access-list (epl-disc)

To add a list of discovered endpoints to an auto IP Service Level Agreements (SLAs) endpoint list, use the **access-list** command in IP SLA endpoint-list auto-discovery configuration mode. To remove the list, use the **no** form of this command.

access-list {*standard-list-number*|*expanded-list-number*}

no access-list

Syntax Description

<i>standard-list-number</i>	Unique identifier of list. Range is from 1 to 99.
<i>expanded-list-number</i>	Unique identifier of list. Range is from 1300 to 1999.

Command Default

No access list is specified in the auto IP SLAs endpoint list being configured.

Command Modes

IP SLA endpoint-list auto-discovery configuration (config-epl-disc)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command assigns a name to a list of discovered IP addresses of IP SLAs destination devices and Cisco IOS IP SLAs Responder endpoints and adds the list to the auto IP SLAs endpoint list being configured.

Before you use this command, you must use the **discover** command in IP SLA endpoint-list configuration mode to build the list of endpoints on target Cisco devices.

To apply an endpoint list to an IP SLAs auto-measure group, use the **destination** command in IP SLA auto-measure group configuration mode.

Examples

The following example shows how to configure an endpoint list using the auto discovery method:

```
Router(config)# ip sla auto discovery
Router(config)# ip sla auto endpoint-list type ip autolist
Router(config-epl)# discover port 5000
Router(config-epl-disc)# access-list 3
Router(config-epl-disc)# end
Router# show ip sla auto endpoint-list
Endpoint-list Name: autolist
  Description:
    Auto Discover Parameters
      Destination Port: 5000
      Access-list: 3
      Ageout: 3600      Measurement-retry: 3
```

```
5 endpoints are discovered for autolist
```

Related Commands

Command	Description
destination (am-group)	Specifies an IP SLAs endpoint list for an IP SLAs auto-measure group.
discover (epl)	Builds a list of endpoints.
ip sla auto discovery	Enables auto discovery in Cisco IP SLAs Engine 3.0.
ip sla responder auto-register	Enables the Cisco device or Cisco IP SLAs Responder to automatically register with the source upon configuration
show ip sla auto endpoint-list	Displays the configuration including default values of auto IP SLAs endpoint lists.

access-list (IP SLA)

To specify the access list to apply to a Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation, use the **access-list** command in auto IP SLA MPLS parameters configuration mode. To remove the access list, use the **no** form of this command.

access-list *access-list-number*

no access-list *access-list-number*

Syntax Description

<i>access-list-number</i>	Number of an access list. This value is a decimal number from 1 to 99 or from 1300 to 1999.

Command Default

No access list is specified.

Command Modes

Auto IP SLA MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

Standard IP access lists can be configured (using the **access-list** [IP standard] command in global configuration mode) to restrict the number of IP SLAs operations that are automatically created by the IP SLAs LSP Health Monitor. When the IP SLAs access list parameter is configured, the list of Border Gateway Protocol (BGP) next hop neighbors discovered by the LSP Health Monitor is filtered based on the conditions defined by the associated standard IP access list. In other words, the LSP Health Monitor will automatically create IP SLAs operations only for those BGP next hop neighbors with source addresses that satisfy the criteria permitted by the standard IP access list.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is

configured to automatically create IP SLAs LSP ping operations for all BGP next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. Standard IP access list 10 is specified to restrict the number of IP SLAs operations to be created by LSP Health Monitor operation 1.

```
!Configure standard IP access list in global configuration mode
access-list 10 permit 10.10.10.8
!
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  access-list 10
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
access-list (IP standard)	Defines a standard IP access list.
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

ageout

To add an ageout timer to an auto IP Service Level Agreements (SLAs) scheduler or endpoint list, use the **ageout** command in IP SLA auto-measure schedule configuration or IP SLA endpoint-list auto-discovery configuration mode. To remove the timer, use the **no** form of this command.

ageout *seconds*

no ageout

Syntax Description

<i>seconds</i>	Length of time to keep an entry in memory, in seconds. Range is from 0 to 2073600. Default is 0.

Command Default

The entry is never saved in memory.

Command Modes

IP SLA auto-measure schedule configuration (config-am-schedule)

IP SLA endpoint-list auto-discovery configuration (config-epl-disc)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command changes the length of time an entry is kept in memory when either the operation or destination is inactive from the default (0) to the specified number, after which the entry is deleted from memory.

An operation can age out before it executes. To ensure that this does not happen, the difference between the time that the IP SLA auto-measure group is configured and the time at which the operation becomes active must be less than the value of the ageout timer.

Note

The total RAM required to hold the history and statistics tables is allocated when the auto IP SLAs operation is scheduled. This prevents router memory problems when the router gets heavily loaded and lowers the amount of overhead an auto IP SLAs operation causes on a router when it is active.

Examples

The following example shows how to configure an auto IP SLAs scheduler that will cause an auto IP SLAs operation to actively collect data at 3:00 p.m. on April 5. The operation will age out after 12 hours of inactivity, which can be before it starts or after it has finished its life. When the operation ages out, all configuration information for the operation is removed from the running configuration in RAM.

```
Router(config)# ip sla auto schedule apr5
```

```

Router(config-am-schedule)# ageout 43200
Router(config-am-schedule)# frequency 70
Router(config-am-schedule)# life 43200
Router(config-am-schedule)# probe-interval 1500
Router(config-am-schedule)# start-time 15:00 apr 5
Router(config-am-schedule)# end
Router#
Router# show ip sla auto schedule apr5
Group sched-id: apr5
  Probe Interval (ms) : 1500
  Group operation frequency (sec): 70
  Status of entry (SNMP RowStatus): Active
  Next Scheduled Start Time: P15:00 apr 5
  Life (sec): 43200
  Entry Ageout (sec): 43200
Router#

```

Related Commands

Command	Description
frequency	Specifies how often an auto IP SLAs operation will repeat once it is started.
life	Specifies length of time that an auto IP SLAs operation will run.
probe-interval	Specifies interval for staggering the start times of auto IP SLAs operations
show ip sla auto schedule	Displays configuration including default values of auto IP SLAs schedulers.
start-time	Specifies when an auto IP SLAs operation will start running.

aggregate interval

To configure an aggregate interval for an IP Service Level Agreements (SLAs) Metro-Ethernet 3.0 (Y.1731) operation, use the **aggregate interval** command in IP SLA Y.1731 delay or IP SLA Y.1731 loss configuration mode. To return to the default, use the **no** form of this command.

aggregate interval *seconds*

no aggregate interval

Syntax Description

<i>seconds</i>	Length of time in seconds. The range is from 1 to 65535. The default is 900.

Command Default

The default aggregate interval is 900 seconds.

Command Modes

IP SLA Y.1731 delay configuration (config-sla-y1731-delay)

IP SLA Y.1731 loss configuration (config-sla-y1731-loss)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

An aggregate interval is the length of time during which the performance measurements are conducted and the results stored. Use this command to change the number of intervals for a delay, delay variation, or frame loss operation from the default (900 seconds) to the specified value.

The aggregate interval value must be less than the life value of the IP SLAs schedule. The default life value for an IP SLAs schedule or IP SLAs multioperation group scheduler configuration is 3600 seconds.

Examples

The following example shows how to configure a single-ended IP SLAs Ethernet delay operation with an aggregate interval of 1500 seconds:

```
Router(config)# ip sla 10
Router(config-ip-sla)# ethernet y7131 delay dmm domain xxx evc yyy mpid 101 cos 3 source
mpid 100
Router(config-sla-y1731-delay)# aggregate interval 1500
Router(config-sla-y1731-delay)#
```

Related Commands

Command	Description
distribution	Configures statistics distributions for an IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) operation.
history interval	Sets the number of statistics distributions kept during the lifetime of an IP SLAs Metro Ethernet 3.0 (ITU-T Y.1731) operation.
ip sla group schedule	Configures multioperation scheduling for IP SLAs operations.
ip sla schedule	Configures the scheduling parameters for a single IP SLAs operation.
show ip sla statistics	Displays the current operational status and statistics of all IP SLAs operations or a specified operation.

aggregation interval

To set the number of interval buckets that are kept during the lifetime of a Cisco IOS IP Service Level Agreements (SLAs) service performance operation, use the **aggregation interval** command in IP SLA service performance configuration mode. To return to the default, use the **no** form of this command.

aggregation interval buckets *buckets*

no aggregation interval buckets

Syntax Description

buckets <i>buckets</i>	Specifies the number of buckets kept. The range is from 1 to 30. The default is 1.

Command Default

One interval bucket per service performance operation is kept.

Command Modes

IP SLA service performance configuration (config-ip-sla-service-performance)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

Performance measurements for an IP SLAs service performance operation are stored in interval buckets. Each time IP SLAs starts an operation, a new bucket is created until the number of buckets matches the specified number or the operation's lifetime expires. Buckets do not wrap (that is, the oldest information is not replaced by newer information).

Examples

```
IP SLAs Infrastructure Engine-III

auto ip sla mpls-lsp-monitor

To begin configuration for an IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation and enter auto IP SLA MPLS configuration mode, use the **auto ip sla mpls-lsp-monitor** command in global configuration mode. To remove all configuration information for an LSP Health Monitor operation, use the **no** form of this command.

auto ip sla mpls-lsp-monitor *operation-number*

no auto ip sla mpls-lsp-monitor *operation-number*

Syntax Description

<i>operation-number</i>	Number used for the identification of the LSP Health Monitor operation you want to configure.

Command Default

No LSP Health Monitor operation is configured.

Command Modes

Global configuration

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr mpls-lsp-monitor command.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr mpls-lsp-monitor command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
15.1(2)SNH	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Entering this command automatically enables the **mpls discovery vpn next-hop** command.

After you configure an LSP Health Monitor operation, you must schedule the operation. To schedule an LSP Health Monitor operation, use the **auto ip sla mpls-lsp-monitor schedule** command in global configuration mode. You can also optionally set reaction configuration for the operation (see the **auto ip sla mpls-lsp-monitor reaction-configuration** command).

To display the current configuration settings of an LSP Health Monitor operation, use the **show ip sla mpls-lsp-monitor configuration** command in EXEC mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor reaction-configuration	Configures certain actions to occur based on events under the control of the IP SLAs LSP Health Monitor.
auto ip sla mpls-lsp-monitor reset	Removes all IP SLAs LSP Health Monitor configuration from the running configuration.
auto ip sla mpls-lsp-monitor schedule	Configures the scheduling parameters for an IP SLAs LSP Health Monitor operation.
mpls discovery vpn next-hop	Enables the MPLS VPN BGP next hop neighbor discovery process.
show ip sla mpls-lsp-monitor configuration	Displays configuration settings for IP SLAs LSP Health Monitor operations.
type echo (MPLS)	Configures the parameters for a Cisco IOS IP SLAs LSP ping operation using the LSP Health Monitor.
type pathEcho (MPLS)	Configures the parameters for a Cisco IOS IP SLAs LSP traceroute operation using the LSP Health Monitor.

auto ip sla mpls-lsp-monitor reaction-configuration

To configure proactive threshold monitoring parameters for a Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation, use the **auto ip sla mpls-lsp-monitor reaction-configuration** command in global configuration mode. To clear all threshold monitoring configuration for a specified LSP Health Monitor operation, use the **no** form of this command.

LSP Health Monitor Without LSP Discovery

auto ip sla mpls-lsp-monitor reaction-configuration *operation-number* **react** {**connectionLoss**| **timeout**} [**action-type** *option*] [**threshold-type** {**consecutive** [*occurrences*] | **immediate**| **never**}]

no auto ip sla mpls-lsp-monitor reaction-configuration *operation-number*

LSP Health Monitor with LSP Discovery

auto ip sla mpls-lsp-monitor reaction-configuration *operation-number* **react** **lpd** {**lpd-group** [**retry** *number*]| **tree-trace**} [**action-type** **trapOnly**]

no auto ip sla mpls-lsp-monitor reaction-configuration *operation-number*

Syntax Description

<i>operation-number</i>	Number of the LSP Health Monitor operation for which reactions are to be configured.
react connectionLoss	Enables monitoring of one-way connection loss events.
react timeout	Enables monitoring of one-way timeout events.
action-type <i>option</i>	(Optional) Specifies what action is performed when threshold events occur. If the threshold-type never keywords are defined, the action-type keyword is disabled. The <i>option</i> argument can be one of the following keywords: • none --No action is taken. This option is the default value. • trapOnly --SNMP trap notification is sent.
threshold-type consecutive [<i>occurrences</i>]	(Optional) When a threshold violation for the monitored element (such as a timeout) are met consecutively for a specified number of times, perform the action defined by the action-type keyword. The default number of 5 consecutive occurrences can be changed using the <i>occurrences</i> argument. The range is from 1 to 16.

threshold-type immediate	(Optional) When a threshold violation for the monitored element (such as a timeout) are met, immediately perform the action defined by the action-type keyword.
threshold-type never	(Optional) Do not calculate threshold violations. This option is the default threshold type.
lpd	(Optional) Specifies the LSP discovery option.
lpd-group	(Optional) Enables monitoring of LSP discovery group status changes.
retry number	(Optional) Specifies the number of times the equal-cost multipaths belonging to an LSP discovery group are retested when a failure is detected. After the specified number of retests have been completed, an SNMP trap notification may be sent depending on the current status of the LSP discovery group. See the “Usage Guidelines” section for more information. The value of the <i>number</i> argument is zero by default. Use the secondary frequency command to increase the frequency at which failed paths belonging to an LSP discovery group are retested. This command is not applicable if the retry value is set to zero.
tree-trace	(Optional) Enables monitoring of situations where LSP discovery to a Border Gateway Protocol (BGP) next hop neighbor fails.
action-type trapOnly	(Optional) Enables SNMP trap notifications.

Command Default IP SLAs proactive threshold monitoring is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.4(6)T	This command was introduced.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr mpls-lsp-monitor reaction-configuration command.

Release	Modification
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr mpls-lsp-monitor reaction-configuration command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

You can configure the **auto ip sla mpls-lsp-monitor reaction-configuration** command multiple times to enable proactive threshold monitoring for multiple elements for the same operation. However, disabling of individual monitored elements is not supported. In other words, the **no auto ip sla mpls-lsp-monitor reaction-configuration** command will disable all proactive threshold monitoring configuration for the specified IP SLAs operation.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Depending on the Cisco IOS software release that you are running, use the **ip sla logging traps** or **ip sla monitor logging traps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Use the **snmp-server enable traps rtr** command to enable the sending of IP SLAs SNMP trap notifications.

To display the current threshold monitoring configuration settings for an LSP Health Monitor operation, use the **show ip sla mpls-lsp-monitor configuration** command.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. As specified by the proactive threshold monitoring configuration, when three consecutive connection loss or timeout events occur, an SNMP trap notification is sent.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
 type echo ipsla-vrf-all
 timeout 1000
 scan-interval 1
 secondary-frequency connection-loss 10
 secondary-frequency timeout 10
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

Command	Description
ip sla logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.
ip sla monitor logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.
show ip sla mpls-lsp-monitor configuration	Displays configuration settings for IP SLAs LSP Health Monitor operations.
snmp-server enable traps rtr	Enables the sending of IP SLAs SNMP trap notifications.

auto ip sla mpls-lsp-monitor reset

To remove all IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor configuration from the running configuration, use the **auto ip sla mpls-lsp-monitor reset** command in global configuration mode.

auto ip sla mpls-lsp-monitor reset [*lpd group-number*]

Syntax Description

lpd <i>group-number</i>	(Optional) Specifies the number used to identify the LSP discovery group you want to configure.

Command Default

None

Command Modes

Global configuration

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. The lpd keyword and <i>lpd-group</i> argument was added.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

Use the **auto ip sla mpls-lsp-monitor reset lpd group-number** command to remove all the stored network connectivity statistics for the specified LSP discovery group from the LSP discovery group database. The non-statistical LSP discovery group data will be set to default values or zero. However, the IP address of the associated Border Gateway Protocol (BGP) next hop neighbor, the list of LSP discovery group IP SLAs operations, and the list of LSP selector IP addresses will be preserved. After the **auto ip sla mpls-lsp-monitor reset lpd group-number** command is entered, statistical data for the group will start aggregating again with new data only.

To clear IP SLAs configuration information (not including IP SLAs LSP Health Monitor configuration) from the running configuration, use the **ip sla reset** command in global configuration mode.

Examples

The following example shows how to remove all the LSP Health Monitor configurations from the running configuration:

```
auto ip sla mpls-lsp-monitor reset
```

Related Commands

Command	Description
ip sla reset	Stops all IP SLAs operations, clears IP SLAs configuration information, and returns the IP SLAs feature to the startup condition.

auto ip sla mpls-lsp-monitor schedule

To configure the scheduling parameters for an IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation, use the **auto ip sla mpls-lsp-monitor schedule** command in global configuration mode. To stop the operation and place it in the default state (pending), use the **no** form of this command.

auto ip sla mpls-lsp-monitor schedule *operation-number* **schedule-period** *seconds* [**frequency** [*seconds*]]
[**start-time** {**after** *hh : mm : ss*| *hh : mm* [: *ss*] [*month* *day*| *day* *month*]}| **now**| **pending**}]

no auto ip sla mpls-lsp-monitor schedule *operation-number*

Syntax Description

<i>operation-number</i>	Number of the LSP Health Monitor operation to be scheduled.
schedule-period <i>seconds</i>	Specifies the amount of time (in seconds) for which the LSP Health Monitor is scheduled.
frequency <i>seconds</i>	(Optional) Specifies the number of seconds after which each IP SLAs operation is restarted. The default frequency is the value specified for the schedule period.
start-time	(Optional) Time when the operation starts collecting information. If the start time is not specified, no information is collected.
after <i>hh : mm : ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.
<i>hh : mm</i> [: <i>ss</i>]	(Optional) Specifies an absolute start time using hours, minutes, and seconds. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a month and day.
<i>month</i>	(Optional) Name of the month in which to start the operation. If a month is not specified, the current month is used. Use of this argument requires that a day be specified. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day (in the range 1 to 31) on which to start the operation. If a day is not specified, the current day is used. Use of this argument requires that a month be specified.

now	(Optional) Indicates that the operation should start immediately.
pending	(Optional) No information is collected. This option is the default value.

Command Default

The LSP Health Monitor operation is placed in a pending state (that is, the operation is enabled but is not actively collecting information).

Command Modes

Global configuration

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr mpls-lsp-monitor schedule command.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr mpls-lsp-monitor schedule command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

After you schedule an LSP Health Monitor operation with the **auto ip sla mpls-lsp-monitor schedule** command, you cannot change the configuration of the operation. To change the configuration of the operation, use the **no auto ip sla mpls-lsp-monitor operation-number** command in global configuration mode and then enter the new configuration information.

To display the current configuration settings of an LSP Health Monitor operation, use the **show ip sla mpls-lsp-monitor configuration** command in user EXEC or privileged EXEC mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The schedule period for LSP Health Monitor operation 1 is set to 60 seconds and the operation is scheduled to start immediately.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
type echo ipsla-vrf-all
```

```

timeout 1000
scan-interval 1
secondary-frequency connection-loss 10
secondary-frequency timeout 10
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now

```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
show ip sla mpls-lsp-monitor configuration	Displays configuration settings for IP SLAs LSP Health Monitor operations.

availability algorithm

To configure the availability algorithm for an IP Service Level Agreements (SLAs) Metro-Ethernet 3.0 (Y.1731) frame loss ratio operation, use the **availability algorithm** command in global configuration mode. To return to the default value, use the **no** form of this command.

availability algorithm {sliding-window| static-window}

no availability algorithm {sliding-window| static-window}

Syntax Description

sliding-window	Specifies a sliding-window control algorithm.
static-window	Specifies static-window control algorithm.

Command Default

The availability algorithm is static-window.

Command Modes

IP SLA Y.1731 loss configuration (config-sla-y1731-loss)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Use this command to change the availability algorithm for determining frame loss ratio to the specified value.

Examples

The following example shows how to change the availability algorithm for an already configured IP SLAs Metro-Ethernet 3.0 (Y.1731) frame loss ratio operation from the default (static-window) to sliding-window:

```
Router (config-term) # ip sla 11
Router (config-sla-y1731-loss) # availability algorithm sliding-window
Router (config-sla-y1731-loss) #
```

bitrate

To configure the maximum bit-rate or bit-rate window size parameter in a predefined or custom synthetic video traffic profile for an IP Service Level Agreements (SLAs) video operation, use the **bitrate** command in the appropriate IP SLA VO profile endpoint configuration submenu. To return the bit-rate values to the default, use the **no** form of this command.

bitrate {**maximum** *max-bitrate*| **window-size** *window-size*}

no bitrate {**maximum** *max-bitrate*| **window-size** *window-size*}

Syntax Description

maximum <i>max-bitrate</i>	Specifies maximum bit-rate in kilobits per second (kb/s). The following values are valid for the video traffic profile being configured: • For CP-9900: The range is from 60 to 1000. • For CTS: The valid options are 1000, 1500, 2250, 3000, 3500, 4000, or 936. • For custom: The range is from 10 to 4000. For a description of each traffic profile type, see the "Usage Guidelines" section.
window-size <i>window-size</i>	Specifies the bit-rate window size in milliseconds. The range is from 0 to 5000. The default is 500.

Command Default

There is no maximum bit-rate parameter configured. The default value for bit-rate window size is 500 milliseconds.

Command Modes

IP SLA VO CP9900 profile endpoint configuration (cfg-ipslavo-cp9900-profile)

IP SLA VO CTS profile endpoint configuration (cfg-ipslavo-cts-profile)

IP SLA VO custom profile endpoint configuration (cfg-ipslavo-custom-profile)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use the **bitrate** command to configure the maximum bit-rate parameter, or change the value of the bit-rate window-size parameter from the default (500) to the specified value, in a video profile for the following video endpoint types:

- CP-9900—Cisco Unified 9900 Series IP Phone System (CP-9900).
- CTS—Cisco Telepresence System 1000/3000 (CTS-1000/3000)
- custom—Customized video endpoint type.

There are restrictions based on the relationships between maximum bit rate, frame rate, and resolution, also known as bandwidth. For the user-defined endpoint types, the table below includes the maximum bit rates allowable in relation to the frame per second (fps) rates and resolution. Cisco IOS software allows you to enter the values of these three parameters in any order and verifies that their combination is within a valid range, as specified. For example, if a 1080 pixels (p) resolution at 30 fps is chosen, the valid maximum bit-rate range is between 1500 and 4000 kb/s.

Table 1: Maximum Bit Rates Allowable for Frame Rates and Resolution in Custom Endpoints

Resolution and Frame Rate	30/24 fps	15 fps	10 fps	7.5 fps	5 fps
QCIF	60–256 kb/s	32–160 kb/s	20–118 kb/s	15–96 kb/s	10–74 kb/s
CIF/SIG/QVGA	128–1000 kb/s	64–564 kb/s	43–397 kb/s	32–314 kb/s	22–230 kb/s
VGA/4CIF/4SIF	384–2000 kb/s	192–1128 kb/s	128–795 kb/s	96–628 kb/s	64–461 kb/s
720p	800–2500 kb/s	400–1506 kb/s	267–1089 kb/s	200–881 kb/s	133–673 kb/s
1080p	1500–4000 kb/s	750–2512 kb/s	500–1845 kb/s	375–1512 kb/s	250–1179 kb/s

Examples

The following example shows how to use the **bitrate** command to configure the maximum bit-rate and to change the bitrate widow-size parameters in a user-defined custom synthetic video traffic profile:

```
Router> enable
Router# configure terminal
Router(config)# ip sla profile video my-profile
Router(cfg-ipslavo-profile)# endpoint custom
Router(cfg-ipslavo-custom-profile)# bitrate maximum 1000
Router(cfg-ipslavo-custom-profile)# bitrate window-size 400
```

Related Commands

Command	Description
frame (VO profile)	Configures frame parameters in user-defined video profile.
resolution	Configures the resolution in user-defined video profile.
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

buckets-of-history-kept

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **buckets-of-history-kept** command is replaced by the **history buckets-kept** command. See the **history buckets-kept** command for more information.

To set the number of history buckets that are kept during the lifetime of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **buckets-of-history-kept** command in the appropriate submode of IP SLA monitor configuration mode. To return to the default value, use the no form of this command.

buckets-of-history-kept *size*

no buckets-of-history-kept

Syntax Description

<i>size</i>	Number of history buckets kept during the lifetime of the operation. The default is 50.

Command Default

50 buckets

Command Modes

DHCP configuration (config-sla-monitor-dhcp)
 DLSw configuration (config-sla-monitor-dlsw)
 DNS configuration (config-sla-monitor-dns)
 FTP configuration (config-sla-monitor-ftp)
 HTTP configuration (config-sla-monitor-http)
 ICMP echo configuration (config-sla-monitor-echo)
 ICMP path echo configuration (config-sla-monitor-pathEcho)
 ICMP path jitter configuration (config-sla-monitor-pathJitter)
 TCP connect configuration (config-sla-monitor-tcp)
 UDP echo configuration (config-sla-monitor-udp)
 VoIP configuration (config-sla-monitor-voip)

Command History

Release	Modification
11.2	This command was introduced.
12.4(4)T	This command was replaced by the history buckets-kept command.
12.2(33)SRB	This command was replaced by the history buckets-kept command.

Release	Modification
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the history buckets-kept command.
12.2(33)SXI	This command was replaced by the history buckets-kept command.

Usage Guidelines

Each time IP SLAs starts an operation, a new bucket is created until the number of history buckets matches the specified size or the operation's lifetime expires. History buckets do not wrap (that is, the oldest information is not replaced by newer information). The operation's lifetime is defined by the **ip sla monitor schedule** global configuration command.

Note

The **buckets-of-history-kept** command does not support the IP SLAs User Datagram Protocol (UDP) jitter operation.

An IP SLAs operation can collect history and capture statistics. By default, the history for an IP SLAs operation is not collected. If history is collected, each history bucket contains one or more history entries from the operation. When the operation type is ICMP path echo, an entry is created for each hop along the path that the operation takes to reach its destination. The type of entry stored in the history table is controlled by the **filter-for-history** command. The total number of entries stored in the history table is controlled by the combination of the **samples-of-history-kept**, **buckets-of-history-kept**, and **lives-of-history-kept** commands.

Note

Collecting history increases the RAM usage. Collect history only when you think there is a problem in the network.

Note

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

Examples

The following example shows how to configure IP SLAs ICMP echo operation 1 to keep 25 history buckets during the operation lifetime.

```
ip sla monitor 1
  type echo protocol ipIcmpEcho 172.16.161.21
  buckets-of-history-kept 25
  lives-of-history-kept 1
!
ip sla monitor schedule 1 start-time now life forever
```

Related Commands

Command	Description
filter-for-history	Defines the type of information kept in the history table for the IP SLAs operation.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
lives-of-history-kept	Sets the number of lives maintained in the history table for the IP SLAs operation.
samples-of-history-kept	Sets the number of entries kept in the history table per bucket for the IP SLAs operation.

clock-tolerance ntp oneway

To set the acceptable Network Time Protocol (NTP) clock synchronization tolerance for a one-way Cisco IOS IP Service Level Agreements (SLAs) operation measurement, use the **clock-tolerance ntp oneway** command in the appropriate UDP jitter submode of IP SLA configuration, IP SLA monitor configuration, or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

clock-tolerance ntp oneway {*absolute value*|*percent value*}

no clock-tolerance ntp oneway

Syntax Description

absolute <i>value</i>	Sets the NTP synchronization tolerance value to an absolute number, in microseconds. The range is from 0 to 100000.
percent <i>value</i>	Sets the NTP synchronization tolerance value as a percentage of the one-way IP SLAs operation delay measurement. The range is from 0 to 100. The NTP clock synchronization tolerance is set to 0 percent by default.

Command Default

The NTP clock synchronization tolerance is set to 0 percent.

Command Modes

IP SLA Configuration

UDP jitter configuration (config-ip-sla-jitter)

Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)

IP SLA Monitor Configuration

UDP jitter configuration (config-sla-monitor-jitter)

IP SLA Template Parameters Configuration

UDP jitter configuration (config-udp-jtr-params)

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Release	Modification
15.1(1)T	This command was modified. The IP SLA template parameters configuration mode was added.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

The **precisionmicroseconds** command must be configured before the **clock-tolerantntponeway** command is used.

Note

This command is supported by the IP SLAs User Datagram Protocol (UDP) jitter operation only.

If the NTP running state is true and the total offset (sum of the offset for the sender and responder) is within the specified tolerance value (defined using the **clock-tolerantntponeway** command) of a one-way IP SLAs operation measurement for all the packets in a stream, the NTP synchronization status is determined to be synchronized. If these conditions are not met, the status is determined to be not synchronized.

The following guidelines apply to the displayed output:

- If the NTP synchronization status is determined to be synchronized, the one-way IP SLAs delay measurement values will be displayed.
- If the NTP synchronization status is determined to be not synchronized, the one-way values will be zero.
- The total number of operational packets that are not synchronized will be tracked during the collection period and reported.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **clock-tolerantntponeway** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured.

If you are using auto IP SLAs in Cisco IOS IP SLAs Engine 3.0, you must enter the **parameters** command in IP SLA template configuration mode before you can use the **clock-tolerantntponeway** command.

Table 2: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration
15.1(1)T	ip sla auto template	IP SLA template configuration

Examples

The following examples show how to enable microsecond precision, configure the NTP synchronization offset tolerance to 10 percent, and set the packet priority to high for IP SLAs UDP jitter operation 1. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 1
  udp-jitter 205.199.199.2 dest-port 9006
  precision microseconds
  clock-tolerance ntp oneway percent 10
  probe-packet priority high
  frequency 300
!
ip sla schedule 1 life forever start-time after 00:00:06
```

Examples

```
ip sla monitor 1
  type jitter dest-ipaddr 205.199.199.2 dest-port 9006
  precision microseconds
  clock-tolerance ntp oneway percent 10
  probe-packet priority high
  frequency 300
!
ip sla monitor schedule 1 life forever start-time after 00:00:06
```

Examples

```
Router(config)# ip sla auto template type ip udp-jitter 1
Router(config-udp-jtr-tplt)# parameters
Router(config-udp-jtr-params)# precision microseconds
Router(config-udp-jtr-params)# clock-tolerance ntp oneway percent 10
Router(config-udp-jtr-params)# operation-packet high
Router(config-udp-jtr-params)# end
Router#
Router# show ip sla auto template type ip udp-jitter
IP SLAs Auto Template: 1
Measure Type: udp-jitter (control enabled)
  Description:
    IP options:
      Source IP: 0.0.0.0      Source Port: 0
      VRF:      TOS: 0x0
    Operation Parameters:
      Request Data Size: 32   Verify Data: false

```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an IP SLAs operation template and enters IP SLA template configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

codec (tplt)

To configure codec in an auto IP Service Level Agreements (SLAs) operation template for a User Datagram Protocol (UDP) jitter operation that returns VoIP scores, use the **codec** command in UDP jitter submode of the IP SLA template configuration mode.

codec *codec-type* [**advantage-factor** *value*] [**codec-numpackets** *number-of-packets*] [**codec-interval** *milliseconds*] [**codec-size** *number-of-bytes*]

Syntax Description

<i>codec-type</i>	The following codec-type keywords are valid: • g711alaw --The G.711 a-law codec (64 kbps transmission) • g711ulaw --The G.711 mu-law codec (64 kbps transmission) • g729a --The G.729A codec (8 kbps transmission)
advantage-factor	(Optional) Specifies expectation factor to be used for ICPIF calculations.
<i>value</i>	Range is from 0 to 20. Default is 0. For recommended values, see the Advantage Factor Recommended Maximum Values table below.
codec-numpackets	(Optional) Specifies number of packets to be transmitted per operation.
<i>number-of-packets</i>	Range is from 1 to 60000. Default is 1000.
codec-interval	(Optional) Specifies interval between packets in operation.
<i>milliseconds</i>	Length of interval, in milliseconds (ms). Range is from 1 to 60000. Default is 20.
codec-size	(Optional) Specifies number of bytes in each packet transmitted.
<i>number-of-bytes</i>	Range is from 16 to 1500. Default varies by codec. For default values, see the Default UDP Jitter Operation Parameters by Codec table below.

Command Default

A codec is not configured in the auto IP SLAs operation template being configured.

Command Modes

IP SLA UDP jitter template configuration (config-tplt-udp-jtr)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command configures the codec in an auto IP SLAs operation template for a UDP jitter operation and generates ICPIF and MOS scores, based on the specified codec type.

The specified *codec-type* should match the encoding algorithm being used for VoIP transmissions.

You must configure the type of auto IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

A UDP jitter operation computes statistics by sending n UDP packets, each of size s , sent t msec apart, from a given source router to a given target router, at a given frequency f . Based on the type of codec you configure for the operation, the number of packets (n), the size of each payload (s), the interpacket time interval (t), and the operational frequency (f) are auto-configured with default values or you can manually configure these parameters using the keyword and argument combinations in this command.

**Note**

You should not specify values for the interval, size, and number of packet options unless you have a specific reason to override the defaults; for example, to approximate a different codec.

The table below lists the default values for each parameter by codec.

Table 3: Default UDP Jitter Operation Parameters by Codec

Codec	Default Number of Packets (n); [codec-numpackets]	Packet Payload (s) [codec-size] ¹	Default Interval Between Packets (t) [codec-interval]	Frequency of Operations (f)
G.711 mu-law (g711ulaw)	1000	160 bytes	20 ms	Once every 60 seconds
G.711 a-law (g711alaw)	1000	160 bytes	20 ms	Once every 60 seconds
G.729A (g729a)	1000	20 bytes	20 ms	Once every 60 seconds

¹ The actual data size of each request packet will contain an additional 12 bytes of Real-Time Transport Protocol (RTP) header data in order to simulate the RTP/UDP/IP/Layer 2 protocol stack.

The **advantage-factor***value* keyword and argument allow you to specify an access Advantage Factor, also known as the Expectation Factor. The table below, adapted from ITU-T Rec. G.113, defines a set of provisional maximum values for Advantage Factors in terms of the service provided.

Table 4: Advantage Factor Recommended Maximum Values

Communication Service	Maximum Value of Advantage/ Expectation Factor (<i>A</i>):
Conventional wire line (land line)	0
Mobility (cellular connections) within a building	5
Mobility within a geographical area or moving within a vehicle	10
Access to hard-to-reach location; for example, via multihop satellite connections	20

These values are only suggestions. To be meaningful, the Advantage/Expectation factor (*A*) and its selected value in a specific application should be used consistently in any planning model you adopt. However, the values in the table above should be considered as the absolute upper limits for *A*. The default Advantage/Expectation factor for UDP jitter operations is always zero.

Examples

In the following example, an auto IP SLAs operation template for a UDP jitter (codec) operation is configured to use the default characteristics of the G.711 a-law codec, which means the operation will consist of 1000 packets, each of 172 bytes (160 plus 12 header bytes), sent 20 ms apart. The default value for the Advantage Factor and operations frequency is used.

```
Router(config)# ip slas auto template type ip udp-jitter voip
Router(config-tplt)# codec g711alaw
Router(config-tplt)# end
Router# show ip sla auto template type ip udp-jitter voip
IP SLAs Auto Template: voip
  Measure Type: udp-jitter (control enabled)
  Description:
  IP options:
    Source IP: 0.0.0.0      Source Port: 0
    VRF:      TOS: 0x0
  Operation Parameters:
    Verify Data: false
    Timeout: 5000          Threshold: 5000
    Codec: g711alaw Number of packets: 1000
    Interval: 20           Payload size: 16      Advantage factor: 0
    Granularity: msec      Operation packet priority: normal
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
```

Related Commands

Command	Description
ip sla auto template	Enters IP SLA template configuration mode for defining an auto IP SLAs operation template.
show ip sla auto template	Displays configuration including default values of auto IP SLAs operation templates.

codec (VO profile)

To configure the codec parameter in a custom video traffic profile for an IP Service Level Agreements (SLAs) video operation, use the **codec** command in the IP SLA VO custom profile endpoint configuration mode. To remove the codec configuration, use the **no** form of this command.

codec *video-codec* **profile baseline**

no codec *video-codec* **profile baseline**

Syntax Description

<i>video-codec</i>	Value of the synthetic video code profile parameter. h.264 is the only valid value for the video-codec argument.
profile baseline	Sets a baseline profile.

Command Default

No codec is defined in the custom video profile.

Command Modes

IP SLA VO custom profile endpoint configuration (cfg-ipslavo-custom-profile)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use the **codec** command to configure the codec parameter in a user-defined custom video traffic profile. IP SLAs video operations support one baseline profile.

Examples

```
Router> enable
Router# configure terminal
Router(config)# ip sla profile video my-profile
Router(cfg-ipslavo-profile)# endpoint custom
Router(cfg-ipslavo-custom-profile)# codec h.264 profile baseline
```

Related Commands

Command	Description
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

control

To configure the control interface type and number for a redundancy group, use the **control** command in redundancy application group configuration mode. To remove the control interface for the redundancy group, use the **no** form of this command.

control *interface-type interface-number protocol id*

no control

Syntax Description

<i>interface-type</i>	Interface type.
<i>interface-number</i>	Interface number.
protocol	Specifies redundancy group protocol media.
<i>id</i>	Redundancy group protocol instance. The range is from 1 to 8.

Command Default

The control interface is not configured.

Command Modes

Redundancy application group configuration (config-red-app-grp)

Command History

Release	Modification
Cisco IOS XE Release 3.1S	This command was introduced.

Examples

The following example shows how to configure the redundancy group protocol media and instance for the control Gigabit Ethernet interface:

```
Router# configure terminal
Router(config)# redundancy
Router(config-red)# application redundancy
Router(config-red-app)# group 1
Router(config-red-app-grp)# control GigabitEthernet 0/0/0 protocol
1
```

Related Commands

Command	Description
application redundancy	Enters redundancy application configuration mode.

Command	Description
authentication	Configures clear text authentication and MD5 authentication for a redundancy group.
data	Configures the data interface type and number for a redundancy group.
group(firewall)	Enters redundancy application group configuration mode.
name	Configures the redundancy group with a name.
preempt	Enables preemption on the redundancy group.
protocol	Defines a protocol instance in a redundancy group.

control (IP SLA)

To configure the parameters for a control protocol message for a Cisco IOS IP Service Level Agreements (SLAs) UDP jitter operation, use the **control** command in multicast UDP jitter configuration mode. To return to the default values, use the **no** form of this command.

control {**retry** *retries* | **timeout** *seconds*}

no control

Syntax Description

retry <i>retries</i>	Specifies the number of times a sending device will resend a control protocol message. The range is 1 to 5 . The default is 3.
timeout <i>seconds</i>	Specifies the length of time, in seconds, that a destination device will wait for a control protocol message. The range is to 1 to 1000. The default is 5.

Command Default

The timeout value is 5 seconds and the retry value is 3.

Command Modes

Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)

Command History

Release	Modification
15.2(4)M	This command was introduced.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

Use this command to change the values of the control protocol message retry and timeout from the defaults (3 retries and 5 seconds respectively) to a specified value.

Examples

```
Device> enable
Device# configure terminal
Device(config)# ip sla 10
Device(config-ip-sla)# udp-jitter 239.1.1.1 5000 endpoint-list mcast-rcvrs source-ip
10.10.10.106 source-port 7012 num-packets 50 interval 25
```

```
Device(config-ip-sla-multicast-jitter-oper)# control retry 2
Device(config-ip-sla-multicast-jitter-oper)# control timeout 4
```

Related Commands

Command	Description
udp-jitter	Configures an IP SLAs UDP jitter or multicast jitter operation.

COS

To set the class of service (CoS) for a Cisco IOS IP Service Level Agreements (SLAs) Ethernet operation, use the **cos** command in the appropriate submode of IP SLA configuration or IP SLA Ethernet monitor configuration mode. To return to the default value, use the **no** form of this command.

cos *cos-value*

no cos

Syntax Description

<i>cos-value</i>	Class of service (CoS) value. The range is from 0 to 7. The default is 0.

Command Default

The CoS value for the IP SLAs Ethernet operation is set to 0.

Command Modes

IP SLA configuration

Ethernet echo configuration (config-ip-sla-ethernet-echo)

Ethernet jitter configuration (config-ip-sla-ethernet-jitter)

IP SLA Ethernet monitor configuration

Ethernet parameters configuration (config-ip-sla-ethernet-params)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Usage Guidelines

You must configure the type of IP SLAs operation (such as Ethernet ping) before you can configure any of the other parameters of the operation.

The configuration mode for the **cos** command varies depending on the operation type configured. For example, if you are running Cisco IOS Release 12.2(33)SRB and the Ethernet ping operation type is configured using the **ethernet echo mpid** command in IP SLA configuration mode, you would enter the **cos** command in Ethernet echo configuration mode (config-ip-sla-ethernet-echo).

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using an IP SLAs auto Ethernet operation. In this example, operation 10 is configured to automatically create IP SLAs Ethernet ping operations for all the discovered maintenance endpoints in the domain named testdomain and VLAN identification number 34. The class of service for each Ethernet ping operation is set to 3. As specified by the proactive threshold monitoring configuration, when three consecutive connection loss events occur, a Simple Network Management Protocol (SNMP) trap notification should be sent. The schedule period for operation 10 is 60 seconds, and the operation is scheduled to start immediately.

```
ip sla ethernet-monitor 10
  type echo domain testdomain vlan 34
  cos 3
!
ip sla ethernet-monitor reaction-configuration 10 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
!
ip sla ethernet-monitor schedule 10 schedule-period 60 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla ethernet-monitor	Begins configuration for an IP SLAs auto Ethernet operation and enters IP SLA Ethernet monitor configuration mode.

data-pattern

To specify the data pattern in a Cisco IOS IP Service Level Agreements (SLAs) operation to test for data corruption, use the **datapattern** command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode. To remove the data pattern specification, use the **no** form of this command.

data-pattern *hex-pattern*

no data-pattern *hex-pattern*

Syntax Description

<i>hex-pattern</i>	Hexadecimal string to use for monitoring the specified operation.

Command Default

The default *hex-pattern* is ABCD.

Command Modes

IP SLA Configuration

UDP echo configuration (config-ip-sla-udp)

IP SLA Monitor Configuration

UDP echo configuration (config-sla-monitor-udp)

Command History

Release	Modification
12.1(1)T	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines

The **data-pattern** command allows users to specify an alphanumeric character string to verify that operation payload does not get corrupted in either direction (source-to-destination [SD] or destination-to-source [DS]).

Note

The **data-pattern** command is supported by the IP SLAs User Datagram Protocol (UDP) echo operation only.

This command is supported in IPv4 networks and in IPv6 networks.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **data-pattern** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured. For example, if you are running Cisco IOS Release 12.4 and the UDP echo operation type is configured, you would enter the **data-pattern** command in UDP echo configuration mode (config-sla-monitor-udp) within IP SLA monitor configuration mode.

Table 5: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

The following examples show how to specify 1234ABCD5678 as the data pattern. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

The examples show the **data-pattern** command being used in an IPv4 network.

Examples

```
ip sla 1
  udp-echo 10.0.54.205 dest-port 101
  data-pattern 1234ABCD5678
!
ip sla schedule 1 life forever start-time now
```

Examples

```
ip sla monitor 1
  type udpEcho dest-ipaddr 10.0.54.205 dest-port 101
  data-pattern 1234ABCD5678
!
ip sla monitor schedule 1 life forever start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

delete-scan-factor

To specify the number of times the IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor should check the scan queue before automatically deleting IP SLAs operations for Border Gateway Protocol (BGP) next hop neighbors that are no longer valid, use the **delete-scan-factor** command in auto IP SLA MPLS parameters configuration mode. To return to the default value, use the **no** form of this command.

delete-scan-factor *factor*

no delete-scan-factor

Syntax Description

<i>factor</i>	Number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.

Command Default

The default scan factor is 1. In other words, each time the LSP Health Monitor checks the scan queue for updates, it deletes IP SLAs operations for BGP next hop neighbors that are no longer valid.

Command Modes

Auto IP SLA MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

This command must be used with the **scan-interval** command. Use the **scan-interval** command to specify the time interval at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.

Note

If the scan factor is set to 0, IP SLAs operations will not be automatically deleted by the LSP Health Monitor. This configuration is not recommended.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The delete scan factor is set to 2. In other words, every other time the LSP Health Monitor checks the scan queue for updates, it deletes IP SLAs operations for BGP next hop neighbors that are no longer valid.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  delete-scan-factor 2
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
scan-interval	Specifies the time interval (in minutes) at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.
show ip sla mpls-lsp-monitor scan-queue	Displays information about adding or deleting BGP next hop neighbors from a particular MPLS VPN of an IP SLAs LSP Health Monitor operation.

description (IP SLA)

To add a description to the configuration of an IP Service Level Agreements (SLAs) auto-measure group, auto IP SLAs operation template, or auto IP SLAs endpoint list, use the **description** command in IP SLA auto-measure group configuration, IP SLA endpoint-list configuration, or IP SLA service performance configuration mode, or the appropriate submode of IP SLA template configuration mode. To remove the description, use the **no** form of this command.

description *description*

no description

Syntax Description

<i>description</i>	String of 1 to 64 ASCII characters.

Command Default

No description is added to configuration.

Command Modes

IP SLA Configuration

IP SLA auto-measure group configuration(config-am-group)

IP SLA endpoint-list configuration(config-epl)

IP SLA performance service configuration (config-ip-sla-service-performance)

IP SLA Template Configuration

ICMP echo configuration (config-tplt-icmp-ech)

ICMP jitter configuration (config-tplt-icmp-jtr)

TCP connect configuration (config-tplt-tcp-conn)

UDP echo configuration (config-tplt-udp-ech)

UDP jitter configuration (config-tplt-udp-jtr)

Command History

Release	Modification
15.1(1)T	This command was introduced.
15.3(2)S	This command was modified. Support was added for IP SLA service performance configuration mode.

Usage Guidelines

This command adds descriptive text to the configuration of an IP SLAs auto-measure group, auto IP SLAs operation template, auto IP SLAs endpoint list, or service performance operation. The description appears in the **show** command output and does not affect the operation of the template.

Examples

The following example shows how to configure this command for an auto IP SLAs operation template:

```
Router(config)# ip sla auto template type ip icmp-jitter 1
Router(config-tplt-icmp-jtr)# description default oper temp for icmp jitter
Router# end
Router# show ip sla auto template type ip icmp-jitter
IP SLAs Auto Template: 1
  Measure Type: icmp-jitter
  Description: default oper temp for icmp jitter
  IP options:
    Source IP: 0.0.0.0
    VRF:      TOS: 0x0
  Operation Parameters:
    Number of Packets: 10   Inter packet interval: 20
    Timeout: 5000          Threshold: 5000
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
```

Related Commands

Command	Description
show ip sla auto group	Displays configuration including default values of IP SLAs auto-measure groups.
show ip sla auto endpoint-list	Displays configuration including default values of auto IP SLAs endpoint lists.
show ip sla auto schedule	Displays configuration including default values of auto IP SLAs schedulers.
show ip sla auto template	Displays configuration including default values of auto IP SLAs operation templates.
show ip sla configuration	Displays configuration including default values of all IP SLAs operations or a specified operation.

description (VO profile)

To add a description to the configuration of a user-defined video traffic profile for an IP Service Level Agreements (SLAs) video operation, use the **description** command in the appropriate IP SLA VO configuration submode. To return to the default, use the **no** form of this command.

description *description*

no description

Syntax Description

<i>description</i>	String of 1 to 64 ASCII characters.

Command Default

No description is added to the profile.

Command Modes

IP SLA VO profile CP9900 endpoint configuration (cfg-ipslavo-cp9900-profile)

IP SLA VO profile CTS endpoint configuration (cfg-ipslavo-cts-profile)

IP SLA VO profile custom endpoint configuration (cfg-ipslavo-custom-profile)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

This command adds descriptive text to the configuration of a user-defined video traffic profile. The description appears in the **show** command output and does not affect the operation of the video operation.

Examples

```
Router> enable
Router# configure terminal
Router(config)# ip sla profile video my-profile
Router(cfg-ipslavo-profile)# endpoint custom
Router(cfg-ipslavo-custom-profile)# description my video profile
```

Related Commands

Command	Description
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

destination (am-group)

To add an auto IP Service Level Agreements (SLAs) endpoint list to the configuration of an IP SLAs auto-measure group, use the **destination** command in IP SLA auto-measure group configuration mode. To remove the endpoint list from the group configuration, use the **no** form of this command.

destination *template-name*

no destination

Syntax Description

<i>template-name</i>	Name of an already-configured endpoint list.

Command Default

No endpoints are defined for the IP SLAs auto-measure group being configured.

Command Modes

IP SLA auto-measure group configuration (config-am-grp)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command specifies an auto IP SLAs endpoint list as a reference for the IP SLAs auto-measure group being configured. An endpoint list contains IP addresses for IP SLAs endpoints.

Only one auto IP SLAs endpoint list can be specified for each IP SLAs auto-measure group. Each endpoint list can be referenced by more than one group.

To change the auto IP SLAs endpoint list in the configuration of an existing auto-measure group, first use the **no** form of this command to remove the endpoint list from the group configuration and then reconfigure the group with a different endpoint list.

To create an auto IP SLAs endpoint list, use the **ip sla auto endpoint-list** command.

Examples

The following example shows how to add an auto IP SLAs endpoint list to the configuration of an IP SLAs auto-measure group:

```
Router(config)# ip sla auto group type ip 1

Router(config-am-grp)# destination 1
Router(config-am-grp)# schedule 1
Router(config-am-grp)# end
Router#
Router# show ip sla auto group
Group Name: 1
Description:
Activation Trigger: Immediate
```

destination (am-group)

```

Destination: 1
Schedule: 1
IP SLAs Auto Template: default
Measure Type: icmp-jitter
Description:
IP options:
    Source IP: 0.0.0.0
    VRF:      TOS: 0x0
Operation Parameters:
    Number of Packets: 10    Inter packet interval: 20
    Timeout: 5000           Threshold: 5000
Statistics Aggregation option:
    Hours of statistics kept: 2
Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
Reaction Configuration: None
IP SLAs auto-generated operations of group 1
no operation created

```

Related Commands

Command	Description
ip sla auto endpoint-list	Enters IP SLA endpoint-list configuration mode for creating an auto IP SLAs endpoint list.

dhcp (IP SLA)

To configure a Cisco IOS IP Service Level Agreements (SLAs) Dynamic Host Configuration Protocol (DHCP) operation, use the **dhcp** command in IP SLA configuration mode.

dhcp {*destination-ip-address*|*destination-hostname*} [**source-ip** {*ip-address*|*hostname*}] [**option-82** [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**subnet-mask** *subnet-mask*]]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	D estination IP address or hostname .
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
option-82	(Optional) Specifies DHCP option 82 for the destination DHCP server.
circuit-id <i>circuit-id</i>	(Optional) Specifies the circuit ID in hexadecimal.
remote-id <i>remote-id</i>	(Optional) Specifies the remote ID in hexadecimal.
subnet-mask <i>subnet-mask</i>	(Optional) Specifies the subnet mask IP address. The default subnet mask is 255.255.255.0.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type dhcp command.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type dhcp command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type dhcp command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type dhcp command.

Usage Guidelines

If the source IP address is configured, then packets will be sent with that source address.

You may configure the **ip dhcp-server** global configuration command to identify the DHCP server that the DHCP operation will measure. If the target IP address is configured, then only that device will be measured. If the **ip dhcp-server** command is not configured and the target IP address is not configured, then DHCP discover packets will be sent on every available IP interface.

Option 82 is called the Relay Agent Information option and is inserted by the DHCP relay agent when client-originated DHCP packets are forwarded to a DHCP server. Servers recognizing the Relay Agent Information option may use the information to implement IP address or other parameter assignment policies. The DHCP server echoes the option back verbatim to the relay agent in server-to-client replies, and the relay agent strips the option before forwarding the reply to the client.

The Relay Agent Information option is organized as a single DHCP option that contains one or more suboptions that convey information known by the relay agent. The initial suboptions are defined for a relay agent that is colocated in a public circuit access unit. These suboptions are as follows: a circuit ID for the incoming circuit, a remote ID that provides a trusted identifier for the remote high-speed modem, and a subnet mask designation for the logical IP subnet from which the relay agent received the client DHCP packet.

**Note**

If an odd number of characters are specified for the circuit ID, a zero will be added to the end of the string.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation number 4 is configured as a DHCP operation enabled for DHCP server 172.16.20.3:

```
ip sla 4
  dhcp option-82 circuit-id 10005A6F1234
ip dhcp-server 172.16.20.3
!
ip sla schedule 4 start-time now
```

Related Commands

Command	Description
ip dhcp-server	Specifies which DHCP servers to use on a network, and specifies the IP address of one or more DHCP servers available on the network.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

discover (epl)

To enter IP SLA endpoint-list auto-discovery configuration mode for building a list of destination IP addresses for Cisco routing devices or Cisco IP Service Level Agreements (SLAs) Responders, use the **discover** command in IP SLA endpoint-list configuration mode. To remove the list, use the **no** form of this command.

discover [**port** *port*]

no discover [**port** *port*]

Syntax Description

port	(Optional) Specifies port on source IP SLAs device.
<i>port</i>	Port number. Range is from 1 to 65535. Default is 5000.

Command Default

No destination IP addresses are identified.

Command Modes

IP SLA endpoint-list configuration (config-epl)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command discovers and builds a list of destination IP addresses to be added to an endpoint list for IP SLAs auto-measure groups.

Before using this command, use the **ip sla auto discovery** command to enable auto-discovery.

Before using this command, use the **ip sla responder auto-register** command on the destination Cisco device to enable endpoints to register with source upon configuration.

Destination IP addresses can either be automatically discovered by using this command or manually configured using the **ip-address** command. If you use this command to build an endpoint list, you cannot use the **ip-address** command to manually add or remove IP addresses in an endpoint list.

To add the discovered list of destination IP addresses to the endpoint list being configured, use the **access-list** command in IP SLA endpoint-list auto-discovery configuration mode.

Examples

The following example shows how to configure an endpoint list using the auto discovery method:

Examples

```
Router(config)# ip sla responder auto-register 10.1.1.25
Router(config)#
```

Examples

```

Router(config)# ip sla auto discovery
Router(config)# ip sla auto endpoint-list type ip autolist
Router(config-epl)# discover port 5000
Router(config-epl-disc)# access-list 3
Router(config-epl-disc)# end
Router# show ip sla auto endpoint-list
Endpoint-list Name: autolist
  Description:
    Auto Discover Parameters
      Destination Port: 5000
      Access-list: 3
      Ageout: 3600      Measurement-retry: 3
.
.
.

```

Related Commands

Command	Description
access-list	Adds a list of discovered endpoints to an auto IP SLAs endpoint list.
ip sla auto discovery	Enables IP SLAs auto discovery for auto IP SLAs in Cisco IOS IP SLAs Engine 3.0.
ip sla responder auto-register	Configures a Cisco IP SLAs Responder to automatically register with the source.
show ip sla auto discovery	Displays the status of IP SLAs auto discovery and the configuration of auto IP SLAs endpoint lists configured using auto discovery.
show ip sla auto endpoint-list	Displays the configuration including default values of auto IP SLAs endpoint lists.

distribution

To configure statistics distributions for an IP Service Level Agreements (SLAs) Metro-Ethernet 3.0 (ITU-T Y.1731) operation, use the **distribution** command in IP SLA Y.1731 delay configuration mode. To return to the default value, use the **no** form of the command.

distribution {**delay**| **delay-variation**} {**one-way**| **two-way**} *number-of-bins* *boundary*[,...,*boundary*]

no distribution {**delay**| **delay-variation**} {**one-way**| **two-way**}

Syntax Description

delay	Specifies that the performance measurement type is delay. This is the default value, along with delay variation.
delay-variation	Specifies that the performance measurement type is delay variation. This is the default value, along with delay.
one-way	Specifies one-way measurement values. This is the default for a dual-ended operation.
two-way	Specifies two-way measurement values. This is the default for a single-ended operation.
<i>number-of-bins</i>	Number of bins kept during an aggregate interval. Range is from 1 to 10. Default is 10.
<i>boundary</i> [..., <i>boundary</i>]	List of upper boundaries for bins in microseconds. Minimum number of boundaries required is one. Maximum allowed value for the uppermost boundary is -1 microsecond. Multiple values must be separated by a comma (.). Default is 5000,10000,15000,20000,25000,30000,35000,40000,45000,-1.

Command Default

The default for distribution is 10 bins with upper boundaries of 5000, 10000, 15000, 20000, 25000, 30000, 35000, 40000, 45000, -1, for both delay and delay-variation performance measurements.

Command Modes

IP SLA Y.1731 delay configuration (config-sla-y1731-delay)

Command History

Release	Modification
15.1(2)S	This command was introduced.

Release	Modification
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Use this command change the type of performance measurements to be calculated and the number and range of distribution bins from the defaults (10 bins with upper boundaries of 5000,10000,15000,20000,25000,30000,35000,40000,45000,-1, for both delay and delay-variation performance measurements) to the specified values.

Configure this command on the Maintenance End Point (MEP) that performs the performance measurement calculation. For single-ended operations, calculations are performed at the sender MEP. For dual-ended operations, calculations are performed at the receiver MEP on the responder.

Statistics distributions are defined by number and range of bins per interval.

A bin is a counter that counts the number of measurements initiated and completed during a specified length of time for each operation. The results of performance measurements falling within a specified range are stored in each bin. When the number of distributions reaches the number and range specified, no further distribution-based information is stored.

The lower bound value for the first upper boundary is always 0 microseconds, such as 0 to 5000 microseconds for the default first upper boundary.

The maximum allowed value for the uppermost boundary is -1 microsecond.

An aggregate interval is the length of time during which the performance measurements are conducted and the results stored. You can configure the interval by using the **aggregate interval** command.

To avoid significant impact on router memory, careful consideration should be used when configuring distribution.

Examples

The following example shows how to configure the sender MEP to calculate two-way, delay-variation performance measurements for a single-ended IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) operation, and store the statistics in five bins:

```
Router(config-term)# ip sla 10
Router(config-ip-sla)# ethernet y1731 delay dmm domain xxx evc yyy mpid 101 cos 3 source
mpid 100
Router(config-sla-y1731-delay)# distribution delay-variation two-way 5
5000,10000,15000,20000-1
Router(config-sla-y1731-delay)#
```

Related Commands

Command	Description
aggregate interval	Configures the aggregate interval.
history interval	Sets the number of statistics distributions kept during the lifetime of an IP SLAs Metro Ethernet 3.0 (ITU-T Y.1731) operation.

distributions-of-statistics-kept

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **distributions-of-statistics-kept** command is replaced by the **history distributions-of-statistics-kept** command. See the **history distributions-of-statistics-kept** command for more information.

To set the number of statistics distributions kept per hop during a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **distributions-of-statistics-kept** command in the appropriate submode of IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

distributions-of-statistics-kept *size*

no distributions-of-statistics-kept

Syntax Description

<i>size</i>	Number of statistics distributions kept per hop. The default is 1 distribution.

Command Default

the default is 1 distribution.

Command Modes

DHCP configuration (config-sla-monitor-dhcp)
 DLSw configuration (config-sla-monitor-dlsw)
 DNS configuration (config-sla-monitor-dns)
 FTP configuration (config-sla-monitor-ftp)
 HTTP configuration (config-sla-monitor-http)
 ICMP echo configuration (config-sla-monitor-echo)
 ICMP path echo configuration (config-sla-monitor-pathEcho)
 ICMP path jitter configuration (config-sla-monitor-pathJitter)
 TCP connect configuration (config-sla-monitor-tcp)
 UDP echo configuration (config-sla-monitor-udp)
 UDP jitter configuration (config-sla-monitor-jitter)
 VoIP configuration (config-sla-monitor-voip)

Command History

Release	Modification
11.2	This command was introduced.

Release	Modification
12.4(4)T	This command was replaced by the history distributions-of-statistics-kept command.
12.2(33)SRB	This command was replaced by the history distributions-of-statistics-kept command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the history distributions-of-statistics-kept command.
12.2(33)SXI	This command was replaced by the history distributions-of-statistics-kept command.

Usage Guidelines

In most situations, you do not need to change the number of statistics distributions kept or the time interval for each distribution. Only change these parameters when distributions are needed, for example, when performing statistical modeling of your network. To set the statistics distributions interval, use the **statistics-distribution-interval** command.

When the number of distributions reaches the size specified, no further distribution-based information is stored.

For the IP SLAs Internet Control Message Protocol (ICMP) path echo operation, the amount of router memory required to maintain the distribution statistics table is based on multiplying all of the values set by the following four commands:

- **distributions-of-statistics-kept**
- **hops-of-statistics-kept**
- **paths-of-statistics-kept**
- **hours-of-statistics-kept**

The general equation used to calculate the memory requirement to maintain the distribution statistics table for an ICMP path echo operation is as follows: Memory allocation = (160 bytes) * (**distributions-of-statistics-kept** *size*) * (**hops-of-statistics-kept** *size*) * (**paths-of-statistics-kept** *size*) * (**hours-of-statistics-kept** *hours*)

Note

To avoid significant impact on router memory, careful consideration should be used when configuring the **distributions-of-statistics-kept**, **hops-of-statistics-kept**, **paths-of-statistics-kept**, and **hours-of-statistics-kept** commands.

**Note**

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

Examples

The following example shows how to set the statistics distribution to 5 and the distribution interval to 10 ms for IP SLAs ICMP echo operation 1. Consequently, the first distribution will contain statistics from 0 to 9 ms, the second distribution will contain statistics from 10 to 19 ms, the third distribution will contain statistics from 20 to 29 ms, the fourth distribution will contain statistics from 30 to 39 ms, and the fifth distribution will contain statistics from 40 ms to infinity.

```
ip sla monitor 1
  type echo protocol ipIcmpEcho 172.16.161.21
  distributions-of-statistics-kept 5
  statistics-distribution-interval 10
!
ip sla monitor schedule 1 life forever start-time now
```

Related Commands

Command	Description
hops-of-statistics-kept	Sets the number of hops for which statistics are maintained per path for the IP SLAs operation.
hours-of-statistics-kept	Sets the number of hours for which statistics are maintained for the IP SLAs operation.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
paths-of-statistics-kept	Sets the number of paths for which statistics are maintained per hour for the IP SLAs operation.
statistics-distribution-interval	Sets the time interval for each statistics distribution kept for the IP SLAs operation.

dlsw peer-ipaddr

To configure a Cisco IOS IP Service Level Agreements (SLAs) Data Link Switching Plus (DLSw+) operation, use the **dlsw peer-ipaddr** command in IP SLA configuration mode.

dlsw peer-ipaddr *ip-address*

Syntax Description

<i>ip-address</i>	IP address of the peer destination.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type dlsw peer-ipaddr command.

Usage Guidelines

To configure an IP SLAs DLSw+ operation, the DLSw+ feature must be configured on the local and target routers.

For DLSw+ operations, the default request packet data size is 0 bytes (use the **request-data-size** command to modify this value) and the default amount of time the operation waits for a response from the request packet is 30 seconds (use the **timeout** command to modify this value).

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla global** configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation number 10 is configured as a DLSw+ operation enabled for remote peer IP address 172.21.27.11. The data size is 15 bytes:

```
ip sla 10
 dlsw peer-ipaddr 172.21.27.11
 request-data-size 15
!
ip sla schedule 4 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
request-data-size	Sets the protocol data size in the payload of the IP SLAs operation's request packet.
show dls w peers	Displays DLSw peer information.

dscp (IP SLA)

To configure the differentiated services code point (DSCP) value for an IP Service Level Agreements (SLAs) multicast UDP jitter operation, use the **dscp** command in multicast UDP jitter configuration mode. To return to the default, use the **no** form of this command.

dscp *dscp-value*

Syntax Description

<i>dscp-value</i>	Number from 0 to 63. The default is 0.

Command Default

The DSCP is 0.

Command Modes

Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)

Command History

Release	Modification
15.2(4)M	This command was introduced.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

Use the **dscp** command to change the value of DSCP from the default (0) to the specified value. The default value is for best-effort traffic.

Examples

```
Device> enable
Device# configure terminal
Device(config)# ip sla 10
Device(config-ip-sla)# udp-jitter 239.1.1.1 5000 endpoint-list mcast-rcvrs source-ip
10.10.10.106 source-port 7012 num-packets 50 interval 25
Device(config-ip-sla-multicast-jitter-oper)# dscp 10
Device(config-ip-sla-multicast-jitter-oper)#
```

Related Commands

Command	Description
udp-jitter	Configures an IP SLAs UDP jitter or multicast UDP jitter operation.

dscp (IP SLA video)

To configure the differentiated services code point (DSCP) value for an IP Service Level Agreements (SLAs) video operation, use the **dscp** command in IP SLA video configuration mode. To return to the default, use the **no** form of this command.

dscp *dscp-value*

no dscp *dscp-value*

Syntax Description

<i>dscp-value</i>	Number from 0 to 63 or a valid keyword for a DSCP marking. See the table in the "Usage Guidelines" section for more information. The default is 0.

Command Default

The default is 0.

Command Modes

IP SLA video configuration (config-ip-sla-video)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use the **dscp** command to change the value of DSCP from the default (0) to the specified value. The default value is for best-effort traffic.

Valid values for the *dscp-value* argument are a decimal number from 0 to 64 or a keyword from the following table.

Table 6: Decimal Values with Corresponding Keywords for the dscp-value Argument

Bit Pattern	Decimal Value	DSCP Marking (keyword)
000000	0	Default
001010	10	AF11
001100	12	AF12
001110	14	AF13
010010	18	AF21

Bit Pattern	Decimal Value	DSCP Marking (keyword)
010100	20	AF22
010110	22	AF23
011010	26	AF31
011100	28	AF32
011110	30	AF33
100010	34	AF41
100100	36	AF42
100110	38	AF43
001000	8	CS1
010000	16	CS2
011000	24	CS3
100000	32	CS4
101000	40	CS5
110000	48	CS6
111000	56	CS7
101110	46	EF

Examples

```
Router> enable
Router# configure terminal
Router(config)# ip sla 1
Router(config-ip-sla-video)# dscp 10
```

Related Commands

Command	Description
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

dns (IP SLA)

To configure a Cisco IOS IP Service Level Agreements (SLAs) Domain Name System (DNS) operation, use the **dns** command in IP SLA configuration mode.

dns {*destination-ip-address*|*destination-hostname*} **name-server** *ip-address* [**source-ip** {*ip-address*|*hostname*} **source-port** *port-number*]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname.
name-server <i>ip-address</i>	Specifies the IP address of the DNS server.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type dns target-addr command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type dns target-addr command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type dns target-addr command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type dns target-addr command.
15.2(3)T	This command was modified. Support for IPv6 addresses was added.
Cisco IOS XE Release 3.7S	This command was integrated into Cisco IOS XE Release 3.7S.

Release	Modification
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 7 is configured as a DNS operation using the target IPv4 address 172.20.2.132:

```
ip sla 7
  dns host1 name-server 172.20.2.132
!
```

```
ip sla schedule 7 start-time now
```

In the following example, IP SLAs operation 1 is configured in Cisco IOS Release 15.2(3)T and later releases as a DNS operation using an IPv6 address, 2001:10:10:10::3, as the target address.

```
ip sla 1
  dns host1 name-server 2001:10:10:10::3
!
```

```
ip sla schedule 1 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

duration (IP SLA video)

To set the amount of time that video traffic is generated for an IP Service Level Agreements (SLAs) video operation, use the **duration** command in IP SLA video configuration mode. To return to the default value, use the **no** form of this command.

duration *seconds*

no duration

Syntax Description

<i>seconds</i>	Length of time, in seconds (sec), during which platform-assisted video traffic is generated by the Cisco device. The range is from 1 to 600. The default is 20.

Command Default

Video traffic is generated for 20 seconds.

Command Modes

IP SLA video configuration (config-ip-sla-video)

Command History

Release	Modification
12.2(58)SE	This command was introduced.
15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Usage Guidelines

This command changes the duration value in an IP SLAs video profile from the default (20 seconds) to the specified value.

Platform-assisted video packets are transmitted for the length of time specified by this command and the transmission is repeated as often as is specified by the **frequency** (IP SLA video) command. The duration value must be less than the frequency value.

The **duration** (IP SLA video) command is supported in IPv4 networks.

Use the **show ip sla configuration** command to display configuration command to display configuration values, including all defaults, for all Cisco IOS IP SLAs operations or for a specified operation.

Examples

The following example shows how to configure an IP SLAs video operation to generate traffic for 40 seconds:

```
Router(config-term)# ip sla 10
Router(config-ip-sla)# video 192.168.2.10 555 source-ip 192.168.2.17 source-port 24 profile
  iptv
Router(config-ip-sla-video)# duration 40
Router(config-ip-sla-video)# frequency 90
Router(config-ip-sla-video)# timeout 45000
Router(config-ip-sla-video)# threshold 40000
Router(config-ip-sla-video)# end
Router#
4d23h: %SYS-5-CONFIG_I: Configured from console by console

Router# show ip sla configuration 10
IP SLAs Infrastructure Engine-III
Entry number: 10
Owner:
Tag:
Operation timeout (milliseconds): 45000
Type of operation to perform: video
Video profile name: IPTV
Target address/Source address: 192.168.2.10/192.168.2.17

  Number of statistic distribution buckets kept: 1
  Statistic distribution interval (milliseconds): 20
Enhanced History:
```

Related Commands

Command	Description
frequency (IP SLA video)	Sets the rate at which an IP SLAs video operation repeats.
show ip sla configuration	Displays configuration values, including all defaults, for all IP SLAs operations or for a specified operation.
threshold (IP SLA video)	Sets the upper threshold value for calculating network monitoring statistics created by an IP SLAs video operation.
timeout (IP SLA video)	Sets the amount of time that an IP SLAs video operation waits for a response to its request packet.

duration time

To set the amount of time that traffic is generated for an IP Service Level Agreements (SLAs) service performance operation, use the **duration time** command in IP SLA service performance configuration mode. To return to the default value, use the **no** form of this command.

duration time *seconds*

no duration time

Syntax Description

<i>seconds</i>	Length of time, in seconds (sec), during which traffic is generated for an operation. The range is from 1 to 65535. The default is 30.

Command Default

Traffic is generated for 30 sec.

Command Modes

IP SLA service performance configuration (config-ip-sla-service-performance)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

This command changes the duration value for an IP SLAs service performance operation from the default (30 seconds) to the specified value. Use this command to configure the length of time for which the operation runs.

To configure the size and frequency of bursts to be transmitted by the operation is specified by the **frequency** (IP SLA service performance) command. The duration value must be less than the frequency value.

Use the **show ip sla configuration** command to display configuration command to display configuration values, including all defaults, for all Cisco IOS IP SLAs operations or for a specified operation.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation

Related Commands

Command	Description
frequency (IP SLA service performance)	Configures rate at which the operation repeats.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or a specified operation.

endpoint

To specify an endpoint type and enter the appropriate IP SLA VO endpoint profile configuration submode to begin configuring a user-defined video traffic profile for an IP Service Level Agreements (SLAs) video operation, use the **endpoint** command in the the IP SLA VO endpoint profile configuration mode.

endpoint *endpoint-type*

Syntax Description

<i>endpoint-type</i>	The following keywords are valid options for the endpoint-type argument: • CP-9900—Cisco Unified 9900 Series IP Phone System (CP-9900). • CTS—Cisco Telepresence System 1000/3000 (CTS-1000/3000). • custom—Customized video endpoint type.

Command Default

The endpoint type is not specified in the video profile.

Command Modes

IP SLA VO endpoint profile configuration (cfg-ipslavo-profile)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use the **endpoint** command to specify the endpoint type for the profile to be configured and enter the appropriate IP SLA VO endpoint configuration submode, based on the specified endpoint type.

Once the endpoint profile type is configured, it cannot be changed. For a different endpoint type, you must create a new profile.

For the CP-9900 and CTS profiles, you must configure the three mandatory parameters: resolution, frame rate, and maximum bit rate. These endpoint types do not allow the configuration of any other video parameters.

For a custom profile, you can also configure certain other video profile parameters, in addition to the three mandatory parameters.

If the bit-rate, frame, and resolution values are not configured, the video profile remains in the shutdown state and the video profile operation is not initiated.

The keywords for this command are not case sensitive. The keywords in online help contain uppercase letters to enhance readability only.

Examples

```
Router(config)# ip sla video profile my-profile
Router(cfg-ipslavo-profile)# endpoint cts
Router(cfg-ipslavo-cts-profile)#
```

Related Commands

Command	Description
bitrate (VO profile)	Configures the max bit rate or bit-rate window size parameter in a user-defined video profile.
frame	Configures frame parameters in a user-defined video profile.
resolution	Configures the resolution in user-defined video profile.
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

enhanced-history

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **enhanced-history** command is replaced by the **history enhanced** command. See the **history enhanced** command for more information.

To enable enhanced history gathering for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **enhanced-history** command in the appropriate submode of IP SLA monitor configuration mode.

enhanced-history [*interval seconds*] [*buckets number-of-buckets*]

Syntax Description

interval <i>seconds</i>	(Optional) Number of seconds that enhanced history should be gathered in each bucket. When this time expires, enhanced history statistics are gathered in a new bucket. The default is 900 (15 minutes).
buckets <i>number-of-buckets</i>	(Optional) Number of history buckets that should be retained in system memory. When this number is reached, statistic gathering for the operation ends. The default is 100.

Command Default

900 seconds and 100 buckets

Command Modes

DHCP configuration (config-sla-monitor-dhcp)
 DLSw configuration (config-sla-monitor-dlsw)
 DNS configuration (config-sla-monitor-dns)
 FTP configuration (config-sla-monitor-ftp)
 HTTP configuration (config-sla-monitor-http)
 ICMP echo configuration (config-sla-monitor-echo)
 ICMP path echo configuration (config-sla-monitor-pathEcho)
 ICMP path jitter configuration (config-sla-monitor-pathJitter)
 TCP connect configuration (config-sla-monitor-tcp)
 UDP echo configuration (config-sla-monitor-udp)
 UDP jitter configuration (config-sla-monitor-jitter)
 VoIP configuration (config-sla-monitor-voip)

Command History

Release	Modification
12.2(11)T	This command was introduced.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.4(4)T	This command was replaced by the history enhanced command.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRB	This command was replaced by the history enhanced command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the history enhanced command.
12.2(33)SXI	This command was replaced by the history enhanced command.

Usage Guidelines

Performance statistics are stored in “buckets” that separate the accumulated data. Each bucket consists of data accumulated over the specified time interval.

**Note**

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

Examples

In the following example, Internet Control Message Protocol (ICMP) echo operation 3 is configured with the standard enhanced history characteristics.

```
ip sla monitor 3
  type echo protocol ipIcmpEcho 172.16.1.175
  enhanced-history interval 900 buckets 100
!
ip sla monitor schedule 3 start-time now life forever
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

Command	Description
show ip sla monitor enhanced-history collection-statistics	Displays data for all collected history buckets for the specified IP SLAs operation, with data for each bucket shown individually.
show ip sla monitor enhanced-history distribution-statistics	Displays enhanced history data for all collected buckets in a summary table.

ethernet echo mpid

To manually configure an individual Cisco IOS IP Service Level Agreements (SLAs) Ethernet ping operation, use the **ethernet echo mpid** command in IP SLA configuration mode.

ethernet echo mpid *mp-id* **domain** *domain-name* [**evc** *evc-id*] [**port**] [**vlan** *vlan-id*]

Syntax Description

<i>mp-id</i>	Maintenance endpoint identification number.
domain <i>domain-name</i>	Specifies the name of the Ethernet Connectivity Fault Management (CFM) maintenance domain.
evc <i>evc-id</i>	Specifies the Ethernet Virtual Circuit (EVC) identification name.
port	Enables port level statistical measurements for two directly connected maintenance endpoints (MEPs).
vlan <i>vlan-id</i>	Specifies the VLAN identification number.

Command Default

No IP SLAs Ethernet ping operation is configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SRD	The evc <i>evc-id</i> keyword and argument were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.
12.2(33)SRE	This command was modified. The port keyword was added.

Usage Guidelines

Unlike the EVC and VLAN statistical measurements, the port level measurement is performed at the physical layer level and does not cross a bridge boundary.

You must configure the type of IP SLAs operation (such as Ethernet ping) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure an IP SLAs Ethernet ping operation. In this example, the maintenance endpoint identification number is 23, the maintenance domain name is testdomain, and the VLAN identification number is 34. Operation 1 is scheduled to start immediately.

```
ip sla 1
  ethernet echo mpid 23 domain testdomain vlan 34
!
ip sla schedule 1 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

ethernet jitter mpid

To manually configure an individual Cisco IOS IP Service Level Agreements (SLAs) Ethernet jitter operation, use the **ethernet jitter mpid** command in IP SLA configuration mode.

ethernet jitter mpid *mp-id* **domain** *domain-name* [**evc** *evc-id*] [**port** | **vlan** *vlan-id*] [**interval** *interframe-interval*] [**num-frames** *frames-number*]

Syntax Description

<i>mp-id</i>	Maintenance endpoint identification number.
domain <i>domain-name</i>	Specifies the name of the Ethernet Connectivity Fault Management (CFM) maintenance domain.
evc <i>evc-id</i>	Specifies the Ethernet Virtual Circuit (EVC) identification name.
vlan <i>vlan-id</i>	Specifies the VLAN identification number.
interval <i>interframe-interval</i>	(Optional) Specifies the interframe interval (in milliseconds). The default is 20.
num-frames <i>frames-number</i>	(Optional) Specifies the number of frames to be sent. The default is 10.

Command Default

No IP SLAs Ethernet jitter operation is configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SRD	The evc <i>evc-id</i> keyword and argument were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.
12.2(33)SRE	This command was modified. The port keyword was added.

Usage Guidelines

Unlike the EVC and VLAN statistical measurements, the port level measurement is performed at the physical layer level and does not cross a bridge boundary.

You must configure the type of IP SLAs operation (such as Ethernet jitter) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure an IP SLAs Ethernet jitter operation. In this example, the maintenance endpoint identification number is 23, the maintenance domain name is testdomain, the VLAN identification number is 34, the interframe interval is 20 ms, and the number of frames to be sent is 30. Operation 2 is scheduled to start immediately.

```
ip sla 2
  ethernet jitter mpid 23 domain testdomain vlan 34 interval 20 num-frames 30
!
ip sla schedule 2 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

ethernet y1731 delay

To configure a sender Maintenance End Point (MEP) for an IP Service Level Agreements (SLAs) Metro Ethernet 3.0 (UTI-T Y.1731) delay or delay variation operation, use the **ethernet y1731 delay** command in IP SLA configuration mode.

ethernet y1731 delay DMM [burst] domain *domain-name* {**evc** *evc-id*| **vlan** *vlan-id*} {**mpid** *target-mp-id*| **mac-address** *target-address*} **cos** *cos* **source** {**mpid** *source-mp-id*| **mac-address** *source-address*}

Cisco ASR 901 Routers

ethernet y1731 delay DMM [burst] domain *domain-name* {**evc** *evc-id*| **vlan** *vlan-id*} {**mpid** *target-mp-id*| **mac-address** *target-address*} **cos** *cos* **source** {**mpid** *source-mp-id*| **mac-address** *source-address*}

Syntax Description

1DM	Specifies that the frames sent are one-way Delay Message (1DM) synthetic frames.
DMM	Specifies that the frames sent are Delay Measurement Message (DMM) synthetic frames.
DMMv1	Specifies that the frames sent are concurrent Ethernet frame Delay Measurement (ETH-DM) synthetic frames.
burst	(Optional) Enables burst mode for this operation.
domain <i>domain-name</i>	Specifies the name of the Ethernet maintenance Operations, Administration & Maintenance (OAM) domain.
evc <i>evc-id</i>	Specifies the Ethernet Virtual Circuit (EVC) identification name.
vlan <i>vlan-id</i>	Specifies the VLAN identification number. The range is from 1 to 4096.
mpid <i>target-mp-id</i>	Specifies the identification numbers of the MEP at the destination. The range is from 1 to 8191.

mac-address <i>target-address</i>	Specifies the MAC address of the MEP at the destination.
cos <i>cos</i>	Specifies, for this MEP, which class of service (CoS) will be sent in the Ethernet message. The range is from 0 to 7.
source mpid <i>source-mp-id</i>	Specifies the identification numbers of the MEP being configured. The range is from 1 to 8191.
mac-address <i>source-address</i>	Specifies the MAC address of the MEP being configured.

Command Default

A sender MEP is not configured for the IP SLAs Metro Ethernet 3.0 (ITU-T Y.1731) operation.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(1)S	This command was modified. The DMMv1 and burst keywords were added.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

This command begins configuring a sender MEP for an Ethernet Frame Delay (ETH-DM: FD) or Ethernet Frame Delay Variation (ETH-DM: FDV) operation and enters IP SLA Y.1731 delay configuration mode.

The **1DM**, **DMM**, and **DMMv1** keywords for this command are not case sensitive. The keywords in online help contain uppercase letters to enhance readability only.

The operation is identified as a dual-ended or single-ended operation by specifying the type of synthetic frames to be sent. One-way Delay Message (1DM) frames are sent during dual-ended operations; Delay Measurement Message (DMM) frames are sent during single-ended operations. For concurrent operations, use the DMMv1 keyword to specify that are sent.

A receiver MEP on the responder device is required for dual-ended operations.

The **no** form of this command is unsupported. To change the operation type of an existing IP SLAs operation, you must first use the **no ip sla** command to delete the IP SLAs operation and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure a sender MEP for a dual-ended Ethernet delay or delay variation operation:

```
Router(config)# ip sla 500
Router(config-ip-sla)# ethernet y1731 delay 1DM domain xxx evc yyy mpid 101 cos 3 source
mpid 100
Router(config-sla-y1731-delay)#
```

The following sample output shows the configuration, including default values, of a sender MEP for a dual-ended Ethernet delay or delay variation operation:

```
Router# show ip sla configuration 500

IP SLAs Infrastructure Engine-III
Entry number: 500
Owner:
Tag:

```

Related Commands

Command	Description
ethernet y1731 delay receive	Configures a receiver MEP on the responder for a dual-ended IP SLAs Metro Ethernet 3.0 (ITU-T Y.1731) delay or delay variation operation.
no ip sla	Deletes an existing configuration for a Cisco IP SLAs operation.

ethernet y1731 delay receive

To configure a receiver Maintenance End Point (MEP) on the responder for a dual-ended IP Service Level Agreements (SLAs) Metro Ethernet 3.0 (ITU-T Y.1731) delay or delay variation operation, use the **ethernet y1731 delay receive** command in IP SLA configuration mode.

ethernet y1731 delay receive 1DM domain *domain-name* {**evc** *evc-id*| **vlan** *vlan-id*} **cos** *cos* {**mpid** *source-mp-id*| **mac-address** *source-address*}

Syntax Description

1DM	Specifies that the frames sent are one-way Delay Message (1DM) synthetic frames.
domain <i>domain-name</i>	Specifies the name of the Ethernet Connectivity Fault Management (CFM) maintenance domain.
evc <i>evc-id</i>	Specifies the Ethernet Virtual Circuit (EVC) identification name.
vlan <i>vlan-id</i>	Specifies the VLAN identification number. The range is from 1 to 4096.
cos <i>cos</i>	Specifies, for this MEP, which class of service (CoS) will be sent in the Ethernet connectivity fault management (CFM) message. The range is from 0 to 7.
mpid <i>source-mp-id</i>	Specifies the maintenance endpoint identification numbers of the MEP being configured. The range is from 1 to 8191.
mac-address <i>source-address</i>	Specifies the MAC address of the MEP being configured.

Command Default

A receiver MEP is not configured on the responder for the dual-ended IP SLAs Metro Ethernet 3.0 (ITU-T Y.1731) delay or delay variation operation.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
15.1(2)S	This command was introduced.

Usage Guidelines

This command begins configuring a receiver MEP on the responder device for a dual-ended Ethernet Frame Delay (ETH-DM: FD) or Ethernet Frame Delay Variation (ETH-DM: FDV) operation and enters IP SLA Y.1731 delay configuration mode. A receiver MEP on the responder device is required for dual-ended operations.

The **IDM** keyword for this command is not case sensitive. The keywords in online help contain uppercase letters to enhance readability only.

The **no** form of this command is unsupported. To change the operation type of an existing IP SLAs operation, you must first use the **no ip sla** command to delete the IP SLAs operation and then reconfigure the operation with the new operation type.

Examples

```
Router(config)# ip sla 501
Router(config-ip-sla)# ethernet y1731 delay receive 1DM domain xxx evc yyy cos 3 mpid 101
Router(config-sla-y1731-delay)#
```

The following sample output shows the configuration, including default values, of a receiver MEP on the responder device for a dual-ended Ethernet delay or delay variation operation:

```
Router# show ip sla configuration 501

Command	Description
ethernet y1731 delay	Configures a sender MEP for an IP SLAs Metro Ethernet 3.0 (ITU-T Y.1731) delay or delay variation operation.

Command	Description
no ip sla	Deletes an existing configuration for a Cisco IP SLAs operation.

ethernet y1737 loss

To configure a sender Maintenance End Point (MEP) for an IP Service Level Agreements (SLAs) Metro Ethernet 3.0 (UTI-T Y.1731) frame loss operation, use the **ethernet y1731 loss** command in IP SLA configuration mode.

ethernet y1731 loss {LMM| SLM [burst]} **domain** *domain-name* {**evc** *evc-id* **vlan** *vlan-id*} {**mpid** *target-mp-id* **mac-address** *target-address*} **cos** *cos* **source** {**mpid** *source-mp-id* **mac-address** *source-address*}

Syntax Description

LMM	Specifies that the frames sent are Loss Measurement Message (LMM) synthetic frames. Note LMM frames are not supported for concurrent operations.
SLM	Specifies that the frames sent are Synthetic Loss Measurement (SLM) frames. Note SLM frames are supported for concurrent operations.
burst	(Optional) Enables burst mode for this operation.
domain <i>domain-name</i>	Specifies the name of the Ethernet Connectivity Fault Management (CFM) maintenance domain.
evc <i>evc-id</i>	Specifies the Ethernet Virtual Circuit (EVC) identification name.
vlan <i>vlan-id</i>	Specifies the VLAN identification number. The range is from 1 to 4096.
mpid <i>target-mp-id</i>	Specifies the identification numbers of the MEP at the destination. The range is from 1 to 8191.
mac-address <i>target-address</i>	Specifies the MAC address of the MEP at the destination.

cos <i>cos</i>	Specifies, for this MEP, which class of service (CoS) that will be sent in the Ethernet CFM message. The range is from 0 to 7.
source mpid <i>source-mp-id</i>	Specifies the identification numbers of the MEP being configured. The range is from 1 to 8191.
source mac-address <i>source-address</i>	Specifies the MAC address of the MEP being configured.

Command Default

A sender MEP is not configured for the IP SLAs Metro Ethernet 3.0 (ITU-T Y.1731) operation.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(1)S	This command was modified, The burst keyword was added.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

This command begins configuring a sender MEP for a single-ended Ethernet Frame Loss ratio (ETH-LM: FLR) operation and enters IP SLA Y.1731 loss configuration mode.

The **LMM** and **SLM** keywords for this command is not case sensitive. The keywords that are displayed in the online help contain uppercase letters to enhance readability only.

For Y.1731 Ethernet frame loss probes, you must enable CoS-level monitoring on both MEPs (sender and destination) associated to the probe by using the **monitor loss counters** command.

The **no** form of this command is unsupported. To change the operation type of an existing IP SLAs operation, you must first use the **no ip sla** command to delete the IP SLAs operation and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure a sender MEP for an Ethernet frame loss operation:

```
Router(config)# ip sla 11
Router(config-ip-sla)# ethernet y1731 loss LMM domain xxx vlan 12 mpid 34 cos 4 source mpid
23
```

```
Router(config-sla-y1731-loss)#
```

The following sample output shows the configuration, including default values, of a sender MEP for an Ethernet frame loss operation:

```
Router# show ip sla configuration 11
```

```
IP SLAs Infrastructure Engine-III
Entry number: 11
Owner:
Tag:
Operation timeout (milliseconds): 5000
Ethernet Y1731 Loss Operation
Frame Type: LMM
Domain: xxx
Vlan: 12
Target Mpid: 34
Source Mpid: 23
CoS: 4
    Request size (Padding portion): 0
    Frame Interval: 1000
Schedule:
    Operation frequency (seconds): 60 (not considered if randomly scheduled)
    Next Scheduled Start Time: Start Time already passed
    Group Scheduled : FALSE
    Randomly Scheduled : FALSE
    Life (seconds): 3600
    Entry Ageout (seconds): never
    Recurring (Starting Everyday): FALSE

```

Related Commands

Command	Description
monitor loss counters	Enables COS-level monitoring.
no ip sla	Deletes an existing configuration for an IP SLAs operation.

exp (IP SLA)

To specify the experimental field value in the header for an echo request packet of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **exp** command in the appropriate submode of auto IP SLA MPLS configuration, IP SLA configuration, or IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

exp *exp-bits*

no exp

Syntax Description

<i>exp-bits</i>	Specifies the experimental field value in the header for an echo request packet. The range is from 0 to 7. The default is 0.

Command Default

The experimental field value is set to 0.

Command Modes

Auto IP SLA MPLS Configuration

MPLS parameters configuration (config-auto-ip-sla-mpls-params)

IP SLA Configuration and IP SLA Monitor Configuration

LSP ping configuration (config-sla-monitor-lspPing)

LSP trace configuration (config-sla-monitor-lspTrace)

VCCV configuration (config-sla-vccv)

Note

The configuration mode varies depending on the Cisco IOS release you are running and the operation type configured. See the “Usage Guidelines” section for more information.

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Release	Modification
12.2(33)SRC	Support for MPLS Pseudo-Wire Emulation Edge-to-Edge (PWE3) services via Virtual Circuit Connectivity Verification (VCCV) was added.
12.2(33)SB	Support for MPLS Pseudo-Wire Emulation Edge-to-Edge (PWE3) services via Virtual Circuit Connectivity Verification (VCCV) was added.

Usage Guidelines

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release table). Note that if you are configuring an IP SLAs label switched path (LSP) Health Monitor operation, refer to the Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release table, for information on Cisco IOS release dependencies. You must configure the type of IP SLAs operation (such as LSP ping) before you can configure any of the other parameters of the operation.

The configuration mode for the **exp** (IP SLA) command varies depending on the Cisco IOS release you are running and the operation type configured. For example, if you are running Cisco IOS Release 12.4(6)T and the LSP ping operation type is configured (without using the LSP Health Monitor), you would enter the **exp** (IP SLA) command in LSP ping configuration mode (config-sla-monitor-lspPing) within IP SLA configuration mode.

Table 7: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Table 8: Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(6)T, 12.0(32)SY, 12.2(31)SB2, 12.2(33)SRB, 12.2(33)SXH, or later releases	auto ip sla mpls-lsp-monitor	Auto IP SLA MPLS configuration

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next

hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The experimental field value for each IP SLAs operations created by LSP Health Monitor operation 1 is set to 5.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  delete-scan-factor 2
  exp 5
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

filter-for-history

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **filter-for-history** command is replaced by the **history filter** command. See the **history filter** command for more information.

To define the type of information kept in the history table for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **filter-for-history** command in the appropriate submode of IP SLA monitor configuration mode. To return to the default value, use the no form of this command.

filter-for-history {none|all|overThreshold|failures}

no filter-for-history {none|all|overThreshold|failures}

Syntax Description

none	No history kept. This is the default.
all	All operations attempted are kept in the history table.
overThreshold	Only packets that are over the threshold are kept in the history table.
failures	Only packets that fail for any reason are kept in the history table.

Command Default

No IP SLAs history is kept for an operation.

Command Modes

DHCP configuration (config-sla-monitor-dhcp)
 DLSw configuration (config-sla-monitor-dlsw)
 DNS configuration (config-sla-monitor-dns)
 FTP configuration (config-sla-monitor-ftp)
 HTTP configuration (config-sla-monitor-http)
 ICMP echo configuration (config-sla-monitor-echo)
 ICMP path echo configuration (config-sla-monitor-pathEcho)
 ICMP path jitter configuration (config-sla-monitor-pathJitter)
 TCP connect configuration (config-sla-monitor-tcp)
 UDP echo configuration (config-sla-monitor-udp)
 VoIP configuration (config-sla-monitor-voip)

Command History

Release	Modification
11.2	This command was introduced.
12.4(4)T	This command was replaced by the history filter command.
12.2(33)SRB	This command was replaced by the history filter command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the history filter command.
12.2(33)SXI	This command was replaced by the history filter command.

Usage Guidelines

Use the **filter-for-history** command to control what gets stored in the history table for an IP SLAs operation. To control how much history gets saved in the history table, use the **lives-of-history-kept**, **buckets-of-history-kept**, and the **samples-of-history-kept** commands.

**Note**

The **filter-for-history** command does not support the IP SLAs User Datagram Protocol (UDP) jitter operation.

An IP SLAs operation can collect history and capture statistics. By default, the history for an IP SLAs operation is not collected. If history is collected, each history bucket contains one or more history entries from the operation. When the operation type is ICMP path echo, an entry is created for each hop along the path that the operation takes to reach its destination. The type of entry stored in the history table is controlled by the **filter-for-history** command. The total number of entries stored in the history table is controlled by the combination of the **samples-of-history-kept**, **buckets-of-history-kept**, and **lives-of-history-kept** commands.

**Note**

Collecting history increases the RAM usage. Collect history only when you think there is a problem in the network.

**Note**

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

Examples

In the following example, only operation packets that fail are kept in the history table.

```
ip sla monitor 1
 type echo protocol ipIcmpEcho 172.16.161.21
```

```
lives-of-history-kept 1
filter-for-history failures
!
ip sla monitor schedule 1 life forever start-time now
```

Related Commands

Command	Description
buckets-of-history-kept	Sets the number of history buckets that are kept during the lifetime of the IP SLAs operation.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
lives-of-history-kept	Sets the number of lives maintained in the history table for the IP SLAs operation.
samples-of-history-kept	Sets the number of entries kept in the history table per bucket for the IP SLAs operation.

flow-label (IP SLA)

To define the flow label field in the IPv6 header of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **flow-label** (IP SLA) command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode. To return to the default value, use the no form of this command.

flow-label *number*

no flow-label

Syntax Description

<i>number</i>	Value in the flow label field of the IPv6 header. The range is from 0 to 1048575 (or FFFFF hexadecimal). This value can be preceded by "0x" to indicate hexadecimal notation. The default value is 0.

Command Default

The default flow label value is 0.

Command Modes

ICMP echo configuration (config-ip-sla-echo)

TCP connect configuration (config-ip-sla-tcp)

UDP echo configuration (config-ip-sla-udp)

UDP jitter configuration (config-ip-sla-jitter)

Command History

Release	Modification
12.2(33)SRC	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

Usage Guidelines

The flow label value is stored in a 20-bit field in the IPv6 packet header and is used by a source to label packets of a flow.

A flow label value of zero is used to indicate packets that are not part of any flow.

When the flow label is defined for an operation, the IP SLAs Responder will reflect the flow-label value it receives.

Note

This command is applicable only to IPv6 networks.

To display the flow label value for all Cisco IOS IP SLAs operations or a specified operation, use the **show ip sla configuration** command.

Examples

In the following example, IP SLAs operation 1 is configured as an Internet Control Message Protocol (ICMP) echo operation with destination IPv6 address 2001:DB8:100::1. The value in the flow label field of the IPv6 header is set to 0x1B669.

```
ip sla 1
 icmp-echo 2001:DB8:100::1
 flow-label 0x1B669
!
ip sla schedule 1 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
show ip sla configuration	Displays configuration values including all defaults for all Cisco IOS IP SLAs operations or a specified operation.

force-explicit-null

To add an explicit null label to all echo request packets of a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **force-explicit-null** command in the appropriate submode of auto IP SLA MPLS configuration mode. To return to the default value, use the **no** form of this command.

force-explicit-null

no force-explicit-null

Syntax Description This command has no arguments or keywords.

Command Default An explicit null label is not added.

Command Modes

Auto IP SLA MPLS Configuration

MPLS parameters configuration (config-auto-ip-sla-mpls-params)

LSP discovery parameters configuration (config-auto-ip-sla-mpls-lpd-params)

Command History	Release	Modification
	12.4(6)T	This command was introduced.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. Support for this command in MPLS label switched path (LSP) discovery parameters configuration mode was added.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines You must configure the type of LSP Health Monitor operation (such as LSP ping) before you can configure any of the other parameters of the operation.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source PE router.

In this example, an explicit null label will be added to all the echo request packets of IP SLAs operations created by LSP Health Monitor operation 1.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  force-explicit-null
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  delete-scan-factor 2
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
  3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

frame (VO profile)

To configure the frame rate, maximum intra-frame size, or maximum intra refresh interval parameters in a user-defined video traffic profile for an IP Service Level Agreements (SLAs) video operation, use the **frame** command in the appropriate IP SLA VO profile endpoint configuration submenu. To remove the configured frame values, use the **no** form of this command.

frame {**rate** *rate*| **intra** {**size maximum** *max-size*| **refresh interval** *seconds*}}

no frame {**rate** *seconds*| **intra** {**size maximum** *max-size*| **refresh interval** *seconds*}}

Syntax Description

rate <i>rate</i>	Specifies the frame rate in frames per second (fps). The following values are valid for the video traffic profile being configured: • For CP-9900: 10, 15, or 30. • For CTS: 30. • For custom: 10, 15, 24, 30, 5, or 7.5. For a description of each traffic profile type, see the "Usage Guidelines" section.
intra	Configures the maximum size or the refresh interval for intra-frame.
size maximum <i>max-size</i>	Specifies the maximum size of the intra-frame in kilobytes (KB/s). The range is from 0 to 250. The default is 50.
refresh interval <i>interval</i>	Specifies the refresh interval of the intra-frame in seconds. The range is from 0 to 300. The default is 0.

Command Default

The default values are as follows:

- No frame rate is specified in the video profile.
- The maximum size of the intra-frame is 50 KB/s.
- The refresh interval of the intra-frame is 0 seconds.

Command Modes

IP SLA VO CP9900 profile endpoint configuration (cfg-ipslavo-cp9900-profile)

IP SLA VO CTS profile endpoint configuration (cfg-ipslavo-cts-profile)

IP SLA VO custom profile endpoint configuration (cfg-ipslavo-custom-profile)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use the **frame** command to configure the frame rate per second parameter in a video profile for the following video endpoint types:

- CP-9900—Cisco Unified 9900 Series IP Phone System (CP-9900).
- CTS—Cisco Telepresence System 1000/3000 (CTS-1000/3000)
- custom—Customized video endpoint type.

You can also use this command to change the value of the maximum size or the refresh interval parameter from the default (50 KB/s or 0 seconds, respectively) to the specified value.

There are restrictions based on the relationships between maximum bit rate, frame rate, and resolution, also known as bandwidth. For the user-defined endpoint types, the table below includes the maximum bit rates allowable in relation to the frame per second (fps) rates and resolution. Cisco IOS software allows you to enter the values of these three parameters in any order and verifies that their combination is within a valid range, as specified. For example, if a 1080 pixels (p) resolution at 30 fps is chosen, the valid maximum bit-rate range is between 1500 and 4000 kb/s.

Table 9: Maximum Bit Rates Allowable for Frame Rates and Resolution in Custom Endpoints

Resolution and Frame Rate	30/24 fps	15 fps	10 fps	7.5 fps	5 fps
QCIF	60–256 kb/s	32–160 kb/s	20–118 kb/s	15–96 kb/s	10–74 kb/s
CIF/SIG/QVGA	128–1000 kb/s	64–564 kb/s	43–397 kb/s	32–314 kb/s	22–230 kb/s
VGA/4CIF/4SIF	384–2000 kb/s	192–1128 kb/s	128–795 kb/s	96–628 kb/s	64–461 kb/s
720p	800–2500 kb/s	400–1506 kb/s	267–1089 kb/s	200–881 kb/s	133–673 kb/s
1080p	1500–4000 kb/s	750–2512 kb/s	500–1845 kb/s	375–1512 kb/s	250–1179 kb/s

Examples

```
Router> enable
Router# configure terminal
Router(config)# ip sla profile video my-profile
Router(cfg-ipslavo-profile)# endpoint custom
Router(cfg-ipslavo-custom-profile)# frame intra refresh interval 40
Router(cfg-ipslavo-custom-profile)# frame intra size maximum 250
Router(cfg-ipslavo-custom-profile)# frame rate maximum 30
```

Related Commands

Command	Description
bitrate (VO profile)	Configures the max bit rate or bit rate window size parameter in a user-defined video profile.
resolution	Configures the resolution in user-defined video profile.
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

frame consecutive

To configure the number of consecutive measurements to be used to determine status for an IP Service Level Agreements (SLAs) Metro-Ethernet 3.0 (ITU-T Y.1731) frame loss operation, use the **frame consecutive** command in IP SLA Y.1731 loss configuration mode. To return to the default, use the **no** form of the command.

frame consecutive *number*

no frame consecutive *number*

Syntax Description

<i>number</i>	Number of consecutive measurements. The range is from 1 to 10. The default is 10.

Command Default

The default is ten consecutive frames.

Command Modes

IP SLA Y.1731 loss configuration (config-sla-y1731-loss)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Availability is defined in terms of the ratio of frames lost to frames sent, or Frame Loss Ratio (FLR). Use this command to change the number of consecutive FLR measurements used to evaluate the status of an availability indicator from the default (10) to the specified number.

Examples

```
Router(config)# ip sla 11
Router(config-ip-sla)# ethernet y1731 loss LMM domain xxx vlan 12 mpid 34 cos 4 source mpid
23
Router(config-sla-y1731-loss)# frame consecutive 5
Router(config-sla-y1731-loss)#
```

frame interval

To configure the rate at which an IP Service Level Agreements (SLAs) Metro-Ethernet 3.0 (ITU-T Y.1731) operation sends synthetic frames, use the **frame interval** command in the IP SLA Y.1731 delay or IP SLA Y.1731 loss configuration mode. To return to the default, use the **no** form of the command.

frame interval *milliseconds*

no frame interval *milliseconds*

Syntax Description

<i>milliseconds</i>	Length of time in milliseconds (ms) between successive synthetic frames. The default is 1000. The valid values are: • 10—Frame interval is 10 ms • 100—Frame interval is 100 ms • 1000—Frame interval is 1000 ms (1 second) • 20—Frame interval is 20 ms • 25—Frame interval is 25 ms • 50—Frame interval is 50 ms

Command Default

The default for the frame interval is 1000 milliseconds.

Command Modes

IP SLA Y.1731 delay configuration (config-sla-y1731-delay)

IP SLA Y.1731 loss configuration (config-sla-y1731-loss)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Use this command to change the gap between successive synthetic frames sent in an Ethernet delay, delay variation, or frame loss operation from the default (1000 ms) to the specified value.

Frames will be sent at a given frequency for the lifetime of the operation. For example, a delay operation with a frame interval of 1000 ms sends a frame once every second, for the lifetime of the operation.

Configure this command on the sender Maintenance End Point (MEP).

**Note**

The value range of this command on the Cisco ASR 901 router is 100 to 1000.

Examples

The following example shows how to configure the sender MEP for a single-ended IP SLAs Ethernet delay operation with a frame interval of 100 ms:

```
Router(config)# ip sla 10
Router(config-ip-sla)# ethernet y7131 delay dmm domain xxx evc yyy mpid 101 cos 3 source
mpid 100
Router(config-sla-y1731-delay)# frame interval 100
Router(config-sla-y1731-delay)# frame size 32
Router(config-sla-y1731-delay)#
```

Command	Description
frame size	Configures the padding for synthetic frames in an Ethernet delay or delay variation operation.

frame offset

To configure the frame offset to be used to calculate statistics for an IP Service Level Agreements (SLAs) Metro-Ethernet 3.0 (ITU-T Y.1731) delay variation operation, use the **frame offset** command in IP SLA Y.1731 delay configuration mode. To return to the default, use the **no** form of this command.

frame offset *offset*

no frame offset *offset*

Syntax Description

<i>offset</i>	Value used for calculating delay variation rates. The range is form 1 (consecutive) to 10. The default is 1.

Command Default

The default for frame offset is consecutive (1).

Command Modes

IP SLA Y.1731 delay configuration (config-sla-y1731-delay)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Use this command to change the value of frame offset from the default (1) to the specified value.

Configure this command on the maintenance End Point (MEP) that performs the performance measurement calculation. For single-ended operations, calculations are performed at the sender MEP. For dual-ended operations, calculations are performed at the receiver MEP on the responder.

Use the **distribution** command to set the performance measurement type to delay variation.

Examples

The following example shows how to configure the sender MEP to calculate the statistics for two-way, delay-variation performance measurements in a single-ended IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) operation:

```
Router(config-term)# ip sla 10
Router(config-ip-sla)# ethernet y1731 delay dmm domain xxx evc yyy mpid 101 cos 3 source
mpid 100
Router(config-sla-y1731-delay)# distribution delay-variation two-way 5
5000,10000,15000,20000-1
Router(config-sla-y1731-delay)# frame offset 2
```

Related Commands

Command	Description
distribution	Configures statistics distributions for an IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) operation.

frame size

To configure the padding for synthetic frames for an IP Service Level Agreements (SLAs) Metro-Ethernet 3.0 (ITU-T Y.1731) delay or delay variation operation, use the **frame size** command in IP SLA Y.1731 delay configuration mode. To return to the default, use the **no** form of this command.

frame size *bytes*

no frame size *bytes*

Syntax Description

<i>bytes</i>	Padding size, in four-octet increments, for the synthetic frames. The range is from 64 to 384. The default is 64.

Command Default

The default for the frame size is 64 bytes.

Command Modes

IP SLA Y.1731 delay configuration (config-sla-y1731-delay)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

This command is used to change the padding size of synthetic frames sent during an Ethernet delay or delay variation operation from the default (64 bytes) to the specified value.

Configure this command on the sender Maintenance Endpoint (MEP).

Examples

The following example shows how to configure the sender MEP for a single-ended IP SLAs Ethernet delay operation with a frame size of 32 bytes:

```
Router(config)# ip sla 10
Router(config-ip-sla)# ethernet y7131 delay dmm domain xxx evc yyy mpid 101 cos 3 source
mpid 100
Router(config-sla-y1731-delay)# frame interval 100
Router(config-sla-y1731-delay)# frame size 32
Router(config-sla-y1731-delay)#
```

Related Commands

Command	Description
frame interval	Configures statistics distributions for an IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) operation.

frequency (am-schedule)

To set the frequency characteristic in an auto IP Service Level Agreements (SLAs) scheduler for restarting auto IP SLAs operations, use the **frequency** command in IP SLA auto-measure schedule configuration mode. To return to the default value, use the **no** form of this command.

frequency {*seconds* | **range** *random-frequency-range*}

no frequency

Syntax Description

<i>seconds</i>	Length of time before an operation repeats, in seconds (sec). Range is from 0 to 604800. Default is 60.
range	Specifies frequencies at which auto IP SLAs operations that share the same schedule will restart are chosen randomly within the specified frequency range. Default is disabled.
<i>random-frequency-range</i>	Lower and upper limits of the range, in seconds, and separated by a hyphen (-), such as 80-100. The hyphen (-) is required.

Command Default

Auto IP SLAs operations restart every 60 sec.

Command Modes

IP SLA auto-measure schedule configuration (config-am-schedule)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command changes the value of frequency in an auto IP SLAs scheduler from the default (every 60 sec) to the specified value. The frequency characteristic determines how often an operation in an IP SLAs auto-measure group will repeat once it is started.

Use the **probe-interval** command to configure the interval between the start time of one operation and the start time of the next operation being controlled by the same auto IP SLAs scheduler.

Random Scheduler

The random scheduler option provides the capability to schedule auto IP SLAs operations that share the same scheduler to begin at random intervals over a specified duration of time. The random scheduler option is disabled by default.

To enable the random scheduler option, you must configure the **range** *random-frequency-range* keyword and argument combination. Auto IP SLAs operations being controlled by a random scheduler restart at uniformly distributed random frequencies within the specified frequency range. The following guidelines apply for setting the random frequency range:

- The starting value of the range should be greater than the timeout value of the operations controlled by the scheduler being configured.
- The starting value of the frequency range should be greater than the schedule period (amount of time for which the operations are scheduled). This guideline ensures that the same operation does not get scheduled more than once within the schedule period.

The following guidelines apply if the random scheduler option is enabled:

- The individual operations being controlled by the same auto IP SLAs scheduler will be uniformly distributed to begin at random intervals over the schedule period.
- The operations being controlled by the same auto IP SLAs scheduler restart at uniformly distributed random frequencies within the specified frequency range.
- The minimum interval between the start of each operation being controlled by the same auto IP SLAs scheduler is 100 ms (0.1 sec).
- Only one operation can be scheduled to begin at any given time. If the random scheduler option is disabled, multiple operations can begin at the same time.
- The first operation will always begin at 0 ms of the schedule period.
- The order in which each operation in a multioperation schedule begins is random.

Multioperation Scheduling

**Note**

A multioperation schedule is created by specifying the same auto IP SLA scheduler for two or more IP SLA auto-measure groups.

The following guidelines apply when you add or delete an operation from an existing multioperation schedule by modifying the configuration of an IP SLAs auto-measure group to add or remove the auto IP SLAs scheduler:

- If two or more operations are added after the multioperation schedule has started, then the start times of the newly added operations will be uniformly distributed based on a time interval that was calculated prior to the addition of the new operations. If two or more operations are added before the multioperation schedule has started, then the time interval is recalculated based on both the existing and newly added operations.
- If an operation is added to a multioperation schedule in which the random scheduler option is enabled, then the start time and frequency of the newly added operation will be randomly chosen within the specified parameters.
- If an operation is added to a multioperation schedule in which the existing operations have aged out or the lifetimes of the existing operations have ended, the newly added operation will start and remain active for the amount of time specified by the multioperation schedule.
- If an active operation is deleted, then the operation will stop collecting information and become inactive.

Examples

The following example shows how to configure an auto IP SLAs scheduler that will cause an auto IP SLAs operation to actively collect data at 3:00 p.m. on April 5. The operation will age out after 12 hours of inactivity, which can be before it starts or after it has finished its life. When the operation ages out, all configuration information for the operation is removed from the running configuration in RAM.

