| Retry count               | Number of times the client has sent any message to the DHCP server—most likely a request message to extend its lease. When the lease is renewed, the Retry count is reset to 0.                                                                                                                      |
| Client-ID                 | MAC address (with optional media type code) that uniquely identifies the client on the subnet for binding lookups.                                                                                                                                                                                   |

The following example shows typical output for the **show dhcp server** command:

```
Router# show dhcp server

DHCP server: ANY (255.255.255.255)
Leases: 1
Offers: 1 Requests: 2 Acks: 1 Naks: 0
Declines: 0 Releases: 0 Bad: 0
TFTP Server Name: SOHOSERVER
TIME0: 1.2.0.250, TIME1: 0.0.0.0
Subnet: 255.255.255.0
Router#
```

Table 0-200 describes the fields shown in the display.

**Table 0-200** *show dhcp server Field Descriptions*

| Field       | Description                                                                |
|-------------|----------------------------------------------------------------------------|
| DHCP server | MAC address used by the DHCP server.                                       |
| Leases      | Number of current leased IP addresses.                                     |
| Offers      | Number of offers for an IP address sent to a proxy client from the server. |

**Table 0-200** *show dhcp server Field Descriptions (continued)*

| Field            | Description                                                                            |
|------------------|----------------------------------------------------------------------------------------|
| Requests         | Number of requests for an IP address to the server.                                    |
| Acks             | Number of acknowledge messages sent by the server to the proxy client.                 |
| Naks             | Number of not acknowledge messages sent by the server to the proxy client.             |
| Declines         | Number of offers from the server that have been declined by the proxy client.          |
| Releases         | Number of times IP addresses have been relinquished gracefully by the client.          |
| Bad              | Number of bad packets received due to wrong length, wrong field type, or other causes. |
| TFTP Server Name | Name (if any) configured for the server providing TFTP downloads to the CM.            |
| TIME0            | IP address of the primary Time-of-Day (ToD) server.                                    |
| TIME1            | IP address of the secondary ToD server.                                                |
| Subnet           | Subnet containing the DHCP server.                                                     |

**Tip**

In Cisco IOS Release 12.2(8)T and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

|                  | diagnostic bootup level | Configures the level of diagnostic tests which run at bootup. |

# show diagnostic content

To display information about available tests, including test ID, test attributes, test schedule, and supported coverage test levels for each test and for each of the bays and line-cards, use the **show diagnostic content** command in user EXEC or privileged EXEC mode.

**show diagnostic content** [**all** | **bay** *slot/bay* | **slot** *slot-no* | **subslot** *slot/subslot*]

| Syntax Description                 |  |                                                                                                                                                                                                                                                                                                                      |
|------------------------------------|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                         |  | Displays information about available tests for all modules.                                                                                                                                                                                                                                                          |
| <b>bay</b> <i>slot/bay</i>         |  | Indicates the card slot and bay number of the SPA for which the available test content details is displayed. The <b>bay</b> keyword is used to refer a SPA on the router. The valid range for the slot number is from 1 to 8 and 0 to 3 for the bay number.                                                          |
| <b>slot</b> <i>slot-no</i>         |  | Indicates the slot number of the full-height line card for which the available test content details is displayed. The <b>slot</b> keyword is used to refer a full-height line card on the router. The valid range for slot is 1 to 8.                                                                                |
| <b>subslot</b> <i>slot/subslot</i> |  | Indicates the slot and subslot number of half-height line card for which the available test content details has to be displayed. The <b>subslot</b> keyword is used to refer a half-height line card on Cisco uBR10012 Router. The valid range for the slot number is from 1 to 8 and 0 to 1 for the subslot number. |

**Command Default**      None

**Command Modes**      User EXEC (>)  
Privileged EXEC (#)

| Command History | Release     | Modification                                               |
|-----------------|-------------|------------------------------------------------------------|
|                 | 12.2(33)SCC | This command was introduced for the Cisco uBR10012 Router. |

**Usage Guidelines**      For each available diagnostic test, a set of attributes is displayed as a series of characters in the Attributes field of the command output. An asterisk (\*) in the character location indicates that the attribute is not applicable to the test. The following set of attributes is displayed:

| Attribute | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| M         | Test runs when the bootup diagnostic level is set to either Minimal or Complete.                                     |
| C         | Test runs when the bootup diagnostic level is set to Complete.                                                       |
| B         | Test runs when the <b>diagnostic ondemand</b> command is executed. Indicates that the test is a basic ondemand test. |
| P         | Test runs on a port, not the entire device (per-port test).                                                          |

| Attribute | Description                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V         | Test runs on the entire device (per-device test).                                                                                                                                                             |
| D         | Test disrupts the network traffic (disruptive test).                                                                                                                                                          |
| N         | Test runs when the system is online without disrupting the network traffic (non disruptive test).                                                                                                             |
| S         | If the card under test is a standby card, only the standby card runs the test. The test does not run from the active card. If the card under test is an active card, the active card runs the test on itself. |
| X         | Test is not a health-monitoring test.                                                                                                                                                                         |
| F         | Monitoring interval of the test cannot be modified by the user (fixed monitoring test).                                                                                                                       |
| E         | User cannot disable the test (always enabled test).                                                                                                                                                           |
| A         | Monitoring is active for this test.                                                                                                                                                                           |
| I         | Monitoring is inactive for this test.                                                                                                                                                                         |

If a test is configured to run periodically, the interval will be displayed in the Test Interval field of the command output in the format dd hh:mm:ss.ms, indicating days, hours, minutes, seconds, and milliseconds. For example, the test interval of a test that runs every 15 minutes will be displayed as 000 00:15:00.00. The test interval of a test that runs every 14 days will be displayed as 014 00:00:00.00.

