

OSPF Shortest Path First Throttling

The OSPF Shortest Path First Throttling feature makes it possible to configure SPF scheduling in millisecond intervals and to potentially delay shortest path first (SPF) calculations during network instability. SPF is scheduled to calculate the Shortest Path Tree (SPT) when there is a change in topology. One SPF run may include multiple topology change events.

The interval at which the SPF calculations occur is chosen dynamically and is based on the frequency of topology changes in the network. The chosen interval is within the boundary of the user-specified value ranges. If network topology is unstable, SPF throttling calculates SPF scheduling intervals to be longer until topology becomes stable.

Feature Specifications for OSPF Shortest Path First Throttling

Feature History

Release	Modification
12.2(14)S	This feature was introduced.
12.0(23)S	This feature was integrated into Cisco Release 12.0(23)S.
12.2(15)T	This feature was integrated into Cisco IOS Release 12.2(15)T.

Supported Platforms

For information about platforms supported, refer to Cisco Feature Navigator.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Information About OSPF SPF Throttling

To use SPF throttling, you should understand the following concepts:

- [Shortest Path First Calculations, page 2](#)

Shortest Path First Calculations

SPF calculations occur at the interval set by the **timers throttle spf** command. The wait interval indicates the amount of time to wait until the next SPF calculation occurs. Each wait interval after that calculation is twice as long as the previous one until the wait interval reaches the maximum wait time specified.

The SPF timing can be better explained using an example. In this example the start interval is set at 5 milliseconds (ms), the wait interval at 1000 milliseconds, and the maximum wait time is set at 90,000 milliseconds.

```
timers throttle spf 5 1000 90000
```

[Figure 1](#) shows the intervals at which the SPF calculations occur so long as at least one topology change event is received in a given wait interval.

Figure 1 *SPF Calculation Intervals Set by the timers throttle spf Command*

Notice that the wait interval between SPF calculations doubles when at least one topology change event is received during the previous wait interval. Once the maximum wait time is reached, the wait interval remains the same until the topology stabilizes and no event is received in that interval.

If the first topology change event is received after the current wait interval, the SPF calculation is delayed by the amount of time specified as the start interval. The subsequent wait intervals continue to follow the dynamic pattern.

If the first topology change event occurs after the maximum wait interval begins, the SPF calculation is again scheduled at the start interval and subsequent wait intervals are reset according the parameters specified in the **timers throttle spf** command. Notice in [Figure 2](#) that a topology change event was received after the start of the maximum wait time interval and that the SPF intervals have been reset.

Figure 2 Timer Intervals Reset after Topology Change Event

How to Configure OSPF SPF Throttling

Perform the following tasks to configure OSPF SPF throttling:

- [Configuring OSPF SPF Throttling, page 3](#) (required)
- [Verifying SPF Throttle Values, page 5](#) (optional)

Configuring OSPF SPF Throttling

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type slot/port**
4. **ip address ip-address mask [secondary]**
5. **exit**
6. **router ospf process-id**
7. **network network-number [mask | prefix-length]**
8. **timers throttle spf spf-start spf-hold spf-max-wait**
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables higher privilege levels, such as privileged EXEC mode. Example: Router> enable
Step 2	configure terminal	Enters global configuration mode. Example: Router# configure terminal
Step 3	interface type slot/port	Enters interface configuration mode for the interface specified. Example: Router(config)# interface ethernet 1/1/1
Step 4	ip address ip-address mask [secondary]	Sets a primary or secondary IP address for an interface. Example: Router(config-if)# ip address 192.168.0.2 255.255.255.0
Step 5	exit	Exits interface configuration mode. Example: router# exit
Step 6	router ospf process-id	Configures an OSPF routing process. Example: Router(config)# router ospf 1
Step 7	network network-number [mask prefix-length]	Configures the subnet number and mask for a Dynamic Host Configuration Protocol (DHCP) address pool on a Cisco IOS DHCP Server. Example: Router(config-router)# network 192.168.0.0 0.0.255.255 area 0
Step 8	timers throttle spf spf-start spf-hold spf-max-wait	Sets OSPF throttling timers. Example: Router(config-router)# timers throttle spf 10 4800 90000
Step 9	end	Exits configuration mode. Example: Router(config-router)# end