```
Router(config)# ip sla auto schedule apr5
Router(config-am-schedule)# ageout 43200
Router(config-am-schedule)# frequency 70
Router(config-am-schedule)# life 43200
Router(config-am-schedule)# probe-interval 1500
Router(config-am-schedule)# start-time 15:00 apr 5
Router(config-am-schedule)# end
Router# show ip sla auto schedule apr5
Group sched-id: apr5
  Probe Interval (ms) : 1500
  Group operation frequency (sec): 70
  Status of entry (SNMP RowStatus): Active
  Next Scheduled Start Time: P15:00 apr 5
  Life (sec): 43200
  Entry Ageout (sec): 43200
```

The following example shows how to schedule auto IP SLAs operations 3, 4, and 6 using multioperation scheduling. In this example, the operations are scheduled to begin at equal intervals over a schedule period of 200 milliseconds. The first operation (or set of operations) is scheduled to start immediately.

```
Router(config)# ip sla auto schedule multi
Router(config-am-schedule)# probe-interval 200
Router(config-am-schedule)# start-time now
Router(config-am-schedule)# end
Router#
Router# show ip sla auto schedule multi
Group sched-id: multi
  Probe Interval (ms) : 200
  Group operation frequency (sec): 60
  Status of entry (SNMP RowStatus): Active
  Next Scheduled Start Time: Now
  Life (sec): 3600
  Entry Ageout (sec): never
Router#configure terminal
Router(config)# ip sla auto group type ip icmp-echo 3
Router(config-am-group)# template 3
Router(config-am-group)# schedule multi
Router(config-am-group)# destination 3
Router(config-am-group)# exit
Router(config)# ip sla auto group type ip icmp-echo 4
Router(config-am-group)# template 4
Router(config-am-group)# schedule multi
Router(config-am-group)# destination 4
Router(config-am-group)# exit
Router(config)# ip sla auto group type ip icmp-echo 6
Router(config-am-group)# template 6
Router(config-am-group)# schedule multi
Router(config-am-group)# destination 6
Router(config-am-group)# exit
Router(config)#
```

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRB	The Ethernet echo and Ethernet jitter configuration modes were added.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	The following configuration modes were added: • Ethernet echo • Ethernet jitter • VCCV
12.4(20)T	The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SXI	The Ethernet echo and Ethernet jitter configuration modes were added.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.

Usage Guidelines

A single IP SLAs operation will repeat at a given frequency for the lifetime of the operation. For example, a User Datagram Protocol (UDP) jitter operation with a frequency of 60 sends a collection of data packets (simulated network traffic) once every 60 seconds, for the lifetime of the operation. The default simulated traffic for a UDP jitter operation consists of ten packets sent 20 milliseconds apart. This “payload” is sent when the operation is started, then is sent again 60 seconds later.

If an individual IP SLAs operation takes longer to execute than the specified frequency value, a statistics counter called “busy” is incremented rather than immediately repeating the operation.

Consider the following guidelines before configuring the **frequency** (IP SLA), **timeout** (IP SLA), and **threshold** (IP SLA) commands. For the IP SLAs UDP jitter operation, the following guidelines are recommended:

- $(\text{frequencyseconds}) > ((\text{timeoutmilliseconds}) + N)$
- $(\text{timeoutmilliseconds}) > (\text{thresholdmilliseconds})$

where $N = (\text{num-packetsnumber-of-packets}) * (\text{intervalinterpacket-interval})$. Use the **udp-jitter** command to configure the **num-packetsnumber-of-packets** and **intervalinterpacket-interval** values.

For all other IP SLAs operations, the following configuration guideline is recommended:

$(\text{frequencyseconds}) > (\text{timeoutmilliseconds}) > (\text{thresholdmilliseconds})$

Note

We recommend that you do not set the frequency value to less than 60 seconds because the potential overhead from numerous active operations could significantly affect network performance.

The **frequency** (IP SLA) command is supported in IPv4 networks. This command is also supported in IPv6 networks when configuring an IP SLAs operation that supports IPv6 addresses.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **frequency** (IP SLA) command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured. For example, if you are running Cisco IOS Release 12.4 and the ICMP echo operation type is configured, you would enter the **frequency** (IP SLA) command in ICMP echo configuration mode (config-sla-monitor-echo) within IP SLA monitor configuration mode.

Table 10: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI , or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

The following examples show how to configure an IP SLAs ICMP echo operation (operation 10) to repeat every 90 seconds. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

This example shows the **frequency** (IP SLA) command being used in an IPv4 network in ICMP echo configuration mode within IP SLA configuration mode:

```
ip sla 10
  icmp-echo 172.16.1.175
  frequency 90
!
ip sla schedule 10 life 300 start-time after 00:05:00
```

Examples

This example shows the **frequency** (IP SLA) command being used in an IPv4 network in ICMP echo configuration mode within IP SLA monitor configuration mode:

```
ip sla monitor 10
  type echo protocol ipIcmpEcho 172.16.1.175
  frequency 90
!
ip sla monitor schedule 10 life 300 start-time after 00:05:00
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
timeout (IP SLA)	Sets the amount of time the IP SLAs operation waits for a response from its request packet.

frequency (IP SLA service performance)

To specify how often an IP Service Level Agreements (SLAs) service performance operation generates groups of packets, use the **frequency** command in IP SLA service performance configuration mode. To return to the default, use the **no** form of this command.

frequency {*iteration number**delay seconds*| *time seconds*}

no frequency {*iteration*| *time*}

Syntax Description

iteration number	Specifies the number of bursts, or groups of packets, to be generated. The range is from 1 to 100. The default is 1.
delay seconds	Specifies the length of time to transmit the burst, in seconds (sec), The range is from 0 to 10. The default is 3
time seconds	The amount of time between bursts, in seconds (sec). The range is from 20 to 65535. The default is 20.

Command Default

The operation has a frequency of one 3-second burst every 20 seconds.

Command Modes

IP SLA service performance (config-ip-sla-service-performance)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

Use this command to configure the size and frequency of bursts to be transmitted by a service performance operation.

Use the **duration** command to configure the length of time during which the operation runs.

The duration value must be less than the frequency value.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation
Type: ethernet
Destination

Outer VLAN: 100
Source MAC Address: 4055.398d.8d4c
Packet Size: 512

Schedule:
Operation frequency (seconds): 64 (not considered if randomly scheduled)
Next Scheduled Start Time: Start Time already passed
Group Scheduled : FALSE
Randomly Scheduled : FALSE
Life (seconds): Forever
Entry Ageout (seconds): never
Recurring (Starting Everyday): FALSE
Status of entry (SNMP RowStatus): Active

Related Commands

Command	Description
duration	Configure operation run time.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or a specified operation.

frequency (IP SLA video)

To set the rate at which an IP Service Level Agreements (SLAs) video operation repeats, use the **frequency** command in IP SLA video configuration mode. To return to the default value, use the **no** form of this command.

frequency *seconds*

no frequency *seconds*

Syntax Description

<i>seconds</i>	Length of time, in seconds (sec), between video operations. The range is from 1 to 604800. The default is 60.

Command Default

The IP SLAs video operation repeats every 60 seconds.

Command Modes

IP SLA video configuration (config-ip-sla-video)

Command History

Release	Modification
12.2(58)SE	This command was introduced.
15.2(3)T	This command was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Usage Guidelines

The frequency setting in the IP SLAs video profile determines how often the video operation will repeat once it is started. This command changes the frequency value from the default (60 seconds) to the specified value.

If an individual IP SLAs operation takes longer to execute than the specified frequency value, a statistics counter called “busy” is incremented rather than immediately repeating the operation.

The frequency value must be greater than the value of the **timeout** (IP SLA video) command. The following guideline is recommended for configuring the frequency, timeout, and threshold settings in the IP SLAs video profile:

(frequency seconds) > (timeout milliseconds) > (threshold milliseconds)

The frequency value must also be greater than the value of the **duration** (IP SLA video) command.

The **frequency** (IP SLA video) command is supported in IPv4 networks.

Use the **show ip sla configuration** command to display configuration values, including all defaults, for all Cisco IOS IP SLAs operations or for a specified operation.

Examples

The following example shows how to configure an IP SLAs video operation to repeat every 90 seconds:

```
Router(config-term)# ip sla 10
Router(config-ip-sla)# video 192.168.2.10 555 source-ip 192.168.2.17 source-port 24 profile
iptv
Router(config-ip-sla-video)# duration 40
Router(config-ip-sla-video)# frequency 90
Router(config-ip-sla-video)# timeout 45000
Router(config-ip-sla-video)# threshold 40000
Router(config-ip-sla-video)# end
Router#
4d23h: %SYS-5-CONFIG_I: Configured from console by console

Router# show ip sla configuration 10
IP SLAs Infrastructure Engine-III

Related Commands

Command	Description
duration (IP SLA video)	Sets the amount of time that platform-assisted video traffic is generated for a Cisco IP SLAs video operation.
show ip sla configuration	Displays configuration values, including all defaults, for all Cisco IP SLAs operations or for a specified operation.
threshold (IP SLA video)	Sets the upper threshold value for calculating network monitoring statistics created by a Cisco IP SLAs video operation.
timeout (IP SLA video)	Sets the amount of time that a Cisco IP SLAs video operation waits for a response from its request packet.

ftp get

To configure a Cisco IOS IP Service Level Agreements (SLAs) File Transfer Protocol (FTP) GET operation, use the **ftp get** command in IP SLA configuration mode.

ftp get *url* [**source-ip** {*ip-address* | *hostname*}][**mode**] {**active** | **passive**}

Syntax Description

<i>url</i>	URL location information for the file to be retrieved.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
mode passive active	(Optional) Specifies the FTP transfer mode as either passive or active. The default is passive transfer mode.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type ftp operation get url command.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type ftp operation get url command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type ftp operation get url command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type ftp operation get url command.
15.2(3)T	This command was modified. Support for IPv6 addresses was added.
Cisco IOS XE Release 3.7S	This command was integrated into Cisco IOS XE Release 3.7S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

The *url* argument must be in one of the following formats:

- ftp://username:password@host/filename
- ftp://host/filename

If the username and password are not specified, the defaults are anonymous and test, respectively.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, an FTP operation is configured. User1 is the username and password1 is the password; host1 is the host and file1 is the filename.

```
ip sla 3
  ftp get ftp://user1:password1@host1/file1
!
```

```
ip sla schedule 3 start-time now
```

In the following example, the source url of the file to be retrieved includes an IPv6 address. IPv6 addressing is supported in Cisco IOS Release 15.2(3)T and later releases.

```
ip sla 3
  ftp get ftp://root:lablab@2001:10:10:10::3/tmp/saatest.log
!
```

```
ip sla schedule 3 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

history buckets-kept

To set the number of history buckets that are kept during the lifetime of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **history buckets-kept** command in the appropriate submode of IP SLA configuration or IP SLA template parameters configuration mode. To return to the default value, use the no form of this command.

history buckets-kept *size*

no history buckets-kept

Syntax Description

<i>size</i>	Number of history buckets kept during the lifetime of the operation. The default is 50.

Command Default

The default number of buckets kept is 50 buckets.

Command Modes

IP SLA Configuration

DHCP configuration (config-ip-sla-dhcp)

DLSw configuration (config-ip-sla-dlsw)

DNS configuration (config-ip-sla-dns)

Ethernet echo (config-ip-sla-ethernet-echo)

Ethernet jitter (config-ip-sla-ethernet-jitter)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the buckets-of-history-kept command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the buckets-of-history-kept command. The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the buckets-of-history-kept command. The following configuration modes were added: • Ethernet echo • Ethernet jitter • VCCV
12.4(20)T	The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the buckets-of-history-kept command. The Ethernet echo and Ethernet jitter configuration modes were added.
15.1(1)T	This command was modified. The ICMP echo, TCP connect, and UDP echo configuration submodes in IP SLA template parameters configuration mode were added.

Usage Guidelines

Each time IP SLAs starts an operation, a new bucket is created until the number of history buckets matches the specified size or the lifetime of the operation expires. History buckets do not wrap.

To define the lifetime of an IP SLAs operation, use the **ip sla schedule** global configuration command. To define the lifetime of an auto IP SLAs operation template in Cisco IP SLAs Engine 3.0, use the **lifec** command in IP SLAs auto-measure schedule configuration mode.

Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

The **history buckets-kept** command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

By default, the history for an IP SLAs operation is not collected. If history is collected, each bucket contains one or more history entries from the operation. When the operation type is Internet Control Message Protocol (ICMP) path echo, an entry is created for each hop along the path that the operation takes to reach its destination.

The type of entry stored in the history table is controlled by the **history filter** command.

The total number of entries stored in the history table is controlled by the combination of the **samples-of-history-kept**, **history buckets-kept**, and **history lives-kept** commands.

**Note**

Collecting history increases the RAM usage. Collect history only if you think there is a problem in the network.

Examples

The following example shows how to configure an ICMP echo operation to keep 25 history buckets during the operation lifetime. The example shows the **history buckets-kept** command being used in an IPv4 network.

Examples

```
ip sla schedule 1 start-time now life forever
ip sla 1
  icmp-echo 172.16.161.21
  history buckets-kept 25
  history lives-kept 1
!
ip sla schedule 1 start-time now life forever
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 1
Router(config-tplt-icmp-ech)# parameters
Router(config-icmp-ech-params)# history buckets-kept 25
Router(config-icmp-ech-params)# end
Router# show ip sla auto template type ip icmp-echo 1
IP SLAs Auto Template: 1
  Measure Type: icmp-echo
.
.
.
Statistics Aggregation option:
  Hours of statistics kept: 5
History options:
  History filter: none
  Max number of history records kept: 25
  Lives of history kept: 1
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None
```

Related Commands

Command	Description
history filter	Defines the type of information kept in the history table for the IP SLAs operation.
history lives-kept	Sets the number of lives maintained in the history table for the IP SLAs operation.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

Command	Description
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
life	Specifies the lifetime characteristic in an auto IP SLAs scheduler
samples-of-history-kept	Sets the number of entries kept in the history table per bucket.

history distributions-of-statistics-kept

To set the number of statistics distributions kept per hop during a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **history distributions-of-statistics-kept** command in the appropriate submode of IP SLA configuration or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

history distributions-of-statistics-kept *size*

no history distributions-of-statistics-kept

Syntax Description

<i>size</i>	Number of statistics distributions kept per hop. The range is from 1 to 20. The default is 1.

Command Default

One distribution is kept per hop.

Command Modes

DHCP configuration (config-ip-sla-dhcp)
 DLSw configuration (config-ip-sla-dlsw)
 DNS configuration (config-ip-sla-dns)
 Ethernet echo (config-ip-sla-ethernet-echo)
 Ethernet jitter (config-ip-sla-ethernet-jitter)
 FTP configuration (config-ip-sla-ftp)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the distributions-of-statistics-kept command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the distributions-of-statistics-kept command. The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the distributions-of-statistics-kept command. The following configuration modes were added: • Ethernet echo • Ethernet jitter • VCCV
12.4(20)T	The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the distributions-of-statistics-kept command. The Ethernet echo and Ethernet jitter configuration modes were added.
15.1(1)T	This command was modified. The ICMP echo, ICMP jitter, TCP connect, UDP echo, and UDP jitter configuration submodes of IP SLA template parameters configuration mode were added.
12.2(58)SE	This command was modified. Support for the video configuration submode of IP SLA configuration mode was added.
15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.

Release	Modification
Cisco IOS XE 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

This command changes the value of distributions kept per hop for the IP SLAs operation from the default (1) to the specified value. When the number of distributions reaches the size specified, no further distribution-based information is stored in memory.

In most situations, you do not need to change the number of statistics distributions kept or the time interval for each distribution. Change these parameters only when distributions are required, for example, when performing statistical modeling of your network. To set the statistics distributions interval, use the **history statistics-distribution-interval** command.

Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

The **history distributions-of-statistics-kept** command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

For the IP SLAs Internet Control Message Protocol (ICMP) path echo operation, the amount of router memory required to maintain the distribution statistics table is based on multiplying all of the values set by the following four commands:

- **history distributions-of-statistics-kept**
- **hops-of-statistics-kept**
- **paths-of-statistics-kept**
- **history hours-of-statistics-kept**

The general equation used to calculate the memory requirement to maintain the distribution statistics table for an ICMP path echo operation is as follows: Memory allocation = (160 bytes) * (**history distributions-of-statistics-kept size**) * (**hops-of-statistics-kept size**) * (**paths-of-statistics-kept size**) * (**history hours-of-statistics-kept hours**)

Note

To avoid significant impact on router memory, careful consideration should be used when configuring the **history distributions-of-statistics-kept**, **hops-of-statistics-kept**, **paths-of-statistics-kept**, and **history hours-of-statistics-kept** commands.

Examples

In the following examples, the statistics distribution is set to five and the distribution interval is set to 10 ms for an ICMP echo operation. Consequently, the first distribution will contain statistics from 0 to 9 ms, the second distribution will contain statistics from 10 to 19 ms, the third distribution will contain statistics from 20 to 29 ms, the fourth distribution will contain statistics from 30 to 39 ms, and the fifth distribution will contain statistics from 40 ms to infinity. The examples show the **history distributions-of-statistics-kept** command being used in an IPv4 network.

Examples

```
ip sla 1
 icmp-echo 172.16.161.21
 history distributions-of-statistics-kept 5
 history statistics-distribution-interval 10
!
ip sla schedule 1 life forever start-time now
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 1
Router(config-tplt-icmp-ech)# parameters
Router(config-icmp-ech-params)# history distributions-of-statistics-kept 5
Router(config-icmp-ech-params)# history statistics-distribution-interval 10
Router(config-icmp-ech-params)# end
Router# show ip sla auto template type ip icmp-echo 1
IP SLAs Auto Template: 1
    Measure Type: icmp-echo (control enabled)
    Description:
    .
    .
    .
Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 10
    Max number of distributions buckets: 5
```

Related Commands

Command	Description
history hours-of-statistics-kept	Sets the number of hours for which statistics are maintained for the IP SLAs operation.
history statistics-distribution-interval	Sets the time interval for each statistics distribution kept for the IP SLAs operation.
hops-of-statistics-kept	Sets the number of hops for which statistics are maintained per path for the IP SLAs operation.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
paths-of-statistics-kept	Sets the number of paths for which statistics are maintained per hour for the IP SLAs operation.

history enhanced

To enable enhanced history gathering for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **history enhanced** command in the appropriate submode of IP SLA configuration or IP SLA template parameters configuration mode.

history enhanced [*interval seconds*] [*buckets number-of-buckets*]

Syntax Description

interval <i>seconds</i>	(Optional) Specifies the length of time, in seconds (sec), that enhanced history is gathered in each bucket. The range is from 1 to 3600. The default is 900.
buckets <i>number-of-buckets</i>	(Optional) Specifies the number of history buckets that are retained in system memory. The range is from 1 to 100. The default is 100.

Command Default

Enhanced history gathering is disabled.

Command Modes

IP SLA Configuration

DHCP configuration (config-ip-sla-dhcp)
 DLSw configuration (config-ip-sla-dlsw)
 DNS configuration (config-ip-sla-dns)
 Ethernet echo (config-ip-sla-ethernet-echo)
 Ethernet jitter (config-ip-sla-ethernet-jitter)
 FTP configuration (config-ip-sla-ftp)
 HTTP configuration (config-ip-sla-http)
 ICMP echo configuration (config-ip-sla-echo)
 ICMP path echo configuration (config-ip-sla-pathEcho)
 ICMP path jitter configuration (config-ip-sla-pathJitter)
 Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)
 TCP connect configuration (config-ip-sla-tcp)
 UDP echo configuration (config-ip-sla-udp)
 UDP jitter configuration (config-ip-sla-jitter)
 VCCV configuration (config-sla-vcv)
 Video (config-ip-sla-video)
 VoIP configuration (config-ip-sla-voip)

IP SLA Template Parameters Configuration

ICMP echo configuration (config-icmp-ech-params)

TCP connect configuration (config-tcp-conn-params)

UDP echo configuration (config-udp-ech-params)

UDP jitter configuration (config-udp-jtr-params)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the enhanced-history command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the enhanced-history command. The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the enhanced-history command. The following configuration modes were added: • Ethernet echo • Ethernet jitter • VCCV
12.4(20)T	The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the enhanced-history command. The Ethernet echo and Ethernet jitter configuration modes were added.
15.1(1)T	This command was modified. The ICMP echo, TCP connect, UDP echo, and UDP jitter configuration submodes in IP SLA template parameters configuration mode were added.
12.2(58)SE	This command was modified. Support for the video configuration submode of IP SLA configuration mode was added.
15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.

Release	Modification
Cisco IOS XE 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

This command enables enhanced history for the IP SLAs operation.

Performance statistics are stored in buckets that separate the accumulated data. Each bucket consists of data accumulated over the specified time interval. When the interval expires, history statistics are gathered in a new bucket. When the specified number of buckets is reached, statistic gathering for the operation ends.

By default, IP SLAs maintains two hours of aggregated statistics for each operation. Values from each operation cycle are aggregated with the previously available data within a given hour. The Enhanced History feature in IP SLAs allows for the aggregation interval to be shorter than one hour.

The **history enhanced** command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

Prior to Cisco IOS Release 12.4(24)T, you can configure this command for IP SLAs VoIP RTP operation but operations are unaffected.

In Cisco IOS Release 12.4(24)T and later releases, you cannot configure this command for IP SLAs VoIP RTP operations. If you attempt to configure this command in VoIP RTP configuration mode, the following message appears.

```
Router(config-ip-sla-voip-rtp)# history enhanced interval 1200 buckets 99
%enhanced-history cannot be set for this probe
```

Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

Examples

In the following examples, an Internet Control Message Protocol (ICMP) echo operation is configured with the standard enhanced history settings. The example shows the **history enhanced** command being used in an IPv4 network.

Examples

```
ip sla 3
 icmp-echo 172.16.1.175
 history enhanced interval 900 buckets 100
!
ip sla schedule 3 start-time now life forever
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 3
Router(config-tplt-icmp-ech)# parameters
Router(config-icmp-ech-params)# history enhanced interval 900 buckets 100
Router(config-icmp-ech-params)# end
Router# show ip sla auto template type ip icmp-echo
IP SLAs Auto Template: 3
  Measure Type: icmp-echo (control enabled)
.
.
.
Statistics Aggregation option:
  Hours of statistics kept: 2
```

```

Enhanced aggregation interval: 900 seconds
Max number of enhanced interval buckets: 100
History options:
  History filter: none
  Max number of history records kept: 15
  Lives of history kept: 0
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None

```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
show ip sla auto summary-statistics	Displays the current operational status and statistics for IP SLAs auto-measure groups.
show ip sla auto template	Displays configuration including default values of auto IP SLAs operation templates.
show ip sla enhanced-history collection-statistics	Displays data for all collected history buckets for the specified IP SLAs operation, with data for each bucket shown individually.
show ip sla enhanced-history distribution-statistics	Displays enhanced history data for all collected buckets in a summary table.

history filter

To define the type of information kept in the history table for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **history filter** command in the appropriate submode of IP SLA configuration or IP SLA template parameters configuration mode. To return to the default value, use the no form of this command.

history filter {none| all| overThreshold| failures}

no history filter {none| all| overThreshold| failures}

Syntax Description

none	No history is kept. This is the default.
all	All operations attempted are kept in the history table.
overThreshold	Only packets that are over the threshold are kept in the history table.
failures	Only packets that fail for any reason are kept in the history table.

Command Default

No IP SLAs history is kept for an operation.

Command Modes

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the filter-for-history command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the filter-for-history command. The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the filter-for-history command. The following configuration modes were added: • Ethernet echo • Ethernet jitter • VCCV
12.4(20)T	The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the filter-for-history command. The Ethernet echo and Ethernet jitter configuration modes were added.
15.1(1)T	This command was modified. The ICMP echo, TCP connect, and UDP echo configuration submodes in IP SLA template parameters configuration mode were added.

Usage Guidelines

Use the **history filter** command to control what gets stored in the history table for an IP SLAs operation. To control how much history gets saved in the history table, use the **history lives-kept**, **history buckets-kept**, and the **samples-of-history-kept** commands.

The **history filter** command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

For auto IP SLAs in Cisco IOS IP SLAs Engine 3.0--Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

An IP SLAs operation can collect history and capture statistics. By default, the history for an IP SLAs operation is not collected. When a problem arises where history is useful (for example, a large number of timeouts are occurring), use the **history lives-kept** command to enable history collection.

**Note**

Collecting history increases the RAM usage. Collect history only when you think there is a problem in the network.

Examples

In the following example, only operation packets that fail are kept in the history table. The example shows the **history filter** command being used in an IPv4 network.

Examples

```
ip sla auto template type ip icmp-echo
 icmp-echo 172.16.161.21
  history lives-kept 1
  history filter failures
!
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 1
Router(config-tplt-icmp-ech)# parameters
Router(config-icmp-ech-params)# history filter failures

Router(config-icmp-ech-params)# end
Router# show ip sla auto template type ip icmp-echo
IP SLAs Auto Template: 1
  Measure Type: icmp-echo
.
.
.
Statistics Aggregation option:
  Hours of statistics kept: 2
History options:
  History filter: failures
  Max number of history records kept: 15
  Lives of history kept: 0
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None
```

Release	Modification
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

This command changes the value of history hours in the IP SLAs operation from the default (2) to the specified value. When the number of hours exceeds the specified value, the statistics table wraps and the oldest information is replaced by newer information.

For the IP SLAs Internet Control Message Protocol (ICMP) path echo operation, the amount of router memory required to maintain the distribution statistics table is based on multiplying all of the values set by the following four commands:

- **history distributions-of-statistics-kept**
- **hops-of-statistics-kept**
- **paths-of-statistics-kept**
- **history hours-of-statistics-kept**

The general equation used to calculate the memory requirement to maintain the distribution statistics table for an ICMP path echo operation is as follows: Memory allocation = (160 bytes) * (**history distributions-of-statistics-kept size**) * (**hops-of-statistics-kept size**) * (**paths-of-statistics-kept size**) * (**history hours-of-statistics-kept hours**)

Note

To avoid significant impact on router memory, careful consideration should be used when configuring the **history distributions-of-statistics-kept**, **hops-of-statistics-kept**, **paths-of-statistics-kept**, and **history hours-of-statistics-kept** commands.

The **history hours-of-statistics-kept** command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

For auto IP SLAs in Cisco IOS IP SLAs Engine 3.0, before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

Examples

The following examples show how to maintain 3 hours of statistics for an ICMP echo operation. The example shows the **history hours-of-statistics-kept** command being used in an IPv4 network.

Examples

```
ip sla 2
icmp-echo 172.16.1.177
```

```

history hours-of-statistics-kept 3
!
ip sla schedule 2 life forever start-time now

```

Examples

```

Router(config)# ip sla auto template type ip icmp-echo 2
Router(config-tplt-icmp-ech)# parameters
Router(config-icmp-ech-params)# history hours-of-statistics-kept 3
Router(config-icmp-ech-params)# end
Router# show ip sla auto template type ip icmp-echo
IP SLAs Auto Template: 2
  Measure Type: icmp-echo
.
.
.
Statistics Aggregation option:
  Hours of statistics kept: 3
  History options:
    History filter: none

Related Commands

Command	Description
history distributions-of-statistics-kept	Sets the number of statistics distributions kept per hop during the lifetime of the IP SLAs operation.
history statistics-distribution-interval	Sets the time interval for each statistics distribution kept for the IP SLAs operation.
hops-of-statistics-kept	Sets the number of hops for which statistics are maintained per path for the IP SLAs operation.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
paths-of-statistics-kept	Sets the number of paths for which statistics are maintained per hour for the IP SLAs operation.

history interval

To set the number of statistics distributions kept during the lifetime of an IP Service Level Agreements (SLAs) Metro Ethernet 3.0 (ITU-T Y.1731) operation, use the **history interval** command in the IP SLA Y.1731 delay configuration or IP SLA Y.1731 loss configuration mode. To return to the default value, use the **no** form of this command.

history interval *intervals-stored*

no history interval *intervals-stored*

Syntax Description

<i>intervals-stored</i>	Number of statistics distributions. Range is 1 to 10. Default is 2.

Command Default

The default history interval is 2 distributions.

Command Modes

IP SLA Y.1731 delay configuration (config-sla-y1731-delay)

IP SLA Y.1731 loss configuration (config-sla-y1731-loss)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Use this command to change the number of distribution statistics kept from the default (2) to the specified number.

Use the **distribution** command to configure the number and range of distribution bins to calculate delay and delay-variation performance measurements per interval.

Use the **aggregate interval** command to configure the length of time during which the performance measurements are conducted and the results stored for an Ethernet operation.

Examples

```
Router(config-term)# ip sla 10
Router(config-ip-sla)# ethernet y1731 delay dmm domain xxx evc yyy mpid 101 cos 3 source
mpid 100
Router(config-sla-y1731-delay)# history interval 1
```

Related Commands

Command	Description
aggregate interval	Configures the aggregate interval.
distribution	Specifies measurement type and configures bins for statistics distributions kept for an Ethernet delay or delay variation operation.

history lives-kept

To set the number of lives maintained in the history table for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **history lives-kept** command in the appropriate submode of IP SLA configuration or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

history lives-kept *lives*

no history lives-kept

Syntax Description

<i>lives</i>	Number of lives maintained in the history table for the operation. If you specify 0 lives, history is not collected for the operation.

Command Default

The default is 0 lives.

Command Modes

IP SLA Configuration

DHCP configuration (config-ip-sla-dhcp)

DLSw configuration (config-ip-sla-dlsw)

DNS configuration (config-ip-sla-dns)

Ethernet echo (config-ip-sla-ethernet-echo)

FTP configuration (config-ip-sla-ftp)

HTTP configuration (config-ip-sla-http)

ICMP echo configuration (config-ip-sla-echo)

ICMP path echo configuration (config-ip-sla-pathEcho)

ICMP path jitter configuration (config-ip-sla-pathJitter)

TCP connect configuration (config-ip-sla-tcp)

UDP echo configuration (config-ip-sla-udp)

VCCV configuration (config-sla-vcv)

VoIP configuration (config-ip-sla-voip)

IP SLA Template Configuration

ICMP echo configuration (config-icmp-ech-params)

TCP connect configuration (config-tcp-conn-params)

UDP echo configuration (config-udp-ech-params)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the lives-of-history-kept command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the lives-of-history-kept command. The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the lives-of-history-kept command. The following configuration modes were added: • Ethernet echo • Ethernet jitter • VCCV
12.4(20)T	The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the lives-of-history-kept command. The Ethernet echo and Ethernet jitter configuration modes were added.
15.1(1)T	This command was modified. The ICMP echo, TCP connect, and UDP echo configuration submodes in IP SLA template parameters configuration mode were added.

Usage Guidelines

The following rules apply to the **history lives-kept** command:

- The number of lives you can specify is dependent on the type of operation you are configuring.
- The default value of 0 lives means that history is not collected for the operation.
- When the number of lives exceeds the specified value, the history table wraps (that is, the oldest information is replaced by newer information).
- When an operation makes a transition from a pending to active state, a life starts. When the life of an operation ends, the operation makes a transition from an active to pending state.

The **history lives-kept** command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

To disable history collection, use the **no history lives-kept** command rather than the **history filter none** command. The **no history lives-kept** command disables history collection before an IP SLAs operation is attempted. The **history filter** command checks for history inclusion after the operation attempt is made.

Examples

The following example shows how to maintain the history for five lives of an ICMP echo operation. The example shows the **history lives-kept** command being used in an IPv4 network.

Examples

```
ip sla 1
 icmp-echo 172.16.1.176
 history lives-kept 5
!
ip sla schedule 1 life forever start-time now
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 1
Router(config-tpllt-icmp-ech)# parameters
Router(config-icmp-ech-params)# history lives-kept 5
Router(config-icmp-ech-params)# end
Router# show ip sla auto template type ip icmp-echo
IP SLAs Auto Template: 1
  Measure Type: icmp-echo
.
.
.
Statistics Aggregation option:
  Hours of statistics kept: 2
History options:
  History filter: none
  Max number of history records kept: 15
  Lives of history kept: 5
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None
```

Related Commands

Command	Description
history buckets-kept	Sets the number of history buckets that are kept during the lifetime of the IP SLAs operation.
history filter	Defines the type of information kept in the history table for the IP SLAs operation.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
samples-of-history-kept	Sets the number of entries kept in the history table per bucket for the IP SLAs operation.

history statistics-distribution-interval

To set the time interval for each statistics distribution kept for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **history statistics-distribution-interval** command in the appropriate submode of IP SLA configuration or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

history statistics-distribution-interval *milliseconds*

no history statistics-distribution-interval

Syntax Description

<i>milliseconds</i>	Length of time, in milliseconds (ms), for which each statistics distribution is kept. The range is from 1 to 100. The default is 20.

Command Default

A statistics distribution is kept for 20 ms.

Command Modes

UDP jitter configuration (config-udp-jtr-params)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the statistics-distribution-interval command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the statistics-distribution-interval command. The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the statistics-distribution-interval command. The following configuration modes were added: • Ethernet echo • Ethernet jitter • VCCV
12.4(20)T	The Ethernet echo and Ethernet jitter configuration modes were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the statistics-distribution-interval command. The Ethernet echo and Ethernet jitter configuration modes were added.
15.1(1)T	This command was modified. The ICMP echo, ICMP jitter, TCP connect, UDP echo, and UDP jitter configuration submodes in IP SLA template parameters configuration mode were added.
12.2(58)SE	This command was modified. Support for the video configuration submode of IP SLA configuration mode was added.
15.2(2)T	This command with support for the video configuration submode of IP SLA configuration mode was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Usage Guidelines

This command changes the value of distribution interval for the IP SLAs operation from the default (20 ms) to the specified value.

In most situations, you do not need to change the number of statistics distributions kept or the time interval for each distribution. Change these parameters only when distributions are required, for example, when performing statistical modeling of your network. To set the number of statistics distributions kept, use the **history statistics-distribution-interval** command.

The **history statistics-distribution-interval** command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

Examples

In the following examples, the statistics distribution is set to five and the distribution interval is set to 10 ms for an IP SLAs operation. Consequently, the first distribution will contain statistics from 0 to 9 ms, the second distribution will contain statistics from 10 to 19 ms, the third distribution will contain statistics from 20 to 29 ms, the fourth distribution will contain statistics from 30 to 39 ms, and the fifth distribution will contain statistics from 40 ms to infinity.

The example shows the **history statistics-distribution-interval** command being used in an IPv4 network.

Examples

```
ip sla 1
 icmp-echo 172.16.161.21
 history distributions-of-statistics-kept 5
 history statistics-distribution-interval 10
!
ip sla schedule 1 life forever start-time now
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 3
Router(config-tplt-icmp-ech)# parameters
Router(config-icmp-ech-params)# history enhanced interval 900 buckets 100
Router(config-icmp-ech-params)# end
Router# show ip sla auto template type ip udp-echo
IP SLAs Auto Template: 5
  Measure Type: icmp-echo
.
.
.
History options:
  History filter: none
  Max number of history records kept: 15
  Lives of history kept: 0
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 10
  Max number of distributions buckets: 1
Reaction Configuration: None
```

Related Commands

Command	Description
history distributions-of-statistics-kept	Sets the number of statistics distributions kept per hop during the IP SLAs operation's lifetime.

Command	Description
history hours-of-statistics-kept	Sets the number of hours for which statistics are maintained for the IP SLAs operation.
hops-of-statistics-kept	Sets the number of hops for which statistics are maintained per path for the IP SLAs operation.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
paths-of-statistics-kept	Sets the number of paths for which statistics are maintained per hour for the IP SLAs operation.

hops-of-statistics-kept

To set the number of hops for which statistics are maintained per path for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **hops-of-statistics-kept** command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

hops-of-statistics-kept *size*

no hops-of-statistics-kept

Syntax Description

<i>size</i>	Number of hops for which statistics are maintained per path. The default is 16.

Command Default

16 hops

Command Modes

IP SLA Configuration

ICMP path echo configuration (config-ip-sla-pathEcho)

IP SLA Monitor Configuration

ICMP path echo configuration (config-sla-monitor-pathEcho)

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines

When the number of hops reaches the size specified, no further hop-based information is stored.

Note

This command is supported by the IP SLAs Internet Control Message Protocol (ICMP) path echo operation only.

For the IP SLAs ICMP path echo operation, the amount of router memory required to maintain the distribution statistics table is based on multiplying all of the values set by the following four commands:

- **distributions-of-statistics-kept**
- **hops-of-statistics-kept**
- **paths-of-statistics-kept**
- **hours-of-statistics-kept**

The general equation used to calculate the memory requirement to maintain the distribution statistics table for an ICMP path echo operation is as follows: Memory allocation = (160 bytes) * (distributions-of-statistics-keptsize) * (hops-of-statistics-keptsize) * (paths-of-statistics-keptsize) * (hours-of-statistics-kepthours)

**Note**

To avoid significant impact on router memory, careful consideration should be used when configuring the **distributions-of-statistics-kept**, **hops-of-statistics-kept**, **paths-of-statistics-kept**, and **hours-of-statistics-kept** commands.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **hops-of-statistics-kept** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured. For example, if you are running Cisco IOS Release 12.4 and the ICMP path echo operation type is configured, you would enter the **hops-of-statistics-kept** command in ICMP path echo configuration mode (config-sla-monitor-pathEcho) within IP SLA monitor configuration mode.

Table 11: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI , or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

The following examples show how to monitor the statistics of IP SLAs ICMP path echo operation 2 for ten hops only. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 2
 path-echo 172.16.1.177
 hops-of-statistics-kept 10
!
ip sla schedule 2 life forever start-time now
```

Examples

```
ip sla monitor 2
 type pathecho protocol ipIcmpEcho 172.16.1.177
 hops-of-statistics-kept 10
!
ip sla monitor schedule 2 life forever start-time now
```

Related Commands

Command	Description
distributions-of-statistics-kept	Sets the number of statistics distributions kept per hop during the lifetime of the IP SLAs operation.
hours-of-statistics-kept	Sets the number of hours for which statistics are maintained for the IP SLAs operation.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
paths-of-statistics-kept	Sets the number of paths for which statistics are maintained per hour for the IP SLAs operation.
statistics-distribution-interval	Sets the time interval for each statistics distribution kept for the IP SLAs operation.

hours-of-statistics-kept

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **hours-of-statistics-kept** command is replaced by the **history hours-of-statistics-kept** command. See the **history hours-of-statistics-kept** command for more information.

To set the number of hours for which statistics are maintained for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **hours-of-statistics-kept** command in the appropriate submode of IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

hours-of-statistics-kept *hours*

no hours-of-statistics-kept

Syntax Description

<i>hours</i>	Number of hours that statistics are maintained. The default is 2.

Command Default

2 hours

Command Modes

DHCP configuration (config-sla-monitor-dhcp)
 DLSw configuration (config-sla-monitor-dlsw)
 DNS configuration (config-sla-monitor-dns)
 FTP configuration (config-sla-monitor-ftp)
 HTTP configuration (config-sla-monitor-http)
 ICMP echo configuration (config-sla-monitor-echo)
 ICMP path echo configuration (config-sla-monitor-pathEcho)
 ICMP path jitter configuration (config-sla-monitor-pathJitter)
 TCP connect configuration (config-sla-monitor-tcp)
 UDP echo configuration (config-sla-monitor-udp)
 UDP jitter configuration (config-sla-monitor-jitter)
 VoIP configuration (config-sla-monitor-voip)

Command History

Release	Modification
11.2	This command was introduced.
12.4(4)T	This command was replaced by the history hours-of-statistics-kept command.

Release	Modification
12.2(33)SRB	This command was replaced by the history hours-of-statistics-kept command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the history hours-of-statistics -kept command.
12.2(33)SXI	This command was replaced by the history hours-of-statistics -kept command.

Usage Guidelines

When the number of hours exceeds the specified value, the statistics table wraps (that is, the oldest information is replaced by newer information).

For the IP SLAs Internet Control Message Protocol (ICMP) path echo operation, the amount of router memory required to maintain the distribution statistics table is based on multiplying all of the values set by the following four commands:

- **distributions-of-statistics-kept**
- **hops-of-statistics-kept**
- **paths-of-statistics-kept**
- **hours-of-statistics-kept**

The general equation used to calculate the memory requirement to maintain the distribution statistics table for an ICMP path echo operation is as follows: Memory allocation = (160 bytes) * (distributions-of-statistics-kept size) * (hops-of-statistics-kept size) * (paths-of-statistics-kept size) * (hours-of-statistics-kept hours)

Note

To avoid significant impact on router memory, careful consideration should be used when configuring the **distributions-of-statistics-kept**, **hops-of-statistics-kept**, **paths-of-statistics-kept**, and **hours-of-statistics-kept** commands.

Note

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

Examples

The following example shows how to maintain 3 hours of statistics for IP SLAs ICMP path echo operation 2.

```
ip sla monitor 2
 type pathecho protocol ipIcmpEcho 172.16.1.177
```

```
hours-of-statistics-kept 3
!
ip sla monitor schedule 2 life forever start-time now
```

Related Commands

Command	Description
distributions-of-statistics-kept	Sets the number of statistics distributions kept per hop during the lifetime of the IP SLAs operation.
hops-of-statistics-kept	Sets the number of hops for which statistics are maintained per path for the IP SLAs operation.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
paths-of-statistics-kept	Sets the number of paths for which statistics are maintained per hour for the IP SLAs operation.
statistics-distribution-interval	Sets the time interval for each statistics distribution kept for the IP SLAs operation.

hours-of-statistics-kept (LSP discovery)

To set the number of hours for which label switched path (LSP) discovery group statistics are maintained for a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **hours-of-statistics-kept** command in auto IP SLA MPLS LSP discovery parameters configuration mode. To return to the default value, use the **no** form of this command.

hours-of-statistics-kept *hours*

no hours-of-statistics-kept

Syntax Description

<i>hours</i>	Number of hours that statistics are maintained. The default is 2.

Command Default

2 hours

Command Modes

Auto IP SLA MPLS LSP discovery parameters configuration (config-auto-ip-sla-mpls-lpd-params)

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.

Usage Guidelines

The LSP discovery group statistics are distributed in one-hour increments. Since the number of LSP discovery groups for a single LSP Health Monitor operation can be significantly large, the collection of group statistics is restricted to a maximum of 2 hours. If the *number* argument is set to zero, no LSP discovery group statistics are maintained.

Use the **path-discover** command to enable the LSP discovery option for an IP SLAs LSP Health Monitor operation and enter auto IP SLA MPLS LSP discovery parameters configuration mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, the LSP discovery option is enabled for LSP Health Monitor operation 1. Operation 1 is configured to automatically create IP SLAs LSP ping operations for the equal-cost multipaths to all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. LSP discovery group statistics are collected every 1 hour.

```
auto ip sla mpls-lsp-monitor 1
type echo ipsla-vrf-all
path-discover
```

```
!  
maximum-sessions 2  
session-timeout 60  
interval 2  
timeout 4  
force-explicit-null  
hours-of-statistics-kept 1  
scan-period 30  
!  
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 frequency 100 start-time now  
!  
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd tree-trace action-type  
trapOnly  
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd lpd-group retry 3 action-type  
trapOnly
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
path-discover	Enables the LSP discovery option for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS LSP discovery parameters configuration mode.

http (IP SLA)

To configure a Cisco IOS IP Service Level Agreements (SLAs) HTTP operation, use the **http** command in IP SLA configuration mode.

http {**get**|**raw**} *url* [**name-server** *ip-address*] [**version** *version-number*] [**source-ip** {*ip-address*|*hostname*}] [**source-port** *port-number*] [**cache** {**enable**|**disable**}] [**proxy** *proxy-url*]

Syntax Description

get	Specifies an HTTP GET operation.
raw	Specifies an HTTP RAW operation.
<i>url</i>	URL of destination HTTP server.
name-server <i>ip-address</i>	(Optional) Specifies the destination IP address of a Domain Name System (DNS) Server.
version <i>version-number</i>	(Optional) Specifies the version number.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.
cache enable disable	(Optional) Enables or disables download of a cached HTTP page.
proxy <i>proxy-url</i>	(Optional) Specifies proxy information or URL.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type http operation command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.

Release	Modification
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type http operation command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type http operation command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type http operation command.
15.2(3)T	This command was modified. Support for IPv6 addresses was added.
Cisco IOS XE Release 3.7S	This command was integrated into Cisco IOS XE Release 3.7S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

You must configure the type of IP SLAs operation, such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo, before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs HTTP operation 6 is configured as an HTTP RAW operation. The destination URL of the HTTP server is <http://www.cisco.com>.

```
ip sla 6
 http raw http://www.cisco.com
 http-raw-request
 GET /index.html HTTP/1.0\r\n
 \r\n
!
```

```
ip sla schedule 6 start-time now
```

In the following example, IP SLAs HTTP operation 7 is configured as an HTTP GET operation. The destination URL of the HTTP server is 2001:10:10:10::3.

```
ip sla 7
 http get http://2001:10:10:10::3
 http-get-request
 GET /index.html HTTP/1.0\r\n
 \r\n
!
```

```
ip sla schedule 7 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

http-raw-request

To explicitly specify the options for a GET request for a Cisco IOS IP Service Level Agreements (SLAs) Hypertext Transfer Protocol (HTTP) operation, use the **http-raw-request** command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode.

http-raw-request

Syntax Description This command has no arguments or keywords.

Command Default No options are specified for a GET request.

Command Modes

IP SLA Configuration
HTTP configuration (config-ip-sla-http)

IP SLA Monitor Configuration
HTTP configuration (config-sla-monitor-http)

Command History	Release	Modification
	12.0(5)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines Use the **http-raw-request** command to explicitly specify the content of an HTTP request. Use HTTP version 1.0 commands after entering the **http-raw-request** command.

IP SLAs will specify the content of an HTTP request if you use the **typehttpoperationget** command. IP SLAs will send the HTTP request, receive the reply, and report round-trip time (RTT) statistics (including the size of the page returned).

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **http-raw-request** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured. For example, if you are running Cisco

IOS Release 12.4 and the HTTP operation type is configured, you would enter the **http-raw-request** command in HTTP configuration mode (config-sla-monitor-http) within IP SLA monitor configuration mode.

Table 12: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI , or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

In the following examples, IP SLAs operation 6 is created and configured as an HTTP operation. The HTTP **GET** command is explicitly specified. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 6
http raw http://www.cisco.com
http-raw-request
GET /index.html HTTP/1.0\r\n
\r\n
!
ip sla schedule 6 start-time now
```

Examples

```
ip sla monitor 6
type http operation raw url http://www.cisco.com
http-raw-request
GET /index.html HTTP/1.0\r\n
\r\n
!
ip sla monitor schedule 6 start-time now
```

icmp-echo

To configure an IP Service Level Agreements (SLAs) Internet Control Message Protocol (ICMP) echo operation, use the **icmp-echo** command in IP SLA configuration mode.

icmp-echo {*destination-ip-address*|*destination-hostname*} [**source-ip** {*ip-address*|*hostname*}|**source-interface** *interface-name*]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IPv4 or IPv6 address or hostname.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP v4 or IPv6 address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-interface <i>interface-name</i>	(Optional) Specifies the source interface for the operation.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type echo protocol ipIcmpEcho command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type echo protocol ipIcmpEcho command.
12.2(33)SRC	Support for IPv6 addresses was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type echo protocol ipIcmpEcho command. Support for IPv6 addresses was added.
12.4(20)T	Support for IPv6 addresses was added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type echo protocol ipIcmpEcho command. The keyword source-interface is not supported.

Usage Guidelines

The default request packet data size for an ICMP echo operation is 28 bytes. Use the **request-data-size** command to modify this value. This data size is the payload portion of the ICMP packet, which makes a 64-byte IP packet.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or ICMP echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

IP SLAs ICMP echo operations support both IPv4 and IPv6 addresses.

Examples

In the following example, IP SLAs operation 10 is created and configured as an echo operation using the ICMP protocol and the destination IPv4 address 172.16.1.175:

```
ip sla 10
 icmp-echo 172.16.1.175
!
ip sla schedule 10 start-time now
```

In the following example, IP SLAs operation 11 is created and configured as an echo operation using the ICMP protocol and the destination IPv6 address 2001:DB8:100::1:

```
ip sla 11
 icmp-echo 2001:DB8:100::1
!
ip sla schedule 11 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

icmp-jitter

To configure an IP Service Level Agreements (SLAs) Internet Control Message Protocol (ICMP) jitter operation, use the **icmp-jitter** command in IP SLA configuration mode.

icmp-jitter {*destination-ip-address* | *destination-hostname*} [**interval** *milliseconds*] [**num-packets** *packet-number*] [**source-ip** {*ip-address* | *hostname*}]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname.
interval <i>milliseconds</i>	(Optional) Specifies the time interval between packets (in milliseconds). The default value is 20 ms.
num-packets <i>packet-number</i>	(Optional) Specifies the number of packets to be sent in each operation. The default value is 10 packets per operation.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.

Usage Guidelines

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure an IP SLAs ICMP jitter operation:

```
ip sla 1
 icmp-jitter 172.18.1.129 interval 40 num-packets 100 source-ip 10.1.2.34
 frequency 50
!
ip sla reaction-configuration 1 react jitterAvg threshold-value 5 2 action-type trap
 threshold-type immediate
!
ip sla schedule 1 start-time now life forever
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

inner-cos

To set the class of service (CoS) for the inner loop in a service performance packet profile, use the **inner-cos** command in the packet profile submode of IP SLA service performance configuration mode. To return to the default, use the **no** form of this command.

inner-cos *cos-number*

Syntax Description

<i>cos-number</i>	Class of service (CoS) value. The range is from 0 to 7.

Command Default

No CoS number for the inner loop is configured in the packet profile.

Command Modes

Packet profile submode of IP SLA service performance configuration (config-ip-sla-service-packet)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

You must configure a packet profile before you can configure parameters for the profile.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation
Type: ethernet
Destination
MAC Address: 4055.398d.8bd2
.
.
.

Profile Traffic:
Direction: internal
CIR: 0
EIR: 0
CBS: 0
EBS: 0
Burst Size: 3
Burst Interval: 20
Rate Step (kbps): 1000 2000

Profile Packet:
Inner COS: 6
Outer COS: 6
Inner VLAN: 100
Outer VLAN: 100
Source MAC Address: 4055.398d.8d4c
Packet Size: 512
.
```

.

.

Related Commands

Command	Description
profile packet	Creates a packet profile for live traffic.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or a specified operation.

inner-vlan

To specify a VLAN for the inner loop in a service performance packet profile, use the **inner-vlan** command in the packet profile submode of IP SLA service performance configuration mode. To return to the default, use the **no** form of this command.

inner-vlan *vlan-id*

no inner-vlan

Syntax Description

<i>vlan</i>	VLAN identifier. The range is from 0 to 4096.

Command Default

No VLAN for the inner loop is configured in the packet profile.

Command Modes

Packet profile submode of IP SLA service performance configuration (config-ip-sla-service-packet)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

You must configure a packet profile before you can configure parameters for the profile.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation
Type: ethernet
Destination
MAC Address: 4055.398d.8bd2
.
.
.

Profile Traffic:
Direction: internal
CIR: 0
EIR: 0
CBS: 0
EBS: 0
Burst Size: 3
Burst Interval: 20
Rate Step (kbps): 1000 2000

Profile Packet:
Inner COS: 6
Outer COS: 6
Inner VLAN: 100
Outer VLAN: 100
Source MAC Address: 4055.398d.8d4c
Packet Size: 512
```

.
.
.

Related Commands

Command	Description
profile packet	Creates a packet profile for live traffic.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or a specified operation.

interval (LSP discovery)

To specify the time interval between Multiprotocol Label Switching (MPLS) echo requests that are sent as part of the label switched path (LSP) discovery process for a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **interval** command in auto IP SLA MPLS LSP discovery parameters configuration mode. To return to the default value, use the **no** form of this command.

interval *milliseconds*

no interval

Syntax Description

<i>milliseconds</i>	Number of milliseconds between each MPLS echo request. The default is 0.

Command Default

0 milliseconds

Command Modes

Auto IP SLA MPLS LSP discovery parameters configuration (config-auto-ip-sla-mpls-lpd-params)

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.

Usage Guidelines

Use the **path-discover** command to enable the LSP discovery option for an IP SLAs LSP Health Monitor operation and enter auto IP SLA MPLS LSP discovery parameters configuration mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, the LSP discovery option is enabled for LSP Health Monitor operation 1. Operation 1 is configured to automatically create IP SLAs LSP ping operations for the equal-cost multipaths to all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. To discover the equal cost multipaths per BGP next hop neighbor, MPLS echo requests are sent every 2 milliseconds.

```
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  path-discover
!
maximum-sessions 2
session-timeout 60
interval 2
timeout 4
force-explicit-null
hours-of-statistics-kept 1
```

```
    scan-period 30
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 frequency 100 start-time now
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd tree-trace action-type
trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd lpd-group retry 3 action-type
trapOnly
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
path-discover	Enables the LSP discovery option for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS LSP discovery parameters configuration mode.

interval (params)

To specify the interval between packets for a jitter operation in an auto IP Service Level Agreements (SLAs) operation template, use the **interval** command in the appropriate submode of IP SLA template parameters configuration mode. To return to the default, use the **no** form of this command.

interval *milliseconds*

no interval

Syntax Description

<i>milliseconds</i>	Interval between packets in milliseconds (ms). Range is from 4 to 60000. Default is 20.

Command Default

The default interval between packets is 20 ms.

Command Modes

IP SLA Template Parameters Configuration

ICMP jitter configuration (config-icmp-jtr-params)

UDP jitter configuration (config-udp-jtr-params)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command changes the interval between packets sent during a jitter operation from the default (20 ms) to the specified interval.

You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) jitter, before you can configure any other parameters of the operation.

Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

Examples

The following example shows how to configure an auto IP SLAs operation template for an ICMP jitter operation with an interval of 30 ms between packets:

```
Router(config)#ip sla auto template type ip icmp-jitter 1
Router(config-tplt-icmp-jtr)#parameters
Router(config-icmp-jtr-params)#interval 30
Router(config-icmp-jtr-params)#end
Router# show ip sla auto template type ip icmp-jitter
IP SLAs Auto Template: 1
  Measure Type: icmp-jitter
  Description:
  IP options:
```

```
Source IP: 0.0.0.0
VRF:      TOS: 0x0
Operation Parameters:
  Number of Packets: 10   Inter packet interval: 30
  Timeout: 5000          Threshold: 5000
Statistics Aggregation option:
  Hours of statistics kept: 2
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None
```

Related Commands

Command	Description
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
show ip sla auto template	Displays configuration including default values of an auto IP SLAs operation template.

ip-address (endpoint list)

To specify destination IP addresses for routing devices or Cisco IOS IP Service Level Agreements (SLAs) Responders in Cisco devices and add them to an IP SLAs endpoint list, use the **ip-address** command in IP SLA endpoint-list configuration mode. To remove some or all IP addresses from the template, use the **no** form of this command.

ip-address *address* [*address* | ,...,*address*] **port** *port*

no ip-address *address* [*address-address* | ,...,*address*] **port** *port*

Syntax Description

<i>address</i>	IP address of destination routing device or destination IP SLAs responder.
- <i>address</i>	(Optional) Last IP address in a range of contiguous IP addresses. The hyphen (-) is required.
, ... , <i>address</i>	(Optional) List of up to five individual IP addresses separated by commas (.). Do not type the ellipses (...).
port <i>port</i>	Specifies port number of destination routing device or destination IP SLAs responder. Range is from 1 to 65535. Note The port configuration is required but ignored by a multicast UDP jitter operation.

Command Default

The IP SLAs endpoint list is empty.

Command Modes

IP SLA endpoint-list configuration (config-epl)

Command History

Release	Modification
15.1(1)T	This command was introduced.
15.2(3)T	This command was modified. Support was added for IPv6.
15.2(4)M	This command was modified. Support was added for configuring a list of unicast IP addresses for multicast UDP jitter operations.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.

Release	Modification
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

This command adds IPv4 or IPv6 addresses to the IP SLAs endpoint list being configured.

Destination IP addresses can either be manually configured by using this command or automatically discovered by using the **discover** command. If you use this command to configure an IP SLAs endpoint list, you cannot use the **discover** command to discover IP addresses for this endpoint list.

You cannot combine a list of individual IP addresses (*address , address*) and a range of IP addresses (*address - address*) in a single command.

The maximum number of IP addresses allowed in a list of individual addresses (*address , address*) per command is five.

To remove one or more IP addresses without reconfiguring the entire template, use the **no** form of this command. You can delete a range of IP addresses or a single IP addresses per command.

Modifications to IP SLAs endpoint lists, such as adding or removing IP addresses, take effect in the next schedule cycle.

Use the **destination** command in IP SLA auto-measure group configuration mode to specify an endpoint list for an IP SLAs auto-measure group.

Use the **endpoint-list** keyword with the **udp-jitter** command to specify an endpoint list for a multicast UDP jitter operation.

Examples

Note

In Cisco IOS Release 15.2(3)T, the **ip sla auto endpoint-list** command was replaced by the **ip sla endpoint-list** command and the **show ip sla auto endpoint-list** command was replaced by the **show ip sla endpoint-list** command.

The following example shows how to configure an IP SLAs endpoint list using this command:

```
Router(config)#ip sla endpoint-list type ip test
Router(config-epl)#ip-address 10.1.1.1-13 port 5000
Router(config-epl)#no ip-address 10.1.1.3-4 port 5000
Router(config-epl)#no ip-address 10.1.1.8 port 5000
Router(config-epl)#no ip-address 10.1.1.12 port 5000

Router(config-epl)#exit
Router#
```

The following output from the **show ip sla auto endpoint-list** command shows the results of the preceding configuration. If this list is for a multicast UDP jitter operation, the port configuration is ignored by the operation.

```
Router# show ip sla endpoint-list
Endpoint-list Name: test
Description:
ip-address 10.1.1.1-2 port 5000
ip-address 10.1.1.5-7 port 5000
ip-address 10.1.1.9-11 port 5000
ip-address 10.1.1.13 port 5000
```

Related Commands

Command	Description
discover (epl)	Enters IP SLA endpoint-list auto-discovery configuration mode for building a list of destination IP addresses.
show ip sla auto endpoint-list	Displays configuration including default values of IP SLAs endpoint lists.
show ip sla endpoint-list	(For Cisco IOS Release 15.2(3)T and later releases) Displays configuration including default values of IP SLAs endpoint lists.
udp-jitter	Configures an IP SLAs multicast UDP jitter operation.

ip sla

To begin configuring a Cisco IOS IP Service Level Agreements (SLAs) operation and enter IP SLA configuration mode, use the **ip sla** command in global configuration mode. To remove all configuration information for an operation, including the schedule of the operation, reaction configuration, and reaction triggers, use the no form of this command.

ip sla *operation-number*

no ip sla *operation-number*

Syntax Description

<i>operation-number</i>	Operation number used for the identification of the IP SLAs operation you want to configure.

Command Default

No IP SLAs operation is configured.

Command Modes

Global configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor command.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

The **ip sla** command is used to begin configuration for an IP SLAs operation. Use this command to specify an identification number for the operation you are about to configure. After you enter this command, the router will enter IP SLA configuration mode.

The **ip sla** command is supported in IPv4 networks. This command can also be used when configuring an IP SLAs operation that supports IPv6 addresses.

IP SLAs allows a maximum of 2000 operations.

Debugging is supported only on the first 32 operation numbers.

After you configure an operation, you must schedule the operation. For information on scheduling an operation, refer to the **ip sla schedule** and **ip sla group schedule** global configuration commands. You can also optionally set reaction triggers for the operation. For information on reaction triggers, refer to the **ip sla reaction-configuration** and **ip sla reaction-trigger** global configuration commands.

To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla**) and then reconfigure the operation with the new operation type.

Note

After you schedule an operation, you cannot modify the configuration of the operation. To modify the configuration of the operation after it is scheduled, you must first delete the IP SLAs operation (using the **no ip sla** command) and then reconfigure the operation with the new operation parameters.

To display the current configuration settings of the operation, use the **show ip sla configuration** command in user EXEC or privileged EXEC mode.

Examples

In the following example, operation 99 is configured as a UDP jitter operation in an IPv4 network and scheduled to start running in 5 hours. The example shows the **ip sla** command being used in an IPv4 network.

```
ip sla 99
  udp-jitter 172.29.139.134 dest-port 5000 num-packets 20
!
ip sla schedule 99 life 300 start-time after 00:05:00
```

Note

If operation 99 already exists and has not been scheduled, the command line interface will enter IP SLA configuration mode for operation 99. If the operation already exists and has been scheduled, this command will fail.

Related Commands

Command	Description
ip sla group schedule	Configures the group scheduling parameters for multiple IP SLAs operations.
ip sla reaction-configuration	Configures certain actions to occur based on events under the control of IP SLAs.

Command	Description
ip sla reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action type options are defined with the ip sla reaction-configuration command.
ip sla schedule	Configures the scheduling parameters for a single IP SLAs operation.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.
show ip sla statistics	Displays the current operational status and statistics of all IP SLAs operations or a specified operation.
show ip sla statistics aggregated	Displays the aggregated statistical errors and distribution information for all IP SLAs operations or a specified operation.

ip sla auto discovery

To enable auto discovery in Cisco IOS IP Service Level Agreements (SLAs) Engine 3.0, use the **ip sla auto discovery** command in global configuration mode. To disable auto discovery, use the **no** form of this command.

ip sla auto discovery

no ip sla auto discovery

Syntax Description This command has no arguments or keywords.

Command Default Auto discovery is disabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	15.1(1)T	This command was introduced.

Usage Guidelines This command enables the source for IP SLAs operations to auto-discover Cisco IP SLAs Responder endpoints.

Examples The following example shows how to configure the **ip sla auto discovery** command:

```
Router>show ip sla auto discovery
IP SLAs auto-discovery status: Disabled
The following Endpoint-list are configured to auto-discovery:
Router>enable
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#ip sla auto discovery

Router(config)#exit
Router#
Router# show ip sla auto discovery
IP SLAs auto-discovery status: Enabled
The following Endpoint-list are configured to auto-discovery:
.
.
.
```

Related Commands	Command	Description
	show ip sla auto discovery	Displays the status of IP SLAs auto discovery and the configuration of auto IP SLAs endpoint lists configured using auto discovery.

ip sla auto endpoint-list

**Note**

Effective with Cisco IOS Release 15.2(3)T, the **ip sla auto endpoint-list** command is replaced with the **ip sla endpoint-list** command. See the **ip sla endpoint-list** command for more information.

To enter IP SLA endpoint-list configuration mode and begin configuring an auto IP Service Level Agreements (SLAs) endpoint list, use the **ip sla auto endpoint-list** command in global configuration mode. To remove an endpoint list, use the **no** form of this command.

ip sla auto endpoint-list type ip *template-name*

no ip sla auto endpoint-list *template-name*

Syntax Description

type ip	Specifies that the operation type is Internet Protocol (IP).
<i>template-name</i>	Unique identifier of the endpoint list. Length of string is 1 to 64 ASCII characters.

Command Default

No auto IP SLAs endpoint list is configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
15.1(1)T	This command was introduced.
15.2(3)T	This command was replaced by the ip sla endpoint-list command.

Usage Guidelines

This command assigns a name to an auto IP SLAs endpoint list and enters IP SLA endpoint-list configuration mode on the router.

Use the commands in IP SLA endpoint-list configuration mode to configure a template of destination IP addresses of routing devices or Cisco IOS IP SLAs Responders in Cisco devices to be referenced by one or more IP SLAs auto-measure groups. Destination addresses can be either manually configured by using the **ip-address** command or automatically discovered using the **discover** command.

Each auto IP SLAs endpoint list can be referenced by one or more IP SLAs auto-measure groups. Use the **destination** command in IP SLA auto-measure group configuration mode to specify an endpoint list for an IP SLAs auto-measure group.

Examples

The following example shows how to configure two auto IP SLAs endpoint lists of endpoints, one by manually configuring destination IP addresses and one using auto discovery:

```
Router(config)# ip sla auto endpoint-list type ip man1
Router(config-epl)# ip-address 10.1.1.1-10.1.1.12 port 23
Router(config-epl)# ip-address 10.1.1.15,10.1.1.23 port 23
Router(config-epl)# no ip-address 10.1.1.8,10.1.1.10 port 23
Router(config-epl)# description testing manual build
Router(config-epl)# exit
Router(config)#
Router(config)# ip sla auto discover
Router(config)# ip sla auto endpoint-list type ip autolist
Router(config-epl)# discover port 5000
Router(config-epl)# access-list 3
Router(config-epl)# exit
Router#
Router# show ip sla auto endpoint-list
Endpoint-list Name: man1
  Description: testing manual build
  ip-address 10.1.1.1-7 port 23
  ip-address 10.1.1.9,10.1.1.15,10.1.1.23 port 23
Endpoint-list Name: autolist
  Description:
  Auto Discover Parameters
    Destination Port: 5000
    Access-list: 3
    Ageout: 3600    Measurement-retry: 3
  1 endpoints are discovered for autolist
```

Related Commands

Command	Description
destination (am-group)	Specifies an endpoint list for an IP SLAs auto-measure group.
discover (epl)	Enters IP SLA endpoint-list auto-discovery configuration mode for building an IP SLAs endpoint list.
ip-address (epl)	Configures and adds endpoints to an IP SLAs endpoint list.
show ip sla auto endpoint-list	Displays configuration including default values of auto IP SLAs endpoint lists.

ip sla auto group

To enter IP SLA auto-measure group configuration mode and begin configuring a Cisco IOS IP Service Level Agreements (SLAs) auto-measure group, use the **ip sla auto group** command in global configuration mode. To remove the auto-measure group configuration, use the **no** form of this command.

ip sla auto group type ip *group-name*

no ip sla auto group *group-name*

Syntax Description

type ip	Specifies that the operation type for the group is Internet Protocol (IP).
<i>group-name</i>	Identifier of the group. String of 1 to 64 ASCII characters.

Command Default

No IP SLAs auto-measure group is configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command assigns a name to an IP SLAs auto-measure group and enters IP SLA auto-measure group configuration mode.

Use the commands in IP SLA auto-measure group configuration mode to specify an auto IP SLAs operation template, endpoint list, and scheduler for the group.

Examples

The following example shows how to configure an IP SLAs auto-measure group:

```
Router(config)#ip sla auto group type ip 1

Router(config-am-grp)#destination 1
Router(config-am-grp)#schedule 1
Router(config-am-grp)#end
Router#
Router# show ip sla auto group
Group Name: 1
  Description:
  Activation Trigger: Immediate
  Destination: 1
  Schedule: 1
IP SLAs Auto Template: default
```

```
Measure Type: icmp-jitter
Description:
IP options:
  Source IP: 0.0.0.0
  VRF:      TOS: 0x0
Operation Parameters:
  Number of Packets: 10   Inter packet interval: 20
  Timeout: 5000          Threshold: 5000
Statistics Aggregation option:
  Hours of statistics kept: 2
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None
IP SLAs auto-generated operations of group 1
no operation created
```

Related Commands

Command	Description
show ip sla auto group	Displays configuration including default values of IP SLAs auto-measure groups.

ip sla auto schedule

To enter IP SLA auto-measure schedule configuration mode and begin configuring an auto IP Service Level Agreements (SLAs) scheduler, use the **ip sla auto schedule** command in global configuration mode. To remove the configuration and stop all operations controlled by this scheduler, use the **no** form of this command.

ip sla auto schedule *schedule-id*

no ip sla auto schedule *schedule-id*

Syntax Description

<i>schedule-id</i>	Unique identifier of scheduler. Range is 1 to 64 alphanumeric characters.

Command Default

No auto IP SLAs scheduler is configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command assigns a unique identifier to an auto IP SLAs scheduler and enters IP SLA auto-measure schedule configuration mode on the router.

Use the commands in IP SLA auto-measure schedule configuration mode to modify the default configuration of an auto IP SLAs scheduler.

Each auto IP SLAs scheduler can be referenced by one or more IP SLAs auto-measure groups. Use the **schedule** command in IP SLA auto-measure group configuration mode to specify a scheduler for an IP SLAs auto-measure group.

Examples

The following example shows how to create the default configuration for an auto IP SLAs scheduler:

```
Router(config)#ip sla auto schedule 2
Router(config-am-schedule)#end
Router#
Router# show ip sla auto schedule 2
Group sched-id: 2
  Probe Interval (ms) : 1000
  Group operation frequency (sec): 60
  Status of entry (SNMP RowStatus): Active
  Next Scheduled Start Time: Pending trigger
  Life (sec): 3600
  Entry Ageout (sec): never
```

Related Commands

Command	Description
schedule	Specifies an auto IP SLAs scheduler for an IP SLAs auto-measure group.
show ip sla auto schedule	Displays configuration including default values of auto IP SLAs schedulers.

ip sla auto template

To enter IP SLA template configuration mode and begin configuring an auto IP Service Level Agreements (SLAs) operation template, use the **ip sla auto template** command in global configuration mode. To remove the operation template, use the **no** form of this command.

ip sla auto template type ip *operation template-name*

no ip sla auto template type ip *operation template-name*

Syntax Description

type ip	Specifies that the operation type is Internet Protocol (IP).
<i>operation</i>	Type of IP operation for this template. Use one of the following keywords: • icmp-echo--Internet Control Message Protocol (ICMP) echo operation • icmp-jitter-- Internet Control Message Protocol (ICMP) jitter operation • tcp-connect-- Transmission Control Protocol (TCP) connection operation • udp-echo-- User Datagram Protocol (UDP) echo operation • udp-jitter-- User Datagram Protocol (UDP) jitter operation
<i>template-name</i>	Identifier of template. String of 1 to 64 alphanumeric characters.

Command Default

No IP SLAs operation template is configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command assigns a name and operation to an auto IP SLAs operation template and enters a submode of the IP SLA template configuration mode based on the specified *operation* argument, such as IP SLA template icmp-echo configuration submode (config-tplt-icmp-ech).

Use the commands in IP SLA template configuration submode to modify the default configuration of an auto IP SLAs operation template.

Each auto IP SLAs operation template can be referenced by one or more IP SLAs auto-measure groups. Use the **template** command in IP SLA auto-measure group configuration mode to specify an operation template for an IP SLAs auto-measure group.

Examples

The following example shows how to create a default configuration for an auto IP SLAs operation template for ICMP echo:

```
Router(config)# ip sla auto template type ip icmp-echo
Router(config-tplt-icmp-ech)#end
Router# show ip sla auto template type ip icmp-echo
IP SLAs Auto Template: basic_icmp_echo
  Measure Type: icmp-echo
  Description:
  IP options:
    Source IP: 0.0.0.0
    VRF:      TOS: 0x0
  Operation Parameters:
    Request Data Size: 28   Verify Data: false
    Timeout: 5000          Threshold: 5000
  Statistics Aggregation option:
    Hours of statistics kept: 2
  History options:
    History filter: none
    Max number of history records kept: 15
    Lives of history kept: 0
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
```

Related Commands

Command	Description
template	Specifies an auto IP SLAs operation template for an IP SLAs auto-measure group.
show ip sla auto template	Display configuration including default values of auto IP SLAs operation templates.

ip sla enable reaction-alerts

To enable Cisco IP Service Level Agreements (SLAs) notifications to be sent to all registered applications, use the **ip sla enable reaction-alerts** command in global configuration mode. To disable IP SLAs notifications, use the **no** form of this command.

ip sla enable reaction-alerts

no ip sla enable reaction-alerts

Syntax Description This command has no arguments or keywords.

Command Default IP SLAs notifications are not sent to registered applications.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.4(22)T	This command was introduced.
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

Usage Guidelines The only applications that can register are Cisco IOS processes running on the router. Proactive threshold monitoring parameters for a Cisco IOS IP SLAs operation can be configured that will generate notifications when a threshold is crossed.

Examples The following example shows how to enable IP SLAs notifications to be sent to all registered applications:

```
Router(config)  
) # ip sla enable reaction-alerts
```

Related Commands	Command	Description
	debug ip sla error	Enables debugging output of IP SLAs operation run-time errors.
	debug ip sla trace	Traces the execution of IP SLAs operations.
	ip sla reaction-configuration	Configures proactive threshold monitoring parameters for a Cisco IOS IP SLAs operation.

Command	Description
show ip sla application	Displays global information about Cisco IOS IP SLAs.
show ip sla event-publisher	Displays a list of clients registered to receive IP SLAs notifications.

ip sla enable timestamp

To enable low-level time stamping for IP Service Level Agreements (SLAs), use the **ip sla enable timestamp** command in global configuration mode. To return to the default, use the **no** form of this command.

ip sla enable timestamp

no ip sla enable timestamp

Syntax Description This command has no arguments or keywords.

Command Default Low-level time stamping is disabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(53)SE	This command was introduced.

Usage Guidelines Use the **ip sla enable timestamp** command to enable low-level time stamping for IP SLAs.

IP SLAs low-level time stamping increases the length of time between when the packet arrives at the interface and when the packet is handed to the application. For Hot Standby Router Protocol (HSRP) on a Cisco Catalyst 3560 Series switch, the longer elapsed time will exceed the default hold time at the standby interface, causing the standby HSRP to be declared active and making both (the active and standby) HSRPs active at the same time. To ensure that HSRP continues to operate correctly when the IP SLAs time stamp is enabled, also configure the **standby timers** command on the standby interface to increase the HSRP hello and hold timers. The recommended hello and hold timer values are 15 seconds and 16 seconds, respectively.

Examples

```
!  
interface FastEthernet0  
  standby ip 172.19.10.1  
  standby 0 timers 15 16  
.  
.  
.  
  
ip sla enable timestamp  
ip sla enable reaction-alerts
```

Related Commands

Command	Description
standby timers	Configures the time between hello packets and the time before other routers declare the active Hot Standby or standby router to be down.

ip sla endpoint-list

To enter IP SLA endpoint-list configuration mode and begin configuring an IP Service Level Agreements (SLAs) endpoint list, use the **ip sla endpoint-list** command in global configuration mode. To remove an endpoint list, use the **no** form of this command.

ip sla endpoint-list type {ip| ipv6} *template-name*

no {ip| ipv6} **sla endpoint-list** *template-name*

Syntax Description

type ip	Specifies that the operation type is IPv4.
type ipv6	Specifies that the operation type is IPv6.
<i>template-name</i>	Unique identifier of the endpoint list. Length of string is 1 to 64 ASCII characters.

Command Default

No IP SLAs endpoint list is configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
15.2(3)T	This command was introduced. This command replaced the ip sla auto endpoint-list command.

Usage Guidelines

This command assigns a name to an IP SLAs endpoint list and enters IP SLA endpoint-list configuration mode on the router.

Use the commands in IP SLA endpoint-list configuration mode to configure a template of destination IP addresses of routing devices or Cisco IOS IP SLAs Responders in Cisco devices to be referenced by one or more IP SLAs auto-measure groups. Destination addresses can be either manually configured by using the **ip-address** command or automatically discovered using the **discover** command.

Each IP SLAs endpoint list can be referenced by one or more IP SLAs auto-measure groups. Use the **destination** command in IP SLA auto-measure group configuration mode to specify an endpoint list for an IP SLAs auto-measure group.

Examples

The following example shows how to configure two IP SLAs endpoint lists of endpoints, one by manually configuring destination IP addresses and one using auto discovery:

```
Router(config)# ip sla endpoint-list type ip man1
```

```

Router(config-epl)# ip-address 10.1.1.1-10.1.1.12 port 23
Router(config-epl)# ip-address 10.1.1.15,10.1.1.23 port 23
Router(config-epl)# no ip-address 10.1.1.8,10.1.1.10 port 23
Router(config-epl)# description testing manual build
Router(config-epl)# exit
Router(config)#
Router(config)#ip sla auto discover
Router(config)#ip sla auto endpoint-list type ip autolist
Router(config-epl)#discover port 5000
Router(config-epl)#access-list 3
Router(config-epl)#exit
Router#
Router# show ip sla endpoint-list
Endpoint-list Name: man1
  Description: testing manual build
    ip-address 10.1.1.1-7 port 23
    ip-address 10.1.1.9,10.1.1.15,10.1.1.23 port 23
Endpoint-list Name: autolist
  Description:
    Auto Discover Parameters
      Destination Port: 5000
      Access-list: 3
      Ageout: 3600      Measurement-retry: 3
    1 endpoints are discovered for autolist

```

Related Commands

Command	Description
destination (am-group)	Specifies an endpoint list for an IP SLAs auto-measure group.
discover (epl)	Enters IP SLA endpoint-list auto-discovery configuration mode for building an IP SLAs endpoint list.
ip-address (epl)	Configures and adds endpoints to an IP SLAs endpoint list.
show ip sla endpoint-list	Displays configuration including default values of IP SLAs endpoint lists.

ip sla ethernet-monitor

To begin configuring a Cisco IOS IP Service Level Agreements (SLAs) auto Ethernet operation and enter IP SLA Ethernet monitor configuration mode, use the **ip sla ethernet-monitor** command in global configuration mode. To remove all configuration information for an auto Ethernet operation, including the schedule of the operation, reaction configuration, and reaction triggers, use the **no** form of this command.

ip sla ethernet-monitor *operation-number*

no ip sla ethernet-monitor *operation-number*

Syntax Description

<i>operation-number</i>	Operation number used for the identification of the IP SLAs operation you want to configure.

Command Default

No IP SLAs operation is configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.
12.2(50)SY	This command was integrated into Cisco IOS Release 12.2(50)SY.

Usage Guidelines

The **ip sla ethernet-monitor** command is used to begin configuration for an IP SLAs auto Ethernet operation. Use this command to specify an identification number for the operation you are about to configure. After you enter this command, the router will enter IP SLA Ethernet monitor configuration mode.

After you configure an auto Ethernet operation, you must schedule the operation. To schedule an auto Ethernet operation, use the **ip sla ethernet-monitor schedule** command in global configuration mode. You can also optionally set reaction configuration for the operation (see the **ip sla ethernet-monitor reaction-configuration** command).

To display the current configuration settings of an auto Ethernet operation, use the **show ip sla ethernet-monitor configuration** command in user EXEC or privileged EXEC mode.

To change the operation type of an existing auto Ethernet operation, you must first delete the operation (using the **no ip sla ethernet-monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using an IP SLAs auto Ethernet operation. In this example, operation 10 is configured to automatically create IP SLAs Ethernet ping operations for all the discovered maintenance endpoints in the domain named testdomain and VLAN identification number 34. As specified by the proactive threshold monitoring configuration, when three consecutive connection loss events occur, a Simple Network Management Protocol (SNMP) trap notification should be sent. The schedule period for operation 10 is 60 seconds, and the operation is scheduled to start immediately.

```
ip sla ethernet-monitor 10
  type echo domain testdomain vlan 34
!
ip sla ethernet-monitor reaction-configuration 10 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
!
ip sla ethernet-monitor schedule 10 schedule-period 60 start-time now
```

Related Commands

Command	Description
ip sla ethernet-monitor reaction-configuration	Configures the proactive threshold monitoring parameters for an IP SLAs auto Ethernet operation.
ip sla ethernet-monitor schedule	Configures the scheduling parameters for an IP SLAs LSP Health Monitor operation.
show ip sla ethernet-monitor configuration	Displays configuration settings for IP SLAs auto Ethernet operations.

ip sla ethernet-monitor reaction-configuration

To configure proactive threshold monitoring parameters for a Cisco IOS IP Service Level Agreements (SLAs) auto Ethernet operation, use the **ipslaethernet-monitorreaction-configuration** command in global configuration mode. To clear all threshold monitoring configuration for a specified auto Ethernet operation, use the **no** form of this command.

ip sla ethernet-monitor reaction-configuration *operation-number* [**react** *monitored-element* [**action-type** {**none**| **trapOnly**}] [**threshold-type** {**average** [*number-of-measurements*]| **consecutive** [*occurrences*]| **immediate**| **never**| **xofy** [*x-value y-value*]}] [**threshold-value** *upper-threshold lower-threshold*]]

no ip sla ethernet-monitor reaction-configuration *operation-number* [**react** *monitored-element*]

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation for which reactions are to be configured.

react <i>monitored-element</i>	(Optional) Specifies the element to be monitored for threshold violations. Keyword options for the monitored-element argument are as follows: • connectionLoss --Specifies that a reaction should occur if there is a one-way connection loss for the monitored operation. • jitterAvg --Specifies that a reaction should occur if the average round-trip jitter value violates the upper threshold or lower threshold. • jitterDSAvg --Specifies that a reaction should occur if the average one-way destination-to-source jitter value violates the upper threshold or lower threshold. • jitterSDAvg --Specifies that a reaction should occur if the average one-way source-to-destination jitter value violates the upper threshold or lower threshold. • maxOfNegativeDS --Specifies that a reaction should occur if the one-way maximum negative jitter destination-to-source threshold is violated. • maxOfNegativeSD --Specifies that a reaction should occur if the one-way maximum negative jitter source-to-destination threshold is violated. • maxOfPositiveDS --Specifies that a reaction should occur if the one-way maximum positive jitter destination-to-source threshold is violated. • maxOfPositiveSD --Specifies that a reaction should occur if the one-way maximum positive jitter source-to-destination threshold is violated.

react <i>monitored-element</i> (continued)	• packetLateArrival --Specifies that a reaction should occur if the one-way number of late packets violates the upper threshold or lower threshold. • packetLossDS --Specifies that a reaction should occur if the one-way destination-to-source packet loss value violates the upper threshold or lower threshold. • packetLossSD --Specifies that a reaction should occur if the one-way source-to-destination packet loss value violates the upper threshold or lower threshold. • packetMIA --Specifies that a reaction should occur if the one-way number of missing packets violates the upper threshold or lower threshold. • packetOutOfSequence --Specifies that a reaction should occur if the one-way number of packets out of sequence violates the upper threshold or lower threshold. • rtt --Specifies that a reaction should occur if the round-trip time violates the upper threshold or lower threshold. • timeout --Specifies that a reaction should occur if there is a one-way timeout for the monitored operation.
action-type none	(Optional) Specifies that no action is taken when threshold events occur. The none keyword is the default value. Note If the threshold-typenever keywords are configured, the action-type keyword is disabled.
action-type trapOnly	(Optional) Specifies that a Simple Network Management Protocol (SNMP) trap notification should be sent when threshold violation events occur. Note If the threshold-typenever keywords are configured, the action-type keyword is disabled.

threshold-type average [<i>number-of-measurements</i>]	(Optional) Specifies that when the average of a specified number of measurements for the monitored element exceeds the upper threshold or when the average of a specified number of measurements for the monitored element drops below the lower threshold, the action defined by the action-type keyword should be performed. For example, if the upper threshold for reactrttthreshold-typeaverage3 is configured as 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000/3 = 5667$. In this case, the average exceeds the upper threshold. The default number of 5 averaged measurements can be changed using the <i>number-of-measurements</i> argument. The valid range is from 1 to 16. This syntax is not available if the connectionLoss or timeout keyword is specified as the monitored element, because upper and lower thresholds do not apply to these options.
threshold-type consecutive [<i>occurrences</i>]	(Optional) Specifies that when a threshold violation for the monitored element is met consecutively for a specified number of times, the action defined by the action-type keyword should be performed. The default number of 5 consecutive occurrences can be changed using the <i>occurrences</i> argument. The valid range is from 1 to 16.
threshold-type immediate	(Optional) Specifies that when a threshold violation for the monitored element is met, the action defined by the action-type keyword should be performed immediately.
threshold-type never	(Optional) Specifies that threshold violations should not be monitored. This is the default threshold type.
threshold-type xofy [<i>x-valuey-value</i>]	(Optional) Specifies that when a threshold violation for the monitored element is met x number of times within the last y number of measurements ("x of y"), action defined by the action-type keyword should be performed. The default is 5 for both the x and y values (xofy55). The valid range for each value is from 1 to 16.
threshold-value [<i>upper-thresholdlower-threshold</i>]	(Optional) Specifies the upper-threshold and lower-threshold values of the applicable monitored elements. See the table in the "Usage Guidelines" section for a list of the default values.

Command Default IP SLAs proactive threshold monitoring is disabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(33)SRB	This command was introduced.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Usage Guidelines

You can configure the **ipslaethernet-monitorreaction-configuration** command multiple times to enable proactive threshold monitoring for multiple elements (for example, configuring thresholds for round-trip time and destination-to-source packet loss) for the same operation. However, disabling of individual monitored elements is not supported. In other words, the **noipslaethernet-monitorreaction-configuration** command will disable all proactive threshold monitoring configuration for the specified IP SLAs operation.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Use the **ipslaloggingsnmp** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Use the **snmp-serverenabletrapsrtr** command to enable the sending of IP SLAs SNMP trap notifications.

To display the current threshold monitoring configuration settings for an auto Ethernet operation, use the **showipslaethernet-monitorconfiguration** command.

The table below lists the default upper and lower thresholds for specific monitored elements.

Table 13: Default Threshold Values for Monitored Elements

Monitored Element Keyword	Upper Threshold	Lower Threshold
jitterAvg	100 ms	100 ms

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using an IP SLAs auto Ethernet operation. In this example, operation 10 is configured to automatically create IP SLAs Ethernet ping operations for all the discovered maintenance endpoints in the domain named testdomain and VLAN identification number 34. As specified by the proactive threshold monitoring configuration, when three consecutive connection loss events occur, an SNMP trap notification should be sent. The schedule period for operation 10 is 60 seconds, and the operation is scheduled to start immediately.

```
Router(config)# ip sla ethernet-monitor 10
Router(config-ip-sla-ethernet-monitor)# type echo domain testdomain vlan 34
!
Router(config)# ip sla ethernet-monitor reaction-configuration 10 react connectionLoss
threshold-type consecutive 3 action-type trapOnly
!
Router(config)# ip sla ethernet-monitor schedule 10 schedule-period 60 start-time now
```

Related Commands

Command	Description
ip sla ethernet-monitor	Begins configuration for an IP SLAs auto Ethernet operation and enters Ethernet monitor configuration mode.
ip sla logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.
show ip sla ethernet-monitor configuration	Displays configuration settings for IP SLAs auto Ethernet operations.
snmp-server enable traps rtr	Enables the sending of IP SLAs SNMP trap notifications.

ip sla ethernet-monitor schedule

To configure the scheduling parameters for an IP Service Level Agreements (SLAs) auto Ethernet operation, use the **ip sla ethernet-monitor schedule** command in global configuration mode. To stop the operation and place it in the default state (pending), use the **no** form of this command.

ip sla ethernet-monitor schedule *operation-number* **schedule-period** *seconds* [**frequency** [*seconds*]]
[**start-time** {**after** *hh : mm : ss*| *hh : mm* [: *ss*] [*month day*| *day month*]}| **now**| **pending**}]

no ip sla ethernet-monitor schedule *operation-number*

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation to be scheduled.
schedule-period <i>seconds</i>	Specifies the time period (in seconds) in which the start times of the individual IP SLAs operations are distributed.
frequency <i>seconds</i>	(Optional) Specifies the number of seconds after which each IP SLAs operation is restarted. The default frequency is the value specified for the schedule period.
start-time	(Optional) Time when the operation starts collecting information. If the start time is not specified, no information is collected.
after <i>hh : mm : ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.
<i>hh : mm</i> [: <i>ss</i>]	(Optional) Specifies an absolute start time using hours, minutes, and seconds. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a month and day.
<i>month</i>	(Optional) Name of the month in which to start the operation. If a month is not specified, the current month is used. Use of this argument requires that a day be specified. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day (in the range 1 to 31) on which to start the operation. If a day is not specified, the current day is used. Use of this argument requires that a month be specified.

now	(Optional) Indicates that the operation should start immediately.
pending	(Optional) No information is collected. This option is the default value.

Command Default

The IP SLAs auto Ethernet operation is placed in a pending state (that is, the operation is enabled but is not actively collecting information).

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Usage Guidelines

After you schedule an IP SLAs auto Ethernet operation with the **ip sla ethernet-monitor schedule** command, you should not change the configuration of the operation until the operation has finished collecting information. To change the configuration of the operation, use the **no ip sla ethernet-monitor schedule operation-number** command in global configuration mode and then enter the new configuration information.

To display the current configuration settings of an IP SLAs auto Ethernet operation, use the **show ip sla ethernet-monitor configuration** command in user EXEC or privileged EXEC mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using an IP SLAs auto Ethernet operation. In this example, operation 10 is configured to automatically create IP SLAs Ethernet ping operations for all the discovered maintenance endpoints in the domain named testdomain and VLAN identification number 34. As specified by the proactive threshold monitoring configuration, when three consecutive connection loss events occur, a Simple Network Management Protocol (SNMP) trap notification should be sent. The schedule period for operation 10 is 60 seconds, and the operation is scheduled to start immediately.

```
ip sla ethernet-monitor 10
 type echo domain testdomain vlan 34
 !
ip sla ethernet-monitor reaction-configuration 10 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
 !
ip sla ethernet-monitor schedule 10 schedule-period 60 start-time now
```

Related Commands

Command	Description
ip sla ethernet-monitor	Begins configuration for an IP SLAs auto Ethernet operation and enters Ethernet monitor configuration mode.
show ip sla ethernet-monitor configuration	Displays configuration settings for IP SLAs auto Ethernet operations.

ip sla group schedule

To perform multioperation scheduling for Cisco IOS IP Service Level Agreements (SLAs) operations, use the **ip sla group schedule** command in global configuration mode. To cause all the IP SLAs operations belonging to a multioperation schedule to become inactive, use the **no** form of this command.

```
ip sla group schedule group-id {operation-ids| add operation-ids| delete operation-ids| reschedule}
{schedule-period seconds| schedule-together} [ageout seconds] [frequency [seconds] range
random-frequency-range] [life {forever| seconds}] [start-time {hh : mm [: ss] [month day| day month]}|
pending| now| after hh : mm : ss| random milliseconds}]
```

```
no ip sla group schedule group-id
```

Syntax Description

<i>group-id</i>	Identification number for the group of IP SLAs operation to be scheduled. The range is from 0 to 65535.
<i>operation-ids</i>	List of one or more identification (ID) numbers of the IP SLAs operations to be included in a new multioperation schedule. The length of this argument is up to 125 characters. Indicate ranges of operation ID numbers with a hyphen. Individual ID numbers and ranges of ID numbers are delimited by a comma. For example, enter a list of operation ID numbers in any of the following ways: • 2, 3, 4, 9, 20 • 10-20, 30-35, 60-70 • 2, 3, 4, 90-100, 105-115 In Cisco IOS Release 15.2(4)T and later releases and in Cisco IOS Release 15.1(1)T: A single operation ID is a valid option for this argument.
add <i>operation-ids</i>	Specifies the ID numbers of one or more IP SLAs operations to be added to an existing multioperation schedule.
delete <i>operation-ids</i>	Specifies the ID numbers of one or more IP SLAs operations to be removed from an existing multioperation schedule.

reschedule	Recalculates the start time for each IP SLAs operation within the multioperation schedule based on the number of operations and the schedule period. Use this keyword after an operation has been added to or removed from an existing multioperation schedule.
schedule-period <i>seconds</i>	Specifies the amount of time (in seconds) for which the group of IP SLAs operations is scheduled. The range is from 1 to 604800.
schedule-together	Starts and runs all of the specified operations at the same time.
ageout <i>seconds</i>	(Optional) Specifies the number of seconds to keep the IP SLAs operations in memory when they are not actively collecting information. The default is 0 (never ages out).
frequency <i>seconds</i>	(Optional) Specifies the number of seconds after which each IP SLAs operation is restarted. The frequency of all operations belonging to the multioperation schedule is overridden and set to the specified frequency. The range is from 1 to 604800. Note The default frequency is the value specified for the schedule period.
frequency range <i>random-frequency-range</i>	(Optional) Enables the random scheduler option. See the “Usage Guidelines” section for more information. The random scheduler option is disabled by default. The frequencies at which the IP SLAs operations within the multioperation schedule will restart are chosen randomly within the specified frequency range (in seconds). Separate the lower and upper values of the frequency range with a hyphen (for example, 80-100).
life forever	(Optional) Schedules the IP SLAs operations to run indefinitely.
life <i>seconds</i>	(Optional) Specifies the number of seconds the IP SLAs operations will actively collect information. The default is 3600 (one hour).
start-time	(Optional) Indicates the time at which the group of IP SLAs operations will start collecting information. If the start-time is not specified, no information is collected until the start-time is configured or a trigger occurs that performs a start-time now .

<i>hh : mm [: ss]</i>	(Optional) Specifies an absolute start time for the multioperation schedule using hours, minutes, and (optionally) seconds. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a <i>month</i> and <i>day</i> .
<i>month</i>	(Optional) Specifies the name of the month in which to start the multioperation schedule. If month is not specified, the current month is used. Use of this argument requires that a day be specified. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Specifies the number of the day (in the range 1 to 31) on which to start the multioperation schedule. If a day is not specified, the current day is used. Use of this argument requires that a month be specified.
pending	(Optional) Indicates that no information is being collected. This is the default value.
now	(Optional) Indicates that the multioperation schedule should start immediately.
after <i>hh : mm : ss</i>	(Optional) Indicates that the multioperation schedule should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.
random <i>milliseconds</i>	(Optional) Adds a random number of milliseconds (between 0 and the specified value) to the current time, after which the operation will start. The range is from 0 to 10000.

Command Default

The multioperation schedule is placed in a **pending** state (that is, the group of IP SLAs operations are enabled but are not actively collecting information).

Command Modes

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor group schedule command.

Release	Modification
12.4(6)T	The following arguments and keywords were added: • add <i>operation-ids</i> • delete <i>operation-ids</i> • reschedule
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr group schedule command. The range keyword and <i>random-frequency-range</i> argument were added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor group schedule command. The range keyword and <i>random-frequency-range</i> argument were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor group schedule command. The range keyword and <i>random-frequency-range</i> argument were added.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.
15.1(1)T	This command was modified. Support for scheduling a single operation was added.
15.1(4)M	This command was modified. A random scheduler will not schedule an IP SLAs probe for which enhanced-history is configured. A fixed frequency multioperation scheduler will not schedule an IP SLAs probe for which enhanced history is configured if the enhanced-history interval is not a multiple of the scheduler frequency.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.2(4)T	This command was modified. Support for scheduling a single operation was added.
15.3(1)T	This command was modified. The random keyword was added for scheduling a random start time.
15.3(2)S	This command was modified. The schedule-together keyword was added. This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Though the IP SLAs multioperation scheduling functionality helps in scheduling thousands of operations, you should be cautious when specifying the number of operations, the schedule period, and the frequency to avoid any significant CPU impact.

For example, consider a scenario where you are scheduling 1 to 780 operations at a schedule period of 60 seconds. The command would be as follows:

ip sla group schedule 2 1-780 schedule-period 60 start-time now

IP SLAs calculates how many operations it should start in each 1-second interval by dividing the number of operations by the schedule period (780 operations divided by 60 seconds, which is 13 operations per second). Operations 1 to 13 in multioperation group 2 start after 0 seconds, operations 14 to 26 start after 1 second, operations 27 to 40 start after 2 seconds, and the iteration continues until operations 768 to 780 start after 59 seconds. This high value of operations starting at every 1-second interval (especially for jitter operations) can load the CPU to very high values.

On a Cisco 2600 router, the maximum recommended value of operations per second is 6 or 7 (approximately 350 to 400 operations per minute). Exceeding this value of 6 or 7 operations per second could cause major performance (CPU) impact. Note that the maximum recommended value of operations per second varies from platform to platform.

Note

No warning messages will be displayed if IP SLAs multiple operations scheduling leads to a high number of operations starting per second.

When you reboot the router, the IP SLAs multiple operations scheduling functionality schedules the operations in the same order as was done before the reboot. For example, assume the following operation had been scheduled:

ip sla group schedule 2 1-20 schedule-period 40 start-time now

Over a range of 40 seconds, 20 operations have to be started (that is, one operation every 2 seconds). After the system reboot, operation 1 will start at t seconds and operation 2 starts at $t + 2$ seconds, operation 3 starts at $t + 4$ seconds, and so on.

The IP SLAs multiple operations scheduling functionality schedules the maximum number of operations possible without aborting. However, this functionality skips those IP SLAs operations that are already running or those that are not configured and hence do not exist. The total number of operations will be calculated based on the number of operations specified in the command, irrespective of the number of operations that are missing or already running. The IP SLAs multiple operations scheduling functionality displays a message showing the number of active and missing operations. However, these messages are displayed only if you schedule operations that are not configured or are already running.

Use the **random** keyword with the **start-time** keyword to randomly choose a scheduled start time for the operation. A random number of milliseconds between 0 and the specified value will be added to the current time to define the start time. The value provided for the random start time applies only to the first time the operation runs after which normal frequency rules apply.

In Cisco IOS Release 15.2(4)T and later releases, and in Cisco IOS Release 15.1(1)T, a single operation ID is a valid option for the *operation-ids* argument. Before Cisco IOS Release 15.1(1)T and in releases between Cisco IOS Release 15.1(1)T and 15.2(4)T, the **ip sla group schedule** command was not used to schedule a single operation because the only valid options for the *operation-ids* argument were a list (id,id,id) of IDs, a

range (id-id) of IDs, or a combination of lists and ranges. If you attempted to use this command to schedule a single operation, the following messages were displayed:

```
Router(config)# sla group schedule 1 1 schedule-period 5 start-time now
%Group Scheduler: probe list wrong syntax
%Group schedule string of probe ID's incorrect
```

Before Cisco IOS Release 15.1(4)M, if an IP SLAs probe that included the **history enhanced** command was added to a multioperation scheduler and the enhanced-history interval was not a multiple of the scheduler frequency, the enhanced-history interval was overwritten and set to a multiple of the scheduler frequency.