## Examples

This example shows a sample output of the **show diagnostic content bay 1/0** command that displays the test suite, monitoring interval, and test attributes for bay 1/0 on the Cisco uBR10012 Universal Broadband Router.

```
Router# show diagnostic content bay 1/0
```

```
Bay 1/0: 2jacket-1
```

```
Diagnostics test suite attributes:
```

```

M/C/* - Minimal bootup level test / Complete bootup level test / NA
B/* - Basic ondemand test / NA
P/V/* - Per port test / Per device test / NA
D/N/* - Disruptive test / Non-disruptive test / NA
S/* - Only applicable to standby unit / NA
X/* - Not a health monitoring test / NA
F/* - Fixed monitoring interval test / NA
E/* - Always enabled monitoring test / NA
A/I - Monitoring is active / Monitoring is inactive

```

```

2) TestModenaLLQDrops -----> ***N***A 02010:10:10.10 99

```

Table 201 describes the fields shown in the **show diagnostic content bay** displays.

**Table 201**      *show diagnostic content bay Field Descriptions*

| Field         | Description                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------|
| ID            | The identification number.                                                                                  |
| Test Name     | The name of the test that is run on the specific bay.                                                       |
| Attributes    | The test attribute for the specific bay.                                                                    |
| Test Interval | The test interval in the dd hh:mm:ss.ms format, indicating days, hours, minutes, seconds, and milliseconds. |

This example shows a sample output of the **show diagnostic content subslot 8/0** command that displays the test suite, monitoring interval, and test attributes for subslot 8/0 on the Cisco uBR10012 Universal Broadband Router.

```
Router# show diagnostic content subslot 8/0
```

```
Subslot 8/0: 5cable-mc520u-d, 5 ports
```

```
Diagnostics test suite attributes:
```

```
 M/C/* - Minimal bootup level test / Complete bootup level test / NA
```

```
 B/* - Basic ondemand test / NA
```

```
 P/V/* - Per port test / Per device test / NA
```

```
 D/N/* - Disruptive test / Non-disruptive test / NA
```

```
 S/* - Only applicable to standby unit / NA
```

```
 X/* - Not a health monitoring test / NA
```

```
 F/* - Fixed monitoring interval test / NA
```

```
 E/* - Always enabled monitoring test / NA
```

```
 A/I - Monitoring is active / Monitoring is inactive
```

| Command                                  | Description                                                                                                             |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>diagnostic bootup level</b>           | Sets the bootup diagnostic level.                                                                                       |
| <b>diagnostic monitor</b>                | Configures the health-monitoring diagnostic testing.                                                                    |
| <b>diagnostic ondemand</b>               | Configures the on-demand diagnostics.                                                                                   |
| <b>diagnostic schedule test</b>          | Sets the scheduling of test-based diagnostic testing for a specific module or schedules a supervisor engine switchover. |
| <b>show diagnostic description</b>       | Describes the diagnostic tests.                                                                                         |
| <b>show diagnostic bootup</b>            | Displays the configured diagnostics level at bootup.                                                                    |
| <b>show diagnostic events</b>            | Displays the diagnostic event log.                                                                                      |
| <b>show diagnostic ondemand settings</b> | Displays the settings for the on-demand diagnostics.                                                                    |
| <b>show diagnostic result</b>            | Displays the diagnostic test results for a module.                                                                      |
| <b>show diagnostic schedule</b>          | Displays the current scheduled diagnostic tasks.                                                                        |

| Command                          | Description                                         |
|----------------------------------|-----------------------------------------------------|
| <b>show diagnostic status</b>    | Displays the running diagnostics tests.             |
| <b>diagnostic ondemand</b>       | Configures the on-demand diagnostics.               |
| <b>diagnostic event-log size</b> | Modifies the diagnostic event-log size dynamically. |
| <b>diagnostic start</b>          | Runs the specified diagnostic test.                 |
| <b>diagnostic stop</b>           | Stops the testing process.                          |

# show diagnostic ood-status

To display status information, such as the line card slot and name, Field Diagnostic image status, and overall results from previous diagnostic tests, enter the **show diagnostic ood-status** command.

**show diagnostic ood-status** [*slot slot-number* | *subslot slot-number/subslot-number*] [*detail*]

|                    |                |                                                                                                                 |
|--------------------|----------------|-----------------------------------------------------------------------------------------------------------------|
| Syntax Description | slot           | Specifies that the status information will be viewed for a line card in a full slot.                            |
|                    | subslot        | Specifies that the status information will be viewed for a line card in a subslot.                              |
|                    | slot-number    | Specifies the slot number of the line card whose status information will appear in the command output.          |
|                    | subslot-number | Specifies the subslot number of the line card whose status information will appear in the command output.       |
|                    | detail         | Displays the status information and the detailed test results of the specified line card in the command output. |

Command Default      No default behavior or values.

Command Modes      Privileged EXEC (#)

|                 |             |                              |
|-----------------|-------------|------------------------------|
| Command History | Release     | Modification                 |
|                 | 12.3(33)SCC | This command was introduced. |

**Usage Guidelines**

The **show diagnostic ood-status** output discloses if a line card supports Field Diagnostic testing and if the line card has already downloaded a Field Diagnostic image. Therefore, the **show diagnostic ood-status** command is useful as a reference before loading the Field Diagnostic image onto the line card.

It is important to note that the **show diag** and **show diagnostic** commands produce completely different outputs. Therefore, the **show diagnostic** output cannot be gathered using **show diag** because the autocomplete function will generate the **show diag**, not the **show diagnostic**, output. If you want to abbreviate the **show diagnostic** command, the shortest possible abbreviation is **show diagn**.

