

# Multilink Frame Relay over L2TPv3/AToM

---

**First Published: May 6, 2004**

**Last Updated: November 17, 2006**

This feature enables Multilink Frame Relay switching over Layer 2 Tunnel Protocol Version 3 (L2TPv3) and Any Transport over MPLS (AToM). The feature works with like-to-like interfaces and disparate interfaces (L2VPN interworking).

Multilink Frame Relay is the logical grouping of one or more physical interfaces between two devices of the User-to-Network Interface/Network-to-Network Interface (UNI/NNI) as one single Frame Relay data link.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for Multilink Frame Relay over L2TPv3/AToM](#)” section on [page 22](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Multilink Frame Relay over L2TPv3/AToM

Before configuring Multilink Frame Relay over L2TPv3/AToM, you should understand how to configure Layer 2 virtual private networks (VPNs) and Multilink Frame Relay. See the [“Additional References” section on page 16](#) for pointers to the feature modules that explain how to configure and use those features.

## Restrictions for Configuring Multilink Frame Relay over L2TPv3/AToM

- Only data-link connection identifier (DLCI)-to-DLCI switching, where each DLCI maps to its own pseudowire, is supported. Port-port mode (also known as HDLC mode), where the entire content of the port, including the Local Management Interface (LMI), is carried across a single pseudowire, is not supported.
- The following functionality is not supported:
  - UNI/NNI or end-to-end fragmentation
  - Nonstop forwarding/stateful switchover
  - Four-byte DLCIs
- On the Cisco 7500 series routers, all bundle links must reside on the same port adapter (PA) of the Versatile Interface Processor (VIP). Links spreading across PAs are not supported.
- Cisco 7500 series routers support the VIP6-80, VIP4-80, VIP4-50, VIP2-50, CH-STM1, CT3/CE3, CT1/CE1, PA-4T+, and PA-8T port adapters.
- On the Cisco 12000 series routers, Multilink Frame Relay is supported only on the following pluggable modules: Cisco 4-port channelized T3 (DSO) shared port adapter, Cisco 8-port channelized T1/E1 shared port adapter, and the Cisco 1-port channelize OC-3/STM-1 shared port adapter.

## Information About Configuring Multilink Frame Relay over L2TPv3/AToM

To configure Multilink Frame Relay over L2TPv3/AToM, you need to understand the following concepts:

- [Multilink Frame Relay over L2TPv3/AToM, page 2](#)
- [Internetworking Support for Multilink Frame Relay, page 3](#)
- [Quality of Service Support for Multilink Frame Relay over L2TPv3/AToM, page 3](#)

## Multilink Frame Relay over L2TPv3/AToM

Multilink Frame Relay over L2TPv3/AToM supports the following functionality:

- Permanent virtual circuit (PVC) status signaling
- LMI types cisco, q933a, and ANSI
- Sequencing
- Frame Relay policing (nondistributed)
- Type of service (ToS) marking for L2TPv3

## Internetworking Support for Multilink Frame Relay

Interworking support for Multilink Frame Relay interfaces supports the following functionality:

- Frame Relay to Ethernet/VLAN (Ethernet and IP interworking)
- Frame Relay to PPP and ATM (IP interworking)
- Cisco and Internet Engineering Task Force (IETF) encapsulation on the customer-edge (CE) router
- Sequencing
- LMI interworking to notify CE routers of PVC status changes

## Quality of Service Support for Multilink Frame Relay over L2TPv3/AToM

### Note

---

Quality of Service features are not supported in Cisco IOS Release 12.4(11)T.

---

L2VPN quality of service (QoS) features supported for Frame Relay are also supported with the Multilink Frame Relay over L2TPv3/AToM feature. You can attach an input service policy to the Multilink Frame Relay interface or individual DLCIs on the interface using the map-class mechanism to police or mark the traffic. You can attach an output policy to the Multilink Frame Relay (MFR) interface to perform class-based queueing, including per-DLCI queueing using the **match fr-dlci** command.