In Cisco IOS Release 15.1(4)M and later releases, if an IP SLAs probe that includes the **history enhanced** command is added to a multioperation scheduler and the enhanced-history interval is not a multiple of the scheduler frequency, the probe is not scheduled and the following message is displayed:

```
Warning, some probes not scheduled because they have Enhanced History Interval which not
multiple of group frequency.
```

The IP SLAs random scheduler option provides the capability to schedule multiple IP SLAs operations to begin at random intervals over a specified duration of time. The random scheduler option is disabled by default. To enable the random scheduler option, you must configure the **frequency range** *random-frequency-range* keywords and argument. The operations within the multioperation schedule restart at uniformly distributed random frequencies within the specified frequency range. The following guidelines apply for setting the frequency range:

- The starting value of the frequency range should be greater than the timeout values of all the operations in the multioperation schedule.
- The starting value of the frequency range should be greater than the schedule period (amount of time for which the group of operations is scheduled). This guideline ensures that the same operation does not get scheduled more than once within the schedule period.

The following guidelines apply if the random scheduler option is enabled:

- The individual operations in a multioperation schedule will be uniformly distributed to begin at random intervals over the schedule period.
- The operations within the multioperation schedule restart at uniformly distributed random frequencies within the specified frequency range.
- The minimum time interval between the start of each operation in a multioperation schedule is 100 milliseconds (0.1 seconds). If the random scheduler option is disabled, the minimum time interval is 1 second.
- Only one operation can be scheduled to begin at any given time. If the random scheduler option is disabled, multiple operations can begin at the same time.
- The first operation will always begin at 0 milliseconds of the schedule period.
- The order in which each operation in a multioperation schedule begins is random.
- Before Cisco IOS Release 15.1(4)M, if an IP SLAs probe that includes the **history enhanced** command is added to a random scheduler, the probe may or may not be scheduled.

- In Cisco IOS Release 15.1(4)M and later releases, if an IP SLAs probe that includes the **history enhanced** command is added to a random scheduler, the probe is not scheduled and the following message is displayed:

```
Warning, some probes not scheduled because they have Enhanced History configured.
```

The following guidelines apply when an IP SLAs operation is added to or deleted from an existing multioperation schedule:

- If an operation is added that already belongs to the multioperation schedule, no action is taken.
- If two or more operations are added after the multioperation schedule has started, then the start times of the newly added operations will be uniformly distributed based on a time interval that was calculated prior to the addition of the new operations. If two or more operations are added before the multioperation schedule has started, then the time interval is recalculated based on both the existing and newly added operations.
- If an operation is added to a multioperation schedule in which the random scheduler option is enabled, then the start time and frequency of the newly added operation will be randomly chosen within the specified parameters.
- If an operation is added to a multioperation schedule in which the existing operations have aged out or the lifetimes of the existing operations have ended, the newly added operation will start and remain active for the amount of time specified by the multioperation schedule.
- If an active operation is deleted, then the operation will stop collecting information and become inactive.
- If the **ip sla group schedule group-id reschedule** command is entered after an operation is added or deleted, the time interval between the start times of the operations is recalculated based on the new number of operations belonging to the multioperation schedule.

Examples

The following example shows how to schedule IP SLAs operations 3, 4, and 6 to 10 (identified as group 1) using multioperation scheduling. In this example, the operations are scheduled to begin at equal intervals over a schedule period of 20 seconds. The first operation (or set of operations) is scheduled to start immediately. Since the frequency is not specified, it is set to the value of the schedule period (20 seconds) by default.

```
ip sla group schedule 1 3, 4, 6-10 schedule-period 20 start-time now
```

The following example shows how to schedule IP SLAs operations 1 to 3 (identified as group 2) using the random scheduler option. In this example, the operations are scheduled to begin at random intervals over a schedule period of 50 seconds. The first operation is scheduled to start immediately. The frequency at which each operation will restart will be chosen randomly within the range of 80 to 100 seconds.

```
ip sla group schedule 2 1-3 schedule-period 50 frequency range 80-100 start-time now
```

Related Commands

Command	Description
ip sla schedule	Configures the scheduling parameters for a single IP SLAs operation.

Command	Description
show ip sla configuration	Displays the configuration details of the IP SLAs operation.
show ip sla group schedule	Displays the group scheduling details of the IP SLAs operations.

ip sla key-chain

To enable Cisco IOS IP Service Level Agreements (SLAs) control message authentication and specify an MD5 key chain, use the **ip sla key-chain** command in global configuration mode. To remove control message authentication, use the no form of this command.

ip sla key-chain *name*

no ip sla key-chain

Syntax Description

<i>name</i>	Name of MD5 key chain.

Command Default

Control message authentication is disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor key-chain command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr key-chain command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor key-chain command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor key-chain command.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.

Usage Guidelines

The authentication configuration on the IP SLAs source and IP SLAs Responder devices must be the same. In other words, both devices must be configured with the same key chain or both devices must not use authentication.

If the **ip sla key-chain** command is entered, at least one key must be added to the specified MD5 key chain in order for MD5 authentication to occur.

Examples

In the following example, the IP SLAs control message uses MD5 authentication, and the key chain name is CSAA. The authentication string for key 1 is csaakey1.

```
ip sla key-chain csaa
key chain csaa
key 1
key-string csaakey1
```

Related Commands

Command	Description
key	Identifies an authentication key on a key chain.
key chain	Enables authentication for routing protocols and identifies a group of authentication keys.
key-string (authentication)	Specifies the authentication string for a key.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

ip sla logging traps

To enable the generation of Simple Network Management Protocol (SNMP) system logging messages specific to Cisco IOS IP Service Level Agreements (SLAs) trap notifications, use the **ip sla logging traps** command in global configuration mode. To disable IP SLAs system logging SNMP traps, use the **no** form of this command.

ip sla logging traps

no ip sla logging traps

Syntax Description This command has no arguments or keywords.

Command Default SNMP system logging messages specific to IP SLAs trap notifications are not generated.

Command Modes Global configuration

Command History	Release	Modification
	12.4(4)T	This command was introduced. This command replaces the ip sla monitor logging traps command.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr logging traps command.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor logging traps command.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor logging traps command.
	12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.
	15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
	Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
	15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines SNMP trap notifications for IP SLAs can be configured as a triggered action, to be sent when monitored values exceed an upper threshold or fall below a lower threshold, or when a set of defined conditions are met.

For example, an SNMP trap can be triggered by five consecutive timeouts during an IP SLAs operation. The sending of SNMP traps is one of the options for triggered actions that can be configured for IP SLAs threshold violations. To configure proactive threshold monitoring parameters for an IP SLAs operation, use the **ip sla reaction-configuration** command in global configuration mode.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Use the **snmp-server enable traps rtr** command to enable the sending of IP SLAs SNMP trap notifications.

Examples

The following example shows the configuration of IP SLAs traps to be triggered for round-trip time (RTT) violations and Voice over IP (VoIP) mean opinion score (MOS) violations, and the necessary SNMP configuration for enabling these SNMP logging traps:

```
ip sla 1
  udp-jitter 209.165.200.225 dest-port 9234
!
ip sla schedule 1 start now life forever
ip sla reaction-configuration 1 react rtt threshold-type immediate threshold-value 3000
2000 action-type trapOnly
ip sla reaction-configuration 1 react MOS threshold-type consecutive 4 threshold-value 390
220 action-type trapOnly
!
ip sla logging traps
snmp-server enable traps rtr
```

Related Commands

Command	Description
ip sla reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.
logging on	Controls (enables or disables) system message logging globally.

ip sla low-memory

To specify how much unused memory must be available to allow Cisco IOS IP Service Level Agreements (SLAs) configuration, use the **ip sla low-memory** command in global configuration mode. To remove the type configuration for the operation, use the **no** form of this command.

ip sla low-memory *bytes*

no ip sla low-memory

Syntax Description

<i>bytes</i>	Specifies amount of memory, in bytes, that must be available to configure IP SLA. The range is from 0 to the maximum amount of free memory bytes available.

Command Default

The default amount of memory is 25 percent of the memory available on the system.

Command Modes

Global configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor low-memory command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr low-memory command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor low-memory command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor low-memory command.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.

Usage Guidelines

The **ip sla low-memory** command allows you to specify the amount of memory that the IP SLAs can use. If the amount of available free memory falls below the value specified in the **ip sla low-memory** command, then the IP SLAs will not allow new operations to be configured. If this command is not used, the default low-memory value is 25 percent. This means that if 75 percent of system memory has been utilized you will not be able to configure any IP SLAs characteristics.

The value of the **ip sla low-memory** command should not exceed the amount of free memory available on the system. To determine the amount of free memory available on the system, use the **show memory** user EXEC or privileged EXEC command.

Examples

In the following example, the router is configured so that no less than 2 MB of memory will be free for IP SLAs configuration:

```
ip sla low-memory 2097152
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
show memory	Displays statistics about memory, including memory-free pool statistics.

ip sla monitor

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor** command is replaced by the **ip sla** command. See the **ip sla** command for more information.

To begin configuring a Cisco IOS IP Service Level Agreements (SLAs) operation and enter IP SLA monitor configuration mode, use the **ip sla monitor** command in global configuration mode. To remove all configuration information for an operation, including the schedule of the operation, reaction configuration, and reaction triggers, use the no form of this command.

ip sla monitor *operation-number*

no ip sla monitor *operation-number*

Syntax Description

<i>operation-number</i>	Operation number used for the identification of the IP SLAs operation you want to configure.

Command Default

No IP SLAs operation is configured.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla command.
12.2(33)SXI	This command was replaced by the ip sla command.

Usage Guidelines

The **ip sla monitor** command is used to begin configuration for an IP SLAs operation. Use this command to specify an identification number for the operation you are about to configure. After you enter this command, the router will enter IP SLA monitor configuration mode.

IP SLAs allows a maximum of 2000 operations.

Debugging is supported only on the first 32 operation numbers.

After you configure an operation, you must schedule the operation. For information on scheduling an operation, refer to the **ip sla monitor schedule** and **ip sla monitor group schedule** global configuration commands. You can also optionally set reaction triggers for the operation. For information on reaction triggers, refer to the **ip sla monitor reaction-configuration** and **ip sla monitor reaction-trigger** global configuration commands.

To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Note

After you schedule an operation, you cannot modify the configuration of the operation. To modify the configuration of the operation after it is scheduled, you must first delete the IP SLAs operation (using the **no ip sla monitor** command) and then reconfigure the operation with the new operation parameters.

To display the current configuration settings of the operation, use the **show ip sla monitor configuration** command in user EXEC or privileged EXEC mode.

Examples

In the following example, operation 99 is configured as a UDP jitter operation and scheduled to start running in 5 hours:

```
ip sla monitor 99
 type jitter dest-ipaddr 172.29.139.134 dest-port 5000 num-packets 20
!
ip sla monitor schedule 99 life 300 start-time after 00:05:00
```

Note

If operation 99 already exists and has not been scheduled, the command line interface will enter IP SLA monitor configuration mode for operation 99. If the operation already exists and has been scheduled, this command will fail.

Related Commands

Command	Description
ip sla monitor group schedule	Configures the group scheduling parameters for multiple IP SLAs operations.
ip sla monitor reaction-configuration	Configures certain actions to occur based on events under the control of IP SLAs.
ip sla monitor reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action type options are defined with the ip sla monitor reaction-configuration command.
ip sla monitor schedule	Configures the scheduling parameters for a single IP SLAs operation.

Command	Description
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.
show ip sla monitor statistics	Displays the current operational status and statistics of all IP SLAs operations or a specified operation.
show ip sla monitor statistics aggregated	Displays the aggregated statistical errors and distribution information for all IP SLAs operations or a specified operation.

ip sla monitor group schedule

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor group schedule** command is replaced by the **ip sla group schedule** command. See the **ip sla group schedule** command for more information.

To perform group scheduling for Cisco IOS IP Service Level Agreements (SLAs) operations, use the **ip sla monitor group schedule** command in global configuration mode. To stop the operation and place it in the default state of normal scheduling, use the **no** form of this command.

ip sla monitor group schedule *group-operation-number* *operation-id-numbers* **schedule-period** *seconds* [**ageout** *seconds*] [**frequency** [*seconds*] **range** *random-frequency-range*] [**life** {**forever** | *seconds*}] [**start-time** {*hh : mm [: ss]* [*month day* | *day month*]}] **pending** | **now** | **after** *hh : mm : ss* }

no ip sla monitor group schedule

Syntax Description

<i>group-operation-number</i>	Group configuration or group schedule number of the IP SLAs operation to be scheduled. The range is from 0 to 65535.
<i>operation-id-numbers</i>	The list of IP SLAs operation ID numbers in the scheduled operation group. Indicate ranges of operation ID numbers with a hyphen. Individual ID numbers and ranges of ID numbers are delimited by a comma. For example, enter a list of operation ID numbers in any of the following ways: • 2, 3, 4, 9, 20 • 10-20, 30-35, 60-70 • 2, 3, 4, 90-100, 105-115 The <i>operation-id-numbers</i> argument can include a maximum of 125 characters.
schedule-period <i>seconds</i>	Specifies the time (in seconds) for which the IP SLAs operation group is scheduled. The range is from 1 to 604800.
ageout <i>seconds</i>	(Optional) Specifies the number of seconds to keep the operation in memory when it is not actively collecting information. The default is 0 (never ages out).

frequency <i>seconds</i>	(Optional) Specifies the number of seconds after which each IP SLAs operation is restarted. If this keyword and argument are specified, the frequency of all operations belonging to the group will be overridden and set to the specified frequency. The range is from 1 to 604800. Note If this keyword and argument are not specified, the frequency for each operation is set to the value specified for the schedule period.
frequency range <i>random-frequency-range</i>	(Optional) Enables the random scheduler option. The random scheduler option is disabled by default. The uniformly distributed random frequencies at which the group of operations will restart is chosen within the specified frequency range (in seconds). Separate the lower and upper frequency values with a hyphen (for example, 80-100).
life forever	(Optional) Schedules the operation to run indefinitely.
life <i>seconds</i>	(Optional) Specifies the number of seconds the operation actively collects information. The default is 3600 (one hour).
start-time	(Optional) Specifies the time when the operation starts collecting information. If the start-time is not specified, no information is collected until the start-time is configured or a trigger occurs that performs a start-time now .
<i>hh : mm [: ss]</i>	(Optional) Specifies an absolute start time using hours, minutes, and (optionally) seconds. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a <i>month</i> and <i>day</i>.
<i>month</i>	(Optional) Name of the month to start the operation in. If month is not specified, the current month is used. Use of this argument requires that a day be specified. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day (in the range 1 to 31) to start the operation on. If a day is not specified, the current day is used. Use of this argument requires that a month be specified.

pending	(Optional) Indicates that no information is collected. This is the default value.
now	(Optional) Indicates that the operation should start immediately.
after <i>hh : mm : ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.

Command Default

The operation is placed in a **pending** state (that is, the operation is enabled but is not actively collecting information).

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(2)T	The range keyword and <i>random-frequency-range</i> argument were introduced.
12.4(4)T	This command was replaced by the ip sla group schedule command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr group schedule command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla group schedule command.
12.2(33)SXI	This command was replaced by the ip sla group schedule command.

Usage Guidelines

Though IP SLAs multiple operations scheduling functionality helps in scheduling thousands of operations, you should be cautious while specifying the number of operations, the schedule period, and the operation group frequency to avoid any significant CPU impact.

For example, consider a scenario where you are scheduling 1 to 780 operations at a schedule period of 60 seconds. The command would be as follows:

ip sla monitor group schedule 2 1-780 schedule-period 60 start-time now

IP SLAs calculates how many operations it should start in each 1-second interval by dividing the number of operations by the schedule period (780 operations divided by 60 seconds, which is 13 operations per second). Operations 1 to 13 in operation group 2 start after 0 seconds, operations 14 to 26 start after 1 second, operations 27 to 40 start after 2 seconds, and the iteration continues until operations 768 to 780 start after 59 seconds.

This high value of operations starting at every 1-second interval (especially for jitter operations) can load the CPU to very high values.

On a Cisco 2600 router, the maximum recommended value of operations per second is 6 or 7 (approximately 350 to 400 operations per minute). Exceeding this value of 6 or 7 operations per second could cause major performance (CPU) impact. Note that the maximum recommended value of operations per second varies from platform to platform.

**Note**

No warning messages will be displayed if IP SLAs multiple operations scheduling leads to a high number of operations starting per second.

When you reboot the router, the IP SLAs multiple operations scheduling functionality schedules the operations in the same order as was done before the reboot. For example, assume the following operation had been scheduled:

ip sla monitor group schedule 2 1-20 schedule-period 40 start-time now

Over a range of 40 seconds, 20 operations have to be started (that is, one operation every 2 seconds). After the system reboot, operation 1 will start at t seconds and operation 2 starts at $t + 2$ seconds, operation 3 starts at $t + 4$ seconds, and so on.

The IP SLAs multiple operations scheduling functionality schedules the maximum number of operations possible without aborting. However, this functionality skips those IP SLAs operations that are already running or those that are not configured and hence do not exist. The total number of operations will be calculated based on the number of operations specified in the command, irrespective of the number of operations that are missing or already running. The IP SLAs multiple operations scheduling functionality displays a message showing the number of active and missing operations. However, these messages are displayed only if you schedule operations that are not configured or are already running.

IP SLAs Random Scheduler

The IP SLAs random scheduler option provides the capability to schedule multiple IP SLAs operations to begin at random intervals over a specified duration of time. The random scheduler option is disabled by default. To enable the random scheduler option, you must configure the **frequency range** *random-frequency-range* keywords and argument. The group of operations restarts at uniformly distributed random frequencies within the specified frequency range. The following guidelines apply for setting the frequency range:

- The starting value of the frequency range should be greater than the timeout values of all the operations in the group operation.
- The starting value of the frequency range should be greater than the schedule period (amount of time for which the group operation is scheduled). This guideline ensures that the same operation does not get scheduled more than once within the schedule period.

The following guidelines apply if the random scheduler option is enabled:

- The individual operations in a group operation will be uniformly distributed to begin at random intervals over the schedule period.
- The group of operations restarts at uniformly distributed random frequencies within the specified frequency range.
- The minimum time interval between the start of each operation in a group operation is 100 milliseconds (0.1 seconds). If the random scheduler option is disabled, the minimum time interval is 1 second.

- Only one operation can be scheduled to begin at any given time. If the random scheduler option is disabled, multiple operations can begin at the same time.
- The first operation will always begin at 0 milliseconds of the schedule period.
- The order in which each operation in a group operation begins is random.

Examples

The following example shows how to schedule IP SLAs operations 3, 4, and 6 to 10 as a group (identified as group 1). In this example, the operations are scheduled to begin at equal intervals over a schedule period of 20 seconds. The first operation (or set of operations) is scheduled to start immediately. Since the frequency is not specified, it is set to the value of the schedule period (20 seconds) by default.

```
ip sla monitor group schedule 1 3, 4, 6-10 schedule-period 20 start-time now
```

The following example shows how to schedule IP SLAs operations 1 to 3 as a group (identified as group 2). In this example, the operations are scheduled to begin at random intervals over a schedule period of 50 seconds. The first operation is scheduled to start immediately. The random scheduler option is enabled and the frequency at which the group of operations will restart will be chosen randomly within the range of 80-100 seconds.

```
ip sla monitor group schedule 2 1-3 schedule-period 50 frequency range 80-100 start-time now
```

Related Commands

Command	Description
ip sla monitor schedule	Configures the scheduling parameters for a single IP SLAs operation.
show ip sla monitor configuration	Displays the configuration details of the IP SLAs operation.
show ip sla monitor group schedule	Displays the group scheduling details of the IP SLAs operations.

ip sla monitor key-chain

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor key-chain** command is replaced by the **ip sla key-chain** command. See the **ip sla key-chain** command for more information.

To enable Cisco IOS IP Service Level Agreements (SLAs) control message authentication and specify an MD5 key chain, use the **ip sla monitor key-chain** command in global configuration mode. To remove control message authentication, use the no form of this command.

ip sla monitor key-chain *name*

no ip sla monitor key-chain

Syntax Description

<i>name</i>	Name of MD5 key chain.

Command Default

Control message authentication is disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla key-chain command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr key-chain command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla key-chain command.
12.2(33)SXI	This command was replaced by the ip sla key-chain command.

Usage Guidelines

The authentication configuration on the IP SLAs source and IP SLAs Responder devices must be the same. In other words, both devices must be configured with the same key chain or both devices must not use authentication.

If the **ip sla monitor key-chain** command is entered, at least one key must be added to the specified MD5 key chain in order for MD5 authentication to occur.

Examples

In the following example, the IP SLAs control message uses MD5 authentication, and the key chain name is CSAA. The authentication string for key 1 is csaakey1.

```
ip sla monitor key-chain csaa
key chain csaa
key 1
key-string csaakey1
```

Related Commands

Command	Description
key	Identifies an authentication key on a key chain.
key chain	Enables authentication for routing protocols and identifies a group of authentication keys.
key-string (authentication)	Specifies the authentication string for a key.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

ip sla monitor logging traps

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor logging traps** command is replaced by the **ip sla logging traps** command. See the **ip sla logging traps** command for more information.

To enable the generation of Simple Network Management Protocol (SNMP) system logging messages specific to Cisco IOS IP Service Level Agreements (SLAs) trap notifications, use the **ip sla monitor logging traps** command in global configuration mode. To disable IP SLAs system logging SNMP traps, use the **no** form of this command.

ip sla monitor logging traps

no ip sla monitor logging traps

Syntax Description

This command has no arguments or keywords.

Command Default

SNMP system logging messages specific to IP SLAs trap notifications are not generated.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla logging traps command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr logging traps command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla logging traps command.
12.2(33)SXI	This command was replaced by the ip sla logging traps command.

Usage Guidelines

SNMP trap notifications for IP SLAs can be configured as a triggered action, to be sent when monitored values exceed an upper threshold or fall below a lower threshold, or when a set of defined conditions are met. For example, an SNMP trap can be triggered by five consecutive timeouts during an IP SLAs operation. The sending of SNMP traps is one of the options for triggered actions that can be configured for IP SLAs threshold violations. To configure proactive threshold monitoring parameters for an IP SLAs operation, use the **ip sla monitor reaction-configuration** command in global configuration mode.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Use the **snmp-server enable traps rtr** command to enable the sending of IP SLAs SNMP trap notifications.

Examples

The following example shows the configuration of IP SLAs traps to be triggered for round-trip time (RTT) violations and Voice over IP (VoIP) mean opinion score (MOS) violations, and the necessary SNMP configuration for enabling these SNMP logging traps:

```
ip sla monitor 1
type jitter dest-ipaddr 209.165.200.225 dest-port 9234
!
ip sla monitor schedule 1 start now life forever
ip sla monitor reaction-configuration 1 react rtt threshold-type immediate threshold-value
3000 2000 action-type trapOnly
ip sla monitor reaction-configuration 1 react MOS threshold-type consecutive 4 threshold-value
390 220 action-type trapOnly
!
ip sla monitor logging traps
snmp-server enable traps rtr
```

Related Commands

Command	Description
ip sla monitor reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.
snmp-server enable traps rtr	Enables the sending of IP SLAs SNMP trap notifications.

ip sla monitor low-memory

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor low-memory** command is replaced by the **ip sla low-memory** command. See the **ip sla low-memory** command for more information.

To specify how much unused memory must be available to allow Cisco IOS IP Service Level Agreements (SLAs) configuration, use the **ip sla monitor low-memory** command in global configuration mode. To remove the type configuration for the operation, use the **no** form of this command.

ip sla monitor low-memory *bytes*

no ip sla monitor low-memory

Syntax Description

<i>bytes</i>	Specifies amount of memory, in bytes, that must be available to configure IP SLA. The range is from 0 to the maximum amount of free memory bytes available.

Command Default

The default amount of memory is 25 percent of the memory available on the system.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla low-memory command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr low-memory command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla low-memory command.
12.2(33)SXI	This command was replaced by the ip sla low-memory command.

Usage Guidelines

The **ip sla monitor low-memory** command allows you to specify the amount of memory that the IP SLAs can use. If the amount of available free memory falls below the value specified in the **ip sla monitor**

low-memory command, then the IP SLAs will not allow new operations to be configured. If this command is not used, the default low-memory value is 25 percent. This means that if 75 percent of system memory has been utilized you will not be able to configure any IP SLAs characteristics.

The value of the **ip sla monitor low-memory** command should not exceed the amount of free memory available on the system. To determine the amount of free memory available on the system, use the **show memory** user EXEC or privileged EXEC command.

Examples

In the following example, the router is configured so that no less than 2 MB of memory will be free for IP SLAs configuration:

```
ip sla monitor low-memory 2097152
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
show memory	Displays statistics about memory, including memory-free pool statistics.

ip sla monitor reaction-configuration

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ipslamonitorreaction-configuration** command is replaced by the **ipslareaction-configuration** command. See the **ipslareaction-configuration** command for more information.

To configure proactive threshold monitoring parameters for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **ipslamonitorreaction-configuration** command in global configuration mode. To clear all threshold monitoring configuration for a specified IP SLAs operation, use the **no** form of this command.

ip sla monitor reaction-configuration *operation-number* **react** *monitored-element* [**action-type** *option*]
[**threshold-type** {**average** [*number-of-measurements*] | **consecutive** [*occurrences*] | **immediate** | **never** | **xofy**
[*x-value y-value*]}] [**threshold-value** *upper-threshold lower-threshold*]

no ip sla monitor reaction-configuration *operation-number*

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation for which reactions are to be configured.

react <i>monitored-element</i>	Specifies the element to be monitored for threshold violations. Note The elements available for monitoring will vary depending on the type of IP SLAs operation you are configuring. Keyword options for the monitored-element argument are as follows: • connectionLoss --Specifies that a reaction should occur if there is a one-way connection loss for the monitored operation. • icpif --Specifies that a reaction should occur if the one-way Calculated Planning Impairment Factor (ICPIF) value violates the upper threshold or lower threshold. • jitterAvg --Specifies that a reaction should occur if the average round-trip jitter value violates the upper threshold or lower threshold. • jitterDSAvg --Specifies that a reaction should occur if the average one-way destination-to-source jitter value violates the upper threshold or lower threshold. • jitterSDAvg --Specifies that a reaction should occur if the average one-way source-to-destination jitter value violates the upper threshold or lower threshold.

react *monitored-element* (continued)

- **maxOfNegativeDS** --Specifies that a reaction should occur if the one-way maximum negative jitter destination-to-source threshold is violated.
- **maxOfNegativeSD** --Specifies that a reaction should occur if the one-way maximum negative jitter source-to-destination threshold is violated.
- **maxOfPositiveDS** --Specifies that a reaction should occur if the one-way maximum positive jitter destination-to-source threshold is violated.
- **maxOfPositiveSD** --Specifies that a reaction should occur if the one-way maximum positive jitter source-to-destination threshold is violated.
- **mos** --Specifies that a reaction should occur if the one-way mean opinion score (MOS) value violates the upper threshold or lower threshold.
- **packetLateArrival** --Specifies that a reaction should occur if the one-way number of late packets violates the upper threshold or lower threshold.
- **packetLossDS** --Specifies that a reaction should occur if the one-way destination-to-source packet loss value violates the upper threshold or lower threshold.
- **packetLossSD** --Specifies that a reaction should occur if the one-way source-to-destination packet loss value violates the upper threshold or lower threshold.
- **packetMIA** --Specifies that a reaction should occur if the one-way number of missing packets violates the upper threshold or lower threshold.
- **packetOutOfSequence** --Specifies that a reaction should occur if the one-way number of packets out of sequence violates the upper threshold or lower threshold.
- **rtt** --Specifies that a reaction should occur if the round-trip time violates the upper threshold or lower threshold.
- **timeout** --Specifies that a reaction should occur if there is a one-way timeout for the monitored operation.
- **verifyError** --Specifies that a reaction should occur if there is a one-way error verification violation.

action-type <i>option</i>	(Optional) Specifies what action or combination of actions the operation performs when threshold events occur. If the threshold-type never keywords are defined, the action-type keyword is disabled. The <i>option</i> argument can be one of the following keywords: • none --No action is taken. This option is the default value. • trapAndTrigger --Trigger an Simple Network Management Protocol (SNMP) trap and start another IP SLAs operation when the violation conditions are met, as defined in the trapOnly and triggerOnly options. • trapOnly --Send an SNMP logging trap when the specified violation type occurs for the monitored element. • triggerOnly --Have one or more target operation's operational state make the transition from pending to active when the violation conditions are met. The target operations to be triggered are specified using the ipslamonitorreaction-trigger command. A target operation will continue until its life expires, as specified by the target operation's configured lifetime value. A triggered target operation must finish its life before it can be triggered again.
threshold-type average [<i>number-of-measurements</i>]	(Optional) When the average of a specified number of measurements for the monitored element exceeds the upper threshold or when the average of a specified number of measurements for the monitored element drops below the lower threshold, perform the action defined by the action-type keyword. For example, if the upper threshold for reactrttthreshold-typeaverage3 is configured as 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000 / 3 = 5667$, thus violating the 5000 ms upper threshold. The default number of 5 averaged measurements can be changed using the <i>number-of-measurements</i> argument. The valid range is from 1 to 16. This syntax is not available if the connectionLoss, timeout, or verifyError keyword is specified as the monitored element, because upper and lower thresholds do not apply to these options.

threshold-type consecutive [<i>occurrences</i>]	(Optional) When a threshold violation for the monitored element is met consecutively for a specified number of times, perform the action defined by the action-type keyword. The default number of 5 consecutive occurrences can be changed using the <i>occurrences</i> argument. The valid range is from 1 to 16. The <i>occurrences</i> value will appear in the output of the showiplamonitorreaction-configuration command as the “Threshold Count” value.
threshold-type immediate	(Optional) When a threshold violation for the monitored element is met, immediately perform the action defined by the action-type keyword.
threshold-type never	(Optional) Do not calculate threshold violations. This is the default threshold type.
threshold-type xofy [<i>x-value</i> <i>y-value</i>]	(Optional) When a threshold violations for the monitored element is met <i>x</i> number of times within the last <i>y</i> number of measurements (“<i>x</i> of <i>y</i>”), perform the action defined by the action-type keyword. The default is 5 for both the <i>x</i> and <i>y</i> values (xofy55). The valid range for each value is from 1 to 16. The <i>x-value</i> will appear in the output of the showiplamonitorreaction-configuration command as the “Threshold Count” value, and the <i>y-value</i> will appear as the “Threshold Count2” value.
[threshold-value <i>upper-threshold</i> <i>lower-threshold</i>]	(Optional) Specifies the upper-threshold and lower-threshold values of the applicable monitored elements. See the table in the “Usage Guidelines” section for a list of the default values. Note For MOS threshold values (reactmos), the number is expressed in three digits representing ones, tenths, and hundredths. For example, to express a MOS threshold of 3.20, enter 320. The valid range is from 100 (1.00) to 500 (5.00).

Command Default

IP SLAs proactive threshold monitoring is disabled.

**Note**

See the table in the “Usage Guidelines” section for a list of the default upper and lower thresholds for specific monitored elements.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(2)T	The following keywords for the <i>monitored-element</i> argument were added: • icpif • maxOfNegativeDS • maxOfPositiveDS • maxOfNegativeSD • maxOfPositiveSD • packetLateArrival • packetMIA • packetOutOfSequence
12.4(4)T	This command was replaced by the ipslareaction-configuration command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtreaction-configuration command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ipslareaction-configuration command.
12.2(33)SXI	This command was replaced by the ipslareaction-configuration command.

Usage Guidelines

You can configure the **ipslamonitorreaction-configuration** command multiple times to enable proactive threshold monitoring for multiple elements (for example, configuring thresholds for destination-to-source packet loss and MOS) for the same operation. However, disabling of individual monitored elements is not supported. In other words, the **noipslamonitorreaction-configuration** command will disable all proactive threshold monitoring configuration for the specified IP SLAs operation.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Use the **ipslamonitorloggingtraps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Use the **snmp-serverenabletrapsrtr** command to enable the sending of IP SLAs SNMP trap notifications.

To display the current threshold monitoring configuration settings for an IP SLAs operation, use the **showipslamonitorconfiguration** command.

The table below lists the default upper and lower thresholds for specific monitored elements.

Table 14: Default Threshold Values for Monitored Elements

Monitored Element Keyword	Upper Threshold	Lower Threshold
icpif	93 (score)	93 (score)
jitterAvg	100 ms	100 ms
jitterDSAvg	100 ms	100 ms
jitterSDAvg	100 ms	100 ms
maxOfNegativeDS	10000 ms	10000 ms
maxOfPositiveDS	10000 ms	10000 ms
maxOfNegativeSD	10000 ms	10000 ms
maxOfPositiveSD	10000 ms	10000 ms
mos	500 (score)	100 (score)
packetLateArrival	10000 packets	10000 packets
packetLossDS	10000 packets	10000 packets
packetLossSD	10000 packets	10000 packets
packetMIA	10000 packets	10000 packets
packetOutOfSequence	10000 packets	10000 packets
rtt	5000 ms	3000 ms

Examples

In the following example, IP SLAs operation 10 (a UDP jitter operation) is configured to send an SNMP logging trap when the MOS value exceeds 4.9 (best quality) or falls below 2.5 (poor quality):

```
ip sla monitor reaction-configuration 10 react mos threshold-type immediate threshold-value
490 250 action-type trapOnly
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
ip sla monitor logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.

Command	Description
ip sla monitor reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action-type options are defined with the ipslamonitorreaction-configuration global configuration command.
show ip sla monitor reaction-configuration	Displays the configured proactive threshold monitoring settings for all IP SLAs operations or a specified operation.
show ip sla monitor reaction-trigger	Displays the configured state of triggered IP SLAs operations.
snmp-server enable traps rtr	Enables the sending of IP SLAs SNMP trap notifications.

ip sla monitor reaction-trigger

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor reaction-trigger** command is replaced by the **ip sla reaction-trigger** command. See the **ip sla reaction-trigger** command for more information.

To define a second Cisco IOS IP Service Level Agreements (SLAs) operation to make the transition from a pending state to an active state when one of the trigger action type options are defined with the **ip sla monitor reaction-configuration** command, use the **ip sla monitor reaction-trigger** command in global configuration mode. To remove the trigger combination, use the no form of this command.

ip sla monitor reaction-trigger *operation-number target-operation*

no ip sla monitor reaction-trigger *operation*

Syntax Description

<i>operation-number</i>	Number of the operation for which a trigger action type is defined (using the ip sla monitor reaction-configuration global configuration command).
<i>target-operation</i>	Number of the operation that will be triggered into an active state.

Command Default

No trigger combination is defined.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla reaction-trigger command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr reaction-trigger command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla reaction-trigger command.
12.2(33)SXI	This command was replaced by the ip sla reaction-trigger command.

Usage Guidelines

Triggers are usually used for diagnostics purposes and are not intended for use during normal operation conditions.

Examples

In the following example, a trigger action type is defined for IP SLAs operation 2. When operation 2 experiences certain user-specified threshold violation events while it is actively collecting statistical information, the operation state of IP SLAs operation 1 will be triggered to change from pending to active.

```
ip sla monitor reaction-trigger 2 1
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
ip sla monitor reaction-configuration	Configures certain actions to occur based on events under the control of the IP SLA.
ip sla monitor schedule	Configures the time parameters for an IP SLAs operation.

ip sla monitor reset

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor reset** command is replaced by the **ip sla reset** command. See the **ip sla reset** command for more information.

To perform a shutdown and restart of the Cisco IOS IP Service Level Agreements (SLAs) engine, use the **ip sla monitor reset** command in global configuration mode.

ip sla monitor reset

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla reset command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr reset command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla reset command.
12.2(33)SXI	This command was replaced by the ip sla reset command.

Usage Guidelines

The **ip sla monitor reset** command stops all operations, clears IP SLAs configuration information, and returns the IP SLAs feature to the startup condition. This command does not reread the IP SLAs configuration stored in the startup configuration in NVRAM. You must retype the configuration or load a previously saved configuration file.

Note

The **ip sla monitor reset** command does not remove IP SLAs label switched path (LSP) Health Monitor configurations from the running configuration.

**Note**

Use the **ip sla monitor reset** command only in extreme situations such as the incorrect configuration of a number of operations.

Examples

The following example shows how to reset the Cisco IOS IP SLAs engine, clearing all stored IP SLAs information and configuration:

```
ip sla monitor reset
```

Related Commands

Command	Description
ip sla monitor restart	Restarts a stopped IP SLAs operation.

ip sla monitor responder

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor responder** command is replaced by the **ip sla responder** command. See the **ip sla responder** command for more information.

To enable the Cisco IOS IP Service Level Agreements (SLAs) Responder for general IP SLAs operations, use the **ip sla monitor responder** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

ip sla monitor responder

no ip sla monitor responder

Syntax Description

This command has no arguments or keywords.

Command Default

The IP SLAs Responder is disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla responder command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr responder command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla responder command.
12.2(33)SXI	This command was replaced by the ip sla responder command.

Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable the sending and receiving of IP SLAs control packets. Enabling the IP SLAs Responder allows the generation of packet loss statistics on the device sending IP SLAs operations.

Prior to sending an operation packet to the IP SLAs Responder, the IP SLAs operation sends a control message to the IP SLAs Responder to enable the destination port.

Examples

The following example shows how to enable the IP SLAs Responder:

```
ip sla monitor responder
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
ip sla monitor responder type tcpConnect ipaddress	Enables the IP SLAs Responder for TCP Connect operations.
ip sla monitor responder type udpEcho ipaddress	Enables the IP SLAs Responder for UDP echo and jitter operations.

ip sla monitor responder type tcpConnect ipaddress

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor responder type tcpConnect ipaddress** command is replaced by the **ip sla responder tcp-connect ipaddress** command. See the **ip sla responder tcp-connect ipaddress** command for more information.

To enable the Cisco IOS IP Service Level Agreements (SLAs) Responder for TCP Connect operations, use the **ip sla monitor responder type tcpConnect ipaddress** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

ip sla monitor responder type tcpConnect ipaddress *ip-address* **port** *port-number*

no ip sla monitor responder type tcpConnect ipaddress *ip-address* **port** *port-number*

Syntax Description

<i>ip-address</i>	Destination IP address.
port <i>port-number</i>	Specifies the destination port number.

Command Default

The IP SLAs Responder is disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla responder tcp-connect ipaddress command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr responder type tcpConnect command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla responder tcp-connect ipaddress command.
12.2(33)SXI	This command was replaced by the ip sla responder tcp-connect ipaddress command.

Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable the acceptance and return of TCP connection operation packets.

Examples

The following example shows how to enable the IP SLAs Responder for TCP connection operations:

```
ip sla monitor responder type tcpConnect ipaddress A.B.C.D port 1
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
ip sla monitor responder	Enables the IP SLAs Responder for nonspecific IP SLAs operations.

ip sla monitor responder type udpEcho ipaddress

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor responder type udpEcho ipaddress** command is replaced by the **ip sla responder udp-echo ipaddress** command. See the **ip sla responder udp-echo ipaddress** command for more information.

To enable the Cisco IOS IP Service Level Agreements (SLAs) Responder for User Datagram Protocol (UDP) echo or jitter operations, use the **ip sla monitor responder type udpEcho ipaddress** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

ip sla monitor responder type udpEcho ipaddress *ip-address* **port** *port-number*

no ip sla monitor responder type udpEcho ipaddress *ip-address* **port** *port-number*

Syntax Description

<i>ip-address</i>	Destination IP address.
port <i>port-number</i>	Specifies the destination port number.

Command Default

The IP SLAs Responder is disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla responder udp-echo ipaddress command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr responder type udpEcho command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla responder udp-echo ipaddress command.
12.2(33)SXI	This command was replaced by the ip sla responder udp-echo ipaddress command.

Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable UDP echo and jitter (UDP+) operations with control disabled.

Examples

The following example shows how to enable the IP SLAs Responder for jitter operations:

```
ip sla monitor responder type udpEcho ipaddress A.B.C.D port 1
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
ip sla monitor responder	Enables the IP SLAs Responder for nonspecific IP SLAs operations.

ip sla monitor restart

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor restart** command is replaced by the **ip sla restart** command. See the **ip sla restart** command for more information.

To restart a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **ip sla monitor restart** command in global configuration mode.

ip sla monitor restart *operation-number*

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation to restart. IP SLAs allows a maximum of 2000 operations.

Command Default

None

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla restart command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr restart command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla restart command.
12.2(33)SXI	This command was replaced by the ip sla restart command.

Usage Guidelines

To restart an operation, the operation should be in an active state.

IP SLAs allows a maximum of 2000 operations.

This command does not have a **no** form.

Examples

The following example shows how to restart operation 12:

```
ip sla monitor restart 12
```

Related Commands

Command	Description
ip sla monitor reset	Clears all current IP SLAs statistics and configuration information from the router and resets the IP SLAs engine.

ip sla monitor schedule

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **ip sla monitor schedule** command is replaced by the **ip sla schedule** command. See the **ip sla schedule** command for more information.

To configure the scheduling parameters for a single Cisco IOS IP Service Level Agreements (SLAs) operation, use the **ip sla monitor schedule** command in global configuration mode. To stop the operation and place it in the default state (pending), use the **no** form of this command.

ip sla monitor schedule *operation-number* [**life** {**forever**| *seconds*}] [**start-time** {*hh : mm [: ss]* [*month day* | *day month*]}] [**pending**| **now**| **after** *hh : mm : ss*] [**ageout** *seconds*] [**recurring**]

no ip sla monitor schedule *operation-number*

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation to schedule.
life forever	(Optional) Schedules the operation to run indefinitely.
life <i>seconds</i>	(Optional) Number of seconds the operation actively collects information. The default is 3600 seconds (one hour).
start-time	(Optional) Time when the operation starts.
<i>hh : mm [: ss]</i>	Specifies an absolute start time using hour, minute, and (optionally) second. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a <i>month</i> and <i>day</i> .
<i>month</i>	(Optional) Name of the month to start the operation in. If month is not specified, the current month is used. Use of this argument requires that a day be specified. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day (in the range 1 to 31) to start the operation on. If a day is not specified, the current day is used. Use of this argument requires that a month be specified.
pending	(Optional) No information is collected. This is the default value.

now	(Optional) Indicates that the operation should start immediately.
after <i>hh : mm : ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.
ageout <i>seconds</i>	(Optional) Number of seconds to keep the operation in memory when it is not actively collecting information. The default is 0 seconds (never ages out).
recurring	(Optional) Indicates that the operation will start automatically at the specified time and for the specified duration every day.

Command Default

The operation is placed in a pending state (that is, the operation is enabled but not actively collecting information).

Command Modes

Global configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the ip sla schedule command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the rtr schedule command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the ip sla schedule command.
12.2(33)SXI	This command was replaced by the ip sla schedule command.

Usage Guidelines

After you schedule the operation with the **ip sla monitor schedule** command, you cannot change the configuration of the operation. To change the configuration of the operation, use the **no** form of the **ip sla monitor** global configuration command and reenter the configuration information.

If the operation is in a pending state, you can define the conditions under which the operation makes the transition from pending to active with the **ip sla monitor reaction-trigger** and **ip sla monitor reaction-configuration** global configuration commands. When the operation is in an active state, it immediately begins collecting information.

The following time line shows the age-out process of the operation:

W-----X-----Y-----Z
 where:

- W is the time the operation was configured with the **ip sla monitor** global configuration command.
- X is the start time or start of life of the operation (that is, when the operation became “active”).
- Y is the end of life as configured with the **ip sla monitor schedule** global configuration command (life seconds have counted down to zero).
- Z is the age out of the operation.

Age out starts counting down at W and Y, is suspended between X and Y, and is reset to its configured size at Y.

The operation can age out before it executes (that is, Z can occur before X). To ensure that this does not happen, configure the difference between the operation’s configuration time and start time (X and W) to be less than the age-out seconds.

Note

The total RAM required to hold the history and statistics tables is allocated at the time of scheduling the IP SLAs operation. This prevents router memory problems when the router gets heavily loaded and lowers the amount of overhead an IP SLAs operation causes on a router when it is active.

The **recurring** keyword is supported only for scheduling single IP SLAs operations. You cannot schedule multiple IP SLAs operations using the **ip sla monitor schedule** command. The **life** value for a recurring IP SLAs operation should be less than one day. The **ageout** value for a recurring operation must be “never” (which is specified with the value 0), or the sum of the **life** and **ageout** values must be more than one day. If the **recurring** option is not specified, the operations are started in the existing normal scheduling mode.

Examples

In the following example, operation 25 begins actively collecting data at 3:00 p.m. on April 5. This operation will age out after 12 hours of inactivity, which can be before it starts or after it has finished with its life. When this operation ages out, all configuration information for the operation is removed (that is, the configuration information is no longer in the running configuration in RAM).

```
ip sla monitor schedule 25 life 43200 start-time 15:00 apr 5 ageout 43200
```

In the following example, operation 1 begins collecting data after a 5-minute delay:

```
ip sla monitor schedule 1 start-time after 00:05:00
```

In the following example, operation 3 begins collecting data immediately and is scheduled to run indefinitely:

```
ip sla monitor schedule 3 start-time now life forever
```

In the following example, operation 15 begins automatically collecting data every day at 1:30 a.m.:

```
ip sla monitor schedule 15 start-time 01:30:00 recurring
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

Command	Description
ip sla monitor group schedule	Performs group scheduling for IP SLAs operations.
ip sla monitor reaction-configuration	Configures certain actions to occur based on events under the control of the IP SLA.
ip sla monitor reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action-type options is defined with the ip sla monitor reaction-configuration global configuration command.
show ip sla monitor configuration	Displays the configuration details of the IP SLAs operation.

ip sla on-demand ethernet

To configure an on-demand IP Service Level Agreements (SLAs) IP SLAs Metro-Ethernet 3.0 delay, delay variation, or loss operation for real-time troubleshooting of Ethernet services, use the **ip sla on-demand ethernet** command in privileged EXEC mode.

```
ip sla on-demand ethernet{DMMv1|SLM} {operation-number | domain domain-name {evc evc-id| vlan vlan-id} {mpid target-mp-id| mac-address target-address} cos cos source {mpid source-mp-id| mac-address source-address} {continuous [interval milliseconds] | burst [interval milliseconds][number number] [frequency seconds]} [size bytes] aggregation seconds} {duration seconds| max number-of-packets}
```

Cisco ASR 901 Routers

```
ip sla on-demand ethernetSLM {operation-number | domain domain-name {evc evc-id| vlan vlan-id} {mpid target-mp-id| mac-address target-address} cos cos source {mpid source-mp-id| mac-address source-address} {continuous [interval milliseconds] | burst [interval milliseconds][number number] [frequency seconds]} [size bytes] aggregation seconds} {duration seconds| max number-of-packets}
```

Syntax Description

DMMv1	Specifies that the frames sent are concurrent Ethernet frame Delay Measurement (ETH-DM) synthetic frames.
SLM	Specifies that the frames sent are Synthetic Loss Measurement (SLM) frames.
<i>operation-number</i>	Operation number of the already-configured IP SLAs operation to be referenced.
domain <i>domain-name</i>	Specifies the name of the Ethernet maintenance Operations, Administration & Maintenance (OAM) domain.
evc <i>evc-id</i>	Specifies the Ethernet Virtual Circuit (EVC) identification name.
vlan <i>vlan-id</i>	Specifies the VLAN identification number. The range is from 1 to 4096.
mpid <i>target-mp-id</i>	Specifies the identification numbers of the MEP at the destination. The range is from 1 to 8191.

mac-address <i>target-address</i>	Specifies the MAC address of the MEP at the destination.
cos <i>cos</i>	Specifies, for this MEP, which class of service (CoS) that will be sent in the Ethernet Connectivity Fault Management (CFM) message. The range is from 0 to 7.
source mpid <i>source-mp-id</i>	Specifies the identification numbers of the MEP being configured. The range is from 1 to 8191.
source mac-address <i>source-address</i>	Specifies the MAC address of the MEP being configured.
continuous	Specifies that a continuous stream of frames are to be sent during this on-demand operation.
burst	Specifies that burst of frames are to sent during this on-demand operation.
interval <i>milliseconds</i>	(Optional) Specifies the length of time in milliseconds (ms) between successive synthetic frames. The default is 1000 (1 second). The valid values are: • 10 • 20 • 25 • 50 • 100 • 1000
number <i>number-of-frames</i>	(Optional) Specifies the number of frames sent per burst. The value is 1 to 65535. The default is 10. Note The number per burst must be less than or equal to the value for max.

frequency <i>seconds</i>	(Optional) Specifies the number of seconds between bursts. The value is 1 to 900. The default is 60. Note The value for frequency must be greater than or equal to the value of <i>N</i>, where <i>N</i> is (number) X (interval) and greater than or equal to the value for duration.
size <i>bytes</i>	(Optional) Specifies payload size, in 4-octet increments, for the frames. The value is 64 to 384. The default is 64.
aggregation <i>seconds</i>	Specifies the length of time in seconds during which the performance measurements are conducted, after which the statistics are displayed. Value is 1 to 900. Note • The value for aggregation must be less than or equal to the value for duration. • For burst mode: The value for aggregation must be greater than and a multiple of the value for frequency.
duration <i>seconds</i>	Specifies the length of time in seconds, during which the on-demand operation runs. The value is 1 to 65535. Note • The value of duration must be greater than or equal to the value for aggregation. • For burst mode, the value for duration cannot be greater than the value for frequency.

max <i>number-of-packets</i>	Specifies the maximum number of packets sent during the on-demand operation. The value is 1 to 65535. Note • For burst mode, the value for max must be equal to or greater than the value for number. • For burst mode, the value for duration in max number of packets must be a multiple of the value for size.

Command Default On-demand operations are not configured.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	15.3(1)S	This command was introduced.
	Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
	15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Use this command to create and start a on-demand operation for generating statistics for Ethernet services. On-demand operations are pseudo operations that run in the background.

Use the *operation-number* argument with this command to create and run an on-demand operation in referenced mode. The operation being referenced must first be configured by using the **ethernet y1731 delay** and **ethernet y1731 loss** commands in IP SLA configuration mode.

Use the **domain** *domain-name* keyword and argument with the **ip sla on-demand ethernet** command to create and run an on-demand operation in direct mode.

For the burst mode of operation, the value of (number of frames) X (length of interval) must be less than or equal to the value of frequency, which must be less than or equal to the value of aggregation, which must be less than or equal to the value of duration.

To stop an on-demand operation, press **Ctrl-Shift-6**.

The **DMMv1** and **SLM** keywords for this command are not case sensitive. The keywords displayed in the online help contain uppercase letters to enhance readability only.

Examples

The following example shows how to configure an on-demand operation in reference mode for measuring frame loss. The operation to be referenced (11) must be configured before it can be referenced.

```
Device(config)# ip sla 11
Device(config-ip-sla)# ethernet y1731 loss SLM domain xxx vlan 10 mpid 3 cos 1 source mpid 1
Device(config-sla-y1731-loss)# end
Device# ip sla on-demand ethernet slm 11 duration 38
```

The following example shows how to configure the same operation on-demand operation in direct mode:

```
Device# ip sla on-demand ethernet SLM domain xxx vlan 10 mpid 3 cos 1 source mpid 1 continuous
aggregation 35 duration 38
```

```
Loss Statistics for Y1731 Operation 2984884426

Related Commands

Command	Description
ethernet y1731 delay	Configures a sender Maintenance End Point (MEP) for an IP Service Level Agreements (SLAs) Metro Ethernet 3.0 (UTI-T Y.1731) delay or delay variation operation.
ethernet y1731 loss	Configures a sender Maintenance End Point (MEP) for an IP Service Level Agreements (SLAs) Metro Ethernet 3.0 (UTI-T Y.1731) frame loss operation.

ip sla profile video

To specify a video profile name and enter a IP SLA VO profile endpoint configuration mode for configuring a user-defined video traffic profile for IP Service Level Agreements (SLAs) video operation, use the **ip sla profile video** command in global configuration mode. To remove the video profile, use the **no** form of this command.

ip sla profile video *profile-name*

no ip sla profile video *profile-name*

Syntax Description

<i>profile-name</i>	The following video profile names are valid options for the profile-name argument: • CP-9900: Cisco Unified 9900 Series IP Phone System (CP-9900) • CTS: Cisco Telepresence System 1000/3000 (CTS-1000/3000) • custom: Customized video endpoint type • <i>name</i>: User-defined unique identifier for profile.

Command Default

No video profile is configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use this command to specify a profile name and enter the IP SLA VO endpoint configuration mode for configuring a user-defined video traffic profile.

The keywords for this command are not case sensitive. The keywords in online help contain uppercase letters to enhance readability only.

Examples

```
Router(config)# ip sla video profile my-profile
Router(cfg-ipslavo-profile)# endpoint cts
Router(cfg-ipslavo-cts-profile)#
```

Related Commands

Command	Description
endpoint	Specifies endpoint type for a user-defined video profile.
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

ip sla reaction-configuration

To configure proactive threshold monitoring parameters for an IP Service Level Agreements (SLAs) operation, use the **ip sla reaction-configuration** command in global configuration mode. To disable all the threshold monitoring configuration for a specified IP SLAs operation, use the **no** form of this command.

```
ip sla reaction-configuration operation-number [react monitored-element [action-type option]  
[threshold-type {average [number-of-measurements] | consecutive [occurrences] | immediate | never | xofy  
[x-value y-value]}] [threshold-value upper-threshold lower-threshold]]
```

```
no ip sla reaction-configuration operation-number [react monitored-element]
```

Cisco ASR 901 Routers

```
ip sla reaction-configuration operation-number [react {unavailableDS | unavailableSD | loss-ratioDS |  
loss-ratioSD} [threshold-type {average [number-of-measurements] | consecutive [occurrences] | immediate |  
never | xofy [x-value y-value]}] [threshold-value upper-threshold lower-threshold]]
```

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation for which reactions are to be configured.

react <i>monitored-element</i>	

(Optional) Specifies the element to be monitored for threshold violations.

Note The elements supported for monitoring will vary depending on the type of IP SLAs operation you are running. See the Usage Guidelines for information.

Keyword options for the *monitored-element* argument are as follows:

- **connectionLoss** —Specifies that a reaction should occur if there is a one-way connection loss for the monitored operation. The **threshold-value** keyword does not apply to this monitored element.
- **frameLossDS** —Specifies that a reaction should occur if the one-way destination-to-source digital signal processor (DSP) frame loss value violates the upper threshold or lower threshold.
- **iaJitterDS** —Specifies that a reaction should occur if the one-way destination-to-source interarrival jitter value violates the upper threshold or lower threshold.
- **iaJitterSD** —Specifies that a reaction should occur if the one-way source-to-destination interarrival jitter value violates the upper threshold or lower threshold.
- **icpif** —Specifies that a reaction should occur if the one-way Calculated Planning Impairment Factor (ICPIF) value violates the upper threshold or lower threshold.
- **jitterAvg** —Specifies that a reaction should occur if the average round-trip jitter value violates the upper threshold or lower threshold.
- **jitterAvgPct** —Specifies that a reaction should occur if the percentile average round-trip jitter value violates the configured threshold.
- **jitterDSAvg** —Specifies that a reaction should occur if the average one-way destination-to-source jitter value violates the upper threshold or lower threshold.
- **jitterDSAvgPct** —Specifies that a reaction should occur if the percentile average one-way destination-to-source jitter value violates the configured threshold.
- **jitterSDAvg** —Specifies that a reaction should

occur if the average one-way source-to-destination jitter value violates the upper threshold or lower threshold.

- **jitterSDAvgPCT** —Specifies that a reaction should occur if the percentile average one-way source-to-destination jitter value violates the configured threshold.

react <i>monitored-element</i> (continued)	

- **latencyDSAvg** —Specifies that a reaction should occur if the average one-way destination-to-source latency value violates the upper threshold or lower threshold.
- **latencySDAvg** —Specifies that a reaction should occur if the average one-way source-to-destination latency value violates the upper threshold or lower threshold.
- **loss-ratioDS**—Specifies that a reaction should occur if the one-way destination-to-source loss-ratio violates the upper threshold or lower threshold.
- **loss-ratioSD**—Specifies that a reaction should occur if the one way source-to-destination loss-ratio violates the upper threshold or lower threshold.
- **maxOflatencyDS** —Specifies that a reaction should occur if the one-way maximum latency destination-to-source threshold is violated.
- **maxOflatencySD** —Specifies that a reaction should occur if the one-way maximum latency source-to-destination threshold is violated.
- **maxOfNegativeDS** —Specifies that a reaction should occur if the one-way maximum negative jitter destination-to-source threshold is violated.
- **maxOfNegativeSD** —Specifies that a reaction should occur if the one-way maximum negative jitter source-to-destination threshold is violated.
- **maxOfPositiveDS** —Specifies that a reaction should occur if the one-way maximum positive jitter destination-to-source threshold is violated.
- **maxOfPositiveSD** —Specifies that a reaction should occur if the one-way maximum positive jitter source-to-destination threshold is violated.
- **mos** —Specifies that a reaction should occur if the one-way Mean Opinion Score (MOS) value violates the upper threshold or lower threshold.
- **moscqds**— Specifies that a reaction should occur if the one-way destination-to-source Mean Opinion Score for Conversational Quality (MOS-CQ) value violates the upper threshold or lower threshold.
- **moscqsd**— Specifies that a reaction should

occur if the one-way source-to-destination Mean Opinion Score for Conversational Quality (MOS-CQ) value violates the upper threshold or lower threshold.

- **moslqds**— Specifies that a reaction should occur if the one-way destination-to-source Mean Opinion Score for Listening Quality (MOS-LQ) value violates the upper threshold or lower threshold.
- **packetLateArrival** —Specifies that a reaction should occur if the one-way number of late packets violates the upper threshold or lower threshold.
- **packetLateArrival** —Specifies that a reaction should occur if the one-way number of late packets violates the upper threshold or lower threshold.

react <i>monitored-element</i> (continued)	

- **packetLoss** —Specifies that a reaction should occur if the packet loss value violates the upper threshold or lower threshold. The path of the packets is unknown.
- **packetLossDS** —Specifies that a reaction should occur if the one-way destination-to-source packet loss value violates the upper threshold or lower threshold.
- **packetLossSD** —Specifies that a reaction should occur if the one-way source-to-destination packet loss value violates the upper threshold or lower threshold.
- **packetMIA** —Specifies that a reaction should occur if the one-way number of missing packets violates the upper threshold or lower threshold.
- **packetOutOfSequence** —Specifies that a reaction should occur if the one-way number of packets out of sequence violates the upper threshold or lower threshold.
- **rFactorDS** —Specifies that a reaction should occur if the one-way destination-to-source estimated transmission rating factor R violates the upper threshold or lower threshold.
- **rFactorSD** —Specifies that a reaction should occur if the one-way source-to-destination estimated transmission rating factor R violates the upper threshold or lower threshold.
- **rtt** —Specifies that a reaction should occur if the round-trip time violates the upper threshold or lower threshold.
- **rttPct** —Specifies that a reaction should occur if the percentile round-trip time violates the configured threshold.
- **successivePacketLoss** —Specifies that a reaction should occur if the one-way number of successively dropped packets violates the upper threshold or lower threshold.
- **timeout** —Specifies that a reaction should occur if there is a one-way timeout for the monitored operation. The **threshold-value** keyword does not apply to this monitored element.
- **unavailableDS**—Specifies that a reaction should occur if the percentage of destination-to-source Frame Loss Ratio (FLR)

	violates the upper threshold or lower threshold. • unavailableSD—Specifies that a reaction should occur if the percentage of source-to-destination FLR violates the upper threshold or lower threshold. • verifyError —Specifies that a reaction should occur if there is a one-way error verification violation. The threshold-value keyword does not apply to this monitored element.
action-type <i>option</i>	(Optional) Specifies what action or combination of actions the operation performs when threshold events occur. If the threshold-type never keywords are defined, the action-type keyword is disabled. The <i>option</i> argument can be one of the following keywords: • none —No action is taken. This option is the default value. • trapAndTrigger —Trigger a Simple Network Management Protocol (SNMP) trap and start another IP SLAs operation when the violation conditions are met, as defined in the trapOnly and triggerOnly options. • trapOnly —Send an SNMP logging trap when the specified violation type occurs for the monitored element. • triggerOnly —Transition one or more target operation's operational state from pending to active when the violation conditions are met. The target operations to be triggered are specified using the ipslareaction-trigger command.

threshold-type average [<i>number-of-measurements</i>]	(Optional) When the average of a specified number of measurements for the monitored element exceeds the upper threshold or when the average of a specified number of measurements for the monitored element drops below the lower threshold, perform the action defined by the action-type keyword. For example, if the upper threshold for reactrttthreshold-typeaverage3 is configured as 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000/3 = 5667$, thus violating the 5000 ms upper threshold. The default number of 5 averaged measurements can be changed using the <i>number-of-measurements</i> argument. The valid range is from 1 to 16. This syntax is not available if the connectionLoss, timeout, or verifyError keyword is specified as the monitored element, because upper and lower thresholds do not apply to these options.
threshold-type consecutive [<i>occurrences</i>]	(Optional) When a threshold violation for the monitored element is met consecutively for a specified number of times, perform the action defined by the action-type keyword. The default number of 5 consecutive occurrences can be changed using the <i>occurrences</i> argument. The valid range is from 1 to 16. The <i>occurrences</i> value will appear in the output of the showipslareaction-configuration command as the “Threshold Count” value.
threshold-type immediate	(Optional) When a threshold violation for the monitored element is met, immediately perform the action defined by the action-type keyword.
threshold-type never	(Optional) Do not calculate threshold violations. This is the default threshold type.
threshold-type xofy [<i>x-value</i> <i>y-value</i>]	(Optional) When a threshold violation for the monitored element is met <i>x</i> number of times within the last <i>y</i> number of measurements (“<i>x</i> of <i>y</i>”), perform the action defined by the action-type keyword. The default is 5 for both the <i>x</i> and <i>y</i> values (xofy55). The valid range for each value is from 1 to 16. The <i>x-value</i> will appear in the output of the showipslareaction-configuration command as the “Threshold Count” value, and the <i>y-value</i> will appear as the “Threshold Count2” value.

threshold-value <i>upper-threshold lower-threshold</i>	(Optional) Specifies the upper-threshold and lower-threshold values of the applicable monitored elements. See the Default Threshold Values for Monitored Elements table in the “Usage Guidelines” section for a list of the default values. Note For MOS threshold values (reactmos), the number is expressed in three digits representing ones, tenths, and hundredths. For example, to express a MOS threshold of 3.20, enter 320 . The valid range is from 100 (1.00) to 500 (5.00).

Command Default IP SLAs proactive threshold monitoring is disabled.

Command Modes Global configuration (config)

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ipslamonitorreaction-configuration command. The following keywords for the <i>monitored-element</i> argument were added to support the IP SLAs RTP-based VoIP operation: • frameLossDS • iaJitterDS • moscqds • moslqds • rFactorDS

Release	Modification
12.4(6)T	This command was modified. The following keywords for the <i>monitored-element</i> argument were added to support the IP SLAs ICMP jitter and IP SLAs RTP-based VoIP operations: • iaJitterSD • latencyDSAvg • latencySDAvg • maxOflatencyDS • maxOflatencySD • moscqsds • packetLoss • rFactorSD • successivePacketLoss
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtreaction-configuration command. The following keywords for the <i>monitored-element</i> argument were added: • icpif • maxOfNegativeDS • maxOfPositiveDS • maxOfNegativeSD • maxOfPositiveSD • packetLateArrival • packetMIA • packetOutOfSequence
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ipslamonitorreaction-configuration command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ipslamonitorreaction-configuration command.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.
15.1(2)S	This command was integrated into Cisco IOS Release 15.1(2)S. This command was modified. The unavailableDS and unavailableSD keywords for <i>monitored-element</i> argument were added for measuring Ethernet Frame Loss Ratio (FLR).

Release	Modification
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.3(2)T	This command was modified. The jitterAvgPct , jitterDSAvgPct , jitterSDAvgPct , overThreshold , and rttPct keywords for the <i>monitored-element</i> argument to track the number of values above the threshold and determine the failure-to-success ratio of a percentile operation.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers. The loss-ratioDS and loss-ratioSD keywords were added.

Usage Guidelines

You can configure the **ipslareaction-configuration** command multiple times to enable proactive threshold monitoring for multiple elements, such as configuring thresholds for both destination-to-source packet loss and MOS for the same operation. However, disabling individual monitored elements is not supported. The **noipslareaction-configuration** command disables all proactive threshold monitoring configuration for the specified IP SLAs operation.

The keyword options for this command are not case sensitive. The keywords in online help for the **action-typeoption** and **reactmonitored-element** keyword and argument combinations contain uppercase letters to enhance readability only.

The **never** keyword option for the **threshold-type** keyword does not work with the **unavailableDS** and **unavailableSD** monitored elements for measuring Ethernet Frame Loss Ratio (FLR).

Not all elements can be monitored by all IP SLAs operations. If you attempt to configure an unsupported *monitored-element*, such as MOS for a UDP echo operation, the following message displays:

```
Invalid react option for the Probe type configured
```

Before Cisco IOS Release 15.2(3)T, when an IP SLA operation is triggered, the (triggered) target operation starts and continues to run independently and without knowledge of the condition of the triggering operation. The target operation continues to run until its life expires, as specified by the lifetime configuration. The target operation must finish its life before it can be triggered again.

In Cisco IOS Release 15.2(3) and later releases, the (triggered) target operation runs until the condition-cleared event. After which the target operation gracefully stops and the state of the target operation changes from Active to Pending so it can be triggered again.

Before Cisco IOS Release 15.1(1)T, valid online help was not available for this command. See the tables below for a list of elements that are supported for each IP SLA operation.

In Cisco IOS Release 15.1(1)T and later releases, type **shift+?** to display a list of supported elements for the IP SLAs operation being configured.

Table 15: Supported Elements, by IP SLA Operation

packetLoss	—	—	—	—	—	—	—	—	—

Return-trip time (RTT) reactions for jitter operations are triggered only at the end of the operation and use the latest value for the return-trip time (LatestRTT). SNMP traps for RTT for jitter operations are based on the average value for the return-trip time (RTTAvg) for the whole operation only and do not include return-trip time values for individual packets sent during the operation.

The connectionLoss trap is sent if the control connection is established and the operation is running, then the IP SLAs responder process stops, for example, if the **noipslaresponder** command is issued. This trap is supported only by operations that use the IPSLA control protocol to establish a control connection, such as udp-jitter and udp-echo. ICMP operations do not support connectionLoss traps.

The table below lists the action or combination of actions that are supported when a threshold event for a monitored element occurs.

Table 17: Supported Action Type for Threshold Events

Threshold Event	Generate Syslog Messages	Trigger SNMP Trap
RTT violations during jitter operations	Y	Unsupported
RTT violations during non-jitter operations	Unsupported	Y
Non-RTT violations other than timeout, connectLoss, or verifyError	Y	Unsupported
timeout violations	Y	Y
connectionLoss violations	Y	Y
verifyError violations	Y	Y

Use the **snmp-serverenabletrapsrtr** or **snmp-serverenabletrapssyslog** command to enable the sending of IP SLAs SNMP trap notifications.

Use the **ipslalogsloggingtraps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications.

The table below lists the default upper and lower thresholds for specific monitored elements.

Table 18: Default Threshold Values for Monitored Elements

Monitored Element Keyword	Upper Threshold	Lower Threshold
frameLossDS	1000 frames	1000 frames
iaJitterDS	20 ms	20 ms
iaJitterSD	20 ms	20 ms
icpif	93 (score)	93 (score)
jitterAvg	100 ms	100 ms
jitterDSAvg	100 ms	100 ms
jitterSDAvg	100 ms	100 ms
latencyDSAvg	5000 ms	3000 ms

Monitored Element Keyword	Upper Threshold	Lower Threshold
latencySDAvg	5000 ms	3000 ms
maxOflatencyDS	5000 ms	3000 ms
maxOflatencySD	5000 ms	3000 ms
maxOfNegativeDS	10000 ms	10000 ms
maxOfNegativeSD	10000 ms	10000 ms
maxOfPositiveDS	10000 ms	10000 ms
maxOfPositiveSD	10000 ms	10000 ms
mos	500 (score)	100 (score)
moscqds	410 (score)	310 (score)
moscqsd	410 (score)	310 (score)
moslqds	410 (score)	310 (score)
packetLateArrival	10000 packets	10000 packets
packetLoss	10000 packets	10000 packets
packetLossDS	10000 packets	10000 packets
packetLossSD	10000 packets	10000 packets
packetMIA	10000 packets	10000 packets
packetOutOfSequence	10000 packets	10000 packets
rFactorDS	80	60
rFactorSD	80	60
rtt	5000 ms	3000 ms
successivePacketLoss	10000 packets	10000 packets

To display the current threshold monitoring configuration settings for an IP SLAs operation, use the **showipslaconfiguration** command.

Examples

The following example shows how to configure IP SLAs operation 10 (a UDP jitter operation) to send an SNMP logging trap when the MOS value exceeds 4.9 (best quality) or falls below 2.5 (poor quality):

```
Router(config)# ip sla reaction-configuration 10 react mos threshold-type immediate
threshold-value 490 250 action-type trapOnly
```

Related Commands

Command	Description
ip sla logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.
ip sla reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action-type options are defined with the ipslareaction-configuration global configuration command.
no ip sla responder	Disables the IP SLAs responder on the destination device.
show ip sla reaction-configuration	Displays the configured proactive threshold monitoring settings for all IP SLAs operations or a specified operation.
show ip sla reaction-trigger	Displays the configured state of triggered IP SLAs operations.
snmp-server enable traps rtr	Enables system to generate CISCO-RTTMON-MIB traps.
snmp-server enable traps syslog	Enables system to generate CISCO-SYSLOG-MIB traps.

ip sla reaction-trigger

To define a second Cisco IOS IP Service Level Agreements (SLAs) operation to make the transition from a pending state to an active state when one of the trigger action type options are defined with the **ip sla reaction-configuration** command, use the **ip sla reaction-trigger** command in global configuration mode. To remove the trigger combination, use the no form of this command.

ip sla reaction-trigger *operation-number target-operation*

no ip sla reaction-trigger *operation*

Syntax Description

<i>operation-number</i>	Number of the operation for which a trigger action type is defined (using the ip sla reaction-configuration global configuration command).
<i>target-operation</i>	Number of the operation that will be triggered into an active state.

Command Default

No trigger combination is defined.

Command Modes

Global configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor reaction-trigger command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr reaction-trigger command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor reaction-trigger command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor reaction-trigger command.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Usage Guidelines

Triggers are usually used for diagnostics purposes and are not intended for use during normal operation conditions.

Examples

In the following example, a trigger action type is defined for IP SLAs operation 2. When operation 2 experiences certain user-specified threshold violation events while it is actively collecting statistical information, the operation state of IP SLAs operation 1 will be triggered to change from pending to active.

```
ip sla reaction-trigger 2 1
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla reaction-configuration	Configures certain actions to occur based on events under the control of the IP SLA.
ip sla schedule	Configures the time parameters for an IP SLAs operation.

ip sla reset

To perform a shutdown and restart of the Cisco IOS IP Service Level Agreements (SLAs) engine, use the **ip sla reset** command in global configuration mode.

ip sla reset

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Global configuration

Command History	Release	Modification
	12.4(4)T	This command was introduced. This command replaces the ip sla monitor reset command.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr reset command.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor reset command.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor reset command.
	12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.

Usage Guidelines The **ip sla reset** command stops all IP SLAs operations, clears IP SLAs configuration information, and returns the IP SLAs feature to the startup condition. This command does not reread the IP SLAs configuration stored in the startup configuration in NVRAM. You must retype the configuration or load a previously saved configuration file.

Note

The **ip sla reset** command does not remove IP SLAs label switched path (LSP) Health Monitor configurations from the running configuration. Use the **auto ip sla mpls-lsp-monitor reset** command to remove LSP Health Monitor configurations from the running configuration.

**Note**

Use the **ip sla reset** command only in extreme situations such as the incorrect configuration of a number of operations.

Examples

The following example shows how to reset the Cisco IOS IP SLAs engine, clearing all stored IP SLAs information and configuration:

```
ip sla reset
```

Related Commands

Command	Description
ip sla restart	Restarts a stopped IP SLAs operation.

ip sla responder

To enable the Cisco IOS IP Service Level Agreements (SLAs) Responder for general IP SLAs operations, use the **ip sla responder** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

ip sla responder

no ip sla responder

Syntax Description This command has no arguments or keywords.

Command Default The IP SLAs Responder is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.4(4)T	This command was introduced. This command replaces the ip sla monitor responder command.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr responder command.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor responder command.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor responder command.
	12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.
	15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
	Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Usage Guidelines This command is used on the destination device for IP SLAs operations to enable the sending and receiving of IP SLAs control packets. Enabling the IP SLAs Responder allows the generation of packet loss statistics on the device sending IP SLAs operations.

Prior to sending an operation packet to the IP SLAs Responder, the IP SLAs operation sends a control message to the IP SLAs Responder to enable the destination port.

The **ip sla responder** command is supported in IPv4 networks. This command can also be used when configuring an IP SLAs operation that supports IPv6 addresses.

Examples

The following example shows how to enable the IP SLAs Responder:

```
ip sla responder
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla responder type tcpConnect ipaddress	Enables the IP SLAs Responder for TCP Connect operations.
ip sla responder type udpEcho ipaddress	Enables the IP SLAs Responder for UDP echo and jitter operations.

ip sla responder auto-register

To configure a destination Cisco routing device or Cisco IP Service Level Agreements (SLAs) Responder to automatically register with the source upon configuration, use the **ip sla responder auto-register** command in global configuration mode. To disable automatic registration, use the **no** form of this command.

ip sla responder auto-register {*source-ipaddress*| *source-hostname*} [**client-id** *client-id*] [**group-name** *name*] [**endpoint-list** *template-name*] [**retry-timer** *minutes*]

no ip sla responder auto-register {*source-ipaddress*| *source-hostname*} [**client-id** *client-id*] [**endpoint-list** *template-name*] [**retry-timer** *minutes*]

Syntax Description

<i>source-ipaddress</i>	IP address of source for IP SLAs operation.
<i>source-hostname</i>	Hostname of source for IP SLAs operation.
client-id	(Optional) Specifies unique identifier for this responder.
<i>client-id</i>	(Optional) String of 1 to 64 alphanumeric characters.
group-name	(Optional) Specifies the group name.
<i>name</i>	(Optional) Group name to register.
endpoint-list	(Optional) Specifies unique identifier of auto IP SLAs endpoint list to which this responder will be added during autodiscovery.
<i>template-name</i>	String of 1 to 64 ASCII characters.
retry-timer	(Optional) Specifies the length of time before responder attempts to register again, in minutes.
<i>minutes</i>	Range is from 1 to 1440. Default is 3 minutes.

Command Default

The Cisco IP SLAs Responder does not automatically register with source.

Command Modes

Global configuration (config)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command is required to allow the Cisco destination routing device or Cisco IP SLAs Responder to automatically register with the source and enable the source to automatically discover the endpoint.

Examples

The following example shows how to configure this command to enable autodiscovery for configuring an auto IP SLAs endpoint list:

Examples

```
Router(config)# ip sla responder auto-register 10.1.1.23 endpoint-list autolist
Router(config)# exit
Router#
```

Examples

```
Router(config)# ip sla auto discover
Router(config)# ip sla auto endpoint-list type ip autolist
Router(config-epl)# discover port 5000
Router(config-epl)# access-list 3
Router(config-term)# exit
Router# show ip sla auto endpoint-list
Endpoint-list Name: autolist
  Description:
    Auto Discover Parameters
      Destination Port: 5000
      Access-list: 3
      Ageout: 3600      Measurement-retry: 3
    1 endpoints are discovered for autolist
```

Related Commands

Command	Description
destination (am-group)	Specifies an endpoint list for an IP SLAs automeasure group.
discover (epl)	Enters IP SLA endpoint-list autodiscovery configuration mode for building an auto IP SLAs endpoint list using autodiscovery.
ip sla auto endpoint-list	Begins configuration for an auto IP SLAs endpoint list and enters IP SLA endpoint-list configuration mode.
show ip sla auto endpoint-list	Displays configuration including default values of auto IP SLAs endpoint lists.

ip sla responder tcp-connect ipaddress

To enable the Cisco IOS IP Service Level Agreements (SLAs) Responder for TCP Connect operations, use the **ip sla responder tcp-connect ipaddress** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

ip sla responder tcp-connect ipaddress *ip-address* **port** *port-number*

no ip sla responder tcp-connect ipaddress *ip-address* **port** *port-number*

Syntax Description

<i>ip-address</i>	Destination IP address.
port <i>port-number</i>	Specifies the destination port number.

Command Default

The IP SLAs Responder is disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor responder type tcpConnect ipaddress command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr responder type tcpConnect command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor responder type tcpConnect ipaddress command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor responder type tcpConnect ipaddress command.

Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable the acceptance and return of TCP connection operation packets.

Examples

The following example shows how to enable the IP SLAs Responder for TCP connection operations:

```
ip sla responder tcp-connect ipaddress A.B.C.D port 1
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla responder	Enables the IP SLAs Responder for nonspecific IP SLAs operations.

ip sla responder twamp

To enable an IP Service Letter Agreements (SLAs) Two-Way Active Measurement Protocol (TWAMP) responder and configure the session-reflector function of the TWAMP responder, use the **ip sla responder twamp** command in global configuration mode. To disable the TWAMP responder, use the **no** form of this command.

ip sla responder twamp

no ip sla responder twamp

Syntax Description This command has no keywords or arguments.

Command Default An IP SLAs TWAMP responder is not enabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	15.2(2)S	This command was introduced.
	Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
	15.2(3)T	This command was integrated into Cisco IOS Release 15.2(3)T.

Usage Guidelines Use this command to configure a Cisco device as a session-reflector for an IP SLAs TWAMP responder and enter TWAMP reflector configuration mode.

For IP SLAs TWAMP Responder v1.0, the TWAMP server and the session-reflector must be configured on the same device.

Examples The following example shows how to configure a TWAMP session-reflector for an IP SLAs TWAMP responder:

```
Device(config)# ip sla responder twamp
Device(config-twamp-ref)# timeout 300
```

In the following example, the IP SLA TWAMP responder is disabled:

```
Router(config)# no ip sla responder twamp
Device(config)# exit
Device# show ip sla twamp session
IP SLAs Responder TWAMP is: Disabled
```

Related Commands

Command	Description
ip sla server twamp	Configures a device as a TWAMP server.
show ip sla twamp session	Displays TWAMP sessions.
timeout	Configures an inactivity timer for a TWAMP test session.

ip sla responder udp-echo ipaddress

To enable the Cisco IOS IP Service Level Agreements (SLAs) Responder for User Datagram Protocol (UDP) echo or jitter operations, use the **ip sla responder udp-echo ipaddress** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

ip sla responder udp-echo ipaddress *ip-address* **port** *port-number*

no ip sla responder udp-echo ipaddress *ip-address* **port** *port-number*

Syntax Description

<i>ip-address</i>	Destination IP address.
port <i>port-number</i>	Specifies the destination port number.

Command Default

The IP SLAs Responder is disabled.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor responder type udpEcho ipaddress command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.

Command History

12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr responder type udpEcho command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor responder type udpEcho ipaddress command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor responder type udpEcho ipaddress command.

Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable UDP echo and jitter (UDP+) operations with control disabled.

Examples

The following example shows how to enable the IP SLAs Responder for jitter operations:

```
ip sla responder udp-echo ipaddress A.B.C.D port 1
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla responder	Enables the IP SLAs Responder for nonspecific IP SLAs operations.

ip sla restart

To restart a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **ip sla restart** command in global configuration mode.

ip sla restart *operation-number*

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation to restart. IP SLAs allows a maximum of 2000 operations.

Command Default

None

Command Modes

Global configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor restart command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr restart command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor restart command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor restart command.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.

Usage Guidelines

To restart an operation, the operation should be in an active state.

IP SLAs allows a maximum of 2000 operations.

This command does not have a **no** form.

Examples

The following example shows how to restart operation 12:

```
ip sla restart 12
```

Related Commands

Command	Description
ip sla reset	Clears all current IP SLAs statistics and configuration information from the router and resets the IP SLAs engine.

ip sla schedule

To configure the scheduling parameters for a single Cisco IOS IP Service Level Agreements (SLAs) operation, use the **ip sla schedule** command in global configuration mode. To stop the operation and place it in the default state (pending), use the **no** form of this command.

ip sla schedule *operation-number* [**life** {**forever**| *seconds*}] [**start-time** {*hh* : *mm* [: *ss*] [*month* *day*| *day* *month*]}] [**pending**| **now**| **after** *hh* : *mm* : *ss*| **random** *milliseconds*}] [**ageout** *seconds*] [**recurring**]

no ip sla schedule *operation-number*

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation to schedule.
life forever	(Optional) Schedules the operation to run indefinitely.
life <i>seconds</i>	(Optional) Number of seconds the operation actively collects information. The default is 3600 seconds (one hour).
start-time	(Optional) Time when the operation starts.
<i>hh</i> : <i>mm</i> [: <i>ss</i>]	Specifies an absolute start time using hour, minute, and (optionally) second. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a <i>month</i> and <i>day</i> .
<i>month</i>	(Optional) Name of the month to start the operation in. If month is not specified, the current month is used. Use of this argument requires that a day be specified. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day (in the range 1 to 31) to start the operation on. If a day is not specified, the current day is used. Use of this argument requires that a month be specified.
pending	(Optional) No information is collected. This is the default value.
now	(Optional) Indicates that the operation should start immediately.
after <i>hh</i> : <i>mm</i> : <i>ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.

random <i>milliseconds</i>	(Optional) Adds a random number of milliseconds (between 0 and the specified value) to the current time, after which the operation will start. The range is from 0 to 10000.
ageout <i>seconds</i>	(Optional) Number of seconds to keep the operation in memory when it is not actively collecting information. The default is 0 seconds (never ages out).
recurring	(Optional) Indicates that the operation will start automatically at the specified time and for the specified duration every day.

Command Default

The operation is placed in a pending state (that is, the operation is enabled but not actively collecting information).

Command Modes

Global configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the ip sla monitor schedule command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the rtr schedule command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the ip sla monitor schedule command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the ip sla monitor schedule command.
12.2(52)SE	This command was integrated into Cisco IOS Release 12.2(52)SE.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.3(1)T	This command was modified. The random keyword was added for scheduling a random start time.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

After you schedule the operation with the **ip sla schedule** command, you cannot change the configuration of the operation. To change the configuration of the operation, use the **no** form of the **ip sla** global configuration command and reenter the configuration information.

If the operation is in a pending state, you can define the conditions under which the operation makes the transition from pending to active with the **ip sla reaction-trigger** and **ip sla reaction-configuration** global configuration commands. When the operation is in an active state, it immediately begins collecting information.

Use the **random** keyword with the **start-time** keyword to randomly choose a scheduled start time for the operation. A random number of milliseconds between 0 and the specified value will be added to the current time to define the start time. The value provided for the random start time applies only to the first time the operation runs after which normal frequency rules apply.

The following time line shows the age-out process of the operation:

W-----X-----Y-----Z

where:

- W is the time the operation was configured with the **ip sla** global configuration command.
- X is the start time or start of life of the operation (that is, when the operation became “active”).
- Y is the end of life as configured with the **ip sla schedule** global configuration command (life seconds have counted down to zero).
- Z is the age out of the operation.

Age out starts counting down at W and Y, is suspended between X and Y, and is reset to its configured size at Y.

The operation can age out before it executes (that is, Z can occur before X). To ensure that this does not happen, configure the difference between the operation’s configuration time and start time (X and W) to be less than the age-out seconds.

Note

The total RAM required to hold the history and statistics tables is allocated at the time of scheduling the IP SLAs operation. This prevents router memory problems when the router gets heavily loaded and lowers the amount of overhead an IP SLAs operation causes on a router when it is active.

The **recurring** keyword is supported only for scheduling single IP SLAs operations. You cannot schedule multiple IP SLAs operations using the **ip sla schedule** command. The **life** value for a recurring IP SLAs operation should be less than one day. The **ageout** value for a recurring operation must be “never” (which is specified with the value 0), or the sum of the **life** and **ageout** values must be more than one day. If the **recurring** option is not specified, the operations are started in the existing normal scheduling mode.

The **ip sla schedule** command is supported in IPv4 networks. This command can also be used when configuring an IP SLAs operation that supports IPv6 addresses.

Examples

In the following example, operation 25 begins actively collecting data at 3:00 p.m. on April 5. This operation will age out after 12 hours of inactivity, which can be before it starts or after it has finished with its life. When

this operation ages out, all configuration information for the operation is removed (that is, the configuration information is no longer in the running configuration in RAM).

```
ip sla schedule 25 life 43200 start-time 15:00 apr 5 ageout 43200
```

In the following example, operation 1 begins collecting data after a 5-minute delay:

```
ip sla schedule 1 start-time after 00:05:00
```

In the following example, operation 3 begins collecting data immediately and is scheduled to run indefinitely:

```
ip sla schedule 3 start-time now life forever
```

In the following example, operation 15 begins automatically collecting data every day at 1:30 a.m.:

```
ip sla schedule 15 start-time 01:30:00 recurring
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla group schedule	Performs group scheduling for IP SLAs operations.
ip sla reaction-configuration	Configures certain actions to occur based on events under the control of the IP SLA.
ip sla reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action-type options is defined with the ip sla reaction-configuration global configuration command.
show ip sla configuration	Displays the configuration details of the IP SLAs operation.

ip sla server twamp

To configure the server function of an IP Service Level Agreements (SLAs) Two-Way Active Measurement Protocol (TWAMP) responder and enter TWAMP server configuration mode, use the **ip sla server twamp** command in global configuration mode. To disable the TWAMP server, use the **no** form of this command.

ip sla server twamp

no ip sla server twamp

Syntax Description This command has no keywords or arguments.

Command Default The TWAMP server function of an IP SLAs TWAMP responder is not configured.

Command Modes Global configuration (config)

Command History	Release	Modification
	15.2(2)S	This command was introduced.
	Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
	15.2(3)T	This command was integrated into Cisco IOS Release 15.2(3)T.

Usage Guidelines Use this command to configure a Cisco device as a TWAMP server for an IP SLAs TWAMP responder and enter the TWAMP server configuration mode.

For IP SLAs TWAMP Responder v1.0, the TWAMP server and the session-reflector must be configured on the same device.

Examples The following example shows how to configure a TWAMP server:

```
Device(config)# ip sla server twamp
Device(config-twamp-srvr)# port 9000
Device(config-twamp-srvr)# timer inactivity 300
```

Related Commands	Command	Description
	ip sla responder twamp	Enables a TWAMP responder.
	port (twamp)	Configures a port for listening.

Command	Description
timer inactivity	Configures an inactivity timer for a TWAMP control session.

life

To specify the lifetime characteristic in an auto IP Service Level Agreements (SLAs) scheduler, use the **life** command in IP SLA auto-measure schedule configuration mode. To return to the default, use the **no** form of this command.

life {**forever**| *seconds*}

no life

Syntax Description

forever	Runs operation indefinitely.
<i>seconds</i>	Length of time the operation actively collects information, in seconds (sec). Range is from 1 to 2147483647. Default is 3600.

Command Default

Auto IP SLAs operation actively collects information for 3600 sec.

Command Modes

IP SLA auto-measure schedule configuration (config-am-schedule)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command changes the default configuration for life (3600 sec) in an auto IP SLA scheduler to the specified value.

Examples

The following example shows how to configure an auto IP SLAs scheduler that will cause an auto IP SLAs operation to actively collect data at 3:00 p.m. on April 5. The operation will age out after 12 hours of inactivity, which can be before it starts or after it has finished its life. When the operation ages out, all configuration information for the operation is removed from the running configuration in RAM.

```
Router(config)#ip sla auto schedule apr5
Router(config-am-schedule)#ageout 43200
Router(config-am-schedule)#frequency 70
Router(config-am-schedule)#life 43200
Router(config-am-schedule)#probe-interval 1500
Router(config-am-schedule)#start-time 15:00 apr 5
Router(config-am-schedule)#end
Router#
Router# show ip sla auto schedule apr5
Group sched-id: apr5
  Probe Interval (ms) : 1500
  Group operation frequency (sec): 70
```

```
Status of entry (SNMP RowStatus): Active
Next Scheduled Start Time: P15:00 apr 5
Life (sec): 43200
Entry Ageout (sec): 43200
Router#
```

Related Commands

Command	Description
react	Configures certain actions to occur based on events under the control of the auto P SLA scheduler.
show ip sla auto schedule	Displays the configuration including default values of an auto IP SLAs scheduler.

lives-of-history-kept

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **lives-of-history-kept** command is replaced by the **history lives-kept** command. See the **history lives-kept** command for more information.

To set the number of lives maintained in the history table for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **lives-of-history-kept** command in the appropriate submode of IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

lives-of-history-kept *lives*

no lives-of-history-kept

Syntax Description

<i>lives</i>	Number of lives maintained in the history table for the operation. If you specify 0 lives, history is not collected for the operation.

Command Default

0 lives

Command Modes

DHCP configuration (config-sla-monitor-dhcp) DLSw configuration (config-sla-monitor-dlsw) DNS configuration (config-sla-monitor-dns) FTP configuration (config-sla-monitor-ftp) HTTP configuration (config-sla-monitor-http) ICMP echo configuration (config-sla-monitor-echo) ICMP path echo configuration (config-sla-monitor-pathEcho) ICMP path jitter configuration (config-sla-monitor-pathJitter) TCP connect configuration (config-sla-monitor-tcp) UDP echo configuration (config-sla-monitor-udp) VoIP configuration (config-sla-monitor-voip)

Command History

Release	Modification
11.2	This command was introduced.
12.4(4)T	This command was replaced by the history lives-kept command.
12.2(33)SRB	This command was replaced by the history lives-kept command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the history lives-kept command.
12.2(33)SXI	This command was replaced by the history lives-kept command.

Usage Guidelines

The following rules apply to the **lives-of-history-kept** command:

- The number of lives you can specify is dependent on the type of operation you are configuring.
- The default value of 0 lives means that history is not collected for the operation.
- When the number of lives exceeds the specified value, the history table wraps (that is, the oldest information is replaced by newer information).
- When an operation makes a transition from a pending to active state, a life starts. When the life of an operation ends, the operation makes a transition from an active to pending state.

Note

The **lives-of-history-kept** command does not support the IP SLAs User Datagram Protocol (UDP) jitter operation.

An IP SLAs operation can collect history and capture statistics. By default, the history for an IP SLAs operation is not collected. If history is collected, each history bucket contains one or more history entries from the operation. When the operation type is ICMP path echo, an entry is created for each hop along the path that the operation takes to reach its destination. The type of entry stored in the history table is controlled by the **filter-for-history** command. The total number of entries stored in the history table is controlled by the combination of the **samples-of-history-kept**, **buckets-of-history-kept**, and **lives-of-history-kept** commands.

To disable history collection, use the **no lives-of-history-kept** command rather than the **filter-for-history none** command. The **no lives-of-history-kept** command disables history collection before an IP SLAs operation is attempted. The **filter-for-history** command checks for history inclusion after the operation attempt is made.

Note

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

Examples

The following example shows how to maintain the history for five lives of IP SLAs ICMP echo operation 1.

```
ip sla monitor 1
  type echo protocol ipIcmpEcho 172.16.1.176
  lives-of-history-kept 5
!
ip sla monitor schedule 1 life forever start-time now
```

Related Commands

Command	Description
buckets-of-history-kept	Sets the number of history buckets that are kept during the lifetime of the IP SLAs operation.
filter-for-history	Defines the type of information kept in the history table for the IP SLAs operation.

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
samples-of-history-kept	Sets the number of entries kept in the history table per bucket for the IP SLAs operation.

lsp-selector

To specify the local host IP address used to select the label switched path (LSP) for a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **lsp-selector** command in auto IP SLA MPLS parameters configuration mode. To return to the default value, use the **no** form of this command.

lsp-selector *ip-address*

no lsp-selector *ip-address*

Syntax Description

<i>ip-address</i>	Specifies a local host IP address used to select the LSP.

Command Default

The local host IP address used to select the LSP is 127.0.0.0.

Command Modes

Auto IP SLA MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

This command is used to force an IP SLAs operation to use a specific LSP to obtain its response time measurement. This option is useful if there are equal-cost multipaths between the source Provider Edge (PE) router and the Border Gateway Protocol (BGP) next hop neighbor.

You must configure the type of LSP Health Monitor operation (such as LSP ping) before you can configure any of the other parameters of the operation.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source PE router.

As specified in the example configuration, IP address 127.0.0.1 is the local host IP address chosen to select the LSP for obtaining response time measurements.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  delete-scan-factor 2
  lsp-selector 127.0.0.1
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
  3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

lsp-selector-base

To specify the base IP address used to select the label switched paths (LSPs) belonging to the LSP discovery groups of a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **lsp-selector-base** command in auto IP SLA MPLS LSP discovery parameters configuration mode. To return to the default value, use the **no** form of this command.

lsp-selector-base *ip-address*

no lsp-selector-base

Syntax Description

<i>ip-address</i>	Base IP address used to select the LSPs within an LSP discovery group. The default IP address is 127.0.0.0.

Command Default

The default base IP address is 127.0.0.0.

Command Modes

Auto IP SLA MPLS LSP discovery parameters configuration (config-auto-ip-sla-mpls-lpd-params)

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.

Usage Guidelines

Each equal-cost multipath belonging to an LSP discovery group is uniquely identified by the following three parameters:

- Local host IP address of the LSP selector
- Outgoing interface
- Downstream MPLS label stack number

Use the **path-discover** command to enable the LSP discovery option for an IP SLAs LSP Health Monitor operation and enter auto IP SLA MPLS LSP discovery parameters configuration mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, the LSP discovery option is enabled for LSP Health Monitor operation 1. Operation 1 is configured to automatically create IP SLAs LSP ping operations for the equal-cost multipaths to all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN

routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The base IP address used to select the LSPs within the LSP discovery groups is set to 127.0.0.2.

```
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  path-discover
!
maximum-sessions 2
session-timeout 60
lsp-selector-base 127.0.0.2
interval 2
timeout 4
force-explicit-null
hours-of-statistics-kept 1
scan-period 30
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 frequency 100 start-time now
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd tree-trace action-type
trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd lpd-group retry 3 action-type
trapOnly
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
path-discover	Enables the LSP discovery option for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS LSP discovery parameters configuration mode.

lsr-path

To define a loose source routing (LSR) path for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **lsr-path** command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode. To remove the definition, use the no form of this command.

lsr-path {**host** *name1* | *ip-address1*} [[*hostname2* | *ip-address2*]... [*hostname8* | *ip-address8*]]

no lsr-path

Syntax Description

<i>host name1</i> <i>ip-address1</i>	Destination hostname or IP address of the first hop in the LSR path.
<i>hostname2</i> <i>ip-address2</i>]...[<i>hostname8</i> <i>ip-address8</i>	(Optional) You can continue specifying host destinations until you specify the final host target. Each hostname or IP address specified indicates another hop on the path. The maximum number of hops you can specify is eight.

Command Default

LSR path is disabled.

Command Modes

IP SLA Configuration

ICMP path echo configuration (config-ip-sla-pathEcho)

ICMP path jitter configuration (config-ip-sla-pathJitter)

IP SLA Monitor Configuration

ICMP path echo configuration (config-sla-monitor-pathEcho)

ICMP path jitter configuration (config-sla-monitor-pathJitter)

Command History

Release	Modification
12.0(3)T	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines

The maximum number of hops available is eight when an LSR path is configured.

**Note**

This command is supported by the IP SLAs Internet Control Message Protocol (ICMP) path echo and path jitter operations only.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **lsr-path** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured. For example, if you are running Cisco IOS Release 12.4 and the ICMP path echo operation type is configured, you would enter the **lsr-path** command in ICMP path echo configuration mode (config-sla-monitor-pathEcho) within IP SLA monitor configuration mode.

Table 19: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI , or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

In the following examples, the LSR path is defined for IP SLAs ICMP path echo operation 1. The target destination for the operation is at 172.16.1.176. The first hop on the LSR path is 172.18.4.149. The second hop on the LSR path is 172.18.16.155. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 1
  path-echo 172.16.1.176
  lsr-path 172.18.4.149 172.18.26.155
!
ip sla schedule 1 life forever start-time now
```

Examples

```
ip sla monitor 1
  type pathEcho protocol ipIcmpEcho 172.16.1.176
  lsr-path 172.18.4.149 172.18.26.155
!
ip sla monitor schedule 1 life forever start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

max-delay

To configure the maximum length of time a Maintenance Endpoint (MEP) in an IP Service Level Agreements (SLAs) Metro-Ethernet 3.0 (ITU-T Y.1731) operation waits for a synthetic frame, use the **max-delay** command in IP SLA Y1731 delay configuration mode. To return to the default, use the **no** form of this command.

max-delay *milliseconds*

no max-delay

Syntax Description

<i>milliseconds</i>	Maximum delay in milliseconds (ms). The range is from 1 to 65535. The default is 5000.

Command Default

The default for max-delay is 5000 milliseconds.

Command Modes

IP SLA Y.1731 delay configuration (config-sla-y1731-delay)

Command History

Release	Modification
15.1(2)S	This command was introduced.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

Use this command to change the maximum amount of time an MEP in an Ethernet delay or delay variation operation will wait for a synthetic frame from the default (5000 ms) to the specified value.

Examples

```
Router(config-term)# ip sla 501
Router(config-ip-sla)# ethernet y1731 delay receive ldm domain xxx evc yyy cos 3 mpid 101
Router(config-sla-y1731-delay)# max-delay 2000

Router# show ip sla configuration 501

maximum-sessions

To specify the maximum number of Border Gateway Protocol (BGP) next hop neighbors that can be concurrently undergoing label switched path (LSP) discovery for a single Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **maximum-sessions** command in auto IP SLA MPLS LSP discovery parameters configuration mode. To return to the default value, use the **no** form of this command.

maximum-sessions *number*

no maximum-sessions

Syntax Description

<i>number</i>	Maximum number of BGP next hop neighbors that can be concurrently undergoing LSP discovery. The default is 1.

Command Default

By default, the *number* argument is set to 1.

Command Modes

Auto IP SLA MPLS LSP discovery parameters configuration (config-auto-ip-sla-mpls-lpd-params)

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.

Usage Guidelines

Use the **path-discover** command to enable the LSP discovery option for an IP SLAs LSP Health Monitor operation and enter auto IP SLA MPLS LSP discovery parameters configuration mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, the LSP discovery option is enabled for LSP Health Monitor operation 1. Operation 1 is configured to automatically create IP SLAs LSP ping operations for the equal-cost multipaths to all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The maximum number of LSP discovery processes allowed to run concurrently is set to 2.

```
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  path-discover
!
  maximum-sessions 2
  session-timeout 60
  interval 2
```

```

```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
path-discover	Enables the LSP discovery option for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS LSP discovery parameters configuration mode.

measurement-retry

To specify the number of times the endpoints belonging to an auto IP SLAs endpoint list are retested when an operation fails, use the **measurement-retry** command in IP SLAs endpoint-list auto-discovery configuration mode. To return to the default, use the **no** form of this command.

measurement-retry *number-of-retries*

no measurement-retry

Syntax Description

<i>number-of-retries</i>	Range is from 0 to 65535. Default is 0.

Command Default

No attempt to retry a failed operation is made.

Command Modes

IP SLA endpoint-list auto-discovery configuration (config-epl-disc)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command specifies the number of times an operation associated with an auto IP SLAs endpoint list is retried when a failure is detected.

This option is supported only by auto IP SLAs endpoint lists that are configured using auto discovery in Cisco IOS IP SLAs Engine 3.0.

Examples

The following example shows how to configure an auto IP SLAs endpoint lists of endpoints using auto discovery:

```
Router(config)#ip sla auto discover
Router(config)#ip sla auto endpoint-list type ip autolist
Router(config-epl)#discover port 5000
Router(config-epl)#measurement-retry 3
Router(config-epl)#access-list 3
Router(config-epl)#exit
Router# show ip sla auto endpoint-list
Endpoint-list Name: man1
  Description: testing manual build
  ip-address 10.1.1.1-7 port 23
  ip-address 10.1.1.9,10.1.1.15,10.1.1.23 port 23
Endpoint-list Name: autolist
  Description:
  Auto Discover Parameters
    Destination Port: 5000
    Access-list: 3
    Ageout: 3600    Measurement-retry: 3
```

```
0 endpoints are discovered for autolist
```

Related Commands

Command	Description
show ip sla auto endpoint-list	Displays configuration including default values of auto IP SLAs endpoint lists.

measurement-type

To configure parameters for the measurement metrics to be collected by an IP Service Level Agreements (SLAs) service performance operation, use the **measurement-type** command in IP SLA service performance configuration mode. To return to default, use the **no** form of this command.

measurement-type direction {external| internal}

no measurement-type direction

Syntax Description

external	Specifies the direction of the measurement.
internal	Specifies the direction of the measurement. This is the default.

Command Default

The measurement type is internal.

Command Modes

IP SLA service performance configuration (config-ip-sla-service-performance)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

Throughput testing can be unidirectional or bidirectional, with independent throughput tests in each direction. This command with the **direction** keyword configures the directions for which the testing is performed.

Use the **show ip sla configuration** command to display configuration command to display configuration values, including all defaults, for all Cisco IOS IP SLAs operations or for a specified operation.

Examples

```

Related Commands

Command	Description
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or a specified operation.

mpls discovery vpn interval

To specify the time interval at which routing entries that are no longer valid are removed from the Border Gateway Protocol (BGP) next hop neighbor discovery database of a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN), use the **mpls discovery vpn interval** command in global configuration mode. To return to the default scan interval, use the **no** form of this command.

mpls discovery vpn interval *seconds*

no mpls discovery vpn interval

Syntax Description

<i>seconds</i>	Specifies the time interval (in seconds) at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database of an MPLS VPN. The default is 300.

Command Default

The default time interval is 300 seconds.

Command Modes

Global configuration

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
15.1(2)SNH	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

When the BGP next hop neighbor discovery process is enabled (using the **mpls discovery vpn next-hop** command), a database of BGP next hop neighbors in use by any VPN routing or forwarding instance (VRF) associated with the source Provider Edge (PE) router is generated based on information from the local VRF and global routing tables. As routing updates are received, new BGP next hop neighbors are added immediately

to the database. However, BGP next hop neighbors (that are no longer valid) are only removed from the database periodically as defined by the user (using the **mpls discovery vpn interval** command).

The BGP next hop neighbor discovery process is used by the Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor feature.

Note

The default interval of time that BGP neighbor statistics are updated is different for the IP SLAs LSP Health Monitor database and the BGP next hop neighbor discovery database. Use the **scan-interval** command to set the timer for the IP SLAs LSP Health Monitor database. Use the **mpls discovery vpn interval** command to set the timer for the BGP next hop neighbor discovery database.

Examples

The following example shows how to enable the MPLS VPN BGP next hop neighbor discovery process and specify 60 seconds as the time interval at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database of an MPLS VPN:

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
```

Related Commands

Command	Description
mpls discovery vpn next-hop	Enables the MPLS VPN BGP next hop neighbor discovery process.
show mpls discovery vpn	Displays routing information relating to the MPLS VPN BGP next hop neighbor discovery process.

mpls discovery vpn next-hop

To enable the Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Border Gateway Protocol (BGP) next hop neighbor discovery process, use the **mpls discovery vpn next-hop** command in global configuration mode. To disable the discovery process, use the **no** form of this command.

mpls discovery vpn next-hop

no mpls discovery vpn next-hop

Syntax Description This command has no arguments or keywords.

Command Default The BGP next hop neighbor discovery process is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.2(27)SBC	This command was introduced.
	12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	15.1(2)SNH	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines When the BGP next hop neighbor discovery process is enabled, a database of BGP next hop neighbors in use by any VPN routing or forwarding instance (VRF) associated with the source Provider Edge (PE) router is generated based on information from the local VRF and global routing tables. As routing updates are received, new BGP next hop neighbors are added immediately to the database. However, BGP next hop neighbors (that are no longer valid) are only removed from the database periodically as defined by the user (using the **mpls discovery vpn interval** command in global configuration mode).

The **mpls discovery vpn next-hop** command is automatically enabled when an IP Service Level Agreements (SLAs) LSP Health Monitor operation is enabled. However, to disable the BGP next hop neighbor discovery process, you must use the **no** form of this command.