**Examples**

In the following example, the **show diagnostic ood-status** command is used to view status information of all the line card in the uBR10012 router.

```
Router# show diagnostic ood-status

Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *05:56:50.835 EDT Thu Nov 5 2009

|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Slot              | Identifies the slot on the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Card Description  | A text explanation of the line card in the specified slot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FDiag Support     | Indicates whether the line card in the specific slot supports Field Diagnostic testing. <ul style="list-style-type: none"> <li>• Yes—the line card in the slot supports Field Diagnostic testing.</li> <li>• No—the card in the slot does not support Field Diagnostic testing.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |
| Loaded Image Type | Specifies the run-time image for each line card. <ul style="list-style-type: none"> <li>• Field Diag—Indicates that the Field Diagnostic image is loaded on the line card. A line card will either have the Field Diagnostic or LCDOS image.</li> <li>• IOS—Specifies that the processor is running Cisco IOS.</li> <li>• LCDOS—Line card DOS. The LCDOS image is the image the line card is running during normal router operation. It is removed temporarily when a Field Diagnostic image is loaded onto the line card and loaded back onto a line card when a Field Diagnostic image is unloaded.</li> </ul> <p><b>Note</b> The LCDOS image is not loaded on cable line cards.</p> |

**Table 202**      *show diagnostic ood-status Field Descriptions (continued)*

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Overall Diag Result | <p>Displays the result of the last performed Field Diagnostic test, assuming the Field Diagnostic image has not been removed since the last test.</p> <ul style="list-style-type: none"> <li>• Pass—This line card passed the last diagnostic test.</li> <li>• Fail—At least one Field Diagnostic test failed during the last diagnostic test.</li> <li>• N/A—This line card has not been tested.</li> </ul>                                                                                      |
| Current Card State  | <p>The current card state:</p> <ul style="list-style-type: none"> <li>• Diag Ready—A diagnostic image is loaded onto the line card and Field Diagnostic tests can be run.</li> <li>• Running Diag—A diagnostic image is loaded on to the line card and is currently being run.</li> <li>• Offline—The line card is not currently passing traffic and no Field Diagnostic image has been downloaded onto the line card.</li> <li>• Online—The line card is active and can pass traffic.</li> </ul> |

In the following sample output, the test results per line card is displayed when the **show diagnostic ood-status** command is used along with **subslot** and **detail** keywords. The output displays diagnostic status of the line card along with details of the tests being run and their status.

| Command                                      | Description                                                                                                         |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>diagnostic event-log size</b>             | Sets the size of the event table.                                                                                   |
| <b>diagnostic load</b>                       | Loads the Field Diagnostic image onto the line card.                                                                |
| <b>diagnostic ondemand action-on-failure</b> | Sets the number of errors allowed in the Field Diagnostic test before the Field Diagnostic test is stopped.         |
| <b>diagnostic ondemand iterations</b>        | Sets the number of times each specific Field Diagnostic test will be run when a Field Diagnostic test is initiated. |
| <b>diagnostic start</b>                      | Starts Field Diagnostic testing on the line card.                                                                   |
| <b>diagnostic stop</b>                       | Stops an in-progress Field Diagnostic test.                                                                         |
| <b>diagnostic unload</b>                     | Unloads the Field Diagnostic image from the line card and restores normal line card operation.                      |
| <b>show diag</b>                             | Shows information of all the line cards in the uBR10012 router, per slot, per subplot.                              |
| <b>show diagnostic content</b>               | Shows the Field Diagnostic test list for a particular line card.                                                    |
| <b>show diagnostic events</b>                | Displays the history of Field Diagnostic events since the last system reload.                                       |

# show diagnostic result

To display the diagnostic test results for a module, use the **show diagnostic result** command in user EXEC or privileged EXEC mode.