The following ingress QoS features are supported with the Multilink Frame Relay over L2TPv3/AToM feature:

- Interface input policy matching on the discard eligibility (DE) bit to set Multiprotocol Label Switching (MPLS) EXP or tunnel differentiated services code point (DSCP).
- Virtual circuit (VC) input policy configured with a color-aware, two-rate, three-color policer using the DE bit as input color and setting the MPLS EXP bit or tunnel DSCP bit based on color.

### Note

---

You cannot use the VC-level and interface-level input policies at the same time on the same interface.

---

The following egress QoS features are supported with the Multilink Frame Relay over L2TPv3/AToM feature:

- Egress queueing using tail drop or discard class-based weighted random early detection (WRED). You can use the latter with a core interface input policy to set the discard class based on the MPLS EXP or tunnel DSCP.
- Interface output policy matching on QoS group (selected by MPLS EXP or tunnel DSCP).
- Interface aggregate shaping policy with queueing policy.
- VC output shaping policy with tail drop or discard class-based WRED.

- Forward explicit congestion notification (FECN)/backward explicit congestion notification (BECN) marking.

**Note**

You cannot use VC-level and interface-level output policies at the same time on the same interface.

**Note**

Egress queueing and shaping policies are not supported with Multilink Frame Relay on the Cisco 7200 series routers.

## How to Configure Multilink Frame Relay over L2TPv3/AToM

This section contains the following procedures:

- [Configuring a Multilink Frame Relay Bundle Interface](#) (required)
- [Configuring a Multilink Frame Relay Bundle Link Interface](#) (required)
- [Connecting Frame Relay PVCs Between Routers](#) (required)
- [Verifying Multilink Frame Relay over L2TPv3/AToM, page 7](#) (optional)

### Configuring a Multilink Frame Relay Bundle Interface

Configure a bundle interface to aggregate bandwidth of multiple member links under a single interface to one virtual pipe. To configure a bundle interface for Multilink Frame Relay, perform the following steps.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface mfr *number***
4. **frame-relay multilink bid *name***

#### DETAILED STEPS

|        | Command or Action  | Purpose  |
|--------|--|--|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.  |

|        | Command or Action   | Purpose   |
|--------|---|---|
| Step 3 | <p><code>interface mfr number</code></p> <p><b>Example:</b><br/>Router(config)# interface mfr 1</p>                             | Configures a multilink Frame Relay bundle interface and enters interface configuration mode.  |
| Step 4 | <p><code>frame-relay multilink bid name</code></p> <p><b>Example:</b><br/>Router(config-if)# frame-relay multilink bid int1</p> | <p>(Optional) Assigns a bundle identification name to a multilink Frame Relay bundle.</p> <p><b>Note</b> The bundle identification (BID) will not go into effect until the interface has gone from the down state to the up state. One way to bring the interface down and back up again is by using the <b>shutdown</b> and <b>no shutdown</b> commands in interface configuration mode.</p> |

## Configuring a Multilink Frame Relay Bundle Link Interface

Configuring a Multilink Frame Relay bundle link interface allows you to combine bandwidth of multiple lower-speed serial links into a single large pipe and avoid the need of upgrading or purchasing new hardware. To configure a bundle link interface for Multilink Frame Relay, perform the following steps.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface serial number`
4. `encapsulation frame-relay mfr number [name]`
5. `frame-relay multilink lid name`
6. `frame-relay multilink hello seconds`
7. `frame-relay multilink ack seconds`
8. `frame-relay multilink retry number`

### DETAILED STEPS

|        | Command or Action  | Purpose   |
|--------|--|---|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b><br/>Router&gt; enable</p>                      | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <p><code>configure terminal</code></p> <p><b>Example:</b><br/>Router# configure terminal</p> | Enters global configuration mode.   |