Examples

The following example shows how to enable the MPLS VPN BGP next hop neighbor discovery process and specify 60 seconds as the time interval at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database of an MPLS VPN:

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
```

Related Commands

Command	Description
mpls discovery vpn interval	Specifies the time interval at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database of an MPLS VPN.
show mpls discovery vpn	Displays routing information relating to the MPLS VPN BGP next hop neighbor discovery process.

mpls lsp ping ipv4

To manually configure an individual Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) ping IPv4 operation, use the **mpls lsp ping ipv4** command in IP SLA configuration mode.

mpls lsp ping ipv4 *destination-address destination-mask* [**force-explicit-null**] [**lsp-selector** *ip-address*] [**src-ip-addr** *source-address*] [**reply** {**dscp** *dscp-value*}] **mode** {**ipv4**| **router-alert**}}

Syntax Description

<i>destination-address</i>	Address prefix of the target to be tested.
<i>destination-mask</i>	Number of bits in the network mask of the target address.
force-explicit-null	(Optional) Adds an explicit null label to all echo request packets.
lsp-selector <i>ip-address</i>	(Optional) Specifies a local host IP address used to select the LSP. Default address is 127.0.0.1
src-ip-addr <i>source-address</i>	(Optional) Specifies a source IP address for the echo request originator.
reply dscp <i>dscp-value</i>	(Optional) Specifies the differentiated services codepoint (DSCP) value of an echo reply packet. Default DSCP value is 0.
reply mode	(Optional) Specifies the reply mode for the echo request packet.
ipv4	(Optional) Replies with an IPv4 UDP packet (default).
router-alert	(Optional) Replies with an IPv4 UDP packet with router alert.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.

Release	Modification
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type mpls lsp ping ipv4 command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type mpls lsp ping ipv4 command.

Usage Guidelines

You must configure the type of IP SLAs operation (such as LSP ping) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

The **lsp-selector** keyword is used to force an IP SLAs operation to use a specific LSP to obtain its response time measurement. This option is useful if there are multiple equal cost paths between Provider Edge (PE) routers.

Examples

The following example shows how to manually configure operation parameters, reaction conditions, and scheduling options for IP SLAs LSP ping operation 1:

```
ip sla 1
mpls lsp ping ipv4 192.168.1.4 255.255.255.255 lsp-selector 127.1.1.1
frequency 120
secondary-frequency timeout 30
exit
!
ip sla reaction-configuration 1 react connectionLoss threshold-type consecutive 3 action-type
trapOnly
ip sla reaction-configuration 1 react timeout threshold-type consecutive 3 action-type
trapOnly
ip sla logging traps
!
ip sla schedule 1 start-time now life forever
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

mpls lsp ping pseudowire

To configure an IP Service Level Agreements (SLAs) Multiprotocol Label Switching (MPLS) Pseudo-Wire Emulation Edge-to-Edge (PWE3) services via Virtual Circuit Connectivity Verification (VCCV) operation and enter VCCV configuration mode, use the **mpls lsp ping pseudowire** command in IP SLA configuration mode.

mpls lsp ping pseudowire *peer-ipaddr* *vc-id* [**source-ipaddr** *source-ipaddr*]

Syntax Description

<i>peer-ipaddr</i>	IPv4 address of the peer Provider Edge (PE) router.
<i>vc-id</i>	Virtual circuit (VC) identifier. The range is from 1 to 4294967295.
source-ipaddr <i>source-ipaddr</i>	(Optional) Specifies a source IP address for the originator of the pseudo-wire ping operation. When a source IP address is not specified, IP SLAs chooses the IP address nearest to the destination.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.2(33)SRC	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.

Usage Guidelines

Use the **mpls lsp ping pseudowire** command to configure a single IP SLAs VCCV operation, which checks MPLS label switched path (LSP) connectivity across an Any Transport over MPLS (AToM) VC by sending a series of pseudo-wire ping operations to the specified peer PE router. The IP SLA maintains pseudo-wire ping statistics for the operation, such as Round Trip Time (RTT). The optional **source-ipaddr** keyword is used to specify the *source-ipaddr* argument as the source IP address for the request originator.

To configure a faster measurement frequency (secondary frequency) to which an IP SLAs VCCV operation should change when a connection-loss or timeout condition occurs, use the **secondary-frequency** command in VCCV configuration mode.

To configure proactive threshold monitoring of an IP SLAs VCCV operation, configure actions to occur based on events under the control of that operation and enable Simple Network Management Protocol (SNMP) logging traps for that operation:

- To configure actions to occur based on events under the control of an IP SLAs operation, including the sending of SNMP logging trap when a specified violation type occurs for the monitored operation, use the **ip sla reaction-configuration** command in global configuration mode.
- To enable the generation of SNMP system logging messages specific to IP SLAs trap notifications, use the **ip sla logging traps** command in global configuration mode.

When these commands are used to configure continuous monitoring of PWE3 services, an IP SLAs VCCV operation can send out an SNMP trap if RTT threshold violations occur, if the connection is lost, or if a response times out.

To schedule an IP SLAs VCCV operation, use the **ip sla schedule** command in global configuration mode.

To display configuration values including all defaults for all IP SLAs operations or a specified operation, use the **show ip sla configuration** command. To display the current operational status and statistics for all IP SLAs operations or a specified operation, use the **show ip sla statistics** command. To display the aggregated statistical errors and distribution information for all IP SLAs operations or a specified operation, use the **show ip sla statistics aggregated** command. To display the reaction settings for all IP SLAs operations or a specified operation, use the **show ip sla reaction-configuration** command.

Examples

The following example shows how to manually configure operation parameters, reaction conditions, and scheduling options for IP SLAs VCCV operation 777.

Note

In this example, a VC with the identifier 123 has already been established between the PE router and its peer at IP address 192.168.1.103.

```
ip sla 777
mpls lsp ping pseudowire 192.168.1.103 123
exp 5
frequency 120
secondary-frequency timeout 30
tag testgroup
threshold 6000
timeout 7000
exit
!
ip sla reaction-configuration 777 react rtt threshold-value 6000 3000 threshold-type
immediate 3 action-type traponly
ip sla reaction-configuration 777 react connectionLoss threshold-type immediate action-type
traponly
ip sla reaction-configuration 777 react timeout threshold-type consecutive 3 action-type
traponly
ip sla logging traps
!
ip sla schedule 777 life forever start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.

Command	Description
ip sla reaction-configuration	Configures certain actions to occur based on events under the control of Cisco IOS IP SLAs.
ip sla schedule	Configures the scheduling parameters for a single IP SLAs operation.
secondary-frequency	Specifies a faster measurement frequency (secondary frequency) to which a Cisco IOS IP Service Level Agreements (SLAs) operation should change when a reaction condition occurs.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or a specified operation.
show ip sla reaction-configuration	Displays the configured proactive threshold monitoring settings for all IP SLAs operations or a specified operation.
show ip sla statistics	Displays the current operational status and statistics for all IP SLAs operations or a specified operation
show ip sla statistics aggregated	Display the aggregated statistical errors and distribution information for all IP SLAs operations or a specified operations.

mpls lsp trace ipv4

To manually configure an individual Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) traceroute IPv4 operation, use the **mpls lsp trace ipv4** command in IP SLA configuration mode.

mpls lsp trace ipv4 *destination-address destination-mask* [**force-explicit-null**] [**lsp-selector** *ip-address*] [**src-ip-addr** *source-address*] [**reply** {**dscp** *dscp-value*| **mode** {**ipv4**| **router-alert**} }]

Syntax Description

<i>destination-address</i>	Address prefix of the target to be tested.
<i>destination-mask</i>	Number of bits in the network mask of the target address.
force-explicit-null	(Optional) Adds an explicit null label to all echo request packets.
lsp-selector <i>ip-address</i>	(Optional) Specifies a local host IP address used to select the LSP. Default address is 127.0.0.1.
src-ip-addr <i>source-address</i>	(Optional) Specifies a source IP address for the echo request originator.
reply dscp <i>dscp-value</i>	(Optional) Specifies the differentiated services codepoint (DSCP) value of an echo reply. Default DSCP value is 0.
reply mode	(Optional) Specifies the reply mode for the echo request packet.
ipv4	(Optional) Replies with an IPv4 UDP packet (default).
router-alert	(Optional) Replies with an IPv4 UDP packet with router alert.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.

Release	Modification
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type mpls lsp trace ipv4 command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type mpls lsp trace ipv4 command.

Usage Guidelines

You must configure the type of IP SLAs operation (such as LSP trace) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Note

This command supports only single path connectivity measurements between the source PE router and associated BGP next hop neighbors.

The **lsp-selector** keyword is used to force an IP SLAs operation to use a specific LSP to obtain its response time measurement. This option is useful if there are multiple equal cost paths between Provider Edge (PE) routers.

Examples

The following example shows how to manually configure operation parameters, reaction conditions, and scheduling options for IP SLAs LSP traceroute operation 1:

```
ip sla 1
mpls lsp trace ipv4 192.168.1.4 255.255.255.255 lsp-selector 127.1.1.1
frequency 120
exit
!
ip sla reaction-configuration 1 react connectionLoss threshold-type consecutive 3 action-type
trapOnly
ip sla reaction-configuration 1 react timeout threshold-type consecutive 3 action-type
trapOnly
ip sla logging traps
!
ip sla schedule 1 start-time now life forever
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

num-packets

To specify the number of packets for a jitter operation in an auto IP Service Level Agreements (SLAs) operation template, use the **num-packets** command in the appropriate submode of the IP SLA template parameters configuration mode. To return to the default, use the **no** form of this command.

num-packets *packet-number*

no num-packets

Syntax Description

<i>packet-number</i>	Number of packets to be sent in each operation. Range is 1 to 60000. Default is 10 per operation.

Command Default

Default is 10 packets.

Command Modes

IP SLA Template Parameters Configuration

ICMP jitter configuration (config-icmp-jtr-params)

UDP jitter configuration (config-udp-jtr-params)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command changes the number of packets sent during a jitter operation from the default (10) to the specified number of packets.

You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or ICMP jitter, before you can configure any other parameters of the operation.

Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

Examples

The following example shows how to configure an auto IP SLAs operation template for an ICMP jitter operation to change the number of packets from the default to 20 packets:

```
Router(config)#ip sla auto template type ip icmp-jitter 1
Router(config-tplt-icmp-jtr)#parameters
Router(config-icmp-jtr-params)#num-packets 20
Router(config-icmp-jtr-params)#end
Router# show ip sla auto template type ip icmp-jitter
IP SLAs Auto Template: 1
  Measure Type: icmp-jitter
  Description:
  IP options:
```

```
Source IP: 0.0.0.0
VRF:      TOS: 0x0
Operation Parameters:
  Number of Packets: 20   Inter packet interval: 20
  Timeout: 5000          Threshold: 5000
Statistics Aggregation option:
  Hours of statistics kept: 2
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None
```

Related Commands

Command	Description
ip sla auto template	Begins configuration for an IP SLAs operation template and enters IP SLA template configuration mode.
show ip sla auto template	Displays configuration including default values of an auto IP SLAs operation template.

operation-packet priority

To specify the packet priority in a Cisco IOS IP Service Level Agreements (SLAs) operation template, use the **operation-packet priority** command in the appropriate submode of IP SLA configuration or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

operation-packet priority {normal| high}

no operation-packet priority

Syntax Description

normal	Specifies that the packet priority is normal. Default is normal.
high	Specifies that the packet priority is high.

Command Default

Packet priority is normal.

Command Modes

IP SLA Configuration

Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)

UDP jitter configuration (config-ip-sla-jitter)

IP SLA Template Parameters Configuration

UDP jitter configuration (config-udp-ech-params)

Command History

Release	Modification
12.4(6)T	This command was introduced. This command replaced the probe-packet priority command.
15.1(1)T	This command was modified. The UDP jitter submode of the IP SLA template parameters configuration mode was added.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

Increasing the packet priority of an IP SLAs operation can reduce the delay time for the packets in the queue.

This command is supported by the IP SLAs User Datagram Protocol (UDP) jitter operation only.

Before you can use this command to configure auto IP SLAs operation templates, you must enter the **parameters** command in IP SLA template configuration mode.

Examples

The following examples show how to enable microsecond precision, configure the Network Time Protocol (NTP) synchronization offset tolerance to 10 percent, and set the packet priority to high for an IP SLAs UDP jitter operation:

Examples

```
ip sla 1
  udp-jitter 205.199.199.2 dest-port 9006
  precision microseconds
  clock-tolerance ntp oneway percent 10
  operation-packet priority high
  frequency 300
!
ip sla schedule 1 life forever start-time after 00:00:06
```

Examples

```
Router(config)# ip sla auto template type ip udp-jitter 1
Router(config-udp-jtr-tplt)# parameters
Router(config-udp-jtr-params)# precision microseconds
Router(config-udp-jtr-params)# clock-tolerance ntp oneway percent 10
Router(config-udp-jtr-params)# operation-packet priority high
Router(config-udp-jtr-params)# end
Router#
Router# show ip sla auto template type ip udp-jitter
IP SLAs Auto Template: 1
Measure Type: udp-jitter (control enabled)
  Description:
    IP options:
      Source IP: 0.0.0.0      Source Port: 0
      VRF:      TOS: 0x0
    Operation Parameters:
      Request Data Size: 32    Verify Data: false
      Number of Packets: 10    Inter packet interval: 20
      Timeout: 5000            Threshold: 5000
      Granularity: usec        Operation packet priority: high
      NTP Sync Tolerance: 10 percent
    Statistics Aggregation option:
      Hours of statistics kept: 2
    Statistics Distributions options:
      Distributions characteristics: RTT
      Distributions bucket size: 20
      Max number of distributions buckets: 1
    Reaction Configuration: None
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an IP SLAs operation template and enters IP SLA template configuration mode.

optimize timestamp

To optimize the time stamp location for more accurate RTT measurements during IP Service Level Agreements (SLAs) UDP jitter operations, use the **optimize timestamp** command in UDP jitter configuration mode. To return to the default value, use the **no** form of this command.

optimize timestamp

no optimize timestamp

Syntax Description This command has no arguments or keywords.

Command Default Time stamp location is not optimized

Command Modes UDP jitter configuration (config-ip-sla-jitter)

Command History	Release	Modification
	Cisco IOS XE 3.7S	This command was introduced. This command is supported on the Cisco ASR 1000 Series Aggregation Services router only.

Usage Guidelines This command optimizes the time-stamp location for IP SLAs for more accurate RTT measurements when QFP time stamping is enabled for an IP SLAs UDP jitter operation.

If you configure this command on a source device, the responder must also support the optimized time stamp location or the IP SLAs operation will fail.

Before configuring the **optimize time stamp** command, you must first configure the **precision microseconds** command to enable QFP time stamping. The devices on which the UDP probe and IP SLAs responder are configured must both be running Cisco software images that support QFP time stamping in order for the QFP Time Stamping feature to work.

You must configure the type of IP SLAs operation (such as UDP jitter) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

IP SLAs UDP jitter operations support both IPv4 and IPv6 operations.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 10
Owner:
Tag:
Operation timeout (milliseconds): 5000
Type of operation to perform: udp-jitter
Target address/Source address: 192.0.2.25/0.0.0.0
Target port/Source port: 8989/0
Type Of Service parameter: 0x0
```

```

Request size (ARR data portion): 64
Packet Interval (milliseconds)/Number of packets: 20/10
Verify data: No
Operation Stats Precision : microseconds !<=enables QFP time stamping
Timestamp Location Optimization: Enabled !<=optimizes time stamp location
Operation Packet Priority : normal
NTP Sync Tolerance : 0 percent
Vrf Name:
Control Packets: enabled
Schedule:
  Operation frequency (seconds): 60 (not considered if randomly scheduled)
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled : FALSE
  Randomly Scheduled : FALSE
  Life (seconds): 3600
  Entry Ageout (seconds): never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
  Threshold (milliseconds): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 1
  Statistic distribution interval (microseconds): 20
Enhanced History:

```

no ip sla	Removes the configuration for an IP SLAs operation.
precision microseconds	Enables QFP time stamping.
show ip sla configuration	Displays configuration values, including all defaults, for all IP SLAs operations or for a specified operation.

outer-cos

To set the class of service (CoS) for the outer loop in a service performance packet profile, use the **outer-cos** command in the packet profile submode of IP SLA service performance configuration mode. To return to the default, use the **no** form of this command.

outer-cos *cos-number*

no outer-cos

Syntax Description

<i>cos-number</i>	Class of service (CoS) value. The range is from 0 to 7.

Command Default

No CoS number for the outer loop is configured in the packet profile.

Command Modes

Packet profile submode of IP SLA service performance configuration (config-ip-sla-service-packet)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

You must configure a packet profile before you can configure parameters for the profile.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation
Type: ethernet
Destination
MAC Address: 4055.398d.8bd2
.
.
.

Profile Traffic:
Direction: internal
CIR: 0
EIR: 0
CBS: 0
EBS: 0
Burst Size: 3
Burst Interval: 20
Rate Step (kbps): 1000 2000

Profile Packet:
Inner COS: 6
Outer COS: 6
Inner VLAN: 100
Outer VLAN: 100
Source MAC Address: 4055.398d.8d4c
Packet Size: 512
```

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRB	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	The following configuration modes were added: • Ethernet echo • Ethernet jitter • Ethernet parameters • VCCV
12.4(20)T	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.

Release	Modification
12.2(33)SXI	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
12.2(58)SE	This command was modified. Support for the video configuration submode of IP SLA configuration mode was added.
15.1(2)S	This command was modified. Support for the IP SLA Y.1731 configuration mode was added.
15.2(2)T	This command with support for the video configuration submode of IP SLA configuration mode was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

The owner name contains one or more of the following: ASCII form of the network management station's transport address, network management station name (that is, the domain name), and network management personnel's name, location, or phone number. In some cases, the agent itself will be the owner of the operation. In these cases, the name can begin with "agent."

The **owner** command is supported in IPv4 networks. This command is also supported in IPv6 networks when configuring an IP SLAs operation that supports IPv6 addresses.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

The configuration mode for the **owner** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured.

Table 20: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI , 12.2(58)SE, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

The following examples show how to set the owner of an IP SLAs ICMP echo operation to 172.16.1.189 cwb.cisco.com User1 RTP 555-0100.

Examples

This example shows the **owner** command being used in an IPv4 network in ICMP echo configuration mode within IP SLA configuration mode:

```
Router# show ip sla configuration 1

ip sla 1
 icmp-echo 172.16.1.176
  owner 172.16.1.189 cwb.cisco.com User1 RTP 555-0100
!
ip sla schedule 1 life forever start-time now
```

Examples

This example shows the **owner** command being used in an IPv4 network in ICMP echo configuration mode within IP SLA monitor configuration mode:

```
Router# show ip sla configuration 1

ip sla monitor 1
 type echo protocol ipIcmpEcho 172.16.1.176
  owner 172.16.1.189 cwb.cisco.com User1 RTP 555-0100
!
ip sla monitor schedule 1 life forever start-time now
```

Examples

This example shows the **owner** command being used in the configuration for an IP SLAs Metro 3.0 (ITU-T Y.1731) delay operation:

```
Router# show ip sla configuration 10

IP SLAs Infrastructure Engine-III
Entry number: 10
Owner: 172.16.1.189 cwb.cisco.com User1 RTP 555-0100
Tag:
Operation timeout (milliseconds): 5000
Ethernet Y1731 Delay Operation
Frame Type: DMM
Domain: xxx
Vlan: yyy
Target Mpid: 101
Source Mpid: 100
CoS: 4
  Max Delay: 5000
  Request size (Padding portion): 64
  Frame Interval: 1000
```

```
Clock: Not In Sync
Threshold (milliseconds): 5000
.
.
.
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

packet-size

To specify a size for packets in a service performance packet profile, use the **packet-size** command in the packet profile submode of IP SLA service performance configuration mode. To return to the default, use the **no** form of this command.

packet-size *size*

no packet-size *size*

Syntax Description

<i>size</i>	Size of a packet in bytes. The following keywords are valid for this argument:
	• 64—This is the default. • 128 • 256 • 512 • 1280 • 1518

Command Default

The packet size in the packet profile is 64 bytes.

Command Modes

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

You must configure a packet profile before you can configure parameters for the profile.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation
Type: ethernet
Destination
MAC Address: 4055.398d.8bd2
.
.
.

Profile Traffic:
Direction: internal
CIR: 0
EIR: 0
```

```
CBS: 0
EBS: 0
Burst Size: 3
Burst Interval: 20
Rate Step (kbps): 1000 2000

Profile Packet:
Inner COS: 6
Outer COS: 6
Inner VLAN: 100
Outer VLAN: 100
Source MAC Address: 4055.398d.8d4c
Packet Size: 512
.
.
.
```

Related Commands

Command	Description
profile packet	Creates a packet profile for live traffic.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or a specified operation.

parameters

To enter IP SLA template parameters configuration mode and begin configuring operation-specific parameters in an auto IP Service Level Agreements (SLAs) operation template, use the **parameters** command in the appropriate submode of IP SLA template configuration mode. To return the configuration for all operation parameters to default values, use the no form of this command.

parameters

no parameters

Syntax Description

This command has no arguments or keywords.

Command Default

All operation parameters are configured with default values.

Command Modes

IP SLA Template Configuration

ICMP echo configuration (config-tplt-icmp-ech)

ICMP jitter configuration (config-tplt-icmp-jtr)

TCP connect configuration (config-tplt-tcp-conn)

UDP echo configuration (config-tplt-udp-ech)

UDP jitter configuration (config-tplt-udp-jtr)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command enters IP SLA template parameters configuration mode for configuring operation-specific parameters in an auto IP SLAs operation template.

You must configure the type of IP SLAs operation, such as User Datagram Protocol Internet Control Message Protocol (ICMP) jitter or Internet Control Message Protocol (ICMP) jitter, before you can configure any other parameters of the operation.

The commands available in IP SLA template parameters configuration mode differ depending on the operation being configured. Type ? in IP SLA template-parameters configuration mode to see the operation-specific parameters that can be configured.

Examples

The following example shows how to modify certain operation-specific parameters in an auto IP SLAs operation template for a UDP jitter operation:

```
Router(config)# ip sla auto template type ip udp-jitter 1
Router(config-tplt-udp-jtr)# parameters
Router(config-udp-jtr-params)# precision microseconds
```

```

Router(config-udp-jtr-params)# clock-tolerance ntp oneway percent 10
Router(config-udp-jtr-params)# operation-packet high
Router(config-udp-jtr-params)# end
Router#
Router# show ip sla auto template type ip udp-jitter
IP SLAs Auto Template: 1
Measure Type: udp-jitter (control enabled)
Description:
IP options:
  Source IP: 0.0.0.0      Source Port: 0
  VRF:      TOS: 0x0
Operation Parameters:
  Request Data Size: 32   Verify Data: false
  Number of Packets: 10   Inter packet interval: 20
  Timeout: 5000           Threshold: 5000
  Granularity: usec       Operation packet priority: high
  NTP Sync Tolerance: 10 percent
Statistics Aggregation option:
  Hours of statistics kept: 2
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None

```

Related Commands

Command	Description
ip sla auto template	Begins configuration for an IP SLAs operation template and enters IP SLA template configuration mode.

path-discover

To enable the label switched path (LSP) discovery option for a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation and enter auto IP SLA MPLS LSP discovery parameters configuration mode, use the **path-discover** command in auto IP SLA MPLS parameters configuration mode. To disable the LSP discovery option, use the **no** form of this command.

path-discover

no path-discover

Syntax Description

This command has no arguments or keywords.

Command Default

The LSP discovery option is disabled.

Command Modes

Auto IP SLA MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.

Examples

The following example shows how to enable the LSP discovery option of IP SLAs LSP Health Monitor operation 1:

```
auto ip sla mpls-lsp-monitor 1
type echo ipsla-vrf-all
path-discover
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

path-echo

To configure a Cisco IOS IP Service Level Agreements (SLAs) Internet Control Message Protocol (ICMP) path echo operation, use the **path-echo** command in IP SLA configuration mode.

path-echo {*destination-ip-address* | *destination-hostname*} [**source-ip** {*ip-address* | *hostname*}]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type pathEcho protocol ipIcmpEcho command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type pathEcho protocol ipIcmpEcho command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type pathEcho protocol ipIcmpEcho command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type pathEcho protocol ipIcmpEcho command.
15.2(3)T	This command was modified. Support for IPv6 addresses was added.
Cisco IOS XE Release 3.7S	This command was integrated into Cisco IOS XE Release 3.7S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 10 is configured as an ICMP path echo operation using the IP/ICMP protocol and the destination IP address 172.16.1.175:

```
ip sla 10
 path-echo 172.16.1.175
!
ip sla schedule 10 start-time now
```

In the following example, IP SLAs operation 1 is configured as an ICMP path echo operation in Cisco IOS Release 15.2(3)T using the IP/ICMP protocol and an IPv6 destination address:

```
ip sla 1
 path-echo 2001:10:10:10::3
!
ip sla schedule 10 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

path-jitter

To configure a Cisco IOS IP Service Level Agreements (SLAs) Internet Control Message Protocol (ICMP) path jitter operation, use the **path-jitter** command in IP SLA configuration mode.

path-jitter {*destination-ip-address*|*destination-hostname*} [**source-ip** {*ip-address*|*hostname*}] [**num-packets** *packet-number*] [**interval** *milliseconds*] [**targetOnly**]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
num-packets <i>packet-number</i>	(Optional) Specifies the number of packets to be transmitted in each operation. The default value is 10 packets per operation.
interval <i>milliseconds</i>	(Optional) Time interval between packets (in milliseconds). The default is 20.
targetOnly	(Optional) Sends test packets to the destination only (path is not traced).

Command Default

No IP SLAs operation type is configured for the operation number being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type pathJitter dest-ipaddr command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type pathJitter dest-ipaddr command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type pathJitter dest-ipaddr command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type pathJitter dest-ipaddr command.

Release	Modification
15.2(3)T	This command was modified. Support for IPv6 addresses was added.
Cisco IOS XE Release 3.7S	This command was integrated into Cisco IOS XE Release 3.7S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

If the **targetOnly** keyword is used, the ICMP path jitter operation will send echoes to the destination only (the path from the source to the destination is not traced).

If the **targetOnly** keyword is not used, the IP SLAs ICMP path jitter operation will trace a “hop-by-hop” IP path from the source to the destination and then send a user-specified number of test packets to each hop along the traced path at user-specified time intervals.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla global** configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example show how to enable the ICMP path jitter operation to trace the IP path to the destination 172.69.5.6 and send 50 test packets to each hop with an interval of 30 ms between each test packet:

```
ip sla 2
 path-jitter 172.69.5.6 num-packets 50 interval 30
!
```

```
ip sla schedule 2 start-time now
```

The following example show how to enable the ICMP path jitter operation in an IPv6 network to trace the IP path to the destination 2001:10:10:10::3 and send 50 test packets to each hop with an interval of 30 ms between each test packet. IPv6 addresses are supported in Cisco IOS Release 15.2(3)T and later releases.

```
ip sla 20
 path-jitter 2001:10:10:10::3 num-packets 50 interval 30
!
```

```
ip sla schedule 20 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

paths-of-statistics-kept

To set the number of paths for which statistics are maintained per hour for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **paths-of-statistics-kept** command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

paths-of-statistics-kept *size*

no paths-of-statistics-kept

Syntax Description

<i>size</i>	Number of paths for which statistics are maintained per hour. The default is 5.

Command Default

5 paths

Command Modes

IP SLA Configuration

ICMP path echo configuration (config-ip-sla-pathEcho)

IP SLA Monitor Configuration

ICMP path echo configuration (config-sla-monitor-pathEcho)

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines

A path is the route the request packet of the operation traverses through the network to get to its destination. The packet may take a different path to reach the same destination for each IP SLAs operation.

When the number of paths reaches the size specified, no further path-based information is stored.

Note

This command is supported by the IP SLAs Internet Control Message Protocol (ICMP) path echo operation only.

For the IP SLAs ICMP path echo operation, the amount of router memory required to maintain the distribution statistics table is based on multiplying all of the values set by the following four commands:

- **distributions-of-statistics-kept**
- **hops-of-statistics-kept**
- **paths-of-statistics-kept**
- **hours-of-statistics-kept**

The general equation used to calculate the memory requirement to maintain the distribution statistics table for an ICMP path echo operation is as follows: Memory allocation = (160 bytes) * (distributions-of-statistics-keptsize) * (hops-of-statistics-keptsize) * (paths-of-statistics-keptsize) * (hours-of-statistics-kepthours)

Note

To avoid significant impact on router memory, careful consideration should be used when configuring the **distributions-of-statistics-kept**, **hops-of-statistics-kept**, **paths-of-statistics-kept**, and **hours-of-statistics-kept** commands.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **paths-of-statistics-kept** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured. For example, if you are running Cisco IOS Release 12.4 and the ICMP path echo operation type is configured, you would enter the **paths-of-statistics-kept** command in ICMP path echo configuration mode (config-sla-monitor-pathEcho) within IP SLA monitor configuration mode.

Table 21: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI , or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

The following examples show how to maintain statistics for only three paths for IP SLAs ICMP path echo operation 2. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 2
 path-echo 172.16.1.177
 paths-of-statistics-kept 3
```

```
!  
ip sla schedule 2 life forever start-time now
```

Examples

```
ip sla monitor 2  
  type pathEcho protocol ipIcmpEcho 172.16.1.177  
  paths-of-statistics-kept 3  
!  
ip sla monitor schedule 2 life forever start-time now
```

Related Commands

Command	Description
distributions-of-statistics-kept	Sets the number of statistics distributions kept per hop during the lifetime of the IP SLAs operation.
hops-of-statistics-kept	Sets the number of hops for which statistics are maintained per path for the IP SLAs operation.
hours-of-statistics-kept	Sets the number of hours for which statistics are maintained for the IP SLAs operation.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
statistics-distribution-interval	Sets the time interval for each statistics distribution kept for the IP SLAs operation.

percentile

To configure percentile support for filtering outliers for Cisco IP Service Level Agreements (SLAs) operations, use the **percentile** command in Ethernet jitter, ICMP jitter, or UDP jitter configuration mode. To remove the percentile configuration, use the **no** form of this command.

percentile {jitteravg| jitterds| jittersd| owds| owsd| rtt} *percent*

no percentile {jitteravg| jitterds| jittersd| owds| owsd| rtt}

Syntax Description

jitteravg	Specifies that average jitter packets be filtered.
jitterds	Specifies that one-way destination-to-source interarrival jitter packets be filtered.
jittersd	Specifies that one-way source-to-destination interarrival jitter packets be filtered.
owds	Specifies that one-way destination-to-source packets be filtered.
owsd	Specifies that one-way source-to-destination packets be filtered.
rtt	Specifies that round-trip-time (RTT) packets be filtered.
<i>percent</i>	Percentage (%) of packets to be used for calculations. The range is from 90 to 100. The default is 100.

Command Default

All packets will be processed.

Command Modes

Ethernet jitter (config-ip-sla-ethernet-jitter)
 ICMP jitter configuration (config-ip-sla-icmpjitter)
 UDP jitter configuration (config-ip-sla-jitter)

Command History

Release	Modification
15.3(2)T	This command was introduced.

Usage Guidelines

Use this command to configure an IP SLAs operation to measure values that are within a specified percentile, such as the 95 percentile of RTT, in order to examine a set of measurements that are 95% faster than and 5% slower than the rest of the data.

To track the number of values above a specified threshold and determine the failure-to-success ratio, use the **ip sla reaction-configuration** command in global configuration mode.

To display the percentile statistics when an operation is configured with the percentile option, use the **show ip sla statistics** command.

Examples

The following example shows how to configure an IP SLAs ICMP jitter operation with the percentile option:

```
ip sla 1
 icmp-jitter 192.168.0.129 interval 40 num-packets 100 source-ip 10.1.2.34
 percentile jitteravg 95
!
ip sla reaction-configuration 1 react jitterAvgpct threshold-value 5 2 action-type trap
 threshold-type immediate
!
ip sla schedule 1 start-time now life forever
```

Related Commands

Command	Description
ip sla reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or for an individual operation.
show ip sla statistics	Displays the current operational status and statistics of all IP SLAs operations or for a n individual operation.

port (twamp)

To specify the port to be used by the server function of an IP Service Level Agreements (SLAs) Two-Way Active Measurement Protocol (TWAMP) responder, use the **port** command in TWAMP server configuration mode. To remove the port configuration, use the **no** form of this command.

port *port-number*

no port

Syntax Description

<i>port-number</i>	Number of port. The range is from 1 to 65535. The default is device specific.

Command Default

A device-specific default port is used by the TWAMP server.

Command Modes

TWAMP server configuration (config-twamp-srvr)

Command History

Release	Modification
15.2(2)S	This command was introduced.
Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
15.2(3)T	This command was integrated into Cisco IOS Release 15.2(3)T.

Usage Guidelines

Use this command to specify the port to be used by the TWAMP server to listen for connection and control requests. The same port negotiates for the port to which performance probes are sent. The configured port must not be an IANA well-known port or any port that is used by other applications.

Examples

The following example shows how to configure a TWAMP server:

```
Device(config)# ip sla server twamp
Device(config-twamp-srvr)# port 9000
Device(config-twamp-srvr)# timer inactivity 300
```

precision

To set the level of precision at which the statistics for a Cisco IOS IP Service Level Agreements (SLAs) operation are measured, use the **precision** command in the UDP jitter submode of IP SLA configuration, IP SLA monitor configuration, or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

precision {milliseconds| microseconds}

no precision

Syntax Description

milliseconds	Sets the precision of IP SLAs operation measurements to 1 millisecond (ms). Milliseconds precision is configured by default.
microseconds	Sets the precision of IP SLAs operation measurements to 1 microsecond (usec). In Cisco IOS XE Release 3.7S and later releases: Enables IP SLAs QFP Time Stamping.

Command Default

Milliseconds precision is configured.

Command Modes

IP SLA Configuration

Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)

UDP jitter configuration (config-ip-sla-jitter)

IP SLA Monitor Configuration

UDP jitter configuration (config-sla-monitor-jitter)

IP SLA Template Parameters Configuration

UDP jitter configuration (config-udp-jtr-params)

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Release	Modification
15.1(1)T	This command was modified. The IP SLA template parameters configuration mode was added.
Cisco IOS XE Release 3.7S	This command was integrated into Cisco IOS XE Release 3.7S. This command with the microseconds keyword enables IP SLAs QFP Time Stamping.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

If the **milliseconds** keyword is configured, the measurements for an IP SLAs operation will be displayed with the granularity of 1 ms. For example, a value of 22 equals 22 ms.

If the **microseconds** keyword is configured, the measurements for an IP SLAs operation will be displayed with the granularity of 1 microsecond. For example, a value of 202 equals 202 microseconds.

In Cisco IOS XE 3.7S and later releases, configure the **precision microseconds** command to enable IP SLAs QFP Time Stamping.

Note

This command is supported by the IP SLAs User Datagram Protocol (UDP) jitter operation only.

Note

The **precisionmicroseconds** command requires that both the source and IP SLAs Responder devices are running a version of Cisco IOS software that supports the **precisionmicroseconds** command. See the "Command History" table for information about the supported Cisco IOS software releases.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) jitter, before you can configure any of the other parameters of the operation.

The configuration mode for the **precision** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured.

If you are using auto IP SLAs in Cisco IOS IP SLAs Engine 3.0, you must enter the **parameters** command in IP SLA template configuration mode before you can use the **precision** command.

Table 22: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, Cisco IOS XE 3.7S, and later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration
15.1(1)T	ip sla auto template	IP SLA template configuration

Examples

The following examples show how to enable microsecond precision, configure the Network Time Protocol (NTP) synchronization offset tolerance to 10 percent, and set the packet priority to high for an IP SLAs UDP jitter operation. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 1
  udp-jitter 192.168.202.169 9006
  precision microseconds
  clock-tolerance ntp oneway percent 10
  probe-packet priority high
  frequency 300
!
ip sla schedule 1 life forever start-time after 00:00:06
```

Examples

The following sample configuration shows how to enable QFP time stamping and to optimize the time stamp location for more accurate RTT measurements.

```
ip sla 1
  udp-jitter 192.0.2.134 5000 num-packets 20
  request-data-size 160
  tos 128
  frequency 30
  precision microseconds
  optimize timestamp
!
ip sla schedule 1 start-time after 00:05:00
```

Examples

```
ip sla monitor 1
  type jitter dest-ipaddr 192.168.202.169 dest-port 9006
  precision microseconds
  clock-tolerance ntp oneway percent 10
  probe-packet priority high
  frequency 300
!
ip sla monitor schedule 1 life forever start-time after 00:00:06
```

Examples

```
Router(config)# ip sla auto template type ip udp-jitter 1
Router(config-udp-jtr-tplt)# parameters
Router(config-udp-jtr-params)# precision microseconds
Router(config-udp-jtr-params)# clock-tolerance ntp oneway percent 10
Router(config-udp-jtr-params)# operation-packet high
Router(config-udp-jtr-params)# end
```

```

Router#
Router# show ip sla auto template type ip udp-jitter
IP SLAs Auto Template: 1
Measure Type: udp-jitter (control enabled)
Description:
IP options:
    Source IP: 0.0.0.0      Source Port: 0
    VRF:      TOS: 0x0
Operation Parameters:
    Request Data Size: 32   Verify Data: false
    Number of Packets: 10   Inter packet interval: 20
    Timeout: 5000           Threshold: 5000
    Granularity: usec       Operation packet priority: high
    NTP Sync Tolerance: 10 percent
Statistics Aggregation option:
    Hours of statistics kept: 2
Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
Reaction Configuration: None

```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an IP SLAs operation template and enters IP SLA template configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
optimize timestamp	Optimizes the time stamp location.

probe-interval

To configure the interval in an auto IP Service Level Agreements (SLAs) scheduler for staggering the start times of operations in Cisco IOS IP SLAs auto-measure groups that share the same schedule, use the **probe-interval** command in IP SLA auto-measure schedule configuration mode. To remove the interval configuration, use the **no** form of this command.

probe-interval *milliseconds*

no probe-interval

Syntax Description

<i>milliseconds</i>	Length of time, in milliseconds (ms). Range is from 100 to 99000. Default is 1000.

Command Default

There is a 1000 ms interval between the start time of one auto IP SLAs operation and the start time of the next auto IP SLAs operation being controlled by the same schedule.

Command Modes

IP SLAs auto-measure schedule configuration (config-am-schedule)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command changes the default interval configuration (1000 ms) in an auto IP SLAs scheduler to the specified value.

An operation is created for each destination in an auto IP SLAs endpoint list specified for an IP SLAs auto-measure group.

Once the operations start, they continue operating based on the frequency specified by the **frequency** command.

Examples

The following example shows how to configure an auto IP SLAs scheduler that will cause an auto IP SLAs operation to actively collect data at 3:00 p.m. on April 5. The operation will age out after 12 hours of inactivity, which can be before it starts or after it has finished its life. When the operation ages out, all configuration information for the operation is removed from the running configuration in RAM:

```
Router(config)#ip sla auto schedule apr5
Router(config-am-schedule)#ageout 43200
Router(config-am-schedule)#frequency 70
Router(config-am-schedule)#life 43200
Router(config-am-schedule)#probe-interval 1500
Router(config-am-schedule)#start-time 15:00 apr 5
Router(config-am-schedule)#end
Router#
```

```
Router# show ip sla auto schedule apr5
Group sched-id: apr5
  Probe Interval (ms) : 1500
  Group operation frequency (sec): 70
  Status of entry (SNMP RowStatus): Active
  Next Scheduled Start Time: P15:00 apr 5
  Life (sec): 43200
  Entry Ageout (sec): 43200
Router#
```

Related Commands

Command	Description
frequency	Sets the frequency characteristic in an auto IP SLAs scheduler for restarting auto IP SLAs operations.
show ip sla auto schedule	Displays configuration including default values of auto IP SLAs schedulers.

probe-packet priority

Note

Effective with Cisco IOS Release 12.4(6)T, the **probe-packetpriority** command is replaced by the **operation-packet-priority** command. See the **operation-packetpriority** command for more information.

To specify the packet priority of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **probe-packetpriority** command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

probe-packet priority {normal| high}

no probe-packet priority

Syntax Description

probe-packet priority normal	Sets the packet priority to normal. Packet priority is normal by default.
probe-packet priority high	Sets the packet priority to high.

Command Default

Packet priority is normal.

Command Modes

IP SLA Configuration

UDP jitter configuration (config-ip-sla-jitter)

IP SLA Monitor Configuration

UDP jitter configuration (config-sla-monitor-jitter)

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.
12.4(6)T	This command was replaced by the operation-packetpriority command.

Usage Guidelines

Increasing the packet priority of an IP SLAs operation can reduce the delay time for the packets in the queue.

**Note**

This command is supported by the IP SLAs User Datagram Protocol (UDP) jitter operation only.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **probe-packetpriority** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured. For example, if you are running Cisco IOS Release 12.4 and the UDP jitter operation type is configured, you would enter the **probe-packetpriority** command in UDP jitter configuration mode (config-sla-monitor-jitter) within IP SLA monitor configuration mode.

Table 23: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

The following examples show how to enable microsecond precision, configure the Network-Time Protocol (NTP) synchronization offset tolerance to 10 percent, and set the packet priority to high for IP SLAs UDP jitter operation 1. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 1
  udp-jitter 205.199.199.2 dest-port 9006
  precision microseconds
  clock-tolerance ntp oneway percent 10
  probe-packet priority high
  frequency 300
!
ip sla schedule 1 life forever start-time after 00:00:06
```

Examples

```
ip sla monitor 1
  type jitter dest-ipaddr 205.199.199.2 dest-port 9006
  precision microseconds
  clock-tolerance ntp oneway percent 10
  probe-packet priority high
  frequency 300
!
ip sla monitor schedule 1 life forever start-time after 00:00:06
```

Related Commands

ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

profile packet

To begin configuring a packet profile for an IP Service Level Agreements (SLAs) service performance operation and enter the packet profile submode of IP SLA service performance configuration mode, use the **profile packet** command in IP SLA service performance configuration mode. To return to the default, use the **no** form of this command.

profile packet

no profile packet

This command has no argument or keywords

Command Default

No packet profile is configured.

Command Modes

IP SLA service performance configuration (config-ip-sla-service-performance)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

Use this command to define the packets to be sent in the live traffic for an IP SLAs service performance operation.

Before configuring a packet profile, you must use the **profile traffic** command to configure a traffic profile for generating live traffic.

Use the **show ip sla configuration** command to display configuration command to display configuration values, including all defaults, for all Cisco IOS IP SLAs operations or for a specified operation.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation
Type: ethernet
Destination
MAC Address: 4055.398d.8bd2
VLAN:
Interface: GigabitEthernet0/4
Service Instance: 10
EVC Name:
Duration Time: 20
Interval Buckets: 5

Signature:
05060708

Description: this is with all operation modes

Measurement Type:
throughput, loss
Direction: internal
```

```
Profile Traffic:
Direction: internal
CIR: 0
EIR: 0
CBS: 0
EBS: 0
Burst Size: 3
Burst Interval: 20
Rate Step (kbps): 1000 2000

Profile Packet:
Inner COS: 6
Outer COS: 6
Inner VLAN: 100
Outer VLAN: 100
Source MAC Address: 4055.398d.8d4c
Packet Size: 512
Schedule:
  Operation frequency (seconds): 64 (not considered if randomly scheduled)
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled : FALSE
  Randomly Scheduled : FALSE
  Life (seconds): Forever
  Entry Ageout (seconds): never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
```

Related Commands

Command	Description
profile traffic	Configures a traffic profile for generating live traffic.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or a specified operation.

profile traffic

To begin configuring a traffic profile for an IP Service Level Agreements (SLAs) service performance operation and enter the traffic profile submode of IP SLA service performance configuration mode, use the **profile traffic** command in IP SLA service performance configuration mode. To return to the default, use the **no** form of this command.

profile traffic direction {external| internal}

no profile traffic direction

Syntax Description

direction	Specifies the direction for the generated traffic.
external	Direction of the traffic.
internal	Direction of the traffic.

Command Default

No traffic profile is configured and no live traffic is generated.

Command Modes

IP SLA service performance

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

Use this command to configure an inline traffic profile for generating live traffic for an IP SLAs service performance operation. A traffic profile defines an upper bound on the volume of the expected service frames belonging to a particular service instance.

Do *not* configure a traffic profile for collecting measurements in passive measurement mode.

Use the **show ip sla configuration** command to display configuration command to display configuration values, including all defaults, for all Cisco IOS IP SLAs operations or for a specified operation.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation
Type: ethernet
Destination
MAC Address: 4055.398d.8bd2
VLAN:
Interface: GigabitEthernet0/4

react (tplt-icmp-ech)

To configure reaction and proactive threshold monitoring parameters in an auto IP Service Level Agreements (SLAs) operation template for an Internet Control Message Protocol (ICMP) echo operation, use the **react** command in the ICMP echo submode of IP SLA template configuration mode. To disable all threshold monitoring or to disable individual monitored elements, use the **no** form of this command.

react [*monitored-element* [[**action-type** *type-of-action*] [**threshold-type** {**average** [*number-of-measurements*] | **consecutive** [*occurrences*] | **immediate** | **never** | **xofy** [*x-value y-value*]}] [**threshold-value** *upper-threshold lower-threshold*]]]

no react [*monitored-element*]

Syntax Description

<i>monitored-element</i>	(Optional) Element to be monitored for threshold violations. Valid keywords are: • timeout --Reaction should occur if there is a one-way timeout. • verifyError --Reaction should occur if there is a one-way error verification violation • rtt --Reaction should occur if round-trip time violates upper or lower threshold.
action-type	(Optional) Specifies action to be taken when threshold violations occur.
<i>type-of-action</i>	(Optional) Keywords for <i>type-of-action</i> are: • none --No action is taken when threshold violations occur. This keyword combination is default for RTT. • trapOnly --A Simple Network Management Protocol (SNMP) trap notification should be sent when the specified violation type occurs for the monitored element. Note If the threshold-type never keywords are configured, the action-type <i>type-of-action</i> keyword and argument combination is disabled.
threshold-type average	(Optional) Specifies that the reaction occurs when the average of a specified number of measurements for the monitored element either exceeds the <i>upperthreshold</i> or drops below the <i>lowerthreshold</i> .

<i>number-of-measurement</i>	(Optional) Number of averaged measurements. Range is 1 to 16. Default is 5. For example, if the <i>number-of-measurement</i> for threshold-type average is 3 and the upper threshold is 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000 / 3 = 5667$ ms and the average exceeds the upper threshold of 5000 ms.
threshold-type consecutive	(Optional) Specifies that the reaction occurs when threshold violation is consecutively met for a specified number of times.
<i>occurrences</i>	(Optional) Number of consecutive occurrences. Range is 1 to 16. Default is 5.
threshold-type immediate	(Optional) Specifies that the reaction occurs each time the threshold violation is met.
threshold-type never	(Optional) Specifies that threshold violations should not be monitored. This is the default threshold type. Note If these keywords are configured, the action-type none and action-type trapOnly keywords are disabled.
threshold-type xofy	(Optional) Specifies that the reaction occurs when violation threshold for the monitored element is met x number of times within the last y number of measurements.
<i>x-value y-value</i>	(Optional) Range for the x-value and for the y-value is 1 to 16. Default is 5 for both values.
threshold-value	(Optional) Specifies upper-threshold and lower-threshold values for monitored elements
<i>upper-threshold</i>	Value in milliseconds. For defaults, see the table below.
<i>lower-threshold</i>	Value in milliseconds. For defaults, see the table below.

Command Default

IP SLAs proactive threshold monitoring is disabled.

Command Modes

ICMP echo submode of IP SLA template configuration (config-tplt-icmp-ech)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command enables proactive threshold monitoring for one or more elements in the auto IP SLAs operation template being configured and defines the conditions under which the operation makes the transition from pending to active.

You can configure this command multiple times so as to allow reactions for multiple monitored elements.

The **noformof** this command with one or more keywords can be used to disable individual monitored elements or use the **noreact** command without keywords to disable all proactive threshold monitoring in the auto IP SLAs operation template.

The table below lists the default upper and lower thresholds for specific monitored elements.

Table 24: Default Threshold Values for Monitored Elements

Monitored Element Keyword	Upper Threshold	Lower Threshold
rtt	5000 ms	3000 ms

Only SNMP traps are supported for round-trip time (RTT) violations during non-Jitter operations.

Only syslog messages are supported for non-RTT violations other than timeout, connectionLoss, or verifyError.

Both SNMP traps and syslog messages are supported for timeout, connectionLoss, or verifyError violations only.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Use the **ipslalogsingtraps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Use the **snmp-serverenabletrapsrtr** or **snmp-serverenabletrapssyslog** command to enable the sending of IP SLAs SNMP trap notifications.

To display the current threshold monitoring configuration for an auto IP SLAs operation, use the **showipslaautotemplate** command.

Examples

The following example shows how to configure operation parameters and proactive threshold monitoring using an auto IP SLAs operation template. In this example, the proactive threshold monitoring configuration for the ICMP echo operation specifies that when three consecutive timeout events occur, an SNMP trap notification should be sent.

```
Router(config)#ip sla auto template type ip icmp-echo react-to
Router(config-tplt-icmp-ech)#react timeout action-type traonly threshold-type coneutive
3
Router(config-tplt-icmp-ech)#end
Router# show ip sla auto template type ip icmp-echo
IP SLAs Auto Template: react-to
  Measure Type: icmp-echo
  Description:
```

```

.
.
.
Reaction Configuration:
  Reaction Index      : 1
  Reaction            : timeout
  Threshold Type      : Consecutive
  Threshold CountX    : 3
  Threshold CountY    : 5
  Action Type         : Trap Only

```

Related Commands

Command	Description
ip sla logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.
show ip sla auto template	Displays configuration including default values of auto IP SLAs operation templates.
snmp-server enable traps rtr	Enables system to generate CISCO-RTTMON-MIB traps.
snmp-server enable traps syslog	Enables system to generate CISCO-SYSLOG-MIB traps.

react (tplt-icmp-jtr)

To configure reaction and proactive threshold monitoring parameters in an auto IP Service Level Agreements (SLAs) operation template for an Internet Control Message Protocol (ICMP) jitter operation, use the **react** command in the ICMP jitter submode of IP SLA template configuration mode. To disable all threshold monitoring or to disable individual monitored elements, use the **no** form of this command.

react [*monitored-element* [[**action-type** *type-of-action*] [**threshold-type** {**average** [*number-of-measurements*] | **consecutive** [*occurrences*] | **immediate** | **never** | **xofy** [*x-value y-value*]}] [**threshold-value** *upper-threshold lower-threshold*]]]

no react [*monitored-element*]

Syntax Description*monitored-element*

(Optional) Element to be monitored for threshold violations. Valid keywords are:

- **jitterAvg** --Reaction should occur if the average round-trip jitter value violates the upper threshold or lower threshold.
- **jitterDSAvg** --Reaction should occur if the average one-way destination-to-source jitter value violates the upper threshold or lower threshold.
- **jitterSDAvg** --Reaction should occur if the average one-way source-to-destination jitter value violates the upper threshold or lower threshold.
- **latencyDSAvg** --Reaction should occur if the average one-way destination-to-source latency value violates the upper threshold or lower threshold.
- **latencySDAvg** --Reaction should occur if the average one-way source-to-destination latency value violates the upper threshold or lower threshold.
- **maxOfLatencyDS** --Reaction should occur if the one-way maximum destination-to-source latency value is violated.
- **maxOfLatencySD** --Reaction should occur if the one-way maximum source-to-destination latency value is violated.
- **maxOfNegativeDS** --Reaction should occur if the one-way maximum negative jitter destination-to-source threshold is violated.
- **maxOfNegativeSD** --Reaction should occur if the one-way maximum negative jitter source-to-destination threshold is violated.
- **maxOfPositiveDS** --Reaction should occur if the one-way maximum positive jitter destination-to-source threshold is violated.
- **maxOfPositiveSD** --Reaction should occur if the one-way maximum positive jitter source-to-destination threshold is violated.

<i>monitored-element</i> (continued)	• packetLateArrival --Reaction should occur if the one-way number of late packets violates the upper threshold or lower threshold. • packetLoss --Reaction should occur if the packet loss value violates the upper threshold or lower threshold. The path of the packets is either destination-to-source or source-to-destination. • packetOutOfSequence --Reaction should occur if the one-way number of packets out of sequence violates the upper threshold or lower threshold. • rtt --Reaction should occur if the round-trip time (RTT) violates the upper threshold or lower threshold. • successivePacketLoss • timeout --Reaction should occur if there is a one-way timeout for the monitored operation. The threshold-value keyword does not apply to this monitored element. • verifyError --Reaction should occur if there is a one-way error verification violation. The threshold-value keyword does not apply to this monitored element.
action-type <i>type-of-action</i>	(Optional) Specifies action to be taken when threshold violations occur. Keywords for <i>type-of-action</i> are: • none --No action is taken when threshold violations occur. This keyword combination is default for RTT. • trapOnly --A Simple Network Management Protocol (SNMP) trap notification should be sent when the specified violation type occurs for the monitored element. Note If the threshold-type never keywords are configured, the action-type <i>type-of-action</i> keyword and argument combination is disabled.
threshold-type average	(Optional) Specifies that the reaction occurs when the average of a specified number of measurements for the monitored element either exceeds the <i>upperthreshold</i> or drops below the <i>lowerthreshold</i>.

<i>number-of-measurement</i>	(Optional) Number of averaged measurements. Range is 1 to 16. Default is 5. For example, if the <i>number-of-measurement</i> value for threshold-typeaverage is 3 and the upper threshold is 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000/3 = 5667$ ms and the average exceeds the upper threshold of 5000 ms.
threshold-type consecutive	(Optional) Specifies that the reaction occurs when threshold violation is consecutively met for a specified number of times.
<i>occurrences</i>	(Optional) Number of consecutive occurrences. Range is 1 to 16. Default is 5.
threshold-type immediate	(Optional) Specifies that the reaction occurs each time the threshold violation is met.
threshold-type never	(Optional) Specifies that threshold violations should not be monitored. This is the default threshold type. Note If these keywords are configured, the action-typenone and action-typetrapOnly keywords are disabled.
threshold-type xofy	(Optional) Specifies that the reaction occurs when threshold violation for the monitored element is met <i>x</i> number of times within the last <i>y</i> number of measurements.
<i>x-value y-value</i>	Range for the <i>x</i> -value and for the <i>y</i> -value is 1 to 16. Default is 5 for both values.
threshold-value	(Optional) Specifies upper-threshold and lower-threshold values for monitored elements
<i>upper-threshold</i>	(Optional) Value in milliseconds (ms). For defaults, see the table below.
<i>lower-threshold</i>	(Optional) Value in milliseconds (ms). For defaults, see the table below.

Command Default IP SLAs proactive threshold monitoring is disabled.

Command Modes ICMP jitter submode of IP SLA template configuration (config-tplt-icmp-jtr)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command enables proactive threshold monitoring for one or more elements in the auto IP SLAs operation template being configured and defines the conditions under which the operation makes the transition from pending to active.

You can configure this command multiple times so as to allow reactions for multiple monitored elements.

The **no**form of this command with one or more keywords can be used to disable individual monitored elements or use the **no** form of this command without keywords to disable all proactive threshold monitoring in the auto IP SLAs operation template.

Return-trip time (RTT) reactions for jitter operations are triggered only at the end of the operation and use the latest value for the return-trip time (LatestRTT).

SNMP traps for RTT for jitter operations are based on the average value for the return-trip time (RTTAvg) for the whole operation only and do not include return-trip time values for individual packets sent during the operation.

For Mean opinion score (MOS), values are computed as numbers to two decimal places, from a value of 1.00 (worst quality) to 5.00 (best quality). The number for *upper-threshold* and *lower-threshold* is expressed in three digits representing ones, tenths, and hundredths. For example, to express a MOS threshold of 3.20, enter **320**. The valid range is from 100 (1.00) to 500 (5.00).

The table below lists the default upper and lower thresholds for specific monitored elements.

Table 25: Default Threshold Values for Monitored Elements

Monitored Element Keyword	Upper Threshold	Lower Threshold
icpif	93 (score)	93 (score)
jitterAvg	100 ms	100 ms
jitterDSAvg	100 ms	100 ms
jitterSDAvg	100 ms	100 ms
latencyDSAvg	5000 ms	3000 ms
latencySDAvg	5000 ms	3000 ms
maxOflatencyDS	5000 ms	3000 ms
maxOflatencySD	5000 ms	3000 ms
maxOfNegativeDS	10000 ms	10000 ms

Monitored Element Keyword	Upper Threshold	Lower Threshold
maxOfNegativeSD	10000 ms	10000 ms
maxOfPositiveDS	10000 ms	10000 ms
maxOfPositiveSD	10000 ms	10000 ms
mos	500 (score)	100 (score)
packetLateArrival	10000 packets	10000 packets
packetLossDS	10000 packets	10000 packets
packetLossSD	10000 packets	10000 packets
packetMIA	10000 packets	10000 packets
packetOutOfSequence	10000 packets	10000 packets
rtt	5000 ms	3000 ms

Only syslog messages are supported for RTTAvg threshold violations.

Only syslog messages are supported for RTT violations during Jitter operations.

Only syslog messages are supported for non-RTT violations other than timeout, connectionLoss, or verifyError.

Both SNMP traps and syslog messages are supported for timeout, connectionLoss, or verifyError violations only.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB.

Use the **snmp-serverenabletrapsrtr** or **snmp-serverenabletrapssyslog** command to enable the sending of IP SLAs SNMP trap notifications.

Use the **ipslaloggingsrtr** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Only system logging messages are supported for RTTAvg threshold violations.

To display the current threshold monitoring configuration settings for an auto IP SLAs operation, use the **showipslaautotemplate** command.

Examples

The following example shows how to configure operation parameters and proactive threshold monitoring using an auto IP SLAs operation template. In this example, the proactive threshold monitoring configuration for the ICMP jitter operation specifies that when three consecutive packet loss events occur, an SNMP trap notification should be sent:

```
Router(config)#ip sla auto template type ip icmp-jitter react-closs

Router(config-tplt-icmp-jtr)#react packetloss action-type traponly threshold-type consecutive
3
Router(config-tplt-icmp-jtr)#end
Router# show ip sla auto template type ip icmp-jitter
IIP SLAs Auto Template: react
Measure Type: icmp-jitter
```

```
.  
.  
.  
Reaction Configuration:  
  Reaction Index      : 1  
  Reaction            : packetLoss  
  Threshold Type      : Consecutive  
  Threshold Rising    : 3  
  Threshold Falling   : 10000  
  Threshold CountX    : 3  
  Threshold CountY    : 5  
  Action Type         : Trap Only
```

Related Commands

Command	Description
ip sla logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.
show ip sla auto template	Displays configuration including default values of auto for IP SLAs a operation templates.
snmp-server enable traps rtr	Enables system to generate CISCO-RTTMON-MIB traps.
snmp-server enable traps syslog	Enables system to generate CISCO-SYSLOG-MIB traps.

react (tplt-tcp-conn)

To configure reaction and proactive threshold monitoring parameters in an auto IP Service Level Agreements (SLAs) operation template for an Transmission Control Protocol (TCP) connect operation, use the **react** command in the TCP connect submode of IP SLA template configuration mode. To disable all threshold monitoring or to disable individual monitored elements, use the **no** form of this command.

react [*monitored-element* [[**action-type** *type-of-action*] [**threshold-type** {**average** [*number-of-measurements*] | **consecutive** [*occurrences*] | **immediate** | **never** | **xofy** [*x-value* *y-value*]}] [**threshold-value** *upper-threshold* *lower-threshold*]]]

no react [*monitored-element*]

Syntax Description

<i>monitored-element</i>	(Optional) Element to be monitored for threshold violations. Valid keywords are: • connectionLoss --Reaction should occur if there is a one-way connection loss for the monitored operation. The threshold-value keyword does not apply to this monitored element. • rtt --Reaction should occur if the round-trip time (RTT) violates the upper threshold or lower threshold. • timeout --Reaction should occur if there is a one-way timeout for the monitored operation. The threshold-value keyword does not apply to this monitored element.
action-type <i>type-of-action</i>	(Optional) Specifies action to be taken when threshold violations occur. Keywords for <i>type-of-action</i> are: • none --No action is taken when threshold violations occur. This keyword combination is default for RTT. • trapOnly --A Simple Network Management Protocol (SNMP) trap notification should be sent when the specified violation type occurs for the monitored element. Note If the threshold-type never keywords are configured, the action-type <i>type-of-action</i> keyword and argument combination is disabled.

threshold-type average	(Optional) Specifies that the reaction occurs when the average of a specified number of measurements for the monitored element either exceeds the <i>upperthreshold</i> value or drops below the <i>lowerthreshold</i> value.
<i>number-of-measurement</i>	(Optional) Number of averaged measurements. Range is 1 to 16. Default is 5. For example, if the <i>number-of-measurement</i> value for threshold-typeaverage is 3 and the upper threshold is 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000/3 = 5667$ ms and the average exceeds the upper threshold of 5000 ms.
threshold-type consecutive	(Optional) Specifies that the reaction occurs when threshold violation is consecutively met for a specified number of times.
<i>occurrences</i>	(Optional) Number of consecutive occurrences. Range is 1 to 16. Default is 5.
threshold-type immediate	(Optional) Specifies that the reaction occurs each time the threshold violation is met.
threshold-type never	(Optional) Threshold violations should not be monitored. This is the default threshold type. Note If the threshold-typenever keywords are configured, the action-typenone and action-typetrapOnly keywords are disabled.
threshold-type xofy	(Optional) Specifies that the reaction occurs when threshold violation for the monitored element is met <i>x</i> number of times within the last <i>y</i> number of measurements.
<i>x-value y-value</i>	Range for the x-value and for the y-value is 1 to 16. Default is 5 for both values.
threshold-value	(Optional) Specifies upper-threshold and lower-threshold values for monitored elements
<i>upper-threshold</i>	(Optional) Value in milliseconds (ms). For defaults, see the table below.
<i>lower-threshold</i>	(Optional) Value in milliseconds (ms). For defaults, see the table below.

Command Default IP SLAs proactive threshold monitoring is disabled.

Command Modes TCP connect submode of IP SLA template configuration (config-tplt-tcp-conn)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command enables proactive threshold monitoring for one or more elements in the auto IP SLAs operation template being configured and defines the conditions under which the operation makes the transition from pending to active.

You can configure this command multiple times so as to allow reactions for multiple monitored elements.

The **no** form of this command with one or more keywords can be used to disable individual monitored elements or use the **no** form of this command without keywords to disable all proactive threshold monitoring in the auto IP SLAs operation template.

The table below lists the default upper and lower thresholds for specific monitored elements.

Table 26: Default Threshold Values for Monitored Elements

Monitored Element Keyword	Upper Threshold	Lower Threshold
rtt	5000 ms	3000 ms

Only SNMP traps are supported for return-trip time (RTT) violations during non-Jitter operations.

Only syslog messages are supported for non-RTT violations other than timeout, connectionLoss, or verifyError.

Both SNMP traps and syslog messages are supported for timeout, connectionLoss, or verifyError violations only.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Use the **ipslalogsloggingtraps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Use the **snmp-serverenabletrapsrtr** or **snmp-serverenabletrapssyslog** command to enable the sending of IP SLAs SNMP trap notifications.

To display the current threshold monitoring configuration settings for an auto IP SLAs operation, use the **showipslaautotemplate** command.

Examples

The following example shows how to configure operation parameters and proactive threshold monitoring using an auto IP SLAs operation template. In this example, the proactive threshold monitoring configuration for the TCP connect operation specifies that when three timeout connection loss events occur, an SNMP trap notification should be sent:

```
Router(config)#ip sla auto template type ip tcp-connect react-to
```

```

Router(config-tplt-tcp-conn)#react timeout action-type traponly threshold-type consecutive 3
Router(config-tplt-tcp-conn)#end
Router# show ip sla auto template type ip tcp-connect
IP SLAs Auto Template: react-to
  Measure Type: tcp-connect
  Description:
  .
  .
  .
Reaction Configuration:
  Reaction Index      : 1
  Reaction            : timeout
  Threshold Type      : Consecutive
  Threshold CountX    : 3
  Threshold CountY    : 5
  Action Type        : Trap Only

```

snmp-server enable traps syslog	Enables system to generate CISCO-SYSLOG-MIB traps.

react (tplt-udp-ech)

To configure reaction and proactive threshold monitoring parameters in an auto IP Service Level Agreements (SLAs) operation template for a User Datagram Protocol (UDP) echo operation, use the **react** command in the UDP echo submode of IP SLA template configuration mode. To disable all threshold monitoring or to disable individual monitored elements, use the **no** form of this command.

react [*monitored-element* [[**action-type** *type-of-action*] [**threshold-type** {**average** [*number-of-measurements*] | **consecutive** [*occurrences*] | **immediate** | **never** | **xofy** [*x-value* *y-value*]}] [**threshold-value** *upper-threshold* *lower-threshold*]]]

no react [*monitored-element*]

Syntax Description

<i>monitored-element</i>	(Optional) Element to be monitored for threshold violations. Valid keywords are: • connectionLoss --Reaction should occur if there is a one-way connection loss for the monitored operation. The threshold-value keyword does not apply to this monitored element. • rtt --Reaction should occur if the round-trip time (RTT) violates the upper threshold or lower threshold. • timeout --Reaction should occur if there is a one-way timeout for the monitored operation. The threshold-value keyword does not apply to this monitored element. • verifyError --Reaction should occur if there is a one-way error verification violation. The threshold-value keyword does not apply to this monitored element.
action-type <i>type-of-action</i>	(Optional) Specifies action to be taken when threshold violations occur. Valid keywords are: • none --No action is taken when threshold violations occur. This keyword combination is default for RTT. • trapOnly --A Simple Network Management Protocol (SNMP) trap notification should be sent when the specified violation type occurs for the monitored element. Note If the threshold-type never keywords are configured, the action-type <i>type-of-action</i> keyword and argument combination is disabled.

threshold-type average	(Optional) Specifies that the reaction occurs when the average of a specified number of measurements for the monitored element either exceeds the <i>upperthreshold</i> or drops below the <i>lowerthreshold</i> .
<i>number-of-measurement</i>	(Optional) Number of averaged measurements. Range is 1 to 16. Default is 5. For example, if the <i>number-of-measurement</i> value for threshold-typeaverage is 3 and the upper threshold is 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000/3 = 5667$ ms and the average exceeds the upper threshold of 5000 ms.
threshold-type consecutive	(Optional) Specifies that the reaction occurs when threshold violation is consecutively met for a specified number of times.
<i>occurrences</i>	(Optional) Number of consecutive occurrences. Range is 1 to 16. Default is 5.
threshold-type immediate	(Optional) Specifies that the reaction occurs each time the threshold violation is met.
threshold-type never	(Optional) Specifies that threshold violations should not be monitored. This is the default threshold type. Note If the threshold-typenever keywords are configured, the action-typenone and action-tyetrapOnly keywords are disabled.
threshold-type xofy	(Optional) Specifies that the reaction occurs when threshold violation for the monitored element is met <i>x</i> number of times within the last <i>y</i> number of measurements.
<i>x-value y-value</i>	Range for the <i>x</i> -value and for the <i>y</i> -value is 1 to 16. Default is 5 for both values.
threshold-value	(Optional) Specifies upper-threshold and lower-threshold values for monitored elements
<i>upper-threshold</i>	(Optional) Value in milliseconds (ms). For defaults, see the table below.
<i>lower-threshold</i>	(Optional) Value in milliseconds (ms). For defaults, see the table below.

Command Default

IP SLAs proactive threshold monitoring is disabled.

Command Modes

UDP echo submode of IP SLA template configuration (config-tplt-udp-ech)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command enables proactive threshold monitoring for one or more elements in the auto IP SLAs operation template being configured and defines the conditions under which the operation makes the transition from pending to active.

You can configure this command multiple times to allow reactions for multiple monitored elements.

The **no** form of this command with one or more keywords can be used to disable individual monitored elements or use the **no** form of this command without keywords to disable all proactive threshold monitoring in the auto IP SLAs operation template.

The table below lists the default upper and lower thresholds for specific monitored elements.

Table 27: Default Threshold Values for Monitored Elements

Monitored Element Keyword	Upper Threshold	Lower Threshold
rtt	5000 ms	3000 ms

Only SNMP traps are supported for round-trip time (RTT) violations during non-Jitter operations.

Only syslog messages are supported for non-RTT violations other than timeout, connectionLoss, or verifyError.

Both SNMP traps and syslog messages are supported for timeout, connectionLoss, or verifyError violations only.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Use the **ipslalogsingtraps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Use the **snmp-serverenabletrapsrtr** or **snmp-serverenabletrapssyslog** command to enable the sending of IP SLAs SNMP trap notifications.

To display the current threshold monitoring configuration settings for an auto IP SLAs operation, use the **showipslaautotemplate** command.

Examples

The following example shows how to configure operation parameters and proactive threshold monitoring using an auto IP SLAs operation template. In this example, the proactive threshold monitoring configuration for the UDP echo operation specifies that when three consecutive timeout events occur, an SNMP trap notification is sent:

```
Router(config)#ip sla auto template type ip udp-echo react-to
```

```

Router(config-tplt-udp-ech)#react timeout action-type traponly threshold-type consecutive 3
Router(config-tplt-udp-ech)#end
Router# show ip sla auto template type ip udp-echo
IP SLAs Auto Template: react-to
  Measure Type: udp-echo
  Description:
  .
  .
  .
Reaction Configuration:
  Reaction Index      : 1
  Reaction            : timeout
  Threshold Type      : Consecutive
  Threshold CountX    : 3
  Threshold CountY    : 5
  Action Type        : Trap Only

```

react (tplt-udp-jtr)

To configure reaction and proactive threshold monitoring parameters in an auto IP Service Level Agreements (SLAs) operation template for an User Datagram Protocol (UDP) jitter operation, use the **react** command in the UDP jitter submode of IP SLA template configuration mode. To disable all threshold monitoring or to disable individual monitored elements, use the **no** form of this command.

```
react [monitored-element [[action-type type-of-action] [threshold-type {average [number-of-measurements] |  
consecutive [occurrences] | immediate | never | xofy [x-value y-value]}] [threshold-value upper-threshold  
lower-threshold]]]
```

```
no react [monitored-element ]
```

Syntax Description

monitored-element

(Optional) Element to be monitored for threshold violations. Valid keywords are:

- **connectionLoss** --Reaction should occur if there is a one-way connection loss for the monitored operation. The **threshold-value** keyword does not apply to this monitored element.
- **icpif** --Calculated Planning Impairment Factor.
- **jitterAvg** --Reaction should occur if the average round-trip jitter value violates the upper threshold or lower threshold.
- **jitterDSAvg** --Reaction should occur if the average one-way destination-to-source jitter value violates the upper threshold or lower threshold.
- **jitterSDAvg** --Reaction should occur if the average one-way source-to-destination jitter value violates the upper threshold or lower threshold.
- **latencyDSAvg** --Reaction should occur if the average one-way destination-to-source latency value violates the upper threshold or lower threshold.
- **latencySDAvg** --Reaction should occur if the average one-way source-to-destination latency value violates the upper threshold or lower threshold.
- **maxOfLatencyDS** --Reaction should occur if the one-way maximum destination-to-source latency value is violated.
- **maxOfLatencySD** --Reaction should occur if the one-way maximum source-to-destination latency value is violated.
- **maxOfNegativeDS** --Reaction should occur if the one-way maximum negative jitter destination-to-source threshold is violated.
- **maxOfNegativeSD** --Reaction should occur if the one-way maximum negative jitter source-to-destination threshold is violated.
- **maxOfPositiveDS** --Reaction should occur if the one-way maximum positive jitter destination-to-source threshold is violated.
- **maxOfPositiveSD** --Reaction should occur if the one-way maximum positive jitter

	source-to-destination threshold is violated.
<i>monitored-element</i> (continued)	• mos --Mean Opinion Score (mos) in either direction rises above or falls below a specified threshold. • packetLateArrival --Reaction should occur if the one-way number of late packets violates the upper threshold or lower threshold. • packetLossDS --Reaction should occur if the packet loss value violates the upper threshold or lower threshold. The path of the packets is unknown. • packetLossSD --Reaction should occur if the packet loss value violates the upper threshold or lower threshold. The path of the packets is unknown. • packetMIA --Reaction should occur if the packet is not returned. • packetOutOfSequence --Reaction should occur if the one-way number of packets out of sequence violates the upper threshold or lower threshold. • rtt --Reaction should occur if the round-trip time (RTT) violates the upper threshold or lower threshold. • timeout --Reaction should occur if there is a one-way timeout for the monitored operation. The threshold-value keyword does not apply to this monitored element. • verifyError --Reaction should occur if there is a one-way error verification violation. The threshold-value keyword does not apply to this monitored element.

action-type <i>type-of-action</i>	(Optional) Specifies action to be taken when threshold violations occur. Valid keywords are: • none --No action is taken when threshold violations occur. This keyword combination is default for RTT. • trapOnly --A Simple Network Management Protocol (SNMP) trap notification should be sent when the specified violation type occurs for the monitored element. Note If the threshold-typenever keywords are configured, the action-type<i>type-of-action</i> keyword and argument combination is disabled.
threshold-type average	(Optional) Specifies that the reaction occurs when the average of a specified number of measurements for the monitored element either exceeds the <i>upperthreshold</i> or drops below the <i>lowerthreshold</i>.
<i>number-of-measurement</i>	(Optional) Number of averaged measurements. Range is 1 to 16. Default is 5. For example, if the <i>number-of-measurement</i> value for threshold-typeaverage is 3 and the upper threshold is 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000/3 = 5667$ ms and the average exceeds the upper threshold of 5000 ms.
threshold-type consecutive	(Optional) Specifies that the reaction occurs when threshold violation is consecutively met for a specified number of times.
<i>occurrences</i>	(Optional) Number of consecutive occurrences. Range is 1 to 16. Default is 5.
threshold-type immediate	(Optional) Specifies that the reaction occurs each time the threshold violation is met.
threshold-type never	(Optional) Specifies that threshold violations should not be monitored. This is the default threshold type. Note If these keywords are configured, the action-typenone and action-typetrapOnly keywords are disabled.

threshold-type <i>xofy</i>	(Optional) Specifies that the reaction occurs when threshold violation for the monitored element is met <i>x</i> number of times within the last <i>y</i> number of measurements.
<i>x-value y-value</i>	(Optional) Range for the <i>x</i> -value and for the <i>y</i> -value is 1 to 16. Default is 5 for both values.
threshold-value	(Optional) Specifies upper-threshold and lower-threshold values for monitored elements
<i>upper-threshold</i>	Value in milliseconds (ms). For defaults, see the table in the Usage Guidelines section.
<i>lower-threshold</i>	Value in milliseconds (ms). For defaults, see the table in the Usage Guidelines section.

Command Default IP SLAs proactive threshold monitoring is disabled.

Command Modes UDP jitter submode of IP SLA template configuration (config-tplt-udp-jtr)

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines This command enables proactive threshold monitoring for one or more elements in the auto IP SLAs operation template being configured and defines the conditions under which the operation makes the transition from pending to active.

You can configure this command multiple times so as to allow reactions for multiple monitored elements.

The **no**form of this command with one or more keywords can be used to disable individual monitored elements or use the **no****react** command without keywords to disable all proactive threshold monitoring in the auto IP SLAs operation template.

Return-trip time (RTT) reactions for jitter operations are triggered only at the end of the operation and use the latest value for the return-trip time (LatestRTT).

SNMP traps for RTT for jitter operations are based on the average value for the return-trip time (RTTAvg) for the whole operation only and do not include return-trip time values for individual packets sent during the operation.

For Mean opinion score (MOS), values are computed as numbers to two decimal places, from a value of 1.00 (worst quality) to 5.00 (best quality). The numbers for *upper-threshold* and *lower-threshold* arguments are expressed in three digits representing ones, tenths, and hundredths. For example, to express a MOS threshold of 3.20, enter **320**. The valid range is from 100 (1.00) to 500 (5.00).

The table below lists the default upper and lower thresholds for specific monitored elements.

Table 28: Default Threshold Values for Monitored Elements

Monitored Element Keyword	Upper Threshold	Lower Threshold
icpif	93 (score)	93 (score)
jitterAvg	100 ms	100 ms
jitterDSAvg	100 ms	100 ms
jitterSDAvg	100 ms	100 ms
latencyDSAvg	5000 ms	3000 ms
latencySDAvg	5000 ms	3000 ms
maxOflatencyDS	5000 ms	3000 ms
maxOflatencySD	5000 ms	3000 ms
maxOfNegativeDS	10000 ms	10000 ms
maxOfNegativeSD	10000 ms	10000 ms
maxOfPositiveDS	10000 ms	10000 ms
maxOfPositiveSD	10000 ms	10000 ms
mos	500 (score)	100 (score)
packetLateArrival	10000 packets	10000 packets
packetLossDS	10000 packets	10000 packets
packetLossSD	10000 packets	10000 packets
packetMIA	10000 packets	10000 packets
packetOutOfSequence	10000 packets	10000 packets
rtt	5000 ms	3000 ms

Only syslog messages are supported for RTTAvg threshold violations.

Only syslog messages are supported for RTT violations during Jitter operations.

Only syslog messages are supported for non-RTT violations other than timeout, connectionLoss, or verifyError.

Both SNMP traps and syslog messages are supported for timeout, connectionLoss, or verifyError violations only.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB.

Use the **snmp-server enable traps rtr** or **snmp-server enable traps syslog** command to enable the sending of IP SLAs SNMP trap notifications.

Use the **ip sla logging traps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Only system logging messages are supported for RTTAvg threshold violations.

To display the current threshold monitoring configuration settings for an auto IP SLAs operation, use the **show ip sla auto template** command.

Examples

The following example shows how to configure operation parameters and proactive threshold monitoring using an auto IP SLAs operation template. In this example, the proactive threshold monitoring configuration for the UDP jitter operation specifies that when three consecutive timeout events occur, an SNMP trap notification should be sent:

```
Router(config)#ip sla auto template type ip udp-jitter react-to
Router(config-tplt-udp-jtr)#react timeout action-type traponly threshold-type consecutive 3
Router(config-tplt-udp-jtr)#end
Router# show ip sla auto template type ip udp-jitter
IP SLAs Auto Template: react-to
  Measure Type: udp-jitter
  Description:
  .
  .
  .
  Reaction Configuration:
    Reaction Index      : 1
    Reaction            : timeout
    Threshold Type      : Consecutive
    Threshold CountX    : 3
    Threshold CountY    : 5
    Action Type        : Trap Only
```

Related Commands

Command	Description
ip sla logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.
show ip sla auto template	Displays configuration including default values of auto IP SLAs operation templates.
snmp-server enable traps rtr	Enables system to generate CISCO-RTTMON-MIB traps.
snmp-server enable traps syslog	Enables system to generate CISCO-SYSLOG-MIB traps.

reply-dscp-bits

To specify the differentiated services codepoint (DSCP) value for an echo reply packet of a Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation, use the **reply-dscp-bits** command in auto IP SLA MPLS parameters configuration mode. To return to the default value, use the **no** form of this command.

reply-dscp-bits *dscp-value*

no reply-dscp-bits *dscp-value*

Syntax Description

<i>dscp-value</i>	Specifies the differentiated services codepoint (DSCP) value for an echo reply packet.

Command Default

The DSCP value is 0.

Command Modes

Auto IP SLA MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

You must configure the type of LSP Health Monitor operation (such as LSP ping) before you can configure any of the other parameters of the operation.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider

Edge (PE) router. The DSCP value for the echo reply packets of IP SLAs operations created by LSP Health Monitor operation 1 is set to 5.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  delete-scan-factor 2
  reply-dscp-bits 5
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
  3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

reply-mode

To specify the reply mode for an echo request packet of a Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation, use the **reply-mode** command in auto IP SLA MPLS parameters configuration mode. To return to the default value, use the **no** form of this command.

reply-mode {ipv4| router-alert}

no reply-mode {ipv4| router-alert}

Syntax Description

ipv4	Replies with an IPv4 User Datagram Protocol (UDP) packet (default).
router-alert	Replies with an IPv4 UDP packet with router alert.

Command Default

The reply mode for an echo request packet is an IPv4 UDP packet by default.

Command Modes

Auto IP SLA MPLS parameters configuration (config-auto-ip-sla-mpls-params)

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider

Edge (PE) router. The reply mode of an echo request packet for IP SLAs operations created by LSP Health Monitor operation 1 is an IPv4 UDP packet with router alert.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  delete-scan-factor 2
  reply-mode router-alert
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
  3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

request-data-size

To set the protocol data size in the payload of a Cisco IOS IP Service Level Agreements (SLAs) operation's request packet, use the **request-data-size** command in the appropriate submode of IP SLA configuration, auto IP SLA MPLS configuration, IP SLA monitor configuration, or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

request-data-size *bytes*

no request-data-size

Syntax Description

<i>bytes</i>	Size of the protocol data in the payload of the request packet of the operation, in bytes. Range is from 0 to the maximum supported by the protocol.

Command Default

The default data size varies depending on the type of IP SLAs operation you are configuring. See the CISCO-RTTMON-MIB documentation for more details.

Command Modes

DLSw configuration (config-ip-sla-dlsw) ICMP echo configuration (config-ip-sla-echo) ICMP path echo configuration (config-ip-sla-pathEcho) ICMP path jitter configuration (config-ip-sla-pathJitter) UDP echo configuration (config-ip-sla-udp) UDP jitter configuration (config-ip-sla-jitter) VCCV configuration (config-sla-vccv)

Command Modes

MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command Modes

DLSw configuration (config-sla-monitor-dlsw) ICMP echo configuration (config-sla-monitor-echo) ICMP path echo configuration (config-sla-monitor-pathEcho) ICMP path jitter configuration (config-sla-monitor-pathJitter) UDP echo configuration (config-sla-monitor-udp) UDP jitter configuration (config-sla-monitor-jitter)

Command Modes

ICMP echo configuration (config-icmp-ech-params) UDP echo configuration (config-udp-ech-params) UDP jitter configuration (config-icmp-ech-params)

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Release	Modification
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	The VCCV configuration mode was added.
15.1(1)T	This command was modified. The IP SLA template-parameters configuration mode was added.

Usage Guidelines

The **request-data-size** command can be used to set the padding size for the data frame of an IP SLAs Ethernet operation. See the documentation for the **request-data-size** (Ethernet) command for more information.

The **request-data-size** command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release table). If you are configuring an IP SLAs label switched path (LSP) Health Monitor operation, see the Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release table for information on Cisco IOS release dependencies. You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

The configuration mode for the **request-data-size** command varies depending on the Cisco IOS release you are running and the operation type configured.

If you are running Cisco IOS IP SLAs Engine 3.0, you must enter the **parameters** command in IP SLA template configuration mode before you can use the **request-datasize** command.

Table 29: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Table 30: Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(6)T, 12.0(32)SY, 12.2(31)SB2, 12.2(33)SRB, 12.2(33)SXH, or later releases	auto ip sla mpls-lsp-monitor	Auto IP SLA MPLS configuration
15.1(1)T	ip sla auto template	IP SLA template configuration

Examples

The following examples show how to set the request packet size to 40 bytes for an IP SLAs ICMP echo operation. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release table).

Examples

```
ip sla 3
 icmp-echo 172.16.1.175
 request-data-size 40
!
ip sla schedule 3 life forever start-time now
```

Examples

```
ip sla monitor 3
 type echo protocol ipIcmpEcho 172.16.1.175
 request-data-size 40
!
ip sla monitor schedule 3 life forever start-time now
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 1
Router(config-icmp-ech-tplt)# parameters
Router(config-icmp-ech-params)# request-data-size 40
Router(config-icmp-ech-params)# end
Router#
Router# show ip sla auto template type ip icmp-echo
IP SLAs Auto Template: 1
Measure Type: icmp-echo (control enabled)
Description:
IP options:
  Source IP: 0.0.0.0      Source Port: 0
  VRF:      TOS: 0x0
Operation Parameters:
  Request Data Size: 40 Verify Data: false
Timeout: 5000      Threshold: 5000
Statistics Aggregation option:
  Hours of statistics kept: 2
History options:
  History filter: none
  Max number of history records kept: 15
  Lives of history kept: 0
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

request-data-size (Ethernet)

To set the padding size for the data frame of a Cisco IOS IP Service Level Agreements (SLAs) Ethernet operation, use the **request-data-size** (Ethernet) command in the appropriate submode of IP SLA configuration or auto IP SLA MPLS configuration mode. To return to the default value, use the **no** form of this command.

request-data-size *bytes*

no request-data-size

Syntax Description

<i>bytes</i>	Padding size (in bytes) for the data frame of the operation. The range is from 0 to the maximum of the protocol.

Command Default

The default padding size will vary depending on the type of IP SLAs operation you are configuring. See the CISCO-RTTMON-MIB documentation for more details.

Command Modes

Ethernet echo (config-ip-sla-ethernet-echo)

Ethernet jitter (config-ip-sla-ethernet-jitter)

Command Modes

Ethernet parameters configuration (config-ip-sla-ethernet-params)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Usage Guidelines

You must configure the type of Ethernet operation (such as Ethernet ping) before you can configure any of the other parameters of the operation.

Examples

The following example shows how to set the padding size to 40 bytes for IP SLAs Ethernet ping operation 3:

```
ip sla 3
  ethernet echo mpid 23 domain testdomain vlan 34
  request-data-size 40
!
ip sla schedule 3 life forever start-time now
```

Related Commands

Command	Description
auto ip sla ethernet-monitor	Begins configuration for an IP SLAs auto Ethernet operation and enters IP SLA Ethernet monitor configuration mode.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

reserve dsp

To reserve digital signalling processing (DSP) credits for an IP Service Level Agreements (SLAs) video operation from the previously reserved DSP video services pool, use the **reserve dsp** command in IP SLA video configuration mode. To return to the default, use the **no** form of this command.

reserve dsp

no reserve dsp

Syntax Description

This command has no arguments or keywords.

Command Default

No DSP resources are explicitly reserved for IP SLAs video operations and video services are deployed on a best-effort basis.

Command Modes

IP SLA video configuration (config-ip-sla-video)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use the **reserve dsp** command to reserve DSP resources for IP SLAs video operations.

Video resources are allocated when the operation is initiated and then released when the operation has completed. During the operation's times pan, it is guaranteed that each session of this operation will be serviced by reserved resources. If resources are not reserved for IP video services, video services are deployed on a best-effort basis; that is, each session will attempt to allocate DSP resources when the session starts at the scheduled time.

Before DSP resources can be allocated to IP SLAs video operations, a percentage of the total voice and video DSP resources, or credits, must be first allocated to the video DSP resource pool to be used for all types of video operations. Allocate DSP resources to the DSP resource pool using the **voice-service dsp-reservation** command.

Examples

```
Router(config-ip-sla-video)# reserve dsp
Router(config-ip-sla-video)#
```

Related Commands

Command	Description
voice-service dsp-reservation	Specifies the percentage of DSP resources that are reserved strictly for VOIP on the voice card.

resolution

To configure the resolution parameter in a user-defined video traffic profile for an IP Service Level Agreements (SLAs) video operation, use the **resolution** command in the appropriate IP SLA VO profile endpoint configuration submode. To remove the resolution value, use the **no** form of this command.

resolution *resolution*

no resolution *resolution*

Syntax Description

<i>resolution</i>	Resolution for profile being configured in pixels. The following keywords are valid options for the resolution: • QCIF: The resolution is 176 x 144 and is valid for the CP-9900 and custom video endpoint types only. • QVCA: The resolution is 320 x 240 and is valid for only the custom video endpoint type. • SIF: The resolution is 352 x 240 and is valid for only the custom video endpoint type. • CIF: The resolution is 352 x 288 and is valid for the CP-9900 and custom video endpoint types. • VGA: The resolution is 640 x 480 and is valid for the CP-9900 and custom video endpoint types. • 4CIF: The resolution is 704 x 480 (also used for w448) and is valid for only the custom video endpoint type. • 4SIF: The resolution is 704 x 480 and is valid for only the custom video endpoint type. • 720P: The resolution is 1280 x 720 and is valid for the CTS and custom video endpoint types. • 1080P: The resolution is 1920 x 1080 and is valid for the CTS and custom video endpoint types. For a description of each traffic profile type, see the "Usage Guidelines" section.

Command Default

No resolution is specified in the video profile.

Command Modes

IP SLA VO CP9900 profile endpoint configuration (cfg-ipslavo-cp9900-profile)
 IP SLA VO CTS profile endpoint configuration (cfg-ipslavo-cts-profile)
 IP SLA VO custom profile endpoint configuration (cfg-ipslavo-custom-profile)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use the **resolution** command to configure the resolution parameter in a video profile for the following video endpoint types:

- CP-9900—Cisco Unified 9900 Series IP Phone System (CP-9900).
- CTS—Cisco Telepresence System 1000/3000 (CTS-1000/3000)
- custom—Customized video endpoint type.

The keywords for this command are not case sensitive. The keywords in online help contain uppercase letters to enhance readability only.

There are restrictions based on the relationships between maximum bit rate, frame rate, and resolution, also known as bandwidth. For the user-defined endpoint types, the table below includes the maximum bit rates allowable in relation to the frame per second (fps) rates and resolution. Cisco IOS software allows you to enter the values of these three parameters in any order and verifies that their combination is within a valid range, as specified. For example, if a 1080 pixels (p) resolution at 30 fps is chosen, the valid maximum bit-rate range is between 1500 and 4000 kb/s.

Table 31: Maximum Bit Rates Allowable for Frame Rates and Resolution in Custom Endpoints

Resolution and Frame Rate	30/24 fps	15 fps	10 fps	7.5 fps	5 fps
QCIF	60–256 kb/s	32–160 kb/s	20–118 kb/s	15–96 kb/s	10–74 kb/s
CIF/SIG/QVGA	128–1000 kb/s	64–564 kb/s	43–397 kb/s	32–314 kb/s	22–230 kb/s
VGA/4CIF/4SIF	384–2000 kb/s	192–1128 kb/s	128–795 kb/s	96–628 kb/s	64–461 kb/s
720p	800–2500 kb/s	400–1506 kb/s	267–1089 kb/s	200–881 kb/s	133–673 kb/s
1080p	1500–4000 kb/s	750–2512 kb/s	500–1845 kb/s	375–1512 kb/s	250–1179 kb/s

Press **Shift+?** to display only those options that are applicable for various endpoint type configurations. For example, if CTS is the previously configured endpoint type, the only resolutions available are 720p and 1080p.

Examples

```
Router> enable
Router# configure terminal
Router(config)# ip sla profile video my-profile
Router(cfg-ipslavo-profile)# endpoint custom
Router(cfg-ipslavo-custom-profile)# resolution VGA
```

Related Commands

Command	Description
bitrate (VO profile)	Configures the max bit rate or bit-rate window size parameter in a user-defined video profile.
frame	Configures frame parameters in a user-defined video profile.
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

response-data-size

To set the protocol data size in the payload of a Cisco IOS IP Service Level Agreements (SLAs) operation response packet, use the **response-data-size** command in UDP jitter configuration mode. To return to the default value of the protocol data size in the payload of the response packet, use the **no** form of this command.

response-data-size *bytes*

no response-data-size

Syntax Description

<i>bytes</i>	Size of the protocol data in the payload of a response packet, in bytes. The range is from 21 to the maximum size supported by the UDP protocol.

Command Default

The default response data size varies depending on the type of IP SLAs operation configured.

Command Modes

UDP jitter configuration (config-ip-sla-jitter)

Command History

Release	Modification
15.3(3)M	This command was introduced.

Usage Guidelines

The **response-data-size** command enables Cisco IP SLAs to support custom-defined packet sizes based on the direction (sender to receiver and receiver to sender) of the traffic. This command is supported in IPv4 and IPv6 networks to configure an IP SLAs operation.

Note

If the **response-data-size** command is not configured, then the response data size value is the same as the request data size value.

Examples

The following example shows how to set the response data size to 25 bytes for an IP SLAs UDP jitter operation:

```
Device> enable
Device# configure terminal
Device(config)# ip sla 10
Device(config-ip-sla)# udp-jitter 192.0.2.114 55
Device(config-ip-sla-jitter)# response-data-size 25
Device(config-ip-sla-jitter)# end
```

Related Commands

Command	Description
ip sla	Starts configuring an IP SLAs operation and enters IP SLA configuration mode.
udp-jitter	Configures an IP SLAs UDP jitter operation.

rtp (VO profile)

To configure the Real-time Transport Protocol (RTP) parameters in a user-defined custom video traffic profile for an IP Service Level Agreements (SLAs) video operation, use the **rtp** command in IP SLA VO custom profile endpoint configuration submode. To return the default, use the **no** form of this command.

rtp {size average *avg-size*| buffer output {burst| shaped}}

no rtp {size average *avg-size*| buffer output {burst| shaped}}

Syntax Description

size average <i>avg-size</i>	Specifies the synthetic video RTP average size in bytes. The range is from 500 to 1300. The default is 1000.
buffer output	Specifies that the synthetic video RTP buffer accepts output packet transmissions. This is the default.
bursty	Specifies that the synthetic video RTP buffer accepts bursty output. This is the default.
shaped	Specifies that the synthetic video RTP buffer accepts shaped output.

Command Default

The RTP average size is 1000 bytes and the synthetic video RTP buffer accepts bursty output.

Command Modes

IP SLA VO custom profile endpoint configuration (cfg-ipslavo-custom-profile)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use this command to change the values for the RTP parameters in a user-defined custom video traffic profile from the defaults (1000 bytes and bursty output) to the specified values. The RTP packet is the carrier vehicle for video media traffic.

Bursty output is defined as sending packets immediately after they are ready for transmission. Shaped output is defined as sending packets evenly distributed within a frame interval.

Examples

```
Router> enable
Router# configure terminal
Router(config)# ip sla profile video my-profile
Router(cfg-ipslavo-profile)# endpoint cts
Router(cfg-ipslavo-cts-profile)# rtp size average 800
```

```
Router(cfg-ipslavo-cts-profile)# rtp buffer output shaped
```

Related Commands

Command	Description
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

rtr

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr**command is replaced by the **ip sla monitor**command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr**command is replaced by the **ip sla**command. See the **ip sla monitor**and **ip sla**commands for more information.

To begin configuration for a Cisco IOS IP Service Level Agreements (IP SLAs) operation and enter RTR configuration mode, use the **rtr**command in global configuration mode. To remove all configuration information for an operation, including the schedule of the operation, reaction configuration, and reaction triggers, use the **no** form of this command.

rtr *operation-number*

no **rtr** *operation-number*

Syntax Description

operation-number

Operation number used for the identification of the IP SLAs operation you wish to configure.

Command Default

No IP SLAs operation is configured.

Command Modes

Global configuration

Command History

Release	Modification
11.2	This command was introduced.
12.2(11)T	The maximum number of operations was increased from 500 to 2000 (SAA Engine II).
12.3(14)T	This command was replaced by the ip sla monitor command.
12.2(31)SB2	This command was replaced by the ip sla monitor command.
12.2(33)SRB	This command was replaced by the ip sla command.

Usage Guidelines

The **rtr** command is used to configure Cisco IOS IP Service Level Agreements (IP SLAs) operations. Use this command to specify an identification number for the operation you are about to configure. After you enter this command, you will enter the RTR configuration mode.

IP SLAs allows a maximum of 2000 operations.

Debugging is supported only on the first 32 operation numbers.

After you configure a operation, you must schedule the operation. For information on scheduling a operation, refer to the **rtr schedule** and **rtr group schedule** global configuration commands. You can also optionally set reaction triggers for the operation. For information on reaction triggers, refer to the **rtr reaction-configuration** and **rtr reaction-trigger** global configuration commands.

Note

After you schedule an operation, you cannot modify the configuration of the operation. To modify the configuration of the operation after it is scheduled, you must first delete the IP SLAs operation (using the **no rtr** command) and then reconfigure the operation with the new operation parameters.

To display the current configuration settings of the operation, use the **show rtr configuration EXEC** command.

Examples

In the following example, operation 1 is configured to perform end-to-end IP SLAs operations using an SNA LU Type 0 connection with the host name cwbc0a. Only the **type** RTR configuration command is required; all others are optional.

```
rtr 1
 type echo protocol snalu0echoappl cwbc0a
 request-data-size 40
 response-data-size 1440
```

Note

If operation 1 already existed and it has not been scheduled, you are placed into RTR configuration mode. If the operation already exists and has been scheduled, this command will fail.

Related Commands

Command	Description
rtr group schedule	Configures the group scheduling parameters for multiple IP SLAs operations.
rtr reaction-configuration	Configures certain actions to occur based on events under the control of IP SLAs.
rtr reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action type options are defined with the ip sla monitor reaction-configuration command.
rtr schedule	Configures the scheduling parameters for a single IP SLAs operation.
show rtr configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

rtr group schedule

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr group schedule** command is replaced by the **ip sla monitor group schedule** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr group schedule** command is replaced by the **ip sla group schedule** command. See the **ip sla monitor group schedule** and **ip sla group schedule** commands for more information.

To perform group scheduling for Cisco IOS IP Service Level Agreements (IP SLAs) operations, use the **rtr group schedule** command in global configuration mode. To stop the operation and place it in the default state of normal scheduling, use the **no** form of this command.

rtr group schedule *group-operation-number operation-id-numbers schedule-period schedule-period-range* [**ageout** *seconds*] [**frequency** *group-operation-frequency*] [**life** {**forever**| *seconds*}] [**start-time** {*hh : mm : ss*} [*month day*| *day month*]] [**pending**| **now**| **after** *hh : mm : ss*]

no **rtr group schedule**

Syntax Description

<i>group-operation-number</i>	Group configuration or group schedule number of the IP SLAs operation to be scheduled. The range is from 0 to 65535.
<i>operation-id-numbers</i>	The list of IP SLAs operation ID numbers in the scheduled operation group. Indicate ranges of operation ID numbers with a hyphen. Individual ID numbers and ranges of ID numbers are delimited by a comma. For example, enter a list of operation ID numbers in any of the following ways: • 2, 3, 4, 9, 20 • 10-20, 30-35, 60-70 • 2, 3, 4, 90-100, 105-115 The <i>operation-id-numbers</i> argument can include a maximum of 125 characters.
schedule-period <i>schedule-period-range</i>	Time (in seconds) for which the IP SLAs operation group is scheduled. The range is from 1 to 604800.
ageout <i>seconds</i>	(Optional) Number of seconds to keep the operation in memory when it is not actively collecting information. The default is 0 (never ages out).

frequency <i>group-operation-frequency</i>	(Optional) Specifies the number of seconds after which each IP SLAs operation is restarted. If this keyword and argument are specified, the frequency of all operations belonging to the group will be overridden and set to the specified frequency. The range is from 1 to 604800. Note If this keyword and argument are not specified, the frequency for each operation is set to the value specified for the schedule period.
life forever	(Optional) Schedules the operation to run indefinitely.
life <i>seconds</i>	(Optional) Number of seconds the operation actively collects information. The default is 3600 (one hour).
start-time	(Optional) Time when the operation starts collecting information. If the start-time is not specified, no information is collected until the start-time is configured or a trigger occurs that performs a start-time now .
<i>hh : mm [: ss]</i>	(Optional) Specifies an absolute start time using hours, minutes, and (optionally) seconds. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a <i>month</i> and <i>day</i> .
<i>month</i>	(Optional) Name of the month to start the operation in. If month is not specified, the current month is used. Use of this argument requires that a day be specified as well. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day (in the range 1 to 31) to start the operation on. If a day is not specified, the current day is used. Use of this argument requires that a month be specified as well.
pending	(Optional) No information is collected. This is the default value.
now	(Optional) Indicates that the operation should start immediately.

after <i>hh</i> : <i>mm</i> : <i>ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.

Command Default

The operation is placed in a **pending** state (that is, the operation is enabled but is not actively collecting information).

Command Modes

Global configuration

Command History

Release	Modification
12.3(8)T	This command was introduced.
12.3(14)T	This command was replaced by the ip sla monitor group schedule command.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the ip sla monitor group schedule command.
12.2(33)SRB	This command was replaced by the ip sla group schedule command.

Usage Guidelines

Though IP SLAs multiple operations scheduling functionality helps in scheduling thousands of operations, you should be cautious while specifying the number of operations, the schedule period, and the operation group frequency to avoid CPU hogging.

For example, consider a scenario where you are scheduling 1 to 780 operations at a schedule period of 60 seconds, the command would be as follows:

rtr group schedule 2 1-780 schedule-period 60 start-now

IP SLAs calculates how many operations it should start in each 1-second interval by dividing the number of operations by the schedule period (780 operations divided by 60 seconds, which is 13 operations per second). Operations 1 to 13 in operation group 2 start after 0 seconds, operations 14 to 26 start after 1 second, operations 27 to 40 start after 2 seconds, and the iteration continues until operations 768 to 780 start after 59 seconds. This high value of operations starting at every 1-second interval (especially for jitter operations) can load the CPU to very high values.

The maximum recommended value of operations per second is 6 or 7. This is approximately 350 to 400 operations per minute. This value of 6 or 7 operation per second will be the maximum that does not have any

major performance (CPU) impact. However, this value varies from platform to platform. The above value is verified and tested on a Cisco 2600 router.

**Note**

No warning messages will be displayed if IP SLAs multiple operations scheduling leads to a high number of operations starting per second.

When you reboot the router, the IP SLAs multiple operations scheduling functionality schedules the operations in the same order as was done before the reboot. For example, assume the following operation had been scheduled:

rtr group schedule 2 1-20 schedule-period 40 start-time now

Over a range of 40 seconds, 20 operations have to be started (that is, one operation every 2 seconds). After the system reboot, operation 1 will start at t seconds and operation 2 starts at $t+2$ seconds, operation 3 starts at $t+4$ seconds, and so on.

The IP SLAs multiple operations scheduling functionality schedules the maximum number of operations possible without aborting. However, this functionality skips those IP SLAs operations that are already running or those that are not configured and hence do not exist. The total number of operations will be calculated based on the number of operations specified in the command, irrespective of the number of operations that are missing or already running. The IP SLAs multiple operations scheduling functionality displays a message showing the number of active and missing operations. However, these messages are displayed only if you schedule operations that are not configured or are already running.

Examples

The following example shows how to schedule IP SLAs operations 3, 4, and 6 to 10 in operation group 1:

```
rtr group schedule 1 3, 4, 6-10
```

The following example shows how to schedule IP SLAs operations 3, 4, and 6 to 10 in operation group 1, with a schedule period of 20 seconds:

```
rtr group schedule 1 3, 4, 6-10 schedule-period 20
```

The following example shows how to schedule IP SLAs operations 3, 4, and 6 to 10 in operation group 1, with a schedule period of 20 seconds with start time as now:

```
rtr group schedule 1 3, 4, 6-10 schedule-period 20 start-time now
```

Related Commands

Command	Description
rtr schedule	Enters rtr scheduling mode.
show rtr collection-statistics	Displays the collection details of the IP SLAs operation.
show rtr configuration	Displays the configuration details of the IP SLAs operation.
show rtr operation	Displays the operation details of the IP SLAs operation.

rtr key-chain

**Note**

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr key-chain** command is replaced by the **ip sla monitor key-chain** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr key-chain** command is replaced by the **ip sla key-chain** command. See the **ip sla monitor key-chain** and **ip sla key-chain** commands for more information.

To enable Cisco IOS IP Service Level Agreements (IP SLAs) control message authentication and specify an MD5 key chain, use the **rtr key-chain** command in global configuration mode. To remove control message authentication, use the no form of this command.

rtr key-chain *name*

no rtr key-chain

Syntax Description

<i>name</i>	Name of MD5 key chain.

Command Default

Control message authentication is disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.0(3)T	This command was introduced.
12.3(14)T	This command was replaced by the ip sla monitor key-chain command.
12.2(31)SB2	This command was replaced by the ip sla monitor key-chain command.
12.2(33)SRB	This command was replaced by the ip sla key-chain command.

Usage Guidelines

The authentication configuration on the IP SLAs source and IP SLAs Responder devices must be the same. In other words, both devices must be configured with the same key chain or both devices must not use authentication.

If the **rtr key-chain** command is entered, at least one key must be added to the specified MD5 key chain in order for MD5 authentication to occur.

Examples

In the following example, the IP SLAs control message uses MD5 authentication, and the key chain name is CSAA. The authentication string for key 1 is csaakey1.

