT: retransmit 2 (171.69.232.23:1048) <- (10.1.1.30:23) SYNRCVD The router establishes the connection with the third client and resends to the server:

INTERCEPT: 1st half of connection is established (171.69.232.23:1048) => (10.1.1.30:23)
INTERCEPT: (171.69.232.23:1048) SYN -> 10.1.1.30:23
INTERCEPT: retransmit 2 (171.69.232.23:1048) -> (10.1.1.30:23) SYNSENT
The server responds; the connection is established:

INTERCEPT: 2nd half of connection established (171.69.232.23:1048) => (10.1.1.30:23)
INTERCEPT: (171.69.232.23:1048) ACK -> 10.1.1.30:23
The router resends to the first two apparent clients, times out, and sends resets:

INTERCEPT: retransmit 8 (172.19.160.17:61774) <- (10.1.1.30:23) SYNRCVD
INTERCEPT: retransmit 8 (172.19.160.17:62030) <- (10.1.1.30:23) SYNRCVD
INTERCEPT: retransmit 16 (172.19.160.17:61774) <- (10.1.1.30:23) SYNRCVD
INTERCEPT: retransmit 16 (172.19.160.17:62030) <- (10.1.1.30:23) SYNRCVD
INTERCEPT: retransmitting too long (172.19.160.17:61774) => (10.1.1.30:23) SYNRCVD

I

INTERCEPT: 172.19.160.17:61774 <- RST (10.1.1.30:23) INTERCEPT: retransmitting too long (172.19.160.17:62030) => (10.1.1.30:23) SYNRCVD INTERCEPT: 172.19.160.17:62030 <- RST (10.1.1.30:23)

debug ip tcp packet

To enable debug messages for received and sent TCP packets, use the **debug ip tcp packet** command in privileged EXEC mode. To disable TCP packet debug messages, use the **no** form of this command.

debug ip tcp packet [line-number| address ip-address| {aux| console| tty| vty} line-number| in| out| port port-number| slot/port| slot/subslot/port]

no debug ip tcp packet [line-number| address ip-address| {aux| console| tty| vty} line-number| in| out| port port-number| slot/port| slot/subslot/port]

Syntax Description

line-number	(Optional) Line number. Valid range is 0 to 710.
address ip-address	(Optional) Specifies the source or destination IP address.
aux line-number	(Optional) Specifies the auxiliary line.
console line-number	(Optional) Specifies the primary terminal line.
in	(Optional) Specifies the incoming segments.
out	(Optional) Specifies the outgoing segments.
port port-number	(Optional) Specifies the source or destination port number.
tty line-number	(Optional) Specifies the terminal controller.
vty line-number	(Optional) Specifies the virtual terminal.
slot / port	(Optional) Specifies the slot and port for modems. The slash mark is required.
slot / subslot / port	(Optional) Specifies the slot, subslot, and port for modems. The slash mark is required.

Command Default If no optional arguments or keywords are entered, this command displays all TCP packet debug messages.

Command Modes Privileged EXEC (#)

Command History

Release	Modification
11.1	This command was introduced.

Examples The following is sample output from the **debug ip tcp packet**command:

```
Router# debug ip tcp packet
tcp0: I LISTEN 172.16.0.0:49620 172.16.0.1:80 seq 2116160325
OPTS 4 SYN WIN 1024
tcp0: O SYNRCVD 172.16.0.34:49620 172.16.0.1:80 seq 3992162775
OPTS 4 ACK 2116160325 SYN WIN 4128
tcp0: I SYNRCVD 172.16.0.34:49620 172.16.0.1:80 seq 2116160326
RST WIN 0
```

Related Commands

I

Command	Description
debug ip packet detail	Displays general IP debugging information and IP security option security transactions.
debug ip tcp driver	Displays information on TCP driver events; for example, connections opening or closing, or packets being dropped because of full queues.
debug ip tcp transactions	Displays information on significant TCP transactions such as state changes, retransmissions, and duplicate packets.

debug ip tcp transactions

To display information on significant TCP transactions such as state changes, retransmissions, and duplicate packets, use the **debug ip tcp transactions**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip tcp transactions

no debug ip tcp transactions

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	11.0	This command was introduced.
	12.3(7)T	The command output was enhanced to account for the following conditions: TCP entering Fast Recovery mode, duplicate acknowledgments being received during Fast Recovery mode, and partial acknowledgments being received.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.

Usage Guidelines This command is particularly useful for debugging a performance problem on a TCP/IP network that you have isolated above the data-link layer.

The **debug ip tcp transactions** command displays output for packets that the router sends and receives, but does not display output for packets that it forwards.

Examples

The following is sample output from the **debug ip tcp transactions**command:

Router# debug ip top transactions TCP: sending SYN, seq 168108, ack 88655553 TCP0: Connection to 10.9.0.13:22530, advertising MSS 966 TCP0: state was LISTEN -> SYNRCVD [23 -> 10.9.0.13(22530)] TCP0: connection to 10.9.0.13:22530, received MSS 956 TCP0: restart retransmission in 5996 TCP0: state was SYNRCVD -> ESTAB [23 -> 10.9.0.13(22530)] TCP2: restart retransmission in 10689 TCP2: restart retransmission in 10641 TCP2: restart retransmission in 10633 TCP2: restart retransmission in 13384 -> 10.0.0.13(16151)] TCP0: restart retransmission in 5996 [23 -> 10.9.0.13(16151)] The following line from the debug ip tcp transactions command output shows that TCP has entered Fast Recovery mode:

fast re-transmit - sndcwnd - 512, snd_last - 33884268765

I

The following lines from the **debug ip tcp transactions** command output show that a duplicate acknowledgment is received when in Fast Recovery mode (first line) and a partial acknowledgment has been received (second line):

TCP0:ignoring second congestion in same window sndcwn - 512, snd_1st - 33884268765 TCP0:partial ACK received sndcwnd:338842495 The table below describes the significant fields shown in the display.

Table 22: debug ip tcp transactions Field Descriptions

Field	Description
ТСР	Indicates that this is a TCP transaction.
sending SYN	Indicates that a synchronize packet is being sent.
seq 168108	Indicates the sequence number of the data being sent.
ack 88655553	Indicates the sequence number of the data being acknowledged.
ТСРО	Indicates the TTY number (0, in this case) with which this TCP connection is associated.
Connection to 10.9.0.13:22530	Indicates the remote address with which a connection has been established.
advertising MSS 966	Indicates the maximum segment size that this side of the TCP connection is offering to the other side.

Field	Description
state was LISTEN -> SYNRCVD	Indicates that the TCP state machine changed state from LISTEN to SYNRCVD. Possible TCP states that can follow are:
	CLOSEDConnection closed.
	• CLOSEWAITReceived a FIN segment.
	• CLOSINGReceived a FIN/ACK segment.
	• ESTABConnection established.
	• FINWAIT 1Sent a FIN segment to start closing the connection.
	• FINWAIT 2Waiting for a FIN segment.
	• LASTACKSent a FIN segment in response to a received FIN segment.
	• LISTENListening for a connection request.
	• SYNRCVDReceived a SYN segment and responded.
	 SYNSENTSent a SYN segment to start connection negotiation.
	• TIMEWAITWaiting for the network to clear segments for this connection before the network no longer recognizes the connection as valid. This must occur before a new connection can be set up.
[23 -> 10.9.0.13(22530)]	The elements within these brackets are as follows:
	• The first field (23) indicates the local TCP port.
	• The second field (10.9.0.13) indicates the destination IP address.
	• The third field (22530) indicates the destination TCP port.
restart retransmission in 5996	Indicates the number of milliseconds until the next retransmission takes place.
sndcwnd - 512	Indicates the size of the send congestion window.
snd_last - 33884268765	Indicates the size of the last window.

debug ip traffic-export events

To enable debugging messages for exported IP packet events, use the **debug ip traffic-export**command in privileged EXEC mode. To disable debugging messages, use the **no** form of this command.

debug ip traffic-export events

no debug ip traffic-export events

- **Syntax Description** This command has no arguments or keywords.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.3(4)T	This command was introduced.
	12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.