```
show diagnostic result [[bay slot/bay | slot slot-no | subslot slot/subslot] {detail | test {test-id | test-id-range | all}} | all]
```

| Syntax Description                  |                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bay</b> <i>slot/bay</i>          | (Optional) Indicates the card slot and bay number for which the diagnostic test results are displayed. The <b>bay</b> keyword is used to refer a SPA on Cisco uBR10012 Universal Broadband Router. The valid range to specify slot is 1 to 8 and the valid range for bay is 0 to 3.                                           |
| <b>slot</b> <i>slot-no</i>          | (Optional) Indicates the slot number of the full-height line card for which the diagnostic test results have to be displayed. The <b>slot</b> keyword is used to refer a full-height line card on Cisco uBR10012 Universal Broadband Router. The valid range for the slot number is from 1 to 8.                              |
| <b>subslot</b> <i>slot/sub-slot</i> | (Optional) Indicates the slot and subslot number of the half-height line card for which the diagnostic test results have to be displayed. The <b>subslot</b> keyword is used to refer a half-height line card on Cisco uBR10012 Router. The valid range to specify slot is 1 to 8 and the valid range for sub-slot is 0 to 1. |
| <b>all</b>                          | (Optional) Displays diagnostic test results for all the SPAs, full-height line cards, and half-height line cards.                                                                                                                                                                                                             |
| <i>list</i>                         | List of modules in the following format: <ul style="list-style-type: none"><li>• Entries separated by a comma, for example, 1,4,6-10.</li><li>• Ranges specified with a hyphen, for example, 1-4,6-10.</li></ul>                                                                                                              |
| <i>slot</i>                         | Single module by slot number.                                                                                                                                                                                                                                                                                                 |
| <i>slot/subslot</i>                 | Single sub module by slot number and subslot or bay within the module.                                                                                                                                                                                                                                                        |
| <b>detail</b>                       | (Optional) Displays the detailed test results. The <b>detail</b> keyword is used along with the <b>bay</b> , <b>slot</b> , or <b>subslot</b> keywords to provide detailed test result information for a SPA, full-height line card, or half-height line card.                                                                 |
| <b>test</b> <i>test-id</i>          | (Optional) Displays test results only for the specified test-ids.                                                                                                                                                                                                                                                             |
| <b>test</b> <i>test-id-range</i>    | (Optional) Displays test results for the specified range of test ids.                                                                                                                                                                                                                                                         |
| <b>test</b> <i>all</i>              | (Optional) Displays the test results for all the tests running on the SPA, full-height line card, or half-height line card.                                                                                                                                                                                                   |

| Release     | Modification                                                                                                                                                                                                                                                                         |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCC | The command was introduced in this release to support the Generic Online Diagnostics (GOLD) functionality on the Cisco uBR10012 Universal Broadband Router. The keywords <b>bay</b> , <b>slot</b> , and <b>subslot</b> were added for the Cisco uBR10012 Universal Broadband Router. |

**Usage Guidelines**

In the command output, the possible testing results are as follows:

- Passed (.)
- Failed (F)
- Untested (U)

To display the results of a specific diagnostic test, specify the *test-id* number using the **test test-id** keyword and argument. The *test-id* numbers for available diagnostic tests are displayed in the output of the **show diagnostic content** command.

You can use the **show diagnostic description** command to see a detailed description of a diagnostic test.

The command syntax to refer a line card or SPAs is different on Cisco uBR10012 Router. The keyword is **slot x** for a full-height line card, **slot x/y** for a half-height card, and **bay x/y** for a SPA.

**Note**

To view the diagnostic test results for a SPA, full-height line card, or half-height line card use the **show diagnostic result** command along with the **bay**, **slot**, or **subslot** keywords respectively.

The GOLD test cases used to poll for system errors in Cisco IOS Software Release 12.2(33)SCC are Low Latency Queueing (LLQ) drop, Cable Line Card (CLC) memory leak, and Guardian index leak tests.

**Examples**

The following example shows a sample output of the **show diagnostic result all** command. The output displays a summary of test results on all the SPAs, full-height line cards, and half-height line cards on the Cisco uBR10012 Router:

```
Router# show diagnostic result all

Current bootup diagnostic level: minimal
Slot 1: 2jacket-1 SerialNo : CAT1146E05
Overall diagnostic result: UNTESTED
Diagnostic level at card bootup: minimal
Test results: (. = Pass, F = Fail, U = Untested)

 1) TestJacketSample -----> U

 Bay 1/0: 2jacket-1 SerialNo : N/A

 Overall diagnostic result: PASS
 Diagnostic level at card bootup: minimal

 Test results: (. = Pass, F = Fail, U = Untested)

 1) TestModenaSample -----> U
 2) TestModenaLLQDrops -----> .

Subslot 5/0: 5cable-mc520u-d, 5 ports SerialNo : CAT10210T9
```

## show diagnostic result

```

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) TestSampleProxy -----> U
2) Test520LLQDrops:

 Port 0 1 2 3 4

3) TestBlazeIndexLeak -----> U
4) TestMemLeaks -----> .

Subslot 8/0: 5cable-mc520u-d, 5 ports SerialNo : CAT08410SS

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) TestSampleProxy -----> U
2) Test520LLQDrops:

 Port 0 1 2 3 4

3) TestBlazeIndexLeak -----> .
4) TestMemLeaks -----> .

Subslot 8/1: 5cable-mc520u-d, 5 ports SerialNo : CAT10251S2

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) TestSampleProxy -----> U
2) Test520LLQDrops:

 Port 0 1 2 3 4

3) TestBlazeIndexLeak -----> U
4) TestMemLeaks -----> .

```

The following example shows a sample output of the **show diagnostic result subslot 5/0 detail** command. The command output provides useful details such as overall diagnostic results and the time-related values of various important parameters, which help in identifying and resolving the issue:

```

Router# show diagnostic result subslot 5/0 detail

Current bootup diagnostic level: minimal
Subslot 5/0: 5cable-mc520u-d, 5 ports SerialNo : CAT10210T9

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) TestSampleProxy -----> U
 Error code -----> 0 (DIAG_SUCCESS)

```

```

Total run count -----> 0
Last test execution time -----> n/a
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> n/a
Total failure count -----> 0
Consecutive failure count -----> 0

```

---

2) Test520LLQDrops:

```

Port 0 1 2 3 4

.
Error code -----> 0 (DIAG_SUCCESS)
Total run count -----> 17
Last test execution time -----> Aug 11 2009 09:42:22
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> Aug 11 2009 09:42:22
Total failure count -----> 0
Consecutive failure count -----> 0

```

---

```

3) TestBlazeIndexLeak -----> U
Error code -----> 0 (DIAG_SUCCESS)
Total run count -----> 1
Last test execution time -----> Aug 11 2009 00:42:19
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> Aug 11 2009 00:42:19
Total failure count -----> 0
Consecutive failure count -----> 0

```

---