```
rtr key-chain csaa
key chain csaa
key 1
key-string csaakey1
```

Related Commands

Command	Description
key	Identifies an authentication key on a key chain.
key chain	Enables authentication for routing protocols and identifies a group of authentication keys.
key-string (authentication)	Specifies the authentication string for a key.
rtr	Specifies an IP SLAs operation and enters RTR configuration mode.

rtr logging traps

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr logging traps** command is replaced by the **ip sla monitor logging traps** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr logging traps** command is replaced by the **ip sla logging traps** command. See the **ip sla monitor logging traps** and **ip sla logging traps** commands for more information.

To enable the generation of Simple Network Management Protocol (SNMP) system logging messages specific to Cisco IOS IP Service Level Agreements (SLAs) trap notifications, use the **rtr logging traps** command in global configuration mode. To disable IP SLAs system logging SNMP traps, use the **no** form of this command.

rtr logging traps

no rtr logging traps

Syntax Description

This command has no arguments or keywords.

Command Default

SNMP system logging messages specific to IP SLAs trap notifications are not generated.

Command Modes

Global configuration

Command History

Release	Modification
12.3(7)T	This command was introduced.
12.3(14)T	This command was replaced by the ip sla monitor logging traps command.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the ip sla monitor logging traps command.
12.2(33)SRB	This command was replaced by the ip sla logging traps command.

Usage Guidelines

SNMP trap notifications for IP SLAs can be configured as a triggered action, to be sent when monitored values exceed an upper threshold or fall below a lower threshold, or when a set of defined conditions are met. For example, an SNMP trap can be triggered by five consecutive timeouts during an IP SLAs operation. The

sending of SNMP traps is one of the options for triggered actions that can be configured for IP SLAs threshold violations. To configure proactive threshold monitoring parameters for an IP SLAs operation, use the **rtr reaction-configuration** command in global configuration mode.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB and CISCO-SYSLOG-MIB. Use the **snmp-server enable traps rtr** command to enable the sending of IP SLAs SNMP trap notifications.

Examples

The following example shows the configuration of IP SLAs traps to be triggered for round-trip time (RTT) violations and Voice over IP (VoIP) mean opinion score (MOS) violations, and the necessary SNMP configuration for enabling these SNMP logging traps:

```
rtr 1
  type jitter dest-ipaddr 209.165.200.225 dest-port 9234
!
rtr schedule 1 start now life forever
rtr reaction-configuration 1 react rtt threshold-type immediate threshold-value 3000 2000
action-type trapOnly
rtr reaction-configuration 1 react MOS threshold-type consecutive 4 threshold-value 390 220
  action-type trapOnly
!
rtr logging traps
snmp-server enable traps rtr
```

Related Commands

Command	Description
logging on	Controls (enables or disables) system message logging globally.
rtr reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.

rtr low-memory

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr low-memory** command is replaced by the **ip sla monitor low-memory** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr low-memory** command is replaced by the **ip sla low-memory** command. See the **ip sla monitor low-memory** and **ip sla low-memory** commands for more information.

To specify how much unused memory must be available to allow Cisco IOS IP Service Level Agreements (IP SLAs) configuration, use the **rtr low-memory** command in global configuration mode. To remove the type configuration for the operation, use the **no** form of this command.

rtr low-memory *value*

no **rtr low-memory**

Syntax Description

<i>value</i>	Specifies amount of memory, in bytes, that must be available to configure IP SLAs. The range is from 0 to the maximum amount of free memory bytes available.

Command Default

The default *value* is 25 percent of the memory available on the system.

Command Modes

Global configuration

Command History

Release	Modification
12.0(5)T	This command was introduced.
12.3(14)T	This command was replaced by the ip sla monitor low-memory command.
12.2(31)SB2	This command was replaced by the ip sla monitor low-memory command.
12.2(33)SRB	This command was replaced by the ip sla low-memory command.

Usage Guidelines

The **rtr low-memory** command allows the user to specify the amount of memory that IP SLAs can use. If the amount of available free memory falls below the value specified in the **rtr low-memory** command, then you will not be allowed to configure new IP SLAs operations. If this command is not used, the default

low-memory value is 25 percent. This means that if 75 percent of system memory has been utilized you will not be able to configure any IP SLAs characteristics.

The value of the **rtr low-memory** command should not exceed the amount of free memory available on the system. To determine the amount of free memory available on the system, use the **show memory EXEC** command.

Examples

In the following example, the router is configured so that no less than 2 MB of memory will be free for IP SLAs configuration:

```
rtr low-memory 2000000
```

Related Commands

Command	Description
rtr	Specifies an identification number for an IP SLAs operation and enters RTR configuration mode.
show memory	Displays statistics about memory, including memory-free pool statistics.

rtr mpls-lsp-monitor

Note

Effective with Cisco IOS Releases 12.2(31)SB2 and 12.2(33)SRB, the **rtr mpls-lsp-monitor** command is replaced by the **auto ip sla mpls-lsp-monitor** command. See the **auto ip sla mpls-lsp-monitor** command for more information.

To begin configuration for an IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation and enter SAA Multiprotocol Label Switching (MPLS) configuration mode, use the **rtr mpls-lsp-monitor** command in global configuration mode. To remove all configuration information for an LSP Health Monitor operation, use the **no** form of this command.

rtr mpls-lsp-monitor *operation-number*

no rtr mpls-lsp-monitor *operation-number*

Syntax Description

<i>operation-number</i>	Number used for the identification of the LSP Health Monitor operation you wish to configure.

Command Default

No LSP Health Monitor operation is configured.

Command Modes

Global configuration

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the auto ip sla mpls-lsp-monitor command.
12.2(33)SRB	This command was replaced by the auto ip sla mpls-lsp-monitor command.

Usage Guidelines

Entering this command automatically enables the **mpls discovery vpn next-hop** command.

After you configure an LSP Health Monitor operation, you must schedule the operation. To schedule an LSP Health Monitor operation, use the **rtr mpls-lsp-monitor schedule** command in global configuration mode. You can also optionally set reaction configuration for the operation (see the **rtr mpls-lsp-monitor reaction-configuration** command).

To display the current configuration settings of an LSP Health Monitor operation, use the **show rtr mpls-lsp-monitor configuration** command in EXEC mode.

Examples

The following example shows how to configure operation parameters, reaction conditions, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all BGP next hop neighbors in use by all VRFs associated with the source Provider Edge (PE) router.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
rtr mpls-lsp-monitor 1
  type echo saa-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
!
rtr mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type consecutive
  3 action-type trapOnly
rtr mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive 3
  action-type trapOnly
rtr logging traps
!
rtr mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
rtr mpls-lsp-monitor reaction-configuration	Configures certain actions to occur based on events under the control of the IP SLAs LSP Health Monitor.
rtr mpls-lsp-monitor schedule	Configures the scheduling parameters for an IP SLAs LSP Health Monitor operation.
show rtr mpls-lsp-monitor configuration	Displays configuration settings for IP SLAs LSP Health Monitor operations.
type echo (MPLS)	Configures the parameters for a Cisco IOS IP SLAs LSP ping operation using the LSP Health Monitor.
type pathEcho (MPLS)	Configures the parameters for a Cisco IOS IP SLAs LSP traceroute operation using the LSP Health Monitor.

rtr mpls-lsp-monitor reaction-configuration

Note

Effective with Cisco IOS Releases 12.2(31)SB2 and 12.2(33)SRB, the **rtr mpls-lsp-monitor reaction-configuration** command is replaced by the **auto ip sla mpls-lsp-monitor reaction-configuration** command. See the **auto ip sla mpls-lsp-monitor reaction-configuration** command for more information.

To configure proactive threshold monitoring parameters for a Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation, use the **rtr mpls-lsp-monitor reaction-configuration** command in global configuration mode. To clear all threshold monitoring configuration for a specified LSP Health Monitor operation, use the **no** form of this command.

rtr mpls-lsp-monitor reaction-configuration *operation-number* **react** *monitored-element* [**action-type** *option*] [**threshold-type** {**consecutive** [*occurrences*] | **immediate** | **never**}]

no **rtr mpls-lsp-monitor reaction-configuration** *operation-number*

Syntax Description

<i>operation-number</i>	Number of the LSP Health Monitor operation for which reactions are to be configured.
react <i>monitored-element</i>	Specifies the element to be monitored for violations. Keyword options for the monitored element are: • connectionLoss --Specifies that a reaction should occur if there is a one-way connection loss for the monitored operation. • timeout --Specifies that a reaction should occur if there is a one-way timeout for the monitored operation.
action-type <i>option</i>	(Optional) Specifies what action or combination of actions the operation performs when threshold events occur. If the threshold-type never keywords are defined, the action-type keyword is disabled. The <i>option</i> argument can be one of the following keywords: • none --No action is taken. This option is the default value. • trapOnly --Send an SNMP logging trap when the specified violation type occurs for the monitored element.

threshold-type consecutive [<i>occurrences</i>]	(Optional) When a threshold violation for the monitored element is met consecutively for a specified number of times, perform the action defined by the action-type keyword. The default number of 5 consecutive occurrences can be changed using the <i>occurrences</i> argument. The range is from 1 to 16.
threshold-type immediate	(Optional) When a threshold violation for the monitored element is met, immediately perform the action defined by the action-type keyword.
threshold-type never	(Optional) Do not calculate threshold violations. This option is the default threshold type.

Command Default IP SLAs proactive threshold monitoring is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.2(27)SBC	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(31)SB2	This command was replaced by the auto ip sla mpls-lsp-monitor reaction-configuration command.
	12.2(33)SRB	This command was replaced by the auto ip sla mpls-lsp-monitor reaction-configuration command.

Usage Guidelines

You can configure the **rtr mpls-lsp-monitor reaction-configuration** command multiple times to enable proactive threshold monitoring for multiple elements for the same operation. However, disabling of individual monitored elements is not supported. In other words, the **no rtr mpls-lsp-monitor reaction-configuration** command will disable all proactive threshold monitoring configuration for the specified IP SLAs operation.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB. Use the **rtr logging traps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Use the **snmp-server enable traps rtr** command to enable the sending of IP SLAs SNMP trap notifications.

To display the current threshold monitoring configuration settings for an LSP Health Monitor operation, use the **show rtr mpls-lsp-monitor configuration** command.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all BGP next hop neighbors in use by all VRFs associated with the source Provider Edge (PE) router. As specified by the reaction condition configuration, when three consecutive connection loss or timeout events occur, an SNMP logging trap is sent.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
rtr mpls-lsp-monitor 1
  type echo saa-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
!
rtr mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type consecutive
  3 action-type trapOnly
rtr mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive 3
  action-type trapOnly
rtr logging traps
!
rtr mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
rtr mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters SAA MPLS configuration mode.
show rtr mpls-lsp-monitor configuration	Displays configuration settings for IP SLAs LSP Health Monitor operations.

rtr mpls-lsp-monitor schedule

Note

Effective with Cisco IOS Releases 12.2(31)SB2 and 12.2(33)SRB, the **rtr mpls-lsp-monitor schedule** command is replaced by the **auto ip sla mpls-lsp-monitor schedule** command. See the **auto ip sla mpls-lsp-monitor schedule** command for more information.

To configure the scheduling parameters for an IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operation, use the **rtr mpls-lsp-monitor schedule** command in global configuration mode. To stop the operation and place it in the default state (pending), use the **no** form of this command.

rtr mpls-lsp-monitor schedule *operation-number* **schedule-period** *seconds* [**frequency** [*seconds*]] [**start-time** {**after** *hh : mm : ss* | *hh : mm* [: *ss*] [*month day* | *day month*]}] **now** | **pending**}]

no **rtr mpls-lsp-monitor schedule** *operation-number*

Syntax Description

<i>operation-number</i>	Number of the LSP Health Monitor operation to be scheduled.
schedule-period <i>seconds</i>	Amount of time (in seconds) for which the LSP Health Monitor operation is scheduled.
frequency <i>seconds</i>	(Optional) Number of seconds after which each IP SLAs operation is restarted. The frequency is equal to the schedule period by default.
start-time	(Optional) Time when the operation starts collecting information. If the start time is not specified, no information is collected.
after <i>hh : mm : ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.
<i>hh : mm</i> [: <i>ss</i>]	(Optional) Specifies an absolute start time using hours, minutes, and seconds. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a month and day.
<i>month</i>	(Optional) Name of the month in which to start the operation. If a month is not specified, the current month is used. Use of this argument requires that a day be specified. You can specify the month by using either the full English name or the first three letters of the month.

<i>day</i>	(Optional) Number of the day (in the range 1 to 31) on which to start the operation. If a day is not specified, the current day is used. Use of this argument requires that a month be specified.
now	(Optional) Indicates that the operation should start immediately.
pending	(Optional) No information is collected. This option is the default value.

Command Default

The LSP Health Monitor operation is placed in a pending state (that is, the operation is enabled but is not actively collecting information).

Command Modes

Global configuration

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the auto ip sla mpls-lsp-monitor schedule command.
12.2(33)SRB	This command was replaced by the auto ip sla mpls-lsp-monitor schedule command.

Usage Guidelines

After you schedule an LSP Health Monitor operation with the **rtr mpls-lsp-monitor schedule** command, you cannot change the configuration of the operation. To change the configuration of the operation, use the **no rtr mpls-lsp-monitor operation-number** command in global configuration mode and then enter the new configuration information.

To display the current configuration settings of an LSP Health Monitor operation, use the **show rtr mpls-lsp-monitor configuration** command in EXEC mode.

Examples

The following example shows how to configure operation parameters, reaction conditions, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all BGP next hop neighbors in use by all VRFs associated with the source Provider Edge (PE) router. As specified in the example configuration, the schedule period for LSP Health Monitor operation 1 is 60 seconds and the operation is scheduled to start immediately.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
```

```
!  
rtr mpls-lsp-monitor 1  
  type echo saa-vrf-all  
  timeout 1000  
  scan-interval 1  
  secondary-frequency connection-loss 10  
  secondary-frequency timeout 10  
!  
rtr mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type consecutive  
  3 action-type trapOnly  
rtr mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive 3  
  action-type trapOnly  
rtr logging traps  
!  
rtr mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
rtr mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters SAA MPLS configuration mode.

rtr reaction-configuration

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr reaction-configuration** command is replaced by the **ip sla monitor reaction-configuration** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr reaction-configuration** command is replaced by the **ip sla reaction-configuration** command. See the **ip sla monitor reaction-configuration** and **ip sla reaction-configuration** commands for more information.

To configure proactive threshold monitoring parameters for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **rtr reaction-configuration** command in global configuration mode. To clear all threshold monitoring configuration for a specified IP SLAs operation, use the **no** form of this command.

rtr reaction-configuration *operation-number* [**react** *monitored-element*] [**threshold-type** {**never**|**immediate**|**consecutive** [*consecutive-occurrences*] | **xofy** [*x-value y-value*] | **average** [*number-of-measurements*] }] [**threshold-value** *upper-threshold lower-threshold*] [**action-type** {**none**|**trapOnly**|**triggerOnly**|**trapAndTrigger**}]

no **rtr reaction-configuration** *operation-number*

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation to configure for which reactions are to be configured.
react <i>monitored-element</i>	Specifies the element to be monitored for threshold violations. Keyword options for the <i>monitored-element</i> are: connectionLoss --Specifies that a reaction should occur if there is a connection loss for the monitored operation. Thresholds do not apply to this monitored element. jitterAvg --Specifies that a reaction should occur if the average round-trip jitter value violates the upper threshold or lower threshold. jitterDSAvg --Specifies that a reaction should occur if the average destination-to-source (DS) jitter value violates the upper threshold or lower threshold. jitterSDAvg --Specifies that a reaction should occur if the average source-to-destination (SD) jitter value violates the upper threshold or lower threshold. mos --Specifies that a reaction should occur if the mean opinion score (MOS) value violates the upper threshold or lower threshold.

react <i>monitored-element</i> (continued)	PacketLossDS --Specifies that a reaction should occur if the destination-to-source packet loss value violates the upper threshold or lower threshold. PacketLossSD --Specifies that a reaction should occur if the source-to-destination packet loss value violates the upper threshold or lower threshold. rtt --Specifies that a reaction should occur if the mean opinion score (MOS) value violates the upper threshold or lower threshold. timeout --Specifies that a reaction should occur if there is a timeout for the monitored operation. Thresholds do not apply to this monitored element. verifyError --Specifies that a reaction should occur if there is an error verification violation. Thresholds do not apply to this monitored element.
threshold-type never	Do not calculate threshold violations. This is the default threshold-type.
threshold-type immediate	When a threshold violation is met for the monitored element, immediately perform the action defined by action-type .
threshold-type consecutive [<i>consecutive-occurences</i>]	When a threshold violation is met for the monitored element five times in a row, perform the action defined by action-type. The optional <i>consecutive-occurences</i> argument can be used to change the number of consecutive occurrences from the default of 5. The valid range is from 1 to 16. The <i>consecutive-occurences</i> value will appear in the output of the show rtr reaction-configuration command as the "Threshold Count:" value.
threshold-type xofy [<i>x-value y-value</i>]	When a threshold violation is met for the monitored element after some number (x) of violations within some other number (y) of measurements ("x of y"), perform the action defined by action-type. The default is 5 for both <i>x-value</i> and <i>y-value</i> (xofy 5 5). The valid range for each value is from 1 to 16. The <i>x-value</i> value will appear in the output of the show rtr reaction-configuration command as the "Threshold Count:" value, and the <i>y-value</i> will appear as the "Threshold Count2:" value.

threshold-type average [<i>number-of-measurements</i>]	When the average of the last five values for the monitored element exceeds the upper threshold or when the average of the last five values for the monitored element drops below the lower threshold, perform the action defined by action-type. For example, if the upper threshold for react rtt threshold-type average 3 is configured as 5000 ms and the last three results of the operation are 6000, 6000, and 5000 ms, the average would be $6000 + 6000 + 5000 = 17000 / 3 = 5667$, thus violating the 5000-ms upper threshold. The default number of 5 averaged measurements can be changed using the optional <i>number-of-measurements</i> argument. The valid range from 1 to 16. This syntax is not available if connectionLoss, timeout, or verifyError is specified as the monitored element, as upper and lower thresholds do not apply to these options.
[threshold-value <i>upper-threshold lower-threshold</i>]	(Optional) Specifies the upper-threshold value and lower-threshold values, for jitterAvg, jitterDSAvg, jitterSDAvg, mos, PacketLossDS, PacketLossSD, and rtt. The default upper-threshold value for all monitored elements except mos is 4500, and the default lower-threshold value is 3000. For MOS threshold values (react mos), the number is expressed in 3 digits representing ones, tenths, and hundredths. For example, to express a MOS threshold of 3.20, enter 320. The valid range is from 100 (1.00) to 500 (5.00). The default upper-threshold for MOS is 300 (3.00) and the default lower-threshold is 200 (2.00).

action-type <i>option</i>	(Optional) Specify what action or combination of actions the operation performs when you configure connection-loss-enable or timeout-enable, or threshold events occur. For the action-type to occur for threshold events, the threshold-type must be defined to anything other than never. Option can be one of the following keywords: • none --No action is taken. • trapOnly --Send an SNMP logging trap when the specified violation type occurs for the monitored element. IP SLAs logging traps are enabled using the rtr logging traps command. For SNMP logging traps to be sent, SNMP logging must be enabled using the appropriate SNMP commands, including the snmp-server enable traps syslog command. • triggerOnly --Have one or more target operation's operational state make the transition from "pending" to "active" when the violation conditions are met. The target operations to be triggered are specified using the rtr reaction-trigger command. A target operation will continue until its life expires, as specified by the target operation's configured lifetime value). A triggered target operation must finish its life before it can be triggered again. • trapAndTrigger --Trigger both an SNMP trap and start another IP SLAs operation when the violation conditions are met, as defined in the trapOnly and triggerOnly options above. The following SNA NMVT action-type options appear in the command line help, but are no longer valid: nmvtOnly, trapAndNmvt, nmvtAndTrigger, trapNmvtAndTrigger. These SNA NMVT CLI options will be removed in an upcoming release.

Command Default IP SLAs proactive threshold monitoring is disabled.

Command Modes Global configuration

Command History	Release	Modification
	11.2	This command was introduced.

Release	Modification
12.1(1)T	The verify-error-enable optional keyword was added.
12.3(7)T	This command was enhanced to provide new monitored elements and reaction options. The old syntax of <pre>rtr reaction-configuration <i>operation-number</i> [verify-error-enable] [connection-loss-enable] [timeout-enable] [threshold-falling <i>milliseconds</i>] [threshold-type <i>option</i>] [action-type <i>option</i>]</pre> was replaced by the syntax shown above. Note Configuration of IP SLAs reactions using the old syntax remains available in release 12.3(7)T for backwards compatibility, but support for the old syntax will be removed in an upcoming release. • The functionality of the connection-loss-enable keyword was replaced by the react connectionLoss syntax. • The functionality of the timeout-enable keyword was replaced by the react timeout syntax. • The functionality of the verify-error-enable keyword was replaced by the react verifyError syntax. • The functionality of the threshold-falling milliseconds syntax (and the threshold RTR configuration command) was replaced by the threshold-value <i>upper-threshold lower-threshold</i> syntax.
12.3(14)T	This command was replaced by the ip sla monitor reaction-configuration command.
12.2(31)SB2	This command was replaced by the ip sla monitor reaction-configuration command.
12.2(33)SRB	This command was replaced by the ip sla reaction-configuration command.

Usage Guidelines

You can configure the **rtr reaction-configuration** command multiple times to enable proactive threshold monitoring for multiple elements (for example, configuring thresholds for destination-to-source packet loss and MOS) for the same operation. However, disabling of individual monitored elements is not supported. In other words, the **no rtr reaction-configuration** command will disable all proactive threshold monitoring configuration for the specified IP SLAs operation.

SNMP traps for IP SLAs are supported by the CISCO-RTTMON-MIB. Use the **rtr logging traps** command to enable the generation of SNMP system logging messages specific to IP SLAs trap notifications. Use the **snmp-server enable traps rtr** command to enable the sending of IP SLAs SNMP trap notifications.

To display the current threshold monitoring configuration settings for an IP SLAs operation, use the **show rtr configuration** command.

Examples

In the following example, IP SLAs operation 10 (a Jitter operation) is configured to send an SNMP logging trap when the MOS value exceeds 4.9 (best quality) or falls below 2.5 (poor quality):

```
rtr reaction-configuration 10 react mos threshold-type immediate threshold-value 490 250
action-type trapOnly
```

Related Commands

Command	Description
rtr	Begins configuration for an IP SLAs operation and enters RTR configuration mode.
rtr logging traps	Enables the generation of SNMP system logging messages specific to IP SLAs trap notifications.
rtr reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action-type options are defined with the rtr reaction-configuration global configuration command.
show rtr reaction-configuration	Displays the configured proactive threshold monitoring settings for all IP SLAs operations or a specified operation.
show rtr reaction-trigger	Displays the configured state of triggered IP SLAs operations.

rtr reaction-trigger

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr reaction-trigger** command is replaced by the **ip sla monitor reaction-trigger** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr reaction-trigger** command is replaced by the **ip sla reaction-trigger** command. See the **ip sla monitor reaction-trigger** and **ip sla reaction-trigger** commands for more information.

To define a second Cisco IOS IP Service Level Agreements (IP SLAs) operation to make the transition from a pending state to an active state when one of the trigger action-type options are defined with the **rtr reaction-configuration** command, use the **rtr reaction-trigger** command in global configuration mode. To remove the trigger combination, use the no form of this command.

rtr reaction-trigger *operation-number target-operation*

no **rtr reaction-trigger** *operation*

Syntax Description

<i>operation-number</i>	Number of the operation in the active state that has the action-type set with the rtr reaction-configuration global configuration command.
<i>target-operation</i>	Number of the operation in the pending state that is waiting to be triggered with the rtr global configuration command.

Command Default

No trigger combination is defined.

Command Modes

Global configuration

Command History

Release	Modification
11.2	This command was introduced.
12.3(14)T	This command was replaced by the ip sla monitor reaction-trigger command.
12.2(31)SB2	This command was replaced by the ip sla monitor reaction-trigger command.
12.2(33)SRB	This command was replaced by the ip sla reaction-trigger command.

Usage Guidelines

Triggers are usually used for diagnostics purposes and are not used in normal operation.

Examples

In the following example, the state of operation 1 is changed from pending state to active state when **action-type** of operation 2 occurs:

```
rtr reaction-trigger 2 1
```

Related Commands

Command	Description
rtr	Specifies an IP SLAs operation and enters RTR configuration mode.
rtr reaction-configuration	Configures certain actions to occur based on events under the control of IP SLAs.
rtr schedule	Configures the scheduling parameters for an IP SLAs operation.

rtr reset

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr reset** command is replaced by the **ip sla monitor reset** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr reset** command is replaced by the **ip sla reset** command. See the **ip sla monitor reset** and **ip sla reset** commands for more information.

To perform a shutdown and restart of the Cisco IOS IP Service Level Agreements (SLAs) engine, use the **rtr reset** command in global configuration mode.

rtr reset

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
11.2	This command was introduced.
12.3(14)T	This command was replaced by the ip sla monitor reset command.
12.2(31)SB2	This command was replaced by the ip sla monitor reset command.
12.2(33)SRB	This command was replaced by the ip sla reset command.

Usage Guidelines

The **rtr reset** command stops all operations, clears IP SLAs configuration information, and returns the IP SLAs feature to the startup condition. This command does not reread the IP SLAs configuration stored in startup-config in NVRAM. You must retype the configuration or load a previously saved configuration file.

Note

The **rtr reset** command does not remove IP SLAs label switched path (LSP) Health Monitor configurations from the running configuration.

Caution

Use the **rtr reset** command only in extreme situations such as the incorrect configuration of a number of operations.

Examples

The following example resets IP SLAs, clearing all stored IP SLAs information and configuration:

```
rtr reset
```

Related Commands

Command	Description
rtr restart	Restarts a stopped IP SLAs operation.

rtr responder

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr responder** command is replaced by the **ip sla monitor responder** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr responder** command is replaced by the **ip sla responder** command. See the **ip sla monitor responder** and **ip sla responder** commands for more information.

To enable the Cisco IOS IP Service Level Agreements (IP SLAs) Responder on a destination (operational target) device, use the **rtr responder** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

rtr responder

no rtr responder

Syntax Description

This command has no arguments or keywords.

Command Default

Disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.0(3)T	This command was introduced.
12.3(14)T	This command was replaced by the ip sla monitor responder command.
12.2(31)SB2	This command was replaced by the ip sla monitor responder command.
12.2(33)SRB	This command was replaced by the ip sla responder command.

Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable the sending of receiving of IP SLAs Control packets. Enabling the IP SLAs Responder allows the generation of monitoring statistics on the device sending IP SLAs operations.

Examples

The following example enables the IP SLAs Responder:

```
rtr responder
```

Related Commands

Command	Description
rtr responder type tcpConnect	Enables the IP SLAs Responder for TCP Connect operations.
rtr responder type udpEcho	Enables the IP SLAs Responder for UDP Echo and Jitter operations.

rtr responder type tcpConnect

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr responder type tcpConnect** command is replaced by the **ip sla monitor responder type tcpConnect ipaddress** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr responder type tcpConnect** command is replaced by the **ip sla responder tcp-connect ipaddress** command. See the **ip sla monitor type tcpConnect ipaddress** and **ip sla responder tcp-connect ipaddress** commands for more information.

To enable the Cisco IOS IP Service Level Agreements (IP SLAs) Responder for TCP Connect operations, use the **rtr responder type tcpConnect** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

rtr responder type tcpConnect ipaddress *ip-address* **port** *port*

no rtr responder type tcpConnect ipaddress *ip-address* **port** *port*

Syntax Description

ipaddress <i>ip-address</i>	(Optional) Specifies the IP address that the operation will be received at.
port <i>port</i>	(Optional) Specifies the port number that the operation will be received on.

Command Default

Disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.0(3)T	This command was introduced.
12.1(1)T	The ipaddr and port keywords were added.
12.3(14)T	This command was replaced by the ip sla monitor responder type tcpConnect ipaddress command.
12.2(31)SB2	This command was replaced by the ip sla monitor responder type tcpConnect ipaddress command.
12.2(33)SRB	This command was replaced by the ip sla responder tcp-connect ipaddress command.

Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable the acceptance and return of TCP Connect operation packets.

Examples

The following example shows how to enable the IP SLAs Responder for TCP connection operations:

```
rtr responder type tcpConnect ipaddress A.B.C.D port 1
```

Related Commands

Command	Description
rtr	Specifies an IP SLAs operation and enters RTR configuration mode.
rtr responder type frame-relay	Enables the IP SLAs Responder for Frame Relay operations.
rtr responder type udpEcho	Enables the IP SLAs Responder for UDP Echo and Jitter operations.

rtr responder type udpEcho

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr responder type udpEcho** command is replaced by the **ip sla monitor responder type udpEcho ipaddress** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr responder type udpEcho** command is replaced by the **ip sla responder udp-echo ipaddress** command. See the **ip sla monitor type udpEcho ipaddress** and **ip sla responder udp-echo ipaddress** commands for more information.

To enable the Cisco IOS IP Service Level Agreements (IP SLAs) Responder for User Datagram Protocol (UDP) Echo or Jitter operations, use the **rtr responder** command in global configuration mode. To disable the IP SLAs Responder, use the **no** form of this command.

rtr responder type udpEcho ipaddress *ip-address* **port** *port*

no rtr responder type udpEcho ipaddress *ip-address* **port** *port*

Syntax Description

ipaddress <i>ip-address</i>	Specifies the IP address that the operation will be received at.
port <i>port</i>	Specifies the port number that the operation will be received on.

Command Default

Disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.1(1)T	This command was introduced.
12.3(14)T	This command was replaced by the ip sla monitor responder type udpEcho ipaddress command.
12.2(31)SB2	This command was replaced by the ip sla monitor responder type udpEcho ipaddress command.
12.2(33)SRB	This command was replaced by the ip sla responder udp-echo ipaddress command.

Usage Guidelines

This command is used on the destination device for IP SLAs operations to enable UPD Echo and Jitter (UDP+) operations on non-native interfaces.

Examples

The following example enables the IP SLAs Responder for Jitter operations:

```
rtr responder type udpEcho ipaddress A.B.C.D port 1
```

Related Commands

Command	Description
rtr responder	Enables the IP SLAs Responder for non-specific IP SLAs operations.
rtr responder type frame-relay	Enables the IP SLAs Responder for Frame Relay operations.

rtr restart

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr restart** command is replaced by the **ip sla monitor restart** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr restart** command is replaced by the **ip sla restart** command. See the **ip sla monitor restart** and **ip sla restart** commands for more information.

To restart a Cisco IOS IP Service Level Agreements (IP SLAs) operation, use the **rtr restart** command in global configuration mode.

rtr restart *operation-number*

Syntax Description

<i>operation-number</i>	Number of the IP SLAs operation to restart. IP SLAs allows a maximum of 2000 operations.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
12.1(1)T	This command was introduced.
12.2(11)T	The maximum number of operations was increased from 500 to 2000 (SAA Engine II).
12.3(14)T	This command was replaced by the ip sla monitor restart command.
12.2(31)SB2	This command was replaced by the ip sla monitor restart command.
12.2(33)SRB	This command was replaced by the ip sla restart command.

Usage Guidelines

To restart an operation, the operation should be in an “active” state (as defined in the **rtr reaction-configuration** command).

IP SLAs allows a maximum of 2000 operations.

This command does not have a **no** form.

Examples

The following example restarts operation 12:

```
rtr restart 12
```

Related Commands

Command	Description
rtr reset	Clears all current IP SLAs statistics and configuration information from the router and resets the IP SLAs engine.

rtr schedule

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **rtr schedule** command is replaced by the **ip sla monitor schedule** command. Effective with Cisco IOS Release 12.2(33)SRB, the **rtr schedule** command is replaced by the **ip sla schedule** command. See the **ip sla monitor schedule** and **ip sla schedule** commands for more information.

To configure the scheduling parameters for a Cisco IOS IP Service Level Agreements (IP SLAs) single operation, use the **rtr schedule** command in global configuration mode. To stop the operation and place it in the default state (**pending**), use the **no** form of this command.

rtr schedule *group-operation-number* [**life** {**forever**| *seconds*}] [**start-time** {*hh : mm [: ss]* [*month day*| *day month*]}] [**pending**| **now**| **after** *hh : mm : ss*] [**ageout** *seconds*] [**recurring**]

no **rtr schedule** *group-operation-number*

Syntax Description

<i>group-operation-number</i>	Group configuration or group schedule number of the IP SLAs operation to schedule.
life forever	(Optional) Schedules the operation to run indefinitely.
life <i>seconds</i>	(Optional) Number of seconds the operation actively collects information. The default is 3600 seconds (one hour).
start-time	Time when the operation starts.
<i>hh : mm [: ss]</i>	Specifies an absolute start time using hour, minute, and (optionally) second. Use the 24-hour clock notation. For example, start-time 01:02 means “start at 1:02 a.m.,” and start-time 13:01:30 means “start at 1:01 p.m. and 30 seconds.” The current day is implied unless you specify a <i>month</i> and <i>day</i> .
<i>month</i>	(Optional) Name of the month to start the operation in. If month is not specified, the current month is used. Use of this argument requires that a day be specified as well. You can specify the month by using either the full English name or the first three letters of the month.
<i>day</i>	(Optional) Number of the day (in the range 1 to 31) to start the operation on. If a day is not specified, the current day is used. Use of this argument requires that a month be specified as well.

pending	(Optional) No information is collected. This is the default value.
now	(Optional) Indicates that the operation should start immediately.
after <i>hh : mm : ss</i>	(Optional) Indicates that the operation should start <i>hh</i> hours, <i>mm</i> minutes, and <i>ss</i> seconds after this command was entered.
ageout <i>seconds</i>	(Optional) Number of seconds to keep the operation in memory when it is not actively collecting information. The default is 0 seconds (never ages out).
recurring	(Optional) Indicates that the operation will start automatically at the specified time and for the specified duration every day.

Command Default

The operation is placed in a **pending** state (that is, the operation is enabled but not actively collecting information).

Command Modes

Global configuration

Command History

Release	Modification
11.2	This command was introduced.
12.1(1)T	The after and forever keywords were added.
12.3(8)T	The recurring keyword was added.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S. This integration includes the addition of the recurring keyword.
12.3(14)T	This command was replaced by the ip sla monitor schedule command.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC. This integration includes the addition of the recurring keyword.
12.2(31)SB2	This command was replaced by the ip sla monitor schedule command.
12.2(33)SRB	This command was replaced by the ip sla restart command.

Usage Guidelines

After you schedule the operation with the **rtr schedule** command, you cannot change the configuration of the operation. To change the configuration of the operation, use the **no** form of the **rtr** global configuration command and reenter the configuration information.

If the operation is in a pending state, you can define the conditions under which the operation makes the transition from pending to active with the **rtr reaction-trigger** and **rtr reaction-configuration** global configuration commands. When the operation is in an active state, it immediately begins collecting information.

The following time line shows the age-out process of the operation:

W-----X-----Y-----Z
where:

- W is the time the operation was configured with the **rtr** global configuration command.
- X is the start time or start of life of the operation (that is, when the operation became “active”).
- Y is the end of life as configured with the **rtr schedule** global configuration command (life seconds have counted down to zero).
- Z is the age out of the operation.

Age out starts counting down at W and Y, is suspended between X and Y, and is reset to its configured size at Y.

It is possible for the operation to age out before it executes (that is, Z can occur before X). To ensure that this does not happen, the difference between the operation’s configuration time and start time (X and W) must be less than the age-out seconds.

Note

The total RAM required to hold the history and statistics tables is allocated at the time of scheduling the IP SLAs operation. This prevents router memory problems when the router gets heavily loaded and lowers the amount of overhead an IP SLAs operation causes on a router when it is active.

The **recurring** keyword is only supported for scheduling single IP SLAs operations. You cannot schedule multiple IP SLAs operations using the **rtr schedule** command. The **life** value for a recurring IP SLAs operation should be less than one day. The **ageout** value for a recurring operation must be “never” (which is specified with the value 0), or the sum of the **life** and **ageout** values must be more than one day. If the **recurring** option is not specified, the operations are started in the existing normal scheduling mode.

Examples

In the following example, operation 25 begins actively collecting data at 3:00 p.m. on April 5. This operation will age out after 12 hours of inactivity, which can be before it starts or after it has finished with its life. When this operation ages out, all configuration information for the operation is removed (that is, the configuration information is no longer in the running-config in RAM).

```
rtr schedule 25 life 43200 start-time 15:00 apr 5 ageout 43200
```

In the following example, operation 1 begins collecting data after a 5-minute delay:

```
rtr schedule 1 start after 00:05:00
```

In the following example, operation 3 begins collecting data immediately and is scheduled to run indefinitely:

```
rtr schedule 3 start-time now life forever
```

In the following example, operation 15 begins automatically collecting data every day at 1:30 a.m.:

```
rtr schedule 15 start-time 01:30:00 recurring
```

Related Commands

Command	Description
rtr	Specifies an IP SLAs operation and enters RTR configuration mode.
rtr group schedule	Performs group scheduling for IP SLAs operations.
rtr reaction-configuration	Configures certain actions to occur based on events under the control of IP SLAs.
rtr reaction-trigger	Defines a second IP SLAs operation to make the transition from a pending state to an active state when one of the trigger action-type options is defined with the rtr reaction-configuration global configuration command.
show rtr configuration	Displays the configuration details of the IP SLAs operation.

samples-of-history-kept

To set the number of entries kept in the history table per bucket for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **samples-of-history-kept** command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

samples-of-history-kept *samples*

no samples-of-history-kept

Syntax Description

<i>samples</i>	Number of entries kept in the history table per bucket. The default is 16.

Command Default

16 entries

Command Modes

ICMP path echo configuration (config-ip-sla-pathEcho)

Command Modes

ICMP path echo configuration (config-sla-monitor-pathEcho)

Note

The configuration mode varies depending on the Cisco IOS release you are running and the operation type configured. See the “Usage Guidelines” section for more information.

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines

An IP SLAs operation can collect history and capture statistics. By default, the history for an IP SLAs operation is not collected. If history is collected, each history bucket contains one or more history entries from the operation. When the operation type is ICMP path echo, an entry is created for each hop along the path that the operation takes to reach its destination. The type of entry stored in the history table is controlled by the

filter-for-history command. The total number of entries stored in the history table is controlled by the combination of the **samples-of-history-kept**, **buckets-of-history-kept**, and **lives-of-history-kept** commands.

**Note**

This command is supported by the IP SLAs ICMP path echo operation only.

**Note**

Collecting history increases the RAM usage. Collect history only when you think there is a problem in the network.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

The configuration mode for the **samples-of-history-kept** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured. For example, if you are running Cisco IOS Release 12.4 and the ICMP path echo operation type is configured, you would enter the **samples-of-history-kept** command in ICMP path echo configuration mode (config-sla-monitor-pathEcho) within IP SLA monitor configuration mode.

Table 32: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI , or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Examples

In the following examples, ten entries are kept in the history table for each of the lives of IP SLAs ICMP path echo operation 1. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 1
  path-Echo 172.16.1.176
  history lives-kept 3
  samples-of-history-kept 10
!
ip sla schedule 1 life forever start-time now
```

Examples

```
ip sla monitor 1
  type pathecho protocol ipIcmpEcho 172.16.1.176
  lives-of-history-kept 3
  samples-of-history-kept 10
```

```
!  
ip sla monitor schedule 1 life forever start-time now
```

Related Commands

Command	Description
buckets-of-history-kept	Sets the number of history buckets that are kept during the lifetime of the IP SLAs operation.
filter-for-history	Defines the type of information kept in the history table for the IP SLAs operation.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
lives-of-history-kept	Sets the number of lives maintained in the history table for the IP SLAs operation.

scan-interval

To specify the time interval at which the IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor checks the scan queue for Border Gateway Protocol (BGP) next hop neighbor updates, use the **scan-interval** command in auto IP SLA MPLS parameters configuration mode. To return to the default value, use the **no** form of this command.

scan-interval *minutes*

no scan-interval

Syntax Description

<i>minutes</i>	Specifies the time interval (in minutes) at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.

Command Default

Scan interval is 240 minutes.

Command Modes

Auto IP SLA MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

At each scan interval, a new IP SLA operation is automatically created for each newly discovered BGP next hop neighbor listed in the LSP Health Monitor scan queue. If there is more than one IP SLAs operation created at a specific scan interval, the start time for each newly created IP SLAs operation is randomly distributed to avoid having all of the operations start at the same time.

Use the **delete-scan-factor** command in IP SLA monitor configuration mode to specify the number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.

You must configure the type of LSP Health Monitor operation (such as LSP ping) before you can configure any of the other parameters of the operation.

Note

The default interval of time that BGP neighbor statistics are updated is different for the IP SLAs LSP Health Monitor database and the BGP next hop neighbor discovery database. Use the **scan-interval** command to set the timer for the IP SLAs LSP Health Monitor database. Use the **mpls discovery vpn interval** command to set the timer for the BGP next hop neighbor discovery database.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The time interval at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates is set to 1 minute.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  delete-scan-factor 2
!

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
delete-scan-factor	Specifies the number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.
show ip sla mpls-lsp-monitor scan-queue	Displays information about adding or deleting BGP next hop neighbors from a particular MPLS VPN of an IP SLAs LSP Health Monitor operation.

scan-period

To set the amount of time after which the label switched path (LSP) discovery process can restart for a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **scan-period** command in auto IP SLA MPLS LSP discovery parameters configuration mode. To return to the default value, use the **no** form of this command.

scan-period *minutes*

no scan-period

Syntax Description

<i>minutes</i>	The amount of time (in minutes) after which the LSP discovery process can restart. The default is 1.

Command Default

1 minute

Command Modes

Auto IP SLA MPLS LSP discovery parameters configuration (config-auto-ip-sla-mpls-lpd-params)

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.

Usage Guidelines

When the LSP discovery process has completed one iteration of discovering the equal-cost multipaths for each applicable Border Gateway Protocol (BGP) next hop neighbors associated with a single LSP Health Monitor operation, the next iteration of the LSP discovery process will start immediately if the time period set by the **scan-period** command has expired. If this rediscovery time period has not yet expired, then the next iteration of the LSP discovery process will not start until the time period has expired.

Setting the LSP rediscovery time period to 0 will cause the LSP discovery process to always restart immediately after completing one iteration of discovering the equal-cost multipaths for each applicable BGP next hop neighbor associated with a single LSP Health Monitor operation.

Use the **path-discover** command to enable the LSP discovery option for an IP SLAs LSP Health Monitor operation and enter auto IP SLA MPLS LSP discovery parameters configuration mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, the LSP discovery option is enabled for LSP Health Monitor operation 1. Operation 1 is configured to automatically create IP SLAs LSP ping operations for the equal-cost multipaths to all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN

routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The LSP rediscovery time period is set to 30 minutes.

```

auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  path-discover
!
  maximum-sessions 2
  session-timeout 60
  interval 2
  timeout 4
  force-explicit-null
  hours-of-statistics-kept 1
  scan-period 30
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 frequency 100 start-time now
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd tree-trace action-type
trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd lpd-group retry 3 action-type
trapOnly

```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
path-discover	Enables the LSP discovery option for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS LSP discovery parameters configuration mode.

schedule

To add an auto IP Service Level Agreements (SLAs) scheduler to the configuration of an IP SLAs auto-measure group, use the **schedule** command in IP SLA auto-measure group configuration mode. To stop operations of the group, use the **no** form of this command.

schedule *schedule-id*

no schedule *schedule-id*

Syntax Description

<i>schedule-id</i>	ID of an already-configured auto IP SLAs scheduler.

Command Default

The operation in the group being configured is not scheduled.

Command Modes

IP SLA auto-measure group configuration (config-am-group)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command specifies an auto IP SLAs scheduler as a reference for the IP SLAs auto-measure group being configured.

Only one auto IP SLAs scheduler can be specified for each IP SLAs auto-measure group. Each scheduler can be referenced by more than one group.

To create a multioperation schedule, specify the same auto IP SLAs scheduler for two or more IP SLAs auto-measure groups.

You cannot modify the configuration of an auto-measure group if the specified auto IP SLAs scheduler has a start time other than Pending trigger (default). If you attempt to modify a group configuration that includes an active scheduler, the following message appears:

```
%Group is active, cannot make changes
```

To modify the configuration of an IP SLAs auto-measure group that includes an active auto IP SLAs scheduler with a specified start time, use the **no** form of this command to remove the scheduler from the group configuration, and then finish configuring the group before adding an active scheduler to the configuration. You can also configure the start time for a scheduler after adding the scheduler to the group configuration.

To create an auto IP SLAs scheduler, use the **ip sla auto schedule** command.

Examples

The following example shows how to add an auto IP SLAs scheduler to the configuration of an IP SLAs auto-measure group:

```
Router(config)#ip sla auto group type ip 1

Router(config-am-grp)#destination 1
Router(config-am-grp)#schedule 1
Router(config-am-grp)#end
Router#
Router# show ip sla auto group
Group Name: 1
  Description:
    Activation Trigger: Pending
    Destination: 1
    Schedule: 1
IP SLAs Auto Template: default
  Measure Type: icmp-jitter
  Description:
  IP options:
    Source IP: 0.0.0.0
    VRF:      TOS: 0x0
  Operation Parameters:
    Number of Packets: 10   Inter packet interval: 20
    Timeout: 5000          Threshold: 5000
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
IP SLAs auto-generated operations of group 1
  no operation created
```

Related Commands

Command	Description
ip sla auto schedule	Begins configuration for an auto IP SLAs scheduler and enters IP SLA auto-measure schedule configuration mode.

secondary-frequency

To set a faster measurement frequency (secondary frequency) to which a Cisco IOS IP Service Level Agreements (SLAs) operation should change when a reaction condition occurs, use the **secondary-frequency** command in the appropriate submode of auto IP SLA MPLS configuration, IP SLA configuration, or IP SLA monitor configuration mode. To disable the secondary frequency, use the **no** form of this command.

secondary-frequency {**both**| **connection-loss**| **timeout**} *frequency*

no secondary-frequency {**connection-loss**| **timeout**}

Syntax Description

both	Specifies that the operation measurement frequency should increase to the secondary frequency value if a one-way connection loss or one-way timeout is detected.
connection-loss	Specifies that the operation measurement frequency should increase to the secondary frequency value if a one-way connection loss is detected.
timeout	Specifies that the operation measurement frequency should increase to the secondary frequency value if a one-way timeout is detected.
<i>frequency</i>	Secondary frequency to which an IP SLAs operation should change when a reaction condition occurs.

Command Default

The secondary frequency option is disabled.

Command Modes

MPLS parameters configuration (config-auto-ip-sla-mpls-params) VCCV configuration (config-ip-sla-vcv)

Command Modes

LSP ping configuration (config-sla-monitor-lspPing) LSP trace configuration (config-sla-monitor-lspTrace)

Note

The configuration mode varies depending on the Cisco IOS release you are running and the operation type configured. See the “Usage Guidelines” section for more information.

Command History

Release	Modification
12.2(27)SBC	This command was introduced.

Release	Modification
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T. The both keyword was added.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SRC	Support for MPLS Pseudo-Wire Emulation Edge-to-Edge (PWE3) services via Virtual Circuit Connectivity Verification (VCCV) was added.
12.2(33)SB	Support for MPLS Pseudo-Wire Emulation Edge-to-Edge (PWE3) services via Virtual Circuit Connectivity Verification (VCCV) was added.

Usage Guidelines

This command provides the capability to specify a secondary frequency for an IP SLAs operation. If the secondary frequency option is configured and a failure (such as a connection loss or timeout) is detected for a particular path, the frequency at which the path is remeasured will increase to the secondary frequency value (testing at a faster rate). When the configured reaction condition is met (such as N consecutive connection losses or N consecutive timeouts), an SNMP trap and syslog message can be sent and the measurement frequency will return to its original frequency value.

Note

By default, if the secondary frequency option is not enabled, the frequency at which an operation remeasures a failed label switched path (LSP) is the same as the schedule period.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release table). Note that if you are configuring an IP SLAs LSP Health Monitor operation, see the Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release table for information on Cisco IOS release dependencies. You must configure the type of IP SLAs operation (such as LSP ping) before you can configure any of the other parameters of the operation.

The configuration mode for the **secondary-frequency** command varies depending on the Cisco IOS release you are running and the operation type configured. For example, if you are running Cisco IOS Release 12.4(6)T and the LSP ping operation type is configured (without using the LSP Health Monitor), you would enter the **secondary-frequency** command in LSP ping configuration mode (config-sla-monitor-lspPing) within IP SLA configuration mode.

Table 33: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Table 34: Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(6)T, 12.0(32)SY, 12.2(31)SB2, 12.2(33)SRB, 12.2(33)SXH, or later releases	auto ip sla mpls-lsp-monitor	Auto IP SLA MPLS configuration

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The secondary frequency option is enabled for both connection loss and timeout events, and the secondary frequency is set to 10 seconds.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency both 10
  delete-scan-factor 2
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

session-timeout (LSP discovery)

To set the amount of time the label switched path (LSP) discovery process for a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation waits for a response to its LSP discovery request for a particular Border Gateway Protocol (BGP) next hop neighbor, use the **session-timeout** command in auto IP SLA MPLS LSP discovery parameters configuration mode. To return to the default value, use the **no** form of this command.

session-timeout *seconds*

no session-timeout

Syntax Description

<i>seconds</i>	The amount of time (in seconds) an LSP Health Monitor operation waits for a response to its LSP discovery request. The default is 120.

Command Default

120 seconds

Command Modes

Auto IP SLA MPLS LSP discovery parameters configuration (config-auto-ip-sla-mpls-lpd-params)

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.

Usage Guidelines

Before an LSP discovery group is created for a particular BGP next hop neighbor, the LSP Health Monitor must receive a response to its LSP discovery request for that BGP next hop neighbor. If no response is received within the specified time limit, the LSP discovery process is not performed for that particular BGP next hop neighbor.

Use the **path-discover** command to enable the LSP discovery option for an IP SLAs LSP Health Monitor operation and enter auto IP SLA MPLS LSP discovery parameters configuration mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, the LSP discovery option is enabled for LSP Health Monitor operation 1. Operation 1 is configured to automatically create IP SLAs LSP ping operations for the equal-cost multipaths to all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN

routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The timeout value for the LSP discovery requests is set to 60 seconds.

```
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  path-discover
!
maximum-sessions 2
session-timeout 60
interval 2
timeout 4
force-explicit-null
hours-of-statistics-kept 1
scan-period 30
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 frequency 100 start-time now
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd tree-trace action-type
trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd lpd-group retry 3 action-type
trapOnly
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
path-discover	Enables the LSP discovery option for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS LSP discovery parameters configuration mode.

service performance

To begin configuring an IP Service Level Agreements (SLAs) service performance operation and enter IP SLA service performance configuration mode, use the **service-performance** command in IP SLA configuration mode.

service performance *type type* **dest-mac-addr** *mac-address* **interface** *interface* **service** *instance id*

Syntax Description

type <i>type</i>	Specifies a type for the service performance operation. The following keyword is valid for <i>type</i> : ethernet
dest-mac-addr <i>mac-address</i>	Identifies the destination device by its MAC address. The format is H.H.H, where H is a hexadecimal value.
interface <i>interface</i>	Specifies the destination interface for the operation. The format for <i>interface</i> is <i>type number</i> .
service <i>instance id</i>	Specifies the Ethernet service instance for the operation.

Command Default

A service performance operation is not configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
15.3(2)S	This command was introduced.

Usage Guidelines

Use this command to configure an IP SLAs service performance operation and enter service performance configuration mode for defining the parameters for a single service performance test stream.

You must first configure the service instance for this operation by using the **service instance** command.

To configure passive measurement mode, do not configure a traffic profile for this service performance operation. Passive measurement mode means that the operation does not generate live traffic and only collects statistics for the destination device configured for the operation.

To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation by using the **no ip sla** command and then reconfigure the operation with the new operation type.

Examples

The following sample output is the default configuration for a passive-measurement service performance operation:

```
sla-asr901-1# show ip sla configuration 10
IP SLAs Infrastructure Engine-III
Entry number: 10
Service Performance Operation
Type: ethernet
Destination
MAC Address: 4055.398d.8bd2

show ip sla application

To display global information about Cisco IOS IP Service Level Agreements (SLAs), use the **show ip sla application** command in user EXEC or privileged EXEC mode.

show ip sla application

Syntax Description This command has no arguments or keywords.

Command Modes
User EXEC (>)
Privileged EXEC (#)

Command History	Release	Modification
	12.4(4)T	This command was introduced. This command replaces the show ip sla monitor application command.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show rtr application command.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor application command.
	12.2(33)SRD	The command output was modified to include information on IP SLAs Ethernet operation EVC support.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor application command.
	12.4(22)T	This command was modified. The command output was modified to include information on IP SLAs Event Publisher.
	12.2(33)SRE	This command was modified. The command output was modified to include information on IP SLAs Ethernet operation port level support and IP SLAs Event Publisher.
	12.2(58)SE	This command was modified. The command output was modified to include information about IP SLAs video operation support.
	15.2(4)M	This command was modified. The command output was modified to include information about IP SLAs multicast (mcast) operation support.
	15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
	Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.

Release	Modification
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

Use the **show ip sla application** command to display information such as supported operation types and supported protocols.

Examples

The following is sample output from the **show ip sla application** command:

```
Router# show ip sla application

IP Service Level Agreement Technologies
Version: Round Trip Time MIB 2.2.0, Infrastructure Engine-III
Supported Operation Types:
    icmpEcho, path-echo, path-jitter, udpEcho, tcpConnect, http
    dns, udpJitter, dhcp, ftp, VoIP, rtp, lsp Group, icmpJitter
    lspPing, lspTrace, 802.1agEcho VLAN, Port
    802.1agJitter VLAN, Port, pseudowirePing, udpApp, wspApp
    mcast, generic

Supported Features:
IPSLAs Event Publisher
IP SLAs low memory water mark: 0
Estimated system max number of entries: 63840
Estimated number of configurable operations: 63840
Number of Entries configured    : 0
Number of active Entries       : 0
Number of pending Entries      : 0
Number of inactive Entries     : 0
Last time the operation configuration changed: *07:22:13.183 UTC Fri Feb 13 2009
The table below describes the significant fields shown in the display.
```

Table 35: show ip sla application Field Descriptions

Field	Description
Version	The version of the IP SLAs infrastructure supported on the router.
Supported Operation Types	The types of operations supported by the command.
Supported Features	The features supported by the command.

Related Commands

Command	Description
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla authentication

To display Cisco IOS IP Service Level Agreements (SLAs) authentication information, use the **show ip sla authentication** command in user EXEC or privileged EXEC mode.

show ip sla authentication

Syntax Description This command has no arguments or keywords.

Command Modes User EXEC Privileged EXEC

Command History	Release	Modification
	12.4(4)T	This command was introduced. This command replaces the show ip sla monitor authentication command.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show rtr authentication command.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor authentication command.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor authentication command.

Usage Guidelines Use the **show ip sla authentication** command to display information such as supported operation types and supported protocols.

Examples The following is sample output from the **show ip sla authentication** command:

```
Router# show ip sla authentication
IP SLA Monitor control message uses MD5 authentication, key chain name is: ipsla
```

Related Commands	Command	Description
	show ip sla configuration	Displays configuration values for IP SLAs operations.

show ip sla auto discovery

To display the status of IP Service Level Agreements (SLAs) auto discovery and the configuration of auto IP SLAs endpoint lists configured to use auto discovery, use the **show ip sla auto discovery** command in user EXEC or privileged EXEC mode.

show ip sla auto discovery

Syntax Description This command has no arguments or keywords.

Command Default Displays the configuration of IP SLAs auto discovery.

Command Modes User EXEC (>) Privileged EXEC (#)

Command History	Release	Modification
	15.1(1)T	This command was introduced.

Examples The following is sample output from the **show ip sla auto discovery** command before, and after, auto discovery was enabled. Note that no IP SLAs endpoint lists are configured yet.

```
Router>show ip sla auto discovery
IP SLAs auto-discovery status: Disabled
The following Endpoint-list are configured to auto-discovery:
Router>enable
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#ip sla auto discovery

Router(config)#exit
Router#
Router# show ip sla auto discovery
IP SLAs auto-discovery status: Enabled
The following Endpoint-list are configured to auto-discovery:
```

The table below describes the significant fields shown in the display.

Table 36: show ip sla auto discovery Field Descriptions

Field	Description
IP SLAs auto-discovery status	Configuration of the ip sla auto discovery command.

Related Commands

Command	Description
ip sla auto discovery	Enables IP SLAs auto discovery in Cisco IP SLAs Engine 3.0.

show ip sla auto endpoint-list

**Note**

Effective with Cisco IOS Release 15.2(3)T, the **show ip sla auto endpoint-list** command is replaced with the **show ip sla endpoint-list** command. See the **show ip sla endpoint-list** command for more information.

To display the configuration including default values of all auto IP Service Level Agreements (SLAs) endpoint lists, all auto IP SLAs endpoint lists for a specified operation type, or a specified auto IP SLAs endpoint list, use the **show ip sla auto endpoint-list** command in user EXEC or privileged EXEC mode.

show ip sla auto endpoint-list [**type ip** [*template-name*]]

Syntax Description

type ip	(Optional) Specifies that the operation type is Internet Protocol.
template-name	(Optional) Unique identifier of the endpoint list. String of 1 to 64 alphanumeric characters.

Command Default

Default display includes configuration for all auto IP SLAs endpoint lists.

Command Modes

User EXEC (>) Privileged EXEC (#)

Command History

Release	Modification
15.1(1)T	This command was introduced.
15.2(3)T	This command was replaced by the show ip sla endpoint-list command.

Examples

The following is sample output from the **show ip sla auto endpoint-list** command for all configured endpoint lists. Because all of the destinations are for IP operations, the **type ip** keyword is not configured.

```
Router# show ip sla auto endpoint-list
Endpoint-list Name: man1
  Description: testing manual build
  ip-address 10.1.1.1-7 port 23
  ip-address 10.1.1.9,10.1.1.15,10.1.1.23 port 23
Endpoint-list Name: autolist
  Description:
  Auto Discover Parameters
    Destination Port: 5000
    Access-list: 3
    Ageout: 3600    Measurement-retry: 3
  0 endpoints are discovered for autolist
```

The table below describes the significant fields shown in the display.

Table 37: show ip sla auto endpoint-list Field Descriptions

Field	Description
Destination Port	Port number of target device or Cisco IP SLAs Responder.
Access-list	Name of list of discovered endpoints.
Ageout	Length of time that operation is kept in memory, in seconds (sec).
Measurement-retry	Number of times the endpoints belonging to an auto IP SLAs destination templates are retested when an operation fails.

Related Commands

Command	Description
access-list (epl-disc)	Adds list of discovered endpoints to an auto IP SLAs endpoint list.
ageout	Adds ageout timer to auto IP SLAs scheduler or endpoint list.
ip sla auto endpoint-list	Enters IP SLA endpoint-list configuration mode and begins creating an auto IP SLAs endpoint list.
measurement-retry	Specifies the number of times an operation associated with an auto IP SLAs endpoint list is retried when a failure is detected.

show ip sla auto group

To display configuration values including all defaults for all Cisco IOS IP Service Level Agreements (SLAs) auto-measure groups or a specified group, use the **show ip sla auto group** command in user EXEC or privileged EXEC mode.

show ip sla auto group [**type ip** [*group-name*]]

Syntax Description

type ip	(Optional) Specifies that the operation type is Internet Protocol.
group-name	(Optional) Unique identifier of auto-measure group. String of 1 to 64 alphanumeric characters.

Command Default

Displays configuration for all IP SLAs endpoint lists.

Command Modes

User EXEC (>) Privileged EXEC (#)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command displays the configuration of an IP SLAs auto-measure group including all default values and information about operations created for each destination in the specified endpoint-list for this group.

Examples

The following is sample output from the **show ip sla auto group** command for an IP SLAs auto-measure group (test) and the created operations within the group:

```
Router# show ip sla auto grou
p test
Group Name: test
  Description:
    Activation Trigger: Immediate
    Destination: testelist
    Schedule: testsched
    Measure Template: testtplt icmp-jitter
IP SLAs auto-generated operations of group test
  sno      oper-id      type      dest-ip-addr/port
  1        299389922    icmp-jitter    20.1.1.32/NA
```

The table below describes the significant fields shown in the display.

Table 38: show ip sla auto group Field Descriptions

Field	Description
Activation Trigger	Start time of operation.
Destination	Name of auto IP SLAs endpoint list referenced by the auto-measure group.
Schedule	Name of auto IP SLAs scheduler referenced by the auto-measure group.
Measure Template	Name of auto IP SLAs template referenced by the auto-measure group.
sno	Serial number of IP SLAs operation created for specified endpoint.
oper-id	Entry number of IP SLAs operation created for specified endpoint.
type	Type of IP SLAs operation created for specified endpoint.
dest-ip-addr/port	IP address and port of destination for operation in current display.

Related Commands

Command	Description
ip sla auto group	Begins configuration for an IP SLAs auto-measure group and enters IP SLA auto-measure group configuration mode.

show ip sla auto schedule

To display configuration values including all defaults for all auto IP Service Level Agreements (SLAs) schedulers or a specified scheduler, use the **show ip sla auto schedule** command in user EXEC or privileged EXEC mode.

show ip sla auto schedule [*schedule-id*]

Syntax Description

<i>schedule-id</i>	(Optional) Unique identifier for IP SLAs schedule. String of 1 to 64 alphanumeric characters.

Command Default

The default output includes the configuration for all auto IP SLAs schedulers.

Command Modes

User EXEC (>) Privileged EXEC (#)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Examples

The following is sample output from the **show ip sla auto schedule** command when you specify an auto IP SLAs scheduler by name (basic-default):

```
Router# show ip sla auto schedule basic-default
Group sched-id: basic-default
  Probe Interval (ms): 1000
  Group operation frequency (sec): 60
  Status of entry (SNMP RowStatus): Active
  Next Scheduled Start Time: Pending trigger
  Life (sec): 3600
  Entry Ageout (sec): never
```

The table below describes the significant fields shown in the display.

Table 39: show ip sla auto schedule Field Descriptions

Field	Description
Probe Interval (ms)	Length of time, in milliseconds (ms), between operations that share the same auto IP SLAs scheduler.
Group operation frequency (sec)	Frequency at which each operation repeats, in seconds (sec).

Field	Description
Next Scheduled Start Time	Start time of operation. "Pending trigger" indicates that neither a specific start time nor a reaction trigger is configured.
Life (sec)	Length of time that the operation runs, in seconds (sec).
Entry Ageout (sec)	Length of time that operation is kept in memory, in seconds (sec).

Related Commands

Command	Description
ageout (IP SLA)	Adds ageout timer to auto IP SLAs scheduler or endpoint list.
frequency	Specifies how often an operation in an IP SLAs auto-measure group will repeat once it is started.
ip sla auto schedule	Enters IP SLA auto-measure schedule configuration mode and begins creating an auto IP SLAs scheduler.
life	Specifies lifetime characteristic in an auto IP SLAs scheduler.
probe-interval	Specifies interval between operations for staggering operations that share the same auto IP SLAs scheduler.
react	Configures reaction and proactive threshold monitoring parameters in an auto IP SLAs operation template.
start-time	Specifies start time for an IP SLAs auto-measure group.

show ip sla auto summary-statistics

To display the current operational status and statistics for a Cisco IOS IP Service Level Agreements (SLAs) auto-measure group or for a specified destination of a group, use the **show ip sla auto summary-statistics** command in user EXEC or privileged EXEC mode.

show ip sla auto summary-statistics group type ip *group-name* [**ip-address** *ip-address* [**port** *port*]]

Syntax Description

<i>group-name</i>	Unique identifier for IP SLAs auto-measure group. String of 1 to 64 alphanumeric characters.
ip-address <i>ip-address</i>	(Optional) Specifies IPv4 address of destination routing device or destination Cisco IP SLAs Responder.
port <i>port</i>	(Optional) Specifies port number of destination routing device or destination Cisco IP SLAs Responder. Range is from 1 to 65535.

Command Default

The default output includes statistics for all endpoints of the operation in an IP SLA auto-measure group.

Command Modes

User EXEC (>) Privileged EXEC (#)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Examples

The following is sample output from the **show ip sla auto summary-statistics** for an IP SLAs auto-measure group (test) that started immediately upon configuration. The partial output from the **show running-config** and **show ip sla group** command are included to illustrate the relationship between the group, operation, and scheduler. Notice that the command to start the operations was configured after the auto IP SLAs scheduler (testsched) was added to the group configuration.

```
Router# show running-config
.
.
.
ip sla auto template type ip icmp-jitter test
ip sla auto endpoint-list type ip test
    ip-address 10.1.1.32 port 2222
ip sla auto group type ip test
schedule testsched
template icmp-jitter testtplt
destination testeplist
```

```

ip sla auto schedule testsched <<=====
  start-time now
.
.
.
Router# show ip sla auto summary-statistics group type ip icmp-jitter test
IP SLAs Auto Group Summary Statistics
Legend -
  sno: Serial Number in current display
  oper-id: Entry Number of IPSLAs operation
  type: Type of IPSLAs operation
  n-rtts: Number of successful round trips in current hour
         of operation
  rtt (min/av/max): The min, max and avg values of latency in
                   current hour of operation
  avg-jitter(DS/SD): average jitter value in destination to
                   source and source to destination direction
  pak-loss: accumulated sum of source to destination and
            destination to source packet loss in current hour
Summary Statistics:
Auto Group Name: test
Template: testtplt
Number of Operations: 1
  sno    oper-id    type          n-rtts    rtt          avg-jitter    packet
      (min/avg/max) (DS/SD)      loss
  1      299389922 icmp-jitter    10        8/16/24 ms    9/0 ms        0

Router# show ip sla auto grou
p

Schedule: testsched
Measure Template: testtplt icmp-jitter
IP SLAs auto-generated operations of group test
  sno    oper-id    type          dest-ip-addr/port
  1      299389922 icmp-jitter    10.1.1.32/NA

```

Related Commands

Command	Description
ip sla auto group	Begins configuration for an IP SLAs auto-measure group and enters IP SLA auto-measure group configuration mode.
ip sla auto endpoint-list	Begins configuration for an auto IP SLAs endpoint-list and enters IP SLA endpoint-list configuration mode.
ip sla auto schedule	Begins configuration for an auto IP SLAs scheduler and enters IP SLA auto-measure schedule configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.

show ip sla auto template

To display configuration values including all defaults for all Cisco IOS IP Service Level Agreements (SLAs) operation templates, all operation templates for a specified type of operation, or a specified operation template, use the **show ip sla auto template** command in user EXEC or privileged EXEC mode.

show ip sla auto template [**type ip** [*operation* [*template-name*]]]

Syntax Description

type ip	Specifies that the operation type is Internet Protocol (IP).
<i>operation</i>	Type of IP operation. Use one of the following keywords: • icmp-echo--Internet Control Message Protocol (ICMP) echo operation • icmp-jitter-- Internet Control Message Protocol (ICMP) jitter operation • tcp-connect-- Transmission Control Protocol (TCP) connection operation • udp-echo-- User Datagram Protocol (UDP) echo operation • udp-jitter-- User Datagram Protocol (UDP) jitter operation
<i>template-name</i>	Unique identifier of an IP SLAs operation template. String of 1 to 64 alphanumeric characters.

Command Default

Default output includes configuration for all auto IP SLAs operation templates.

Command Modes

User EXEC (>) Privileged EXEC (#)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Examples

The following is sample shows output for the **show ip sla auto template** command when you specify a template by name (**basic_icmp_jtr**):

```
Router# show ip sla auto template type ip icmp-jitter basic_icmp_jtr
IP SLAs Auto Template: basic_icmp_jtr
  Measure Type: icmp-jitter
  Description: default oper temp for icmp jitter
  IP options:
    Source IP: 0.0.0.0
    VRF:      TOS: 0x0
  Operation Parameters:
    Number of Packets: 10    Inter packet interval: 20
    Timeout: 5000           Threshold: 5000
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
```

The following is sample output for the **show ip sla auto template** command when you use the **type ip operation** keyword and argument combination to specify a certain type of operation:

```
Router# show ip sla auto template type ip udp-jitter
IP SLAs Auto Template: basic_udp_jitter
  Measure Type: udp-jitter (control enabled)
  Description: default oper temp for udp jitter
  IP options:
    Source IP: 0.0.0.0 Source Port: 0
    VRF:      TOS: 0x0
  Operation Parameters:
    Request Data Size: 32    Verify Data: false
    Number of Packets: 10    Inter packet interval: 20
    Timeout: 5000           Threshold: 5000
    Granularity: msec       Operation packet priority: normal
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
IP SLAs Auto Template: voip_g711alaw
  Measure Type: udp-jitter (control enabled)
  Description: oper template for voip udp
  IP options:
    Source IP: 0.0.0.0      Source Port: 0
    VRF:      TOS: 0x0
  Operation Parameters:
    Verify Data: false
    Timeout: 5000           Threshold: 5000
    Codec: g711alaw Number of packets: 1000
    Interval: 20    Payload size: 16    Advantage factor: 0
    Granularity: msec       Operation packet priority: normal
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
```

The following is sample output for the **show ip sla auto template** command for all configured IP SLAs operation templates. Because all of the templates are for IP operations, the **type ip** keyword is not configured.

```
Router# show ip sla auto template
IP SLAs Auto Template: basic_icmp_echo
  Measure Type: icmp-echo
  Description:
  IP options:
    Source IP: 0.0.0.0
    VRF:      TOS: 0x0
  Operation Parameters:
    Request Data Size: 28   Verify Data: false
    Timeout: 5000          Threshold: 5000
  Statistics Aggregation option:
    Hours of statistics kept: 2
  History options:
    History filter: none
    Max number of history records kept: 15
    Lives of history kept: 0
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
IP SLAs Auto Template: basic_icmp_jtr
  Measure Type: icmp-jitter
  Description: default oper temp for icmp jitter
  IP options:
    Source IP: 0.0.0.0
    VRF:      TOS: 0x0
  Operation Parameters:
    Number of Packets: 10   Inter packet interval: 20
    Timeout: 5000          Threshold: 5000
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
IP SLAs Auto Template: basic_udp_jitter
  Measure Type: udp-jitter (control enabled)
  Description: default oper temp for udp jitter
  IP options:
    Source IP: 0.0.0.0 Source Port: 0
    VRF:      TOS: 0x0
  Operation Parameters:
    Request Data Size: 32   Verify Data: false
    Number of Packets: 10   Inter packet interval: 20
    Timeout: 5000          Threshold: 5000
    Granularity: msec       Operation packet priority: normal

```

The table below describes the significant fields shown in the display.

Table 40: show ip sla auto template Field Descriptions

Field	Description
IP SLAs Auto Template	Name of auto IP SLAs operation template in current display.
Measure Type	Type of IP operation defined for auto IP SLAs operation template in current display, including status of protocol control.

Related Commands

Command	Description
ip sla auto template	Begins configuring an auto IP SLAs operation template and enters IP SLA template configuration mode.

show ip sla configuration

To display configuration values including all default values for all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **show ip sla configuration** command in user EXEC or privileged EXEC mode.

show ip sla configuration *operation*

Syntax Description

<i>operation</i>	(Optional) Number of IP SLAs operations for which the details are displayed.

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the show ip sla monitor configuration command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show rtr configuration command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor configuration command.
12.2(33)SRD	This command was modified. The command output has been modified to include information on IP SLAs Ethernet operation EVC support.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor configuration command.
12.2(33)SRE	This command was modified. The command output has been modified to include information on IP SLAs Ethernet operation port level support.
12.2(58)SE	This command was modified. The command output has been modified to include information about IP SLAs video operations.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Release	Modification
15.2(3)T	This command was modified. The command output was modified to display IPv4 and IPv6 addresses for Domain Name System (DNS), FTP, HTTP, Path Echo, and Path Jitter IP SLAs operations.
Cisco IOS XE 3.7S	This command was integrated into Cisco IOS XE Release 3.7S.
15.2(4)M	This command was modified. The command output was modified to display multicast UDP jitter operations.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
15.3(2)T	This command was modified. The output was modified to display the percentile configuration.
15.3(2)S	This command was modified. The output was modified to display the configuration for a service performance operation. This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.
15.3(3)M	This command was modified. The output was modified to display the response data size for UDP jitter operations in IPv4 and IPv6 networks.

Usage Guidelines

The IPv4 and IPv6 support for different IP SLAs operations are described below:

- IP SLAs Internet Control Message Protocol (ICMP) echo operations support both IPv4 and IPv6 addresses.
- IP SLAs UDP echo operations support both IPv4 and IPv6 addresses.
- IP SLAs TCP connect operations support both IPv4 and IPv6 addresses.
- IP SLAs UDP jitter connect operations support both IPv4 and IPv6 addresses.
- IP SLAs video operations support only IPv4 addresses.

Examples

This section shows sample output from the **show ip sla configuration** command for different IP SLAs operations in IPv4 and IPv6 networks.

The following sample output from the **show ip sla configuration** command displays that the specified operation is an ICMP echo operation in an IPv4 network:

```
Device# show ip sla configuration 3

Entry number: 3
Owner:
Tag:
Type of operation: echo
Target address/Source address: 192.0.2.10/192.0.2.9
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Vrf Name:
Request size (ARR data portion): 28
Verify data: No
Schedule:
```

```

Next Scheduled Start Time: Start Time already passed
Group Scheduled: False
Operation frequency (seconds): 60
Life/Entry Ageout (seconds): Forever/never
Recurring (Starting Everyday): FALSE
Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None
Enhanced History:

```

The following sample output from the **show ip sla configuration** command displays that the specified operation is an ICMP echo operation in an IPv6 network:

```

Device# show ip sla configuration 1

IP SLAs, Infrastructure Engine-II.
Entry number: 1
Owner:
Tag:
Type of operation to perform: echo
Target address/Source address: 2001:DB8:100::1/2001:DB8:200::FFFE
Traffic-Class parameter: 0x80
Flow-Label parameter: 0x1B669
Request size (ARR data portion): 28
Operation timeout (milliseconds): 5000
Verify data: No
Vrf Name:
Schedule:
  Operation frequency (seconds): 60
  Next Scheduled Start Time: Pending trigger
  Group Scheduled : FALSE
  Randomly Scheduled : FALSE
  Life (seconds): 3600
  Entry Ageout (seconds): never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): notInService
Threshold (milliseconds): 5000

```

The following sample output from the **show ip sla configuration** command displays that the specified operation is an HTTP operation:

```

Device# show ip sla configuration 3

Entry number: 3
Owner:
Tag:
Type of operation: http
Target address/Source address: 192.0.2.100/192.0.2.98
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
HTTP Operation: get
HTTP Server Version: 1.0
URL: http://www.cisco.com
Proxy:
Raw String(s):
Cache Control: enable
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000

  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5

```

```

    Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None

```

The following sample output from the **show ip sla configuration** command displays that the specified operation is an ICMP path jitter operation:

```

Device# show ip sla configuration 3

Entry number: 3
Owner:
Tag:
Type of operation: pathJitter
Target address/Source address: 192.0.2.50/192.0.2.34
Packet Interval/Number of Packets: 20 ms/10
Target Only: Disabled
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Loose Source Routing: Disabled
LSR Path:
Vrf Name:
Request size (ARR data portion): 28
Verify data: No
Schedule:
    Next Scheduled Start Time: Start Time already passed
    Group Scheduled: False
    Operation frequency (seconds): 60
    Life/Entry Ageout (seconds): Forever/never
    Recurring (Starting Everyday): FALSE
    Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000

```

The following sample output from the **show ip sla configuration** command displays that the specified operation is an ICMP path echo operation:

```

Device# show ip sla configuration 3

Entry number: 3
Owner:
Tag:
Type of operation: pathEcho
Target address/Source address: 192.0.2.20/192.0.2.11
Packet Interval/Number of Packets: 20 ms/10
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Loose Source Routing: Disabled
Vrf Name:
LSR Path:
Request size (ARR data portion): 28
Verify data: No
Schedule:
    Next Scheduled Start Time: Start Time already passed

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

show ip sla endpoint-list

To display the configuration including default values of all IP Service Level Agreements (SLAs) endpoint lists, all P SLAs endpoint lists for a specified operation type, or a specified IP SLAs endpoint list, use the **show ip sla endpoint-list** command in user EXEC or privileged EXEC mode.

show ip endpoint-list [**type** {**ip**|**ipv6**} [*template-name*]]

Syntax Description

type ip	(Optional) Specifies that the operation type is IPv4.
type ipv6	(Optional) Specifies that the operation type is IPv6.
template-name	(Optional) Unique identifier of the endpoint list. String of 1 to 64 alphanumeric characters.

Command Default

Default display includes configuration for all IP SLAs endpoint lists.

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

Release	Modification
15.2(3)T	This command was introduced. This command replaced the show ip sla auto endpoint-list command.
15.2(4)M	This command was modified. The command output has been modified to display multicast UDP jitter operations.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Examples

The following is sample output from the **show ip sla endpoint-list** command for all configured endpoint lists. Because all of the destinations are for IP operations, the **typeip** keyword is not configured.

```
Router# show ip sla endpoint-list
Endpoint-list Name: man1
```

```

Description: testing manual build
ip-address 10.1.1.1-7 port 23
ip-address 10.1.1.9,10.1.1.15,10.1.1.23 port 23
Endpoint-list Name: autolist
Description:
Auto Discover Parameters
  Destination Port: 5000
  Access-list: 3
  Ageout: 3600    Measurement-retry: 3
0 endpoints are discovered for autolist

```

The following sample output displays a list of unicast IP addresses that are part of an endpoint list for a multicast UDP jitter operation. Because this endpoint list is for a multicast UDP jitter operation, the port configuration is ignored by the operation.

```
Router# show ip sla auto endpoint-list multicast
```

```

Endpoint-list Name: multicast
Description:
ip-address 1.1.1.1 port 1111
ip-address 2.2.2.2 port 2222
ip-address 3.3.3.3 port 3333

```

The table below describes the significant fields shown in the display.

Table 42: show ip sla endpoint-list Field Descriptions

Field	Description
Destination Port	Port number of target device or Cisco IP SLAs Responder.
Access-list	Name of list of discovered endpoints.
Ageout	Length of time that operation is kept in memory, in seconds (sec).
Measurement-retry	Number of times the endpoints belonging to an auto IP SLAs destination templates are retested when an operation fails.

Related Commands

Command	Description
access-list (ep1-disc)	Adds list of discovered endpoints to an auto IP SLAs endpoint list.
ageout	Adds ageout timer to auto IP SLAs scheduler or endpoint list.
ip sla endpoint-list	Enters IP SLA endpoint-list configuration mode and begins creating an IP SLAs endpoint list.
measurement-retry	Specifies the number of times an operation associated with an auto IP SLAs endpoint list is retried when a failure is detected.

show ip sla enhanced-history collection-statistics

To display enhanced history statistics for all collected history buckets for the specified Cisco IOS IP Service Level Agreements (SLAs) operation, use the **show ip sla enhanced-history collection-statistics** command in user EXEC or privileged EXEC mode.

show ip sla enhanced-history collection-statistics [*operation-number*] [*interval seconds*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which enhanced history statistics is displayed.
interval <i>seconds</i>	(Optional) Displays enhanced history distribution statistics for only the specified aggregation interval.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the show ip sla monitor enhanced-history collection-statistics command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show ip sla monitor enhanced-history collection-statistics command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor enhanced-history collection-statistics command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor enhanced-history collection-statistics command.

Usage Guidelines

This command displays data for each bucket of enhanced history data. Data is shown individually (one after the other).

The number of buckets and the collection interval is set using the **history enhanced** command.

You can also use the following commands to display additional statistics or history information, or to view the status of the operation:

- **show ip sla enhanced-history distribution-statistics**
- **show ip sla statistics**

- show ip sla statistics aggregated

**Tip**

If the letter n appears in your output, or not all fields are displayed, you should increase the screen width for your command line interface display (for example, using the **width** line configuration command or the **terminalwidth** EXEC mode command).

Examples

The following example shows sample output for the **show ip sla enhanced-history collection-statistics** command. The output of this command will vary depending on the type of IP SLAs operation.

```
Router# show ip sla enhanced-history collection-statistics 1
Entry number: 1
Aggregation Interval: 900
Bucket Index: 1
Aggregation start time 00:15:00.003 UTC Thur May 1 2003
Target Address:
Number of failed operations due to a Disconnect: 0
Number of failed operations due to a Timeout: 0
Number of failed operations due to a Busy: 0
Number of failed operations due to a No Connection: 0
Number of failed operations due to an Internal Error: 0
Number of failed operations due to a Sequence Error: 0
Number of failed operations due to a Verify Error: 0
.
.
.
```

The table below describes the significant fields shown in the display.

Table 43: show ip sla enhanced-history collection-statistics Field Descriptions

Field	Description
Aggregation Interval	The number of seconds the operation runs for each enhanced history bucket. For example, a value of 900 indicates that statistics were gathered for 15 minutes before the next bucket was created.
Bucket Index	The number identifying the collection bucket. The number of buckets is set using the historyenhancedIP SLA configuration command.

Related Commands

Command	Description
ip sla	Allows configuration of IP SLA operations by entering IP SLA configuration mode for the specified operation number.
show ip sla enhanced-history distribution-statistics	Displays enhanced history distribution statistics for IP SLAs operations in tabular format.

Command	Description
show ip sla statistics	Displays the current operational status and statistics of all IP SLAs operations or a specified operation.
show ip sla statistics aggregated	Displays the aggregated statistical errors and distribution information for all IP SLAs operations or a specified operation.

show ip sla enhanced-history distribution-statistics

To display enhanced history distribution statistics for Cisco IOS IP Service Level Agreements (SLAs) operations in tabular format, use the **show ip sla enhanced-history distribution-statistics** command in user EXEC or privileged EXEC mode.

show ip sla enhanced-history distribution-statistics [*operation-number* [**interval** *seconds*]]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which enhanced history statistics is displayed.
interval <i>seconds</i>	(Optional) Displays enhanced history distribution statistics for only the specified aggregation interval for only the specified operation.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the show ip sla monitor enhanced-history distribution-statistics command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show ip sla monitor enhanced-history distribution-statistics command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor enhanced-history distribution-statistics command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor enhanced-history distribution-statistics command.

Usage Guidelines

The distribution statistics consist of the following:

- The sum of completion times (used to calculate the mean)
- The sum of the completion times squared (used to calculate standard deviation)
- The maximum and minimum completion times
- The number of completed attempts

You can also use the following commands to display additional statistics or history information, or to view the status of the operation:

- **show ip sla enhanced-history collection-statistics**
- **show ip sla statistics**
- **show ip sla statistics aggregated**

Tip

If the letter n appears in your output, or not all fields are displayed, you should increase the screen width for your command line interface display (for example, using the **width** line configuration command or the **terminalwidth** EXEC mode command).

Examples

The following is sample output from the **show ip sla enhanced-history distribution-statistics** command. The fields are defined at the beginning of the output for the command. RTT means round-trip time.

```
Router# show ip sla enhanced-history distribution-statistics 3

.
.
.
```

The time elapsed between BucketIndex 1 (started at 257,850,000) and BucketIndex 2 (started at 258,750,002) in this example is 900,002 milliseconds, or 900 seconds.

The table below describes the significant fields shown in the display.

Table 44: show ip sla enhanced-history distribution-statistics Field Descriptions

Field	Description
Entry	The operation ID number you specified for the IP SLAs operation.

Field	Description
Int	Aggregation interval--The configured statistical distribution buckets interval, in seconds. For example, a value of 900 for Int means that statistics are gathered for 900 seconds per bucket.
BucI	Bucket index number--A number uniquely identifying the statistical distribution (aggregation) bucket. The number of history buckets to be kept is configured using the historybuckets-kept command. A bucket will gather statistics for the specified interval of time (aggregation interval), after which a new statistics bucket is created. If a number-of-buckets-kept value is configured, the interval for the last bucket is infinity (until the end of the operation). Buckets are not applicable to HTTP and UDP jitter monitoring operations. This field is equivalent to the rttMonStatsCaptureDistIndex object in the Cisco RTTMON MIB.
StartT	Aggregation start time--Start time for the aggregation interval (per Bucket Index). Shows the start time as the number of milliseconds since the router started; in other words, the time stamp is the number of milliseconds since the last system bootup.
Pth	Path index number--An identifier for a set of different paths to the target destination that have been discovered. For example, if the first operation iteration finds the path h1, h2, h3, h4, then this path is labeled as 1. If, on a later iteration, a new path is discovered, (such as h1, h2, h5, h6, h4) then this new path will be identified as 2, and so on. Data collection per path is available only for ICMP path echo operations ("pathEcho probes"). For all other operations, a value of 1 will always appear. Data collection per path is configured using the paths-of-statistics-kept<i>number</i> command when configuring the operation.

Field	Description
Hop	Hop Index Number--Statistics data per hop. A hop is data transmission between two points in a path (for example, from device h2 to device h3). Data collection per hop is available only for ICMP path echo operations ("pathEcho probes"). For all other operations, a value of "1" will always appear. Data collection per hop is configured using the hops-of-statistics-kept<i>number</i> command when configuring the operation. This field is equivalent to the rrttMonStatsCaptureHopIndex object in the Cisco RTTMON MIB.
Comps	Completions--The number of round-trip time operations that have completed without an error and without timing out, per bucket index. This object has the special behavior as defined by the ROLLOVER NOTE in the DESCRIPTION of the Cisco Rttmon MIB object.
SumCmp	Sum of completed operation times (1)--The total of all round-trip time values for all successful operations in the row, in milliseconds.

Field	Description
SumCmp2L	Sum of the squares of completed operation times (2), Low-Order--The sum of the square roots of round-trip times for operations that were successfully measured, in milliseconds; displays the low-order 32 bits of the value only. 32 low-order bits and 32 high-order bits are ordered in unsigned 64-bit integers (Int64) as follows: ----- High-order 32 bits Low-order 32 bits ----- - The “SumCmp2” values are split into “high-order” and “low-order” numbers because of limitations of Simple Network Management Protocol (SNMP). The maximum value allowed for an SNMP object is 4,294,967,295 (the Gauge32 limit). If the sum of the square roots for your operation exceeds this value, then the “high-order” value will be utilized. (For example, the number 4,294,967,296 would have all low-order bits as 0, and the right-most high-order bit would be 1). - The low-order value (SumCmp2L) appears first in the output because in most cases, the value will be less than 4,294,967,295, which means that the value of SumCmp2H will appear as zero.
SumCmp2H	Sum of the squares of completed operation times (2), High-Order--The high-order 32 bits of the accumulated squares of completion times (in milliseconds) of operations that completed successfully.
TMax	Round-trip time, maximum--The highest recorded round-trip time, in milliseconds, per aggregation interval.
TMin	Round-trip time, minimum--The lowest recorded round-trip time, in milliseconds, per aggregation interval.

Related Commands

Command	Description
ip sla	Allows configuration of IP SLA operations by entering IP SLA configuration mode for the specified operation number.
show ip sla enhanced-history collection-statistics	Displays enhanced history statistics for all collected history buckets for the specified IP SLAs operation.
show ip sla statistics	Displays the current operational status and statistics of all IP SLAs operations or a specified operation.
show ip sla statistics aggregated	Displays the aggregated statistical errors and distribution information for all IP SLAs operations or a specified operation.

show ip sla ethernet-monitor configuration

To display configuration settings for IP Service Level Agreements (SLAs) auto Ethernet operations, use the **show ip sla ethernet-monitor configuration** command in user EXEC or privileged EXEC mode.

show ip sla ethernet-monitor configuration [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the auto Ethernet operation for which the details will be displayed.

Command Modes

User EXEC (>) Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Usage Guidelines

If the identification number of an auto Ethernet operation is not specified, configuration values for all the configured auto Ethernet operations will be displayed.

Examples

The following is sample output from the **show ip sla ethernet-monitor configuration** command:

```
Router# show ip sla ethernet-monitor configuration 1
Entry Number : 1
Modification time : *00:47:46.703 GMT Thu Jan 11 2007
Operation Type : echo
Domain Name : a
VLAN ID : 11
Excluded MPIDs :
Owner :
Tag :
Timeout(ms) : 5000
Threshold(ms) : 5000
Frequency(sec) : 60
Operations List : Empty
Schedule Period(sec) : 0
Request size : 0
CoS : 0
Start Time : Pending trigger
SNMP RowStatus : notInService
Reaction Configs :
Reaction Index : 1
```

```

Reaction           : RTT
Threshold Type     : Never
Threshold Rising   : 300
Threshold Falling  : 200
Threshold CountX   : 5
Threshold CountY   : 5
Action Type        : None

```

The table below describes the significant fields shown in the display.

Table 45: show ip sla ethernet-monitor configuration Field Descriptions

Field	Description
Entry Number	Identification number for the auto Ethernet operation.
Operation Type	Type of IP SLAs operation configured by the auto Ethernet operation.
Domain Name	Name of the Ethernet Connectivity Fault Management (CFM) maintenance domain.
VLAN ID	VLAN identification number
Excluded MPIDs	List of maintenance endpoint identification numbers to be excluded from the auto Ethernet operation.
Owner	Simple Network Management Protocol (SNMP) owner of an IP SLAs operation.
Tag	User-specified identifier for an IP SLAs operation.
Timeout(ms)	Amount of time the IP SLAs operation waits for a response from its request packet.
Threshold(ms)	Upper threshold value for calculating network monitoring statistics created by an IP SLAs operation.
Frequency(sec)	Time after which an individual IP SLAs operation is restarted.
Operations List	Identification numbers of the individual operations created by the auto Ethernet operation.
Schedule Period(sec)	Time period (in seconds) in which the start times of the individual Ethernet operations are distributed.
Request size	Padding size for the data frame of the individual operations created by the auto Ethernet operation.
CoS	Class of Service of the individual operations created by the auto Ethernet operation.
Start Time	Status of the start time for the auto Ethernet operation.

Field	Description
SNMP RowStatus	Indicates whether SNMP RowStatus is active or inactive.
Reaction Configs	Reaction configuration of the IP SLAs operation.
Reaction Index	Identification number used to identify different reaction configurations for an IP SLAs operation.
Reaction	Reaction condition being monitored.
Threshold Type	Specifies when an action should be performed as a result of a reaction event.
Threshold Rising	The upper threshold value of the reaction condition being monitored. Corresponds to the <i>upper-threshold</i> argument of the threshold-valueupper-thresholdlower-threshold syntax in the ipslaethernet-monitorreaction-configuration command.
Threshold Falling	The lower threshold value of the reaction condition being monitored. Corresponds to the <i>lower-threshold</i> argument of the threshold-valueupper-thresholdlower-threshold syntax in the ipslaethernet-monitorreaction-configuration command.
Threshold CountX	Corresponds to the <i>x-value</i> argument of the threshold-typexofyx-valuey-values syntax in the ipslaethernet-monitorreaction-configuration command.
Threshold CountY	Corresponds to the <i>y-value</i> argument of the threshold-typexofyx-valuey-values syntax in the ipslaethernet-monitorreaction-configuration command.
Action Type	Type of action that should be performed as a result of a reaction event.

Related Commands

Command	Description
ip sla ethernet-monitor	Begins configuration for an IP SLAs auto Ethernet operation and enters Ethernet monitor configuration mode.
ip sla ethernet-monitor reaction-configuration	Configures the proactive threshold monitoring parameters for an IP SLAs auto Ethernet operation.
ip sla ethernet-monitor schedule	Configures the scheduling parameters for an IP SLAs LSP Health Monitor operation.

show ip sla event-publisher

To display the list of client applications that are registered to receive IP Service Level Agreements (SLAs) notifications, use the **show ip sla event-publisher** command in user EXEC or privileged EXEC mode.

show ip sla event-publisher

Command Modes

User EXEC (>) Privileged EXEC (#)

Command History

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

Examples

The following is sample output from the **show ip sla event-publisher** command:

```
Router# show ip sla event-publisher
client-id  process-id  event-type
-----
appl1      1111      react-alert
appl1      1221      react-alert
appl1      1331      react-alert
Router#
```

The table below describes the fields shown in the display.

Table 46: show ip sla event-publisher Field Descriptions

Field	Description
client-id	The identity of the client registered to receive IP SLAs notifications.
process-id	The process identity associated with the client.
event-type	The type of notification (event) that the client has registered to receive.

Related Commands

Command	Description
ip sla enable reaction-alerts	Enables IP SLA notifications to be sent to all registered applications.

Command	Description
show ip sla application	Displays global information about Cisco IOS IP SLAs.

show ip sla group schedule

To display the group schedule details for Cisco IOS IP Service Level Agreements (SLAs) operations, use the **show ip sla group schedule** command in user EXEC or privileged EXEC mode.

show ip sla group schedule [*group-operation-number*]

Syntax Description

<i>group-operation-number</i>	(Optional) Number of the IP SLAs group operation to display.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the show ip sla monitor group schedule command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show rtr group schedule command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor group schedule command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor group schedule command.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Examples

The following is sample output from the **show ip sla group schedule** command that shows information about group (multiple) scheduling. The last line in the example indicates that the IP SLAs operations are multiple scheduled (TRUE):

```
Router# show ip sla group schedule
Multi-Scheduling Configuration:
Group Entry Number: 1
Probes to be scheduled: 2,3,4,9-30,89
Schedule period :60
Group operation frequency: 30
Multi-scheduled: TRUE
```

The following is sample output from the **show ip sla group schedule** command that shows information about group (multiple) scheduling, with the frequency value the same as the schedule period value, the life value as 3600 seconds, and the ageout value as never:

```
Router# show ip sla group schedule
Group Entry Number: 1
Probes to be scheduled: 3,4,6-10
Total number of probes: 7
Schedule period: 20
Group operation frequency: Equals schedule period
Status of entry (SNMP RowStatus): Active
Next Scheduled Start Time: Start Time already passed
Life (seconds): 3600
Entry Ageout (seconds): never
```

The table below describes the significant fields shown in the displays.

Table 47: show ip sla group schedule Field Descriptions

Field	Description
Group Entry Number	The operation group number specified for IP SLAs multiple operations scheduling.
Probes to be scheduled	The operations numbers specified in the operation group 1.
Scheduled period	The time (in seconds) for which the IP SLAs group is scheduled.
Group operation frequency	The frequency at which each operation is started.
Multi-scheduled	The value TRUE shows that group scheduling is active.

Related Commands

Command	Description
show ip sla configuration	Displays the configuration details for IP SLAs operations.

show ip sla history

To display history collected for all Cisco IOS IP Service Level Agreements (SLAs) operations or for a specified operation, use the **showipslahistory** command in user EXEC or privileged EXEC mode.

show ip sla history [*operation-number*] [**tabular**|**full**|**interval-statistics**]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which history details is displayed.
tabular	(Optional) Displays information in a column format, reducing the number of screens required to display the information. This is the default.
full	(Optional) Displays all information, using identifiers next to each displayed value.
interval-statistics	(Optional) Displays interval statistics.

Command Default

Tabular format history for all operations is displayed.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the showipslamonitorhistory command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the showrtrhistory command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the showipslamonitorhistory command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the showipslamonitorhistory command.
Cisco IOS XE Release 3.3S	This command was integrated into Cisco IOS XE Release 3.3S. This command was modified. The interval-statistics keyword was added.

Release	Modification
15.2(2)S	This command was modified. The Available and Unavailable counters that cause the state change are counted towards the new state.
Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

The table below lists the Response Return values used in the output of the **show ip sla history** command.

If the default (tabular) format is used, the Response Return description is displayed as a code in the Sense column. If the full format is used, the Response Return is displayed as indicated in the Description column.

Table 48: Response Return (Sense Column) Codes

Code	Description
1	Okay.
2	Disconnected.
3	Over threshold.
4	Timeout.
5	Busy.
6	Not connected.
7	Dropped.
8	Sequence error.
9	Verify error.
10	Application specific.

Before Cisco IOS Release 15.2(2)S, the counters were incremented only after state change. In Cisco IOS Release 15.2(2)S and later releases, the Available and Unavailable counters that cause the state change are also counted towards the new state.

This command with the **interval-statistics** keyword displays the Available and Unavailable indicators for an IP SLAs Ethernet Frame Loss (FRL) operation.

Prior to Cisco IOS Release 12.4(24)T, the value for SampleT was displayed in centiseconds. In Cisco IOS Release 12.4(24)T and later releases, the value for SampleT is displayed in milliseconds. SampleT is the system uptime value at the start of the operation iteration.

Examples

The following is sample output from the **show ip sla history** command in tabular format.

```
Device# show ip sla history
Point by point History
Multiple Lines per Entry

Line 1
Entry      = Entry Number
LifeI      = Life Index
BucketI    = Bucket Index
SampleI    = Sample Index
SampleT    = Sample Start Time (milliseconds)
CompT      = Completion Time (milliseconds)
Sense      = Response Return Code
Line 2 has the Target Address
Entry LifeI      BucketI    SampleI    SampleT    CompT      Sense
2      1          1          1          174365480    16          1
  AB 45 A0 16
2      1          2          1          174365510    4           1
  AC 12 7 29
2      1          2          2          174365510    1           1
  AC 12 5 22
2      1          2          3          174365520    4           1
  AB 45 A7 22
2      1          2          4          174365520    4           1
  AB 45 A0 16
```

The following sample output from the **show ip sla history** command with the **interval-statistics** keyword includes the Available and Unavailable indicators for an IP SLAs Ethernet Frame Loss (FRL) operation.

Note

Before Cisco IOS Release 15.2(2)S, the counters were incremented only after state change. In Cisco IOS Release 15.2(2)S and later releases, the Available and Unavailable counters that cause the state change are also counted towards the new state.

```

Related Commands

Command	Description
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla history interval

To display the latest history collected for all IP Service Level Agreements (SLAs) Metro Ethernet 3.0 (ITU-T Y.1731) operations or for a specified operation, use the **show ip sla history interval** command in user EXEC or privileged EXEC mode.

show ip sla history interval [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which history details are to be displayed.

Command Default

Latest history for all operations is displayed.

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

Release	Modification
15.1(2)S	This command was introduced.

Usage Guidelines

This command displays the current state of IP SLAs operations, including the monitoring data returned for the last (most recently completed) operation. One of the following Operation Return values is displayed for the latest operation. The values are self-explanatory.

- OK
- Over Threshold
- Timeout
- Unknown
- Internal Error

The output of this command is the same as the output displayed for the **show ip sla statistics** command with the **detail**.

Examples

The following is sample output from the **show ip sla history interval** command for an Ethernet delay operation (3).

```
Router# show ip sla history interval 3
```

```
IPSLA operation id: 3  
Delay Statistics for Y1731 Operation 3

Related Commands

Command	Description
show ip sla statistics	Displays the current operational status and statistics of all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation.

show ip sla monitor application

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **show ip sla monitor application** command is replaced by the **show ip sla application** command. See the **show ip sla application** command for more information.

To display global information about Cisco IOS IP Service Level Agreements (SLAs), use the **show ip sla monitor application** command in user EXEC or privileged EXEC mode.

show ip sla monitor application [**tabular**| **full**]

Syntax Description

tabular	(Optional) Displays information in a column format, reducing the number of screens required to display the information.
full	(Optional) Displays all information, using identifiers next to each displayed value. This is the default.

Command Default

Full format

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the show ip sla application command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the show rtr application command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the show ip sla application command.
12.2(33)SXI	This command was replaced by the show ip sla application command.

Usage Guidelines

Use the **show ip sla monitor application** command to display information such as supported operation types and supported protocols.

Examples

The following is sample output from the **show ip sla monitor application** command in full format:

```
Router# show ip sla monitor application

      IP Service Level Agreement Monitor
Version: 2.2.0 Round Trip Time MIB
Time of last change in whole IP SLA Monitor: *17:21:30.819 UTC Tue Mar 19 2002

```

Related Commands

Command	Description
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla monitor authentication

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **show ip sla monitor authentication** command is replaced by the **show ip sla authentication** command. See the **show ip sla authentication** command for more information.

To display Cisco IOS IP Service Level Agreements (SLAs) authentication information, use the **show ip sla monitor authentication** command in user EXEC or privileged EXEC mode.

show ip sla monitor authentication

Syntax Description

This command has no arguments or keywords.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the show ip sla authentication command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the show rtr authentication command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the show ip sla authentication command.
12.2(33)SXI	This command was replaced by the show ip sla authentication command.

Usage Guidelines

Use the **show ip sla monitor authentication** command to display information such as supported operation types and supported protocols.

Examples

The following is sample output from the **show ip sla monitor authentication** command:

```
Router# show ip sla monitor authentication
```

```
IP SLA Monitor control message uses MD5 authentication, key chain name is: ipsla
```

Related Commands

Command	Description
show ip sla monitor configuration	Displays configuration values for IP SLAs operations.

show ip sla monitor collection-statistics

**Note**

Effective with Cisco IOS Release 12.4(2)T, the **showipslamonitorcollection-statistics** command is replaced by the **showipslamonitorstatisticsaggregated** command. See the **showipslamonitorstatisticsaggregated** command for more information.

To display statistical errors for all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **showipslamonitorcollection-statistics** command in user EXEC or privileged EXEC mode.

show ip sla monitor collection-statistics [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the IP SLAs operation to display.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(2)T	This command was replaced by the showipslamonitorstatisticsaggregated command.

Usage Guidelines

Use the **showipslamonitorcollection-statistics** command to display information such as the number of failed operations and the failure reason. You can also use the **showipslamonitordistribution-statistics** and **showipslamonitortotals-statistics** commands to display additional statistical information.

This command shows information collected over the past two hours, unless you specify a different amount of time using the **hours-of-statistics-kept** command.

For one-way delay jitter operations, the clocks on each device must be synchronized using Network Time Protocol (NTP) or global positioning systems. If the clocks are not synchronized, one-way measurements are discarded. (If the sum of the source to destination (SD) and the destination to source (DS) values is not within 10 percent of the round-trip time, the one-way measurement values are assumed to be faulty, and are discarded.)

**Note**

This command does not support the IP SLAs ICMP path jitter operation.

Examples

The following is sample output from the **showipslamonitorcollection-statistics** command:

```
Router# show ip sla monitor collection-statistics 1
Collected Statistics
Entry Number: 1
Start Time Index: *17:15:41.000 UTC Thu May 16 1996
Path Index: 1
Hop in Path Index: 1
Number of Failed Operations due to a Disconnect: 0
Number of Failed Operations due to a Timeout: 0
Number of Failed Operations due to a Busy: 0
Number of Failed Operations due to a No Connection: 0
Number of Failed Operations due to an Internal Error: 0
Number of Failed Operations due to a Sequence Error: 0
Number of Failed Operations due to a Verify Error: 0
Target Address: 172.16.1.176
```

Examples

The following is output from the **showipslamonitorcollection-statistics** command when the specified operation is an HTTP operation:

```
Router# show ip sla monitor collection-statistics 2          Collected Statistics

Entry Number:2
HTTP URL:
http://172.20.150.200
Start Time:*00:01:16.000 UTC Mon Nov 1 2003

Comps:1              RTTMin:343
OvrTh:0              RTTMax:343
DNSTimeOut:0         RTTSum:343
TCPTimeOut:0         RTTSum2:117649
TraTimeOut:0         DNSRRT:0
DNSError:0           TCPConRTT:13
HTTPError:0          TransRTT:330
IntError:0           MesgSize:1771
Busies:0
```

Examples

The following is sample output from the **showipslamonitorcollection-statistics** command, where operation 2 is a jitter operation that includes one-way statistics. The table below describes the significant fields shown in the display.