Examples

The following is sample output from the **debug ip traffic-export events**command:

Router# debug	ip tra	affic-ez	кро	ort events
RITE:exported	input	packet	#	547
RITE:exported	input	packet	#	548
RITE:exported	input	packet	#	549
RITE:exported	input	packet	#	550
RITE:exported	input	packet	#	551
RITE:exported	input	packet	#	552
RITE:exported	input	packet	#	553
RITE:exported	input	packet	#	554
RITE:exported	input	packet	#	555
RITE:exported	input	packet	#	556
RITE:exported	input	packet	#	557
RITE:exported	input	packet	#	558
RITE:exported	input	packet	#	559
RITE:exported	input	packet	#	560
RITE:exported	input	packet	#	561
RITE:exported	input	packet	#	562

Related Commands

;	Command	Description
	ip traffic-export profile	Creates or edits an IP traffic export profile and enables the profile on an ingress interface.

debug ip trigger-authentication

To display information related to automated double authentication, use the **debug ip trigger-authentication** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip trigger-authentication [verbose]

no debug ip trigger-authentication [verbose]

Syntax Description				
Synax Description	verbose	(Optional) Specifies that the complete debugging output be displayed, including information about packets that are blocked before authentication is complete.		
Command Modes	Privileged EXEC			
<u></u>				
Usage Guidelines	Use this command when troubleshooting			
	This command displays information about the remote host table. Whenever entries are added, updated, or removed, a new debugging message is displayed.			
	What is the remote host table? Whenever a remote user needs to be user-authenticated in the second stage of automated double authentication, the local device sends a User Datagram Protocol (UDP) packet to the host of the remote user. Whenever such a UDP packet is sent, the host IP address of the user is added to a table. If additional UDP packets are sent to the same remote host, a new table entry is not created; instead, the existing entry is updated with a new time stamp. This remote host table contains a cumulative list of host entries; entries are deleted after a timeout period or after you manually clear the table by using the clear ip trigger-authentication command.			
	If you include the verbose keyword, the	debugging output also includes information about packet activity.		
Examples	local device at 172.21.127.186 sends a U	debug ip trigger-authentication command. In this example, the DP packet to the remote host at 172.21.127.114. The UDP packet is e and password (or PIN). (The output says "New entry added.")		
	After a timeout period, the local device has not received a valid response from the remote host, so the local device sends another UDP packet. (The output says "Time stamp updated.")			
	Then the remote user is authenticated, an from the remote host table. (The output s	d after a length of time (the timeout period) the entry is removed ays "remove obsolete entry.")		

I

You can see many packets that are being blocked at the interface because the user has not yet been double authenticated. These packets will be permitted through the interface only after the user has been double authenticated. (You can see packets being blocked when the output says "packet enqueued" and then "packet ignored.")

remote host=172.21.127.113, local host=172.21.127.186 (if: 0.0.0.0)
TRIGGER_AUTH: UDP sent from 172.21.127.186 to 172.21.127.113, qdata=69FEEC	
Time stamp updated	
TRIGGER_AUTH: packet enqueued, qdata=69FEEC	
remote host=172.21.127.113, local host=172.21.127.186 (if: 0.0.0.0)
TRIGGER_AUTH: packet ignored, qdata=69FEEC	
TRIGGER_AUTH: packet enqueued, qdata=69FEEC	
remote host=172.21.127.113, local host=172.21.127.186 (if: 0.0.0.0)
TRIGGER_AUTH: packet ignored, qdata=69FEEC	
TRIGGER_AUTH: packet enqueued, qdata=69FEEC	
remote host=172.21.127.113, local host=172.21.127.186 (if: 0.0.0.0)
TRIGGER_AUTH: UDP sent from 172.21.127.186 to 172.21.127.113, qdata=69FEEC	
Time stamp updated

TRIGGER_AUTH: packet ignored, qdata=69FEEC	

debug ip trm

To enable debug information of the Trend Registration Module (TRM), use the **debug ip trm** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip trm [detailed| timers]

no debug ip trm [detailed| timers]

Syntax Description	detailed	(Optional) The system prints detailed information about the TRM. If not specified, the system displays basic status information.		
	timers	(Optional) The system prints information about timer events on the TRM. If not specified, the system displays basic status information.		
Command Default	This command is not enabled.			
Command Modes	Privileged EXEC (#)			
Command History	Release	Modification		
	12.4(15)XZ This command was introduced.			
Usage Guidelines	Use the debug ip trm to enable debug info system and the Trend Router Provisioning	rmation of the TRM, which handles the registration between the Server (TRPS).		
Examples	The following is sample output from the d	ebug ip trmcommand:		
	Router# debug ip trm TRM: Exceeded retry timeouts. Settin	g server inactive		
	The following is sample output from the d			
	Router# debug ip trm detailed TRM: Sending Reg Req to TRPS. Reques Modify Trend Global Parameter map	ting AV Key = No		
	The following is sample output from the d	ebug ip trm timers command:		
	Router# debug ip trm timers TRM: Wait timer for active server. S	ent Reg request		

debug ip urd

I

To display debugging messages for URL Rendezvous Directory (URD) channel subscription report processing, use the **debug ip urd command in privileged EXEC** mode. To disable debugging output, use the **no** form of this command.

debug ip urd [hostname| ip-address]

no debug ip urd

Syntax Description	1	(Orthogol) The Jameir Name Sector (DNO) and
, ,	hostname	(Optional) The domain Name System (DNS) name.
	ip-address	(Optional) The IP address.
Command Default	If no host name or IP addr	ess is specified, all URD reports are debugged.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(3)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
Examples	The following is sample of	atput from the debug ip urd command:

Router# debug ip urd
13:36:25 pdt:URD:Data intercepted from 171.71.225.103
13:36:25 pdt:URD:Enqueued string:
'/cgi-bin/error.pl?group=232.16.16.16&port=32620&source=171.69.214.1&li'
13:36:25 pdt:URD:Matched token:group
13:36:25 pdt:URD:Parsed value:232.16.16.16
13:36:25 pdt:URD:Creating IGMP source state for group 232.16.16.16

debug ip urlfilter

To enable debug information of URL filter subsystems, use the **debug ip urlfilter** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip urlfilter {function-trace| detailed| events}

no debug ip urlfilter {function-trace| detailed| events}

Syntax Description

1	function-trace	The system displays a sequence of important functions that are called when configuring URL filtering.	
	detailed	The system displays detailed information about various activities that occur during URL filtering.	
	events	The system displays various events such as queue event, timer event, and socket event.	

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(11)YU	This command was introduced.
	12.2(15)T	This command was integrated into Cisco IOS Release 12.2(15)T.
	12.4(15)XZ	This command was implemented on the Cisco 881 and Cisco 888 platforms.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Examples

The following is sample output from the **debug ip urlfilter** command when SmartFilter URL filtering configured:

debug ip virtual-reassembly

To enable debugging of the virtual fragment reassembly (VFR) subsystem, use the **debug ip virtual-reassembly** command in privileged EXEC mode. To disable VFR debugging, use the no form of this command.

debug ip virtual-reassembly [list {access-list| extended-access-list}]

no debug ip virtual-reassembly [list {access-list] extended-access-list}]

Syntax Description

list	(Optional) Enables VFR conditional debugging.			
access-list	Filters the generated list of VFR conditional debugging messages. The valid range is from 1 to 199.			
extended-access-list	Filters the generated list of extended VFR conditional debugging messages. The valid range is from 1300 to 2699.			

Command Modes Privileged EXEC

Command History Release Modification 12.3(8)T This command was introduced. 15.0(1)M The list keyword was introduced.