```

4) TestMemLeaks -----> .
Error code -----> 0 (DIAG_SUCCESS)
Total run count -----> 7
Last test execution time -----> Aug 11 2009 06:42:19
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> Aug 11 2009 06:42:19
Total failure count -----> 0
Consecutive failure count -----> 0

```

---

|-----------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(33)SCC | The command was introduced in this release to support Generic Online Diagnostics (GOLD) functionality for Cisco uBR10012 Universal Broadband Router. The keywords <b>bay</b> , <b>slot</b> , and <b>subslot</b> were added for the Cisco uBR10012 Universal Broadband Router. |

|                  |                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | Diagnostic tests for a specific bay, slot, or subslot can be scheduled daily, weekly, or on specific dates and time using the <b>diagnostic schedule</b> command from global configuration mode. The <b>show diagnostic schedule</b> command output displays the diagnostic tests that have been scheduled for the bay, slot, or subslot using the command <b>diagnostic schedule</b> . |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|          |                                                                                                                                                                                                |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Examples | This example shows a sample output of the <b>show diagnostic schedule slot 1</b> command that displays diagnostic tasks scheduled for slot 1 on the Cisco uBR10012 Universal Broadband Router: |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Router# **show diagnostic schedule slot 1**

## show diagnostic schedule

Current Time = 13:55:35 EST Tue Aug 11 2009

Diagnostic for Slot 1:

Schedule #1:

To be run on September 1 2009 12:00

Test ID(s) to be executed: 1.

This example shows a sample output of how to display the diagnostic tasks scheduled for all the bays, full-height line cards, and half-height line cards installed on the Cisco uBR10012 Universal Broadband Router:

Router# **show diagnostic schedule all**

Current Time = 14:05:41 EST Tue Aug 11 2009

Diagnostic for Slot 1:

Schedule #1:

To be run on September 1 2009 12:00

Test ID(s) to be executed: 1.

Diagnostic for Bay 1/0 is not scheduled.

Diagnostic for Subslot 5/0 is not scheduled.

Diagnostic for Subslot 8/0:

Schedule #1:

To be run daily 12:00

Test ID(s) to be executed: 2.

Diagnostic for Subslot 8/1:

Schedule #1:

To be run weekly Sunday 12:00

Test ID(s) to be executed: 3.

### Related Commands

| Command                                  | Description                                                               |
|------------------------------------------|---------------------------------------------------------------------------|
| <b>diagnostic schedule</b>               | Sets the diagnostic test schedule for a particular bay, slot, or subslot. |
| <b>show diagnostic description</b>       | Provides the description for the diagnostic tests.                        |
| <b>diagnostic start</b>                  | Runs the specified diagnostic test.                                       |
| <b>diagnostic stop</b>                   | Stops the testing process.                                                |
| <b>show diagnostic content module</b>    | Displays the available diagnostic tests.                                  |
| <b>diagnostic bootup level</b>           | Configures the diagnostic bootup level.                                   |
| <b>diagnostic event-log size</b>         | Modifies the diagnostic event-log size dynamically.                       |
| <b>diagnostic monitor</b>                | Configures the health-monitoring diagnostic testing.                      |
| <b>diagnostic ondemand</b>               | Configures the on-demand diagnostics.                                     |
| <b>show diagnostic bootup</b>            | Displays the configured diagnostics level at bootup.                      |
| <b>show diagnostic events</b>            | Displays the diagnostic event log.                                        |
| <b>show diagnostic ondemand settings</b> | Displays the settings for the on-demand diagnostics.                      |
| <b>show diagnostic result</b>            | Displays the diagnostic test results for a module.                        |
| <b>show diagnostic schedule</b>          | Displays the current scheduled diagnostic tasks.                          |
| <b>show diagnostic status</b>            | Displays the running diagnostics tests.                                   |

# show facility-alarm status

To display the current temperature thresholds that will trigger a facility alarm, use the **show facility-alarm status** command in user EXEC or privileged EXEC mode.

**show facility-alarm status** [*severity*]

|                           |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>severity</i> | (Optional) String that identifies the severity of an alarm. The default severity level is info, which shows all alarms. Severity levels are defined as the following: <ul style="list-style-type: none"><li>• <b>critical</b>—Only critical alarms are shown.</li><li>• <b>major</b>—All major and critical facility alarms are shown.</li><li>• <b>minor</b>—All minor, major, and critical facility alarms are shown.</li><li>• <b>info</b>—All facility alarms are shown.</li><li>• <b>phy-index</b>—All facility alarms for the specified physical index entity are shown.</li></ul> |
|---------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                       |
|------------------------|-----------------------|
| <b>Command Default</b> | All alarms are shown. |
|------------------------|-----------------------|

|                      |                                |
|----------------------|--------------------------------|
| <b>Command Modes</b> | User EXEC, Privileged EXEC (#) |
|----------------------|--------------------------------|

| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                                                                                 |
|------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
|                        | 12.2(1)XF1     | This command was introduced for the Cisco uBR10012 router.                                                                          |
|                        | 12.3BC         | This command was integrated into Cisco IOS Release 12.3BC.                                                                          |
|                        | 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                  |
|                        | 12.2(33)SCE4   | This command was modified. The <b>phy-index</b> keyword was added to the command for the Cisco uBR7200 series and uBR10012 routers. |

|                         |                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | When a severity level is identified, statuses of alarms at that level and higher are shown. For example, when you set a severity of major, all major and critical alarms are shown. |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The **show facility-alarm status** command does not show the real status of the upstream channel connector when frequency stacking is configured on the upstream channel.

**Note**

The **show facility-alarm status** command does not show the critical alarm temperature thresholds. You can display these values using the **show running-config | include facility** command. If this does not display any commands for critical alarms, then the temperature thresholds are set at their default values.

For additional information on Frequency Stacking feature, refer to the [Virtual Interfaces and Frequency Stacking Configuration on MC5x20S and MC28U Linecards](#) document on Cisco.com.

**Examples**

The following example shows a typical display of the **show facility-alarm status** command:

```
Router# show facility-alarm status
Thresholds:
Intake minor 40 major 49 critical 72
Core minor 45 major 53 critical 85
```