```
Router# show ip sla monitor collection-statistics
Collected Statistics
Entry Number: 2
Target Address: 5.0.0.1, Port Number:99
Start Time: 11:12:03.000 UTC Thu Jul 1 1999
RTT Values:
NumOfRRT: 600  RTTSum: 3789  RTTSum2: 138665
Packet Loss Values:
PacketLossSD: 0  PacketLossDS: 0
PacketOutOfSequence: 0  PacketMIA: 0  PacketLateArrival: 0
InternalError: 0  Busies: 0
Jitter Values:
MinOfPositivesSD: 1  MaxOfPositivesSD: 2
NumOfPositivesSD: 26  SumOfPositivesSD: 31  Sum2PositivesSD: 41
MinOfNegativesSD: 1  MaxOfNegativesSD: 4
NumOfNegativesSD: 56  SumOfNegativesSD: 73  Sum2NegativesSD: 133
MinOfPositivesDS: 1  MaxOfPositivesDS: 338
NumOfPositivesDS: 58  SumOfPositivesDS: 409  Sum2PositivesDS: 114347
MinOfNegativesDS: 1  MaxOfNegativesDS: 338
NumOfNegativesDS: 48  SumOfNegativesDS: 396  Sum2NegativesDS: 114332
One Way Values:
```

```

NumOfOW: 440
OWMinSD: 2  OWMaxSD: 6    OWSumSD: 1273  OWSum2SD: 4021
OWMinDS: 2  OWMaxDS: 341  OWSumDS: 1643  OWSum2DS: 120295

```

Examples

The following is sample output from the **show ip sla monitor collection-statistics** command, where operation 10 is a UDP jitter (codec) operation. The table above describes the significant fields shown in the display.

```

Router# show ip sla monitor collection-statistics 10
Entry Number: 10
Start Time Index: 12:57:45.931 UTC Wed Mar 12 2003
Number of successful operations: 60
Number of operations over threshold: 0
Number of failed operations due to a Disconnect: 0
Number of failed operations due to a Timeout: 0
Number of failed operations due to a Busy: 0
Number of failed operations due to a No Connection: 0
Number of failed operations due to an Internal Error: 0
Number of failed operations due to a Sequence Error: 0
Number of failed operations due to a Verify Error: 0
Voice Scores:
  MinOfICPIF: 2   MaxOfICPIF: 20   MinOfMos: 3.20   MaxOfMos: 4.80

```

Table 49: show ip sla monitor collection-statistics Field Descriptions

Field	Description
Voice Scores	Indicates that Voice over IP statistics appear on the following lines. Voice score data is computed when the operation type is configured as typejitter (codec).

Field	Description
ICPIF	The Calculated Planning Impairment Factor (ICPIF) value for the operation. The ICPIF value is computed by IP SLAs using the formula $Icpif=Io+Iq+Idte+Idd+Ie-A$, where • The values for <i>Io</i> , <i>Iq</i> , and <i>Idte</i> are set to zero. • The value <i>Idd</i> is computed based on the measured one-way delay. • The value <i>Ie</i> is computed based on the measured packet loss. • The value of <i>A</i> is specified by the user. ICPIF values are expressed in a typical range of 5 (very low impairment) to 55 (very high impairment). ICPIF values numerically lower than 20 are generally considered “adequate.” Note This value is intended only for relative comparisons, and may not match ICPIF values generated using alternate methods.
MinOfICPIF	The lowest (minimum) ICPIF value computed for the collected statistics.
MaxOfICPIF	The highest (maximum) ICPIF value computed for the collected statistics.
Mos	The estimated Mean Opinion Score (Conversational Quality, Estimated) for the latest iteration of the operation. The MOS-CQE is computed by IP SLAs as a function of the ICPIF. MOS values are expressed as a number from 1 (1.00) to 5 (5.00), with 5 being the highest level of quality, and 1 being the lowest level of quality. A MOS value of 0 (zero) indicates that MOS data could not be generated for the operation.
MinOfMos	The lowest (minimum) MOS value computed for the collected statistics.
MaxOfMos	The highest (maximum) ICPIF value computed for the collected statistics.
RTT Values	Indicates that round-trip-time statistics appear on the following lines.
NumOfRTT	The number of successful round-trips.

Field	Description
RTTSum	The sum of all successful round-trip values (in milliseconds).
RTTSum2	The sum of squares of those round-trip values (in milliseconds).
PacketLossSD	The number of packets lost from source to destination.
PacketLossDS	The number of packets lost from destination to source.
PacketOutOfSequence	The number of packets returned out of order.
PacketMIA	The number of packets lost where the direction (SD/DS) cannot be determined.
PacketLateArrival	The number of packets that arrived after the timeout.
InternalError	The number of times an operation could not be started due to other internal failures.
Busies	The number of times this operation could not be started because the previously scheduled run was not finished.
Jitter Values:	Indicates that jitter statistics appear on the following lines. Jitter is interpacket delay variance.
NumOfJitterSamples	The number of jitter samples collected. This is the number of samples that are used to calculate the following jitter statistics.
MinOfPositivesSD MaxOfPositivesSD	The minimum and maximum positive jitter values from source to destination, in milliseconds.
NumOfPositivesSD	The number of jitter values from source to destination that are positive (that is, network latency increases for two consecutive test packets).
SumOfPositivesSD	The sum of those positive values (in milliseconds).
Sum2PositivesSD	The sum of squares of those positive values.
MinOfNegativesSD MaxOfNegativesSD	The minimum and maximum negative jitter values from source to destination. The absolute value is given.
NumOfNegativesSD	The number of jitter values from source to destination that are negative (that is, network latency decreases for two consecutive test packets).

Field	Description
SumOfNegativesSD	The sum of those values.
Sum2NegativesSD	The sum of the squares of those values.
Interarrival jitterout	The source-to-destination (SD) jitter value calculation, as defined in RFC 1889.
Interarrival jitterin	The destination-to-source (DS) jitter value calculation, as defined in RFC 1889.
One Way Values	Indicates that one-way measurement statistics appear on the following lines. One Way (OW) values are the amount of time required for the packet to travel from the source router to the target router (SD) or from the target router to the source router (DS).
NumOfOW	Number of successful one-way time measurements.
OWMinSD	Minimum time (in milliseconds) from the source to the destination.
OWMaxSD	Maximum time (in milliseconds) from the source to the destination.
OWSumSD	Sum of the OWMinSD and OWMaxSD values.
OWSum2SD	Sum of the squares of the OWMinSD and OWMaxSD values.

Related Commands

Command	Description
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.
show ip sla monitor distributions-statistics	Displays statistics distribution information (captured response times) for all IP SLAs operations or the specified operation.
show ip sla monitor totals-statistics	Displays the total statistical values (accumulation of error counts and completions) for all IP SLAs operations or the specified operation.
show ntp status	Displays the status of the NTP configuration on your system.

show ip sla monitor configuration

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **show ip sla monitor configuration** command is replaced by the **show ip sla configuration** command. See the **show ip sla configuration** command for more information.

To display configuration values including all defaults for all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **show ip sla monitor configuration** command in user EXEC or privileged EXEC mode.

show ip sla monitor configuration [*operation*]

Syntax Description

<i>operation</i>	(Optional) Number of the IP SLAs operation for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(2)T	The displayed information was reorganized.
12.4(4)T	This command was replaced by the show ip sla configuration command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the show rtr configuration command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the show ip sla configuration command.
12.2(33)SXI	This command was replaced by the show ip sla configuration command.

Examples

The following sections show sample output from the **show ip sla monitor configuration** command for different IP SLAs operations.

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is an Internet Control Message Protocol (ICMP) echo operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: echo
Target address/Source address: 1.1.1.1/0.0.0.0
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Vrf Name:
Request size (ARR data portion): 28
Verify data: No
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None
Enhanced History:
```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is a Hypertext Transfer Protocol (HTTP) operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: http
Target address/Source address: 1.1.1.1/0.0.0.0
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
HTTP Operation: get
HTTP Server Version: 1.0
URL: http://www.cisco.com
Proxy:
Raw String(s):
Cache Control: enable
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None
```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is an ICMP path jitter operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: pathJitter
Target address/Source address: 1.1.1.1/0.0.0.0
Packet Interval/Number of Packets: 20 ms/10
Target Only: Disabled
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Loose Source Routing: Disabled
LSR Path:
Vrf Name:
Request size (ARR data portion): 28
Verify data: No
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is an ICMP path echo operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: pathEcho
Target address/Source address: 1.1.1.1/0.0.0.0
Packet Interval/Number of Packets: 20 ms/10
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Loose Source Routing: Disabled
Vrf Name:
LSR Path:
Request size (ARR data portion): 28
Verify data: No
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic paths kept: 5
  Number of statistic hops kept: 16
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None
```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is a Domain Name System (DNS) operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: dns
Target Address/Source address: 1.1.1.1/0.0.0.0
Target Port/Source Port: 1111/0
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None
```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is a UDP echo operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: udpEcho
Target address/Source address: 1.1.1.1/0.0.0.0
Target Port/Source Port: 1111/0
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Data Pattern:
Vrf Name:
Request size (ARR data portion): 28
Verify data: No
Control Packets: enabled
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None
Enhanced History:
```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is a Transmission Control Protocol (TCP) connect operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: tcpConnect
Target Address/Source address: 1.1.1.1/0.0.0.0
Target Port/Source Port: 1111/0
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Control Packets: enabled
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None
Enhanced History:
```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is a Dynamic Host Configuration Protocol (DHCP) operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: dhcp
Target Address/Source address: 1.1.1.1/0.0.0.0
Operation timeout (milliseconds): 5000
Dhcp option:
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None
```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is a File Transfer Protocol (FTP) operation:

```
Router# show ip sla monitor configuration 3
Entry number: 3
```

```

Owner:
Tag:
Type of operation: ftp
Source address: 0.0.0.0
FTP URL: ftp://ipsla:ipsla@172.19.192.109/test.txt
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Number of history Lives kept: 0
Number of history Buckets kept: 15
History Filter Type: None

```

Examples

The following example shows output from the **show ip sla monitor configuration** command when the specified operation is a User Datagram Protocol (UDP) jitter operation:

```

Router# show ip sla monitor configuration 3
Entry number: 3
Owner:
Tag:
Type of operation: jitter
Target Address/Source address: 1.1.1.1/0.0.0.0
Target Port/Source Port: 1111/0
Packet Interval/Number of Packets: 20 ms/10
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Vrf Name:
Request size (ARR data portion): 28
Verify data: No
Control Packets: enabled
Schedule:
  Next Scheduled Start Time: Start Time already passed
  Group Scheduled: False
  Operation frequency (seconds): 60
  Life/Entry Ageout (seconds): Forever/never
  Recurring (Starting Everyday): FALSE
  Status of entry (SNMP RowStatus): Active
Threshold (ms): 5000
Distribution Statistics:
  Number of statistic hours kept: 2
  Number of statistic distribution buckets kept: 5
  Statistic distribution interval (milliseconds): 10
Enhanced History:

```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

show ip sla monitor distributions-statistics

**Note**

Effective with Cisco IOS Release 12.4(2)T, the **show ip sla monitor distributions-statistics** command is replaced by the **show ip sla monitor statistics aggregated details** command. See the **show ip sla monitor statistics aggregated** command for more information.

To display distribution statistics (captured response times) for all Cisco IOS IP Service Level Agreements (SLAs) operations or the specified operation, use the **show ip sla monitor distributions-statistics** command in user EXEC or privileged EXEC mode.

show ip sla monitor distributions-statistics [*operation*] [**tabular** | **full**]

Syntax Description

<i>operation</i>	(Optional) Number of the IP SLAs operation to display.
tabular	(Optional) Displays information in a column format, reducing the number of screens required to display the information. This is the default.
full	(Optional) Displays all information, using identifiers next to each displayed value.

Command Default

Statistics are displayed for the past two hours.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(2)T	This command was replaced by the show ip sla monitor statistics aggregated details command.

Usage Guidelines

The distribution statistics consist of the following:

- The sum of completion times (used to calculate the mean)
- The sum of the completion times squared (used to calculate standard deviation)
- The maximum and minimum completion time

- The number of completed attempts

**Note**

This command does not support the IP SLAs ICMP path jitter operation.

This command shows information collected over the past two hours, unless you specify a different amount of time using the **hours-of-statistics-kept** command.

You can also use the **show ip sla monitor collection-statistics** and **show ip sla monitor totals-statistics** commands to display additional statistical information.

Examples

The following is sample output from the **show ip sla monitor distributions-statistics** command:

```
Router# show ip sla monitor distributions-statistics
Captured Statistics
Multiple Lines per Entry

Line 1
Entry      = Entry Number
StartT     = Start Time of Entry (hundredths of seconds)
Pth        = Path Index
Hop        = Hop in Path Index
Dst        = Time Distribution Index
Comps      = Operations Completed
OvrTh      = Operations Completed Over Thresholds
SumCmp     = Sum of Completion Times (milliseconds)
Line 2
SumCmp2L   = Sum of Completion Times Squared Low 32 Bits (milliseconds)
SumCmp2H   = Sum of Completion Times Squared High 32 Bits (milliseconds)
TMax       = Completion Time Maximum (milliseconds)
TMin       = Completion Time Minimum (milliseconds)
Entry StartT Pth Hop Dst Comps OvrTh SumCmp SumCmp2L SumCmp2H TMax TMin
1 17417068 1 1 1 2 0 128 8192 0 64 64
```

The fields shown in the display are self-explanatory.

Related Commands

Command	Description
show ip sla monitor collection-statistics	Displays statistical errors for all IP SLAs operations or the specified operation.
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.
show ip sla monitor totals-statistics	Displays the total statistical values (accumulation of error counts and completions) for all IP SLAs operations or the specified operation.

show ip sla monitor enhanced-history collection-statistics

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **showipslamonitorenhanced-historycollection-statistics** command is replaced by the **showipslaenhanced-historycollection-statistics** command. See the **showipslaenhanced-historycollection-statistics** command for more information.

To display enhanced history statistics for all collected history buckets for the specified Cisco IOS IP Service Level Agreements (SLAs) operation, use the **showipslamonitorenhanced-historycollection-statistics** command in user EXEC or privileged EXEC mode.

show ip sla monitor enhanced-history collection-statistics [*operation-number*] [**interval** *seconds*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which enhanced history statistics is displayed.
interval <i>seconds</i>	(Optional) Displays enhanced history distribution statistics for only the specified aggregation interval.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the showipslaenhanced-historycollection-statistics command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the showrtrenhanced-historycollection-statistics command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslaenhanced-historycollection-statistics command.
12.2(33)SXI	This command was replaced by the showipslaenhanced-historycollection-statistics command.

Usage Guidelines

This command displays data for each bucket of enhanced history data. Data is shown individually (one after the other).

The number of buckets and the collection interval is set using the **enhanced-history** command.

You can also use the following commands to display additional statistics or history information, or to view the status of the operation:

- **show ip sla monitor enhanced-history distribution-statistics**
- **show ip sla monitor statistics**
- **show ip sla monitor statistics aggregated**

Tip

If the letter n appears in your output, or not all fields are displayed, you should increase the screen width for your command line interface display (for example, using the **width** line configuration command or the **terminalwidth** EXEC mode command).

Examples

The following example shows sample output for the **show ip sla monitor enhanced-history collection-statistics** command. The output of this command will vary depending on the type of IP SLAs operation.

```
Router# show ip sla monitor enhanced-history collection-statistics 1
Entry number: 1
Aggregation Interval: 900
Bucket Index: 1
Aggregation start time 00:15:00.003 UTC Thur May 1 2003
Target Address:
Number of failed operations due to a Disconnect: 0
Number of failed operations due to a Timeout: 0
Number of failed operations due to a Busy: 0
Number of failed operations due to a No Connection: 0
Number of failed operations due to an Internal Error: 0
Number of failed operations due to a Sequence Error: 0
Number of failed operations due to a Verify Error: 0
.
.
.
```

The table below describes the significant fields shown in the display.

Table 50: show ip sla monitor enhanced-history collection-statistics Field Descriptions

Field	Description
Aggregation Interval	The number of seconds the operation runs for each enhanced history bucket. For example, a value of 900 indicates that statistics were gathered for 15 minutes before the next bucket was created.
Bucket Index	The number identifying the collection bucket. The number of buckets is set using the enhanced-history IP SLA monitor configuration command.

Related Commands

Command	Description
ip sla monitor	Allows configuration of IP SLA operations by entering IP SLA monitor configuration mode for the specified operation number.
show ip sla monitor enhanced-history distribution-statistics	Displays enhanced history distribution statistics for IP SLAs operations in tabular format.
show ip sla monitor statistics	Displays the current operational status and statistics of all IP SLAs operations or a specified operation.
show ip sla monitor statistics aggregated	Displays the aggregated statistical errors and distribution information for all IP SLAs operations or a specified operation.

show ip sla monitor enhanced-history distribution-statistics

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **showipslamonitorenhanced-historydistribution-statistics** command is replaced by the **showipslaenhanced-historydistribution-statistics** command. See the **showipslaenhanced-historydistribution-statistics** command for more information.

To display enhanced history distribution statistics for Cisco IOS IP Service Level Agreements (SLAs) operations in tabular format, use the **showipslamonitorenhanced-historydistribution-statistics** command in user EXEC or privileged EXEC mode.

show ip sla monitor enhanced-history distribution-statistics [*operation-number* [**interval** *seconds*]]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which enhanced history statistics is displayed.
interval <i>seconds</i>	(Optional) Displays enhanced history distribution statistics for only the specified aggregation interval for only the specified operation.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the showipslaenhanced-historydistribution-statistics command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the showrtrenhanced-historydistribution-statistics command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslaenhanced-historydistribution-statistics command.
12.2(33)SXI	This command was replaced by the showipslaenhanced-historydistribution-statistics command.

Usage Guidelines

The distribution statistics consist of the following:

- The sum of completion times (used to calculate the mean)
- The sum of the completion times squared (used to calculate standard deviation)
- The maximum and minimum completion times
- The number of completed attempts

You can also use the following commands to display additional statistics or history information, or to view the status of the operation:

- **show ip sla monitor enhanced-history collection-statistics**
- **show ip sla monitor statistics**
- **show ip sla monitor statistics aggregated**

Tip

If the letter n appears in your output, or not all fields are displayed, you should increase the screen width for your command line interface display (for example, using the **width** line configuration command or the **terminalwidth** EXEC mode command).

Examples

The following is sample output from the **show ip sla monitor enhanced-history distribution-statistics** command. The fields are defined at the beginning of the output for the command. RTT means round-trip time.

```
Router# show ip sla monitor enhanced-history distribution-statistics 3
Point by point Enhanced History
Entry      = Entry Number
Int        = Aggregation Interval (seconds)
BucI       = Bucket Index
StartT     = Aggregation Start Time
Pth        = Path index
Hop        = Hop in path index
Comps      = Operations completed
OvrTh      = Operations completed over thresholds
SumCmp     = Sum of RTT (milliseconds)
SumCmp2L   = Sum of RTT squared low 32 bits (milliseconds)
SumCmp2H   = Sum of RTT squared high 32 bits (milliseconds)
TMax       = RTT maximum (milliseconds)
TMin       = RTT minimum (milliseconds)
Entry  Int  BucI  StartT      Pth  Hop  Comps  OvrTh  SumCmp  SumCmp2L  SumCmp2H  TMax  TMin
3      900  1     257850000  1    1    3      0     43     617       0       15    14
3      900  2     258750002  1    1    3      0     45     677       0       16    14
3      900  3     259650000  1    1    3      0     44     646       0       15    14
3      900  4     260550002  1    1    3      0     42     594       0       15    12
3      900  5     261450003  1    1    3      0     42     590       0       15    13
3      900  6     262350001  1    1    3      0     46     706       0       16    15
3      900  7     263250003  1    1    3      0     46     708       0       16    14
.
.
.
```

The time elapsed between BucketIndex 1 (started at 257,850,000) and BucketIndex 2 (started at 258,750,002) in this example is 900,002 milliseconds, or 900 seconds.

The table below describes the significant fields shown in the display.

Table 51: show ip sla monitor enhanced-history distribution-statistics Field Descriptions

Field	Description
Entry	The operation ID number you specified for the IP SLAs operation.
Int	Aggregation interval--The configured statistical distribution buckets interval, in seconds. For example, a value of 900 for Int means that statistics are gathered for 900 seconds per bucket.
BucI	Bucket index number--A number uniquely identifying the statistical distribution (aggregation) bucket. The number of history buckets to be kept is configured using the buckets-of-history-kept command. A bucket will gather statistics for the specified interval of time (aggregation interval), after which a new statistics bucket is created. If a number-of-buckets-kept value is configured, the interval for the last bucket is infinity (until the end of the operation). Buckets are not applicable to HTTP and UDP jitter monitoring operations. This field is equivalent to the rttMonStatsCaptureDistIndex object in the Cisco RTTMON MIB.
StartT	Aggregation start time--Start time for the aggregation interval (per Bucket Index). Shows the start time as the number of milliseconds since the router started; in other words, the time stamp is the number of milliseconds since the last system bootup.

Field	Description
Pth	Path index number--An identifier for a set of different paths to the target destination that have been discovered. For example, if the first operation iteration finds the path h1, h2, h3, h4, then this path is labeled as 1. If, on a later iteration, a new path is discovered, (such as h1, h2, h5, h6, h4) then this new path will be identified as 2, and so on. Data collection per path is available only for ICMP path echo operations ("pathEcho probes"). For all other operations, a value of 1 will always appear. Data collection per path is configured using the paths-of-statistics-kept<i>number</i> command when configuring the operation.
Hop	Hop Index Number--Statistics data per hop. A hop is data transmission between two points in a path (for example, from device h2 to device h3). Data collection per hop is available only for ICMP path echo operations ("pathEcho probes"). For all other operations, a value of "1" will always appear. Data collection per hop is configured using the hops-of-statistics-kept<i>number</i> command when configuring the operation. This field is equivalent to the rttMonStatsCaptureHopIndex object in the Cisco RTTMON MIB.
Comps	Completions--The number of round-trip time operations that have completed without an error and without timing out, per bucket index. This object has the special behavior as defined by the ROLLOVER NOTE in the DESCRIPTION of the Cisco Rttmon MIB object.
SumCmp	Sum of completed operation times (1)--The total of all round-trip time values for all successful operations in the row, in milliseconds.

Field	Description
SumCmp2L	Sum of the squares of completed operation times (2), Low-Order--The sum of the square roots of round-trip times for operations that were successfully measured, in milliseconds; displays the low-order 32 bits of the value only. 32 low-order bits and 32 high-order bits are ordered in unsigned 64-bit integers (Int64) as follows: <pre>----- High-order 32 bits Low-order 32 bits -----</pre> - The "SumCmp2" values are split into "high-order" and "low-order" numbers because of limitations of Simple Network Management Protocol (SNMP). The maximum value allowed for an SNMP object is 4,294,967,295 (the Gauge32 limit). If the sum of the square roots for your operation exceeds this value, then the "high-order" value will be utilized. (For example, the number 4,294,967,296 would have all low-order bits as 0, and the right-most high-order bit would be 1). - The low-order value (SumCmp2L) appears first in the output because in most cases, the value will be less than 4,294,967,295, which means that the value of SumCmp2H will appear as zero.
SumCmp2H	Sum of the squares of completed operation times (2), High-Order--The high-order 32 bits of the accumulated squares of completion times (in milliseconds) of operations that completed successfully.
TMax	Round-trip time, maximum--The highest recorded round-trip time, in milliseconds, per aggregation interval.
TMin	Round-trip time, minimum--The lowest recorded round-trip time, in milliseconds, per aggregation interval.

Related Commands

Command	Description
ip sla monitor	Allows configuration of IP SLA operations by entering IP SLA monitor configuration mode for the specified operation number.
show ip sla monitor enhanced-history collection-statistics	Displays enhanced history statistics for all collected history buckets for the specified IP SLAs operation.
show ip sla monitor statistics	Displays the current operational status and statistics of all IP SLAs operations or a specified operation.
show ip sla monitor statistics aggregated	Displays the aggregated statistical errors and distribution information for all IP SLAs operations or a specified operation.

show ip sla monitor group schedule

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **showipslamonitorgroupschedule** command is replaced by the **showipslagroupschedules** command. See the **showipslagroupschedules** command for more information.

To display the group schedule details for Cisco IOS IP Service Level Agreements (SLAs) operations, use the **showipslamonitorgroupschedule** command in user EXEC or privileged EXEC mode.

show ip sla monitor group schedule [*group-operation-number*]

Syntax Description

<i>group-operation-number</i>	(Optional) Number of the IP SLAs group operation to display.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the showipslagroupschedules command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the showrtrgroupschedule command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslagroupschedules command.
12.2(33)SXI	This command was replaced by the showipslagroupschedules command.

Examples

The following is sample output from the **showipslamonitorgroupschedule** command that shows information about group (multiple) scheduling. The last line in the example indicates that the IP SLAs operations are multiple scheduled (TRUE):

```
Router# show ip sla monitor group schedule
Multi-Scheduling Configuration:
Group Entry Number: 1
Probes to be scheduled: 2,3,4,9-30,89
Schedule period :60
Group operation frequency: 30
Multi-scheduled: TRUE
```

The following is sample output from the **show ip sla monitor group schedule** command that shows information about group (multiple) scheduling, with the frequency value the same as the schedule period value, the life value as 3600 seconds, and the ageout value as never:

```
Router# show ip sla monitor group schedule
Group Entry Number: 1
Probes to be scheduled: 3,4,6-10
Total number of probes: 7
Schedule period: 20
Group operation frequency: Equals schedule period
Status of entry (SNMP RowStatus): Active
Next Scheduled Start Time: Start Time already passed
Life (seconds): 3600
Entry Ageout (seconds): never
```

The table below describes the significant fields shown in the displays.

Table 52: show ip sla monitor group schedule Field Descriptions

Field	Description
Group Entry Number	The operation group number specified for IP SLAs multiple operations scheduling.
Probes to be scheduled	The operations numbers specified in the operation group 1.
Scheduled period	The time (in seconds) for which the IP SLAs group is scheduled.
Group operation frequency	The frequency at which each operation is started.
Multi-scheduled	The value TRUE shows that group scheduling is active.

Related Commands

Command	Description
show ip sla monitor configuration	Displays the configuration details for IP SLAs operations.

show ip sla monitor history

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **showipslamonitorhistory** command is replaced by the **showipslahistory** command. See the **showipslahistory** command for more information.

To display history collected for all Cisco IOS IP Service Level Agreements (SLAs) operations or for a specified operation, use the **showipslamonitorhistory** command in user EXEC or privileged EXEC mode.

show ip sla monitor history [*operation-number*] [**tabular** | **full**]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which history details is displayed.
tabular	(Optional) Displays information in a column format, reducing the number of screens required to display the information. This is the default.
full	(Optional) Displays all information, using identifiers next to each displayed value.

Command Default

Tabular format history for all operations is displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the showipslahistory command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the showrtrhistory command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslahistory command.
12.2(33)SXI	This command was replaced by the showipslahistory command.

Usage Guidelines

The table below lists the Response Return values used in the output of the **show ip sla monitor history** command. If the default (**tabular**) format is used, the Response Return description is displayed as a code in the Sense column. If the full format is used, the Response Return is displayed as indicated in the Description column.

Table 53: Response Return (Sense Column) Codes

Code	Description
1	Okay.
2	Disconnected.
3	Over threshold.
4	Timeout.
5	Busy.
6	Not connected.
7	Dropped.
8	Sequence error.
9	Verify error.
10	Application specific.

Examples

The following is sample output from the **show ip sla monitor history** command in tabular format:

```
Router# show ip sla monitor history
          Point by point History
          Multiple Lines per Entry
Line 1
Entry    = Entry Number
LifeI    = Life Index
BucketI  = Bucket Index
SampleI  = Sample Index
SampleT  = Sample Start Time
CompT    = Completion Time (milliseconds)
Sense    = Response Return Code
Line 2 has the Target Address
Entry LifeI      BucketI      SampleI      SampleT      CompT      Sense
2      1          1          1          17436548     16         1
  AB 45 A0 16
2      1          2          1          17436551     4          1
  AC 12 7 29
2      1          2          2          17436551     1          1
  AC 12 5 22
2      1          2          3          17436552     4          1
  AB 45 A7 22
2      1          2          4          17436552     4          1
  AB 45 A0 16
```

Related Commands

Command	Description
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla monitor mpls-lsp-monitor collection-statistics

**Note**

Effective with Cisco IOS Release 12.2(33)SB, the **showipslamonitormpls-lsp-monitorcollection-statistics** command is replaced by the **showipslamlpls-lsp-monitorcollection-statistics** command. See the **showipslamlpls-lsp-monitorcollection-statistics** command for more information.

To display the statistics for Cisco IOS IP Service Level Agreements (SLAs) operations belonging to a label switched path (LSP) discovery group of an LSP Health Monitor operation, use the **showipslamonitormpls-lsp-monitorcollection-statistics** command in user EXEC or privileged EXEC mode.

show ip sla monitor mpls-lsp-monitor collection-statistics [*group-id*]

Syntax Description

<i>group-id</i>	(Optional) Identification number of the LSP discovery group for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SB	This command was replaced by the showipslamlpls-lsp-monitorcollection-statistics command.

Usage Guidelines

Use the **showipslamonitormpls-lsp-monitorcollection-statistics** command if the LSP discovery option is enabled for an LSP Health Monitor operation. This command is not applicable if the LSP discovery option is disabled.

When the LSP discovery option is enabled, an individual IP SLAs operation is created by the LSP Health Monitor for each equal-cost multipath belonging to an LSP discovery group of a particular LSP Health Monitor operation. The network connectivity statistics collected by each individual IP SLAs operation are aggregated and stored in one-hour increments (data can be collected for a maximum of two hours). Results are stored as group averages representative of all the equal-cost multipaths within the group for a given one-hour increment.

Examples

The following is sample output from the **showipslamonitormpls-lsp-monitorcollection-statistics** command:

```
Router# show ip sla monitor mpls-lsp-monitor collection-statistics 100001
Entry number: 100001
Start Time Index: *19:32:37.995 EST Mon Feb 28 2005
Path Discovery Start Time: *20:23:43.919 EST Mon Feb 28 2005
```

```

Target destination IP address: 10.131.161.251
Path Discovery Status: OK
Path Discovery Completion Time: 1772
Path Discovery Minimum Paths: 12
Path Discovery Maximum Paths: 12
LSP Group Index: 100001
LSP Group Status: up
Total Pass: 1225
Total Timeout: 0 Total Fail: 0
Latest probe status: 'up,up,up,up,up,up,up,up,up,up,up,up'
Latest Path Identifier:
'2700138403,270068403,2700138403,270028403,270048403,270058403,2700138403,270068403,2700138403,270028403,270048403,270058403'
Minimum RTT: 24 Maximum RTT: 100 Average RTT: 42

```

The table below describes the significant fields shown in the display.

Table 54: show ip sla monitor mpls-lsp-monitor collection-statistics Field Descriptions

Field	Description
Entry number	Identification number of the LSP discovery group.
Start Time Index	Start time of the LSP Health Monitor operation.
Path Discovery Start Time	Time in which the most recent iteration of LSP discovery started.
Target destination IP address	IP address of the Border Gateway Protocol (BGP) next hop neighbor.
Path Discovery Status	Return code of the most recent iteration of LSP discovery.
Path Discovery Completion Time	Amount of time (in milliseconds) it took to complete the most recent iteration of the LSP discovery process.
Path Discovery Minimum Paths	Minimum number of equal-cost multipaths discovered by the LSP discovery process.
Path Discovery Maximum Paths	Maximum number of equal-cost multipaths discovered by the LSP discovery process.
LSP Group Index	Identification number of the LSP discovery group.
LSP Group Status	Operation status of the LSP discovery group.
Total Pass	Total number of LSP discovery process iterations.
Total Timeout	Total number of LSPs in which a timeout violation was reported.
Total Fail	Total number of LSPs in which an operation failure was reported.
Latest probe status	Current operation status for each IP SLAs operation belonging to the specified LSP discovery group.

Field	Description
Latest Path Identifier	Current identification information (IP address used to select the LSP, outgoing interface, and label stack) for each IP SLAs operation belonging to the specified LSP discovery group.
Minimum RTT	Minimum round-trip time (in milliseconds) measured by the IP SLAs operations associated with the specified LSP discovery group.
Maximum RTT	Maximum round-trip time (in milliseconds) measured by the IP SLAs operations associated with the specified LSP discovery group.
Average RTT	Average round-trip time (in milliseconds) for all the IP SLAs operations associated with the specified LSP discovery group.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

show ip sla monitor mpls-lsp-monitor configuration

**Note**

Effective with Cisco IOS Release 12.2(33)SB, the **showipslamonitormpls-lsp-monitorconfiguration** command is replaced by the **showipslamlpls-lsp-monitorconfiguration** command. See the **showipslamlpls-lsp-monitorconfiguration** command for more information.

To display configuration settings for IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operations, use the **showipslamonitormpls-lsp-monitorconfiguration** command in user EXEC or privileged EXEC mode.

show ip sla monitor mpls-lsp-monitor configuration [*operation-number*]

Syntax Description

operation-number

(Optional) Number of the LSP Health Monitor operation for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(31)SB2	This command was introduced. This command replaces the showrtrmpls-lsp-monitorconfiguration command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslamlpls-lsp-monitorconfiguration command.

Usage Guidelines

If the identification number of an LSP Health Monitor operation is not specified, configuration values for all the configured LSP Health Monitor operations will be displayed.

Examples

The following is sample output from the **showipslamonitormpls-lsp-monitorconfiguration** command:

```
Router# show ip sla monitor mpls-lsp-monitor configuration 1
Entry Number : 1
Modification time : *12:18:21.830 PDT Fri Aug 19 2005
Operation Type : echo

The table below describes the significant fields shown in the displays.

Table 55: show ip sla monitor mpls-lsp-monitor configuration Field Descriptions

Field	Description
Entry Number	Identification number for the LSP Health Monitor operation.
Operation Type	Type of IP SLAs operation configured by the LSP Health Monitor operation.
Vrf Name	If a specific name is displayed in this field, then the LSP Health Monitor is configured to discover only those Border Gateway Protocol (BGP) next hop neighbors in use by the VPN routing or forwarding instance (VRF) specified. If saa-vrf-all is displayed in this field, then the LSP Health Monitor is configured to discover all BGP next hop neighbors in use by all VRFs associated with the source Provider Edge (PE) router.
Tag	User-specified identifier for the LSP Health Monitor operation.
EXP Value	Experimental field value in the header for an echo request packet of the IP SLAs operation.
Timeout(ms)	Amount of time the IP SLAs operation waits for a response from its request packet.
Threshold(ms)	Threshold value of the IP SLAs operation for which a reaction event is generated if violated.
Frequency(sec)	Time after which the IP SLAs operation is restarted.
LSP Selector	Local host IP address used to select the LSP for the IP SLAs operation.
ScanInterval(min)	Time interval at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.
Delete Scan Factor	Specifies the number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.
Operations List	Identification numbers IP SLAs operations created by the LSP Health Monitor operation.
Schedule Period(sec)	Amount of time for which the LSP Health Monitor operation is scheduled.

Field	Description
Request size	Protocol data size for the request packet of the IP SLAs operation.
Start Time	Status of the start time for the LSP Health Monitor operation.
SNMP RowStatus	Indicates whether SNMP RowStatus is active or inactive.
TTL value	The maximum hop count for an echo request packet of the IP SLAs operation.
Reply Mode	Reply mode for an echo request packet of the IP SLAs operation.
Reply Dscp Bits	Differentiated services codepoint (DSCP) value of an echo reply packet of the IP SLAs operation.
Path Discover	Indicates whether the LSP discovery option is enabled.
Maximum sessions	Maximum number of BGP next hop neighbors that can be concurrently undergoing LSP discovery for a single LSP Health Monitor operation.
Session Timeout (seconds)	The amount of time the LSP discovery process waits for a response to its LSP discovery request for a particular BGP next hop neighbor.
Base LSP Selector	The base IP address used to select the LSPs of the LSP discovery groups.
Echo Timeout (seconds)	The amount of time the LSP discovery process waits for a response to its echo request packets.
Send Interval (msec)	The time interval (in milliseconds) between MPLS echo requests that are sent as part of the LSP discovery process.
Label Shimming Mode	Indicates whether the MPLS explicit null label option is enabled for the echo request packets.
Number of Stats Hours	The number of hours for which LSP discovery group statistics are maintained.
Scan Period (minutes)	The amount of time after which the LSP discovery process can restart.

Field	Description
Secondary Frequency	Reaction condition that will enable the secondary frequency option.
Value(sec)	Secondary frequency value.
Reaction Configs	The configured proactive threshold monitoring settings for the IP SLAs operation.
Reaction	Reaction condition being monitored.
Retry Number	Indicates the number of times the equal-cost multipaths belonging to an LSP discovery group are retested when a reaction condition is detected.
Threshold Type	Specifies when an action should be performed as a result of a reaction event.
Threshold Count	The number of times a reaction condition can occur before an action should be performed.
Action Type	Type of action that should be performed as a result of a reaction event.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
auto ip sla mpls-lsp-monitor reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs LSP Health Monitor operation.
auto ip sla mpls-lsp-monitor schedule	Configures the scheduling parameters for an IP SLAs LSP Health Monitor operation.

show ip sla monitor mpls-lsp-monitor lpd operational-state

**Note**

Effective with Cisco IOS Release 12.2(33)SB, the **showipslamonitormpls-lsp-monitorlpdoperational-state** command is replaced by the **showipslamlpls-lsp-monitorlpdoperational-state** command. See the **showipslamlpls-lsp-monitorlpdoperational-state** command for more information.

To display the operational status of the label switched path (LSP) discovery groups belonging to an IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **showipslamonitormpls-lsp-monitorlpdoperational-state** command in user EXEC or privileged EXEC mode.

show ip sla monitor mpls-lsp-monitor lpd operational-state [*group-id*]

Syntax Description

<i>group-id</i>	(Optional) Identification number of the LSP discovery group for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SB	This command was replaced by the showipslamlpls-lsp-monitorlpdoperational-state command.

Usage Guidelines

Use the **showipslamonitormpls-lsp-monitorlpdoperational-state** command if the LSP discovery option is enabled for an LSP Health Monitor operation. This command is not applicable if the LSP discovery option is disabled.

Examples

The following is sample output from the **showipslamonitormpls-lsp-monitorlpdoperational-state** command:

```
Router# show ip sla monitor mpls-lsp-monitor lpd operational-state 100001
Entry number: 100001
MPLSLM Entry Number: 1
Target FEC Type: LDP IPv4 prefix
Target Address: 192.168.1.11
Number of Statistic Hours Kept: 2
Last time LPD Stats were reset: *21:21:18.239 GMT Tue Jun 20 2006
Traps Type: 3
Latest Path Discovery Mode: rediscovery complete
Latest Path Discovery Start Time: *21:59:04.475 GMT Tue Jun 20 2006
Latest Path Discovery Return Code: OK
Latest Path Discovery Completion Time(ms): 3092
```

```

Number of Paths Discovered: 3
Path Information :
Path   Outgoing   Lsp       Link Conn Adj   Downstream
Index  Interface  Selector Type  Id   Addr Label Stack  Status
1 Et0/0 127.0.0.8 90 0 10.10.18.30 21 OK
2 Et0/0 127.0.0.2 90 0 10.10.18.30 21 OK
3 Et0/0 127.0.0.1 90 0 10.10.18.30 21 OK

```

The table below describes the significant fields shown in the display.

Table 56: show ip sla monitor mpls-lsp-monitor lpd operational-state Field Descriptions

Field	Description
Entry number	Identification number of the LSP discovery group.
MPLSLM Entry number	Identification number of the LSP Health Monitor operation.
Target FEC Type	The Forward Equivalence Class (FEC) type of the BGP next hop neighbor.
Target Address	IP address of the Border Gateway Protocol (BGP) next hop neighbor.
Number of Statistic Hours Kept	The amount of time (in hours) in which LSP discovery group statistics will be maintained. Use the hours-of-statistics-kept command to configure this value.
Traps Type	Trap type values indicate the type of threshold monitoring that has been enabled using the autoipslampls-lsp-monitorreaction-configuration command. Trap type values are defined as follows: • 1--timeout • 2--connection loss • 3--LSP discovery group status changes • 4--LSP discovery failure
Latest Path Discovery Mode	Current mode of the LSP discovery process. Modes include initial discovery, initial complete, rediscovery running, and rediscovery complete.
Latest Path Discovery Start Time	Time in which the most recent iteration of LSP discovery started.
Latest Path Discovery Return Code	Return code for the most recent iteration of LSP discovery.
Latest Path Discovery Completion Time	Amount of time (in milliseconds) it took to complete the most recent iteration of the LSP discovery process.

Field	Description
Number of Paths Discovered	Number of equal-cost multipaths discovered during the most recent iteration of the LSP discovery process.
Path Index	Identification number for the equal-cost multipath.
Outgoing Interface	Outgoing interface of the echo request packet.
Lsp Selector	IP address used to select the LSP.
Adj Addr	IP address of the next hop physical interface.
Downstream Label Stack	Downstream MPLS label stack number.
Status	Return code for the most recent IP SLAs LSP ping operation of the specified equal-cost multipath.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

show ip sla monitor mpls-lsp-monitor neighbors

Note

Effective with Cisco IOS Release 12.2(33)SB, the **showipslamonitormpls-lsp-monitorneighbors** command is replaced by the **showipslamlpls-lsp-monitorneighbors** command. See the **showipslamlpls-lsp-monitorneighbors** command for more information.

To display routing and connectivity information about Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Border Gateway Protocol (BGP) next hop neighbors discovered by the IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor, use the **showipslamonitormpls-lsp-monitorneighbors** command in user EXEC or privileged EXEC mode.

show ip sla monitor mpls-lsp-monitor neighbors

Syntax Description

This command has no arguments or keywords.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(31)SB2	This command was introduced. This command replaces the showrtrmpls-lsp-monitorneighbors command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslamlpls-lsp-monitorneighbors command.

Examples

The following is sample output from the **showipslamonitormpls-lsp-monitorneighbors** command:

```
Router# show ip sla monitor mpls-lsp-monitor neighbors
IP SLA MPLS LSP Monitor Database : 1
BGP Next hop 10.10.10.5 (Prefix: 10.10.10.5/32) OK
  ProbeID: 100001 (red, blue, green)
BGP Next hop 10.10.10.7 (Prefix: 10.10.10.7/32) OK
  ProbeID: 100002 (red, blue, green)
BGP Next hop 10.10.10.8 (Prefix: 10.10.10.8/32) OK
  ProbeID: 100003 (red, blue, green)
```

The table below describes the significant fields shown in the display.

Table 57: show ip sla monitor mpls-lsp-monitor neighbors Field Descriptions

Field	Description
BGP Next hop	Identifier for the BGP next hop neighbor.

Field	Description
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next hop neighbor to be used by the MPLS LSP ping operation.
ProbeID	The identification number of the IP SLAs operation. The names of the VPN routing or forwarding instances (VRFs) that contain routing entries for the specified BGP next hop neighbor are listed in parentheses.
OK	LSP ping or LSP traceroute connectivity status between the source Provider Edge (PE) router and specified BGP next hop neighbor. Connectivity status can be the following: • OK--Successful reply. • ConnectionLoss--Reply is from a device that is not egress for the Forward Equivalence Class (FEC). • Timeout--Echo request timeout. • Unknown--State of LSP is not known.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

show ip sla monitor mpls-lsp-monitor scan-queue

Note

Effective with Cisco IOS Release 12.2(33)SB, the **showipslamonitormpls-lsp-monitorscan-queue** command is replaced by the **showipslamlpls-lsp-monitorscan-queue** command. See the **showipslamlpls-lsp-monitorscan-queue** command for more information.

To display information about adding or deleting Border Gateway Protocol (BGP) next hop neighbors from a particular Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) of an IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **showipslamonitormpls-lsp-monitorscan-queue** command in user EXEC or privileged EXEC mode.

show ip sla monitor mpls-lsp-monitor scan-queue *operation-number*

Syntax Description

operation-number

Number of the LSP Health Monitor operation for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(31)SB2	This command was introduced. This command replaces the showrtrmpls-lsp-monitorscan-queue command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslamlpls-lsp-monitorscan-queue command.

Examples

The following is sample output from the **showipslamonitormpls-lsp-monitorscan-queue** command:

```
Router# show ip sla monitor mpls-lsp-monitor scan-queue 1
Next scan Time after: 23 Secs
Next Delete scan Time after: 83 Secs
BGP Next hop      Prefix          vrf          Add/Delete?
10.10.10.8        10.10.10.8/32   red          Add
10.10.10.8        10.10.10.8/32   blue         Add
10.10.10.8        10.10.10.8/32   green        Add
```

The table below describes the significant fields shown in the display.

Table 58: show ip sla monitor mpls-lsp-monitor scan-queue Field Descriptions

Field	Description
Next scan Time after	Amount of time left before the LSP Health Monitor checks the scan queue for information about adding BGP next hop neighbors to a particular VPN. At the start of each scan time, IP SLAs operations are created for all newly discovered neighbors.
Next Delete scan Time after	Amount of time left before the LSP Health Monitor checks the scan queue for information about deleting BGP next hop neighbors from a particular VPN. At the start of each delete scan time, IP SLAs operations are deleted for neighbors that are no longer valid.
BGP Next hop	Identifier for the BGP next hop neighbor.
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next hop neighbor to be used by the MPLS LSP ping operation.
vrf	Name of the VPN routing or forwarding instance (VRF) that contains a routing entry for the specified BGP next hop neighbor.
Add/Delete	Indicates that the specified BGP next hop neighbor will be added to or removed from the specified VPN.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
delete-scan-factor	Specifies the number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.
mpls discovery vpn interval	Specifies the time interval at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database of an MPLS VPN.
scan-interval	Specifies the time interval (in minutes) at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.

show ip sla monitor mpls-lsp-monitor summary

**Note**

Effective with Cisco IOS Release 12.2(33)SB, the **showipslamonitormpls-lsp-monitorsummary** command is replaced by the **showipslamlpls-lsp-monitorsummary** command. See the **showipslamlpls-lsp-monitorsummary** command for more information.

To display Border Gateway Protocol (BGP) next hop neighbor and label switched path (LSP) discovery group information for IP Service Level Agreements (SLAs) LSP Health Monitor operations, use the **showipslamonitormpls-lsp-monitorsummary** command in user EXEC or privileged EXEC mode.

show ip sla monitor mpls-lsp-monitor summary [*operation-number* [**group** [*group-id*]]]

Syntax Description

<i>operation-number</i>	(Optional) Number of the LSP Health Monitor operation for which the details will be displayed.
group <i>group-id</i>	(Optional) Specifies the identification number of the LSP discovery group for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SB	This command was replaced by the showipslamlpls-lsp-monitorsummary command.

Usage Guidelines

Use the **showipslamonitormpls-lsp-monitorsummary** command if the LSP discovery option is enabled for an LSP Health Monitor operation. This command is not applicable if the LSP discovery option is disabled.

Examples

The following is sample output from the **showipslamonitormpls-lsp-monitorsummary***operation-number* command:

```
Router# show ip sla monitor mpls-lsp-monitor summary 1
Index - MPLS LSP Monitor probe index.
Destination - Target IP address of the BGP Next Hop.
Status - LPD Group Status.
LPD Group ID - Unique index to identify the LPD Group.
Last Operation Time - Last time an operation was attempted by a particular probe in the LPD group.
```

```

Index Destination Status LPD Group ID Last Operation Time
1 100.1.1.1 up 100001 19:33:37.915 EST Mon Feb 28 2005
2 100.1.1.2 down 100002 19:33:47.915 EST Mon Feb 28 2005
3 100.1.1.3 retry 100003 19:33:57.915 EST Mon Feb 28 2005
4 100.1.1.4 partial 100004 19:34:07.915 EST Mon Feb 28 2005

```

The following is sample output from the

show ip sla monitor mpls-lsp-monitor summary operation-number group-id command:

```

Router# show ip sla monitor mpls-lsp-monitor summary 1 group 100001
Group ID - Unique number to identify a LPD group
Lsp-selector - Unique 127/8 address used to identify an LPD.
Latest operation status - Latest probe status.
Last Operation time - Time when the last operation was attempted.
Group ID Lsp-Selector Status Failures Successes RTT Last Operation Time
100001 127.0.0.13 up 0 78 32 *20:11:37.895 EST Mon Feb 28 2005
100001 127.0.0.15 up 0 78 32 *20:11:37.995 EST Mon Feb 28 2005
100001 127.0.0.16 up 0 78 32 *20:11:38.067 EST Mon Feb 28 2005
100001 127.0.0.26 up 0 78 32 *20:11:38.175 EST Mon Feb 28 2005

```

The table below describes the significant fields shown in the display.

Table 59: show ip sla monitor mpls-lsp-monitor summary Field Descriptions

Field	Description
Failures	Number of times the IP SLAs operation for the specified LSP failed to report an RTT value.
Successes	Number of times the IP SLAs operation for the specified LSP successfully reported an RTT value.
RTT	Average round-trip time (in milliseconds) for the specified LSP.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

show ip sla monitor reaction-configuration

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **showipslamonitorreaction-configuration** command is replaced by the **showipslareaction-configuration** command. See the **showipslareaction-configuration** command for more information.

To display the configured proactive threshold monitoring settings for all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **showipslamonitorreaction-configuration** command in user EXEC or privileged EXEC mode.

show ip sla monitor reaction-configuration [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which the reaction configuration characteristics is displayed.

Command Default

Displays configured proactive threshold monitoring settings for all IP SLAs operations.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the showipslareaction-configuration command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the showrtrreaction-configuration command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslareaction-configuration command.
12.2(33)SXI	This command was replaced by the showipslareaction-configuration command.

Usage Guidelines

Use the **ipslamonitorreaction-configuration** command in global configuration mode to configure the proactive threshold monitoring parameters for an IP SLAs operations.

Examples

In the following example, multiple monitored elements (indicated by the Reaction values) are configured for a single IP SLAs operation:

```
Router# show ip sla monitor reaction-configuration
```

```
Entry Number: 1
Reaction: RTT
Threshold type: Never
Rising (milliseconds): 5000
Falling (milliseconds): 3000
Threshold Count: 5
Threshold Count2: 5
Action Type: None
Reaction: jitterDSAvg
Threshold type: average
Rising (milliseconds): 5
Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: triggerOnly
Reaction: jitterDSAvg
Threshold type: immediate
Rising (milliseconds): 5
Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: trapOnly
Reaction: PacketLossSD
Threshold type: immediate
Rising (milliseconds): 5
Threshold Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: trapOnly
```

The table below describes the significant fields shown in the display.

Table 60: show ip sla monitor reaction-configuration Field Descriptions

Field	Description
Reaction	The monitored element configured for the specified IP SLAs operation. Corresponds to the react{connectionLoss jitterAvg jitterDSAvg jitterSDAvg mos PacketLossDS PacketLossSD rtt timeout verifyError} syntax in the ipslamonitorreaction-configuration command.
Threshold type	The configured threshold type. Corresponds to the threshold-type {never immediate consecutive xofy average} syntax in the ipslamonitorreaction-configuration command.

Field	Description
Rising (milliseconds)	The <i>upper-threshold</i> value. Corresponds to the threshold-valueupper-thresholdlower-threshold syntax in the ipslamonitorreaction-configuration command.
Falling (milliseconds)	The <i>lower-threshold</i> value. Corresponds to the threshold-valueupper-thresholdlower-threshold syntax in the ipslamonitorreaction-configuration command.
Threshold Count	The <i>x-value</i> in the xofy threshold type, or the <i>number-of-measurements</i> value for the average threshold type.
Threshold Count2	The <i>y-value</i> in the xofy threshold type.
Action Type	The reaction to be performed when the violation conditions are met. Corresponds to the action-type {none trapOnly triggerOnly trapAndTrigger} syntax in the ipslamonitorreaction-configuration command.

Related Commands

Command	Description
ip sla monitor reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.

show ip sla monitor reaction-trigger

**Note**

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **show ip sla monitor reaction-trigger** command is replaced by the **show ip sla reaction-trigger** command. See the **show ip sla reaction-trigger** command for more information.

To display the reaction trigger information for all Cisco IOS IP Service Level Agreements (SLAs) operations or the specified operation, use the **show ip sla monitor reaction-trigger** command in user EXEC or privileged EXEC mode.

show ip sla monitor reaction-trigger [*operation-number*]

Syntax Description

operation-number

(Optional) Number of the IP SLAs operation to display.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the show ip sla reaction-trigger command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the show rtr reaction-trigger command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the show ip sla reaction-trigger command.
12.2(33)SXI	This command was replaced by the show ip sla reaction-trigger command.

Usage Guidelines

Use the **show ip sla monitor reaction-trigger** command to display the configuration status and operational state of target operations that will be triggered as defined with the **ip sla monitor reaction-configuration** global configuration command.

Examples

The following is sample output from the **show ip sla monitor reaction-trigger** command:

```
Router# show ip sla monitor reaction-trigger 1
      Reaction Table
```

Entry Number: 1
Target Entry Number: 2
Status of Entry (SNMP RowStatus): active
Operational State: pending

Related Commands

Command	Description
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla monitor responder

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **show ip sla monitor responder** command is replaced by the **show ip sla responder** command. See the **show ip sla responder** command for more information.

To display information about the Cisco IOS IP Service Level Agreements (SLAs) Responder, use the **show ip sla monitor responder** command in user EXEC or privileged EXEC mode.

show ip sla monitor responder

Syntax Description

This command has no arguments or keywords.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the show ip sla responder command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the show rtr responder command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the show ip sla responder command.
12.2(33)SXI	This command was replaced by the show ip sla responder command.

Usage Guidelines

Use the **show ip sla monitor responder** command to display information about recent sources of IP SLAs control messages, such as who has sent recent control messages and who has sent invalid control messages.

Examples

The following is sample output from the **show ip sla monitor responder** command:

```
Router# show ip sla monitor responder

IP SLA Monitor Responder is: Enabled
Number of control message received: 19 Number of errors: 1
Recent sources:
10.0.0.1 [19:11:49.035 UTC Sat Dec 2 1995]
10.0.0.1 [19:10:49.023 UTC Sat Dec 2 1995]
10.0.0.1 [19:09:48.707 UTC Sat Dec 2 1995]
10.0.0.1 [19:08:48.687 UTC Sat Dec 2 1995]
```

```
10.0.0.1 [19:07:48.671 UTC Sat Dec 2 1995]  
Recent error sources:  
10.0.0.1 [19:10:49.023 UTC Sat Dec 2 1995] RTT_AUTH_FAIL
```

Related Commands

Command	Description
show ip sla monitor configuration	Displays configuration values for IP SLAs operations.

show ip sla monitor statistics

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **showipslamonitorstatistics** command is replaced by the **showipslaststatistics** command. See the **showipslaststatistics** command for more information.

To display the current operational status and statistics of all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **showipslamonitorstatistics** command in user EXEC or privileged EXEC mode.

show ip sla monitor statistics [*operation-number*] [**details**]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which operational status and statistics are displayed.
details	(Optional) Operational status and statistics are displayed in greater detail.

Command Default

Displays output for all running IP SLAs operations.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the showipslaststatistics command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the showrtroperational-state command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the showipslaststatistics command.
12.2(33)SXI	This command was replaced by the showipslaststatistics command.

Usage Guidelines

Use the **showiplamonitorstatistics** command to display the current state of IP SLAs operations, including how much life the operation has left, whether the operation is active, and the completion time. The output will also include the monitoring data returned for the last (most recently completed) operation.

Examples

The following is sample output from the **showiplamonitorstatistics** command:

```
Router# show ip sla monitor statistics          Current Operational State
Entry Number: 3
Modification Time: *22:15:43.000 UTC Sun Feb 11 2001
Diagnostics Text:
Last Time this Entry was Reset: Never
Number of Octets in use by this Entry: 1332
Number of Operations Attempted: 2
Current Seconds Left in Life: 3511
Operational State of Entry: active
Latest Completion Time (milliseconds): 544
Latest Operation Start Time: *22:16:43.000 UTC Sun Feb 11 2001
Latest Oper Sense: ok
Latest Sense Description: 200 OK
Total RTT: 544
DNS RTT: 12
TCP Connection RTT: 28
HTTP Transaction RTT: 504
HTTP Message Size: 9707
```

The following is sample output from the **showiplamonitorstatistics** command when the specified operation is a UDP jitter (codec) operation. The values shown indicate the values for the last IP SLAs operation.

```
Router# show ip sla monitor statistics          Current Operational State
Entry number: 10
Modification time: 12:57:45.690 UTC Sun Oct 26 2003
Number of operations attempted: 3
Number of operations skipped: 0
Current seconds left in Life: 3570
Operational state of entry: Active
Last time this entry was reset: Never
Connection loss occurred: FALSE
Timeout occurred: FALSE
Over thresholds occurred: FALSE
Latest RTT (milliseconds): 19
Latest operation start time: 12:57:45.723 Sun Oct 26 2003
Latest operation return code: OK
Voice Scores:

The table below describes the significant fields shown in the display.

Table 61: show ip sla monitor statistics Field Descriptions

Field	Description
Voice Scores	Indicates that Voice over IP statistics appear on the following lines. Voice score data is computed when the operation type is configured as typejitter (codec).
ICPIF	The Calculated Planning Impairment Factor (ICPIF) value for the operation. The ICPIF value is computed by IP SLAs using the formula $Icpif=Io+Iq+Idte+Idd+Ie-A$, where • The values for Io, Iq, and $Idte$ are set to zero. • The value Idd is computed based on the measured one-way delay. • The value Ie is computed based on the measured packet loss. • The value of A is specified by the user. ICPIF values are expressed in a typical range of 5 (very low impairment) to 55 (very high impairment). ICPIF values numerically lower than 20 are generally considered "adequate." Note This value is intended only for relative comparisons, and may not match ICPIF values generated using alternate methods.
MOS Score	The estimated Mean Opinion Score (Conversational Quality, Estimated) for the latest iteration of the operation. The MOS-CQE is computed by IP SLAs as a function of the ICPIF. MOS values are expressed as a number from 1 (1.00) to 5 (5.00), with 5 being the highest level of quality, and 1 being the lowest level of quality. A MOS value of 0 (zero) indicates that MOS data could not be generated for the operation.
RTT Values	Indicates that round-trip-time statistics appear on the following lines.
NumOfRTT	The number of successful round-trips.
RTTSum	The sum of all successful round-trip values (in milliseconds).

Field	Description
RTTSum2	The sum of squares of those round-trip values (in milliseconds).
PacketLossSD	The number of packets lost from source to destination.
PacketLossDS	The number of packets lost from destination to source.
PacketOutOfSequence	The number of packets returned out of order.
PacketMIA	The number of packets lost where the direction (SD/DS) cannot be determined.
PacketLateArrival	The number of packets that arrived after the timeout.
InternalError	The number of times an operation could not be started due to other internal failures.
Busies	The number of times this operation could not be started because the previously scheduled run was not finished.
Jitter Values:	Indicates that jitter statistics appear on the following lines. Jitter is interpacket delay variance.
NumOfJitterSamples	The number of jitter samples collected. This is the number of samples that are used to calculate the following jitter statistics.
MinOfPositivesSD MaxOfPositivesSD	The minimum and maximum positive jitter values from source to destination, in milliseconds.
NumOfPositivesSD	The number of jitter values from source to destination that are positive (that is, network latency increases for two consecutive test packets).
SumOfPositivesSD	The sum of those positive values (in milliseconds).
Sum2PositivesSD	The sum of squares of those positive values.
MinOfNegativesSD MaxOfNegativesSD	The minimum and maximum negative jitter values from source to destination. The absolute value is given.
NumOfNegativesSD	The number of jitter values from source to destination that are negative (that is, network latency decreases for two consecutive test packets).
SumOfNegativesSD	The sum of those values.

Field	Description
Sum2NegativesSD	The sum of the squares of those values.
Interarrival jitterout	The source-to-destination (SD) jitter value calculation, as defined in RFC 1889.
Interarrival jitterin	The destination-to-source (DS) jitter value calculation, as defined in RFC 1889.
One Way Values	Indicates that one-way measurement statistics appear on the following lines. One Way (OW) values are the amount of time required for the packet to travel from the source router to the target router (SD) or from the target router to the source router (DS).
NumOfOW	Number of successful one-way time measurements.
OWMinSD	Minimum time (in milliseconds) from the source to the destination.
OWMaxSD	Maximum time (in milliseconds) from the source to the destination.
OWSumSD	Sum of the OWMinSD and OWMaxSD values.
OWSum2SD	Sum of the squares of the OWMinSD and OWMaxSD values.

Related Commands

Command	Description
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla monitor statistics aggregated

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SB, and 12.2(33)SXI, the **show ip sla monitor statistics aggregated** command is replaced by the **show ip sla statistics aggregated** command. See the **show ip sla statistics aggregated** command for more information.

To display the aggregated statistical errors and distribution information for all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **show ip sla monitor statistics aggregated** command in user EXEC or privileged EXEC mode.

show ip sla monitor statistics aggregated [*operation-number*] [**details**]

Syntax Description

<i>operation-number</i>	(Optional) Number of the IP SLAs operation to display.
details	(Optional) Aggregated statistical information is displayed in greater detail. Distribution information is included when this keyword is specified.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(2)T	This command was introduced.
12.4(4)T	This command was replaced by the show ip sla statistics aggregated command.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2. This command replaces the show rtr collection-statistics command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the show ip sla statistics aggregated command.
12.2(33)SXI	This command was replaced by the show ip sla statistics aggregated command.

Usage Guidelines

Use this command to display information such as the number of failed operations and the failure reason. The distributions statistics consist of the following:

- The sum of completion times (used to calculate the mean)
- The sum of the completion times squared (used to calculate standard deviation)
- The maximum and minimum completion time
- The number of completed attempts

This command shows information collected over the past two hours, unless you specify a different amount of time using the **hours-of-statistics-kept** command.

**Note**

This command does not support the IP SLAs ICMP path jitter operation.

Examples

The following sections show sample output from the **show ip sla monitor statistics aggregated** and **show ip sla monitor statistics aggregated details** commands for different IP SLAs operations.

Examples

The following example shows output from the **show ip sla monitor statistics aggregated** and **show ip sla monitor statistics aggregated details** commands when the specified operation is a Hypertext Transfer Protocol (HTTP) operation:

```
Router# show ip sla monitor statistics aggregated 1
Round trip time (RTT) Index 3
DNS RTT: 3004 ms
TCP Connection RTT: 16 ms
HTTP Transaction RTT: 84 ms
Number of successes: 0
Number of failures: 1
Router# show ip sla monitor statistics aggregated 1 details
Round trip time (RTT) Index 3
DNS RTT: 3004
TCP Connection RTT: 0
HTTP Transaction RTT: 0
HTTP time to first byte: 0
DNS TimeOut: 0
TCP TimeOut: 0
Transaction TimeOut: 0
DNS Error: 0
TCP Error: 0
Number of successes: 0
Number of failures: 1
Failed Operations due to over threshold: 0
Failed Operations due to Disconnect/TimeOut/Busy/No Connection: 0/0/0/0
Failed Operations due to Internal/Sequence/Verify Error: 1/0/0
Distribution Statistics:
Bucket Range: 0-9 ms:

Related Commands

Command	Description
hours-of-statistics-kept	Sets the number of hours for which statistics are maintained for the IP SLAs operation.
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla monitor totals-statistics

Note

Effective with Cisco IOS Release 12.4(2)T, the **show ip sla monitor totals-statistics** command is replaced by the **show ip sla monitor statistics aggregated** command. See the **show ip sla statistics aggregated** command for more information.

To display the total statistical values (accumulation of error counts and completions) for all Cisco IOS IP Service Level Agreements (SLAs) operations or the specified operation, use the **show ip sla monitor totals-statistics** command in user EXEC or privileged EXEC mode.

show ip sla monitor totals-statistics [*number*] [**tabular** | **full**]

Syntax Description

<i>number</i>	(Optional) Number of the IP SLAs operation to display.
tabular	(Optional) Display information in a column format, reducing the number of screens required to display the information.
full	(Optional) Display all information, using identifiers next to each displayed value. This is the default.

Command Default

Full format for all operations

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(2)T	This command was replaced by the show ip sla monitor statistics aggregated command.

Usage Guidelines

The total statistics consist of the following items:

- The operation number
- The start time of the current hour of statistics
- The age of the current hour of statistics

- The number of attempted operations

You can also use the **show ip sla monitor distributions-statistics** and **show ip sla monitor collection-statistics** commands to display additional statistical information.

Examples

The following is sample output from the **show ip sla monitor totals-statistics** command in full format:

```
Router# show ip sla monitor totals-statistics
Statistic Totals
Entry Number: 1
Start Time Index: *17:15:41.000 UTC Thu May 16 1996
Age of Statistics Entry (hundredths of seconds): 48252
Number of Initiations: 10
```

Related Commands

Command	Description
show ip sla monitor collection-statistics	Displays statistical errors for all IP SLAs operations or the specified operation.
show ip sla monitor configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.
show ip sla monitor distributions-statistics	Displays statistics distribution information (captured response times) for all IP SLAs operations or the specified operation.

Minimum RTT: 24 Maximum RTT: 100 Average RTT: 42

The table below describes the significant fields shown in the display.

Table 62: show ip sla mpls-lsp-monitor collection-statistics Field Descriptions

Field	Description
Entry number	Identification number of the LSP discovery group.
Start Time Index	Start time of the LSP Health Monitor operation.
Path Discovery Start Time	Time in which the most recent iteration of LSP discovery started.
Target destination IP address	IP address of the Border Gateway Protocol (BGP) next hop neighbor.
Path Discovery Status	Return code of the most recent iteration of LSP discovery.
Path Discovery Completion Time	Amount of time (in milliseconds) it took to complete the most recent iteration of the LSP discovery process.
Path Discovery Minimum Paths	Minimum number of equal-cost multipaths discovered by the LSP discovery process.
Path Discovery Maximum Paths	Maximum number of equal-cost multipaths discovered by the LSP discovery process.
LSP Group Index	Identification number of the LSP discovery group.
LSP Group Status	Operation status of the LSP discovery group.
Total Pass	Total number of LSP discovery process iterations.
Total Timeout	Total number of LSPs in which a timeout violation was reported.
Total Fail	Total number of LSPs in which an operation failure was reported.
Latest probe status	Current operation status for each IP SLAs operation belonging to the specified LSP discovery group.
Latest Path Identifier	Current identification information (IP address used to select the LSP, outgoing interface, and label stack) for each IP SLAs operation belonging to the specified LSP discovery group.

Field	Description
Minimum RTT	Minimum round-trip time (in milliseconds) measured by the IP SLAs operations associated with the specified LSP discovery group.
Maximum RTT	Maximum round-trip time (in milliseconds) measured by the IP SLAs operations associated with the specified LSP discovery group.
Average RTT	Average round-trip time (in milliseconds) for all the IP SLAs operations associated with the specified LSP discovery group.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

show ip sla mpls-lsp-monitor configuration

To display configuration settings for IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operations, use the **showipslamlpls-lsp-monitorconfiguration** command in user EXEC or privileged EXEC mode.

show ip sla mpls-lsp-monitor configuration [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the LSP Health Monitor operation for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the showrtrmpls-lsp-monitorconfiguration command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the showipslamonitormpls-lsp-monitorconfiguration command.

Usage Guidelines

If the identification number of an LSP Health Monitor operation is not specified, configuration values for all the configured LSP Health Monitor operations will be displayed.

Examples

The following is sample output from the **showipslamlpls-lsp-monitorconfiguration** command:

```
Router# show ip sla mpls-lsp-monitor configuration 1
Entry Number : 1
Modification time : *12:18:21.830 PDT Fri Aug 19 2005
Operation Type : echo
Vrf Name : ipsla-vrf-all
Tag :
EXP Value : 0
Timeout(ms) : 1000
Threshold(ms) : 5000
Frequency(sec) : Equals schedule period
LSP Selector : 127.0.0.1
ScanInterval(min) : 1
Delete Scan Factor : 1
Operations List : 100001-100003
Schedule Period(sec) : 60
```

```

Request size      : 100
Start Time       : Start Time already passed
SNMP RowStatus   : Active
TTL value        : 255
Reply Mode       : ipv4
Reply Dscp Bits  :
Secondary Frequency : Enabled on Timeout
                  Value(sec) : 10
Reaction Configs :
  Reaction       : connectionLoss
  Threshold Type  : Consecutive
  Threshold Count : 3
  Action Type     : Trap Only
  Reaction       : timeout
  Threshold Type  : Consecutive
  Threshold Count : 3
  Action Type     : Trap Only

```

The table below describes the significant fields shown in the display.

Table 63: show ip sla mpls-lsp-monitor configuration Field Descriptions

Field	Description
Entry Number	Identification number for the LSP Health Monitor operation.
Operation Type	Type of IP SLAs operation configured by the LSP Health Monitor operation.
Vrf Name	If a specific name is displayed in this field, then the LSP Health Monitor is configured to discover only those BGP next hop neighbors in use by the VRF specified. If ipsla-vrf-all is displayed in this field, then the LSP Health Monitor is configured to discover all BGP next hop neighbors in use by all VRFs associated with the source Provider Edge (PE) router.
Tag	User-specified identifier for an IP SLAs operation.
EXP Value	Experimental field value in the header for an echo request packet of the IP SLAs operation.
Timeout(ms)	Amount of time the IP SLAs operation waits for a response from its request packet.
Threshold(ms)	Upper threshold value for calculating network monitoring statistics created by an IP SLAs operation.
Frequency(sec)	Time after which the IP SLAs operation is restarted.
LSP Selector	Local host IP address used to select the LSP for the IP SLAs operation.

Field	Description
ScanInterval(min)	Time interval at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.
Delete Scan Factor	Specifies the number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.
Operations List	Identification numbers of the IP SLAs operations created by the LSP Health Monitor operation.
Schedule Period(sec)	Time period (in seconds) in which the start times of the individual IP SLAs operations are distributed.
Request size	Protocol data size for the request packet of the IP SLAs operation.
Start Time	Status of the start time for the LSP Health Monitor operation.
SNMP RowStatus	Indicates whether SNMP RowStatus is active or inactive.
TTL value	The maximum hop count for an echo request packet of the IP SLAs operation.
Reply Mode	Reply mode for an echo request packet of the IP SLAs operation.
Reply Dscp Bits	Differentiated services codepoint (DSCP) value of an echo reply packet of the IP SLAs operation.
Secondary Frequency	Reaction condition that will enable the secondary frequency option.
Value(sec)	Secondary frequency value.
Reaction Configs	Reaction configuration of the IP SLAs operation.
Reaction	Reaction condition being monitored.
Threshold Type	Specifies when an action should be performed as a result of a reaction event.
Threshold Count	The number of times a reaction event can occur before an action should be performed.

Field	Description
Action Type	Type of action that should be performed as a result of a reaction event.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
auto ip sla mpls-lsp-monitor schedule	Configures the scheduling parameters for an IP SLAs LSP Health Monitor operation.

show ip sla mpls-lsp-monitor lpd operational-state

To display the operational status of the label switched path (LSP) discovery groups belonging to an IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **show ip sla mpls-lsp-monitor lpd operational-state** command in user EXEC or privileged EXEC mode.

show ip sla mpls-lsp-monitor lpd operational-state [*group-id*]

Syntax Description

<i>group-id</i>	(Optional) Identification number of the LSP discovery group for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor mpls-lsp-monitor lpd operational-state command.

Usage Guidelines

Use the **show ip sla mpls-lsp-monitor lpd operational-state** command if the LSP discovery option is enabled for an LSP Health Monitor operation. This command is not applicable if the LSP discovery option is disabled.

Examples

The following is sample output from the **show ip sla mpls-lsp-monitor lpd operational-state** command:

```
Router# show ip sla mpls-lsp-monitor lpd operational-state 100001
Entry number: 100001
MPLSLM Entry Number: 1
Target FEC Type: LDP IPv4 prefix
Target Address: 192.168.1.11
Number of Statistic Hours Kept: 2
Last time LPD Stats were reset: *21:21:18.239 GMT Tue Jun 20 2006
Traps Type: 3
Latest Path Discovery Mode: rediscovery complete
Latest Path Discovery Start Time: *21:59:04.475 GMT Tue Jun 20 2006
Latest Path Discovery Return Code: OK
Latest Path Discovery Completion Time(ms): 3092
Number of Paths Discovered: 3
Path Information :
Path   Outgoing   Lsp       Link Conn Adj   Downstream
Index Interface Selector Type  Id   Addr  Label Stack  Status
1 Et0/0 127.0.0.8 90 0 10.10.18.30 21 OK
2 Et0/0 127.0.0.2 90 0 10.10.18.30 21 OK
3 Et0/0 127.0.0.1 90 0 10.10.18.30 21 OK
```

The table below describes the significant fields shown in the display.

Table 64: show ip sla mpls-lsp-monitor lpd operational-state Field Descriptions

Field	Description
Entry number	Identification number of the LSP discovery group.
MPLSLM Entry number	Identification number of the LSP Health Monitor operation.
Target FEC Type	The Forward Equivalence Class (FEC) type of the BGP next hop neighbor.
Target Address	IP address of the Border Gateway Protocol (BGP) next hop neighbor.
Number of Statistic Hours Kept	The amount of time (in hours) in which LSP discovery group statistics will be maintained. Use the hours-of-statistics-kept command to configure this value.
Traps Type	Trap type values indicate the type of threshold monitoring that has been enabled using the autoipslampls-lsp-monitorreaction-configuration command. Trap type values are defined as follows: • 1--timeout • 2--connection loss • 3--LSP discovery group status changes • 4--LSP discovery failure
Latest Path Discovery Mode	Current mode of the LSP discovery process. Modes include initial discovery, initial complete, rediscovery running, and rediscovery complete.
Latest Path Discovery Start Time	Time in which the most recent iteration of LSP discovery started.
Latest Path Discovery Return Code	Return code for the most recent iteration of LSP discovery.
Latest Path Discovery Completion Time	Amount of time (in milliseconds) it took to complete the most recent iteration of the LSP discovery process.
Number of Paths Discovered	Number of equal-cost multipaths discovered during the most recent iteration of the LSP discovery process.
Path Index	Identification number for the equal-cost multipath.
Outgoing Interface	Outgoing interface of the echo request packet.

Field	Description
Lsp Selector	IP address used to select the LSP.
Adj Addr	IP address of the next hop physical interface.
Downstream Label Stack	Downstream MPLS label stack number.
Status	Return code for the most recent IP SLAs LSP ping operation of the specified equal-cost multipath.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

show ip sla mpls-lsp-monitor neighbors

To display routing and connectivity information about Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Border Gateway Protocol (BGP) next hop neighbors discovered by the IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor, use the **showipslamlsp-lsp-monitorneighbors** command in user EXEC or privileged EXEC mode.

show ip sla mpls-lsp-monitor neighbors

Syntax Description

This command has no arguments or keywords.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the showrtrmpls-lsp-monitorneighbors command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the showipslamonitormpls-lsp-monitorneighbors command.

Examples

The following is sample output from the **showipslamlsp-lsp-monitorneighbors** command:

```
Router# show ip sla mpls-lsp-monitor neighbors
IP SLA MPLS LSP Monitor Database : 1
BGP Next hop 10.10.10.5 (Prefix: 10.10.10.5/32) OK
  ProbeID: 100001 (red, blue, green)
BGP Next hop 10.10.10.7 (Prefix: 10.10.10.7/32) OK
  ProbeID: 100002 (red, blue, green)
BGP Next hop 10.10.10.8 (Prefix: 10.10.10.8/32) OK
  ProbeID: 100003 (red, blue, green)
```

The table below describes the significant fields shown in the display.

Table 65: show ip sla mpls-lsp-monitor neighbors Field Descriptions

Field	Description
BGP Next hop	Identifier for the BGP next hop neighbor.
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next hop neighbor to be used by the MPLS LSP ping operation.

Field	Description
ProbeID	The identification number of the IP SLAs operation. The names of the VRFs that contain routing entries for the specified BGP next hop neighbor are listed in parentheses.
OK	LSP ping or LSP traceroute connectivity status between the source PE router and specified BGP next hop neighbor. Connectivity status can be the following: • OK--Successful reply. • ConnectionLoss--Reply is from a device that is not egress for the Forward Equivalence Class (FEC). • Timeout--Echo request timeout. • Unknown--State of LSP is not known.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

show ip sla mpls-lsp-monitor scan-queue

To display information about adding or deleting Border Gateway Protocol (BGP) next hop neighbors from a particular Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) of an IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **show ip sla mpls-lsp-monitor scan-queue** command in user EXEC or privileged EXEC mode.

show ip sla mpls-lsp-monitor scan-queue *operation-number*

Syntax Description

<i>operation-number</i>	Number of the LSP Health Monitor operation for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(6)T	This command was introduced.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show rtr mpls-lsp-monitor scan-queue command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor mpls-lsp-monitor scan-queue command.

Examples

The following is sample output from the **show ip sla mpls-lsp-monitor scan-queue** command:

```
Router# show ip sla mpls-lsp-monitor scan-queue 1
Next scan Time after: 23 Secs
Next Delete scan Time after: 83 Secs
BGP Next hop      Prefix          vrf          Add/Delete?
10.10.10.8        10.10.10.8/32   red          Add
10.10.10.8        10.10.10.8/32   blue         Add
10.10.10.8        10.10.10.8/32   green        Add
```

The table below describes the significant fields shown in the display.

Table 66: show ip sla mpls-lsp-monitor scan-queue Field Descriptions

Field	Description
Next scan Time after	Amount of time left before the LSP Health Monitor checks the scan queue for information about adding BGP next hop neighbors to a particular VPN. At the start of each scan time, IP SLAs operations are created for all newly discovered neighbors.
Next Delete scan Time after	Amount of time left before the LSP Health Monitor checks the scan queue for information about deleting BGP next hop neighbors from a particular VPN. At the start of each delete scan time, IP SLAs operations are deleted for neighbors that are no longer valid.
BGP Next hop	Identifier for the BGP next hop neighbor.
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next hop neighbor to be used by the MPLS LSP ping operation.
vrf	Name of the VRF that contains a routing entry for the specified BGP next hop neighbor.
Add/Delete	Indicates that the specified BGP next hop neighbor will be added to or removed from the specified VPN.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
delete-scan-factor	Specifies the number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.
mpls discovery vpn interval	Specifies the time interval at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database of an MPLS VPN.
scan-interval	Specifies the time interval (in minutes) at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.

show ip sla mpls-lsp-monitor summary

To display Border Gateway Protocol (BGP) next hop neighbor and label switched path (LSP) discovery group information for IP Service Level Agreements (SLAs) LSP Health Monitor operations, use the **show ip sla mpls-lsp-monitor summary** command in user EXEC or privileged EXEC mode.

show ip sla mpls-lsp-monitor summary [*operation-number*] [**group** [*group-id*]]

Syntax Description

<i>operation-number</i>	(Optional) Number of the LSP Health Monitor operation for which the details will be displayed.
group <i>group-id</i>	(Optional) Specifies the identification number of the LSP discovery group for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor mpls-lsp-monitor summary command.

Usage Guidelines

Use the **show ip sla mpls-lsp-monitor summary** command if the LSP discovery option is enabled for an LSP Health Monitor operation. This command is not applicable if the LSP discovery option is disabled.

Examples

The following is sample output from the **show ip sla mpls-lsp-monitor summary operation-number** command:

```
Router# show ip sla mpls-lsp-monitor summary 1
Index - MPLS LSP Monitor probe index.
Destination - Target IP address of the BGP Next Hop.
Status - LPD Group Status.
LPD Group ID - Unique index to identify the LPD Group.
Last Operation Time - Last time an operation was attempted by a particular probe in the LPD group.
Index Destination Status LPD Group ID Last Operation Time
1 100.1.1.1 up 100001 19:33:37.915 EST Mon Feb 28 2005
2 100.1.1.2 down 100002 19:33:47.915 EST Mon Feb 28 2005
3 100.1.1.3 retry 100003 19:33:57.915 EST Mon Feb 28 2005
4 100.1.1.4 partial 100004 19:34:07.915 EST Mon Feb 28 2005
```

The following is sample output from the **show ip sla mpls-lsp-monitor summary operation-number group group-id** command:

```
Router# show ip sla mpls-lsp-monitor summary 1 group 100001
Group ID - Unique number to identify a LPD group
Lsp-selector - Unique 127/8 address used to identify an LPD.
Latest operation status - Latest probe status.
Last Operation time - Time when the last operation was attempted.
Group ID Lsp-Selector Status Failures Successes RTT Last Operation Time
100001 127.0.0.13 up 0 78 32 *20:11:37.895 EST Mon Feb 28 2005
100001 127.0.0.15 up 0 78 32 *20:11:37.995 EST Mon Feb 28 2005
100001 127.0.0.16 up 0 78 32 *20:11:38.067 EST Mon Feb 28 2005
100001 127.0.0.26 up 0 78 32 *20:11:38.175 EST Mon Feb 28 2005
```

The table below describes the significant fields shown in the display.

Table 67: show ip sla mpls-lsp-monitor summary Field Descriptions

Field	Description
Failures	Number of times the IP SLAs operation for the specified LSP failed to report an RTT value.
Successes	Number of times the IP SLAs operation for the specified LSP successfully reported an RTT value.
RTT	Average round-trip time (in milliseconds) for the specified LSP.

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

show ip sla profile video

To display a list of standard predefined and user-defined video traffic profiles available for IP Service Level Agreements (SLAs) video operations or to display configuration values including all defaults for a specified profile, use the **show ip sla profile video** command in user EXEC or privileged EXEC mode.

show ip sla profile video [*profile-name*]

Syntax Description

<i>profile-name</i>	(Optional) name of synthetic video traffic profile to be displayed. Valid options are as follows: • cp9900: The predefined Cisco Unified 9900 Series IP Phone System profile. • cts: The predefined Cisco Telepresence System 1000/3000 profile. • custom: A customized video endpoint type. • <i>name</i>: Unique identifier for the user-defined endpoint.

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Examples

```
Router# show ip sla profile video
CTS-1080P-Best

CTS-720P-Best
CTS-720P-Better
CTS-720P-Good
CTS-720P-Lite
CP-9900-VGA-30fps-1000kbps
CP-9900-VGA-15fps-1000kbps
CP-9900-CIF-30fps-1000kbps
CP-9900-CIF-15fps-384kbps
CP-9900-QCIF-30fps-249kbps
CP-9900-QCIF-15fps-99kbps
CP-9900-QCIF-10fps-79kbps
My-TP
My-RT
custom
```

```

Router# show ip sla profile video cp9900
IP SLA synthetic video traffic profile parameter details:
  Name: cp9900
  ID: 17
  Administrative status: not in service
  Operational status: none
  Description: (not set)
  Endpoint type: CP-9900
    Codec type: H.264 Profile: baseline
    Content: single-person
    Resolution: CIF (352x288)
    Frame rate: 15fps
    Bit rate maximum: 333kbps
    Bit rate maximum: 3500kbps

```

The table below describes the significant fields that can be shown in the display.

Field	Description
Name:	One of the following: • CP9900 • CTS • Custom • A text string that is a unique identifier for the user-defined endpoint.
ID:	IP SLA identifier index.
Administrative status:	One of the following: • not ready—If any one or more of the three mandatory parameters are not configured, the profile remains in the not-ready state. • not in service—When each of the three mandatory parameters are configured, the profile is in the not-in-service state. • active—When the profile is in the “not in service” state, entering the no shutdown command changes the status of the the profile to the active state. Compared to the normal interface administrative mode, the not-ready or not-in-service states are analogous to the interface down state.

Field	Description
Operational status:	One of the following: • none—When a profile is not in the administrative active state, Cisco IOS software displays the operational status as none. • idle—When a profile is in the administrative active state but the profile is not being used by any IP SLA VO operation, the operational status is idle. • in use—When a profile is in the administrative active state and the profile is being used by an IP SLA VO operation, the operational status is in use.
Description:	Description (text string) of the video profile.
Endpoint type:	The endpoint type is one of the following: TS, CP-9900, or custom.
Codec type:	Codec profile type.
Content:	Video content type is conference-room, single-person, news-broadcast, sports, or street-view.
Resolution:	Video resolution is one of the following: QCIF, CIF, SIF, QVGA, VGA, 4CIF, 4SIF, 720p, or 1080p.
Frame rate:	Frame rate of 30, 24, 15, 10, 7.5, or 5 frames per second (fps).
Bitrate maximum:	Maximum bit rate in kilobits per second (kb/s).
Bitrate window size:	Bit-rate window size in milliseconds.
Frame intra size maximum:	Maximum intra-frame size in kilobytes (KB/s).
Frame intra refresh interval:	Intra-frame refresh interval in milliseconds
RTP packet size average:	Average RTP packet size in bytes.
RTP buffer output:	Buffer output as either bursty or shaped.

show ip sla reaction-configuration

To display the configured proactive threshold monitoring settings for all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **show ip sla reaction-configuration** command in user EXEC or privileged EXEC mode.

show ip sla reaction-configuration [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which the reaction configuration characteristics is displayed.

Command Default

Displays configured proactive threshold monitoring settings for all IP SLAs operations.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the show ip sla monitor reaction-configuration command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show ip sla reaction-configuration command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor reaction-configuration command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor reaction-configuration command.

Usage Guidelines

Use the **ip sla reaction-configuration** command in global configuration mode to configure the proactive threshold monitoring parameters for an IP SLAs operations.

Examples

In the following example, multiple monitored elements (indicated by the Reaction values) are configured for a single IP SLAs operation:

```
Router# show ip sla reaction-configuration
```

```
Entry Number: 1
Reaction: RTT
Threshold type: Never
```

```

Rising (milliseconds): 5000
Falling (milliseconds): 3000
Threshold Count: 5
Threshold Count2: 5
Action Type: None
Reaction: jitterDSAvg
Threshold type: average
Rising (milliseconds): 5
Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: triggerOnly
Reaction: jitterDSAvg
Threshold type: immediate
Rising (milliseconds): 5
Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: trapOnly
Reaction: PacketLossSD
Threshold type: immediate
Rising (milliseconds): 5
Threshold Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: trapOnly

```

The table below describes the significant fields shown in the display.

Table 68: show ip sla reaction-configuration Field Descriptions

Field	Description
Reaction	The monitored element configured for the specified IP SLAs operation. Corresponds to the react { connectionLoss jitterAvg jitterDSAvg jitterSDAvg mos PacketLossDS PacketLossSD rtt timeout verifyError } syntax in the ipslareaction-configuration command.
Threshold type	The configured threshold type. Corresponds to the threshold-type { never immediate consecutive xofy average } syntax in the ipslareaction-configuration command.
Rising (milliseconds)	The <i>upper-threshold</i> value. Corresponds to the threshold-value <i>upper-threshold</i> <i>lower-threshold</i> syntax in the ipslareaction-configuration command.
Falling (milliseconds)	The <i>lower-threshold</i> value. Corresponds to the threshold-value <i>upper-threshold</i> <i>lower-threshold</i> syntax in the ipslareaction-configuration command.
Threshold Count	The <i>x-value</i> in the xofy threshold type, or the <i>number-of-measurements</i> value for the average threshold type.

Field	Description
Threshold Count2	The <i>y-value</i> in the xofy threshold type.
Action Type	The reaction to be performed when the violation conditions are met. Corresponds to the action-type {none trapOnly triggerOnly trapAndTrigger} syntax in the ipslareaction-configuration command.

Related Commands

Command	Description
ip sla reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.

show ip sla reaction-trigger

To display the reaction trigger information for all Cisco IOS IP Service Level Agreements (SLAs) operations or the specified operation, use the **show ip sla reaction-trigger** command in user EXEC or privileged EXEC mode.

show ip sla reaction-trigger [*operation-number*]

Syntax Description

operation-number

(Optional) Number of the IP SLAs operation to display.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the show ip sla monitor reaction-trigger command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show rtr reaction-trigger command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor reaction-trigger command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor reaction-trigger command.

Usage Guidelines

Use the **show ip sla reaction-trigger** command to display the configuration status and operational state of target operations that will be triggered as defined with the **ip sla reaction-configuration** global configuration command.

Examples

The following is sample output from the **show ip sla reaction-trigger** command:

```
Router# show ip sla reaction-trigger 1
      Reaction Table
Entry Number: 1
Target Entry Number: 2
Status of Entry (SNMP RowStatus): active
Operational State: pending
```

Related Commands

Command	Description
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla responder

To display information about the Cisco IOS IP Service Level Agreements (SLAs) Responder, use the **show ip sla responder** command in user EXEC or privileged EXEC mode.

show ip sla responder

Syntax Description This command has no arguments or keywords.

Command Modes User EXEC Privileged EXEC

Command History	Release	Modification
	12.4(4)T	This command was introduced. This command replaces the show ip sla monitor responder command.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show rtr responder command.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor responder command.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor responder command.

Usage Guidelines Use the **show ip sla responder** command to display information about recent sources of IP SLAs control messages, such as who has sent recent control messages and who has sent invalid control messages.

Examples The following sections show sample output from the **show ip sla responder** command for IP SLAs Responders in IPv4 and IPv6 networks.

Examples The following is sample output from the **show ip sla responder** command in an IPv4 network:

```
Router# show ip sla responder

IP SLA Monitor Responder is: Enabled
Number of control message received: 19 Number of errors: 1
Recent sources:
10.0.0.1 [19:11:49.035 UTC Sat Dec 2 2005]
10.0.0.1 [19:10:49.023 UTC Sat Dec 2 2005]
10.0.0.1 [19:09:48.707 UTC Sat Dec 2 2005]
10.0.0.1 [19:08:48.687 UTC Sat Dec 2 2005]
10.0.0.1 [19:07:48.671 UTC Sat Dec 2 2005]
```

```
Recent error sources:
10.0.0.1 [19:10:49.023 UTC Sat Dec 2 2005] RTT_AUTH_FAIL
```

Examples

The following is sample output from the **show ip sla responder** command in an IPv6 network:

```
Router# show ip sla responder

IP SLA Responder is: Enabled
Number of control message received: 19 Number of errors: 1
Recent sources:
2001:DB8:100::1 [19:11:49.035 IST Thu Jul 13 2006]
2001:DB8:100::1 [19:10:49.023 IST Thu Jul 13 2006]
2001:DB8:100::1 [19:09:48.707 IST Thu Jul 13 2006]
2001:DB8:100::1 [19:08:48.687 IST Thu Jul 13 2006]
2001:DB8:100::1 [19:07:48.671 IST Thu Jul 13 2006]
Recent error sources:
2001:DB8:100::1 [19:10:49.023 IST Thu Jul 13 2006] RTT_AUTH_FAIL
```

Related Commands

Command	Description
show ip sla configuration	Displays configuration values for IP SLAs operations.

show ip sla statistics

To display the current operational status and statistics of all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **show ip sla statistics** command in user EXEC or privileged EXEC mode.

show ip sla statistics [*operation-number*] [**details**]

Syntax Description

<i>operation-number</i>	(Optional) Number of the operation for which operational status and statistics are displayed. Note For Multicast UDP jitter operations: Valid operation numbers include the operation IDs (oper-id) for each responder in the endpoint list for the operation.
details	(Optional) Operational status and statistics are displayed in greater detail.

Command Default

Displays output for all running IP SLAs operations.

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the show ip sla monitor statistics command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show ip operational-state command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor statistics command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor statistics command.
12.2(58)SE	This command was modified. The command output has been modified to include information about IP SLAs video operations.
15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.

Release	Modification
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.2(4)M	This command was modified. The command output has been modified to include information about multicast UDP jitter operations.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.
15.3(2)T	This command was modified. The command output has been modified to include information about percentile operations.
15.3(2)S	This command was modified. the command output has been modified to include information about service performance operations.

Usage Guidelines

Use the **showipslaststatistics** command to display the current state of IP SLAs operations, including how much life the operation has left, whether the operation is active, and the completion time. The output will also include the monitoring data returned for the last (most recently completed) operation.

For multicast UDP jitter operations with an endpoint-list: Operation IDs (oper-id) are generated for each destination responder that is associated with the multicast UDP jitter operation. This generated operation ID is displayed when you use the **show ip sla configuration** command for the base multicast operation, and as part of the summery statistics for the entire operation.

Doing a show on the specific operation ID will allow details for that one responder to be displayed.

Examples

The following is sample output from the **showipslaststatistics** command:

```
Router# show ip sla statistics          Current Operational State
Entry Number: 3
Modification Time: *22:15:43.000 UTC Sun Feb 11 2001
Diagnostics Text:
Last Time this Entry was Reset: Never

```

The table below describes the significant fields shown in the display.

Table 69: show ip sla statistics Field Descriptions

Field	Description
Voice Scores	Indicates that Voice over IP statistics appear on the following lines. Voice score data is computed when the operation type is configured as udp-jitter (codec).

Field	Description
ICPIF	The Calculated Planning Impairment Factor (ICPIF) value for the operation. The ICPIF value is computed by IP SLAs using the formula $Icpif=Io+Iq+Idte+Idd+Ie-A$, where • The values for <i>Io</i> , <i>Iq</i> , and <i>Idte</i> are set to zero. • The value <i>Idd</i> is computed based on the measured one-way delay. • The value <i>Ie</i> is computed based on the measured packet loss. • The value of <i>A</i> is specified by the user. ICPIF values are expressed in a typical range of 5 (very low impairment) to 55 (very high impairment). ICPIF values numerically lower than 20 are generally considered “adequate.” Note This value is intended only for relative comparisons, and may not match ICPIF values generated using alternate methods.
MOS Score	The estimated Mean Opinion Score (Conversational Quality, Estimated) for the latest iteration of the operation. The MOS-CQE is computed by IP SLAs as a function of the ICPIF. MOS values are expressed as a number from 1 (1.00) to 5 (5.00), with 5 being the highest level of quality, and 1 being the lowest level of quality. A MOS value of 0 (zero) indicates that MOS data could not be generated for the operation.
RTT Values	Indicates that round-trip-time statistics appear on the following lines.
NumOfRTT	The number of successful round-trips.
RTTSum	The sum of all successful round-trip values (in milliseconds).
RTTSum2	The sum of squares of those round-trip values (in milliseconds).
PacketLossSD	The number of packets lost from source to destination.
PacketLossDS	The number of packets lost from destination to source.
PacketOutOfSequence	The number of packets returned out of order.

Field	Description
PacketMIA	The number of packets lost where the direction (SD/DS) cannot be determined.
PacketLateArrival	The number of packets that arrived after the timeout.
InternalError	The number of times an operation could not be started due to other internal failures.
Busies	The number of times this operation could not be started because the previously scheduled run was not finished.
Jitter Values	Indicates that jitter statistics appear on the following lines. Jitter is interpacket delay variance.
NumOfJitterSamples	The number of jitter samples collected. This is the number of samples that are used to calculate the following jitter statistics.
MinOfPositivesSD MaxOfPositivesSD	The minimum and maximum positive jitter values from source to destination, in milliseconds.
NumOfPositivesSD	The number of jitter values from source to destination that are positive (that is, network latency increases for two consecutive test packets).
SumOfPositivesSD	The sum of those positive values (in milliseconds).
Sum2PositivesSD	The sum of squares of those positive values.
MinOfNegativesSD MaxOfNegativesSD	The minimum and maximum negative jitter values from source to destination. The absolute value is given.
NumOfNegativesSD	The number of jitter values from source to destination that are negative (that is, network latency decreases for two consecutive test packets).
SumOfNegativesSD	The sum of those values.
Sum2NegativesSD	The sum of the squares of those values.
Interarrival jitterout	The source-to-destination (SD) jitter value calculation, as defined in RFC 1889.
Interarrival jitterin	The destination-to-source (DS) jitter value calculation, as defined in RFC 1889.

Field	Description
One Way Values	Indicates that one-way measurement statistics appear on the following lines. One Way (OW) values are the amount of time required for the packet to travel from the source router to the target router (SD) or from the target router to the source router (DS).
NumOfOW	Number of successful one-way time measurements.
OWMinSD	Minimum time (in milliseconds) from the source to the destination.
OWMaxSD	Maximum time (in milliseconds) from the source to the destination.
OWSumSD	Sum of the OWMinSD and OWMaxSD values.
OWSum2SD	Sum of the squares of the OWMinSD and OWMaxSD values.

The following is an example of the output from this command for an Ethernet service performance operation:

```
IPSLAs Latest Operation Statistics
IPSLA operation id: 10
Type of operation: Ethernet Service Performance
Test mode: Two-way Measurement
Steps Tested (kbps): 1000
Test duration: 30 seconds
Latest measurement: 03:48:57.912 IST Fri Feb 15 2013
Latest return code: OK
Overall Throughput: 1000 kbps
Step 1 (1000 kbps):
Stats:
IR(kbps) FL FLR Avail
1000 0 0.00% 100.00%
Tx Packets: 7563 Tx Bytes: 3872256
Rx Packets: 7563 Rx Bytes: 3872256
Step Duration: 30 seconds
```

The table below describes the significant fields shown in the display for service performance operations.

Field	Description
Type of operation	Type of service performance operation.
Test Mode	Mode of testing such as two-way measurement or traffic generation mode.
Latest return code	Current status of the IP SLAs session.
Stats	Specifies the network performance such as throughput, frame loss, frame loss ratio, and availability of a session.

Field	Description
Tx	Packets or bytes transmitted.
Rx	Packets or bytes received.

Related Commands

Command	Description
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla statistics aggregated

To display the aggregated statistical errors and distribution information for all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **show ip sla statistics aggregated** command in user EXEC or privileged EXEC mode.

show ip sla statistics aggregated [*operation-number*] [**details**]

Syntax Description

<i>operation-number</i>	(Optional) Number of the IP SLAs operation to display.
details	(Optional) Aggregated statistical information is displayed in greater detail. Distribution information is included when this keyword is specified.

Command Modes

User EXEC (>) Privileged EXEC (#)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the show ip sla monitor statistics aggregated command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the show rtr collection-statistics , show rtr distributions-statistics , and show rtr totals-statistics commands.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the show ip sla monitor statistics aggregated command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the show ip sla monitor statistics aggregated command.
12.2(58)SE	This command was modified. The command output has been modified to include information about IP SLAs video operations.
15.2(4)M	This command was modified. The command output has been modified to include information about multicast UDP jitter operations.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.

Release	Modification
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

Use this command to display information such as the number of failed operations and the failure reason. The distributions statistics consist of the following:

- The sum of completion times (used to calculate the mean)
- The sum of the completions times squared (used to calculate standard deviation)
- The maximum and minimum completion time
- The number of completed attempts

This command shows information collected over the past two hours, unless you specify a different amount of time using the **history hours-of-statistics-kept** command.

Note

This command does not support the IP SLAs ICMP path jitter operation.

Examples

The following sections show sample output from the **show ip sla statistics aggregated** and **show ip sla statistics aggregated details** commands for different IP SLAs operations:

Examples

The following example shows output from the **show ip sla statistics aggregated** and **show ip sla statistics aggregated details** commands when the specified operation is a Hypertext Transfer Protocol (HTTP) operation:

```
Router# show ip sla statistics aggregated 1
Round trip time (RTT) Index 3
DNS RTT: 3004 ms
TCP Connection RTT: 16 ms
HTTP Transaction RTT: 84 ms
Number of successes: 0
Number of failures: 1
Router# show ip sla statistics aggregated 1 details
Round trip time (RTT) Index 3
DNS RTT: 3004

Examples

For multicast UDP jitter operations, the following statements apply:

- The fail counter in the per operation Success and Fail (suc/fail) column indicates that the operation failed completely. It does not include operations for which some responders succeeded and others failed.
- The Loss column in the per operation results displays the minimum, average, and maximum (Min/Avg/Max) values of packet loss for all multicast receivers.
- The Fail counter in per responder statistics means the receiver took part in the operation but the operation to this receiver failed for some reason.

```

Related Commands

Command	Description
history hours-of-statistics-kept	Sets the number of hours for which statistics are maintained for the IP SLAs operation.
show ip sla configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show ip sla summary

To display summary statistics for IP Service Level Agreements (SLAs) operations, use the **show ip sla summary** command in privileged EXEC mode.

show ip sla summary [destination {*ip-address*|*hostname*}]

destination	(Optional) Displays destination-address-based statistics.
<i>destination-ip-address</i>	IP address of the destination device.
<i>destination-hostname</i>	Hostname of the destination device.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
15.2(3)T	This command was introduced.
Cisco IOS XE Release 3.7S	This command was integrated into Cisco IOS XE Release 3.7S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.
15.3(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

This command displays summary statistics for multicast operations and for unicast on which multiple operations are configured on the same destination IP address or hostname.

Examples

```
Device# show ip sla summary
ID      Type      Destination  Stats (ms)  ReturnCode  LastRun
---      -
100     icmp-jitter  192.0.2.2    100         OK          22:49:53 PST Tue May 3 2011
101     udp-jitter   192.0.2.3    100         OK          22:49:53 PST Tue May 3 2011
102     tcp-connect  192.0.2.4    -           NoConnection 22:49:53 PST Tue May 3 2011
```

```
Device# show ip sla summary destination 192.0.2.2
ID      Type      Destination  State  Stats (ms)  ReturnCode  LastRun
---      -
100     icmp-jitter  192.0.2.2    Active  100         OK          22:49:53 PST Tue May 3 2011
101     udp-jitter   192.0.2.2    Active  100         OK          22:49:53 PST Tue May 3 2011

```

The table below describes the significant fields shown in the display.

Table 70: show ip sla summary Field Descriptions

Field	Description
ID	IP SLAs operation identifier.
Destination	IP address or hostname of the destination device for the listed operation.
Stats	Round trip time in milliseconds.

show ip sla twamp connection

To display information for current IP Service Level Agreements (SLAs) Two-Way Active Measurement Protocol (TWAMP) connections, use the **show ip sla twamp connection** command in privileged EXEC mode.

show ip sla twamp connection {**detail** | [**source-ip** {*ip-address* | *hostname*}]} [**requests**]

Syntax Description

detail	Displays greater detail for current connections.
source-ip	(Optional) Displays information for a specific TWAMP connection.
<i>ip-address</i>	IPv4 address of TWAMP connection.
<i>hostname</i>	Hostname of TWAMP connection.
requests	Displays current connection requests.

Command Default

Displays information for all current TWAMP connections.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
15.2(2)S	This command was introduced.
Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
15.2(3)T	This command was integrated into Cisco IOS Release 15.2(3)T.

Examples

Device# **show ip sla twamp connection detail**

```
Connection Id:          91
Client IP Address:      172.27.111.225
Client Port:            43026
Mode:                   Unauthenticated
Connection State:        Connected
Control State:           None
Number of Test Requests - 0:1
```

```
Device# show ip sla twamp connection requests

Connection-Id    Client Address    Client Port
91               172.27.111.225    43026
Total number of current connections: 1
```

The table below describes the significant fields shown in the display.

Table 71: show ip sla twamp connection Field Descriptions

Field	Description
Connection- Id	TWAMP connection identifier.
Client IP Address	IPv4 address of the TWAMP control device for the listed connection.
Client Port	Port number for the listed connection.

show ip sla twamp session

To display information and results for IP Service Level Agreements (SLAs) Two-Way Active Measurement Protocol (TWAMP) test sessions, use the **show ip sla twamp session** command in privileged EXEC mode.

show ip sla session [**source-ip** {*ip-address*| *hostname*} **source-port** *port-number*]

Syntax Description

source-ip	(Optional) Display results from the TWAMP test session for a specific TWAMP connection.
<i>ip-address</i>	IPv4 or IPv6 address of a TWAMP connection.
<i>hostname</i>	Alphanumeric string that identifies a TWAMP connection.
source-port	Display results from the TWAMP test session for a specific port.
<i>port-number</i>	Port number of the source port. The range is from 1 to 65535.

Command Default

Information and results for all TWAMP test sessions is displayed.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
15.2(2)S	This command was introduced.
Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
15.2(3)T	This command was integrated into Cisco IOS Release 15.2(3)T.

Examples

```
Device# show ip sla twamp session
IP SLAs Responder TWAMP is: Enabled
Recv Addr: 172.27.117.116
Recv Port: 3619
Sender Addr: 172.27.111.225
Sender Port: 32910
Session Id: 172.27.117.116:533112:9C41EC42
Connection Id: 95
```

In the following example, the IP SLAs TWAMP responder is not disabled.