Examples

The following sample output from the debug ip virtual-reassembly command allows you to monitor datagram fragmentation and reassembly status--such as whether a datagram is incomplete and when fragments (from the datagram) are created (after a datagram is determined to be complete).

```
Router# debug ip virtual-reassembly
00:17:35: IP VFR: fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:0, len:104) in fast
 path ...
00:17:35: IP VFR: created frag state for sa:13.0.0.2, da:17.0.0.2, id:11745...
00:17:35: IP_VFR: pak incomplete cpak-offset:0, cpak-len:104, flag: 1 00:17:35: IP_VFR: dgrm incomplete, returning...
00:17:35: IP VFR: fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:104, len:104) in
fast path ...
00:17:35: IP VFR: cpak-offset:0, cpak-len:104, npak-offset:104
00:17:35: IP_VFR: pak incomplete cpak-offset:104, cpak-len:104, flag: 1

00:17:35: IP_VFR: pak incomplete cpak-offset:208, cpak-len:104, flag: 1
00:17:35: IP VFR: dgrm incomplete, returning...
```

00:17:35: IP VFR: fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:312, len:104) in fast path ... 00:17:35: IP VFR: cpak-offset:0, cpak-len:104, npak-offset:104 00:17:35: IP_VFR: cpak-offset:104, cpak-len:104, npak-offset:208 00:17:35: IP_VFR: cpak-offset:208, cpak-len:104, npak-offset:312 00:17:35: IP_VFR: pak incomplete cpak-offset:312, cpak-len:104, flag: 1 00:17:35: IP VFR: dgrm incomplete, returning... 00:17:35: IP VFR: fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:416, len:92) in fast path.. 00:17:35: IP_VFR: cpak-offset:0, cpak-len:104, npak-offset:104 00:17:35: IP VFR: cpak-offset:104, cpak-len:104, npak-offset:208 00:17:35: IP VFR: cpak-offset:208, cpak-len:104, npak-offset:312 00:17:35: IP_VFR: cpak-offset:312, cpak-len:104, npak-offset:416 00:17:35: IP_VFR: dgrm complete, switching the frags. 00:17:35: IP_VFR: switching fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:0, len:104) 00:17:35: IP VFR: switching fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:104, len:104) 00:17:35: IP VFR: switching fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:208, len:104) 00:17:35: IP VFR: switching fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:312, len:104) 00:17:35: IP VFR: switching fragment (sa:13.0.0.2, da:17.0.0.2, id:11745, offset:416, len:92) 00:17:35: IP_VFR: all fragments have been switched. 00:17:35: IP_VFR: pak_subblock_free - pak_0x64A3DC30 00:17:35: IP_VFR: pak_subblock_free - pak 0x6430F010 00:17:35: IP_VFR: pak_subblock_free - pak 0x6430F678 00:17:35: IP_VFR: pak_subblock_free - pak 0x643119B4 00:17:35: IP_VFR: deleted frag state for sa:13.0.0.2, da:17.0.0.2, id:11745 00:17:35: IP_VFR: pak_subblock_free - pak 0x64A3D5C8

Related Commands

Command	Description		
ip virtual-reassembly	Enables VFR on an interface.		
debug ip wccp

To display information about IPv4 Web Cache Communication Protocol (WCCP) services, use the **debug ip wccp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip wccp {default| vrf*vrf-name* {events| packets [control]}| events| packets [bypass| control| redirect]| platform| subblocks}

no debug ip wccp {default| vrf *vrf-name* {events| packets [control]}| events| packets [bypass| control| redirect]| platform| subblocks}

Syntax Description

Γ

default	Displays information about default WCCP services.
vrf vrf-name	Specifies a virtual routing and forwarding (VRF) instance to associate with a service group.
events	Displays information about significant WCCP events.
packets	Displays information about every WCCP packet received or sent by the router.
control	(Optional) Displays information about WCCP control packets.
bypass	(Optional) Displays information about WCCP bypass packets.
redirect	(Optional) Displays information about WCCP redirect packets.
platform	Displays information about the WCCP platform application programming interface (API).
subblocks	Displays information about WCCP subblocks.

Command Default Debug information is not displayed.

Command Modes Privileged EXEC (#)

Command History

I

Release	Modification
15.0(1)M	This command was introduced. This command replaces the debug ip wccp packets and debug ip wccp events commands.

Release	Modification
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE
Cisco IOS XE Release 3.1S	This command was integrated into Cisco IOS XE Release 3.1S.

Usage Guidelines When the vrf keyword is not used, the command displays debug information about all WCCP services on the router. The default keyword is used to specify default WCCP services.

Examples

The following is sample output from the **debug ip wccp events** command when a Cisco Cache Engine is added to the list of available Web caches:

Router# debug ip wccp events

WCCP-EVNT: Built I See You msg body w/l usable web caches, change # 0000000A WCCP-EVNT: Web Cache 192.168.25.3 added WCCP-EVNT: Built I See You msg body w/2 usable web caches, change # 000000B WCCP-EVNT: Built I See You msg body w/2 usable web caches, change # 000000C The following is sample output from the **debug ip wccp packets** command. The router is sending keepalive packets to the Cisco Cache Engines at 192.168.25.4 and 192.168.25.3. Each keepalive packet has an identification number associated with it. When the Cisco Cache Engine receives a keepalive packet from the router, it sends a reply with the identification number back to the router.

Router# debug ip wccp packets

WCCP-PKT: Received valid Here_I Am packet from 192.168.25.4 w/rcvd_id 00003532 WCCP-PKT: Sending I_See_You packet to 192.168.25.4 w/ rcvd_id 00003534 WCCP-PKT: Received valid Here_I Am packet from 192.168.25.3 w/rcvd_id 00003533 WCCP-PKT: Sending I_See_You packet to 192.168.25.3 w/ rcvd_id 00003535 WCCP-PKT: Received valid Here_I Am packet from 192.168.25.4 w/rcvd_id 00003536 WCCP-PKT: Received valid Here_I Am packet from 192.168.25.3 w/rcvd_id 00003536 WCCP-PKT: Received valid Here_I Am packet from 192.168.25.3 w/rcvd_id 00003536 WCCP-PKT: Received valid Here_I Am packet from 192.168.25.3 w/rcvd_id 00003537 WCCP-PKT: Received valid Here_I Am packet from 192.168.25.4 w/rcvd_id 00003536 WCCP-PKT: Received valid Here_I Am packet from 192.168.25.4 w/rcvd_id 00003536 WCCP-PKT: Sending I_See_You packet to 192.168.25.4 w/rcvd_id 00003536 WCCP-PKT: Sending I_See_You packet to 192.168.25.4 w/rcvd_id 00003537 WCCP-PKT: Sending I_See_You packet to 192.168.25.4 w/rcvd_id 00003538 WCCP-PKT: Sending I_See_You packet to 192.168.25.4 w/rcvd_id 00003537 WCCP-PKT: Sending I_See_You packet to 192.168.25.3 w/rcvd_id 00003538

Related Commands

Command	Description
clear ip wccp	Clears the counter for packets redirected using WCCP.
ір wccp	Enables support of the specified WCCP service for participation in a service group.
ip wccp redirect	Enables packet redirection on an outbound or inbound interface using WCCP.
show ip interface	Lists a summary of the IP information and status of an interface.

I

debug ipc

To display debugging messages about interprocess communication (IPC) activity, use the **debug ipc** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipc {all| ports| seats| sessions| zones}

no debug ipc {all| ports| seats| sessions| zones}

Syntax Description

all	Displays all debugging IPC messages. A confirmation message will appear because enabling this keyword can severely impact performance.
ports	Displays debugging messages related to the creation and deletion of IPC ports.
seats	Displays debugging messages related to the creation and deletion of IPC nodes (seats).
sessions	Displays debugging messages related to the creation and deletion of IPC sessions.
zones	Displays debugging messages related to the creation and deletion of IPC zones.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2	This command was introduced.
	12.3(11)T	The sessions and zones keywords were added.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage Guidelines

Use the **debug ipc** command to troubleshoot IPC issues discovered when the **show ipc** command is run. The debugging output varies depending on the types of IPC packets that are selected by the different keywords.

Command	Description
debug ipc packets	Displays debugging messages about IPC packets.
show ipc	Displays IPC information.

debug ipc acks

To display debugging messages about interprocess communication (IPC) acknowledgments (ACKs), use the **debug ipc acks** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipc acks [rx| tx] [dest destination-port-id] [source source-seat-id] [session session-id] [header dump] no debug ipc acks [rx| tx] [dest destination-port-id] [source source-seat-id] [session session-id] [header dump]

Syntax Description

rx	(Optional) Displays debugging messages related the retrieval of IPC ACK messages.
tx	(Optional) Displays debugging messages related the transmission of IPC ACK messages.
dest	(Optional) Displays debugging messages related to destination port of IPC ACK messages. If not specified, information about all destinations is displayed.
	• Use the <i>destination-port-id</i> argument to spec a hexadecimal number that represents a destination port ID. The range is from 0 to FFFFFFFF.
source	(Optional) Displays debugging information about messages from an IPC node. If not specified, information about all nodes is displayed.
	• Use the <i>source-seat-id</i> argument to specify hexadecimal number that represents a source seat ID. The range is from 0 to FFFFFFF.
session	(Optional) Displays debugging messages related an IPC session. If not specified, information about sessions is displayed.
	• Use the <i>session-id</i> argument to specify a sess ID. The range is from 0 to 65535.
header dump	(Optional) Displays only the packet header information.