|        | Command or Action   | Purpose   |
|--------|---|---|
| Step 3 | <code>interface serial number</code><br><br><b>Example:</b><br>Router(config)# interface serial 1/1                                   | Configures an interface and enters interface configuration mode.  |
| Step 4 | <code>encapsulation frame-relay mfr number [name]</code><br><br><b>Example:</b><br>Router(config-if)# encapsulation frame-relay mfr 1 | Creates a multilink Frame Relay bundle link and associates the link with a bundle.<br><br><b>Tips</b> To minimize latency that results from the arrival order of packets, we recommend bundling physical links of the same line speed in one bundle.  |
| Step 5 | <code>frame-relay multilink lid name</code><br><br><b>Example:</b><br>Router(config-if)# frame-relay multilink lid four               | (Optional) Assigns a bundle link identification name with a multilink Frame Relay bundle link.<br><br><b>Note</b> The bundle link identification (LID) will not go into effect until the interface has gone from the down state to the up state. One way to bring the interface down and back up again is by using the <b>shutdown</b> and <b>no shutdown</b> commands in interface configuration mode. |
| Step 6 | <code>frame-relay multilink hello seconds</code><br><br><b>Example:</b><br>Router(config-if)# frame-relay multilink hello 20          | (Optional) Configures the interval at which a bundle link will send out hello messages. The default value is 10 seconds.  |
| Step 7 | <code>frame-relay multilink ack seconds</code><br><br><b>Example:</b><br>Router(config-if)# frame-relay multilink ack 10              | (Optional) Configures the number of seconds that a bundle link will wait for a hello message acknowledgment before resending the hello message. The default value is 4 seconds.   |
| Step 8 | <code>frame-relay multilink retry number</code><br><br><b>Example:</b><br>Router(config-if)# frame-relay multilink retry 5            | (Optional) Configures the maximum number of times a bundle link will resend a hello message while waiting for an acknowledgment. The default value is 2 tries.  |

## Connecting Frame Relay PVCs Between Routers

By connecting Frame Relay PVCs between routers, you can integrate Frame Relay over a Level 2 VPN backbone, which allows you to use your existing Frame Relay network without upgrading. To connect Frame Relay PVCs between routers, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **connect connection-name mfr number dlci l2transport**
4. **xconnect peer-router-id vcid encapsulation mpls**

## DETAILED STEPS

|        | Command or Action   | Purpose   |
|--------|---|---|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal  | Enters global configuration mode.   |
| Step 3 | <b>connect</b> <i>connection-name</i> <b>mfr</b> <i>number</i> <i>dcli</i> <b>l2transport</b><br><br><b>Example:</b><br>Router(config)# connect fr1 mfr 1 100 l2transport             | Defines connections between Frame Relay PVCs. <ul style="list-style-type: none"> <li>Using the <b>l2transport</b> keyword specifies that the PVC will not be a locally switched PVC, but will be tunneled over the backbone network.</li> <li>The <i>connection-name</i> argument is a text string that you provide.</li> <li>The <i>dcli</i> argument is the DLCI number of the PVC that will be connected.</li> </ul> |
| Step 4 | <b>xconnect</b> <i>peer-router-id</i> <i>vcid</i> <b>encapsulation</b> <b>mpls</b><br><br><b>Example:</b><br>Router(config-fr-pw-switching)# xconnect 10.0.0.1 123 encapsulation mpls | Enters connect configuration submode.<br><br>Creates the VC to transport the Layer 2 packets. In a DLCI-to-DLCI connection type, Frame Relay over MPLS uses the <b>xconnect</b> command in connect configuration submode.   |

## Verifying Multilink Frame Relay over L2TPv3/AToM

To verify the configuration of Multilink Frame Relay, perform the following steps. The tunnel and session should be in the established (est) state.

## SUMMARY STEPS

1. **show l2tunnel**
2. **show mpls forwarding**

## DETAILED STEPS

**Step 1** **show l2tunnel**

On both PE routers, use the following command to verify the configuration of Multilink Frame Relay over L2TPv3:

```
PE1# show l2tunnel
```

```
Tunnel and Session Information Total tunnels 1 sessions 1
```

| LocID | RemID | Remote Name | State | Remote Address | Port | Sessions | L2TPclass       |
|-------|-------|-------------|-------|----------------|------|----------|-----------------|
| 35788 | 41451 | FRWI1       | est   | 10.9.9.9       | 0    | 1        | l2tp_default_cl |

| LocID | RemID | TunID | Username, Intf/<br>Vcid, Circuit | State |
|-------|-------|-------|----------------------------------|-------|
| 8161  | 54072 | 35788 | 6, MF1:206                       | est   |

```
PE2# show l2tunnel
```

```
Tunnel and Session Information Total tunnels 1 sessions 1
```

| LocID | RemID | Remote Name | State | Remote Address | Port | Sessions | L2TPclass |
|-------|-------|-------------|-------|----------------|------|----------|-----------|
| 41451 | 35788 | FRWI3       | est   | 10.8.8.8       | 0    | 1        |           |

| LocID | RemID | TunID | Username, Intf/<br>Vcid, Circuit | State |
|-------|-------|-------|----------------------------------|-------|
| 54072 | 8161  | 41451 | 6, Fa0/1.6:6                     | est   |