```
System Totals Critical: 0 Major: 0 Minor: 77
```

| Source        | Severity | ACO    | Description [Index]          |
|---------------|----------|--------|------------------------------|
| -----         | -----    | ---    | -----                        |
| chassis       | MINOR    | NORMAL | Core minor temperature limi] |
| Cable5/0-MAC0 | INFO     | NORMAL | Physical Port Administrativ] |
| Cable5/0-MAC1 | INFO     | NORMAL | Physical Port Administrativ] |
| Cable5/0-MAC2 | INFO     | NORMAL | Physical Port Administrativ] |
| Cable5/0-MAC3 | INFO     | NORMAL | Physical Port Administrativ] |
| Cable5/0-MAC4 | INFO     | NORMAL | Physical Port Administrativ] |
| Cable5/0-US0  | MINOR    | NORMAL | Physical Port Link Down [0]  |
| Cable5/0-US1  | MINOR    | NORMAL | Physical Port Link Down [0]  |
| Cable5/0-US2  | MINOR    | NORMAL | Physical Port Link Down [0]  |

```
Router#
```

The following example shows a typical display of the **show facility-alarm status phy-index** command:

```
Router# show facility-alarm status phy-index
```

```
Intake minor 40 major 49 critical 72
Core minor 45 major 53 critical 85
```

```
System Totals Critical: 4 Major: 1 Minor: 0
```

| PhyIdx | Source         | Severity | ACO    | Description [Index]          |
|--------|----------------|----------|--------|------------------------------|
| -----  | -----          | -----    | ---    | -----                        |
| 28     | RP A           | MAJOR    | NORMAL | Secondary failure [2]        |
| 46     | GigE1H 3/0/0   | CRITICAL | NORMAL | Physical Port Link Down [0]  |
| 48     | GigE1H 3/1/0   | CRITICAL | NORMAL | Physical Port Link Down [0]  |
| 5510   | Cable5/1-US4   | INFO     | NORMAL | Physical Port Administrative |
|        | State Down [1] |          |        |                              |
| 5511   | Cable5/1-US5   | INFO     | NORMAL | Physical Port Administrative |
|        | State Down [1] |          |        |                              |

[Table 204](#) describes the significant fields shown in the outputs.

**Table 204** *show facility-alarm status Field Descriptions*

| Field               | Description                                                                                                                                 |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| System Totals       | Total number of alarms generated, identified by severity.                                                                                   |
| PhyIdx              | The entity physical index for a specific alarm node.                                                                                        |
| Source              | Interface from which the alarm was generated.                                                                                               |
| Severity            | Severity level of the alarm generated.                                                                                                      |
| ACO                 | Alarm cutoff. It could be “NORMAL” or “CLEARED”.                                                                                            |
| Description [Index] | Type of the alarm and the index of the alarm type. The index can be any number based on the number of alarm types that the device supports. |

**Related Commands**

| Command                     | Description                                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clear facility-alarm</b> | Clears some or all of the facility alarms on the Cisco uBR10012 router.                                                                   |
| <b>facility-alarm</b>       | Sets the temperature thresholds at which the processor generates a critical, major, or minor alarm to warn of potential equipment damage. |

# show frame-clocks

To display information about the midplane time-division multiplexing (TDM) clock reference, use the **show frame-clocks** command in privileged EXEC mode.

**show frame-clocks**

**Syntax Description** This command has no keywords or arguments.

**Command Modes** Privileged EXEC

| Command History | Release    | Modification                                                                           |
|-----------------|------------|----------------------------------------------------------------------------------------|
|                 | 12.0(T)    | This command was introduced.                                                           |
|                 | 12.1(1a)T1 | This command was modified to include the cable clock card as the current clock source. |

**Examples** The following sample output from the **show frame-clocks** command shows that there are no clock sources configured and the clock card is the default clock source:

```
Router# show frame-clocks

Priority 1 clock source:not configured input:none
Priority 2 clock source:not configured input:none
Priority 3 clock source:not configured input:none
Priority 4 clock source:not configured input:none
Current clock source:Clockcard, input:Primary, priority:5
```

[Table 0-205](#) describes the fields displayed by the **show frame-clocks** command:

**Table 0-205 show frame-clocks Field Descriptions**

| Field                     | Description                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------|
| Priority 1-4 clock source | The configuration of the four network clock sources.                                                              |
| Current clock source      | The current clock source, its input, and priority. In this example, the clock card is providing the clock source. |

**Tip**

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

| Related Commands | Command                                 | Description                                     |
|------------------|-----------------------------------------|-------------------------------------------------|
|                  | <b>show cable clock</b>                 | Displays status information for the clock card. |
|                  | <b>show controllers clock-reference</b> | Displays the clock card's hardware information. |

# show hccp

To display information about HCCP groups associated with cable interfaces, use the **show hccp** command in user EXEC or privileged EXEC mode.

**show hccp** [*group* | **brief** | **channel-switch** | **detail** | **event-history** | **interface** | **linecard**]

| Syntax Description    |                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group</i>          | (Optional) Group number to be displayed. The valid range is 1 to 255. It is a 1-based MAC domain number and hence on a: <ul style="list-style-type: none"> <li>Cisco uBR10-MC5X20 and Cisco UBR-MC20X20V line card, the group range is from 1 to 5.</li> <li>Cisco uBR-MC3GX60V line card, the group range is from 1 to 15.</li> </ul> |
| <b>brief</b>          | (Optional) Displays a brief summary of the groups, configuration types, member numbers, and status for cable interfaces. You can also use this option when displaying information for a specific group.                                                                                                                                |
| <b>channel-switch</b> | (Optional) Displays information about the channel-switch configuration.                                                                                                                                                                                                                                                                |
| <b>detail</b>         | (Optional) Displays a detailed summary of the groups, configuration types, member numbers, and status for cable interfaces, as well as the CLI commands that are being synchronized across interfaces.                                                                                                                                 |
| <b>event-history</b>  | (Optional) Displays information about switchover and sync events.                                                                                                                                                                                                                                                                      |
| <b>interface</b>      | (Optional) Displays a summary on each interface.                                                                                                                                                                                                                                                                                       |
| <b>linecard</b>       | (Optional) Displays line card-level HCCP information.                                                                                                                                                                                                                                                                                  |

|-----------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.1(3a)EC  | This command was introduced.                                                                                                                                                                                            |
|                 | 12.2(4)BC1  | The <b>detail</b> option was added.                                                                                                                                                                                     |
|                 | 12.2(8)BC2  | The current time to resync and current wait to restore values were added to the display for the <b>brief</b> option.                                                                                                    |
|                 | 12.2(11)BC1 | Support was added for the Cisco uBR-RFSW N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.                                                          |
|                 | 12.2(15)BC2 | The output of the <b>show hccp detail</b> command was changed to show separate lists of the critical and non-critical CLI commands that are being synchronized for each Working and Protect interface and subinterface. |
|                 | 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB and the output of the <b>show hccp detail</b> command was changed to show CMTS interface pre-critical config information.                                |
|                 | 12.2(33)SCC | This command was integrated into Cisco IOS Release 12.2(33)SCC.                                                                                                                                                         |

| Release     | Modification                                                                                                                                                                                                                                                 |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCE | This command was modified. <b>line card</b> keyword was added.                                                                                                                                                                                               |
| 12.2(33)SCF | This command supports configuration of a card with a lower license as protect for a working card with a higher license. However, when a switchover occurs, this protect card does not become active until it is upgraded and reloaded with a higher license. |

### Usage Guidelines

Starting with Cisco IOS Release 12.2(33)SCF, you can configure a card with a lower license as the protect card for a working card with a higher license. This protect card remains in a nonfunctional mode (not in standby mode) and does not become active until it is upgraded and reloaded with a higher license, when a switchover occurs.

### Examples

The following examples are from the **show hccp** and **show hccp brief** commands for the entire chassis:

Router# **show hccp**