Command Modes

Privileged EXEC

٦

Command History	Release	Modification		
	12.3(11)T	This command was introduced.		
Usage Guidelines	Use the debug ipc acks cor activities, use the debug ipc	mand to troubleshoot IPC ACK issues. To enable debugging for other IPC command.		
Examples	The following example shows how to enable the display of packet headers only when debugging IPC ACK messages. The debugging output varies depending on the type of IPC activity that is specified. Each entry includes some text explanationthe example below shows that the server received an ACK HDRfollowed by a series of header or data fields.			
	Router# debug ipc acks header dump Aug 19 03:52:36.136:IFC:Server received ACK HDR:442A64E0 src:100000A, dst:406116E8, index:-1, seq:22045, sz:0, type:65535, flags:2 hi:1F371, lo:0			
Related Commands	Command	Description		
	debug ipc	Displays IPC debugging information.		

debug ipc errors

To display debugging messages about interprocess communication (IPC) errors and warnings, use the **debug ipc errors** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipc errors [driver] [sequence] [timeout]

no debug ipc errors [driver] [sequence] [timeout]

Syntax Description

driver	(Optional) Displays debugging messages related to IPC errors at the driver (transport) medium.
sequence	(Optional) Displays information related to IPC messages that have sequence-related issues, such as duplicate or unexpected messages.
timeout	(Optional) Displays only information related to IPC messages that have timed out.

Command Modes Privileged EXEC

Г

Command History	Release	Modification
	12.2	This command was introduced.
	12.3(11)T	The driver , sequence , and timeout keywords were added.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
Usage Guidelines	Use the debug ipc errors	command to troubleshoot IPC error issues. To enable debugging for other IPC
	activities, use the debug ipc command. The debugging output varies depending on the type of IPC act that is specified.	
Examples	The following example shows how to enable the display of error debugging information about IPC message that have timed out. The debugging output varies depending on the type of IPC activity that is specified. Each entry includes some text explanationthe example below shows that the message number 4428D3D0 times out waiting for an acknowledgment (Ack)followed by a series of header or data fields.

Command	Description
debug ipc	Displays IPC debugging information.

debug ipc fragments

To display debugging messages about interprocess communication (IPC) fragments, use the **debug ipc fragments**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipc fragments [**rx**| **tx**] [**dest** *destination-port-id*] [**source** *source-seat-id*] [**session** *session-id*] [**type** *application-type*] [**flags** *header-flag*] [**sequence** *sequence*] [**msgidhi** *msg-id-high*] [**msgidlo** *msg-id-low*] [**data offset** *offset-from-header* **value** *value-to-match* **dump** *bytes*] [**size** *size*] [**header dump**]

no debug ipc fragments [**rx**| **tx**] [**dest** destination-port-id] [**source** source-seat-id] [**session** session-id] [**type** application-type] [**flags** header-flag] [**sequence** sequence] [**msgidhi** msg-id-high] [**msgidlo** msg-id-low] [**data offset** offset-from-header value value-to-match **dump** bytes] [**size** size] [**header dump**]

Syntax Description	rx	(Optional) Displays debugging messages related to the retrieval of IPC fragments.
	tx	(Optional) Displays debugging messages related to the transmission of IPC fragments.
	dest	 (Optional) Displays debugging messages related to a destination port of IPC fragments. If not specified, information about all destinations is displayed. Use the <i>destination-port-id</i> argument to specify a hexadecimal number that represents a destination port ID. The range is from 0 to FFFFFFFF.
	source	 (Optional) Displays debugging information about messages from an IPC node. If not specified, information about all nodes is displayed. Use the <i>source-seat-id</i> argument to specify a hexadecimal number that represents a source seat ID. The range is from 0 to FFFFFFFF.
	session	 (Optional) Displays debugging messages related to an IPC session. If not specified, information about all sessions is displayed. Use the <i>session-id</i> argument to specify a session ID. The range is from 0 to 65535.

٦

type	 (Optional) Displays debugging messages related to a type of IPC fragments. If not specified, information about all application types is displayed. Use the <i>application-type</i> argument to specify a hexadecimal number that represents an application. The range is from 0 to FFFF.
flags	 (Optional) Displays debugging messages related to an IPC fragment's header flag. If not specified, information about all header flags is displayed. Use the <i>header-flag</i> argument to specify a hexadecimal number that represents a header flag value. The range is from 0 to FFFF.
sequence	 (Optional) Displays debugging messages related to a sequence number of an IPC fragment. If not specified, information about all sequence numbers is displayed. Use the <i>sequence</i> argument to specify a sequence number. The range is from 0 to 65535.
msgidhi	 (Optional) Displays debugging messages related to the higher byte of the unique ID of an IPC fragment. Use the <i>msg-id-high</i> argument to specify a hexadecimal number that represents a higher byte of the unique ID. The range is from 0 to FFFFFFFF.
msgidlo	 (Optional) Displays debugging messages related to the lower byte of the unique ID of an IPC fragment. Use the <i>msg-id-low</i> argument to specify a hexadecimal number that represents a lower byte of the unique ID. The range is from 0 to FFFFFFFF.

data	(Optional) Displays debugging messages related to the IPC fragment payload. If not specified, information about all of the IPC fragment's payload is displayed.
	• offset(Optional) Displays offset IPC data. If this keyword is configured, the value keyword must also be configured.
	• Use the <i>offset-from-header</i> argument to specify the offset value from the start of the IPC data. The range is from 0 to 65535.
	• Use the value keyword to configure the value expected at the offset of the IPC data.
	• Use the <i>value-to-match</i> argument to specify the hexadecimal number that represents the value expected at the offset of the IPC data. The range is from 0 to FF.
	• dump (Optional) Configures the number of data bytes to display.
	• Use the <i>bytes</i> argument to specify the number of data bytes. The range is from 0 to 65535.
size	 (Optional) Displays IPC fragment debugging messages of a specific size. If not specified, information about messages of any size is displayed. Use the <i>size</i> argument to specify the message size in rows. The range is from 0 to 65535.
header dump	(Optional) Displays only the packet header information.

Release

This command was introduced.

Modification

Usage Guidelines	Use the debug ipc fragments command to troubleshoot IPC fragment issues. To enable debugging for other
	IPC activities, use the debug ipc command.

Examples The following example shows how to enable the display of debugging information about IPC fragments. The debugging output varies depending on the type of IPC activity that is specified. Each entry includes some text explanation--the example below shows that the server received a fragment message--followed by a series of header or data fields.

Router# debug ipc fragments
IPC Fragments debugging is on

Command	Description
debug ipc	Displays IPC debugging information.

debug ipc nacks

To display debugging messages about interprocess communication (IPC) negative acknowledgments (NACKs), use the **debug ipc nacks** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipc nacks [rx| tx] [dest destination-port-id] [source source-seat-id] [session session-id] [header dump]

no debug ipc nacks [rx| tx] [dest destination-port-id] [source source-seat-id] [session session-id] [header dump]

Syntax Description rx (Optional) Displays debugging messages related to the retrieval of IPC NACK messages. tx (Optional) Displays debugging messages related to the transmission of IPC NACK messages. dest (Optional) Displays debugging messages related to a destination port of IPC NACK messages. If not specified, information about all destinations is displayed. • Use the destination-port-id argument to specify a hexadecimal number that represents a destination port ID. The range is from 0 to FFFFFFFF. source (Optional) Displays debugging information about messages from an IPC node. If not specified, information about all nodes is displayed. • Use the source-seat-id argument to specify a hexadecimal number that represents a source seat ID. The range is from 0 to FFFFFFF. session (Optional) Displays debugging messages related to an IPC session. If not specified, information about all sessions is displayed. • Use the session-id argument to specify a session ID. The range is from 0 to 65535. header dump (Optional) Displays only the packet header information.