## Step 2 show mpls forwarding

On both PE routers, use the following command to verify the configuration of Multilink Frame Relay over MPLS:

```
PE1# show mpls forwarding
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel ID | Bytes tag switched | Outgoing interface | Next Hop    |
|-----------|--------------------|---------------------|--------------------|--------------------|-------------|
| 16        | Pop tag            | 10.0.0.0/24         | 0                  | PO4/1/0            | point2point |
| 17        | Untagged           | l2ckt(5)            | 0                  | MF1                | point2point |
| 18        | Untagged           | l2ckt(6)            | 0                  | MF1                | point2point |
| 19        | 17                 | 10.9.9.9/32         | 0                  | PO4/1/0            | point2point |

```
PE2# show mpls forwarding
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel ID | Bytes tag switched | Outgoing interface | Next Hop    |
|-----------|--------------------|---------------------|--------------------|--------------------|-------------|
| 16        | 16                 | 10.8.8.8/32         | 0                  | PO2/0              | point2point |
| 17        | Pop tag            | 10.13.0.0/24        | 0                  | PO2/0              | point2point |
| 18        | Untagged           | l2ckt(5)            | 2244               | MF2                | point2point |
| 19        | Untagged           | l2ckt(6)            | 510                | MF2                | point2point |

# Configuration Examples for Multilink Frame Relay over L2TPv3/AToM

This section includes the following configuration examples:

- [Frame Relay-to-Frame Relay over L2TPv3 on Multilink Frame Relay Interfaces: Example, page 10](#)
- [Frame Relay-to-Ethernet VLAN Interworking over L2TPv3 on Multilink Frame Relay Interfaces: Example, page 11](#)
- [Frame Relay-to-Ethernet Interworking over MPLS on Multilink Frame Relay Interfaces: Example, page 12](#)
- [MQC Color-Aware Policing: Example, page 13](#)

- [DE Bit Matching: Example, page 13](#)
- [DLCI-Based queueing: Example, page 13](#)
- [Discard Class-Based WRED: Example, page 14](#)
- [Aggregate Shaping: Example, page 15](#)
- [VC Shaping: Example, page 15](#)
- [FECN/BECN Marking: Example, page 16](#)

## Frame Relay-to-Frame Relay over L2TPv3 on Multilink Frame Relay Interfaces: Example

The following example sets up Multilink Frame Relay interfaces to transport Frame Relay data between PE routers:

| PE1   | PE2  |
|---|--|
| <pre> configure terminal ip cef distributed frame-relay switching ! interface loopback 0  ip address 10.8.8.8 255.255.255.255  no shutdown ! pseudowire-class fr-xconnect  encapsulation l2tp  protocol l2tpv3  ip local interface loopback0 ! controller T3 1/1/1 t1 1 framing esf t1 1 clock source internal t1 1 channel-group 1 timeslots 1-24 speed 64 ! t1 2 framing esf t1 2 clock source inter t1 2 channel-group 1 timeslots 1-24 speed 64 ! interface mfr 1  encapsulation frame-relay  logging event dlci-status-change  frame-relay intf-type nni  no shutdown ! interface Serial1/1/1/1:1  encapsulation frame-relay mfr1 interface Serial1/1/1/2:1  encapsulation frame-relay mfr1 ! interface POS4/1/0  clock source internal  ip address 10.13.0.0 255.255.255.0  no shutdown  no fair-queue ! connect fr-fr mfr1 206 12  xconnect 10.9.9.9 6 pw-class fr-xconnect ! router ospf 10  network 10.13.0.0 0.0.0.0 area 0  network 10.8.8.8 0.0.0.0 area 0 end </pre> | <pre> configure terminal ip routing ip cef frame-relay switching ! interface loopback 0  ip address 10.9.9.9 255.255.255.255  no shutdown ! interface p2/0  clock source internal  ip address 10.14.0.2 255.255.255.0  no shutdown  no fair-queue ! controller T3 3/1 t1 1 framing esf t1 1 clock source internal t1 1 channel-group 1 timeslots 1-24 speed 64 ! t1 2 framing esf t1 2 clock source internal t1 2 channel-group 1 timeslots 1-24 speed 64 ! interface mfr2  encapsulation frame-relay  logging event dlci-status-change  frame-relay intf-type dce  no shutdown ! interface serial3/1/1:1  encapsulation frame-relay mfr2 ! interface s3/1/2:1  encapsulation frame-relay mfr2 ! pseudowire-class fr-xconnect  encapsulation l2tpv3  protocol l2tpv3  ip local interface loopback0 ! connect fr-fr mfr2 306 l2transport  xconnect 10.8.8.8 6 pw-class fr-xconnect ! router ospf 10  network 10.14.0.2 0.0.0.0 area 0  network 10.9.9.9 0.0.0.0 area 0 end </pre> |