Verifying SPF Throttle Values

To verify SPF throttle timer values, use the **show ip ospf** command. The values are displayed in the lines that begin, “Initial SPF schedule delay...,” “Minimum hold time between two consecutive SPFs...,” and “Maximum wait time between two consecutive SPFs....”

```
Router# show ip ospf
Routing Process "ospf 1" with ID 10.10.10.2 and Domain ID 0.0.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
It is an autonomous system boundary router
Redistributing External Routes from,
    static, includes subnets in redistribution
Initial SPF schedule delay 5 msec
Minimum hold time between two consecutive SPFs 1000 msec
Maximum wait time between two consecutive SPFs 90000 msec
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msec
Retransmission pacing timer 66 msec
Number of external LSA 4. Checksum Sum 0x17445
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
    Area BACKBONE(0)
        Number of interfaces in this area is 2
        Area has no authentication
        SPF algorithm last executed 19:11:15.140 ago
        SPF algorithm executed 28 times
        Area ranges are
            Number of LSA 4. Checksum Sum 0x2C1D4
            Number of opaque link LSA 0. Checksum Sum 0x0
            Number of DCbitless LSA 0
            Number of indication LSA 0
            Number of DoNotAge LSA 0
        Flood list length 0
```

Table 1 describes the **show ip ospf** display fields and their descriptions.

Table 1 *show ip ospf Field Descriptions*

Field	Description
Routing process “ospf 201” with ID 192.42.110.200	Process ID and OSPF router ID.
Supports ...	Number of types of service supported (Type 0 only).
It is ...	Possible types are internal, area border, or autonomous system boundary.
Summary Link update interval	Specifies summary update interval in hours:minutes:seconds, and time until next update.
External Link update interval	Specifies external update interval in hours:minutes:seconds, and time until next update.
Redistributing External Routes from	Lists of redistributed routes, by protocol.

Table 1 show ip ospf Field Descriptions (continued)

Field	Description
SPF calculations	Lists start, hold, and maximum wait interval values in milliseconds.
Number of areas	Number of areas in router, area addresses, and so on.
SPF algorithm last executed	Shows the last time an SPF calculation was performed in response to topology change event records.
Link State Update Interval	Specifies router and network link-state update interval in hours:minutes:seconds, and time until next update.
Link State Age Interval	Specifies max-aged update deletion interval, and time until next database cleanup, in hours:minutes:seconds.

Configuration Examples for OSPF SPF Throttling

This section contains the following examples:

- [Throttle Timers Example, page 6](#)

Throttle Timers Example

This example shows a router configured with the start, hold, and maximum interval values for the **timers throttle spf** command set at 5, 1,000, and 90,000 milliseconds, respectively.

```
router ospf 1
router-id 10.10.10.2
log-adjacency-changes
timers throttle spf 5 1000 90000
redistribute static subnets
network 21.21.21.0 0.0.0.255 area 0
network 22.22.22.0 0.0.0.255 area 00
```

Command Reference

This section documents the new **timers throttle spf** command. All other commands used with this feature are documented in the Cisco IOS Release 12.2T command reference publications.

Obsolete and Replaced Commands

[Table 2](#) lists commands that have been replaced since Cisco IOS Release 12.2.

Table 2 Replaced OSPF Commands

Command in Cisco IOS Release 12.2	Replacement Command in Cisco IOS Release 12.2(11)S
timer spf-interval	timers throttle spf

timers throttle spf

To turn on OSPF SPF throttling, use the **timers throttle spf** command in router configuration mode. To turn off SPF throttling, use the **no** form of this command.

timers throttle spf *spf-start* *spf-hold* *spf-max-wait*

no timers throttle spf *spf-start* *spf-hold* *spf-max-wait*

Syntax Description	<i>spf-start</i>	Indicates the initial SPF schedule delay in milliseconds. Value range is 1 to 600,000 milliseconds.
Defaults	<i>spf-hold</i>	Indicates the minimum hold time between two consecutive SPF calculations. Value range is 1 to 600,000 milliseconds.
Command Modes	<i>spf-maximum</i>	Indicates the maximum wait time between two consecutive SPF calculations. Value range is 1 to 600,000 milliseconds.

Defaults SPF throttling is not set.

Command Modes Router configuration

Command History	Release	Modification
	12.2(14)S	This command was introduced.

Usage Guidelines The **timers throttle spf** command replaces the **timers spf-interval** command.

The first wait interval between SPF calculations is the amount of time in milliseconds specified by the *spf-start* argument. Each consecutive wait interval is two times the current hold level in milliseconds until the wait time reaches the maximum time in milliseconds as specified by the *spf-maximum* argument. Subsequent wait times remain at the maximum until the values are reset or an LSA is received between SPF calculations.

Examples The following example shows a router configured with the start, hold, and maximum interval values for the **timers throttle spf** command set at 5, 1,000, and 90,000 milliseconds, respectively.

```
router ospf 1
  router-id 10.10.10.2
  log-adjacency-changes
  timers throttle spf 5 1000 90000
  redistribute static subnets
  network 21.21.21.0 0.0.0.255 area 0
  network 22.22.22.0 0.0.0.255 area 00
```

■ **timer spf-interval**

timer spf-interval

This command is replace by the **timers throttle spf** command. Refer to the [timers throttle spf](#) command reference page for instructions on using the new command.