debug ipc packets

I

To display debugging messages about interprocess communication (IPC) packets, use the **debug ipc packets** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipc packets [rx| tx] [dest destination-port-id] [source source-seat-id] [session session-id] [type application-type] [flags header-flag] [sequence sequence] [msgidhi msg-id-high] [msgidlo msg-id-low] [data offset offset-from-header value value-to-match dump bytes] [size size] [header dump]

no debug ipc packets [**rx**| **tx**] [**dest** destination-port-id] [**source** source-seat-id] [**session** session-id] [**type** application-type] [**flags** header-flag] [**sequence** sequence] [**msgidhi** msg-id-high] [**msgidlo** msg-id-low] [**data offset** offset-from-header value value-to-match **dump** bytes] [**size** size] [**header dump**]

Syntax Description	rx	(Optional) Displays debugging messages related to the retrieval of IPC packets.
	tx	(Optional) Displays debugging messages related to the transmission of IPC packets.
	dest	 (Optional) Displays debugging messages related to a destination port of IPC packets. If not specified, information about all destinations is displayed. Use the <i>destination-port-id</i> argument to specify a hexadecimal number that represents a destination port ID. The range is from 0 to FFFFFFFF.
	source	 (Optional) Displays debugging information about messages from an IPC node. If not specified, information about all nodes is displayed. Use the <i>source-seat-id</i> argument to specify a hexadecimal number that represents a source seat ID. The range is from 0 to FFFFFFFF.
	session	 (Optional) Displays debugging messages related to an IPC session. If not specified, information about all sessions is displayed. Use the <i>session-id</i> argument to specify a session ID. The range is from 0 to 65535.

٦

type	 (Optional) Displays debugging messages related to a type of IPC packet. If not specified, information about all application types is displayed. Use the <i>application-type</i> argument to specify a hexadecimal number that represents an application. The range is from 0 to FFFF.
flags	 (Optional) Displays debugging messages related to an IPC packet header flag. If not specified, information about all header flags is displayed. Use the <i>header-flag</i> argument to specify a hexadecimal number that represents a header flag value. The range is from 0 to FFFF.
sequence	 (Optional) Displays debugging messages related to a sequence number of an IPC packet. If not specified, information about all sequence numbers is displayed. Use the <i>sequence</i> argument to specify a sequence number. The range is from 0 to 65535.
msgidhi	 (Optional) Displays debugging messages related to the higher byte of the unique ID of an IPC packet. Use the <i>msg-id-high</i> argument to specify a hexadecimal number that represents a higher byte of the unique ID. The range is from 0 to FFFFFFFF.
msgidlo	 (Optional) Displays debugging messages related to the lower byte of the unique ID of an IPC packet. Use the <i>msg-id-low</i> argument to specify a hexadecimal number that represents a lower byte of the unique ID. The range is from 0 to FFFFFFFF.

data	 (Optional) Displays debugging messages related to the IPC packet payload. If not specified, information about all of the IPC packet's payload is displayed. offset(Optional) Displays offset IPC data. If this keyword is configured, the value keyword must also be configured. Use the offset-from-header argument to specify the offset value from the start of the IPC data. The range is from 0 to 65535. Use the value keyword to configure the value expected at the offset of the IPC data. Use the value-to-match argument to specify the hexadecimal number that represents the value expected at the offset of the IPC data. The range is from 0 to FF. dump(Optional) Configures the number of data bytes to display. Use the bytes argument to specify the number of data bytes. The range is from 0 to 65535.
size	 (Optional) Displays IPC packet debugging messages of a specific size. If not specified, information about messages of any size is displayed. Use the <i>size</i> argument to specify the message size in rows. The range is from 0 to 65535.
header dump	(Optional) Displays only the packet header information.

٦

Usage Guidelines		Use the debug ipc packets command to troubleshoot IPC packet issues. To enable debugging for other IPC activities, use the debug ipc command.	
	Caution	Use the debug ipc packets command with caution because the volume of output can severely impact system performance. A confirmation message is displayed. We recommend that you use one of the optional keywords to focus on a specific IPC activity and to limit the volume of output.	
Examples		The following example shows how to enable the display of IPC packet debugging messages and includes some sample output. The debugging output varies depending on the type of IPC activity that is specified. Each entry includes some text explanationthe example below shows that the IPC server received a messagefollowed by a series of header or data fields.	
		Router# debug ipc packets This may severely impact system performance. Continue?[confirm] Y Aug 19 030612.297 IPC Server received MSG ptr 0x441BE75C, flags 0x80, retries 0, seq 0x0, refcount 1, retry never, rpc_result = 0x0, data_buffer = 0x443152A8, header = 0x4431566C, data = 0x4431568C HDR src 0x1060000, dst 0x1000C, index 2, seq 0, sz 28, type 770, flags 0x40 hi 0x1F25B, lo 0x442F0BC0 DATA 00 00 00 06 00 00 00 00 00 06 00 E7 00 02 00 00 00 The following example shows how to enable the display of IPC messages received with a destination port of 0x1000C in session 1 with a message size of 500 rows.	
		Router# debug ipc packets rx dest 1000C session 1 size 500

debug ipc rpc

To display debugging messages about interprocess communication (IPC) remote-procedure call (RPC) packets, use the **debug ipc rpc**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipc rpc [**rx**| **tx**] [**query**| **response**] [**dest** *destination-port-id*] [**source** *source-seat-id*] [**session** *session-id*] [**type** *application-type*] [**flags** *header-flag*] [**sequence** *sequence*] [**msgidhi** *msg-id-high*] [**msgidlo** *msg-id-low*] [**data offset** *offset-from-header* **value** *value-to-match* **dump** *bytes*] [**size** *size*] [**header dump**]

no debug ipc rpc [**rx**| **tx**] [**query**| **response**] [**dest** *destination-port-id*] [**source** *source-seat-id*] [**session** *session-id*] [**type** *application-type*] [**flags** *header-flag*] [**sequence** *sequence*] [**msgidhi** *msg-id-high*] [**msgidlo** *msg-id-low*] [**data offset** *offset-from-header* **value** *value-to-match* **dump** *bytes*] [**size** *size*] [**header dump**]

rx	(Optional) Displays debugging messages related to the retrieval of IPC RPC packets.
tx	(Optional) Displays debugging messages related to the transmission of IPC RPC packets.
query	(Optional) Displays debugging messages related to IPC RPC queries.
response	(Optional) Displays debugging messages related to IPC RPC responses.
dest	(Optional) Displays debugging messages related to destination port of IPC RPC packets. If not specified information about all destinations is displayed.
	• Use the <i>destination-port-id</i> argument to specify a hexadecimal number that represents a destination port ID. The range is from 0 to FFFFFFFF.
source	(Optional) Displays debugging information about messages from an IPC node. If not specified, information about all nodes is displayed.
	• Use the <i>source-seat-id</i> argument to specify a hexadecimal number that represents a source seat ID. The range is from 0 to FFFFFFFF.
session	(Optional) Displays debugging messages related to an IPC session. If not specified, information about a sessions is displayed.
	• Use the <i>session-id</i> argument to specify a session ID. The range is from 0 to 65535.