```
Device(config)# no ip sla responder twamp
Device(config)# exit
Device# show ip sla twamp session
IP SLAs Responder TWAMP is: Disabled
```

The table below describes the significant fields shown in the display.

Table 72: show ip sla twamp session Field Descriptions

Field	Description
Recv Addr	IP address of the session-reflector on the IP SLAs TWAMP responder.
Recv Port	Port number of the TWAMP server on the IP SLAs TWAMP responder.
Sender Addr	IP address of the session-sender on the TWAMP control device.
Sender Port	Port number of the session-sender entity on the control device.

Related Commands

Command	Description
ip sla responder twamp	Sets up a TWAMP responder.

show ip sla twamp standards

To display a list of Two-Way Active Measurement Protocol (TWAMP) standards that are implemented on a Cisco device, use the **show ip sla twamp standards** command in privileged EXEC mode.

show ip sla twamp standards

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	15.2(2)S	This command was introduced.
	Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
	15.2(3)T	This command was integrated into Cisco IOS Release 15.2(3)T.

Usage Guidelines The list of supported standards depends on the Cisco software release running on your device.

Examples The following sample output shows which TWAMP standards are implemented in a Cisco software release that supports IP SLAs TWAMP Responder v1.0:

Device# **show ip sla twamp standards**

Feature	Organization	Standard
TWAMP Server	IETF	draft-ietf-ippm-twamp-06
TWAMP Reflector	IETF	draft-ietf-ippm-twamp-06

show mpls discovery vpn

To display routing information relating to the Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Border Gateway Protocol (BGP) next hop neighbor discovery process, use the **showmplsdiscoveryvpn** command in user EXEC or privileged EXEC mode.

show mpls discovery vpn

Syntax Description This command has no arguments or keywords.

Command Modes User EXEC Privileged EXEC

Command History	Release	Modification
	12.2(27)SBC	This command was introduced.
	12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Examples The following is sample output from the **showmplsdiscoveryvpn** command:

```
Router# show mpls discovery vpn
Refresh interval set to 60 seconds.
Next refresh in 46 seconds
Next hop 10.10.10.5 (Prefix: 10.10.10.5/32)
    in use by: red, blue, green
Next hop 10.10.10.7 (Prefix: 10.10.10.7/32)
    in use by: red, blue, green
Next hop 10.10.10.8 (Prefix: 10.10.10.8/32)
    in use by: red, blue, green
The table below describes the fields shown in the display.
```

Table 73: show mpls discovery vpn Field Descriptions

Field	Description
Refresh interval	The time interval at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database. The default time interval is 300 seconds.

Field	Description
Next refresh	The amount of time left before the next refresh interval starts.
Next hop	Identifier for the BGP next hop neighbor.
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next hop neighbor to be used by the MPLS LSP ping operation.
in use by	Names of the VPN routing and forwarding (VRF) instances that contain routing entries for the specified BGP next hop neighbor.

Related Commands

Command	Description
mpls discovery vpn interval	Specifies the time interval at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database of an MPLS VPN.
mpls discovery vpn next-hop	Enables the MPLS VPN BGP next hop neighbor discovery process.

show rtr application

**Note**

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **show rtr application** command is replaced by the **show ip sla monitor application** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr application** command is replaced by the **show ip sla application** command. See the **show ip sla monitor application** and **show ip sla application** commands for more information.

To display global information about Cisco IOS IP Service Level Agreements (IP SLAs), use the **show rtr application** command in user EXEC or privileged EXEC mode.

show rtr application [**tabular**| **full**]

Syntax Description

tabular	(Optional) Displays information in a column format reducing the number of screens required to display the information.
full	(Optional) Displays all information using identifiers next to each displayed value. This is the default.

Command Default

Full format

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
11.2	This command was introduced.
12.3(14)T	This command was replaced by the show ip sla monitor application command.
12.2(31)SB2	This command was replaced by the show ip sla monitor application command.
12.2(33)SRB	This command was replaced by the show ip sla application command.

Usage Guidelines

Use the **show rtr application** command to display information such as supported operation types and supported protocols.

Examples

The following is sample output from the **show rtr application** command in full format:

```
Router# show rtr application

      SA Agent
Version: 2.2.0 Round Trip Time MIB
Time of last change in whole RTR: *17:21:30.819 UTC Tue Mar 19 2002
Estimated system max number of entries: 4699

Number of Entries configured:5
  Number of active Entries:5
  Number of pending Entries:0
  Number of inactive Entries:0
    Supported Operation Types
Type of Operation to Perform:  echo
Type of Operation to Perform:  pathEcho
Type of Operation to Perform:  udpEcho
Type of Operation to Perform:  tcpConnect
Type of Operation to Perform:  http
Type of Operation to Perform:  dns
Type of Operation to Perform:  jitter
Type of Operation to Perform:  dlsw
Type of Operation to Perform:  dhcp
Type of Operation to Perform:  ftp
    Supported Protocols
Protocol Type: ipIcmpEcho
Protocol Type: ipUdpEchoAppl
Protocol Type: snaRUEcho
Protocol Type: snaLU0EchoAppl
Protocol Type: snaLU2EchoAppl
Protocol Type: ipTcpConn
Protocol Type: httpAppl
Protocol Type: dnsAppl
Protocol Type: jitterAppl
Protocol Type: dlsw
Protocol Type: dhcp
Protocol Type: ftpAppl

Number of configurable probe is 490
```

Related Commands

Command	Description
show rtr configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show rtr authentication

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **show rtr authentication** command is replaced by the **show ip sla monitor authentication** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr authentication** command is replaced by the **show ip sla authentication** command. See the **show ip sla monitor authentication** and **show ip sla authentication** commands for more information.

To display Cisco IOS IP Service Level Agreements (IP SLAs) authentication information, use the **show rtr authentication** command in user EXEC or privileged EXEC mode.

show rtr authentication

Syntax Description

This command has no arguments or keywords.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.0(3)T	This command was introduced.
12.3(14)T	This command was replaced by the show ip sla monitor authentication command.
12.2(31)SB2	This command was replaced by the show ip sla monitor authentication command.
12.2(33)SRB	This command was replaced by the show ip sla authentication command.

Usage Guidelines

Use the **show rtr authentication** command to display information such as supported operation types and supported protocols.

Examples

The following is sample output from the **show rtr authentication** command:

```
Router# show rtr authentication
RTR control message uses MD5 authentication, key chain name is: rtr
```

Related Commands

Command	Description
show rtr configuration	Displays configuration values for IP SLAs operations.

show rtr collection-statistics

Note

Effective with Cisco IOS Release 12.3(14)T, the **show rtr collection-statistics** command is replaced by the **show ipslamonitor collection-statistics** command. Effective with 12.2(31)SB2, the **show rtr collection-statistics** command is replaced by the **show ipslamonitor statistics aggregated** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr collection-statistics** command is replaced by the **show ipslastatistics aggregated** command. See the **show ipslamonitor collection-statistics**, **show ipslamonitor statistics aggregated**, and **show ipslastatistics aggregated** commands for more information.

To display statistical errors for all Cisco IOS IP Service Level Agreements (IP SLAs) operations or a specified operation, use the **show rtr collection-statistics** command in user EXEC or privileged EXEC mode.

show rtr collection-statistics [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the IP SLAs operation to display.

Command Default

Shows statistics for the past two hours.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
11.2	This command was introduced.
12.0(5)T	The output for this command was expanded to show information for Jitter operations.
12.1	The tabular and full keywords were removed.
12.1(1)T	The output for this command was expanded to show information for the FTP operation type and for One Way Delay Jitter operations.
12.2(8)T, 12.2(8)S	Output for "NumOfJitterSamples" was added (CSCdv30022).
12.2(11)T	The SAA Engine II was implemented. The maximum number of operations was increased from 500 to 2000.
12.3(4)T	Output (MOS and ICPIF scores) for the Jitter (codec) operation type was added.

Release	Modification
12.3(7)T	Decimal granularity for MOS scores was added.
12.3(14)T	This command was replaced by the showiplamonitorcollection-statistics command.
12.2(31)SB2	This command was replaced by the showiplamonitorstatisticsaggregated command.
12.2(33)SRB	This command was replaced by the showiplaststatisticsaggregated command.

Usage Guidelines

Use the **showrtrcollection-statistics** command to display information such as the number of failed operations and the failure reason. You can also use the **showrtrdistribution-statistics** and **showrtrtotals-statistics** commands to display additional statistical information.

This command shows information collected over the past two hours, unless you specify a different amount of time using the **hours-of-statistics-kept** command.

For One Way Delay Jitter operations, the clocks on each device must be synchronized using NTP (or GPS systems). If the clocks are not synchronized, one way measurements are discarded. (If the sum of the source to destination (SD) and the destination to source (DS) values is not within 10 percent of the round trip time, the one way measurement values are assumed to be faulty, and are discarded.)

Note

This command does not support the IP SLAs ICMP path jitter operation.

Examples

The following shows sample output from the **showrtrcollection-statistics** command in full format.

```
Router# show rtr collection-statistics 1
    Collected Statistics
Entry Number: 1
Start Time Index: *17:15:41.000 UTC Thu May 16 1996
Path Index: 1
Hop in Path Index: 1
Number of Failed Operations due to a Disconnect: 0
Number of Failed Operations due to a Timeout: 0
Number of Failed Operations due to a Busy: 0
Number of Failed Operations due to a No Connection: 0
Number of Failed Operations due to an Internal Error: 0
Number of Failed Operations due to a Sequence Error: 0
Number of Failed Operations due to a Verify Error: 0
Target Address: 172.16.1.176
```

Examples

The following example shows output from the **show rtr collection-statistics** command when the specified operation is an HTTP operation:

```
Router# show rtr collection-statistics 2          Collected Statistics
Entry Number:2
HTTP URL:
http://172.20.150.200
```

```

Start Time:*00:01:16.000 UTC Mon Nov 1 2003

Comps:1           RTTMin:343
OvrTh:0           RTTMax:343
DNSTimeOut:0      RTTSum:343
TCPTimeOut:0      RTTSum2:117649
TraTimeOut:0      DNSRTT:0
DNSError:0        TCPConRTT:13
HTTPError:0       TransRTT:330
IntError:0        MesgSize:1771
Busies:0

```

Examples

The following is sample output from the **showrtrcollection-statistics** command, where operation 2 is a Jitter operation that includes One Way statistics:

```

Router# show rtr collection-statistics
Collected Statistics
Entry Number: 2
Target Address: 5.0.0.1, Port Number:99
Start Time: 11:12:03.000 UTC Thu Jul 1 1999
RTT Values:
NumOfRTT: 600 RTTSum: 3789 RTTSum2: 138665
Packet Loss Values:
PacketLossSD: 0 PacketLossDS: 0
PacketOutOfSequence: 0 PacketMIA: 0 PacketLateArrival: 0
InternalError: 0 Busies: 0
Jitter Values:
MinOfPositivesSD: 1 MaxOfPositivesSD: 2
NumOfPositivesSD: 26 SumOfPositivesSD: 31 Sum2PositivesSD: 41
MinOfNegativesSD: 1 MaxOfNegativesSD: 4
NumOfNegativesSD: 56 SumOfNegativesSD: 73 Sum2NegativesSD: 133
MinOfPositivesDS: 1 MaxOfPositivesDS: 338
NumOfPositivesDS: 58 SumOfPositivesDS: 409 Sum2PositivesDS: 114347
MinOfNegativesDS: 1 MaxOfNegativesDS: 338
NumOfNegativesDS: 48 SumOfNegativesDS: 396 Sum2NegativesDS: 114332
One Way Values:
NumOfOW: 440
OWMinSD: 2 OWMaxSD: 6 OWSumSD: 1273 OWSum2SD: 4021
OWMinDS: 2 OWMaxDS: 341 OWSumDS: 1643 OWSum2DS: 120295

```

The values shown indicate the aggregated values for the current hour. RTT stands for Round-Trip-Time. SD stands for Source-to-Destination. DS stands for Destination-to-Source. OW stands for One Way. [show rtr collection-statistics](#) describes the significant fields shown in this output.

Examples

The following is sample output from the **showrtrcollection-statistics** command, where operation 10 is a Jitter (codec) operation:

```

Router# show rtr collection-statistics 10
Entry number: 10
Start Time Index: 13:18:49.904 PST Mon Jun 24 2002
Number of successful operations: 2
Number of operations over threshold: 0
Number of failed operations due to a Disconnect: 0
Number of failed operations due to a Timeout: 0
Number of failed operations due to a Busy: 0
Number of failed operations due to a No Connection: 0
Number of failed operations due to an Internal Error: 0
Number of failed operations due to a Sequence Error: 0
Number of failed operations due to a Verify Error: 0
Voice Scores:
MinOfICPIF: 0 MaxOfICPIF: 0 MinOfMOS: 0 MaxOfMOS: 0
RTT Values:
NumOfRTT: 122 RTTAvg: 2 RTTMin: 2 RTTMax: 3
RTTSum: 247 RTTSum2: 503
Packet Loss Values:
PacketLossSD: 0 PacketLossDS: 0

```

```

PacketOutOfSequence: 0   PacketMIA: 0   PacketLateArrival: 0
InternalError: 0         Busies: 0     PacketSkipped: 78 <<<<=====
Jitter Values:
MinOfPositivesSD: 1      MaxOfPositivesSD: 1
NumOfPositivesSD: 9      SumOfPositivesSD: 9      Sum2PositivesSD: 9
MinOfNegativesSD: 1      MaxOfNegativesSD: 1
NumOfNegativesSD: 8      SumOfNegativesSD: 8      Sum2NegativesSD: 8
MinOfPositivesDS: 1      MaxOfPositivesDS: 1
NumOfPositivesDS: 6      SumOfPositivesDS: 6      Sum2PositivesDS: 6
MinOfNegativesDS: 1      MaxOfNegativesDS: 1
NumOfNegativesDS: 7      SumOfNegativesDS: 7      Sum2NegativesDS: 7
Interarrival jitterout: 0   Interarrival jitterin: 0
One Way Values:
NumOfOW: 0
OWMinSD: 0      OWMaxSD: 0      OWSumSD: 0      OWSum2SD: 0
OWMinDS: 0      OWMaxDS: 0      OWSumDS: 0      OWSum2DS: 0

```

Table 74: show rtr collection-statistics Field Descriptions

Field	Description
Voice Scores:	Indicates that Voice over IP statistics appear on the following lines. Voice score data is computed when the operation type is configured as typejitter(codec) .
ICPIF	The Calculated Planning Impairment Factor (ICPIF) value for the operation. The ICPIF value is computed by IP SLAs using the formula $Icpif=Io+Iq+Idte+Idd+Ie-A$, where - the values for Io, Iq, and $Idte$ are set to zero, - the value Idd is computed based on the measured one way delay, - the value Ie is computed based on the measured packet loss, - and the value of A is specified by the user. ICPIF values are expressed in a typical range of 5 (very low impairment) to 55 (very high impairment). ICPIF values numerically less than 20 are generally considered “adequate.” Note This value is intended only for relative comparisons, and may not match ICPIF values generated using alternate methods.
MinOfICPIF:	The lowest (minimum) ICPIF value computed for the collected statistics.
MaxOfICPIF:	The highest (maximum) ICPIF value computed for the collected statistics.

Field	Description
Mos	The estimated Mean Opinion Score (Conversational Quality, Estimated) for the latest iteration of the operation. The MOS-CQE is computed by IP SLAs as a function of the ICPIF. MOS values are expressed as a number from 1 (1.00) to 5 (5.00), with 5 being the highest level of quality, and 1 being the lowest level of quality. A MOS value of 0 (zero) indicates that MOS data could not be generated for the operation.
MinOfMos:	The lowest (minimum) MOS value computed for the collected statistics.
MaxOfMos:	The highest (maximum) ICPIF value computed for the collected statistics.
RTT Values:	Indicates that Round-Trip-Time statistics appear on the following lines.
NumOfRTT	The number of successful round trips.
RTTSum	The sum of all successful round trip values (in milliseconds).
RTTSum2	The sum of squares of those round trip values (in milliseconds).
PacketLossSD	The number of packets lost from source to destination.
PacketLossDS	The number of packets lost from destination to source.
PacketOutOfSequence	The number of packets returned out of order.
PacketMIA	The number of packets lost where the direction (SD/DS) cannot be determined.
PacketLateArrival	The number of packets that arrived after the timeout.
PacketSkipped	The number of packets that are not sent during the IP SLAs jitter operation.
InternalError	The number of times an operation could not be started due to other internal failures.
Busies	The number of times this operation could not be started because the previously scheduled run was not finished.

Field	Description
Jitter Values:	Indicates that Jitter statistics appear on the following lines. Jitter is inter-packet delay variance.
NumOfJitterSamples:	The number of jitter samples collected. This is the number of samples that are used to calculate the following jitter statistics.
MinOfPositivesSD MaxOfPositivesSD	The minimum and maximum positive jitter values from source to destination, in milliseconds.
NumOfPositivesSD	The number of jitter values from source to destination that are positive (i.e., network latency increases for two consecutive test packets).
SumOfPositivesSD	The sum of those positive values (in milliseconds).
Sum2PositivesSD	The sum of squares of those positive values.
MinOfNegativesSD MaxOfNegativesSD	The minimum and maximum negative jitter values from source to destination. The absolute value is given.
NumOfNegativesSD	The number of jitter values from source to destination that are negative (i.e., network latency decreases for two consecutive test packets).
SumOfNegativesSD	The sum of those values.
Sum2NegativesSD	The sum of the squares of those values.
Interarrival jitterout:	The source to destination (SD) jitter value calculation, as defined in RFC 1889.
Interarrival jitterin:	The destination to source (DS) jitter value calculation, as defined in RFC 1889.
One Way Values	Indicates that one way measurement statistics appear on the following lines. One Way (OW) Values are the amount of time it took the packet to travel from the source router to the target router (SD) or from the target router to the source router (DS).
NumOfOW	Number of successful one way time measurements.
OWMinSD	Minimum time from the source to the destination.

Field	Description
OWMaxSD	Maximum time from the source to the destination.
OWSumSD	Sum of the OWMinSD and OWMaxSD values.
OWSum2SD	Sum of the squares of the OWMinSD and OWMaxSD values.

The DS values show the same information as above for Destination-to-Source Jitter values.

Related Commands

Command	Description
show ntp status	Displays the status of the Network Time Protocol configuration on your system.
show rtr configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.
show rtr distributions-statistics	Displays statistic distribution information (captured response times) for all IP SLAs operations or the specified operation.
show rtr totals-statistics	Displays the total statistical values (accumulation of error counts and completions) for all IP SLAs operations or the specified operation.

show rtr configuration

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **show rtr configuration** command is replaced by the **show ip sla monitor configuration** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr configuration** command is replaced by the **show ip sla configuration** command. See the **show ip sla monitor configuration** and **show ip sla configuration** commands for more information.

To display configuration values including all defaults for all Cisco IOS IP Service Level Agreements (IP SLAs) operations or the specified operation, use the **show rtr configuration** command in user EXEC or privileged EXEC mode.

show rtr configuration [*operation*]

Syntax Description

<i>operation</i>	(Optional) Number of the IP SLAs operation for, which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
11.2	This command was introduced.
12.1	The tabular and full keywords were removed.
12.3(2)T	Output was added to show the VRF assignment name (if configured).
12.3(4)T	Output specific to the jitter (codec) operation type was added.
12.3(7)T	Output pertaining to reaction configuration (threshold values, reaction types) was removed from the output. Reaction configuration is now displayed using the show rtr reaction-configuration command.
12.3(8)T	Output was added to show the group schedule and the recurring schedule details for the IP SLAs operations.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S. This integration includes the addition of output to show the group schedule and recurring schedule details for the IP SLAs operations.
12.3(14)T	This command was replaced by the show ip sla monitor configuration command.

Release	Modification
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC. This integration includes the addition of output to show the group schedule and recurring schedule details for the IP SLAs operations.
12.2(31)SB2	This command was replaced by the show ip sla monitor configuration command.
12.2(33)SRB	This command was replaced by the show ip sla configuration command.

Examples

The following is sample output from the **show rtr configuration** command for an IP SLAs Echo operation:

```
Router# show rtr configuration
      Complete Configuration Table (includes defaults)
Entry Number: 1
Owner: "Sample Owner"
Tag: "Sample Tag Group"
Type of Operation to Perform: echo
Reaction and History Threshold (milliseconds): 5000
Operation Frequency (seconds): 60
Operation Timeout (milliseconds): 5000
Verify Data: FALSE
Status of Entry (SNMP RowStatus): active
Protocol Type: ipIcmpEcho
Target Address: 172.16.1.176
Request Size (ARR data portion): 1
Response Size (ARR data portion): 1
Life (seconds): 3600
Next Start Time: Start Time already passed
Entry Ageout (seconds): 3600
Number of Statistic Hours kept: 2
Number of Statistic Paths kept: 1
Number of Statistic Hops kept: 1
Number of Statistic Distribution Buckets kept: 1
Number of Statistic Distribution Intervals (milliseconds): 20
Number of History Lives kept: 0
Number of History Buckets kept: 50
Number of History Samples kept: 1
History Filter Type: none
```

The following is sample output from the **show rtr configuration** command that verifies the configuration of an IP SLAs HTTP operation:

```
Router# show rtr configuration
      Complete Configuration Table (includes defaults)
Entry Number: 3
Owner: Joe
Tag: AppleTree
Type of Operation to Perform: http
Reaction and History Threshold (milliseconds): 5000
Operation Frequency (seconds): 60
Operation Timeout (milliseconds): 5000
Verify Data: FALSE
Status of Entry (SNMP RowStatus): active
Protocol Type: httpAppl
Target Address:
Source Address: 0.0.0.0
Target Port: 0
Source Port: 0
Request Size (ARR data portion): 1
Response Size (ARR data portion): 1
Control Packets: enabled
```

```

Loose Source Routing:disabled
LSR Path:
Type of Service Parameters:0x0
HTTP Operation:get
HTTP Server Version:1.0
URL:http://www.cisco.com
Cache Control:enabled
Life (seconds):3600
Next Scheduled Start Time:Start Time already passed
Entry Ageout:never
Number of Statistic Hours kept:2
Number of Statistic Paths kept:1
Number of Statistic Hops kept:1
Number of Statistic Distribution Buckets kept:1
Statistic Distribution Interval (milliseconds):20
Number of History Lives kept:0
Number of History Buckets kept:15
Number of History Samples kept:1
History Filter Type:none

```

The following is sample output from the **show rtr configuration** command that shows output for a PathJitter operation associated with the VPN vrf1:

```

Router# show rtr configuration 1

Entry number: 1
Owner:
Tag:
Type of operation to perform: pathJitter
Destination address: 171.69.1.129
Source address: 0.0.0.0
Number of packets: 10
Interval (milliseconds): 20
Target Only: Disabled
Request size (ARR data portion): 1
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Verify data: No
Loose Source Routing: Disabled
Vrf Name: vrf1
LSR Path:
Operation frequency (seconds): 60
Next Scheduled Start Time: Start Time already passed
Life (seconds): 2000
Entry Ageout (seconds): never
Status of entry (SNMP RowStatus): Active

```

The following is sample output from the **show rtr configuration** command that includes output for the **type jitter (codec)** operation for VoIP metric monitoring:

```

Router# show rtr configuration

Entry number: 10
Owner: admin_bofh
Tag:
Type of operation to perform: jitter
Target address: 209.165.200.225
Source address: 0.0.0.0
Target port: 16384
Source port: 0
Operation timeout (milliseconds): 5000
Codec Type: g711alaw
Codec Number Of Packets: 1000
Codec Packet Size: 172
Codec Interval (milliseconds): 20
Advantage Factor: 2
Type Of Service parameters: 0x0
Verify data: No
Vrf Name:
Control Packets: enabled
Operation frequency (seconds): 60
Next Scheduled Start Time: Start Time already passed
Life (seconds): 3600

```

```

Entry Ageout (seconds): never
Status of entry (SNMP RowStatus): Active
Threshold (milliseconds): 5000
Number of statistic hours kept: 2
Number of statistic distribution buckets kept: 1
Statistic distribution interval (milliseconds): 20
Enhanced History:

```

The following is sample output from the **show rtr configuration** command for a recurring IP SLAs operation, with the recurring state as TRUE:

```

Router# show rtr configuration
Entry number: 5
Owner:
Tag:
Type of operation to perform: udpEcho
Target address: 10.2.31.121
Source address: 0.0.0.0
Target port: 989
Source port: 0
Request size (ARR data portion): 16
Operation timeout (milliseconds): 5000
Type Of Service parameters: 0x0
Verify data: No
Data pattern:
Vrf Name:
Control Packets: enabled
Operation frequency (seconds): 60
Next Scheduled Start Time: Start Time already passed
Group Scheduled: FALSE
Group Schedule Entry number :
Life (seconds): 3600
Entry Ageout (seconds): never
Recurring (Starting everyday): TRUE
Status of entry (SNMP RowStatus): Active
Connection loss reaction enabled: No

```

Related Commands

Command	Description
show rtr application	Displays global information about the IP SLAs feature.
show rtr collection-statistics	Displays statistical errors for all IP SLAs operations or the specified operation.
show rtr distributions-statistics	Displays statistic distribution information (captured response times) for all IP SLAs operations or the specified operation.
show rtr group schedule	Displays the group schedule details of the specified IP SLAs operation.
show rtr history	Displays history collected for all IP SLAs operations or the specified operation.
show rtr operational-state	Displays the operational state of all IP SLAs operations or the specified operation.
show rtr reaction-trigger	Displays the reaction trigger information for all IP SLAs operations or the specified operation.

Command	Description
show rtr totals-statistics	Displays the total statistical values (accumulation of error counts and completions) for all IP SLAs operations or the specified operation.

show rtr distributions-statistics

Note

Effective with Cisco IOS Release 12.3(14)T, the **show rtr distributions-statistics** command is replaced by the **show ip sla monitor distributions -statistics** command. Effective with Cisco IOS Release 12.2(31)SB2, the **show rtr distributions-statistics** command is replaced by the **show ip sla monitor statistics aggregated** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr distributions-statistics** command is replaced by the **show ip sla statistics aggregated** command. See the **show ip sla monitor distributions-statistics**, **show ip sla monitor statistics aggregated**, and **show ip sla statistics aggregated** commands for more information.

To display statistic distribution information (captured response times) for all Cisco IOS IP Service Level Agreements (IP SLAs) operations or the specified operation, use the **show rtr distributions-statistics** command in user EXEC or privileged EXEC mode.

show rtr distributions-statistics [*operation*] [**tabular** | **full**]

Syntax Description

<i>operation</i>	(Optional) Number of the IP SLAs operation to display.
tabular	(Optional) Displays information in a column format reducing the number of screens required to display the information. This is the default.
full	(Optional) Displays all information using identifiers next to each displayed value.

Command Default

Tabular format for all operations is displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
11.2	This command was introduced.
12.3(14)T	This command was replaced by the show ip sla monitor distributions-statistics command.
12.2(31)SB2	This command was replaced by the show ip sla monitor statistics aggregated command.
12.2(33)SRB	This command was replaced by the show ip sla statistics aggregated command.

Usage Guidelines

The distributions statistics consist of the following:

- The sum of completion times (used to calculate the mean)
- The sum of the completions times squared (used to calculate standard deviation)
- The maximum and minimum completion time
- The number of completed attempts

Note

This command does not support the IP SLAs ICMP path jitter operation.

You can also use the **show rtr collection-statistics** and **show rtr totals-statistics** commands to display additional statistical information.

Examples

The following is sample output from the **show rtr distributions-statistics** command in tabular format when the output is split over multiple lines

```
Router# show rtr distributions-statistics
Captured Statistics
Multiple Lines per Entry

Line 1
Entry      = Entry Number
StartT     = Start Time of Entry (hundredths of seconds)
Pth        = Path Index
Hop        = Hop in Path Index
Dst        = Time Distribution Index
Comps      = Operations Completed
OvrTh      = Operations Completed Over Thresholds
SumCmp     = Sum of Completion Times (milliseconds)

Line 2
SumCmp2L   = Sum of Completion Times Squared Low 32 Bits (milliseconds)
SumCmp2H   = Sum of Completion Times Squared High 32 Bits (milliseconds)
TMax       = Completion Time Maximum (milliseconds)
TMin       = Completion Time Minimum (milliseconds)

Entry StartT      Pth Hop Dst Comps      OvrTh      SumCmp
SumCmp2L SumCmp2H TMax TMin
1      17417068   1   1   1   2         0         128
      8192        0        64        64
```

The following example shows the output as it appears on a single line:

```
Entry StartT      Pth Hop Dst Comps      OvrTh      SumCmp      SumCmp2L      SumCmp2H      TMax      TMin
10     3581        1   1   1   0         0         0         0         0         0         0
```

Related Commands

Command	Description
show rtr collection-statistics	Displays statistical errors for all IP SLAs operations or the specified operation.
show rtr configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

Command	Description
show rtr totals-statistics	Displays the total statistical values (accumulation of error counts and completions) for all IP SLAs operations or the specified operation.

show rtr enhanced-history collection-statistics

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **showrtrenhanced-historycollection-statistics** command is replaced by the **showiplslamonitorenhanced-historycollection-statistics** command. Effective with Cisco IOS Release 12.2(33)SRB, the **showrtrenhanced-historycollection-statistics** command is replaced by the **showiplslaenhanced-historycollection-statistics** command. See the **showiplslamonitorenhanced-historycollection-statistics** and **showiplslaenhanced-historycollection-statistics** commands for more information.

To display enhanced history statistics for all collected history buckets for the specified Cisco IOS IP Service Level Agreements (IP SLAs) operation, use the **showrtrenhanced-historycollection-statistics** command in user EXEC or privileged EXEC mode.

show rtr enhanced-history collection-statistics [*operation-number*] [**interval** *seconds*]

Syntax Description

<i>operation-number</i>	(Optional) Displays enhanced history distribution statistics for only the specified operation.
interval <i>seconds</i>	(Optional) Displays enhanced history distribution statistics for only the specified aggregation interval.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(15)T	This command was introduced.
12.3(14)T	This command was replaced by the showiplslamonitorenhanced-historycollection-statistics command.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the showiplslamonitorenhanced-historycollection-statistics command.
12.2(33)SRB	This command was replaced by the showiplslaenhanced-historycollection-statistics command.

Usage Guidelines

This command displays data for each bucket of enhanced history data shown individually (one after the other). The number of buckets and the collection interval is set using the **enhanced-history interval seconds buckets number-of-buckets** RTR configuration command.

Examples

The following example shows sample output for the **show rtr enhanced-history collection-statistics** command. The output of this command will vary depending on the type of IP SLAs operation.

```
Router# show rtr enhanced-history collection-statistics 1
Entry number: 1
Aggregation Interval: 900
Bucket Index: 1
Aggregation start time 00:15:00.003 UTC Thur May 1 2003
Target Address:
Number of failed operations due to a Disconnect: 0
Number of failed operations due to a Timeout: 0
Number of failed operations due to a Busy: 0
Number of failed operations due to a No Connection: 0
Number of failed operations due to an Internal Error: 0
Number of failed operations due to a Sequence Error: 0
Number of failed operations due to a Verify Error: 0
.
.
.
```

The table below describes the significant fields shown in the display.

Table 75: show rtr enhanced-history collection-statistics Field Descriptions

Field	Description
Aggregation Interval:	The number of seconds the operation runs for each enhanced history bucket. For example, a value of 900 indicates that statistics were gathered for 15 minutes before the next bucket was created.
Bucket Index:	The number identifying the collection bucket. The number of buckets is set using the enhanced-history RTR configuration command.

show rtr enhanced-history distribution-statistics

**Note**

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **showrtrenhanced-historydistribution-statistics** command is replaced by the **showiplslamonitorenhanced-historydistribution-statistics** command. Effective with Cisco IOS Release 12.2(33)SRB, the **showrtrenhanced-historydistribution-statistics** command is replaced by the **showiplslaenhanced-historydistribution-statistics** command. See the **showiplslamonitorenhanced-historydistribution-statistics** and **showiplslaenhanced-historydistribution-statistics** commands for more information.

To display enhanced history distribution statistics for Cisco IOS IP Service Level Agreements (IP SLAs) operations in tabular format, use the **showrtrenhanced-historydistribution-statistics** command in user EXEC or privileged EXEC mode.

show rtr enhanced-history distribution-statistics [*operation-number* [**interval** *seconds*]]

Syntax Description

<i>operation-number</i>	(Optional) Displays enhanced history distribution statistics for only the specified operation.
interval <i>seconds</i>	(Optional) Displays enhanced history distribution statistics for only the specified aggregation interval for only the specified operation. • The range is from 1 to 3600 (1 hour). The default is 900.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(1)	This command was introduced.
12.3(14)T	This command was replaced by the showiplslamonitorenhanced-historydistribution-statistics command.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the showiplslamonitorenhanced-historydistribution-statistics command.

Release	Modification
12.2(33)SRB	This command was replaced by the show ip sla enhanced-history distribution-statistics command.

Usage Guidelines

The distribution statistics consist of the following:

- The sum of completion times (used to calculate the mean)
- The sum of the completion times squared (used to calculate standard deviation)
- The maximum and minimum completion times
- The number of completed attempts

You can also use the following commands to display additional statistics or history information, or to view the status of the operation:

- **show rtr enhanced-history collection-statistics**
- **show rtr enhanced-history totals-statistics**

Tip

If the character 'n' appears in your output, or not all fields are displayed, you should increase the screen width for your CLI display (for example, using the **width** line configuration command or the **terminalwidth** EXEC mode command).

Examples

The following is sample output from the **show rtr enhanced-history distribution-statistics** command. The fields are defined at the beginning of the output for the command. RTT means round-trip-time.

```
Router# show rtr enhanced-history distribution-statistics 3
Point by point Enhanced History
Entry    = Entry Number
Int      = Aggregation Interval (seconds)
BucI     = Bucket Index
StartT   = Aggregation Start Time
Pth      = Path index
Hop      = Hop in path index
Comps    = Operations completed
OvrTh    = Operations completed over thresholds
SumCmp   = Sum of RTT (milliseconds)
SumCmp2L = Sum of RTT squared low 32 bits (milliseconds)
SumCmp2H = Sum of RTT squared high 32 bits (milliseconds)
TMax     = RTT maximum (milliseconds)
TMin     = RTT minimum (milliseconds)
Entry Int BucI StartT Pth Hop Comps OvrTh SumCmp SumCmp2L SumCmp2H TMax TMin
3 900 1 257850000 1 1 3 0 43 617 0 15 14
3 900 2 258750002 1 1 3 0 45 677 0 16 14
3 900 3 259650000 1 1 3 0 44 646 0 15 14
3 900 4 260550002 1 1 3 0 42 594 0 15 12
3 900 5 261450003 1 1 3 0 42 590 0 15 13
3 900 6 262350001 1 1 3 0 46 706 0 16 15
3 900 7 263250003 1 1 3 0 46 708 0 16 14
.
.
.
```

The time elapsed between BucketIndex 1 (started at 257,850,000) and BucketIndex 2 (started at 258,750,002) in this example is 900,002 milliseconds, or 900 seconds.

The table below describes the significant fields shown in the display.

Table 76: show rtr enhanced-history distribution-statistics Field Descriptions

Field	Description
Entry	The operation ID number you specified for the IP SLAs operation.
Int	Aggregation interval--The configured statistical distribution buckets interval, in seconds. For example, a value of 900 for Int means that statistics are gathered for 900 seconds per bucket.
BucI	Bucket index number--A number uniquely identifying the statistical distribution (aggregation) bucket. The number of history buckets to be kept is configured using the buckets-of-history-kept command. A bucket will gather statistics for the specified interval of time (aggregation interval), after which a new statistics bucket is created. If a number-of-buckets-kept value is configured, the interval for the last bucket is infinity (until the end of the operation). Buckets are not applicable to HTTP and UDP jitter monitoring operations. This field is equivalent to the rttMonStatsCaptureDistIndex object in the Cisco RTTMON MIB.
StartT	Aggregation start time--Start time for the aggregation interval (per Bucket Index). Shows the start time as the number of milliseconds since the router started; in other words, the time stamp is the number of milliseconds since the last system bootup.

Field	Description
Pth	Path index number--An identifier for a set of different paths to the target destination that have been discovered. For example, if the first operation iteration finds the path h1, h2, h3, h4, then this path is labeled as 1. If, on a later iteration, a new path is discovered, (such as h1, h2, h5, h6, h4) then this new path will be identified as 2, and so on. Data collection per path is available only for ICMP path echo operations ("pathEcho probes"). For all other operations, a value of 1 will always appear. Data collection per path is configured using the paths-of-statistics-kept<i>number</i> command when configuring the operation.
Hop	Hop Index Number--Statistics data per hop. A hop is data transmission between two points in a path (for example, from device h2 to device h3). Data collection per hop is available only for ICMP path echo operations ("pathEcho probes"). For all other operations, a value of "1" will always appear. Data collection per hop is configured using the hops-of-statistics-kept<i>number</i> command when configuring the operation. This field is equivalent to the rrttMonStatsCaptureHopIndex object in the Cisco RTTMON MIB.
Comps	Completions--The number of round-trip time operations that have completed without an error and without timing out, per bucket index. This object has the special behavior as defined by the ROLLOVER NOTE in the DESCRIPTION of the Cisco Rttmon MIB object.
SumCmp	Sum of completed operation times (1)--The total of all round-trip time values for all successful operations in the row, in milliseconds.

Field	Description
SumCmp2L	Sum of the squares of completed operation times (2), Low-Order--The sum of the square roots of round-trip times for operations that were successfully measured, in milliseconds; displays the low-order 32 bits of the value only. 32 low-order bits and 32 high-order bits are ordered in unsigned 64-bit integers (Int64) as follows: ----- High-order 32 bits Low-order 32 bits ----- - The "SumCmp2" values are split into "high-order" and "low-order" numbers because of limitations of Simple Network Management Protocol (SNMP). The maximum value allowed for an SNMP object is 4,294,967,295 (the Gauge32 limit). If the sum of the square roots for your operation exceeds this value, then the "high-order" value will be utilized. (For example, the number 4,294,967,296 would have all low-order bits as 0, and the right-most high-order bit would be 1). - The low-order value (SumCmp2L) appears first in the output because in most cases, the value will be less than 4,294,967,295, which means that the value of SumCmp2H will appear as zero.
SumCmp2H	Sum of the squares of completed operation times (2), High-Order--The high-order 32 bits of the accumulated squares of completion times (in milliseconds) of operations that completed successfully.
TMax	Round-trip time, maximum--The highest recorded round-trip time, in milliseconds, per aggregation interval.
TMin	Round-trip time, minimum--The lowest recorded round-trip time, in milliseconds, per aggregation interval.

Related Commands

Command	Description
rtr	Begins configuration for an IP SLAs operation and enters RTR configuration mode.
show rtr enhanced-history collection-statistics	Displays data for all collected history buckets for the specified IP SLAs operation, with data for each bucket shown individually.

show rtr group schedule

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **show rtr groupschedule** command is replaced by the **show ip slamonitor groupschedule** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr groupschedule** command is replaced by the **show ip slagroupschedules** command. See the **show ip slamonitor groupschedule** and **show ip slagroupschedules** commands for more information.

To display the group schedule details of Cisco IOS IP Service Level Agreements (IP SLAs) operations, use the **show rtr groupschedule** command in user EXEC or privileged EXEC mode.

show rtr group schedule [*group-operation-number*]

Syntax Description

<i>group-operation-number</i>	(Optional) Number of the IP SLAs group operation to display.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(8)T	This command was introduced.
12.3(14)T	This command was replaced by the show ip slamonitor groupschedule command.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the show ip slamonitor groupschedule command.
12.2(33)SRB	This command was replaced by the show ip slagroupschedules command.

Examples

The following is sample output from the **show rtr groupschedule** command that shows information about group (multiple) scheduling. The last line in the example indicates that the IP SLAs operations are multiple scheduled (TRUE):

```
Router# show rtr group schedule
Multi-Scheduling Configuration:
```

```

Group Entry Number: 1
Probes to be scheduled: 2,3,4,9-30,89
Schedule period :60
Group operation frequency: 30
Multi-scheduled: TRUE

```

The following is sample output from the **showrtrgroupschedule** command that shows information about group (multiple) scheduling, with the **frequency** value the same as the **schedule-period** value, the **life** value as 3600 seconds, and the **ageout** value as never:

```

Router# show rtr group schedule
Group Entry Number: 1
Probes to be scheduled: 3,4,6-10
Total number of probes: 7
Schedule period: 20
Group operation frequency: Equals schedule period
Status of entry (SNMP RowStatus): Active
Next Scheduled Start Time: Start Time already passed
Life (seconds): 3600
Entry Ageout (seconds): never

```

The table below describes the significant fields shown in the displays.

Table 77: show rtr group schedule Field Descriptions

Field	Description
Group Entry Number	The operation group number specified for IP SLAs multiple operations scheduling.
Probes to be scheduled	The operations numbers specified in the operation group 1.
Scheduled period	The time in seconds you mentioned while scheduling the operation.
Group operation frequency	The frequency at which each operation is started.
Multi-scheduled	The value TRUE shows that group scheduling is active.

Related Commands

Command	Description
show rtr configuration	Displays the scheduling details.
show running configuration	Displays the configuration details which includes the IP SLAs multiple operations scheduling information.

show rtr history

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **showrtrhistory** command is replaced by the **showiplamonitorhistory** command. Effective with Cisco IOS Release 12.2(33)SRB, the **showrtrhistory** command is replaced by the **showiplahistory** command. See the **showiplamonitorhistory** and **showiplahistory** commands for more information.

To display history collected for all Cisco IOS IP Service Level Agreements (IP SLAs) operations or for a specified operation, use the **showrtrhistory** command in user EXEC or privileged EXEC mode.

show rtr history [*operation-number*] [**tabular** | **full**]

Syntax Description

<i>operation-number</i>	(Optional) Displays history for only the specified operation.
tabular	(Optional) Displays information in a column format reducing the number of screens required to display the information. This is the default.
full	(Optional) Displays all information using identifiers next to each displayed value.

Command Default

Tabular format history for all operations is displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
11.2	This command was introduced.
12.3(14)T	This command was replaced by the showiplamonitorhistory command.
12.2(31)SB2	This command was replaced by the showiplamonitorhistory command.
12.2(33)SRB	This command was replaced by the showiplahistory command.

Usage Guidelines

The table below lists the Response Return values used in the output of the **showrtrhistory** command. If the default (**tabular**) format is used, the Response Return description is displayed as a code in the Sense column. If the full format is used, the Response Return is displayed as indicated in the Description column.

Table 78: Response Return (Sense Column) Codes

Code	Description
1	Okay.
2	Disconnected.
3	Over threshold.
4	Timeout.
5	Busy.
6	Not connected.
7	Dropped.
8	Sequence error.
9	Verify error.
10	Application specific.

Examples

The following is sample output from the **show rtr history** command in tabular format:

```
Router# show rtr history
          Point by point History
          Multiple Lines per Entry
Line 1
Entry      = Entry Number
LifeI      = Life Index
BucketI    = Bucket Index
SampleI    = Sample Index
SampleT    = Sample Start Time
CompT      = Completion Time (milliseconds)
Sense      = Response Return Code
Line 2 has the Target Address
Entry LifeI      BucketI    SampleI    SampleT    CompT      Sense
2      1          1          1          17436548    16          1
  AB 45 A0 16
2      1          2          1          17436551    4           1
  AC 12 7 29
2      1          2          2          17436551    1           1
  AC 12 5 22
2      1          2          3          17436552    4           1
  AB 45 A7 22
2      1          2          4          17436552    4           1
  AB 45 A0 16
```

Related Commands

Command	Description
show rtr configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show rtr mpls-lsp-monitor configuration

**Note**

Effective with Cisco IOS Release 12.2(31)SB2, the **showrtrmpls-lsp-monitorconfiguration** command is replaced by the **showiplamonitormpls-lsp-monitorconfiguration** command. Effective with Cisco IOS Release 12.2(33)SRB, the **showrtrmpls-lsp-monitorconfiguration** command is replaced by the **showiplampls-lsp-monitorconfiguration** command. See the **showiplamonitormpls-lsp-monitorconfiguration** and **showiplampls-lsp-monitorconfiguration** commands for more information.

To display configuration settings for IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor operations, use the **showrtrmpls-lsp-monitorconfiguration** command in user EXEC or privileged EXEC mode.

show rtr mpls-lsp-monitor configuration [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) Number of the LSP Health Monitor operation for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the showiplamonitormpls-lsp-monitorconfiguration command.
12.2(33)SRB	This command was replaced by the showiplampls-lsp-monitorconfiguration command.

Usage Guidelines

If the identification number of an LSP Health Monitor operation is not specified, configuration values for all the configured LSP Health Monitor operations will be displayed.

Examples

The following is sample output from the **showrtrmpls-lsp-monitorconfiguration** command:

```
Router# show rtr mpls-lsp-monitor configuration 1
Entry Number : 1
Modification time : *12:18:21.830 PDT Fri Aug 19 2005
```

```

Operation Type      : echo

```

The table below describes the significant fields shown in the display.

Table 79: show rtr mpls-lsp-monitor configuration Field Descriptions

Field	Description
Entry Number	Identification number for the LSP Health Monitor operation.
Operation Type	Type of IP SLAs operation configured by the LSP Health Monitor operation.
Vrf Name	If a specific name is displayed in this field, then the LSP Health Monitor is configured to discover only those BGP next hop neighbors in use by the VRF specified. If saa-vrf-all is displayed in this field, then the LSP Health Monitor is configured to discover all BGP next hop neighbors in use by all VRFs associated with the source Provider Edge (PE) router.
Tag	User-specified identifier for the LSP Health Monitor operation.
EXP Value	Experimental field value in the header for an echo request packet of the IP SLAs operation.
Timeout(ms)	Amount of time the IP SLAs operation waits for a response from its request packet.

Field	Description
Threshold(ms)	Threshold value of the IP SLAs operation for which a reaction event is generated if violated.
Frequency(sec)	Time after which the IP SLAs operation is restarted.
LSP Selector	Local host IP address used to select the LSP for the IP SLAs operation.
ScanInterval(min)	Time interval at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.
Delete Scan Factor	Specifies the number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.
Operations List	Identification numbers IP SLAs operations created by the LSP Health Monitor operation.
Schedule Period(sec)	Amount of time for which the LSP Health Monitor operation is scheduled.
Request size	Protocol data size for the request packet of the IP SLAs operation.
Start Time	Status of the start time for the LSP Health Monitor operation.
SNMP RowStatus	Indicates whether SNMP RowStatus is active or inactive.
TTL value	The maximum hop count for an echo request packet of the IP SLAs operation.
Reply Mode	Reply mode for an echo request packet of the IP SLAs operation.
Reply Dscp Bits	Differentiated services codepoint (DSCP) value of an echo reply packet of the IP SLAs operation.
Secondary Frequency	Reaction condition that will enable the secondary frequency option.
Value(sec)	Secondary frequency value.
Reaction Configs	Reaction configuration of the IP SLAs operation.
Reaction	Reaction condition being monitored.

Field	Description
Threshold Type	Specifies when an action should be performed as a result of a reaction event.
Threshold Count	The number of times a reaction event can occur before an action should be performed.
Action Type	Type of action that should be performed as a result of a reaction event.

Related Commands

Command	Description
rtr mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters SAA MPLS configuration mode.
rtr mpls-lsp-monitor schedule	Configures the scheduling parameters for an IP SLAs LSP Health Monitor operation.

show rtr mpls-lsp-monitor neighbors

Note

Effective with Cisco IOS Release 12.2(31)SB2, the **showrtrmpls-lsp-monitorneighbors** command is replaced by the **showiplamonitormpls-lsp-monitorneighbors** command. Effective with Cisco IOS Release 12.2(33)SRB, the **showrtrmpls-lsp-monitorneighbors** command is replaced by the **showiplampls-lsp-monitorneighbors** command. See the **showiplamonitormpls-lsp-monitorneighbors** and **showiplampls-lsp-monitorneighbors** commands for more information.

To display routing and connectivity information about Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Border Gateway Protocol (BGP) next hop neighbors discovered by the IP Service Level Agreements (SLAs) label switched path (LSP) Health Monitor, use the **showrtrmpls-lsp-monitorneighbors** command in user EXEC or privileged EXEC mode.

show rtr mpls-lsp-monitor neighbors

Syntax Description

This command has no arguments or keywords.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the showiplamonitormpls-lsp-monitorneighbors command.
12.2(33)SRB	This command was replaced by the showiplampls-lsp-monitorneighbors command.

Examples

The following is sample output from the **showrtrmpls-lsp-monitorneighbors** command:

```
Router# show rtr mpls-lsp-monitor neighbors
SAA MPLS LSP Monitor Database : 1
BGP Next hop 10.10.10.5 (Prefix: 10.10.10.5/32) OK
  ProbeID: 100001 (red, blue, green)
BGP Next hop 10.10.10.7 (Prefix: 10.10.10.7/32) OK
  ProbeID: 100002 (red, blue, green)
BGP Next hop 10.10.10.8 (Prefix: 10.10.10.8/32) OK
  ProbeID: 100003 (red, blue, green)
```

The table below describes the significant fields shown in the display.

Table 80: show rtr mpls-lsp-monitor neighbors Field Descriptions

Field	Description
BGP Next hop	Identifier for the BGP next hop neighbor.
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next hop neighbor to be used by the MPLS LSP ping operation.
ProbeID	The identification number of the IP SLAs operation. The names of the VRFs that contain routing entries for the specified BGP next hop neighbor are listed in parentheses.
OK	LSP ping or LSP traceroute connectivity status between the source PE router and specified BGP next hop neighbor. Connectivity status can be the following: • OK--Successful reply. • ConnectionLoss--Reply is from a device that is not egress for the Forward Equivalence Class (FEC). • Timeout--Echo request timeout. • Unknown--State of LSP is not known.

Related Commands

Command	Description
rtr mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters SAA MPLS configuration mode.

show rtr mpls-lsp-monitor scan-queue

Note

Effective with Cisco IOS Release 12.2(31)SB2, the **show rtr mpls-lsp-monitor scan-queue** command is replaced by the **show ip slamonitor mpls-lsp-monitor scan-queue** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr mpls-lsp-monitor scan-queue** command is replaced by the **show ip slampls-lsp-monitor scan-queue** command. See the **show ip slamonitor mpls-lsp-monitor scan-queue** and **show ip slampls-lsp-monitor scan-queue** commands for more information.

To display information about adding or deleting Border Gateway Protocol (BGP) next hop neighbors from a particular Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) of an IP Service Level Agreements (SLAs) LSP Health Monitor operation, use the **show rtr mpls-lsp-monitor scan-queue** command in user EXEC or privileged EXEC mode.

show rtr mpls-lsp-monitor scan-queue *operation-number*

Syntax Description

<i>operation-number</i>	Number of the LSP Health Monitor operation for which the details will be displayed.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the show ip slamonitor mpls-lsp-monitor scan-queue command.
12.2(33)SRB	This command was replaced by the show ip slampls-lsp-monitor scan-queue command.

Examples

The following is sample output from the **show rtr mpls-lsp-monitor scan-queue** command:

```
Router# show rtr mpls-lsp-monitor scan-queue 1
Next scan Time after: 23 Secs
Next Delete scan Time after: 83 Secs
BGP Next hop    Prefix          vrf          Add/Delete?
10.10.10.8      10.10.10.8/32   red          Add
10.10.10.8      10.10.10.8/32   blue         Add
10.10.10.8      10.10.10.8/32   green        Add
```

The table below describes the significant fields shown in the display.

Table 81: show rtr mpls-lsp-monitor scan-queue Field Descriptions

Field	Description
Next scan Time after	Amount of time left before the LSP Health Monitor checks the scan queue for information about adding BGP next hop neighbors to a particular VPN. At the start of each scan time, IP SLAs operations are created for all newly discovered neighbors.
Next Delete scan Time after	Amount of time left before the LSP Health Monitor checks the scan queue for information about deleting BGP next hop neighbors from a particular VPN. At the start of each delete scan time, IP SLAs operations are deleted for neighbors that are no longer valid.
BGP Next hop	Identifier for the BGP next hop neighbor.
Prefix	IPv4 Forward Equivalence Class (FEC) of the BGP next hop neighbor to be used by the MPLS LSP ping operation.
vrf	Name of the VRF that contains a routing entry for the specified BGP next hop neighbor.
Add/Delete	Indicates that the specified BGP next hop neighbor will be added to or removed from the specified VPN.

Related Commands

Command	Description
delete-scan-factor	Specifies the number of times the LSP Health Monitor should check the scan queue before automatically deleting IP SLAs operations for BGP next hop neighbors that are no longer valid.
mpls discovery vpn interval	Specifies the time interval at which routing entries that are no longer valid are removed from the BGP next hop neighbor discovery database of an MPLS VPN.
rtr mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters SAA MPLS configuration mode.

Command	Description
scan-interval	Specifies the time interval (in minutes) at which the LSP Health Monitor checks the scan queue for BGP next hop neighbor updates.

show rtr operational-state

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **show rtr operational-state** command is replaced by the **show ip sla monitor statistics** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr operational-state** command is replaced by the **show ip sla statistics** command. See the **show ip sla monitor statistics** and **show ip sla statistics** commands for more information.

To display the operational state of all Cisco IOS IP Service Level Agreements (IP SLAs) operations or a specified operation, use the **show rtr operational-state** command in user EXEC or privileged EXEC mode.

show rtr operational-state [*operation-number*]

Syntax Description

<i>operation-number</i>	(Optional) ID number of the IP SLAs operation to display.

Command Default

Displays output for all running IP SLAs operations.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
11.2	This command was introduced.
12.0(5)T	Output for the Jitter operation type was added.
12.1	The tabular and full keywords were removed.
12.2(8)T	Output for "NumOfJitterSamples" was added (CSCdv30022).
12.2(8)S	Output for "NumOfJitterSamples" was added (CSCdv30022).
12.3(4)T	Output (MOS and ICPIF scores) for the Jitter (codec) operation type was added.
12.3(7)T	Decimal granularity for MOS scores was added.
12.3(14)T	This command was replaced by the show ip sla monitor statistics command.
12.2(31)SB2	This command was replaced by the show ip sla monitor statistics command.
12.2(33)SRB	This command was replaced by the show ip sla statistics command.

Usage Guidelines

Use the **showrtroperational-state** command to display the current state of IP SLAs operations, including how much life the operation has left, whether the operation is active, and the completion time. The output will also include the monitoring data returned for the last (most recently completed) operation.

Examples

The following example shows basic sample output from the **showrtroperational-state** command:

```
Router# show rtr operational-state          Current Operational State
Entry Number: 3
Modification Time: *22:15:43.000 UTC Sun Feb 11 2001
Diagnostics Text:
Last Time this Entry was Reset: Never
Number of Octets in use by this Entry: 1332
Number of Operations Attempted: 2
Current Seconds Left in Life: 3511
Operational State of Entry: active
Latest Completion Time (milliseconds): 544
Latest Operation Start Time: *22:16:43.000 UTC Sun Feb 11 2001
Latest Oper Sense: ok
Latest Sense Description: 200 OK
Total RTT: 544
DNS RTT: 12
TCP Connection RTT: 28
HTTP Transaction RTT: 504
HTTP Message Size: 9707
```

The following example shows sample output from the **showrtroperational-state** command when the specified operation is a Jitter (codec) operation:

```
Router# show rtr operational-state 1
Entry number: 1
Modification time: 13:18:38.012 PST Mon Jun 24 2002
Number of Octets Used by this Entry: 10392
Number of operations attempted: 2
Number of operations skipped: 0
Current seconds left in Life: Forever
Operational state of entry: Active
Last time this entry was reset: Never
Connection loss occurred: FALSE
Timeout occurred: FALSE
Over thresholds occurred: FALSE
Latest RTT (milliseconds): 2
Latest operation start time: *13:18:42.896 PST Mon Jun 24 2002
Latest operation return code: OK
Voice Scores:
ICPIF Value: 0   MOS score: 0
RTT Values:
NumOfRTT: 61      RTTAvg: 2      RTTMin: 2      RTTMax: 3
RTTSum: 123      RTTSum2: 249
Packet Loss Values:
PacketLossSD: 0 PacketLossDS: 0
PacketOutOfSequence: 0 PacketMIA: 0   PacketLateArrival: 0
InternalError: 0    Busies: 0    PacketSkipped: 39 <<<<<=====
Jitter Values:
MinOfPositivesSD: 1      MaxOfPositivesSD: 1
NumOfPositivesSD: 1      SumOfPositivesSD: 1      Sum2PositivesSD: 1
MinOfNegativesSD: 1      MaxOfNegativesSD: 1
NumOfNegativesSD: 1      SumOfNegativesSD: 1      Sum2NegativesSD: 1
MinOfPositivesDS: 0      MaxOfPositivesDS: 0
NumOfPositivesDS: 0      SumOfPositivesDS: 0      Sum2PositivesDS: 0
MinOfNegativesDS: 0      MaxOfNegativesDS: 0
NumOfNegativesDS: 0      SumOfNegativesDS: 0      Sum2NegativesDS: 0
Interarrival jitterout: 0      Interarrival jitterin: 0
One Way Values:
NumOfOW: 0
```

```
OWMinSD: 0      OWMaxSD: 0      OWSumSD: 0      OWSum2SD: 0
OWMinDS: 0      OWMaxDS: 0      OWSumDS: 0      OWSum2DS: 0
```

The values shown indicate the values for the last IP SLAs operation. RTT stands for Round-Trip-Time. SD stands for Source-to-Destination. DS stands for Destination-to-Source. OW stands for One Way. The * symbol in front of the time stamps indicates the time is synchronized using NTP or SNTP. The table below describes the significant fields shown in this output.

Table 82: show rtr operational-state Field Descriptions

Field	Description
Voice Scores:	Indicates that Voice over IP statistics appear on the following lines. Voice score data is computed when the operation type is configured as typejitter(codec) .
ICPIF:	The Calculated Planning Impairment Factor (ICPIF) value for the latest iteration of the operation. The ICPIF value is computed by IP SLAs using the formula $Icpif=Io+Iq+Idte+Idd+Ie-A$, where - the values for <i>Io</i> , <i>Iq</i> , and <i>Idte</i> are set to zero, - the value <i>Idd</i> is computed based on the measured one way delay, - the value <i>Ie</i> is computed based on the measured packet loss, - and the value of A is specified by the user. ICPIF values are expressed in a typical range of 5 (very low impairment) to 55 (very high impairment). ICPIF values numerically less than 20 are generally considered “adequate.” Note This value is intended only for relative comparisons, and may not match ICPIF values generated using alternate methods.
MOS:	The estimated Mean Opinion Score (Conversational Quality, Estimated) for the latest iteration of the operation. The MOS-CQE is computed by IP SLAs as a function of the ICPIF. MOS values are expressed as a number from 1 (1.00) to 5 (5.00), with 5 being the highest level of quality, and 1 being the lowest level of quality. A MOS value of 0 (zero) indicates that MOS data could not be generated for the operation.
RTT Values:	Indicates that Round-Trip-Time statistics appear on the following lines.
NumOfRTT	The number of successful round trips.

Field	Description
RTTSum	The sum of those round trip values (in milliseconds).
RTTSum2	The sum of squares of those round trip values (in milliseconds).
Packet Loss Values:	Indicates that Packet Loss statistics appear on the following lines.
PacketLossSD	The number of packets lost from source to destination.
PacketLossDS	The number of packets lost from destination to source.
PacketOutOfSequence	The number of packets returned out of order.
PacketMIA	The number of packets lost where the direction (SD or DS) cannot be determined (MIA: "missing in action").
PacketLateArrival	The number of packets that arrived after the timeout.
PacketSkipped	The number of packets that are not sent during the IP SLAs jitter operation.
InternalError	The number of times an operation could not be started due to other internal failures.
Busies	The number of times this operation could not be started because the previously scheduled run was not finished.
Jitter Values:	Indicates that jitter operation statistics appear on the following lines. Jitter is inter-packet delay variance.
NumOfJitterSamples:	The number of jitter samples collected. This is the number of samples that are used to calculate the following jitter statistics.
MinOfPositivesSD MaxOfPositivesSD	The minimum and maximum positive jitter values from source to destination, in milliseconds.
NumOfPositivesSD	The number of jitter values from source to destination that are positive (i.e., network latency increases for two consecutive test packets).
SumOfPositivesSD	The sum of those positive values (in milliseconds).
Sum2PositivesSD	The sum of squares of those positive values.

Field	Description
MinOfNegativesSD MaxOfNegativesSD	The minimum and maximum negative jitter values from source to destination. The absolute value is given.
NumOfNegativesSD	The number of jitter values from source to destination that are negative (that is, network latency decreases for two consecutive test packets).
SumOfNegativesSD	The sum of those values.
Sum2NegativesSD	The sum of the squares of those values.
Interarrival jitterout:	The source to destination (SD) jitter value calculation, as defined in RFC 1889.
Interarrival jitterin:	The destination to source (DS) jitter value calculation, as defined in RFC 1889.
One Way Values	Indicates that One Way measurement statistics appear on the following lines. One Way (OW) Values are the amount of time it took the packet to travel from the source router to the target router (SD) or from the target router to the source router (DS).
NumOfOW	Number of successful one way time measurements.
OWMinSD	Minimum time from the source to the destination.
OWMaxSD	Maximum time from the source to the destination.
OWSumSD	Sum of the OWMinSD and OWMaxSD values.
OWSum2SD	Sum of the squares of the OWMinSD and OWMaxSD values.

Related Commands

Command	Description
show rtr configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show rtr reaction-configuration

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **show rtr reaction-configuration** command is replaced by the **show ip slamonitor reaction-configuration** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr reaction-configuration** command is replaced by the **show ip slareaction-configuration** command. See the **show ip slamonitor reaction-configuration** and **show ip slareaction-configuration** commands for more information.

To display the configured proactive threshold monitoring settings for all Cisco IOS IP Service Level Agreements (SLAs) operations or a specified operation, use the **show rtr reaction-configuration** command in user EXEC or privileged EXEC mode.

show rtr reaction-configuration [*operation-number*]

Syntax Description

operation-number

(Optional) Displays the reaction configuration for only the specified IP SLAs operation.

Command Default

Displays configured proactive threshold monitoring settings for all IP SLAs operations.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.3(7)T	This command was introduced.
12.3(14)T	This command was replaced by the show ip slamonitor reaction-configuration command.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was replaced by the show ip slamonitor reaction-configuration command.
12.2(33)SRB	This command was replaced by the show ip slareaction-configuration command.

Usage Guidelines

Use the **rtrreaction-configuration** command in global configuration mode to configure the proactive threshold monitoring parameters for an IP SLAs operations.

Examples

In the following example, multiple monitored elements (indicated by the Reaction values) are configured for a single IP SLAs operation:

```
Router# show rtr reaction-configuration
```

```
Entry Number: 1
Reaction: RTT
Threshold type: Never
Rising (milliseconds): 5000
Falling (milliseconds): 3000
Threshold Count: 5
Threshold Count2: 5
Action Type: None
Reaction: jitterDSAvg
Threshold type: average
Rising (milliseconds): 5
Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: triggerOnly
Reaction: jitterDSAvg
Threshold type: immediate
Rising (milliseconds): 5
Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: trapOnly
Reaction: PacketLossSD
Threshold type: immediate
Rising (milliseconds): 5
Threshold Falling (milliseconds): 3
Threshold Count: 5
Threshold Count2: 5
Action Type: trapOnly
```

The table below describes the significant fields shown in this output.

Table 83: show rtr reaction-configuration Field Descriptions

Field	Description
Reaction:	The monitored element configured for the specified IP SLAs operation. Corresponds to the react{connectionLoss jitterAvg jitterDSAvg jitterSDAvg mos PacketLossDS PacketLossSD rtt timeout verifyError} syntax in the rtrreaction-configuration command.
Threshold type:	The configured threshold type. Corresponds to the threshold-type {never immediate consecutive xofy average} syntax in the rtrreaction-configuration command.

Field	Description
Rising (milliseconds):	The <i>upper-threshold</i> value, as configured by the threshold-valueupper-thresholdlower-threshold syntax in the rtrreaction-configuration command.
Threshold Falling (milliseconds):	The <i>lower-threshold</i> value, as configured by the threshold-valueupper-thresholdlower-threshold syntax in the rtrreaction-configuration command.
Threshold Count:	The <i>x-value</i> in the xofy threshold type, or the <i>number-of-measurements</i> value for average threshold type.
Threshold Count2:	The <i>y-value</i> in the xofy threshold-type.
Action Type:	The reaction to be performed when the violation conditions are met, as configured by the action-type { none trapOnly triggerOnly trapAndTrigger } syntax in the rtrreaction-configuration command.

Related Commands

Command	Description
rtr reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.

show rtr reaction-trigger

**Note**

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **show rtr reaction-trigger** command is replaced by the **show ip sla monitor reaction-trigger** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr reaction-trigger** command is replaced by the **show ip sla reaction-trigger** command. See the **show ip sla monitor reaction-trigger** and **show ip sla reaction-trigger** commands for more information.

To display the reaction trigger information for all Cisco IOS IP Service Level Agreements (IP SLAs) operations or the specified operation, use the **show rtr reaction-trigger** command in user EXEC or privileged EXEC mode.

show rtr reaction-trigger [*operation-number*]

Syntax Description

operation-number

(Optional) Number of the IP SLAs operation to display.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
11.2	This command was introduced.
12.3(14)T	This command was replaced by the show ip sla monitor reaction-trigger command.
12.2(31)SB2	This command was replaced by the show ip sla monitor reaction-trigger command.
12.2(33)SRB	This command was replaced by the show ip sla reaction-trigger command.

Usage Guidelines

Use the **show rtr reaction-trigger** command to display the configuration status and operational state of target operations that will be triggered as defined with the **rtr reaction-configuration** global command.

Examples

The following is sample output from the **show rtr reaction-trigger** command:

```
Router# show rtr reaction-trigger 1
      Reaction Table
Entry Number: 1
Target Entry Number: 2
```

Status of Entry (SNMP RowStatus): active
Operational State: pending

Related Commands

Command	Description
show rtr configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.

show rtr responder

Note

Effective with Cisco IOS Release 12.3(14)T and 12.2(31)SB2, the **show rtr responder** command is replaced by the **show ip sla monitor responder** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr responder** command is replaced by the **show ip sla responder** command. See the **show ip sla monitor responder** and **show ip sla responder** commands for more information.

To display Cisco IOS IP Service Level Agreements (IP SLAs) Responder information, use the **show rtr responder** command in user EXEC or privileged EXEC mode.

show rtr responder

Syntax Description

This command has no arguments or keywords.

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
12.0(3)T	This command was introduced.
12.3(14)T	This command was replaced by the show ip sla monitor responder command.
12.2(31)SB2	This command was replaced by the show ip sla monitor responder command.
12.2(33)SRB	This command was replaced by the show ip sla responder command.

Usage Guidelines

Use the **show rtr responder** command to display information about recent sources of IP SLAs control messages, such as who has sent recent control messages and who has sent invalid control messages.

Examples

The following is sample output from the **show rtr responder** command:

```
Router# show rtr responder

RTR Responder is: Enabled
Number of control message received: 19 Number of errors: 1
Recent sources:
  4.0.0.1 [19:11:49.035 UTC Sat Dec 2 1995]
  4.0.0.1 [19:10:49.023 UTC Sat Dec 2 1995]
  4.0.0.1 [19:09:48.707 UTC Sat Dec 2 1995]
  4.0.0.1 [19:08:48.687 UTC Sat Dec 2 1995]
  4.0.0.1 [19:07:48.671 UTC Sat Dec 2 1995]
Recent error sources:
  4.0.0.1 [19:10:49.023 UTC Sat Dec 2 1995] RTT_AUTH_FAIL
```

Related Commands

Command	Description
show rtr configuration	Displays configuration values for IP SLAs operations.

show rtr totals-statistics

Note

Effective with Cisco IOS Release 12.3(14)T, the **show rtr totals-statistics** command is replaced by the **show ip sla monitor totals -statistics** command. Effective with Cisco IOS Release 12.2(31)SB2, the **show rtr totals-statistics** command is replaced by the **show ip sla monitor statistics aggregated** command. Effective with Cisco IOS Release 12.2(33)SRB, the **show rtr totals-statistics** command is replaced by the **show ip sla statistics aggregated** command. See the **show ip sla monitor totals -statistics**, **show ip sla monitor statistics aggregated**, and **show ip sla statistics aggregated** commands for more information.

To display the total statistical values (accumulation of error counts and completions) for all Cisco IOS IP Service Level Agreements (IP SLAs) operations or the specified operation, use the **show rtr totals-statistics** command in user EXEC or privileged EXEC mode.

show rtr totals-statistics [*number*] [**tabular** | **full**]

Syntax Description

<i>number</i>	(Optional) Number of the IP SLAs operation to display.
tabular	(Optional) Display information in a column format reducing the number of screens required to display the information.
full	(Optional) Display all information using identifiers next to each displayed value. This is the default.

Command Default

Full format for all operations

Command Modes

User EXEC Privileged EXEC

Command History

Release	Modification
11.2	This command was introduced.
12.3(14)T	This command was replaced by the show ip sla monitor total-statistics command.
12.2(31)SB2	This command was replaced by the show ip sla monitor statistics aggregated command.
12.2(33)SRB	This command was replaced by the show ip sla statistics aggregated command.

Usage Guidelines

The total statistics consist of the following items:

- The operation number
- The start time of the current hour of statistics
- The age of the current hour of statistics
- The number of attempted operations

You can also use the **show rtr distributions-statistics** and **show rtr collection-statistics** commands to display additional statistical information.

Examples

The following is sample output from the **show rtr totals-statistics** command in full format:

```
Router# show rtr totals-statistics
      Statistic Totals
Entry Number: 1
Start Time Index: *17:15:41.000 UTC Thu May 16 1996
Age of Statistics Entry (hundredths of seconds): 48252
Number of Initiations: 10
```

Related Commands

Command	Description
show rtr collection-statistics	Displays statistical errors for all IP SLAs operations or the specified operation.
show rtr configuration	Displays configuration values including all defaults for all IP SLAs operations or the specified operation.
show rtr distributions-statistics	Displays statistic distribution information (captured response times) for all IP SLAs operations or the specified operation.

signature (IP SLA)

To specify the payload pattern of Ethernet frames for an IP Service level Agreements (SLAs) service performance test stream, use the **signature** command in IP SLA service performance configuration mode. To return to default, use the **no** form of this command.

signature *sequence*

no signature

Syntax Description	
<i>sequence</i>	Sequence of payload nibbles (4 bits). The maximum number of nibbles is 64.

Command Default	No pattern is defined.

Command Modes	IP SLA service performance (config-ip-sla-service-performance)

Command History	Release	Modification
	15.3(2)S	This command was introduced.

Usage Guidelines	Use this command to specify a numeric character string to verify that the operation payload is not corrupted in either direction.

Examples

```
IP SLAs Infrastructure Engine-III
Entry number: 1
Service Performance Operation
Type: ethernet
Destination
MAC Address: 4055.398d.8bd2
VLAN:
Interface: GigabitEthernet0/4
Service Instance: 10
EVC Name:
Duration Time: 20
Interval Buckets: 5

Signature:
05060708

Description: this is with all operation modes

Measurement Type:
throughput, loss
Direction: internal

Profile Traffic:
Direction: internal
CIR: 0
```

EIR: 0
CBS: 0
EBS: 0
Burst Size: 3
Burst Interval: 20
Rate Step (kbps): 1000 2000

Profile Packet:

Inner COS: 6
Outer COS: 6
Inner VLAN: 100
Outer VLAN: 100
Source MAC Address: 4055.398d.8d4c
Packet Size: 512

Schedule:

Operation frequency (seconds): 64 (not considered if randomly scheduled)
Next Scheduled Start Time: Start Time already passed
Group Scheduled : FALSE
Randomly Scheduled : FALSE
Life (seconds): Forever
Entry Ageout (seconds): never
Recurring (Starting Everyday): FALSE
Status of entry (SNMP RowStatus): Active

source-ip (tplt)

To specify an source IP address in an auto IP Service Level Agreements (SLAs) operation template, use the **source-ip** command in the appropriate submode of IP SLA template configuration mode. To remove the specified address from the configuration, use the **no** form of the command.

source-ip {*ip-address*| *hostname*}

no source-ip {*ip-address*| *hostname*}

Syntax Description

<i>ip-address</i> <i>hostname</i>	IP v4 address or hostname of source .

Command Default

The source address for the operation template is the IP address closest to the destination.

Command Modes

ICMP echo configuration (config-tplt-icmp-ech) ICMP jitter configuration (config-tplt-icmp-jtr) TCP connect configuration (config-tplt-tcp-conn) UDP echo configuration (config-tplt-udp-ech) UDP jitter configuration (config-tplt-udp-jtr)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command adds the specified source address to the configuration of an auto IP SLAs operation template. When a source IP address or hostname is not specified, auto IP SLAs chooses the IP address nearest to the destination.

You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

Examples

The following example shows how to configure the IP address and port number of the source in an auto IP SLAs operation template:

```
Router(config)#ip sla auto template type ip udp-jitter 1
Router(config-tplt-udp-jtr)# source-ip 10.1.1.1
Router(config-tplt-udp-jtr)# source-port 23
Router(config-tplt-udp-jtr)# end
Router# show
ip sla auto template type ip udp-jitter
IP SLAs Auto Template: 1
  Measure Type: udp-jitter (control enabled)
  Description:
  IP options:
    Source IP: 10.1.1.1 Source Port: 23
```

```

VRF:      TOS: 0x0
Operation Parameters:
  Request Data Size: 16   Verify Data: false
  Timeout: 5000          Threshold: 5000
Statistics Aggregation option:
  Hours of statistics kept: 2
History options:
  History filter: none
  Max number of history records kept: 15
  Lives of history kept: 0
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None

```

Related Commands

Command	Description
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.

source-port

To specify a source-port number in an auto Service Level Agreements (SLAs) operation template, use the **source-port** command in the appropriate submode of IP SLA template configuration mode. To remove the specified port from the configuration, use the **no** form of the command.

source-port *port-number*

no source-port *port-number*

Syntax Description

<i>port-number</i>	Port number of source.

Command Default

Auto IP SLAs chooses an available port.

Command Modes

TCP connect configuration (config-tplt-tcp-conn) UDP echo configuration (config-tplt-udp-ech) UDP jitter configuration (config-tplt-udp-jtr)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command adds the specified source-port number to the configuration of an auto IP SLAs operation template. When a source-port number is not specified, auto IP SLAs chooses an available port.

You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

Examples

The following example shows how to configure the IP address and port number of the source in an auto IP SLAs operation template:

```
Router(config)#ip sla auto template type ip udp-jitter 1
Router(config-tplt-udp-jtr)# source-ip 10.1.1.1
Router(config-tplt-udp-jtr)# source-port 23
Router(config-tplt-udp-jtr)# end
Router# show
  ip sla auto template type ip udp-jitter
IP SLAs Auto Template: 1
  Measure Type: udp-jitter (control enabled)
  Description:
  IP options:
    Source IP: 10.1.1.1 Source Port: 23
    VRF:      TOS: 0x0
  Operation Parameters:
    Request Data Size: 16   Verify Data: false
```

```
Timeout: 5000           Threshold: 5000
Statistics Aggregation option:
  Hours of statistics kept: 2
History options:
  History filter: none
  Max number of history records kept: 15
  Lives of history kept: 0
Statistics Distributions options:
  Distributions characteristics: RTT
  Distributions bucket size: 20
  Max number of distributions buckets: 1
Reaction Configuration: None
```

Related Commands

Command	Description
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.

start-time

To specify the start time in an auto IP Service Level Agreement (SLAs) scheduler, use the **start-time** command in IP SLAs auto-measure schedule configuration mode.

start-time {*hh : mm [: ss]* [*month day*| *day month*]} **pending**| **now**| **after** *hh : mm : ss*}

Syntax Description

<i>hh : mm [:ss]</i>	Absolute start time, in 24-hour clock format with hours (<i>hh</i>), minutes (<i>mm</i>), and seconds (<i>ss</i>) separated by a colon (:). Seconds (:ss) are optional. Range is from 00:00:00 to 23:59:59, with 00:00 being midnight and 23:59 being 11:59 p.m. The colons (:) are required. Current month and day is default.
<i>month day</i>	(Optional) Start day other than today, in month then day format. Value for month is either the full English name or the first three letters of the month. Range for day is from 1 to 31.
<i>day month</i>	(Optional) Start day other than today, in day then month format. Range for day is from 1 to 31. Value for the month is either the full English name or the first three letters of the month.
pending	Specifies that no information is collected. This is the default.
now	Specifies that this operation starts immediately after this command is configured.
after <i>hh : mm : ss</i>	Specifies that start time is up to one 24-hour day after this command is configured, with hours (<i>hh</i>), minutes (<i>mm</i>), and seconds (<i>ss</i>) separated by a colon (:). Range is from 00:00:00 to 23:59:59. The colons (:) are required.

Command Default

The auto IP SLAs scheduler is enabled and the state of the scheduler is pending.

Command Modes

IP SLAs auto-measure schedule configuration (config-am-schedule)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command changes the value of the start-time characteristic in the IP SLAs schedule from the default (pending) to the specified value.

If the operation being controlled by an auto IP SLAs scheduler is in a pending trigger (default) state, you can define the conditions under which the operation makes the transition from pending to active with the **react** command.

After you configure this command to specify a start time other than the default (pending), you cannot modify the auto IP SLAs scheduler. If you attempt to modify a scheduler with a specified start-time, the following message appears:

```
%Entry already scheduled and cannot be modified
```

To change the configuration of an auto IP SLAs scheduler in which the start time is other than the default, use the **no** form of the **ip sla auto schedule** command to remove the scheduler configuration and reenter the configuration information.

Examples

The following example shows how to configure an auto IP SLAs scheduler that will cause an auto IP SLAs operation to actively collect data at 3:00 p.m. on April 5. The operation will age out after 12 hours of inactivity, which can be before it starts or after it has finished its life. When the operation ages out, all configuration information for the operation is removed from the running configuration in RAM:

```
Router(config)#ip sla auto schedule apr5
Router(config-am-schedule)#ageout 43200
Router(config-am-schedule)#frequency 70
Router(config-am-schedule)#life 43200
Router(config-am-schedule)#probe-interval 1500
Router(config-am-schedule)#start-time 15:00 apr 5
Router(config-am-schedule)#end
Router#
Router# show ip sla auto schedule apr5
Group sched-id: apr5
  Probe Interval (ms) : 1500
  Group operation frequency (sec): 70
  Status of entry (SNMP RowStatus): Active
  Next Scheduled Start Time: P15:00 apr 5
  Life (sec): 43200
  Entry Ageout (sec): 43200
Router#
```

Related Commands

Command	Description
ip sla auto schedule	Begins configuration for an auto IP SLAs scheduler and enters IP SLA auto-measure schedule configuration mode.
schedule	Specifies an auto IP SLAs scheduler for an IP SLAs auto-measure group.
react	Configures certain actions to occur based on events under the control of auto IP SLAs.

Command	Description
show ip sla auto schedule	Displays the configuration including default values of auto IP SLAs schedulers.

statistics-distribution-interval

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **statistics-distribution-interval** command is replaced by the **history statistics-distribution-interval** command. See the **history statistics-distribution-interval** command for more information.

To set the time interval for each statistics distribution kept for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **statistics-distribution-interval** command in the appropriate submode of IP SLA monitor configuration mode. To return to the default value, use the **no** form of this command.

statistics-distribution-interval *milliseconds*

no statistics-distribution-interval

Syntax Description

milliseconds

Number of milliseconds (ms) used for each statistics distribution kept. The default is 20.

Command Default

20 ms

Command Modes

DHCP configuration (config-sla-monitor-dhcp) DLSw configuration (config-sla-monitor-dlsw) DNS configuration (config-sla-monitor-dns) FTP configuration (config-sla-monitor-ftp) HTTP configuration (config-sla-monitor-http) ICMP echo configuration (config-sla-monitor-echo) ICMP path echo configuration (config-sla-monitor-pathEcho) ICMP path jitter configuration (config-sla-monitor-pathJitter) TCP connect configuration (config-sla-monitor-tcp) UDP echo configuration (config-sla-monitor-udp) UDP jitter configuration (config-sla-monitor-jitter) VoIP configuration (config-sla-monitor-voip)

Command History

Release	Modification
11.2	This command was introduced.
12.4(4)T	This command was replaced by the history statistics-distribution-interval command.
12.2(33)SRB	This command was replaced by the history statistics-distribution-interval command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Release	Modification
12.2(33)SB	This command was replaced by the history statistics-distribution-interval command.
12.2(33)SXI	This command was replaced by the history statistics-distribution-interval command.

Usage Guidelines

In most situations, you do not need to change the time interval for each statistics distribution or number of distributions kept. Only change these parameters when distributions are needed, for example, when performing statistical modeling of your network. To set the number of statistics distributions kept, use the **distributions-of-statistics-kept** command.

Note

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation.

Examples

In the following example, the statistics distribution is set to five and the distribution interval is set to 10 ms for IP SLAs ICMP echo operation 1. Consequently, the first distribution will contain statistics from 0 to 9 ms, the second distribution will contain statistics from 10 to 19 ms, the third distribution will contain statistics from 20 to 29 ms, the fourth distribution will contain statistics from 30 to 39 ms, and the fifth distribution will contain statistics from 40 ms to infinity.

```
ip sla monitor 1
 type echo protocol ipIcmpEcho 172.16.161.21
 distributions-of-statistics-kept 5
 statistics-distribution-interval 10
!
ip sla monitor schedule 1 life forever start-time now
```

Related Commands

Command	Description
distributions-of-statistics-kept	Sets the number of statistics distributions kept per hop during the IP SLAs operation's lifetime.
hops-of-statistics-kept	Sets the number of hops for which statistics are maintained per path for the IP SLAs operation.
hours-of-statistics-kept	Sets the number of hours for which statistics are maintained for the IP SLAs operation.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
paths-of-statistics-kept	Sets the number of paths for which statistics are maintained per hour for the IP SLAs operation.

tag (IP SLA)

To create a user-specified identifier for a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **tag** (IP SLA) command in the appropriate submode of IP SLA configuration, auto IP SLA MPLS configuration, or IP SLA monitor configuration mode. To remove a tag from an operation, use the **no** form of this command.

tag *text*

no tag

Syntax Description

<i>text</i>	Name of a group to which the operation belongs from 0 to 16 ASCII characters.

Command Default

No tag identifier is specified.

Command Modes

IP SLA Configuration

DHCP configuration (config-ip-sla-dhcp)

DLsw configuration (config-ip-sla-dlsw)

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRB	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	The following configuration modes were added: • Ethernet echo • Ethernet jitter • Ethernet parameters • VCCV
12.4(20)T	This command was modified. The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.
12.2(58)SE	This command was modified. Support for the video configuration submode of the IP SLA configuration mode was added.

Release	Modification
15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.

Usage Guidelines

An operation tag is normally used to logically link operations in a group.

Tags can be used to support automation (for example, by using the same tag for two different operations on two different routers echoing the same target).

The **tag** (IP SLA) command is supported in IPv4 networks. This command is also supported in IPv6 networks when configuring an IP SLAs operation that supports IPv6 addresses.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release table). Note that if you are configuring an IP SLAs label switched path (LSP) Health Monitor operation, see the Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release table for information on Cisco IOS release dependencies. You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

The configuration mode for the **tag** (IP SLA) command varies depending on the Cisco IOS release you are running and the operation type configured.

Table 84: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI, 12.2(58)SE, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Table 85: Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(6)T, 12.0(32)SY, 12.2(31)SB2, 12.2(33)SRB, 12.2(33)SXH, or later releases	auto ip sla mpls-lsp-monitor	Auto IP SLA MPLS configuration

Examples

In the following examples, an IP SLAs ICMP echo operation is tagged with the label testoperation.

Examples

This example shows the **tag** (IP SLA) command being used in an IPv4 network in ICMP echo configuration mode within IP SLA configuration mode:

```
ip sla 1
 icmp-echo 172.16.1.176
 tag testoperation
!
ip sla schedule 1 life forever start-time now
```

Examples

This example shows the **tag** (IP SLA) command being used in an IPv4 network in ICMP echo configuration mode within IP SLA monitor configuration mode:

```
ip sla monitor 1
 type echo protocol ipIcmpEcho 172.16.1.176
 tag testoperation
!
ip sla monitor schedule 1 life forever start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

tcp-connect

To define a Cisco IOS IP Service Level Agreements (SLAs) Transmission Control Protocol (TCP) connection operation, use the **tcp-connect** command in IP SLA configuration mode.

tcp-connect {*destination-ip-address*|*destination-hostname*} *destination-port* [**source-ip** {*ip-address*|*hostname*} **source-port** *port-number*] [**control** {**enable**|**disable**}]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP v4 or IPv6 address or hostname .
<i>destination-port</i>	Specifies the destination port number. The range is from 1 to 65535 or for a non-Cisco IP host, a known port number (for example, 21 for FTP, 23 for Telnet, or 80 for HTTP server). In Cisco IOS Release 15.2(3)T and later releases, the value of the <i>destination-port</i> variable is selected by the responder if you do not specify a port number.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP v4 or IPv6 address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
<i>source-port</i> <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.
control enable disable	(Optional) Enables or disables the IP SLAs control protocol to send a control message to the IP SLAs Responder prior to sending an operation packet. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs Responder.

Command Default

No IP SLAs operation type is associated with the operation number being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type tcpConnect dest-ipaddr command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type tcpConnect dest-ipaddr command.
12.2(33)SRC	Support for IPv6 addresses was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type tcpConnect dest-ipaddr command. Support for IPv6 addresses was added.
12.4(20)T	Support for IPv6 addresses was added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type tcpConnect dest-ipaddr command.
15.2(3)T	This command was modified. A value for the <i>destination-port</i> variable is selected by the responder if you do not specify a port number.

Usage Guidelines

The TCP connection operation is used to discover the time required to connect to the target device. This operation can be used to test virtual circuit availability or application availability and is useful for testing Telnet or HTTP connection times.

If the target is a Cisco router, then IP SLAs makes a TCP connection to any port number specified by using the *destination-port* variable. If the destination is a non-Cisco IP host, you must specify a known target port number (for example, 21 for FTP, 23 for Telnet, or 80 for HTTP server).

In Cisco IOS Release 15.2(3)T and later releases, if you do not specify a destination port number using the *destination-port* variable, the responder selects a port number on the target device and sends the port number back to the sender for use during the operation.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla global** configuration command) and then reconfigure the operation with the new operation type.

You must enable the IP SLAs Responder on the target router before you can configure a TCP Connect operation.

Control protocol is required when the target device is a Cisco router that does not natively provide the UDP or TCP Connect service. Prior to sending an operation packet to the target router, IP SLAs sends a control message to the IP SLAs Responder to enable the destination port. If you disable control by using the **control disable** keyword combination with this command, you must define the IP address of the source for the Cisco IOS IP SLAs Responder by using the **ip sla responder tcp-connect ipaddress** command on the destination device.

IP SLAs TCP connect operations support both IPv4 and IPv6 addresses.

Examples

In the following example, IP SLAs operation 11 is configured as a TCP connection operation using the destination IP address 172.16.1.175 and the destination port 2400:

```
ip sla 11
  tcp-connect 172.16.1.175 2400
!
```

```
ip sla schedule 11 start-time now life forever
```

In the following example, IP SLAs operation 12 is configured as a TCP connection operation using the destination IPv6 address 2001:0DB8:200::FFFE and the destination port 2400:

```
ip sla 12
  tcp-connect 2001:0DB8:200::FFFE
!
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla responder tcp-connect ipaddress	Permanently enables IP SLAs Responder functionality on specified IP address and port.

template (am-group)

To add a auto IP Service Level Agreements (SLAs) operation template to the configuration of an IP SLAs auto-measure group, use the **template** command in IP SLA auto-measure group configuration mode. To remove the template from the configuration and restore the default, use the **no** form of this command.

template *operation*

no template

Syntax Description

<i>operation</i>	Type of IP operation. Use one of the following keywords: • icmp-echo --Internet Control Message Protocol (ICMP) echo operation • icmp-jitter-- Internet Control Message Protocol (ICMP) jitter operation • tcp-connect-- Transmission Control Protocol (TCP) connection operation • udp-echo-- User Datagram Protocol (UDP) echo operation • udp-jitter-- User Datagram Protocol (UDP) jitter operation

Command Default

Type of operation for the auto-measure group being configured is ICMP jitter.

Command Modes

IP SLA auto-measure group configuration (config-am-grp)

Command History

Release	Modification
15.1(1)T	This command was introduced.

Usage Guidelines

This command changes the operation for the auto-measure group being configured from the default (ICMP jitter) to the operation defined in the specified template.

Only one auto IP SLAs operation template can be specified for each IP SLAs auto-measure group. Each operation template can be referenced by more than one group.

If no auto IP SLAs operation template is specified for an auto-measure group, the operation for the group is ICMP jitter (default).

If you issue this command and the specified template does not exist, the auto-measure group operations cannot start. If you configure the specified template after using this command, the template is added to the group configuration and scheduling can proceed.

To change the operation of an existing auto-measure group, first use the **no** form of this command to delete the auto IP SLAs operation template from the group configuration and then reconfigure the group with either a different or no operation template.

To configure an auto IP SLAs operation template, use the **ip sla auto template** command.

Examples

The following example shows how to add an auto IP SLAs endpoint list to the configuration of an IP SLAs auto-measure group:

```
Router(config)#ip sla auto group type ip 1

Router(config-am-grp)#template 1
Router(config-am-grp)#destination 1
Router(config-am-grp)#schedule 1
Router(config-am-grp)#end
Router#
Router#show ip sla auto group
Group Name: 1
  Description:
  Activation Trigger: Immediate
  Destination: 1
  Schedule: 1
IP SLAs Auto Template: 1
  Measure Type: icmp-jitter
  Description:
  IP options:
    Source IP: 0.0.0.0
    VRF:      TOS: 0x0
  Operation Parameters:
    Number of Packets: 10   Inter packet interval: 20
    Timeout: 5000          Threshold: 5000
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None
IP SLAs auto-generated operations of group 1
  no operation created
```

Related Commands

Command	Description
ip sla auto template	Enters IP SLA auto-measure template configuration mode and begins creating an auto IP SLAs operation template.

threshold (IP SLA)

To set the upper threshold value for calculating network monitoring statistics created by a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **threshold** command in the appropriate submode of IP SLA configuration, auto IP SLA MPLS configuration, IP SLA auto Ethernet configuration, IP SLA monitor configuration, or IP SLA template parameters configuration mode. To return to the default value, use the no form of this command.

threshold *milliseconds*

no threshold

Syntax Description

<i>milliseconds</i>	Length of time required for a rising threshold to be declared, in milliseconds (ms). Range is 0 to 60000. Default is 5000.

Command Default

The default is 5000 ms.

Command Modes

DHCP configuration (config-ip-sla-dhcp) DLSw configuration (config-ip-sla-dlsw) DNS configuration (config-ip-sla-dns) Ethernet echo (config-ip-sla-ethernet-echo) Ethernet jitter (config-ip-sla-ethernet-jitter) FTP configuration (config-ip-sla-ftp) HTTP configuration (config-ip-sla-http) ICMP echo configuration (config-ip-sla-echo) ICMP jitter configuration (config-ip-sla-icmpjitter) ICMP path echo configuration (config-ip-sla-pathEcho) ICMP path jitter configuration (config-ip-sla-pathJitter) TCP connect configuration (config-ip-sla-tcp) UDP echo configuration (config-ip-sla-udp) UDP jitter configuration (config-ip-sla-jitter) VCCV configuration (config-sla-vccv) VoIP configuration (config-ip-sla-voip)

Command Modes

MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command Modes

Ethernet parameters configuration (config-ip-sla-ethernet-params)

Command Modes

DHCP configuration (config-sla-monitor-dhcp) DLSw configuration (config-sla-monitor-dlsw) DNS configuration (config-sla-monitor-dns) FTP configuration (config-sla-monitor-ftp) HTTP configuration (config-sla-monitor-http) ICMP echo configuration (config-sla-monitor-echo) ICMP path echo configuration (config-sla-monitor-pathEcho) ICMP path jitter configuration (config-sla-monitor-pathJitter) TCP connect configuration (config-sla-monitor-tcp) UDP echo configuration (config-sla-monitor-udp) UDP jitter configuration (config-sla-monitor-jitter) VoIP configuration (config-sla-monitor-voip)

Command Modes

ICMP echo configuration (config-icmp-ech-params) TCP connect configuration (config-tcp-conn-params) UDP echo configuration (config-udp-ech-params) UDP jitter configuration (config-udp-jtr-params)

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRB	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SRC	The VCCV configuration mode was added.
12.2(33)SB	The following configuration modes were added: • Ethernet echo • Ethernet jitter • Ethernet parameters • VCCV
12.4(20)T	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
12.2(33)SXI	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
15.1(1)T	This command was modified. The IP SLA template parameters configuration mode was added.

Usage Guidelines

The value specified for this command must not exceed the value specified for the **timeout** command.

The threshold value configured by this command is used only to calculate network monitoring statistics created by a Cisco IOS IP SLAs operation. This value is not used for generating Simple Network Management Protocol (SNMP) trap notifications. Use the **ipslareaction-configuration** command in global configuration mode to configure the thresholds for generating IP SLAs SNMP trap notifications. For auto IP SLAs in Cisco IOS IP SLA Engine 3.0, use the **react** command to configure the thresholds for generating IP SLAs SNMP trap notifications.

For the IP SLAs User Datagram Protocol (UDP) jitter operation, the **threshold (IP SLA)** command sets the upper threshold value for the average jitter calculation. For all other IP SLAs operations, the **threshold (IP SLA)** command sets the upper threshold value for the round-trip time (RTT) measurement. IP SLAs will calculate the number of times the average jitter or RTT measurement exceeds the specified threshold value.

Consider the following guidelines before configuring the **frequency (IP SLA)**, **timeout (IP SLA)**, and **threshold (IP SLA)** commands. For the IP SLAs UDP jitter operation, the following guidelines are recommended:

- $(\text{frequencyseconds}) > ((\text{timeoutmilliseconds}) + N)$
- $(\text{timeoutmilliseconds}) > (\text{thresholdmilliseconds})$

where $N = (\text{num-packetsnumber-of-packets}) * (\text{intervalinterpacket-interval})$. If you are running Cisco IOS IP SLAs Engine 3.0, use the **num-packets** command and the **interval** (params) commands to configure the values that define N. Otherwise, use the **udp-jitter** command to configure the **num-packetsnumber-of-packets** and **intervalinterpacket-interval** values.

For all other IP SLAs operations, the following configuration guideline is recommended:

$(\text{frequencyseconds}) > (\text{timeoutmilliseconds}) > (\text{thresholdmilliseconds})$

The **threshold** (IP SLA) command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release table). If you are configuring an IP SLAs label switched path (LSP) Health Monitor operation, see the Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release table for information on Cisco IOS release dependencies. You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

The configuration mode for the **threshold** command varies depending on the Cisco IOS release you are running and the operation type configured.

If you are running Cisco IOS IP SLAs Engine 3.0, you must enter the **parameters** command in IP SLA template configuration mode before you can use the **threshold** command.

Table 86: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration
15.1(1)T	ip sla auto template	IP SLA template configuration

Table 87: Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(6)T, 12.0(32)SY, 12.2(31)SB2, 12.2(33)SRB, 12.2(33)SXH, or later releases	auto ip sla mpls-lsp-monitor	Auto IP SLA MPLS configuration

Examples

The following examples show how to configure the threshold of the IP SLAs ICMP echo operation to 2500.

Examples

```
ip sla 1
  icmp-echo 172.16.1.176
  threshold 2500
!
ip sla schedule 1 start-time now
```

Examples

```
ip sla monitor 1
  type echo protocol ipIcmpEcho 172.16.1.176
  threshold 2500
!
ip sla monitor schedule 1 start-time now
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 1
Router(config-tplt-icmp-ech)# parameters
Router(config-icmp-ech-params)# timeout 2500
Router(config-icmp-ech-params)# threshold 2500
Router(config-icmp-ech-params)# end
Router#
00:02:26: %SYS-5-CONFIG_I: Configured from console by console
Router# show
  ip sla auto template type ip udp-echo
IP SLAs Auto Template: 1
  Measure Type: udp-echo (control enabled)
  Description:
.
.
.
Operation Parameters:
  Request Data Size: 16   Verify Data: false
  Timeout: 2500 Threshold: 2500

    Max number of distributions buckets: 1
  Reaction Configuration: None
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

Command	Description
ip sla monitor reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.
ip sla reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.
react	Configures reaction and proactive threshold monitoring parameters in an auto IP SLAs operation template
timeout	Sets the amount of time the IP SLAs operation waits for a response from its request packet.

threshold (IP SLA video)

To set the upper threshold value for calculating network monitoring statistics created by an IP Service Level Agreements (SLAs) video operation, use the **threshold** command in IP SLA video configuration mode. To return to the default value, use the **no** form of this command.

threshold *milliseconds*

no threshold *milliseconds*

Syntax Description

<i>milliseconds</i>	Length of time, in milliseconds (ms), required for a rising threshold to be declared. The range is from 0 to 60000. The default is based on the type of video traffic specified for the video profile being configured.

Command Default

The default is video-traffic dependent.

Command Modes

IP SLA video configuration (config-ip-sla-video)

Command History

Release	Modification
12.2(58)SE	This command was introduced.
15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Usage Guidelines

This command changes the threshold value in the video profile for an IP SLAs video operation from the traffic-dependent default to the specified value.

The threshold value configured by this command is used only to calculate network monitoring statistics created by an IP SLAs video operation. This value is not used for generating Simple Network Management Protocol (SNMP) trap notifications. Use the **ip sla reaction-configuration** command in global configuration mode to configure the thresholds for generating IP SLAs SNMP trap notifications.

The threshold value must be less than the value of the **timeout** (IP SLA video) command. The following guideline is recommended for configuring the frequency, timeout, and threshold settings in the video profile:

(frequency seconds) > (timeout milliseconds) > (threshold milliseconds)

The **threshold** (IP SLA video) command is supported in IPv4 networks.

Use the **show ip sla configuration** command to display configuration values, including all defaults, for all Cisco IOS IP SLAs operations or for a specified operation.

Examples

The following example shows how to configure the threshold of the IP SLAs video operation to 40 seconds:

```
Router(config-term)# ip sla 10
Router(config-ip-sla)# video 192.168.2.10 555 source-ip 192.168.2.17 source-port 24 profile
iptv
Router(config-ip-sla-video)# duration 40
Router(config-ip-sla-video)# frequency 90
Router(config-ip-sla-video)# timeout 45000
Router(config-ip-sla-video)# threshold 40000
Router(config-ip-sla-video)# end
Router#
4d23h: %SYS-5-CONFIG_I: Configured from console by console

Router# show ip sla configuration 10

Related Commands

Command	Description
duration (IP SLA video)	Sets the amount of time that platform-assisted video traffic is generated for an IP SLAs video operation.
frequency (IP SLA video)	Sets the rate at which an IP SLAs video operation repeats.
ip sla reaction-configuration	Configures proactive threshold monitoring parameters for an IP SLAs operation.
show ip sla configuration	Displays configuration values, including all defaults, for all IP SLAs operations or for a specified operation.
timeout (IP SLA video)	Sets the amount of time that an IP SLAs video operation waits for a response from its request packet.

timer inactivity

To configure an inactivity timer for the Two-Way Active Measurement Protocol (TWAMP) control session, use the **timer inactivity** command in TWAMP server configuration mode. To return to the default, use **no** form of this command.

timer inactivity *seconds*

no timer inactivity

Syntax Description

<i>seconds</i>	Timer value, in seconds. The range is from 1 to 6000. The default is 900.

Command Default

A TWAMP control session will end after 900 seconds of inactivity.

Command Modes

TWAMP server configuration (config-twamp-srvr)

Command History

Release	Modification
15.2(2)S	This command was introduced.
Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
15.2(3)T	This command was integrated into Cisco IOS Release 15.2(3)T.

Usage Guidelines

Use this command to specify the maximum time the TWAMP control session can be inactive before the session is ended.

Examples

The following example shows how to configure the TWAMP server function for an IP SLAs TWAMP responder:

```
Device(config)# ip sla server twamp
Device(config-twamp-srvr)# port 9000
Device(config-twamp-srvr)# timer inactivity 300
```

Related Commands

Command	Description
ip sla responder twamp	Enables a TWAMP control session.

timeout (IP SLA)

To set the amount of time a Cisco IOS IP Service Level Agreements (SLAs) operation waits for a response from its request packet, use the **timeout**(IP SLA) command in the appropriate submode of IP SLA configuration, auto IP SLA MPLS configuration, IP SLA auto Ethernet configuration, IP SLA monitor configuration or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

timeout *milliseconds*

no timeout

Syntax Description

<i>milliseconds</i>	Length of time the operation waits to receive a response from its request packet, in milliseconds (ms). Range is 0 to 604800000. We recommend that the value of the <i>milliseconds</i> argument be based on the sum of both the maximum round-trip time (RTT) value for the packets and the processing time of the IP SLAs operation.

Command Default

The default timeout value varies depending on the type of IP SLAs operation you are configuring.

Command Modes

DHCP configuration (config-ip-sla-dhcp)
 DLSw configuration (config-ip-sla-dlsw)
 DNS configuration (config-ip-sla-dns)
 Ethernet echo (config-ip-sla-ethernet-echo)
 Ethernet jitter (config-ip-sla-ethernet-jitter)
 FTP configuration (config-ip-sla-ftp)

UDP jitter configuration (config-sla-monitor-jitter)

VoIP configuration (config-sla-monitor-voip)

Command Modes

ICMP echo configuration (config-icmp-ech-params)

ICMP jitter configuration (config-icmp-jtr-params)

TCP connect configuration (config-tcp-conn-params)

UDP echo configuration (config-udp-ech-params)

UDP jitter configuration (config-udp-jtr-params)

Command History

Release	Modification
11.2	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRB	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SRC	The VCCV configuration mode was added.

Release	Modification
12.2(33)SB	The following configuration modes were added: • Ethernet echo • Ethernet jitter • Ethernet parameters • VCCV
12.4(20)T	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
12.2(33)SXI	The Ethernet echo, Ethernet jitter, and Ethernet parameters configuration modes were added.
15.1(1)T	This command was modified. The IP SLA template parameters configuration mode was added.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

We recommend that the value of the *milliseconds* argument be based on the sum of both the maximum round-trip time (RTT) value for the packets and the processing time of the IP SLAs operation.

Use the **timeout** (IP SLA) command to set how long the operation waits to receive a response from its request packet, and use the **frequency** (IP SLA) command to set the rate at which the IP SLAs operation restarts. The value specified for the **timeout** (IP SLA) command cannot be greater than the value specified for the **frequency** (IP SLA) command.

Consider the following guidelines before configuring the **frequency** (IP SLA), **timeout** (IP SLA), and **threshold** (IP SLA) commands. For the IP SLAs User Datagram Protocol (UDP) jitter operation, the following guidelines are recommended:

- $(\text{frequencyseconds}) > ((\text{timeoutmilliseconds}) + N)$
- $(\text{timeoutmilliseconds}) > (\text{thresholdmilliseconds})$

where $N = (\text{num-packetsnumber-of-packets}) * (\text{intervalinterpacket-interval})$. If you are running Cisco IOS IP SLAs Engine 3.0, use the **num-packets** command and the **interval** (params) commands to configure the values that define N. Otherwise, use the **udp-jitter** command to configure the **num-packetsnumber-of-packets** and **intervalinterpacket-interval** values.

For all other IP SLAs operations, the following configuration guideline is recommended:

(frequencyseconds) > (timeoutmilliseconds) > (thresholdmilliseconds)

The **timeout** (IP SLA) command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLA operation that supports IPv6 addresses.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release table). Note that if you are configuring an IP SLAs label switched path (LSP) Health Monitor operation, see the Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release table for information on Cisco IOS release dependencies. You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

The configuration mode for the **timeout** command varies depending on the Cisco IOS release you are running and the operation type configured.

If you are running Cisco IOS IP SLAs Engine 3.0, you must enter the **parameters** command in IP SLA template configuration mode before you can use the **timeout** command.

Table 88: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration
15.1(1)T	ip sla auto template	IP SLA template configuration

Table 89: Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(6)T, 12.0(32)SY, 12.2(31)SB2, 12.2(33)SRB, 12.2(33)SXH, or later releases	auto ip sla mpls-lsp-monitor	Auto IP SLA MPLS configuration

Examples

In the following examples, the timeout value for an IP SLAs operation 1 is set for 2500 ms:

Examples

```
ip sla 1
 icmp-echo 172.16.1.176
 timeout 2500
!
ip sla schedule 1 start-time now
```

Examples

```
ip sla monitor 1
  type echo protocol ipIcmpEcho 172.16.1.176
  timeout 2500
!
ip sla monitor schedule 1 start-time now
```

Examples

```
Router(config)#ip sla auto template type ip icmp-echo 1
Router(config-tplt-icmp-ech)#parameters
Router(config-icmp-ech-params)#timeout 2500
Router(config-icmp-ech-params)#end
Router#

frequency	Sets the rate at which the IP SLAs operation restarts.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

timeout (IP SLA video)

To set the amount of time that a Cisco IOS IP Service Level Agreements (SLAs) video operation waits for a response to its request packet, use the **timeout** command in IP SLA video configuration mode. To return to the default value, use the **no** form of this command.

timeout *milliseconds*

no timeout *milliseconds*

Syntax Description

<i>milliseconds</i>	Length of time, in milliseconds (ms), that the operation waits to receive a response from its request packet. The range is from 0 to 604800000. The default is 5000.