## Frame Relay-to-Ethernet VLAN Interworking over L2TPv3 on Multilink Frame Relay Interfaces: Example

The following example sets up Multilink Frame Relay interfaces to perform Frame Relay-to-Ethernet VLAN interworking between PE routers. The example uses IP interworking, also referred to as routed interworking.

| PE1  | PE2   |
|--|---|
| <pre> configure terminal ip cef distributed frame-relay switching ! ! interface loopback 0  ip address 10.8.8.8 255.255.255.255  no shutdown ! pseudowire-class ip  encapsulation l2tp  interworking ip  ip local interface loopback0 ! interface mfr 1  encapsulation frame-relay  logging event dlci-status-change  no shutdown  frame-relay intf-type nni ! interface Serial1/1/1/1:1  encapsulation frame-relay mfr1 interface Serial1/1/1/2:1  encapsulation frame-relay mfr1 ! interface POS4/1/0  clock source internal  ip address 13.0.0.2 255.255.255.0  no shutdown  no fair-queue ! connect fr-vlan mfr1 206 12  xconnect 9.9.9.913.0.0.2 6 pw-class ip ! router ospf 10  network 10.13.0.2 0.0.0.0 area 0  network 10.8.8.8 0.0.0.0 area 0 end </pre> | <pre> configure terminal ip routing ip cef frame-relay switching ! ! interface loopback 0  ip address 10.9.9.9 255.255.255.255  no shutdown ! pseudowire-class ip  encapsulation l2tp  interworking ip  ip local interface loopback0 ! ! interface p2/0  clock source internal  ip address 10.14.0.2 255.255.255.0  no shutdown  no fair-queue ! interface FastEthernet0/1  no shutdown ! interface FastEthernet0/1.6  encapsulation dot1Q 6  xconnect 10.8.8.8 6 pw-class ip  no shutdown ! router ospf 10  network 10.14.0.2 0.0.0.0 area 0  network 10.9.9.9 0.0.0.0 area 0 ! end </pre> |

## Frame Relay-to-Ethernet Interworking over MPLS on Multilink Frame Relay Interfaces: Example

The following example sets up Multilink Frame Relay interfaces to perform Frame Relay-to-Ethernet interworking between PE routers. The example uses IP interworking, also referred to as routed interworking.