Syntax Description

I

٦

type	 (Optional) Displays debugging messages related to a type of IPC RPC message. If not specified, information about all application types is displayed. Use the <i>application-type</i> argument to specify a hexadecimal number that represents an application. The range is from 0 to FFFF.
flags	 (Optional) Displays debugging messages related to an IPC RPC message header flag. If not specified, information about all header flags is displayed. Use the <i>header-flag</i> argument to specify a hexadecimal number that represents a header flag value. The range is from 0 to FFFF.
sequence	 (Optional) Displays debugging messages related to a sequence number of an IPC RPC message. If not specified, information about all sequence numbers is displayed. Use the <i>sequence</i> argument to specify a sequence number. The range is from 0 to 65535.
msgidhi	 (Optional) Displays debugging messages related to the higher byte of the unique ID of an IPC RPC message. Use the <i>msg-id-high</i> argument to specify a hexadecimal number that represents a higher byte of the unique ID. The range is from 0 to FFFFFFFF.
msgidlo	 (Optional) Displays debugging messages related to the lower byte of the unique ID of an IPC RPC message. Use the <i>msg-id-low</i> argument to specify a hexadecimal number that represents a lower byte of the unique ID. The range is from 0 to FFFFFFFF.

data	 (Optional) Displays debugging messages related to the IPC RPC payload. If not specified, information about all of the IPC RPC's payload is displayed. offset(Optional) Displays offset IPC data. If this keyword is configured, the value keyword must also be configured. Use the offset-from-header argument to specify the offset value from the start of the IPC data. The range is from 0 to 65535. Use the value keyword to configure the value expected at the offset of the IPC data. Use the value-to-match argument to specify the hexadecimal number that represents the value expected at the offset of the IPC data. The range is from 0 to FF. dump(Optional) Configures the number of data bytes to display. Use the bytes argument to specify the number of data bytes. The range is from 0 to 65535.
size	 (Optional) Displays IPC RPC debugging messages of a specific size. If not specified, information about messages of any size is displayed. Use the <i>size</i> argument to specify the message
header dump	(Optional) Displays only the packet header information.

debug iphc ipc

I

To display the IP header compression (IPHC) interprocessor communication (IPC) messages that are passed between the route processor (RP) and line cards (LCs), use the **debug iphc ipc**command in privileged EXEC mode. To disable the display of these messages, use the **no** form of this command.

debug iphc ipc [events| statistics]

no debug iphc ipc [events| statistics]

Syntax Description		
Syntax Description	events	(Optional) Displays IPHC IPC command and control
		events.
	statistics	(Optional) Displays IPHC IPC counter updates.
Command Default	IPHC IPC messages are not displayed	1.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.0(32)SY	This command was introduced.
	12.4(10)	This command was integrated into Cisco IOS Release 12.4(10).
Usage Guidelines	the RP and the LC are displayed. On r	nand without keywords, all the IPC messages that are passed between outers with many interfaces and distributed systems, the number of IPC of all the counter updates. To display only the events that indicate ug iphc ipc events command.
Examples	The following example enables the display of all IPHC IPC messages:	
	Router# debug iphc ipc IPHC IPC statistics debugging i IPHC IPC event debugging is on The following example disables Router# no debug iphc ipc stati IPHC IPC statistics debugging i The following example enables the d	IPHC IPC statistics debugging: stics s off
	Router# debug iphc ipc events IPHC IPC event debugging is on	

The command output shows the event messages as the interface changes from enabled to administratively down:

%OSPF-5-ADJCHG: Process 1, Nbr 10.10.10 on Multilink8 from FULL to DOWN %LINK-5-CHANGED: Interface Multilink8, changed state to administratively down. IPHC IPC 2: Set Negotiated mesg (Mu PPP 128 2 0) IPHC Mu8: Distributed FS disabled IPHC IPC 2: Send Set Configured mesg (Mu PPP 128 2 0) IPHC IPC Mu8: i/f state change complete (Up/Down: 0/1) The following example enables the display of IPHC IPC counter updates:

Router# **debug iphc ipc statistics** IPHC IPC statistics debugging is on The command output shows the interface counter updates:

```
IPHC IPHC 2: recv Stats msg, count:4
IPHC IPC Mu8: stats update from LC
IPHC IPC Mu6: stats update from LC
IPHC IPC Se2/0/0/3:0: stats update from LC
IPHC IPC Se2/0/0/1:0: stats update from LC
```

Command	Description
show interfaces	Displays statistics for all interfaces.
show ipc	Displays IPC statistics.

debug ipv6 cef drop

To display debug messages for Cisco Express Forwarding for IPv6 (CEFv6) and distributed CEFv6 (dCEFv6) dropped packets, use the **debug ipv6 cef drop**command in privileged EXEC mode. To disable debug messages for CEFv6 and dCEFv6 dropped packets, use the **no** form of this command.

debug ipv6 cef drop [rpf]

no debug ipv6 cef drop

Syntax Description	rpf	(Optional) Displays packets dropped by the IPv6 CEF Unicast Reverse-Path Forwarding (Unicast RPF) feature.

Command Default Debugging for CEFv6 and dCEFv6 dropped packets is not enabled.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.0(22)8	This command was introduced.
	12.2(13)T	This command was integrated into Cisco IOS Release 12.2(13)T.
	12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.
	12.2(25)8	The rpf keyword was added.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines The **debug ipv6 cef drop** command is similar to the **debug ip cef drops** command, except that it is IPv6-specific.

By default, the network server sends the output from **debug** commands and system error messages to the console. To redirect debug output, use the **logging** command options in global configuration mode. Destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. For complete information on **debug** commands and redirecting debug output, refer to the Release 12.3 *Cisco IOS Debug Command Reference*.

Examples

The following is sample output from the **debug ipv6 cef drop**command:

Router# debug ipv6 cef drop *Aug 30 08:20:51.169: IPv6-CEF: received packet on Serial6/0/2 *Aug 30 08:20:51.169: IPv6-CEF: found no adjacency for 2001:0DB8::1 reason 2 *Aug 30 08:20:51.169: IPv6-CEF: packet not switched: code 0x1 The table below describes the significant fields shown in the display.

Table 23: debug ipv6 cef drop Field Descriptions

Field	Description
IPv6-CEF: received packet on Serial6/0/2	Cisco Express Forwarding has received a packet addressed to the router via serial interface 6/0/2.
IPv6-CEF: found no adjacency for 2001:0DB8::1	Cisco Express Forwarding has found no adjacency for the IPv6 address prefix of 2001:0DB8::1.
IPv6-CEF: packet not switched	Cisco Express Forwarding has dropped the packet.

Command	Description
debug ipv6 cef events	Displays debug messages for CEFv6 and dCEFv6 general events.
debug ipv6 cef table	Displays debug messages for CEFv6 and dCEFv6 table modification events.

debug ipv6 cef events

To display debug messages for Cisco Express Forwarding for IPv6 (CEFv6) and distributed CEFv6 (dCEFv6) general events, use the **debug ipv6 cef events** command in privileged EXEC mode. To disable debug messages for CEFv6 and dCEFv6 general events, use the **no** form of this command.

debug ipv6 cef events no debug ipv6 cef events

Syntax Description This command has no arguments or keywords.

Command Default Debugging for CEFv6 and dCEFv6 general events is not enabled.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.0(22)S	This command was introduced.
	12.2(13)T	This command was integrated into Cisco IOS Release 12.2(13)T.
	12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

The **debug ipv6 cef events** command is similar to the **debug ip cef events** command, except that it is IPv6-specific.

By default, the network server sends the output from debug commands and system error messages to the console. To redirect debug output, use the logging command options in global configuration mode. Destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. For complete information on **debug** commands and redirecting debug output, refer to the Release 12 *Cisco IOS Debug Command Reference*.

Examples The following is sample output from the **debug ipv6 cef events**command:

```
Router# debug ipv6 cef events
IPv6 CEF packet events debugging is on
Router#
*Aug 30 08:22:57.809: %LINK-3-UPDOWN: Interface Serial6/0/2, changed state to up
*Aug 30 08:22:58.809: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial6/0/2, changed
state to up
*Aug 30 08:23:00.821: CEFv6-IDB: Serial6/0/2 address 2001:0DB8::248 add download succeeded
The table below describes the significant fields shown in the display.
```

Table 24: debug ipv6 cef events Field Descriptions

Field	Description
Interface Serial6/0/2, changed state to up	Indicates that the interface hardware on serial interface 6/0/2 is currently active.
Line protocol on Interface Serial6/0/2, changed state to up	Indicates that the software processes that handle the line protocol consider the line usable for serial interface $6/0/2$.
Serial6/0/2 address 2001:0DB8::248 add download succeeded	The IPv6 address 2001:0DB8::248 was downloaded successfully.

Command	Description
debug ipv6 cef table	Displays debug messages for CEFv6 and dCEFv6 table modification events.

debug ip rtp header-compression through debug ipv6 icmp

debug ipv6 cef hash

To display debug messages for Cisco Express Forwarding for IPv6 (CEFv6) and distributed CEFv6 (dCEFv6) load-sharing hash algorithm events, use the **debug ipv6 cef hash**command in privileged EXEC mode. To disable debug messages for CEFv6 and dCEFv6 load-sharing hash algorithm events, use the **no** form of this command.

debug ipv6 cef hash no debug ipv6 cef hash

Syntax Description This command has no arguments or keywords.