```
Cable4/0 - Group 1 Protect, enabled, blocking
authentication md5, key-chain "cisco1"
hello time 2000 msec, hold time 6000 msec
Member 1 standby
ip addr: working 10.20.111.11, protect 10.20.111.10
downstream wavecom (1.1.11.3/1, 1.1.11.3/2), upstream none
```

Router# **show hccp brief**

```
Interface Config Grp Mbr Status
Ca5/0/0 Protect 1 3 standby
Ca7/0/0 Working 1 3 active
```

In Cisco IOS Release 12.2(8)BC2 and later 12.2 BC releases, the **brief** option also shows the amount of time left before the next resynchronization and the time left before a restore:

Router# **show hccp brief**

```
Interface Config Grp Mbr Status WaitToResync WaitToRestore
Ca5/0/0 Protect 1 3 standby 00:01:50.892
Ca7/0/0 Working 1 3 active 00:00:50.892 00:01:50.892
```

Router#

The following example shows a sample output for the **show hccp channel-switch** command, displaying the groups and module numbers for each configured member:

Router# **show hccp channel-switch**

Grp 1 Mbr 1 Working channel-switch:

```
"uc" - enabled, frequency 555000000 Hz
"rfswitch" - module 1, normal
module 3, normal
module 5, normal
module 7, normal
module 11, normal
```

Grp 2 Mbr 1 Working channel-switch:

```
"uc" - enabled, frequency 555000000 Hz
"rfswitch" - module 2, normal
module 4, normal
```

```

 module 6, normal
 module 9, normal
 module 13, normal
Grp 1 Mbr 7 Protect channel-switch:
 "uc" - disabled, frequency 555000000 Hz
 "rfswitch" - module 1, normal
 module 3, normal
 module 5, normal
 module 7, normal
 module 11, normal
Grp 1 Mbr 5 Protect channel-switch:
 "uc" - disabled, frequency 555000000 Hz
 "rfswitch" - module 1, normal
 module 3, normal
 module 5, normal
 module 7, normal
 module 11, normal

```

Router#

The following example shows the first part of the display for the **detail** option of this command, which first displays chassis-wide configuration information. The command then displays the CLI configuration commands that are being synchronized for each subinterface.

Router# **show hccp detail**

```

Router#

```

In Cisco IOS Release 12.2(33)SCB and later releases, the **show hccp detail** command shows CMTS interface pre-critical configuration information as part of the critical and non-critical synchronized CLI commands:

Router# **show hccp detail**

```

HCCP software version 3.0
Cable5/0/0 - Group 1 Working, enabled, forwarding
 authentication none
 hello time 5000 msec, hold time 15000 msec, revert time 30 min
 track interfaces: Cable5/0/0
 sync time 1000 msec, suspend time 120000 msec
 switch time 240000 msec retries 5
 local state is Teach, tran 9
 in sync, out staticsync, start static sync in never
 last switch reason is internal
 data plane directly sends sync packets
 statistics:
 standby_to_active 2, active_to_standby 1
 active_to_active 0, standby_to_standby 0
 Member 5 active
 target ip address: protect 222.1.1.9, working 222.1.1.9
 channel-switch "uc" (wavecom-hd, 1.10.45.11/7, 1.10.45.11/4) enabled
 channel-switch "rfsw" (rfswitch-group, 1.10.52.33/0x40100000/8) enabled
 tran #: SYNC 9, last SYNC_ACK 0, last HELLO_ACK 54
 hold timer expires in 00:00:13.180
Cable6/0/0 - Group 1 Protect, enabled, blocking
 authentication none
 hello time 5000 msec, hold time 15000 msec, revertive
 track interfaces: Cable6/0/0

```