| PE1   | PE2  |
|---|--|
| <pre> configure terminal ip cef distributed frame-relay switching ! ! interface loopback 0   ip address 10.8.8.8 255.255.255.255   no shutdown ! interface mfr 1   encapsulation frame-relay   logging event dlci-status-change   no shutdown   frame-relay intf-type nni ! interface Serial1/1/1/1:1   encapsulation frame-relay mfr1 interface Serial1/1/1/2:1   encapsulation frame-relay mfr2 ! interface POS4/1/0   clock source internal   ip address 10.13.0.2 255.255.255.0   no shutdown   mpls ip ! router ospf 10   network 10.13.0.2 0.0.0.0 area 0   network 10.8.8.8 0.0.0.0 area 0 ! mpls label protocol ldp mpls ldp router-id loopback0 mpls ip ! pseudowire-class atom   encapsulation mpls   interworking ip ! connect fr-eth mfr1 207 12   xconnect 10.9.9.9 7 pw-class atom ! end </pre> | <pre> configure terminal ip routing ip cef frame-relay switching ! interface loopback 0   ip address 10.9.9.9 255.255.255.255   no shutdown ! interface POS2/0   clock source internal   ip address 10.14.0.2 255.255.255.0   no shutdown   no fair-queue   mpls ip ! router ospf 10   network 10.14.0.2 0.0.0.0 area 0   network 10.9.9.9 0.0.0.0 area 0 ! mpls label protocol ldp mpls ldp router-id loopback0 mpls ip ! pseudowire-class atom   encapsulation mpls   interworking ip ! interface FastEthernet0/1   xconnect 10.8.8.8 7 pw-class atom   no shutdown ! end </pre> |

## MQC Color-Aware Policing: Example

**Note**

Quality of Service features are not supported in Cisco IOS Release 12.4(11)T.

The following example configures a VC input policy with a color-aware, two-rate, three-color policing method using a DE bit as input color and setting the tunnel Differentiated Services Code Point (DSCP) based on color. Packets in excess of peak rates are discarded.

```
class-map not-fr-de
  match not fr-de
!
policy-map police
  class class-default
    police cir 64000 pir 256000
    conform-color not-fr-de
    conform-action set-dscp-tunnel-transmit af31
    exceed-action set-dscp-tunnel-transmit af32
    violate-action drop
!
interface MFR1
  frame-relay interface-dlci 206 switched
  class police
!
connect fr-vlan mfr1 206 12
  xconnect 10.9.9.9 6 pw-class ip
!
map-class frame-relay police
  service-policy input police
```

## DE Bit Matching: Example

**Note**

Quality of Service features are not supported in Cisco IOS Release 12.4(11)T.

The following example shows the configuration of an interface input policy matching on the DE bit to set the tunnel DSCP:

```
class-map de
  match fr-de
!
policy-map de
  class de
    set ip dscp tunnel af32
  class class-default
    set ip dscp tunnel af31
!
interface MFR1
  service-policy input de
```

## DLCI-Based queueing: Example

**Note**

Quality of Service features are not supported in Cisco IOS Release 12.4(11)T.

The following example shows the configuration of an interface output policy matching on a QoS group based on the DLCI:

```
class-map dlci100
  match fr-dlci 100
class-map dlci200
  match fr-dlci 200
!
policy-map dlci
  class dlci100
    bandwidth percent 10
  class dlci200
    bandwidth percent 20
!
interface MFR1
  service-policy output dlci
```

## Discard Class-Based WRED: Example

### Note

---

Quality of Service features are not supported in Cisco IOS Release 12.4(11)T.

---

The following example shows the configuration of an interface output policy matching on a QoS group based on the tunnel DSCP:

```
class-map conform
  match ip dscp af31
  match mpls experimental 4
class-map exceed
  match ip dscp af32
  match mpls experimental 3
class-map cos1
  match qos-group 1
!
policy-map core
  class conform
    set qos-group 1
    set discard-class 1
  class exceed
    set qos-group 1
    set discard-class 2
!
policy-map wred
  class cos1
    bandwidth percent 40
    random-detect discard-class-based
    random-detect discard-class 1 20 30 10
    random-detect discard-class 2 1 9 10
!
interface POS1/0
  service-policy input core
!
interface MFR1
  service-policy output wred
```

## Aggregate Shaping: Example

**Note**

Quality of Service features are not supported in Cisco IOS Release 12.4(11)T.

The following example shows the configuration of an interface aggregate shaping policy with a DLCI-based queueing policy:

```
class-map dlci205
  match fr-dlci 205
class-map dlci206
  match fr-dlci 206
!
policy-map dlci
  class dlci205
    bandwidth 128
  class dlci206
    bandwidth 256
!
policy-map shape
  class class-default
    shape average 512000 2048 2048
    service-policy dlci
!
interface MFR1
  service-policy output shape
```

## VC Shaping: Example

**Note**

Quality of Service features are not supported in Cisco IOS Release 12.4(11)T.