Command Default Debugging for CEFv6 and dCEFv6 load-sharing hash algorithm events is not enabled.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.0(22)S	This command was introduced.
	12.2(13)T	This command was integrated into Cisco IOS Release 12.2(13)T.
	12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.

Command	Description
debug ipv6 cef events	Displays debug messages for CEFv6 and dCEFv6 general events.
debug ipv6 cef table	Displays debug messages for CEFv6 and dCEFv6 table modification events.

Cisco IOS Debug Command Reference - Commands I through L

debug ipv6 cef table

To display debug messages for Cisco Express Forwarding for IPv6 (CEFv6) and distributed CEFv6 (dCEFv6) table modification events, use the **debug ipv6 cef table**command in privileged EXEC mode. To disable debug messages for CEFv6 and dCEFv6 table modification events, use the **no** form of this command.

debug ipv6 cef table [background]

no debug ipv6 cef table [background]

Syntax Description	background		(Optional) Sets CEFv6 and dCEFv6 table background updates.
Command Default	Debugging for CEFv6 and dCI	EFv6 table modification	n events is not enabled.
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.0(22)S	This command wa	as introduced.
	12.2(13)T	This command wa	as integrated into Cisco IOS Release 12.2(13)T.
	12.2(14)S	This command wa	as integrated into Cisco IOS Release 12.2(14)S.
	12.2(28)SB	This command wa	as integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command wa	as integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command wa	as integrated into Cisco IOS Release 12.2(33)SXH.

Usage GuidelinesThe debug ipv6 cef tablecommand is similar to the debug ip cef tablecommand, except that it is IPv6-specific.This command is used to record CEFv6 and dCEFv6 table events related to the Forwarding Information Base
(FIB) tables. Types of events include the following:

- Routing updates that populate the FIB tables
- Flushing of the FIB tables
- · Adding or removing of entries to the FIB tables
- Table reloading process

I

By default, the network server sends the output from debug commands and system error messages to the console. To redirect debug output, use the logging command options in global configuration mode. Destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. For complete information on debug commands and redirecting debug output, refer to the *Cisco IOS Debug Command Reference*.

Examples

The following is sample output from the **debug ipv6 cef table**command when a static route is added:

```
Router# debug ipv6 cef table
IPv6 CEF table debugging is on
router(config) # ipv6 route 5555::/64 serial 2/0 3000::2
router(config)#
*Feb 24 08:46:09.187: IPv6CEF-Table: Event add, 5555::/64
*Feb 24 08:46:09.187: IPv6 CEF table: Created path_list 01184570
*Feb 24 08:46:09.187: IPv6 CEF table: Adding path 01181A80 to path list 01184570 old path
count=0
*Feb 24 08:46:09.187: IPv6 CEF table: No matching list for path list 01184570
*Feb 24 08:46:09.187: IPv6 CEF table: Adding fib entry 0117EE80 to path list 01184570 old
refcount=0
*Feb 24 08:46:09.187: IPv6 CEF table: Added path list 01184570 to hash 50
*Feb 24 08:46:09.187: IPv6 CEF: Linking path 01181A80 to adjacency 01138E28
*Feb 24 08:46:09.187: IPv6 CEF table: Created 0 loadinfos for path list 01184570
*Feb 24 08:46:09.187: IPv6CEF-Table: Validated 5555::/64
The following is sample output when the static route is removed:
```

```
router(config)# no ipv6 route 5555::/64 serial 2/0 3000::2
router(config)#
*Feb 24 08:46:43.871: IPv6CEF-Table: Event delete, 5555::/64
*Feb 24 08:46:43.871: IPv6CEF-Table: Invalidated 5555::/64
*Feb 24 08:46:43.871: IPv6CEF-Table: Deleted 5555::/64
*Feb 24 08:46:43.871: IPv6CEF table: Removing fib entry 0117EE80 from path_list 01184570
old refcount=1
*Feb 24 08:46:43.871: IPv6 CEF table: Removed path_list 01184570 from hash 50
*Feb 24 08:46:43.871: IPv6 CEF table: Freeing path_list 01184570 refcount=0
*Feb 24 08:46:43.871: IPv6 CEF table: Freeing path_list 01184570 refcount=0
*Feb 24 08:46:43.871: IPv6 CEF table: Freeing path_list 01184570
*Feb 24 08:46:43.871: IPv6 CEF table: Freeing path_list 01184570
```

Command	Description
debug ipv6 cef events	Displays debug messages for CEFv6 and dCEFv6 general events.
debug ipv6 dhcp

I

To enable debugging for Dynamic Host Configuration Protocol (DHCP) for IPv6, use the **debug ipv6 dhcp** command in privileged EXEC mode. To disable debugging for DHCP for IPv6, use the **no** form of this command.

debug ipv6 dhcp [detail] no debug ipv6 dhcp [detail]

Syntax Description	detail		(Optional) Displays detailed information about DHCP for IPv6 message decoding.
Command Default	Debugging for the DHCP for IPv	6 is disabled.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.3(4)T	This command	l was introduced.
	12.4(24)T	This command	I was integrated into Cisco IOS Release 12.4(24)T.
	Cisco IOS XE Release 2.1	This command	I was integrated into Cisco IOS XE Release 2.1.
	12.2(33)SRE	This command 12.2(33)SRE.	was modified. It was integrated into Cisco IOS Release
Usage Guidelines	The debug ipv6 dhcp detail com assignment.	nmand is used to sho	ow debug information related to the server address
Examples	The following example enables d	lebugging for DHCP	for IPv6:
	Router# debug ipv6 dhcp deta IPv6 DHCP debugging is on (c		
Related Commands	Command		Description
	debug ipv6 dhcp database		Enables debugging for the DHCP for IPv6 binding database agent.

٦

Command	Description	
debug ipv6 dhcp relay	Enables the DHCP for IPv6 relay agent debugging.	

debug ipv6 dhcp database

ſ

	To enable debugging for the Dynamic Host Configuration Protocol (DHCP) for IPv6 binding database agent, use the debug ipv6 dhcp database command in privileged EXEC mode. To disable the display of debug messages for the DHCP for IPv6 binding database agent, use the no form of this command.		
	debug ipv6 dhcp database		
	no debug ipv6 dhcp database		
Syntax Description	This command has no keywords or argume	nts.	
Command Default	Debugging for the DHCP for IPv6 binding	database a	gent is disabled.
Command Modes	Privileged EXEC		
Command History	Release	Modificati	ion
	12.3(4)T	This comm	nand was introduced.
	Cisco IOS XE Release 2.1	This comm	nand was integrated into Cisco IOS XE Release 2.1.
Usage Guidelines	The debug ipv6 dhcp database command	enables de	bugging for DHCP for IPv6 database processing.
Examples	The following example enables debugging	for the DH	CP for IPv6 binding database agent:
	Router# debug ipv6 dhcp database		
Related Commands	Command		Description

Commands	Command	Description
	debug ipv6 dhcp	Enables debugging for DHCP for IPv6.

debug ipv6 dhcp redundancy

To enable Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server redundancy debugging, use the **debug ipv6 dhcp redundancy** command in privileged EXEC mode. To disable DHCPv6 server redundancy debugging, use the **no** form of this command.

debug ipv6 dhcp redundancy [detail]

no debug ipv6 dhcp redundancy [detail]

Syntax Description	detail	(Optional) Displays detailed DHCPv6 High
		Availability (HA) packet information.
Command Default	DHCPv6 server redundancy debugging is	disabled by default.
Commond Modes		
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	15 2(1)8	
	15.2(1)S	This command was introduced.
	Cisco IOS XE Release 3.5S	This command was integrated into Cisco IOS XE Release 3.5S.
		-
Usage Guidelines	To debug DHCPv6 server redundancy, use	the debug ipv6 dhcp redundancy command in privileged EXEC
	mode. To view detailed DHCPv6 HA pack	ket information, use the optional detail keyword.
Examples	The following example shows how to ena	ble DHCPv6 redundancy debugging.
Examples	The following example shows now to end	bie biter vo reduidancy debugging.
	Router# debug ipv6 dhcp redundancy	
Related Commands	[
	Command	Description
	debug ipv6 dhcp relay	Enables DHCPv6 relay agent debugging.