Command Default

The IP SLAs video operation waits 5000 ms for a response to its request packet.

Command Modes

IP SLA video configuration (config-ip-sla-video)

Command History

Release	Modification
12.2(58)SE	This command was introduced.
15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Usage Guidelines

This command changes the timeout value in the video profile for an IP SLAs video operation from the default (5000 ms) to the specified value.

The timeout value must be less than the value of the **frequency** (IP SLA video) command and must be greater than the value of the **threshold** (IP SLA video) command. The following guideline is recommended for configuring the frequency, timeout, and threshold settings in the video profile:

(frequency seconds) > (timeout milliseconds) > (threshold milliseconds)

The **timeout** (IP SLA video) command is supported in IPv4 networks.

Use the **show ip sla configuration** command to display configuration values, including all defaults, for all Cisco IOS IP SLAs operations or for a specified operation.

Examples

The following example shows how to configure an IP SLAs video operation to timeout in 45 seconds:

```
Router(config-term)# ip sla 10
Router(config-ip-sla)# video 192.168.2.10 555 source-ip 192.168.2.17 source-port 24 profile
iptv
Router(config-ip-sla-video)# duration 40
Router(config-ip-sla-video)# frequency 90
Router(config-ip-sla-video)# timeout 45000
Router(config-ip-sla-video)# threshold 40000
Router(config-ip-sla-video)# end
Router#
4d23h: %SYS-5-CONFIG_I: Configured from console by console

Router# show ip sla configuration 10

Related Commands

Command	Description
duration (IP SLA video)	Sets the amount of time that platform-assisted video traffic is generated for an IP SLAs video operation.
frequency (IP SLA video)	Sets the rate at which an IP SLAs video operation repeats.
show ip sla configuration	Displays configuration values, including all defaults, for all IP SLAs operations or for a specified operation.
threshold (IP SLA video)	Sets the upper threshold value for calculating network monitoring statistics created by an IP SLAs video operation.

timeout (LSP discovery)

To set the amount of time the label switched path (LSP) discovery process for a Cisco IOS IP Service Level Agreements (SLAs) LSP Health Monitor operation waits for a response to its echo request packets, use the **timeout** command in auto IP SLA MPLS LSP discovery parameters configuration mode. To return to the default value, use the **no** form of this command.

timeout *seconds*

no timeout

Syntax Description

<i>seconds</i>	The amount of time (in seconds) the LSP discovery process waits for a response to its echo request packets. The default value is 5 seconds.

Command Default

5 seconds

Command Modes

Auto IP SLA MPLS LSP discovery parameters configuration (config-auto-ip-sla-mpls-lpd-params)

Command History

Release	Modification
12.2(31)SB2	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.

Usage Guidelines

If no response is received for echo request packets sent along a particular LSP within the specified time limit, the LSP is considered to have had an operation failure.

Use the **path-discover** command to enable the LSP discovery option for an IP SLAs LSP Health Monitor operation and enter auto IP SLA MPLS LSP discovery parameters configuration mode.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, the LSP discovery option is enabled for LSP Health Monitor operation 1. Operation 1 is configured to automatically create IP SLAs LSP ping operations for the equal-cost multipaths to all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The timeout value for the echo request packets sent during the LSP discovery process is 4 seconds.

```
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  path-discover
!
maximum-sessions 2
```

```
session-timeout 60
interval 2
timeout 4
force-explicit-null
hours-of-statistics-kept 1
scan-period 30
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 frequency 100 start-time now
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd tree-trace action-type
trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react lpd lpd-group retry 3 action-type
trapOnly
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
path-discover	Enables the LSP discovery option for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS LSP discovery parameters configuration mode.

timeout (twamp)

To configure an inactivity timer for a Two-Way Active Measurement Protocol (TWAMP) test session, use the **timeout** command in TWAMP reflector configuration mode. To return to the default, use the **no** form of this command.

timeout *seconds*

no timeout

Syntax Description

<i>seconds</i>	Timer value, in seconds. The range is from 1 to 604800. The default is 900.

Command Default

A TWAMP test session will end after 900 seconds of inactivity.

Command Modes

TWAMP reflector configuration (config-twamp-ref)

Command History

Release	Modification
15.2(2)S	This command was introduced.
Cisco IOS XE Release 3.6S	This command was integrated into Cisco IOS XE Release 3.6S.
15.2(3)T	This command was integrated into Cisco IOS Release 15.2(3)T.

Usage Guidelines

Use this command to specify the maximum number of seconds after which an inactive TWAMP test session will end.

Examples

The following example shows how to configure a TWAMP session-reflector for an IP SLAs TWAMP responder:

```
Device(config)# ip sla responder twamp
Device(config-twamp-ref)# timeout 300
```

tos (IP SLA)

To define a type of service (ToS) byte in the IPv4 header of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **tos** (IP SLA) command in the appropriate submode of IP SLA configuration, IP SLA monitor configuration, or IP SLA template configuration mode. To return to the default value, use the no form of this command.

tos *number*

no tos

Syntax Description

<i>number</i>	Service type byte in the IPv4 header. The range is from 0 to 255. The default is 0.

Command Default

The default type-of-service value is 0.

Command Modes

HTTP configuration (config-ip-sla-http)
ICMP echo configuration (config-ip-sla-echo)
ICMP jitter configuration (config-ip-sla-icmpjitter)
ICMP path echo configuration (config-ip-sla-pathEcho)
ICMP path jitter configuration (config-ip-sla-pathJitter)
Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)
TCP connect configuration (config-ip-sla-tcp)
UDP echo configuration (config-ip-sla-udp)
UDP jitter configuration (config-ip-sla-jitter)

Command Modes

HTTP configuration (config-sla-monitor-http)
ICMP echo configuration (config-sla-monitor-echo)
ICMP path echo configuration (config-sla-monitor-pathEcho)
ICMP path jitter configuration (config-sla-monitor-pathJitter)
TCP connect configuration (config-sla-monitor-tcp)
UDP echo configuration (config-sla-monitor-udp)
UDP jitter configuration (config-sla-monitor-jitter)

Command Modes

ICMP echo configuration (config-tplt-icmp-ech)
ICMP jitter configuration (config-tplt-icmp-ech)

TCP connect configuration (config-tplt-tcp-conn)

UDP echo configuration (config-tplt-udp-ech)

UDP jitter configuration (config-tplt-udp-ech)

Command History

Release	Modification
12.0(3)T	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
15.1(1)T	This command was modified. The IP SLA template configuration mode was added.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

The ToS value is stored in an 8-bit field in the IPv4 packet header. This value contains information such as precedence and ToS. This information is useful for policy routing and for features like Committed Access Rate (CAR), where routers examine ToS values. This value is similar to the IPv6 traffic-class value that is stored in IPv6 packet headers using the **traffic-class** (IP SLA) command, but the two fields use different codes.

Note

This command is applicable only to IPv4 networks. In an IPv6 network, use the **traffic-class** (IP SLA) command to define a traffic-class byte in the IPv6 header of a Cisco IOS IP SLAs ICMP echo operation.

When the type of service is defined for an operation, the IP SLAs Responder will reflect the ToS value it receives.

To display the ToS value for all Cisco IOS IP SLAs operations or a specified operation, use the **showipslaconfiguration** command. To display the ToS value for all or an auto IP SLAs operation template, use the **showipslaautotemplate** command.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation, such

as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

The configuration mode for the **tos** command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured.

Table 90: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(33)SXI, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration
15.1(1)T	ip sla auto template	IP SLA template configuration

Examples

In the following examples, IP SLAs operation 1 is configured as an ICMP echo operation with destination IP address 172.16.1.176. The ToS value is set to 0x80. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

The examples show the **tos** (IP SLA) command being used in an IPv4 network.

Examples

```
ip sla 1
 icmp-echo 172.16.1.176
  tos 0x80
!
ip sla schedule 1 start-time now
```

Examples

```
ip sla monitor 1
 type echo protocol ipIcmpEcho 172.16.1.176
  tos 0x80
!
ip sla monitor schedule 1 start-time now
```

Examples

```
Router(config)#ip sla auto template type ip udp-echo 1
Router(config-tplt-udp-ech)# source-ip 10.1.1.1
Router(config-tplt-udp-ech)# tos 80
Router(config-tplt-udp-ech)# end
Router# show
 ip sla auto template type ip udp-echo
IP SLAs Auto Template: 1
  Measure Type: udp-echo (control enabled)
  Description:

  Max number of distributions buckets: 1
Reaction Configuration: None

```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
show ip sla configuration	Displays configuration values including all defaults for all Cisco IOS IP SLAs operations or a specified operation.
show ip sla auto template	Displays configuration values including all defaults for all auto IP SLAs operation templates or a specified template.
traffic-class (IP SLA)	Defines a traffic-class byte in the IPv6 header of a Cisco IOS IP SLAs ICMP echo operation in an IPv6 network.

track ip sla

To track the state of a Cisco IOS IP Service Level Agreements (SLAs) operation and to enter tracking configuration mode, use the **trackipsla** command in global configuration mode. To remove the tracking, use the **no** form of this command.

track *object-number* **ip sla** *operation-number* [**state**| **reachability**]

no track *object-number* **ip sla** *operation-number* [**state**| **reachability**]

Syntax Description

<i>object-number</i>	Object number representing the object to be tracked. The range is from 1 to 1000.
<i>operation-number</i>	Number used for the identification of the IP SLAs operation you are tracking.
state	(Optional) Tracks the operation return code.
reachability	(Optional) Tracks whether the route is reachable.

Command Default

IP SLAs tracking is disabled.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.4(20)T	This command was introduced. This command replaces the trackrtr command.
12.2(33)SX11	This command was integrated into Cisco IOS Release 12.2(33)SX11. This command replaces the trackrtr command.
Cisco IOS XE Release 2.4	This command was integrated into Cisco IOS XE Release 2.4. This command replaces the trackrtr command.
12.2(33)SRE	This command was integrated into Cisco IOS XE 12.2(33)SRE. This command replaces the trackrtr command.
15.1(3)T	This command was modified. The valid range of the <i>object-number</i> argument increased to 1000.
15.1(1)S	This command was modified. The valid range for the <i>object-number</i> argument increased to 1000.

Usage Guidelines

Every IP SLAs operation maintains an operation return-code value. This return code is interpreted by the tracking process. The return code may return OK, OverThreshold, and several other return codes. Different operations may have different return-code values, so only values common to all operation types are used.

Two aspects of an IP SLAs operation can be tracked: state and reachability. The difference between these aspects relates to the acceptance of the OverThreshold return code. The table below

shows the state and reachability aspects of IP SLAs operations that can be tracked.

Table 91: Comparison of State and Reachability Operations

Tracking	Return Code	Track State
State	OK	Up
	(all other return codes)	Down
Reachability	OK or over threshold	Up
	(all other return codes)	Down

As of Cisco IOS Release 15.1(3)T, a maximum of 1000 objects can be tracked. Although 1000 tracked objects can be configured, each tracked object uses CPU resources. The amount of available CPU resources on a router is dependent upon variables such as traffic load and how other protocols are configured and run. The ability to use 1000 tracked objects is dependent upon the available CPU. Testing should be conducted on site to ensure that the service works under the specific site traffic conditions.

Examples

The following example shows how to configure the tracking process to track the state of IP SLAs operation 2:

```
Router(config)#
track 1 ip sla 2 state
```

The following example shows how to configure the tracking process to track the reachability of IP SLAs operation 3:

```
Router(config)#
track 2 ip sla 3 reachability
```

Related Commands

Command	Description
track ip route	Tracks the state of an IP route and enters tracking configuration mode.

track rtr

Note

Effective with Cisco IOS Release 12.4(20)T, 12.2(33)SX11, 12.2(33)SRE and Cisco IOS XE Release 2.4, the **trackrtr** command is replaced by the **trackipsla** command. See the **trackipsla** command for more information.

To track the state of a Cisco IOS IP Service Level Agreements (SLAs) operation and to enter tracking configuration mode, use the **trackrtr** command in global configuration mode. To remove the tracking, use the **no** form of this command.

ttrack rtr command
track *object-number* **rtr** *operation-number* [**state**|**reachability**]

no track *object-number* **rtr** *operation-number* [**state**|**reachability**]

Syntax Description

<i>object-number</i>	Object number representing the object to be tracked. The range is from 1 to 500.
<i>operation-number</i>	Number used for the identification of the IP SLAs operation you are tracking.
state	Tracks the operation return code.
reachability	Tracks whether the route is reachable.

Command Default

IP SLAs tracking is disabled.

Command Modes

Global configuration (config)

Command History

12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.

Release	Modification
12.4(20)T	This command was replaced. This command was replaced by the trackipsla command.
12.2(33)SXII	This command was replaced. This command was replaced by the trackipsla command.
Cisco IOS XE Release 2.4	This command was replaced. This command was replaced by the trackipsla command.
12.2(33)SRE	This command was replaced. This command was replaced by the trackipsla command.

Usage Guidelines

Every IP SLAs operation maintains an operation return-code value. This return code is interpreted by the tracking process. The return code may return OK, OverThreshold, and several other return codes. Different operations may have different return-code values, so only values common to all operation types are used.

Two aspects of an IP SLAs operation can be tracked: state and reachability. The difference between these aspects relates to the acceptance of the OverThreshold return code. The table below shows the state and reachability aspects of IP SLAs operations that can be tracked.

Table 92: Comparison of State and Reachability Operations

Tracking	Return Code	Track State
State	OK (all other return codes)	Up Down
Reachability	OK or over threshold (all other return codes)	Up Down

Examples

The following example shows how to configure the tracking process to track the state of IP SLAs operation 2:

```
Router(config)# track 1 rtr 2 state
```

The following example shows how to configure the tracking process to track the reachability of IP SLAs operation 3:

```
Router(config)# track 2 rtr 3 reachability
```

traffic-class (IP SLA)

To define the traffic-class field in the IPv6 header of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **traffic-class (IP SLA)** command in the appropriate submode of IP SLA configuration or IP SLA monitor configuration mode. To return to the default value, use the no form of this command.

traffic-class *number*

no traffic-class

Syntax Description

<i>number</i>	Value in the traffic-class field of the IPv6 header. The range is from 0 to 255 (or FF in hexadecimal). This value can be preceded by "0x" to indicate hexadecimal notation. The default is 0.

Command Default

The default traffic-class value is 0.

Command Modes

ICMP echo configuration (config-ip-sla-echo)

TCP connect configuration (config-ip-sla-tcp)

UDP echo configuration (config-ip-sla-udp)

UDP jitter configuration (config-ip-sla-jitter)

Note

The configuration mode varies depending on the operation type configured.

Command History

Release	Modification
12.2(33)SRC	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

Usage Guidelines

The traffic-class value is stored in an 8-bit field in the IPv6 packet header and designates the IPv6 traffic class. This field is similar to the IPv4 type-of-service (ToS) field that is configured in IPv4 packet headers using the **tos (IP SLA)** command, but the two fields use different codes.

**Note**

The **traffic-class** command is supported only in IPv6 networks. In an IPv4 network, use the **tos** (IP SLA) command to define a ToS byte in the IPv4 header of a Cisco IOS IP SLAs operation.

When the traffic-class value is defined for an operation, the IP SLAs Responder will reflect the traffic-class value it receives.

To display the traffic class value for all Cisco IOS IP SLAs operations or a specified operation, use the **show ip sla configuration** command.

Examples

In the following example for an IPv6 network, IP SLAs operation 1 is configured as an ICMP echo operation with destination IPv6 address 2001:DB8:100::1. The value in the traffic-class field of the IPv6 header is set to 0x80.

```
ip sla 1
 icmp-echo 2001:DB8:100::1
 traffic-class 0x80
!
ip sla schedule 1 start-time now
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
show ip sla configuration	Displays configuration values including all defaults for all Cisco IOS IP SLAs operations or a specified operation.
tos (IP SLA)	Defines the ToS value in the IPv4 header of a Cisco IOS IP SLAs operation in an IPv4 network.

tree-init

To configure the number of setup packets sent for building the multicast tree for a Cisco IOS IP Service Level Agreements (SLAs) multicast UDP jitter operation, use the **tree-init** command in multicast UDP jitter configuration mode. To return to the default values, use the **no** form of this command.

tree-init *number*

no tree-init

Syntax Description

<i>number</i>	Number of setup packets sent for building the multicast network tree. The range is 0 to 10. The default is 0 (one packet).

Command Default

One setup packet (with the sequence number of 0) is sent to build the network tree.

Command Modes

Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)

Command History

Release	Modification
15.2(4)M	This command was introduced.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

Before the first data packet is sent for a multicast UDP jitter operation, a setup packet is sent to set up the multicast tree. Multicast packets are processed only after the IGMP join for the setup packet succeeds. The setup packet is dropped, or ignored at the responder, and any data associated with the setup packet is discarded.

Use this command to change the number of setup packets to be sent from the default (one packet with the sequence number of 0) to the specified value. The number of packets to be sent is equal to the value of the *number* variable plus 1.

Examples

```
Device> enable
Device# configure terminal
Device(config)# ip sla 10
Device(config-ip-sla)# udp-jitter 239.1.1.1 5000 endpoint-list mcast-rcvrs source-ip
```

```
10.10.10.106 source-port 7012 num-packets 50 interval 25
Device(config-ip-sla-multicast-jitter-oper)# tree-init 1
```

Related Commands

Command	Description
udp-jitter	Configures an IP SLAs UDP jitter or multicast jitter operation.

ttl (IP SLA)

To specify the maximum hop count for an echo request packet of a Cisco IOS IP Service Level Agreements (SLAs) operation, use the **ttl** command in the appropriate submode of auto IP SLA MPLS configuration or IP SLA configuration mode. To return to the default value, use the **no** form of this command.

ttl *time-to-live*

no ttl

Syntax Description

<i>time-to-live</i>	Specifies the maximum hop count for an echo request packet. For IP SLAs LSP ping operations, valid values are from 1 to 255 and the default is 255. For IP SLAs LSP traceroute operations, the range is from 1 to 30. The default is 30.

Command Default

For IP SLAs LSP ping operations, the default time-to-live value is 255. For IP SLAs LSP traceroute operations, the default time-to-live value is 30.

Command Modes

MPLS parameters configuration (config-auto-ip-sla-mpls-params)

Command Modes

LSP ping configuration (config-sla-monitor-lspPing) LSP trace configuration (config-sla-monitor-lspTrace)

Note

The configuration mode varies depending on the Cisco IOS release you are running and the operation type configured. See the “Usage Guidelines” section for more information.

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release table). Note that if you are configuring an IP SLAs LSP Health Monitor operation, see the Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release table for information on Cisco IOS release dependencies. You must configure the type of IP SLAs operation (such as LSP ping) before you can configure any of the other parameters of the operation.

The configuration mode for the **ttl** command varies depending on the Cisco IOS release you are running and the operation type configured. For example, if you are running Cisco IOS Release 12.4(6)T and the LSP ping operation type is configured (without using the LSP Health Monitor), you would enter the **ttl** command in LSP ping configuration mode (config-sla-monitor-lspPing) within IP SLA configuration mode.

Table 93: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration

Table 94: Command Used to Begin Configuration of an IP SLAs LSP Health Monitor Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(6)T, 12.0(32)SY, 12.2(31)SB2, 12.2(33)SRB, 12.2(33)SXH, or later releases	auto ip sla mpls-lsp-monitor	Auto IP SLA MPLS configuration

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source Provider Edge (PE) router. The maximum hop count for echo request packets of IP SLAs operations created by LSP Health Monitor operation 1 is set to 200 hops.

```
mpls discovery vpn interval 60

auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

type dhcp

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type dhcp** command is replaced by the **dhcp** (IP SLA) command. See the **dhcp** (IP SLA) command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) Dynamic Host Configuration Protocol (DHCP) operation, use the **type dhcp** command in IP SLA monitor configuration mode.

type dhcp [**source-ipaddr** {*ip-address* | *hostname*}] [**dest-ipaddr** {*ip-address* | *hostname*}] [**option 82** [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**subnet-mask** *subnet-mask*]]

Syntax Description

source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
dest-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the destination IP address or hostname.
option 82	(Optional) Specifies DHCP option 82 for the destination DHCP server.
circuit-id <i>circuit-id</i>	(Optional) Specifies the circuit ID in hexadecimal.
remote-id <i>remote-id</i>	(Optional) Specifies the remote ID in hexadecimal.
subnet-mask <i>subnet-mask</i>	(Optional) Specifies the subnet mask IP address. The default subnet mask is 255.255.255.0.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.0(5)T	This command was introduced.

Release	Modification
12.1(1)T	The following keywords were added: • source-ipaddr • dest-ipaddr • option 82
12.4(4)T	This command was replaced by the dhcp (IP SLA)command.
12.2(33)SRB	This command was replaced by the dhcp (IP SLA)command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the dhcp (IP SLA)command.
12.2(33)SXI	This command was replaced by the dhcp (IP SLA)command.

Usage Guidelines

If the source IP address is configured, then packets will be sent with that source address.

You may configure the **ip dhcp-server** global configuration command to identify the DHCP server that the DHCP operation will measure. If the target IP address is configured, then only that device will be measured. If the **ip dhcp-server** command is not configured and the target IP address is not configured, then DHCP discover packets will be sent on every available IP interface.

Option 82 is called the Relay Agent Information option and is inserted by the DHCP relay agent when client-originated DHCP packets are forwarded to a DHCP server. Servers recognizing the Relay Agent Information option may use the information to implement IP address or other parameter assignment policies. The DHCP server echoes the option back verbatim to the relay agent in server-to-client replies, and the relay agent strips the option before forwarding the reply to the client.

The Relay Agent Information option is organized as a single DHCP option that contains one or more suboptions that convey information known by the relay agent. The initial suboptions are defined for a relay agent that is colocated in a public circuit access unit. These suboptions are as follows: a circuit ID for the incoming circuit, a remote ID that provides a trusted identifier for the remote high-speed modem, and a subnet mask designation for the logical IP subnet from which the relay agent received the client DHCP packet.

Note

If an odd number of characters are specified for the circuit ID, a zero will be added to the end of the string.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation number 4 is configured as a DHCP operation enabled for DHCP server 172.16.20.3.

```
ip sla monitor 4
  type dhcp option 82 circuit-id 10005A6F1234
ip dhcp-server 172.16.20.3
!
ip sla monitor schedule 4 start-time now
```

Related Commands

Command	Description
ip dhcp-server	Specifies which DHCP servers to use on a network, and specifies the IP address of one or more DHCP servers available on the network.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type dlsw peer-ipaddr

**Note**

Effective with Cisco IOS Releases 12.4(4)T, the **type dlsw peer-ipaddr** command is replaced by the **dlsw peer-ipaddr** command. See the **dlsw peer-ipaddr** command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) Data Link Switching Plus (DLSw+) operation, use the **type dlsw peer-ipaddr** command in IP SLA monitor configuration mode.

type dlsw peer-ipaddr *ip-address*

Syntax Description

<i>ip-address</i>	IP address of the peer destination.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.0(5)T	This command was introduced.
12.4(4)T	This command was replaced by the dlsw peer-ipaddr command.

Usage Guidelines

To configure an IP SLAs DLSw+ operation, the DLSw feature must be configured on the local and target routers.

For DLSw+ operations, the default request packet data size is 0 bytes (use the **request-data-size** command to modify this value) and the default amount of time the operation waits for a response from the request packet is 30 seconds (use the **timeout** command to modify this value).

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation number 10 is configured as a DLSw+ operation enabled for remote peer IP address 172.21.27.11. The data size is 15 bytes.

```
ip sla monitor 10
 type dlsw peer-ipaddr 172.21.27.11
```

```
type dls w peer-ipaddr
```

```
request-data-size 15
!  
ip sla monitor schedule 10 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
request-data-size	Sets the protocol data size in the payload of the IP SLAs operation's request packet.
show dls w peers	Displays DLSw peer information.

type dns target-addr

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type dns target-addr** command is replaced by the **dns** (IP SLA) command. See the **dns** (IP SLA) command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) Domain Name System (DNS) operation, use the **type dns target-addr** command in IP SLA monitor configuration mode.

type dns target-addr {*target-hostname* | *target-ip-address*} **name-server** *ip-address* [**source-ipaddr** {*ip-address* | *hostname*} **source-port** *port-number*]

Syntax Description

<i>target-hostname</i> <i>target-ip-address</i>	Target (destination) IP address or hostname.
name-server <i>ip-address</i>	Specifies the IP address of the DNS server.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.0(5)T	This command was introduced.
12.4(4)T	This command was replaced by the dns (IP SLA) command.
12.2(33)SRB	This command was replaced by the dns (IP SLA) command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the dns (IP SLA) command.

Release	Modification
12.2(33)SXI	This command was replaced by the dns (IP SLA) command.

Usage Guidelines

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 7 is configured as a DNS operation using the target IP address 172.20.2.132.

```
ip sla monitor 7
  type dns target-addr host1 name-server 172.20.2.132
!
ip sla monitor schedule 7 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type echo (MPLS)

To configure Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) ping operations using the LSP Health Monitor, use the **type echo** command in auto IP SLA MPLS configuration mode.

type echo [**ipsla-vrf-all**| **vrf** *vpn-name*]

Syntax Description

ipsla-vrf-all	(Optional) Specifies that LSP ping operations should be automatically created for all Border Gateway Protocol (BGP) next hop neighbors in use by a VPN routing or forwarding instance (VRF) corresponding to all the Virtual Private Networks (VPNs) in which the originating Provider Edge (PE) router belongs. This option is the default.
vrf <i>vpn-name</i>	(Optional) Specifies that LSP ping operations should be automatically created for only those BGP next hop neighbors associated with the specified VPN name.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

Auto IP SLA MPLS configuration (config-auto-ip-sla-mpls)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
15.1(2)SNH	This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.

Usage Guidelines

You must configure the type of LSP Health Monitor operation (such as LSP ping) before you can configure any of the other parameters of the operation.

**Note**

When an IP SLAs LSP ping operation is created by the LSP Health Monitor, an operation number (identification number) is automatically assigned to the operation. The operation numbering starts at 100001.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP ping operations for all Border Gateway Protocol (BGP) next hop neighbors in use by all VPN routing and forwarding (VRF) instances associated with the source PE router.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type echo ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
  delete-scan-factor 2
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description
auto ip sla mpls-lsp-monitor	Begins configuration for an IP SLAs LSP Health Monitor operation and enters auto IP SLA MPLS configuration mode.

type echo domain

To configure a Cisco IOS IP Service Level Agreements (SLAs) auto Ethernet operation to create Ethernet ping operations, use the **type echo domain** command in IP SLA Ethernet monitor configuration mode.

type echo domain *domain-name* {**evc** *evc-id*| **vlan** *vlan-id*} [**exclude-mpids** *mp-ids*]

Syntax Description

<i>domain-name</i>	Name of the Ethernet Connectivity Fault Management (CFM) maintenance domain.
evc <i>evc-id</i>	Specifies the Ethernet Virtual Circuit (EVC) identification name.
vlan <i>vlan-id</i>	Specifies the VLAN identification number.
exclude-mpids <i>mp-ids</i>	(Optional) Specifies the list of maintenance endpoint identification numbers to be excluded from the operation.

Command Default

Ethernet ping operations are not configured.

Command Modes

IP SLA Ethernet monitor (config-ip-sla-ethernet-monitor)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SRD	The evc <i>evc-id</i> keyword and argument were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Usage Guidelines

Note

When an IP SLAs Ethernet ping operation is created by an auto Ethernet operation, an operation number (identification number) is automatically assigned to the ping operation. The operation numbering starts at 100001.

You must configure the type of auto Ethernet operation (such as Ethernet ping) before you can configure any of the other parameters of the operation.

To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla ethernet-monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using an IP SLAs auto Ethernet operation. In this example, operation 10 is configured to automatically create IP SLAs Ethernet ping operations for all the discovered maintenance endpoints in the domain named testdomain and VLAN identification number 34. As specified by the proactive threshold monitoring configuration, when three consecutive connection loss events occur, a Simple Network Management Protocol (SNMP) trap notification should be sent. The schedule period for operation 10 is 60 seconds, and the operation is scheduled to start immediately.

```
ip sla ethernet-monitor 10
  type echo domain testdomain vlan 34
!
ip sla ethernet-monitor reaction-configuration 10 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
!
ip sla ethernet-monitor schedule 10 schedule-period 60 start-time now
```

Related Commands

Command	Description
ip sla ethernet-monitor	Begins configuration for an IP SLAs auto Ethernet operation and enters Ethernet monitor configuration mode.

type echo protocol ipIcmpEcho

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type echo protocol ipIcmpEcho** command is replaced by the **icmp-echo** command. See the **icmp-echo** command for more information.

To configure an IP Service Level Agreements (SLAs) Internet Control Message Protocol (ICMP) echo operation, use the **type echo protocol ipIcmpEcho** command in IP SLA monitor configuration mode.

type echo protocol ipIcmpEcho {*destination-ip-address* | *destination-hostname*} [**source-ipaddr** {*ip-address* | *hostname*} | **source-interface** *interface-name*]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname for the operation.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-interface <i>interface-name</i>	(Optional) Specifies the source interface for the operation.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
11.2	This command was introduced.
12.0(5)T	The following keyword and arguments were added: • source-ipaddr {<i>ip-address</i> <i>hostname</i>}
12.3(7)XR	The source-interface keyword and <i>interface-name</i> argument were added.
12.3(11)T	The source-interface keyword and <i>interface-name</i> argument were added.
12.4(4)T	This command was replaced by the icmp-echo command.
12.2(33)SRB	This command was replaced by the icmp-echo command.

Release	Modification
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the icmp-echo command.
12.2(33)SXI	This command was replaced by the icmp-echo command.

Usage Guidelines

The default request packet data size for an ICMP echo operation is 28 bytes. Use the **request-data-size** command to modify this value. This data size is the payload portion of the ICMP packet, which makes a 64-byte IP packet.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 10 is created and configured as an echo operation using the IP/ICMP protocol and the destination IP address 172.16.1.175.

```
ip sla monitor 10
 type echo protocol ipIcmpEcho 172.16.1.175
!
ip sla monitor schedule 10 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type ftp operation get url

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type ftp operation get url** command is replaced by the **ftp get** command. See the **ftp get** command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) File Transfer Protocol (FTP) GET operation, use the **type ftp operation get url** command in IP SLA monitor configuration mode.

type ftp operation get url *url* [*source-ipaddr* {*ip-address* | *hostname*}] [**mode** {**passive** | **active**}]

Syntax Description

<i>url</i>	URL location information for the file to be retrieved.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
mode passive active	(Optional) Specifies the FTP transfer mode as either passive or active. The default is passive transfer mode.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.1(1)T	This command was introduced.
12.4(4)T	This command was replaced by the ftp get command.
12.2(33)SRB	This command was replaced by the ftp get command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the ftp get command.
12.2(33)SXI	This command was replaced by the ftp get command.

Usage Guidelines

The *url* argument must be in one of the following formats:

- ftp://username:password@host/filename
- ftp://host/filename

If the username and password are not specified, the defaults are anonymous and test, respectively.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, an FTP operation is configured. User1 is the username and password1 is the password; host1 is the host and file1 is the filename.

```
ip sla monitor 3
 type ftp operation get url ftp://user1:password1@host1/file1
!
ip sla monitor schedule 3 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type http operation

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type http operation** command is replaced by the **http** (IP SLA) command. See the **http** (IP SLA) command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) HTTP operation, use the **type http operation** command in IP SLA monitor configuration mode.

type http operation {get| raw} url *url* [name-server *ip-address*] [version *version-number*] [source-ipaddr {*ip-address*| *hostname*}] [source-port *port-number*] [cache {enable| disable}] [proxy *proxy-url*]

Syntax Description

get	Specifies an HTTP GET operation.
raw	Specifies an HTTP RAW operation.
url <i>url</i>	Specifies the URL of destination HTTP server.
name-server <i>ip-address</i>	(Optional) Specifies the destination IP address of a Domain Name System (DNS) Server.
version <i>version-number</i>	(Optional) Specifies the version number.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.
cache enable disable	(Optional) Enables or disables download of a cached HTTP page.
proxy <i>proxy-url</i>	(Optional) Specifies proxy information or URL.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.0(5)T	This command was introduced.
12.4(4)T	This command was replaced by the http (IP SLA) command.
12.2(33)SRB	This command was replaced by the http (IP SLA) command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the http (IP SLA) command.
12.2(33)SXI	This command was replaced by the http (IP SLA) command.

Usage Guidelines

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs HTTP operation 6 is configured as an HTTP RAW operation. The destination URL is `http://www.cisco.com`.

```
ip sla monitor 6
 type http operation raw url http://www.cisco.com
 http-raw-request
 GET /index.html HTTP/1.0\r\n
 \r\n
 !
 ip sla monitor schedule 6 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type jitter dest-ipaddr

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type jitter dest-ipaddr** command is replaced by the **udp-jitter** command. See the **udp-jitter** command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) User Datagram Protocol (UDP) jitter operation, use the **type jitter dest-ipaddr** command in IP SLA monitor configuration mode.

type jitter dest-ipaddr {*destination-ip-address* | *destination-hostname*} **dest-port** *port-number* [**source-ipaddr** {*ip-address* | *hostname*}] [**source-port** *port-number*] [**control** {**enable** | **disable**}] [**num-packets** *number-of-packets*] [**interval** *interpacket-interval*]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname.
dest-port <i>port-number</i>	Specifies the destination port number.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.
control enable disable	(Optional) Enables or disables the sending of IP SLAs control messages to the IP SLAs Responder. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs Responder.
num-packets <i>number-of-packets</i>	(Optional) Number of packets, as specified by the number argument. The default value is 10.
interval <i>interpacket-interval</i>	(Optional) Interpacket interval in milliseconds. The default value is 20 ms.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.0(5)T	This command was introduced.
12.4(4)T	This command was replaced by the udp-jitter command.
12.2(33)SRB	This command was replaced by the udp-jitter command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the udp-jitter command.
12.2(33)SXI	This command was replaced by the udp-jitter command.

Usage Guidelines

The **type jitter dest-ipaddr** command configures an IP SLAs UDP Plus operation. The UDP Plus operation is a superset of the UDP echo operation. In addition to measuring UDP round-trip time, the UDP Plus operation measures per-direction packet loss and jitter. Jitter is interpacket delay variance. Jitter statistics are useful for analyzing traffic in a Voice over IP (VoIP) network.

You must enable the IP SLAs Responder on the target router before you can configure a UDP jitter operation. Prior to sending an operation packet to the target router, IP SLAs sends a control message to the IP SLAs Responder to enable the destination port.

The default request packet data size for an IP SLAs UDP jitter operation is 32 bytes. Use the **request-data-size** command to modify this value.

**Note**

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

IP SLAs VoIP UDP Jitter (codec) Operation

When you specify the codec in the command syntax of the **type jitter dest-ipaddr** command, the standard configuration options are replaced with codec-specific keywords and arguments. The codec-specific command syntax is documented separately from the command syntax for the standard implementation of the **type jitter dest-ipaddr** command. For information about the codec-specific command syntax, see the documentation for the **type jitter dest-ipaddr (codec)** command.

Examples

In the following example, operation 6 is configured as a UDP jitter operation with the destination IP address 172.30.125.15, the destination port number 2000, 20 packets, and an interpacket interval of 20 ms.

```
ip sla monitor 6
 type jitter dest-ipaddr 172.30.125.15 dest-port 2000 num-packets 20 interval 20
```

```
!  
ip sla monitor schedule 6 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
request-data-size	Sets the payload size for IP SLAs operation request packets.
type jitter dest-ipaddr (codec)	Configures an IP SLAs UDP jitter operation that returns VoIP scores.

type jitter dest-ipaddr (codec)

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **typejitterdest-ipaddr** (codec) command is replaced by the **udp-jitter** (codec)command. See the **udp-jitter** (codec)command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) User Datagram Protocol (UDP) jitter operation that returns Voice over IP (VoIP) scores, use the **typejitterdest-ipaddr** command in IP SLA monitor configuration mode.

type jitter dest-ipaddr {*destination-ip-address*|*destination-hostname*} **dest-port** *port-number* **codec** *codec-type* [**codec-numpackets** *number-of-packets*] [**codec-size** *number-of-bytes*] [**codec-interval** *milliseconds*] [**advantage-factor** *value*] [**source-ipaddr** {*ip-address*|*hostname*}] [**source-port** *port-number*] [**control** {**enable**|**disable**}]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Specifies the destination IP address or hostname.
dest-port <i>port-number</i>	Specifies the destination port number. For UDP jitter (codec) operations, the port number should be an even number in the range of 16384 to 32766 or 49152 to 65534.
codec <i>codec-type</i>	Enables the generation of estimated voice-quality scores in the form of Calculated Planning Impairment Factor (ICPIF) and Mean Opinion Score (MOS) values. The codec type should match the encoding algorithm you are using for VoIP transmissions. The following codec-type keywords are available: • g711alaw --The G.711 a-law codec (64 kbps transmission) • g711ulaw --The G.711 muHm-law codec (64 kbps transmission) • g729a --The G.729A codec (8 kbps transmission) Configuring the codec type sets default values for the variables codec-numpackets, codec-size, and codec-interval in this command. See the Default UDP Jitter Operation Parameters by Codec table for details.
codec-numpackets <i>number-of-packets</i>	(Optional) Specifies the number of packets to be transmitted per operation. The valid range is from 1 to 60000 packets. The default is 1000 packets.

codec-size <i>number-of-bytes</i>	(Optional) Specifies the number of bytes in each packet transmitted. (Also called the payload size or request size.) The valid range is from 16 to 1500 packets. The default varies by codec (see the Default UDP Jitter Operation Parameters by Codec table).
codec-interval <i>milliseconds</i>	Specifies the interval (delay) between packets that should be used for the operation, in milliseconds (ms). The valid range is from 1 to 60000 ms. By default, packets are sent 20 ms apart.
advantage-factor <i>value</i>	Specifies the expectation factor to be used for ICPIF calculations. This value is subtracted from the measured impairments to yield the final ICPIF value (and corresponding MOS value). See the “Usage Guidelines” section for recommended values. The valid range is from 0 to 20. The default is 0.
source-ipaddr <i>{ip-address hostname}</i>	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.
control <i>{enable disable}</i>	(Optional) Enables or disables the sending of IP SLAs control messages to the IP SLAs Responder. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs Responder. Note Control messages are enabled by default. Disabling the IP SLAs control messages for UDP jitter operations is not recommended. If you disable IP SLAs control messages, packet loss statistics and IP telephony scores will not be generated accurately.

Command Default

No IP SLAs operation type is associated with the operation number being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.0(5)T	The type jitter dest-ipaddr command was introduced.

Release	Modification
12.3(4)T	The codec-specific keywords and arguments were added to the typejitterdest-ipaddr command to support the IP SLAs VoIP UDP jitter operation.
12.4(4)T	This command was replaced by the udp-jitter (codec) command.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRB	This command was replaced by the udp-jitter (codec) command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the udp-jitter (codec) command.
12.2(33)SXI	This command was replaced by the udp-jitter (codec) command.

Usage Guidelines

When you specify the codec in the command syntax of the **typejitterdest-ipaddr** command, the standard configuration options are replaced with codec-specific keywords and arguments. The codec-specific command syntax is documented separately from the command syntax for the standard implementation of the **typejitterdest-ipaddr** command. For information about the command syntax for the standard implementation, see the documentation for the **typejitterdest-ipaddr** command.

You must enable the IP SLAs Responder on the target router before you can configure a UDP jitter (codec) operation. Prior to sending an operation packet to the target router, IP SLAs sends a control message to the IP SLAs Responder to enable the destination port.

Note

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **noipslamonitor** global configuration command) and then reconfigure the operation with the new operation type.

IP SLAs VoIP UDP Jitter (codec) Statistics

The IP SLAs UDP jitter operation computes statistics by sending n UDP packets, each of size s , sent t milliseconds apart, from a given source router to a given target router, at a given frequency f .

To generate MOS and ICPIF scores, you specify the codec type used for the connection when configuring the UDP jitter operation. Based on the type of codec you configure for the operation, the number of packets (n), the size of each payload (s), the inter-packet time interval (t), and the operational frequency (f) will be auto-configured with default values. (See the Default UDP Jitter Operation Parameters by Codec table for

specific information.) However, you are given the option, if needed, to manually configure these parameters in the syntax of the `type jitter dest-ipaddr(codec)` command.

The table below shows the default parameters that are configured for the operation by codec.

Table 95: Default UDP Jitter Operation Parameters by Codec

Codec	Default Number of Packets (n); [codec- numpackets]	Packet Payload (s) [codec-size] ²	Default Interval Between Packets (t) [codec-interval]	Frequency of Operations (f)
G.711 mu-law (g711ulaw)	1000	160 bytes	20 ms	Once every 60 seconds
G.711 a-law (g711alaw)	1000	160 bytes	20 ms	Once every 60 seconds
G.729A (g729a)	1000	20 bytes	20 ms	Once every 60 seconds

² The actual data size of each request packet will contain an additional 12 bytes of Real-Time Transport Protocol (RTP) header data in order to simulate the RTP/UDP/IP/Layer 2 protocol stack.

For example, if you configure the UDP jitter operation to use the characteristics for the g711ulaw codec, by default an operation will be sent once a minute (f). Each operation would consist of 1000 packets (n), with each packet containing 160 bytes (plus 12 header bytes) of synthetic data (s), sent 20 ms apart (t).

The **advantage-factor** keyword and argument allow you to specify an access Advantage Factor (also called the Expectation Factor). The Advantage Factor Recommended Maximum Values table, adapted from ITU-T Rec. G.113, defines a set of provisional maximum values for Advantage Factors in terms of the service provided.

Table 96: Advantage Factor Recommended Maximum Values

Communication Service	Maximum Value of Advantage/ Expectation Factor (A):
Conventional wire line (land line)	0
Mobility (cellular connections) within a building	5
Mobility within a geographical area or moving within a vehicle	10
Access to hard-to-reach location; (for example, via multihop satellite connections)	20

These values are only suggestions. To be meaningful, the use of the Advantage/Expectation factor (A) and its selected value in a specific application should be used consistently in any planning model you adopt.

However, the values in the table above should be considered as the absolute upper limits for A . The default Advantage/Expectation factor for IP SLAs UDP jitter operations is always zero.

Examples

In the following example, IP SLAs operation 10 is configured as a UDP jitter (codec) operation with the destination IP address 209.165.200.225 and the destination port number 3000. The operation is configured to use the characteristics of the G.711 a-law codec, which means the operation will consist of 1000 packets, each of 172 bytes (160 plus 12 header bytes), sent 20 ms apart. The default value for the Advantage Factor and operation frequency is used.

```
ip sla monitor 10
  type jitter dest-ipaddr 209.165.200.225 dest-port 3000 codec g711alaw
!
ip sla monitor schedule 10 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
type jitter dest-ipaddr	Configures an IP SLAs UDP jitter operation.

type jitter domain

To configure a Cisco IOS IP Service Level Agreements (SLAs) auto Ethernet operation to create Ethernet jitter operations, use the **type jitter domain** command in IP SLA Ethernet monitor configuration mode.

type jitter domain *domain-name* {**evc** *evc-id*| **vlan** *vlan-id*} [**exclude-mpids** *mp-ids*] [**interval** *interframe-interval*] [**num-frames** *frames-number*]

Syntax Description

<i>domain-name</i>	Name of the Ethernet Connectivity Fault Management (CFM) maintenance domain.
evc <i>evc-id</i>	Specifies the Ethernet Virtual Circuit (EVC) identification name.
vlan <i>vlan-id</i>	Specifies the VLAN identification number.
exclude-mpids <i>mp-ids</i>	(Optional) Specifies the list of maintenance endpoint identification numbers to be excluded from the operation.
interval <i>interframe-interval</i>	(Optional) Specifies the interframe interval (in milliseconds). The default is 20.
num-frames <i>frames-number</i>	(Optional) Specifies the number of frames to be sent. The default is 10.

Command Default

Ethernet jitter operations are not configured.

Command Modes

IP SLA Ethernet monitor (config-ip-sla-ethernet-monitor)

Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SRD	The evc <i>evc-id</i> keyword and argument were added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Usage Guidelines **Note**

When an IP SLAs Ethernet jitter operation is created by an auto Ethernet operation, an operation number (identification number) is automatically assigned to the jitter operation. The operation numbering starts at 100001.

You must configure the type of auto Ethernet operation (such as Ethernet jitter) before you can configure any of the other parameters of the operation.

To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla ethernet-monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using an IP SLAs auto Ethernet operation. In this example, operation 20 is configured to automatically create IP SLAs Ethernet jitter operations for all the discovered maintenance endpoints in the domain named testdomain and VLAN identification number 34. For each Ethernet jitter operation, the interframe interval is set to 20 ms and the number of frames to be sent is 30. As specified by the proactive threshold monitoring configuration, when three consecutive connection loss events occur, a Simple Network Management Protocol (SNMP) trap notification should be sent. The schedule period for operation 20 is 60 seconds, and the operation is scheduled to start immediately.

```
ip sla ethernet-monitor 20
 type jitter domain testdomain vlan 34 interval 20 num-frames 30
!
ip sla ethernet-monitor reaction-configuration 20 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
!
ip sla ethernet-monitor schedule 20 schedule-period 60 start-time now
```

Related Commands

Command	Description
ip sla ethernet-monitor	Begins configuration for an IP SLAs auto Ethernet operation and enters Ethernet monitor configuration mode.

type mpls lsp ping ipv4

Note

Effective with Cisco IOS Release 12.2(33)SRB and 12.2(33)SB, the **type mpls lsp ping ipv4** command is replaced by the **mpls lsp ping ipv4** command. See the **mpls lsp ping ipv4** command for more information.

To manually configure an individual Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) ping IPv4 operation, use the **type mpls lsp ping ipv4** command in IP SLA monitor configuration mode.

type mpls lsp ping ipv4 *destination-address destination-mask* [**force-explicit-null**] [**lsp-selector** *ip-address*] [**src-ip-addr** *source-address*] [**reply** {**dscp** *dscp-value*| **mode** {**ipv4**| **router-alert**} }]

Syntax Description

<i>destination-address</i>	Address prefix of the target to be tested.
<i>destination-mask</i>	Number of bits in the network mask of the target address.
force-explicit-null	(Optional) Adds an explicit null label to all echo request packets.
lsp-selector <i>ip-address</i>	(Optional) Specifies a local host IP address used to select the LSP. The default address is 127.0.0.1.
src-ip-addr <i>source-address</i>	(Optional) Specifies a source IP address for the echo request originator.
reply dscp <i>dscp-value</i>	(Optional) Specifies the differentiated services codepoint (DSCP) value of an echo reply packet. The default DSCP value is 0.
reply mode	(Optional) Specifies the reply mode for the echo request packet.
ipv4	(Optional) Replies with an IPv4 UDP packet (default).
router-alert	(Optional) Replies with an IPv4 UDP packet with router alert.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	The force-explicit-null keyword was added.
12.2(33)SRB	This command was replaced by the mpls lsp ping ipv4 command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the mpls lsp ping ipv4 command.

Usage Guidelines

The **lsp-selector** keyword is used to force an IP SLAs operation to use a specific LSP to obtain its response time measurement. This option is useful if there are multiple equal cost paths between Provider Edge (PE) routers.

You must configure the type of IP SLAs operation (such as LSP ping) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

**Note**

This command supports only single path connectivity measurements between the source PE router and associated Border Gateway Protocol (BGP) next hop neighbors.

Examples

The following examples show how to manually configure operation parameters, proactive threshold monitoring, and scheduling options for IP SLAs LSP ping operation 1.

```
ip sla monitor 1
type mpls lsp ping ipv4 192.168.1.4 255.255.255.255 lsp-selector 127.1.1.1
frequency 120
secondary-frequency timeout 30
exit
!
ip sla monitor reaction-configuration 1 react connectionLoss threshold-type consecutive 3
action-type trapOnly
ip sla monitor reaction-configuration 1 react timeout threshold-type consecutive 3 action-type
trapOnly
ip sla monitor logging traps
!
ip sla monitor schedule 1 start-time now life forever
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type mpls lsp trace ipv4

Note

Effective with Cisco IOS Release 12.2(33)SRB and 12.2(33)SB, the **type mpls lsp trace ipv4** command is replaced by the **mpls lsp trace ipv4** command. See the **mpls lsp trace ipv4** command for more information.

To manually configure an individual Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) traceroute IPv4 operation, use the **type mpls lsp trace ipv4** command in IP SLA monitor configuration mode.

type mpls lsp trace ipv4 *destination-address destination-mask* [**force-explicit-null**] [**lsp-selector** *ip-address*] [**src-ip-addr** *source-address*] [**reply** {**dscp** *dscp-value*| **mode** {**ipv4**| **router-alert**} }]

Syntax Description

<i>destination-address</i>	Address prefix of the target to be tested.
<i>destination-mask</i>	Number of bits in the network mask of the target address.
force-explicit-null	(Optional) Adds an explicit null label to all echo request packets.
lsp-selector <i>ip-address</i>	(Optional) Specifies a local host IP address used to select the LSP. The default address is 127.0.0.1.
src-ip-addr <i>source-address</i>	(Optional) Specifies a source IP address for the echo request originator.
reply dscp <i>dscp-value</i>	(Optional) Specifies the differentiated services codepoint (DSCP) value of an echo reply. The default DSCP value is 0.
reply mode	(Optional) Specifies the reply mode for the echo request packet.
ipv4	(Optional) Replies with an IPv4 UDP packet (default).
router-alert	(Optional) Replies with an IPv4 UDP packet with router alert.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	The force-explicit-null keyword was added.
12.2(33)SRB	This command was replaced by the mpls lsp trace ipv4 command.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was replaced by the mpls lsp trace ipv4 command.

Usage Guidelines

The **lsp-selector** keyword is used to force an IP SLAs operation to use a specific LSP to obtain its response time measurement. This option is useful if there are multiple equal cost paths between Provider Edge (PE) routers.

You must configure the type of IP SLAs operation (such as LSP ping) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

**Note**

This command supports only single path connectivity measurements between the source PE router and associated Border Gateway Protocol (BGP) next hop neighbors.

Examples

The following examples show how to manually configure operation parameters, proactive threshold monitoring, and scheduling options for IP SLAs LSP traceroute operation 1.

```
ip sla monitor 1
type mpls lsp trace ipv4 192.168.1.4 255.255.255.255 lsp-selector 127.1.1.1
frequency 120
exit
!
ip sla monitor reaction-configuration 1 react connectionLoss threshold-type consecutive 3
action-type trapOnly
ip sla monitor reaction-configuration 1 react timeout threshold-type consecutive 3 action-type
trapOnly
ip sla monitor logging traps
!
ip sla monitor schedule 1 start-time now life forever
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type pathEcho (MPLS)

To configure Cisco IOS IP Service Level Agreements (SLAs) label switched path (LSP) LSP traceroute operations using the LSP Health Monitor, use the **type pathEcho** command in auto IP SLA MPLS configuration mode.

```
type pathEcho [ipsla-vrf-all] vrf vpn-name
```

Syntax Description

ipsla-vrf-all	(Optional) Specifies that LSP traceroute operations should be automatically created for all Border Gateway Protocol (BGP) next hop neighbors in use by a VPN routing or forwarding instance (VRF) corresponding to all the Virtual Private Networks (VPNs) in which the originating Provider Edge (PE) router belongs. This option is the default.
vrf <i>vpn-name</i>	(Optional) Specifies that LSP traceroute operations should be automatically created for only those BGP next hop neighbors associated with the specified VPN name.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

Auto IP SLA MPLS configuration (config-auto-ip-sla-mpls)

Command History

Release	Modification
12.2(27)SBC	This command was introduced.
12.4(6)T	This command was integrated into Cisco IOS Release 12.4(6)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

Usage Guidelines

You must configure the type of LSP Health Monitor operation (such as LSP ping) before you can configure any of the other parameters of the operation.

You must configure the type of IP SLAs operation (such as LSP ping) before you can configure any of the other parameters of the operation. To change the operation type of an existing LSP Health Monitor operation, you must first delete the operation (using the **no auto ip sla mpls-lsp-monitor** global configuration command) and then reconfigure the operation with the new operation type.

**Note**

When an IP SLAs LSP traceroute operation is created by the LSP Health Monitor, an operation number (identification number) is automatically assigned to the operation. The operation numbering starts at 100001.

**Note**

This command supports only single path connectivity measurements between the source PE router and associated BGP next hop neighbors.

Examples

The following example shows how to configure operation parameters, proactive threshold monitoring, and scheduling options using the LSP Health Monitor. In this example, LSP Health Monitor operation 1 is configured to automatically create IP SLAs LSP traceroute operations for all BGP next hop neighbors in use by all VRFs associated with the source PE router.

```
mpls discovery vpn interval 60
mpls discovery vpn next-hop
!
auto ip sla mpls-lsp-monitor 1
  type pathEcho ipsla-vrf-all
  timeout 1000
  scan-interval 1
  secondary-frequency connection-loss 10
  secondary-frequency timeout 10
!
auto ip sla mpls-lsp-monitor reaction-configuration 1 react connectionLoss threshold-type
consecutive 3 action-type trapOnly
auto ip sla mpls-lsp-monitor reaction-configuration 1 react timeout threshold-type consecutive
3 action-type trapOnly
ip sla logging traps
!
auto ip sla mpls-lsp-monitor schedule 1 schedule-period 60 start-time now
```

Related Commands

Command	Description

type pathEcho protocol ipIcmpEcho

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type pathEcho protocol ipIcmpEcho** command is replaced by the **path-echo** command. See the **path-echo** command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) Internet Control Message Protocol (ICMP) path echo operation, use the **type pathEcho protocol ipIcmpEcho** command in IP SLA monitor configuration mode.

type pathEcho protocol ipIcmpEcho {*destination-ip-address* | *destination-hostname*} [**source-ipaddr** {*ip-address* | *hostname*}]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
11.2	This command was introduced.
12.4(4)T	This command was replaced by the path-echo command.
12.2(33)SRB	This command was replaced by the path-echo command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the path-echo command.
12.2(33)SXI	This command was replaced by the path-echo command.

Usage Guidelines

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 10 is configured as an ICMP path echo operation using the IP/ICMP protocol and the destination IP address 172.16.1.175.

```
ip sla monitor 10
  type pathEcho protocol ipIcmpEcho 172.16.1.175
!
ip sla monitor schedule 10 start-time now
```

type pathJitter dest-ipaddr

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type pathJitter dest-ipaddr** command is replaced by the **path-jitter** command. See the **path-jitter** command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) Internet Control Message Protocol (ICMP) path jitter operation, use the **type pathJitter dest-ipaddr** command in IP SLA monitor configuration mode.

type pathJitter dest-ipaddr {*destination-ip-address* | *destination-hostname*} [**source-ipaddr** {*ip-address* | *hostname*}] [**num-packets** *packet-number*] [**interval** *milliseconds*] [**targetOnly**]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
num-packets <i>packet-number</i>	(Optional) Specifies the number of packets to be transmitted in each operation. The default value is 10 packets per operation.
interval <i>milliseconds</i>	(Optional) Time interval between packets (in milliseconds). The default value is 20 ms.
targetOnly	(Optional) Sends test packets to the destination only (path is not traced).

Command Default

No IP SLAs operation type is configured for the operation number being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.2(2)T	This command was introduced.
12.4(4)T	This command was replaced by the path-jitter command.
12.0(26)S	This command was integrated into Cisco IOS Release 12.0(26)S.
12.2(20)S	This command was integrated into Cisco IOS Release 12.2(20)S.

Release	Modification
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SRB	This command was replaced by the path-jitter command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the path-jitter command.
12.2(33)SXI	This command was replaced by the path-jitter command.

Usage Guidelines

If the **targetOnly** keyword is used, the ICMP path jitter operation will send echoes to the destination only (the path from the source to the destination is not traced).

If the **targetOnly** keyword is not used, the IP SLAs ICMP path jitter operation will trace a “hop-by-hop” IP path from the source to the destination and then send a user-specified number of test packets to each hop along the traced path at user-specified time intervals.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to enable the ICMP path jitter operation to trace the IP path to the destination 172.69.5.6 and send 50 test packets to each hop with an interval of 30 ms between each test packet.

```
ip sla monitor 2
 type pathJitter dest-ipaddress 172.69.5.6 num-packets 50 interval 30
!
ip sla monitor schedule 2 start-time now
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type tcpConnect dest-ipaddr

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type tcpConnect dest-ipaddr** command is replaced by the **tcp-connect** command. See the **tcp-connect** command for more information.

To define a Cisco IOS IP Service Level Agreements (SLAs) Transmission Control Protocol (TCP) connection operation, use the **type tcpConnect dest-ipaddr** command in IP SLA monitor configuration mode.

type tcpConnect dest-ipaddr {*destination-ip-address* | *destination-hostname*} **dest-port** *port-number* [**source-ipaddr** {*ip-address* | *hostname*} **source-port** *port-number*] [**control** {**enable** | **disable**}]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname .
dest-port <i>port-number</i>	Specifies the destination port number.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.
control enable disable	(Optional) Enables or disables the IP SLAs control protocol to send a control message to the IP SLAs Responder prior to sending an operation packet. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs Responder.

Command Default

No IP SLAs operation type is associated with the operation number being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.0(3)T	This command was introduced.
12.4(4)T	This command was replaced by the tcp-connect command.

Release	Modification
12.2(33)SRB	This command was replaced by the tcp-connect command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the tcp-connect command.
12.2(33)SXI	This command was replaced by the tcp-connect command.

Usage Guidelines

The TCP connection operation is used to discover the time required to connect to the target device. This operation can be used to test virtual circuit availability or application availability. If the target is a Cisco router, then IP SLAs makes a TCP connection to any port number specified by the user. If the destination is a non-Cisco IP host, then the user must specify a known target port number (for example, 21 for FTP, 23 for Telnet, or 80 for HTTP server). This operation is useful in testing Telnet or HTTP connection times.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 11 is configured as a TCP connection operation using the destination IP address 172.16.1.175 and the destination port 2400.

```
ip sla monitor 11
  type tcpConnect dest-ipaddr 172.16.1.175 dest-port 2400
!
ip sla monitor schedule 11 start-time now life forever
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type udpEcho dest-ipaddr

Note

Effective with Cisco IOS Release 12.4(4)T, 12.2(33)SRB, 12.2(33)SB, and 12.2(33)SXI, the **type udpEcho dest-ipaddr** command is replaced by the **udp-echo** command. See the **udp-echo** command for more information.

To define a Cisco IOS IP Service Level Agreements (SLAs) User Datagram Protocol (UDP) echo operation, use the **type udpEcho dest-ipaddr** command in IP SLA monitor configuration mode.

type udpEcho dest-ipaddr {*ip-address* | *hostname*} **dest-port** *port-number* [**source-ipaddr** {*ip-address* | *hostname*} **source-port** *port-number*] [**control** {**enable** | **disable**}]

Syntax Description

<i>ip-address</i> <i>hostname</i>	Destination IP address or hostname of the operation .
dest-port <i>port-number</i>	Specifies the destination port number.
source-ipaddr { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP address or hostname . When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available UDP port.
control enable disable	(Optional) Enables or disables the IP SLAs control protocol to send a control message to the IP SLAs Responder prior to sending an operation packet. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs Responder.

Command Default

No IP SLAs operation type is associated with the operation number being configured.

Command Modes

IP SLA monitor configuration (config-sla-monitor)

Command History

Release	Modification
12.0(3)T	This command was introduced.

Release	Modification
12.4(4)T	This command was replaced by the udp-echo command.
12.2(33)SRB	This command was replaced by the udp-echo command.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.2(33)SB	This command was replaced by the udp-echo command.
12.2(33)SXI	This command was replaced by the udp-echo command.

Usage Guidelines

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 12 is configured as a UDP echo operation using the destination IP address 172.16.1.175 and destination port 2400.

```
ip sla monitor 12
 type udpEcho dest-ipaddr 172.16.1.175 dest-port 2400
!
ip sla monitor schedule 12 start-time now life forever
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type voip delay gatekeeper registration

**Note**

Effective with Cisco IOS Release 12.4(4)T, the **type voip delay gatekeeper registration** command is replaced by the **voip delay gatekeeper-registration** command. See the **voip delay gatekeeper-registration** command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) Voice over IP (VoIP) gatekeeper delay operation, use the **type voip delay gatekeeper registration** command in IP SLA monitor configuration mode.

type voip delay gatekeeper registration

Syntax Description

This command has no arguments or keywords.

Command Default

No IP SLAs operation type is associated with the operation number being configured.

Command Modes

IP SLA monitor configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the voip delay gatekeeper-registration command.

Usage Guidelines

The IP SLAs gatekeeper registration delay operation provides statistical data on the amount of time taken to register a gateway to a gatekeeper. IP SLAs was designed to gather information over time, at intervals you specify, so that statistics can be provided on key metrics often used in Service Level Agreements (SLAs). Aggregated totals, median, or average data can be viewed using the Cisco IOS command-line interface (CLI) on the device running the IP SLAs operation, or retrieved from the device by external applications using Simple Network Management Protocol (SNMP).

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 10 is configured as a VoIP gatekeeper registration delay operation:

```
ip sla monitor 10
 type voip delay gatekeeper registration
```

```
!  
ip sla monitor schedule 10 start-time now life forever
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

type voip delay post-dial

Note

Effective with Cisco IOS Release 12.4(4)T, the **type voip delay post-dial** command is replaced by the **voip delay post-dial** command. See the **voip delay post-dial** command for more information.

To configure a Cisco IOS IP Service Level Agreements (SLAs) Voice over IP (VoIP) call setup (post-dial delay) operation, use the **type voip delay post-dial** command in IP SLA monitor configuration mode.

type voip delay post-dial [**detect-point** {**alert-ringing**| **connect-ok**}] **destination** *tag*

Syntax Description

detect-point alert-ringing	Sets the Voice over IP (VoIP) call setup operation to measure the response time for the called number to ring. If the detect-point keyword is not specified, the response time for the called number to ring is measured by default.
detect-point connect-ok	Sets the VoIP call setup operation to measure the response time for the called party to answer the call.
destination <i>tag</i>	Specifies the E.164 number or URL of the destination dial-peer.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA monitor configuration

Command History

Release	Modification
12.3(14)T	This command was introduced.
12.4(4)T	This command was replaced by the voip delay post-dial command.

Usage Guidelines

In order to use the IP SLAs VoIP call setup functionality, your Cisco IOS software image must support the IP SLAs VoIP test-call application and IP SLAs VoIP Responder application. To determine if your Cisco IOS software image is configured with these applications, use the **show call application voice** command in user EXEC or privileged EXEC mode.

**Note**

The IP SLAs VoIP Responder application is different from the IP SLAs Responder (which is configured using the **ip sla monitor responder** command in global configuration mode).

If the **detect-point** keyword is not specified, the response time for the called number to ring is measured by default.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla monitor** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure an originating gateway to start the IP SLAs VoIP test-call application, set up the dial peer to route the test call, define the VoIP call setup operation, and schedule the VoIP call setup operation. In this example, test-call messages are generated using the Session Initiation Protocol (SIP).

```
call application session start ipsla-testcall ipsla-testcall
!
dial-peer voice 6789 voip
destination-pattern 6789
session target ipv4:172.29.129.123
session protocol sipv2
!
ip sla monitor 1
 type voip delay post-dial detect-point alert-ringing destination 6789
!
ip sla monitor schedule 1 start-time now life forever
```

The following example shows how to configure a terminating gateway to set up the dial peer and enable the IP SLAs VoIP Responder application to respond to the IP SLAs VoIP call setup test call. In this example, test-call messages are generated using the Session Initiation Protocol (SIP).

```
dial-peer voice 6789 voip
incoming called-number 6789
application ipsla-responder
session protocol sipv2
```

Related Commands

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
show call application voice	Displays information about configured voice applications.

udp-echo

To define a Cisco IOS IP Service Level Agreements (SLAs) User Datagram Protocol (UDP) echo operation, use the **udp-echo** command in IP SLA configuration mode.

udp-echo {*destination-ip-address* | *destination-hostname*} *destination-port* [**source-ip** {*ip-address* | *hostname*} **source-port** *port-number*] [**control** {**enable** | **disable**}]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP v4 or IPv6 address or hostname of the operation .
<i>destination-port</i>	Specifies the destination port number. The range is from 1 to 65535. In Cisco IOS Release 15.2(3)T and later releases, the value of the <i>destination-port</i> variable is selected by the responder if you do not specify a port number.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IPv4 or IPv6 address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
<i>source-port</i> <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available UDP port.
control enable disable	(Optional) Enables or disables the IP SLAs control protocol to send a control message to the IP SLAs Responder prior to sending an operation packet. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs Responder.

Command Default

No IP SLAs operation type is associated with the operation number being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type udpEcho dest-ipaddr command.

Release	Modification
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type udpEcho dest-ipaddr command.
12.2(33)SRC	Support for IPv6 addresses was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type udpEcho dest-ipaddr command. Support for IPv6 addresses was added.
12.4(20)T	Support for IPv6 addresses was added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type udpEcho dest-ipaddr command.
15.2(3)T	This command was modified. A value for the <i>destination-port</i> variable is selected by the responder if you do not specify a port number.

Usage Guidelines

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla global** configuration command) and then reconfigure the operation with the new operation type.

In Cisco IOS Release 15.2(3)T and later releases, if you do not specify a destination port number using the *destination-port* variable, the responder selects a port number on the target device and sends the port number back to the sender for use during the operation.

IP SLAs UDP echo operations support both IPv4 and IPv6 addresses.

Control protocol is required when the target device is a Cisco router that does not natively provide the UDP or TCP Connect service. If you disable control by using the **control disable** keyword combination, you must define the IP address of the source for the Cisco IOS IP SLAs Responder by using the **ip sla responder udp-echo ipaddress** command on the destination device.

Examples

In the following example, IP SLAs operation 12 is configured as a UDP echo operation using the destination IPv4 address 172.16.1.175 and destination port 2400:

```
ip sla 12
  udp-echo 172.16.1.175 2400
!
ip sla schedule 12 start-time now life forever
```

In the following example, IP SLAs operation 13 is configured as a UDP echo operation using the destination IPv6 address 2001:DB8:100::1 and destination port 2400:

```
ip sla 13
  udp-echo 2001:DB8:100::1 2400
!
ip sla schedule 13 start-time now life forever
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla responder udp-echo ipaddress	Permanently enables IP SLAs Responder functionality on specified IP address and port.

udp-jitter

To configure a Cisco IOS IP Service Level Agreements (SLAs) User Datagram Protocol (UDP) jitter operation or a IP SLAs multicast UDP jitter operation and enter UDP jitter or multicast UDP jitter configuration mode, use the **udp-jitter** command in IP SLA configuration mode.

udp-jitter {*destination-ip-address* | *destination-hostname*} *destination-port* [**endpoint-list** [*endpoint-list*]] [**ssm**] [**source-ip** {*ip-address* | *hostname*}] [**source-port** *port-number*] [**control** {**enable** | **disable**}] [**num-packets** *number-of-packets*] [**interval** *interpacket-interval*]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IPv4 or IPv6 address or hostname. • For a multicast UDP jitter operation, this must be a multicast IP address.
<i>destination-port</i>	Specifies the destination port number. The range is from 1 to 65535. • In Cisco IOS Release 15.2(3)T and later releases, the default value of 10000 for the <i>destination-port</i> variable is selected by the responder if you do not specify a port number.
endpoint-list <i>endpoint-list</i>	(Optional) Required for multicast UDP jitter operations. Specifies the unique identifier of an endpoint list for a multicast UDP jitter operation.
ssm	(Optional) For multicast UDP jitter operations only. Specifies that the source IP address is a source specific multicast address. Note The source-ip <i>ip-address</i> keyword and argument combination is required with this keyword.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IPv4 or IPv6 address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination. Note The source-ip <i>ip-address</i> keyword and argument combination is required ssm keyword. The value of the <i>ip-address</i> argument must be an SSM address
source-port <i>port-number</i>	(Optional) Specifies the source port number. When a port number is not specified, IP SLAs chooses an available port.

control { enable disable }	(Optional) Enables or disables the sending of IP SLAs control messages to the IP SLAs Responder. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs responder. Note This keyword combination is not supported for multicast UDP jitter operations.
num-packets <i>number-of-packets</i>	(Optional) Specifies the number of packets. The default is 10.
interval <i>interpacket-interval</i>	(Optional) Specifies the interpacket interval in milliseconds. The default is 20.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

12.4(4)T	This command was introduced. This command replaces the type jitter dest-ipaddr command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the type jitter dest-ipaddr command.
12.2(33)SRC	Support for IPv6 addresses was added.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the type jitter dest-ipaddr command. Support for IPv6 addresses was added.
12.4(20)T	Support for IPv6 addresses was added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the type jitter dest-ipaddr command.
15.2(3)T	This command was modified. A default port number for the <i>destination-port</i> variable is selected by the responder if you do not specify a port number.
15.2(4)M	This command was modified. Support for multicast UDP jitter operations was added. The <i>endpoint-list</i> argument and optional ssm keyword were added for multicast UDP jitter operations only.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.

Cisco IOS XE Release 3.8S This command was integrated into Cisco IOS XE Release 3.8S.

15.1(2)SG This command was integrated into Cisco IOS Release 15.1(2)SG.

Cisco IOS XE Release 3.4SG This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

This command configures an IP SLAs UDP Plus operation and enters UDP jitter configuration mode. The UDP Plus operation is a superset of the UDP echo operation. In addition to measuring UDP round-trip time, the UDP Plus operation measures per-direction packet loss and jitter. Jitter is interpacket delay variance. Jitter statistics are useful for analyzing traffic in a Voice over IP (VoIP) network.

This command with an IP multicast address for the *destination-ip-address* argument configures an IP SLAs multicast UDP jitter operation and enters multicast UDP jitter operations configuration mode. The **endpoint-list endpoint-list** keyword and argument identifies an endpoint list of multicast responders to be used for the multicast UDP jitter operation being configured. Use the **ip sla endpoint-list** command in global configuration mode to configure a list of multicast responders.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

You must enable the IP SLAs Responder on the target router before you can configure a UDP jitter operation. Prior to sending an operation packet to the target router, IP SLAs sends a control message to the IP SLAs Responder to enable the destination port. Control protocol is required when the target device is a Cisco router that does not natively provide the UDP or TCP Connect service. If you disable control by using the **control disable** keyword combination with this command, you must define the IP address of the source for the Cisco IOS IP SLAs Responder by using the **ip sla responder udp-echo ipaddress** command on the destination device.

For multicast UDP jitter operations: The **control** keyword is not supported for multicast UDP jitter operations because control is always enabled for multicast UDP jitter operations.

The default request packet data size for an IP SLAs UDP jitter operation is 32 bytes. Use the **request-data-size** command to modify this value.

In Cisco IOS Release 15.2(3)T and later releases, if you do not specify a destination port number using the *destination-port* variable, the responder sends the default port number (10000) back to the sender for use during the operation.

IP SLAs UDP jitter and multicast UDP jitter operations support both IPv4 and IPv6 addresses.

IP SLAs VoIP UDP Jitter (codec) Operation

When you specify the codec in the command syntax of the **udp-jitter** command, the standard configuration options are replaced with codec-specific keywords and arguments. The codec-specific command syntax is documented separately from the command syntax for the standard implementation of the **udp-jitter** command. For information about the codec-specific command syntax, see the documentation for the **udp-jitter (codec)** command.

Examples

In the following example, operation 6 is configured as a UDP jitter operation with the destination IPv4 address 172.30.125.15, the destination port number 2000, 20 packets, and an interpacket interval of 20 ms:

```
ip sla 6
  udp-jitter 172.30.125.15 2000 num-packets 20 interval 20
!
```

```
ip sla schedule 6 start-time now
```

In the following example, operation 7 is configured as a UDP jitter operation with the destination IPv6 address 2001:0DB8:200::FFFE, the destination port number 2000, 20 packets, and an interpacket interval of 20 ms:

```
ip sla 7
  udp-jitter 2001:0DB8:200::FFFE 2000 num-packets 20 interval 20
!
```

```
ip sla schedule 7 start-time now
```

The following example shows how to configure a multicast UDP jitter operation. Note that the IP address of the destination device is a multicast address.

```
ip sla 2
  udp-jitter 239.1.1.1 5000 mcast source-ip 10.10.10.106 source-port 7012 num-packets 50
  interval 25
!
```

```
ip sla schedule 2 start-time now
```

Related Commands

Command	Description
control (IP SLA)	Configures control message parameters.
ip sla endpoint-list	Assigns a name to an IP SLAs endpoint list and enters IP SLA endpoint-list configuration mode.
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla responder udp-echo ipaddress	Permanently enables IP SLAs Responder functionality on specified IP address and port.
request-data-size	Sets the payload size for IP SLAs operation request packets.
udp-jitter (codec)	Configures an IP SLAs UDP jitter operation that returns VoIP scores.

udp-jitter (codec)

To configure a Cisco IOS IP Service Level Agreements (SLAs) User Datagram Protocol (UDP) jitter operation that returns Voice over IP (VoIP) scores, use the **udp-jitter** command in IP SLA configuration mode.

udp-jitter {*destination-ip-address*| *destination-hostname*} *destination-port* **codec** *codec-type* [**codec-numpackets** *number-of-packets*] [**codec-size** *number-of-bytes*] [**codec-interval** *milliseconds*] [**advantage-factor** *value*] [**source-ip** {*ip-address*| *hostname*}] [**source-port** *port-number*] [**control** {**enable**| **disable**}]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Specifies the destination IP address or hostname. For a multicast UDP jitter operation, this must be a multicast IP address.
<i>destination-port</i>	Specifies the destination port number. For UDP jitter (codec) operations, the port number should be an even number in the range of 16384 to 32766 or 49152 to 65534.
codec <i>codec-type</i>	Enables the generation of estimated voice-quality scores in the form of Calculated Planning Impairment Factor (ICPIF) and Mean Opinion Score (MOS) values. The codec type should match the encoding algorithm you are using for VoIP transmissions. The following codec-type keywords are available: g711alaw --The G.711 a-law codec (64 kbps transmission) g711ulaw --The G.711 muHm-law codec (64 kbps transmission) g729a --The G.729A codec (8 kbps transmission) Configuring the codec type sets default values for the variables codec-numpackets , codec-size , and codec-interval in this command. See the Default UDP Jitter Operation Parameters by Codec table below for details.
codec-numpackets <i>number-of-packets</i>	(Optional) Specifies the number of packets to be transmitted per operation. The range is from 1 to 60000. The default is 1000.

codec-size <i>number-of-bytes</i>	(Optional) Specifies the number of bytes in each packet transmitted. (Also called the payload size or request size.) The range is from 16 to 1500. The default varies by codec (see the Default UDP Jitter Operation Parameters by Codec table below).
codec-interval <i>milliseconds</i>	Specifies the interval (delay) between packets that should be used for the operation, in milliseconds (ms). The range is from 1 to 60000. The default is 20.
advantage-factor <i>value</i>	Specifies the expectation factor to be used for ICPIF calculations. This value is subtracted from the measured impairments to yield the final ICPIF value (and corresponding MOS value). See the "Usage Guidelines" section for recommended values. The range is from 0 to 20. The default is 0.
ssm	(Optional) For multicast UDP jitter operations only. Specifies that the source IP address is a source specific multicast address. Note The source-ip <i>ip-address</i> keyword and argument combination is required with this keyword.
source-ip { <i>ip-address</i> <i>hostname</i> }	(Optional) Specifies the source IP v4 or IPv6 address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination. Note The source-ip <i>ip-address</i> keyword and argument combination is required ssm keyword. The value of the <i>ip-address</i> argument must be an SSM address
control { enable disable }	(Optional) Enables or disables the sending of IP SLAs control messages to the IP SLAs Responder. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs Responder. Note Control messages are enabled by default. Disabling the IP SLAs control messages for UDP jitter operations is not recommended. If you disable IP SLAs control messages, packet loss statistics and IP telephony scores will not be generated accurately.

Command Default

No IP SLAs operation type is associated with the operation number being configured.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the typejitterdest-ipaddr (codec) command.
12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB. This command replaces the typejitterdest-ipaddr (codec) command.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB. This command replaces the typejitterdest-ipaddr (codec) command.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI. This command replaces the typejitterdest-ipaddr (codec) command.
15.2(4)M	This command was modified. Support was added for multicast UDP jitter operations for VoIP. The ssm keyword was added for multicast UDP jitter operations only.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.

Usage Guidelines

When you specify the codec in the command syntax of the **udp-jitter** command, the standard configuration options are replaced with codec-specific keywords and arguments. The codec-specific command syntax is documented separately from the command syntax for the standard implementation of the **udp-jitter** command. For information about the command syntax for the standard implementation, see the documentation for the **udp-jitter** command.

You must enable the IP SLAs Responder on the target router before you can configure a UDP jitter (codec) operation. Prior to sending an operation packet to the target router, IP SLAs sends a control message to the IP SLAs Responder to enable the destination port.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **noipslaglobal** configuration command) and then reconfigure the operation with the new operation type.

The *endpoint-list* argument identifies an endpoint list of multicast responders to be used for the multicast UDP jitter operation being configured. Use the **ip sla endpoint-list** command in global configuration mode to configure a list of multicast responders.

IP SLAs VoIP UDP Jitter (codec) Statistics

The IP SLAs UDP jitter operation computes statistics by sending n UDP packets, each of size s , sent t milliseconds apart, from a given source router to a given target router, at a given frequency f .

To generate MOS and ICPIF scores, you specify the codec type used for the connection when configuring the UDP jitter operation. Based on the type of codec you configure for the operation, the number of packets (n), the size of each payload (s), the inter-packet time interval (t), and the operational frequency (f) will be auto-configured with default values. (See the Default UDP Jitter Operation Parameters by Codec table for specific information.) However, you are given the option, if needed, to manually configure these parameters in the syntax of the **udp-jitter(codec)** command.

The table below shows the default parameters that are configured for the operation by codec.

Table 97: Default UDP Jitter Operation Parameters by Codec

Codec	Default Number of Packets (n); [codec-numpackets]	Packet Payload (s) [codec-size] ³	Default Interval Between Packets (t) [codec-interval]	Frequency of Operations (f)
G.711 mu-law (g711ulaw)	1000	160 bytes	20 ms	Once every 60 seconds
G.711 a-law (g711alaw)	1000	160 bytes	20 ms	Once every 60 seconds
G.729A (g729a)	1000	20 bytes	20 ms	Once every 60 seconds

³ The actual data size of each request packet will contain an additional 12 bytes of Real-Time Transport Protocol (RTP) header data in order to simulate the RTP/UDP/IP/Layer 2 protocol stack.

For example, if you configure the UDP jitter operation to use the characteristics for the g711ulaw codec, by default an operation will be sent once a minute (f). Each operation would consist of 1000 packets (n), with each packet containing 160 bytes (plus 12 header bytes) of synthetic data (s), sent 20 ms apart (t).

The **advantage-factor** *value* keyword and argument allow you to specify an access Advantage Factor (also called the Expectation Factor). The table below, adapted from ITU-T Rec. G.113, defines a set of provisional maximum values for Advantage Factors in terms of the service provided.

Table 98: Advantage Factor Recommended Maximum Values

Communication Service	Maximum Value of Advantage/ Expectation Factor (A):
Conventional wire line (land line)	0
Mobility (cellular connections) within a building	5
Mobility within a geographical area or moving within a vehicle	10
Access to hard-to-reach location; (for example, via multihop satellite connections)	20

These values are only suggestions. To be meaningful, the use of the Advantage/Expectation factor (A) and its selected value in a specific application should be used consistently in any planning model you adopt. However, the values in the table above should be considered as the absolute upper limits for A . The default Advantage/Expectation factor for IP SLAs UDP jitter operations is always zero.

Examples

In the following example, IP SLAs operation 10 is configured as a UDP jitter (codec) operation with the destination IP address 209.165.200.225 and the destination port number 3000. The operation is configured to use the characteristics of the G.711 a-law codec, which means the operation will consist of 1000 packets, each of 172 bytes (160 plus 12 header bytes), sent 20 ms apart. The default value for the Advantage Factor and operations frequency is used.

```
ip sla 10
  udp-jitter 209.165.200.225 3000 codec g711alaw
!
ip sla schedule 10 start-time now
```

Related Commands

Command	Description
ip sla endpoint-list	Assigns a name to an IP SLAs endpoint list and enters IP SLA endpoint-list configuration mode.
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.
udp-jitter	Configures an IP SLAs UDP jitter operation.

verify-data (IP SLA)

To cause a Cisco IOS IP Service Level Agreements (SLAs) operation to check each reply packet for data corruption, use the **verify-data**(IP SLA) command in the appropriate submode of IP SLA configuration, IP SLA monitor configuration, or IP SLA template parameters configuration mode. To return to the default value, use the **no** form of this command.

verify-data

no verify-data

Syntax Description	This command has no arguments or keywords.

Command Default	Data is not checked for corruption.

Command Modes	ICMP echo configuration (config-ip-sla-echo) ICMP path echo configuration (config-ip-sla-pathEcho) ICMP path jitter configuration (config-ip-sla-pathJitter) Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper) UDP echo configuration (config-ip-sla-udp) UDP jitter configuration (config-ip-sla-jitter)

Command Modes	ICMP echo configuration (config-sla-monitor-echo) ICMP path echo configuration (config-sla-monitor-pathEcho) ICMP path jitter configuration (config-sla-monitor-pathJitter) UDP echo configuration (config-sla-monitor-udp) UDP jitter configuration (config-sla-monitor-jitter)

Command Modes	ICMP echo configuration (config-icmp-ech-params) UDP echo configuration (config-udp-ech-params) UDP jitter configuration (config-udp-jtr-params)

Command History	Release	Modification
	11.2	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Release	Modification
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
15.1(1)T	This command was modified. The IP SLA template parameters configuration mode was added.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.
15.1(2)SG	This command was integrated into Cisco IOS Release 15.1(2)SG.
Cisco IOS XE Release 3.4SG	This command was integrated into Cisco IOS XE Release 3.4SG.

Usage Guidelines

Use the **verify-data** (IP SLA) command only when data corruption may be an issue. Do not enable this feature during normal operation because it can cause unnecessary network overhead.

The **verify-data** command is supported in IPv4 networks. This command can also be used when configuring an IP SLAs operation that supports IPv6 addresses.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

The configuration mode for the **verify-data** (IP SLA) command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured.

If you are running Cisco IOS IP SLAs Engine 3.0, you must enter the **parameters** command in IP SLA template configuration mode before you can use the **verify-data** command.

Table 99: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration
15.1(1)T	ip sla auto template	IP SLA template configuration

Examples

The following examples show how to configure an IP SLAs ICMP echo operation to verify each reply packet for data corruption. Note that the Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table above).

Examples

```
ip sla 5
 icmp-echo 172.16.1.174
 verify-data
!
ip sla schedule 5 start-time now life forever
```

Examples

```
ip sla monitor 5
 type echo protocol ipIcmpEcho 172.16.1.174
 verify-data
!
ip sla monitor schedule 5 start-time now life forever
```

Examples

```
Router(config)#ip sla auto template type ip icmp-echo 5
Router(config-tplnt-icmp-ech)#parameters
Router(config-icmp-ech-params)#verify-dat
a
Router(config-icmp-ech-params)#end
Router#
00:02:26: %SYS-5-CONFIG_I: Configured from console by console
Router# show ip sla auto template type ip icmp-echo 5
IP SLAs Auto Template: 5
  Measure Type: icmp-echo
  Description:
  .
  .

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
ip sla auto template	Begins configuration for an auto IP SLAs operation template and enters IP SLA template configuration mode.

Command	Description
ip sla monitor	Begins configuration for an IP SLAs operation and enters IP SLA monitor configuration mode.

video (IP SLA)

To enter IP SLA video configuration mode and begin configuring a video profile for an IP Service Level Agreements (SLAs) operation, use the **video** command in IP SLA configuration mode.

video {*destination-ip-address* | *destination-hostname*} *destination-port* **source-ip** {*source-ip-address* | *source-hostname*} **source-port** *port-number* **profile** *traffic-type*

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	IPv4 address or hostname of the destination (responder) device.
<i>destination-port</i>	Port number on the destination device. The range is from 1 to 65535.
source-ip { <i>source-ip-address</i> <i>source-hostname</i> }	Specifies the IPv4 address or hostname of the source (sender) device.
source-port <i>port-number</i>	Specifies the port number on the source device. The range is from 1 to 65535.

profile <i>traffic-type</i>	

Specifies the type of video traffic. To see a complete list of valid options, type **Shift+?** for command help.

Keyword options for the *traffic-type* argument are as follows:

- **iptv**: IP television traffic (2.6 Mbps)
- **ipvsc**: IP video surveillance camera traffic (2.2 Mbps)
- **telepresence**: Cisco TelePresence 1080P traffic (6.6 Mbps)

The following keyword options were added in Cisco IOS Release 15.2(2)T:

- **CP-9900-CIF-15-384kbps**: Cisco CP-9900 Round Table Phone CIF 15fps 384 kb/s
- **CP-9900-CIF-30-1000kbps**: Cisco CP-9900 Round Table Phone CIF 30fps 1000 kb/s
- **CP-9900-QCIF-10-79kbps**: Cisco CP-9900 Round Table Phone QCIF 10fps 79 kb/s
- **CP-9900-QCIF-15-99kbps**: Cisco CP-9900 Round Table Phone QCIF 15fps 99 kb/s
- **CP-9900-QCIF-30-249kbps**: Cisco CP-9900 Round Table Phone QCIF 30fps 249 kb/s
- **CP-9900-VGA-15-1000kbps**: Cisco CP-9900 Round Table Phone VGA 15fps 1000 kb/s
- **CP-9900-VGA-30-1000kbps**: Cisco CP-9900 Round Table Phone VGA 30fps 1000 kb/s
- **CTS-1080P-Best**: Cisco Telepresence System 1080p 30fps 4000 kb/s Best Quality
- **CTS-1080P-Better**: Cisco Telepresence System 1080p 30fps 3500 kb/s Better Quality
- **CTS-1080P-Good**: Cisco Telepresence System 1080p 30fps 3000 kb/s Good Quality
- **CTS-720P-Best**: Cisco Telepresence System 720p 30fps 2250 kb/s Best Quality
- **CTS-720P-Better**: Cisco Telepresence System 720p 30fps 1500 kb/s Better Quality
- **CTS-720P-Good**: Cisco Telepresence System 720p 30fps 1000 kb/s Good Quality
- **CTS-720P-Lite**: Cisco Telepresence System 720p 30fps 936 kb/s Lite Quality

- **custom**: User-defined video traffic type

Command Default

No video profile is configured for the IP SLAs operation.

Command Modes

IP SLA configuration (config-ip-sla)

Command History

Release	Modification
12.2(58)SE	This command was introduced.
15.2(2)T	This command was modified. New keywords for the <i>traffic-type</i> argument were added.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.

Usage Guidelines

This command configures a basic video profile for an IP SLAs video operation with the default values for the specified type of video traffic. Traffic types are limited to the options available using the **profile** *traffic-type* keyword and argument combination.

The keywords for this command are not case sensitive. The keywords in online help contain uppercase letters to enhance readability only.

Depending on profile type: After configuring the basic video profile, use the commands in IP SLA video configuration mode to change the default values of certain settings in the video profile, such as duration, frequency, threshold, or timeout, or use the commands in the appropriate IP SLA VO endpoint profile configuration submode to configure required parameters such as bit rate, frame, or resolution.

To change the traffic type of the video profile for an existing IP SLAs video operation, you must first use the **no** form of the **ip sla** command to delete the IP SLAs operation and then reconfigure the operation and video profile.

Use the **show ip sla configuration** command to display configuration values, including all defaults, for all IP SLAs operations or for a specified operation.

You must enable the IP SLAs Responder on the target device before starting a video operation.

Examples

The following example shows how to configure operation 1 with a basic video profile for Cisco TelePresence 1080P traffic:

```
Router(config)# ip sla 1
Router(config-ip-sla)# video 192.168.2.1 2345 source-ip 192.168.2.25 source-port 555 profile
telepresence
Router(config-ip-sla-video)# end

Router# show ip sla 1
```

```

IP SLAs Infrastructure Engine-III
Entry number: 1

  Frame rate: 15fps
  Bit rate maximum: 333kbps

```

Related Commands

Command	Description
bitrate (VO profile)	Configures the max bit rate or bit-rate window size parameter in a user-defined video profile.
duration (IP SLA video)	Sets the amount of time that platform-assisted video traffic is generated for an IP SLAs video operation.
frame (VO profile)	Configures frame parameters in a user-defined video profile.
frequency (IP SLA video)	Sets the rate at which an IP SLAs video operation repeats.

Command	Description
ip sla	Enters the IP SLA configuration mode and begins configuring an IP SLAs operation.
resolution	Configures the resolution in a user-defined video profile.
show ip sla configuration	Displays configuration values, including all defaults, for all IP SLAs operations or for a specified operation.
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.
threshold (IP SLA video)	Sets the upper threshold value for calculating network monitoring statistics created by an IP SLAs video operation.
timeout (IP SLA video)	Sets the amount of time that an IP SLAs video operation waits for a response from its request packet.

video-content

To configure the video-content parameter in a custom video traffic profile for an IP Service LevelAgreements (SLAs) video operation, use the **video-content** command in the IP SLA VO custom profile endpoint configuration submode. To return the video content value to its default value, use the **no** form of this command.

video-content *content-type*

Syntax Description

<i>content-type</i>	The following keywords are valid options for the <i>content-type</i> argument: • conference-room • single-person • news-broadcast • sports • street-view

Command Default

The video content type is not configured in a custom video traffic profile.

Command Modes

IP SLA VO custom profile endpoint configuration (cfg-ipslavo-custom-profile)

Command History

Release	Modification
15.2(2)T	This command was introduced.

Usage Guidelines

Use this command to configure the video content type for a user-defined custom video traffic profile. Video traffic generated by the video probe must match the traffic characteristics described in the designated traffic profile.

Cisco IP SLA VO video content type influences how often an intra-frame (I-frame) is sent as triggered by video scene changes. The following content types are configured by using this command:

- Conference-room—approximates slow to medium scene motion.
- Single-person—approximates slow scene motion.
- News-broadcast—approximates medium scene motion.
- Sports—approximates fast scene motion.
- Street-view—approximates medium to fast scene motion for a busy street.

Examples

```
Router> enable
Router# configure terminal
Router(config)# ip sla profile video my-profile
Router(cfg-ipslavo-profile)# endpoint custom
Router(cfg-ipslavo-prof-custom)# video-content conference-room
```

Related Commands

Command	Description
show ip sla profile video	Displays a summary of IP SLAs video traffic profiles.

voip delay gatekeeper-registration

To configure a Cisco IOS IP Service Level Agreements (SLAs) Voice over IP (VoIP) gatekeeper delay operation, use the **voip delay gatekeeper-registration** command in IP SLA configuration mode.

voip delay gatekeeper-registration

Syntax Description

This command has no arguments or keywords.

Command Default

No IP SLAs operation type is associated with the operation number being configured.

Command Modes

IP SLA configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type voip delay gatekeeper registration command.

Usage Guidelines

The IP SLAs gatekeeper registration delay operation provides statistical data on the amount of time taken to register a gateway to a gatekeeper. IP SLAs was designed to gather information over time, at intervals you specify, so that statistics can be provided on key metrics often used in Service Level Agreements (SLAs). Aggregated totals, median, or average data can be viewed using the Cisco IOS command-line interface (CLI) on the device running the IP SLAs operation, or retrieved from the device by external applications using Simple Network Management Protocol (SNMP).

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

In the following example, IP SLAs operation 10 is configured as a VoIP gatekeeper registration delay operation:

```
ip sla 10
  voip delay gatekeeper-registration
!
ip sla schedule 10 start-time now life forever
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.

voip delay post-dial

To configure a Cisco IOS IP Service Level Agreements (SLAs) Voice over IP (VoIP) call setup (post-dial delay) operation, use the **voip delay post-dial** command in IP SLA configuration mode.

voip delay post-dial [**detect-point** {**alert-ringing**| **connect-ok**}] **destination** *tag*

Syntax Description

detect-point alert-ringing	Sets the Voice over IP (VoIP) call setup operation to measure the response time for the called number to ring. If the detect-point keyword is not specified, the response time for the called number to ring is measured by default.
detect-point connect-ok	Sets the VoIP call setup operation to measure the response time for the called party to answer the call.
destination <i>tag</i>	Specifies the E.164 number or URL of the destination dial-peer.

Command Default

No IP SLAs operation type is configured for the operation being configured.

Command Modes

IP SLA configuration

Command History

Release	Modification
12.4(4)T	This command was introduced. This command replaces the type voip delay post-dial command.

Usage Guidelines

In order to use the IP SLAs VoIP call setup functionality, your Cisco IOS software image must support the IP SLAs VoIP test-call application and IP SLAs VoIP Responder application. To determine if your Cisco IOS software image is configured with these applications, use the **show call application voice** command in user EXEC or privileged EXEC mode.

Note

The IP SLAs VoIP Responder application is different from the IP SLAs Responder (which is configured using the **ip sla responder** command in global configuration mode).

If the **detect-point** keyword is not specified, the response time for the called number to ring is measured by default.

You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla** global configuration command) and then reconfigure the operation with the new operation type.

Examples

The following example shows how to configure an originating gateway to start the IP SLAs VoIP test-call application, set up the dial peer to route the test call, define the VoIP call setup operation, and schedule the VoIP call setup operation. In this example, test-call messages are generated using the Session Initiation Protocol (SIP).

```
call application session start ipsla-testcall ipsla-testcall
!
dial-peer voice 6789 voip
destination-pattern 6789
session target ipv4:172.29.129.123
session protocol sipv2
!
ip sla 1
  voip delay post-dial detect-point alert-ringing destination 6789
!
ip sla schedule 1 start-time now life forever
```

The following example shows how to configure a terminating gateway to set up the dial peer and enable the IP SLAs VoIP Responder application to respond to the IP SLAs VoIP call setup test call. In this example, test-call messages are generated using the Session Initiation Protocol (SIP).

```
dial-peer voice 6789 voip
incoming called-number 6789
application ipsla-responder
session protocol sipv2
```

Related Commands

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode.
show call application voice	Displays information about configured voice applications.

voip rtp

To configure a Cisco IOS IP Service Level Agreement (SLAs) RTP-based Voice over IP (VoIP) operation, use the **voip rtp** command in IP SLA configuration mode.

voip rtp {*destination-ip-address*|*destination-hostname*} **source-ip** {*ip-address*|*hostname*} **source-voice-port** *slot* [/*subunit*/*port* : *ds0-group-number*] [**codec** *codec-type*] [**duration** *seconds*] [**advantage-factor** *value*]

Syntax Description

<i>destination-ip-address</i> <i>destination-hostname</i>	Destination IP address or hostname .
source-ip { <i>ip-address</i> <i>hostname</i> }	Specifies the source IP address or hostname .
source-voice-port	Specifies the source voice port.
<i>slot</i>	Source slot number.
/ <i>subunit</i>	Source subunit number. A slash must precede this value.
/ <i>port</i>	Source port number. A slash must precede this value.
: <i>ds0-group-number</i>	Source DS0 group number. A colon must precede this value.
codec <i>codec-type</i>	(Optional) Enables the generation of estimated voice quality scores in the form of Calculated Planning Impairment Factor (ICPIF) and Mean Opinion Score (MOS) values. The codec type should match the encoding algorithm you are using for VoIP transmissions. The following codec type keywords are available: • g711alaw --The G.711 A-Law codec (64 kbps transmission) • g711ulaw --The G.711 muHm-Law codec (64 kbps transmission) • g729a --The G.729A codec (8 kbps transmission) Default codec type is the G.729A codec.
duration <i>seconds</i>	(Optional) Specifies the duration (in seconds) of the test call. The default is 20 seconds.

advantage-factor <i>value</i>	(Optional) Specifies the expectation factor to be used for ICPIF calculations. This value is subtracted from the measured impairments to yield the final ICPIF value (and corresponding MOS value). The valid range is from 0 to 20. The default is 0.

Command Default No IP SLAs operation type is configured for the operation being configured.

Command Modes IP SLA configuration (config-ip-sla)

Release	Modification
12.4(4)T	This command was introduced.

Usage Guidelines You must configure the type of IP SLAs operation (such as User Datagram Protocol [UDP] jitter or Internet Control Message Protocol [ICMP] echo) before you can configure any of the other parameters of the operation. To change the operation type of an existing IP SLAs operation, you must first delete the IP SLAs operation (using the **no ip sla global** configuration command) and then reconfigure the operation with the new operation type.

Examples The following example shows how to configure an IP SLAs RTP-based VoIP operation:

```
ip sla 1
  voip rtp 10.2.3.4 source-ip 10.5.6.7 source-voice-port 1/0:1 codec g711alaw duration 30
  advantage-factor 5
  exit
!
ip sla reaction-configuration 1 react FrameLossDS threshold-type consecutive 3 action-type
  traponly
!
ip sla schedule 1 start-time now life forever
```

Command	Description
ip sla	Begins configuration for an IP SLAs operation and enters IP SLA configuration mode

vrf (IP SLA)

To allow monitoring within Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs) using Cisco IOS IP Service Level Agreements (SLAs) operations, use the **vrf** command in the appropriate submode of IP SLA configuration, IP SLA monitor configuration, or IP SLA template configuration mode.

vrf *vrf-name*

Syntax Description

<i>vrf-name</i>	VPN routing and forwarding (VRF) name.

Command Default

The MPLS VPN parameter is not configured for the IP SLAs operation.

Command Modes

IP SLA Configuration

DNS configuration (config-ip-sla-dns)

FTP configuration (config-ip-sla-ftp)

HTTP configuration (config-ip-sla-http)

ICMP echo configuration (config-ip-sla-echo)

ICMP jitter configuration (config-ip-sla-icmpjitter)

ICMP path echo configuration (config-ip-sla-pathEcho)

ICMP path jitter configuration (config-ip-sla-pathJitter)

Multicast UDP jitter configuration (config-ip-sla-multicast-jitter-oper)

TCP connect configuration (config-ip-sla-tcp)

UDP echo configuration (config-ip-sla-udp)

UDP jitter configuration (config-ip-sla-jitter)

Video configuration (config-ip-sla-video)

IP SLA Monitor Configuration

ICMP echo configuration (config-sla-monitor-echo)

ICMP path echo configuration (config-sla-monitor-pathEcho)

ICMP path jitter configuration (config-sla-monitor-pathJitter)

UDP echo configuration (config-sla-monitor-udp)

UDP jitter configuration (config-sla-monitor-jitter)

IP SLA Template Configuration

ICMP echo configuration (config-tplt-icmp-ech)

ICMP jitter configuration (config-tplt-icmp-ech)

TCP connect configuration (config-tplt-tcp-conn)

UDP echo configuration (config-tplt-udp-ech)

UDP jitter configuration (config-tplt-udp-ech)

Command History

Release	Modification
12.2(2)T	This command was introduced.
12.2(11)T	Syntax changed from vrfName to vrf with SAA Engine II.
12.0(26)S	This command was integrated into Cisco IOS Release 12.0(26)S. Support for this command was also added for ICMP path jitter operations.
12.3(2)T	Support for this command was added for ICMP path jitter operations.
12.2(20)S	This command was integrated into Cisco IOS Release 12.2(20)S. Support for this command was also added for ICMP path jitter operations.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
12.4(20)T	Support for this command was added for the IP SLAs DNS, FTP, HTTP, and TCP connect operations.
15.1(1)T	This command was modified. The IP SLA template configuration mode was added.
12.2(58)SE	This command was modified. Support for the IP SLA video configuration mode was added.
15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T.
15.1(1)SG	This command was integrated into Cisco IOS Release 15.1(1)SG.
Cisco IOS XE Release 3.3SG	This command was integrated into Cisco IOS XE Release 3.3SG.
15.1(1)SY	This command was integrated into Cisco IOS Release 15.1(1)SY.
15.2(4)M	This command was modified. The multicast UDP jitter configuration mode was added.
15.3(1)S	This command was integrated into Cisco IOS Release 15.3(1)S.
Cisco IOS XE Release 3.8S	This command was integrated into Cisco IOS XE Release 3.8S.

Usage Guidelines

This command identifies the VPN for the operation being configured.

Use this command only if the response time over the VPN tunnel must be measured.

For ICMP path jitter operations, you must specify the source IP address or hostname when using the **vrf** command.

The **vrf** (IP SLA) command is supported in IPv4 networks. This command is also supported in IPv6 networks to configure an IP SLAs operation that supports IPv6 addresses.

IP SLAs Operation Configuration Dependence on Cisco IOS Release

The Cisco IOS command used to begin configuration for an IP SLAs operation varies depending on the Cisco IOS release you are running (see the table below). You must configure the type of IP SLAs operation, such as User Datagram Protocol (UDP) jitter or Internet Control Message Protocol (ICMP) echo, before you can configure any of the other parameters of the operation.

The configuration mode for the **vrf** (IP SLA) command varies depending on the Cisco IOS release you are running (see the table below) and the operation type configured.

Table 100: Command Used to Begin Configuration of an IP SLAs Operation Based on Cisco IOS Release

Cisco IOS Release	Global Configuration Command	Command Mode Entered
12.4(4)T, 12.0(32)SY, 12.2(33)SRB, 12.2(33)SB, 12.2(58)SE, or later releases	ip sla	IP SLA configuration
12.3(14)T, 12.4, 12.4(2)T, 12.2(31)SB2, or 12.2(33)SXH	ip sla monitor	IP SLA monitor configuration
15.1(1)T	ip sla auto template	IP SLA template configuration

Examples

The following examples show how to configure an IP SLAs operation for an MPLS VPN. These examples show how test traffic can be sent in an already existing VPN tunnel between two endpoints.

Examples

```
ip sla 1
 icmp-echo 10.1.1.1
 vrf vpn1
 !
ip sla schedule 1 start now
```

Examples

```
ip sla monitor 1
 type echo protocol ipIcmpEcho 10.1.1.1
 vrf vpn1
 !
ip sla monitor schedule 1 start now
```

Examples

```
Router(config)# ip sla auto template type ip icmp-echo 1
Router(config-tplt-icmp-ech) # source-ip 10.1.1.1
Router(config-tplt-icmp-ech) # vrf vpn1
Router(config-icmp-ech-params) # end
```

```

Router#
00:02:26: %SYS-5-CONFIG_I: Configured from console by console
Router# show ip sla auto template type ip icmp-echo 1
IP SLAs Auto Template: 1
  Measure Type: icmp-echo
  Description:
  IP options:
    Source IP: 10.1.1.1
    VRF: vpn1      TOS: 0x0
  Operation Parameters:
    Number of Packets: 10   Inter packet interval: 20
    Timeout: 5000          Threshold: 5000
  Statistics Aggregation option:
    Hours of statistics kept: 2
  Statistics Distributions options:
    Distributions characteristics: RTT
    Distributions bucket size: 20
    Max number of distributions buckets: 1
  Reaction Configuration: None

```