The following example shows the configuration of a VC output shaping policy with discard class-based WRED:

```
class-map conform
  match mpls experimental 4
class-map exceed
  match mpls experimental 3
class-map cos1
  match qos-group 1
!
policy-map core
  class conform
    set qos-group 1
    set discard-class 1
  class exceed
    set qos-group 1
    set discard-class 2
!
policy-map vc-wred
  class class-default
    bandwidth percent 40
    random-detect discard-class-based
    random-detect discard-class 1 20 30 10
    random-detect discard-class 2 1 9 10
!
policy-map shape
```

```

class class-default
  shape average 512000 2048 2048
  service-policy vc-wred
!
interface POS4/1/0
  service-policy input core
!
interface MFR1
  frame-relay interface-dlci 206 switched
  class shape
!
map-class frame-relay shape
  service-policy output shape

```

## FECN/BECN Marking: Example

### Note

---

Quality of Service features are not supported in Cisco IOS Release 12.4(11)T.

---

The following example shows the configuration of an output policy that configures BECN and FECN bits:

```

policy-map dlci
  class dlci100
    bandwidth percent 10
  class dlci200
    bandwidth percent 20
    set fr-fecn-becn 1
interface MFR1
  service-policy output dlci
  frame-relay congestion-management
    threshold ecn 20

```

## Command Reference

This section documents modified commands only.

- [xconnect](#)

# xconnect

To bind an attachment circuit to a pseudowire, use the **xconnect** command in one of the supported configuration modes. To restore the default values, use the **no** form of this command.

```
xconnect peer-ip-address vcid pseudowire-parameters [sequencing {transmit | receive | both}]
```

```
no xconnect
```

## Syntax Description

|                              |   |
|------------------------------|---|
| <i>peer-ip-address</i>       | IP address of the remote provider edge (PE) peer.   |
| <i>vcid</i>                  | The 32-bit identifier of the virtual circuit between the PE routers.  |
| <i>pseudowire-parameters</i> | Encapsulation and pseudowire class parameters to be used for the attachment circuit. At least one of the following pseudowire parameters must be configured: <ul style="list-style-type: none"> <li>• <b>encapsulation</b> {<b>l2tpv3</b> [<b>manual</b>]   <b>mpls</b>}— Specifies the tunneling method to encapsulate the data in the pseudowire: <ul style="list-style-type: none"> <li>– <b>l2tpv3</b>—Specifies L2TPv3 as the tunneling method.</li> <li>– <b>manual</b>—Specifies that no signaling is to be used in the attachment circuit. This keyword places the router in xconnect configuration mode for manual configuration the attachment circuit.</li> <li>– <b>mpls</b>—Specifies Multiprotocol Label Switching (MPLS) as the tunneling method.</li> </ul> </li> <li>• <b>pw-class</b> <i>pw-class-name</i>—Specifies the pseudowire class configuration from which the data encapsulation type is taken. This option is mandatory if you select an encapsulation method.</li> </ul> |
| <b>sequencing</b>            | (Optional) Sets the sequencing method to be used for packets received or sent.  |
| <b>transmit</b>              | Sequences data packets received from the attachment circuit.  |
| <b>receive</b>               | Sequences data packets sent into the attachment circuit.  |
| <b>both</b>                  | Sequences data packets that are both sent and received from the attachment circuit.   |

## Command Default

The attachment circuit is not bound to the pseudowire.

## Command Modes

Interface configuration  
l2transport configuration (for ATM)  
connect configuration mode

## Command History

| Release   | Modification   |
|-----------|--|
| 12.0(23)S | This command was introduced.                             |
| 12.0(28)S | Support was added for Multilink Frame Relay connections. |

| Release     | Modification  |
|-------------|---|
| 12.3(2)T    | This command was integrated into Cisco IOS Release 12.3(2)T.    |
| 12.2(25)S   | This command was integrated into Cisco IOS Release 12.2(25)S.   |
| 12.2(27)SBC | This command was integrated into Cisco IOS Release 12.2(27)SBC. |
| 12.4(11)T   | This command was integrated into Cisco IOS Release 12.4(11)T.   |

### Usage Guidelines

The combination of the *peer-ip-address* and *vcid* arguments must be unique on the router. Each xconnect configuration must have a unique combination of *peer-ip-address* and *vcid* configuration.