Enables DHCP debugging for IPv6.

debug ipv6 dhcp relay

To enable DHCP for IPv6 relay agent debugging, use the **debug ipv6 dhcp relay**command in user EXEC or privileged EXEC mode. To disable DHCP for IPv6 relay agent debugging, use the **no** form of this command.

debug ipv6 dhcp relay [bulk-lease]

debug ipv6 dhcp

no debug ipv6 dhcp relay [bulk-lease]

Syntax Description	bulk-lease		(Optional) Enables bulk lease query debugging flows.
Command Modes			
	User EXEC (>) Privileged EXEC (#)		
Command History	Release	Modification	
	12.3(11)T	This commar	nd was introduced.
	Cisco IOS XE Release 2.1	This commar	nd was integrated into Cisco IOS XE Release 2.1.
	15.1(1)S	This commar	nd was modified. The bulk-lease keyword was added.
Usage Guidelines	one of these functions is enabled and	a user tries to co	agent are mutually exclusive on an interface. When onfigure a different function on the same interface, one DHCP client mode, Interface is in DHCP server mode,
Examples	The following example enables DHC	P for IPv6 relay	agent debugging:
	Router# debug ipv6 dhcp relay		
Related Commands	Command		Description

debug ipv6 eigrp

debug ipv6 eigrp

To display information about the Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6 protocol, use the **debug ipv6 eigrp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipv6 eigrp [as-number] [neighbor ipv6-address| notification| summary]

no debug ipv6 eigrp

Syntax Description

as-number	(Optional) Autonomous system number.
neighbor ipv6-address	(Optional) IPv6 address of the neighboring router.
notification	(Optional) Displays EIGRP for IPv6 events and notifications in the console of the router.
summary	(Optional) Displays a summary of EIGRP for IPv6 routing information.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.4(6)T	This command was introduced.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	Cisco IOS XE Release 2.1	This command was introduced on Cisco ASR 1000 Series Routers.

Usage Guidelines Because the **debug ipv6 eigrp** command generates a substantial amount of output, use it only when traffic on the network is light.

Examples The following example enables debugging output:

Router# debug ipv6 eigrp

debug ipv6 icmp

To display debugging messages for IPv6 Internet Control Message Protocol (ICMP) transactions (excluding IPv6 ICMP neighbor discovery transactions), use the **debug ipv6 icmp**command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ipv6 icmp no debug ipv6 icmp

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** Debugging for IPv6 ICMP is not enabled.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(2)T	This command was introduced.
	12.0(21)ST	This command was integrated into Cisco IOS Release 12.0(21)ST.
	12.0(22)S	This command was integrated into Cisco IOS Release 12.0(22)S.
	12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(25)8G	This command was integrated into Cisco IOS Release 12.2(25)SG.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.2(33)SB	This command's output was modified on the Cisco 10000 series router for the PRE3 and PRE4.
	15.1(1)S	This command was integrated into Cisco IOS 15.1(1)S.

Usage Guidelines

I

The **debug ipv6 icmp**command is similar to the **debug ip icmp**command, except that it is IPv6-specific. When you run this command, you can view echo reply messages that are generated in response to echo requests.

By default, the network server sends the output from **debug** commands and system error messages to the console. To redirect debugging output, use the logging command options in global configuration mode. Destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server.

This command helps you determine whether the router is sending or receiving IPv6 ICMP messages. Use it, for example, when you are troubleshooting an end-to-end connection problem.

Note

For more information about the fields in **debug ipv6 icmp** output, refer to RFC 2463, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6)*.

Cisco 10000 Series Router Usage Guidelines

In Cisco IOS Release 12.2(33)SB, output from the debug ipv6 icmp command displays information similar to the following:

ICMPv6: Received echo reply from 2010:1:1:1:1:1:1:2 In Cisco IOS Release 12.2(31)SB, the debug ipv6 icmp command output displays information similar to the following:

ICMPv6: Received ICMPv6 packet from 2010:1:1:1:1:1:1:2, type 129

Examples

The following is sample output from the **debug ipv6 icmp**command:

Router# debug ipv6 icmp

```
13:28:40:ICMPv6:Received ICMPv6 packet from 2000:0:0:3::2, type 136
13:28:45:ICMPv6:Received ICMPv6 packet from FE80::203:A0FF:FED6:1400, type 135
13:28:50:ICMPv6:Received ICMPv6 packet from FE80::203:A0FF:FED6:1400, type 136
13:28:55:ICMPv6:Received ICMPv6 packet from FE80::203:A0FF:FED6:1400, type 135
The table below describes significant fields shown in the first line of the display.
```

Table 26: debug ipv6 icmp Field Descriptions

Field	Description
13:28:40:	Indicates the time (hours:minutes:seconds) at which the ICMP neighbor discovery event occurred.
<i>n</i> w <i>n</i> d: (not shown in sample output)	Indicates time (weeks, days) since last reboot of the event occurring. For example, 1w4d: indicates the time (since the last reboot) of the event occurring was 1 week and 4 days ago.
ICMPv6:	Indication that this message describes an ICMP version 6 packet.
Received ICMPv6 packet from 2000:0:0:3::2	IPv6 address from which the ICMP version 6 packet is received.

I

ſ

Field	Description
type 136	The number variable indicates one of the following IPv6 ICMP message types:
	• 1Destination unreachable. The router cannot forward a packet that was sent or received.
	• 2Packet too big. The router attempts to send a packet that exceeds the maximum transmission unit (MTU) of a link between itself and the packet destination.
	• 3Time exceeded. Either the hop limit in transit or the fragment reassembly time is exceeded.
	• 4Parameter problem. The router attempts to send an IPv6 packet that contains invalid parameters. An example is a packet containing a next header type unsupported by the router that is forwarding the packet.
	• 128Echo request. The router received an echo reply.
	• 129Echo reply. The router sent an echo reply.
	• 133Router solicitation messages. Hosts send these messages to prompt routers on the local link to send router advertisement messages.
	• 134Router advertisement messages. Routers periodically send these messages to advertise their link-layer addresses, prefixes for the link, and other link-specific information. These messages are also sent in response to router solicitation messages.
	• 135Neighbor solicitation messages. Nodes send these messages to request the link-layer address of a station on the same link.
	• 136Neighbor advertisement messages. Nodes send these messages, containing their link-local addresses, in response to neighbor solicitation messages.
	• 137Redirect messages. Routers send these messages to hosts when a host attempts to use a less-than-optimal first hop address when forwarding packets. These messages contain a better first hop address that should be used instead.

Following are examples of the IPv6 ICMP messages types that can be displayed by the **debug ipv6 icmp** command:

• ICMP echo request and ICMP echo reply messages. In the following example, an ICMP echo request is sent to address 2052::50 and an ICMP echo reply is received from address 2052::50.

lw4d:ICMPv6:Sending echo request to 2052::50 lw4d:ICMPv6:Received echo reply from 2052::50

• ICMP packet too big messages. In the following example, a router tried to forward a packet to destination address 2052::50 via the next hop address 2052::52. The size of the packet was greater than 1280 bytes, which is the MTU of destination address 2052::50. As a result, the router receives an ICMP packet too big message from the next hop address 2052::52.

1w4d:Received ICMP too big from 2052::52 about 2052::50, MTU=1300

• ICMP parameter problem messages. In the following example, an ICMP parameter problem message is received from address 2052::52.

1w4d:Received ICMP parameter problem from 2052::52

 ICMP time exceeded messages. In the following example, an ICMP time exceeded message is received from address 2052::52.

1w4d:Received ICMP time exceeded from 2052::52

 ICMP unreachable messages. In the following example, an ICMP unreachable message with code 1 is received from address 2052::52. Additionally, an ICMP unreachable message with code 1 is sent to address 2060::20 about address 2062::20.

lw4d:Received ICMP unreachable code 1 from 2052::52 lw4d:Sending ICMP unreachable code 1 to 2060::20 about 2062::20 The table below lists the codes for ICMP unreachable messages.

Code	Description
0	The router has no route to the packet destination.
1	Although the router has a route to the packet destination, communication is administratively prohibited.
3	The address is unreachable.
4	The port is unreachable.