#### Note

If the remote router is a Cisco 12000 series Internet router, the *peer-ip-address* argument must specify a loopback address on that router.

The same *vcid* value that identifies the attachment circuit must be configured using the **xconnect** command on the local and remote provider edge (PE) router. The *vcid* creates the binding between a pseudowire and an attachment circuit.

For L2TPv3, to manually configure the settings used in the attachment circuit, use the **manual** keyword in the **xconnect** command. This configuration is called a static session. The router is placed in xconnect configuration mode, and you can then configure the following options:

- Local and remote session identifiers (using the **l2tp id** command) for local and remote PE routers at each end of the session.
- Size of the cookie field used in the L2TPv3 headers of incoming (sent) packets from the remote PE peer router (using the **l2tp cookie local** command).
- Size of the cookie field used in the L2TPv3 headers of outgoing (received) L2TP data packets (using the **l2tp cookie remote** command).
- Interval used between sending hello keepalive messages (using the **l2tp hello** command).

For L2TPv3, if you do not enter **encapsulation l2tpv3 manual** in the **xconnect** command, the data encapsulation type for the L2TPv3 session is taken from the encapsulation type configured for the pseudowire class specified with the **pseudowire-class pw-class-name** command.

The **pw-class pw-class-name** value binds the xconnect configuration of an attachment circuit to a specific pseudowire class. In this way, the pseudowire class configuration serves as a template that contains settings used by all attachment circuits bound to it with the **xconnect** command.

#### Note

If you specify the **encapsulation** keywords, you must specify the **pw-class** keyword.

### Examples

The following example configures xconnect service for an Ethernet interface by binding the Ethernet circuit to the pseudowire named 123 with a remote peer 10.0.3.201. The configuration settings in the pseudowire class named `vlan-xconnect` are used.

```
Router(config)# interface Ethernet0/0.1
Router(config-if)# xconnect 10.0.3.201 123 pw-class vlan-xconnect
```

The following example enters xconnect configuration mode and manually configures L2TPv3 parameters for the attachment circuit:

```
Router(config)# interface Ethernet 0/0
```

```

Router(config-if)# xconnect 10.0.3.201 123 encapsulation l2tpv3 manual pw-class ether-pw
Router(config-if-xconn) l2tp id 222 111
Router(config-if-xconn) l2tp cookie local 4 54321
Router(config-if-xconn) l2tp cookie remote 4 12345
Router(config-if-xconn) l2tp hello l2tp-defaults

```

**Related Commands**

| Command                   | Description   |
|---------------------------|---|
| <b>show xconnect</b>      | Displays information about xconnect attachment circuits and pseudowires   |
| <b>pseudowire-class</b>   | Configures a template of pseudowire configuration settings used by the attachment circuits transported over a pseudowire.       |
| <b>l2tp-class</b>         | Configures a template of L2TP control plane configuration settings that can be inherited by different pseudowire classes.       |
| <b>l2tp cookie local</b>  | Configures the size of the cookie field used in the L2TPv3 headers of incoming packets received from the remote PE peer router. |
| <b>l2tp cookie remote</b> | Configures the size of the cookie field used in the L2TPv3 headers of outgoing packets sent from the local PE peer router.      |
| <b>l2tp hello</b>         | Specifies the use of a hello keepalive setting contained in a specified L2TP class configuration for a static L2TPv3 session.   |
| <b>l2tp id</b>            | Configures the identifiers used by the local and remote provider edge routers at each end of an L2TPv3 session.                 |

# Feature Information for Multilink Frame Relay over L2TPv3/AToM

This feature enables Multilink Frame Relay switching over Layer 2 Tunnel Protocol Version 3 (L2TPv3) and Any Transport over MPLS (AToM). The feature works with like-to-like interfaces and disparate interfaces (L2VPN interworking).

[Table 1](#) lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

[Table 1](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for Multilink Frame Relay over L2TPv3/AToM

| Feature Name                           | Releases   | Feature Information  |