```

sync time 1000 msec, suspend time 120000 msec
local state is Learn, tran 54
last switch reason is none
last HELLO tran 54, elapsed 3928 msec, hello timer expires in 00:00:01.068
data plane directly sends sync packets

Router#

```

**Tip**

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following example shows a detailed display for the Cisco uBR10-MC5X20S cable interface line card:

```

Router# show hccp detail

 mac-address 0005.00e4.1236
cmts config:
 resolve sid, dci-response success,
 downstream - frequency 441000000, channel id 0
 downstream - insertion_invl auto min = 60, max = 480
 downstream - rf-shutdown, rf-power 48
 upstream 0 - frequency 11408000, power level 0
 upstream 0 - modulation-profile 1, channel-width 3200000
 upstream 0 - cnr-profile1 25, cnr-profile2 15
 corr-fec 1, uncorr-fec 1

```

**Note**

For cable interfaces with an integrated upconverter, the line showing the RF power will show **rf-shutdown** when the upconverter has been powered off.

**Related Commands**

| Command                    | Description                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>show hccp interface</b> | Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured. |
| <b>show hccp linecard</b>  | Displays line card-level HCCP information.                                                                                           |
| <b>show hccp group</b>     | Displays group information.                                                                                                          |

# show hccp channel-switch

To display channel-switch hccp information, use the **show hccp channel-switch** command in privileged EXEC mode.

**show hccp channel-switch** [**command-history local** | **counter** | **image** | **state** | **version**]

|                    |                              |                                                        |
|--------------------|------------------------------|--------------------------------------------------------|
| Syntax Description | <b>command-history local</b> | Displays the command history on the Cisco CMTS router. |
|                    | <b>counter</b>               | Displays the counters on the Cisco NGRFSW-ADV.         |
|                    | <b>image</b>                 | Displays the image list on the Cisco NGRFSW-ADV.       |
|                    | <b>state</b>                 | Displays the current state of the Cisco NGRFSW-ADV.    |
|                    | <b>version</b>               | Displays the version of the Cisco NGRFSW-ADV.          |

Table 206 describes the significant fields shown in the display.

**Table 206** *show hccp channel-switch Field Descriptions*

| Field              | Description                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timestamp          | Time at which a command was executed.                                                                                                                             |
| State              | State of the switch card.                                                                                                                                         |
| command            | List of commands executed on the Cisco CMTS router.                                                                                                               |
| Module Id          | Switchover module identifier in the Cisco NGRFSW-ADV.                                                                                                             |
| Ctrl Version       | Version of the Controller.                                                                                                                                        |
| Switch Version     | Version of the Switch.                                                                                                                                            |
| Bootload Version   | Version of the bootload in the Cisco NGRFSW-ADV.                                                                                                                  |
| Watchdog Error     | Watchdog error number.                                                                                                                                            |
| Temperature        | Temperature of the switch card.                                                                                                                                   |
| Voltage Monitoring | Voltage value.                                                                                                                                                    |
| Uptime             | Uptime of the switch card.                                                                                                                                        |
| Serial             | Serial string for the controller and switchover cards.                                                                                                            |
| Type               | Type of the switch card (upstream or downstream).                                                                                                                 |
| Slot ID            | Slot number of the switch card.                                                                                                                                   |
| TotalPower Cycle   | Power cycle number for the switchover card.                                                                                                                       |
| Relay pos          | Relay position register. It is a 11-bit value, where 's' represents a set bit, 'R' represents a reset bit, and '-' is for an unused bit.                          |
| Coil Fail Register | Coil failure register in the switchover cards. It is a 11-bit value, where 'P' represents a normal bit, 'F' represents a failed bit and '-' is for an unused bit. |
| TotalRelay Cycle   | Relay cycle number for the switchover card.                                                                                                                       |

|------------------|----------------------------------------------------------------------------|
| <b>show hccp</b> | Displays Hot Standby Connection-to-Connection Protocol (HCCP) information. |

# show hccp interface

To display information on all Hot Standby Connection-to-Connection Protocol (HCCP) groups associated with a specific cable interface, use the **show hccp interface** command in user EXEC or privileged EXEC mode.

```
show hccp interface interface [brief | detail]
```

|                    |           |                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | interface | The cable interface for which you want to display HCCP group information. The information presented includes HCCP groups, configuration types, member numbers, status, authentication algorithms, authentication key chains, HCCP timers, Ip address assignments, and downstream switch designations for the specified cable interface. |
|                    | brief     | (Option) Displays a brief summary of the HCCP groups, configuration types, member numbers, and status for a specified cable interface.                                                                                                                                                                                                  |
|                    | detail    | (Option) Displays a detailed summary of the HCCP groups, configuration types, member numbers, and status for a specified cable interface.                                                                                                                                                                                               |

| Command History | Release     | Modification                                                                                                                                    |
|                 | 12.1(3a)EC  | This command was introduced.                                                                                                                    |
|                 | 12.2(4)BC1  | The <b>detail</b> option was added.                                                                                                             |
|                 | 12.2(8)BC2  | The current time to resync and current wait to restore was added to the <b>brief</b> option.                                                    |
|                 | 12.2(11)BC1 | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards. |

Examples

The following examples are from the **show hccp interface cable 4/0** and **show hccp interface cable 4/0 brief** commands:

```
Router# show hccp interface cable 4/0

Cable4/0 - Group 1 Protect, enabled, blocking
authentication md5, key-chain "cisco1"
hello time 2000 msec, hold time 6000 msec
Member 1 standby
ip addr: working 10.20.111.11, protect 10.20.111.10
downstream wavecom (1.1.11.3/1, 1.1.11.3/2), upstream none

Router# show hccp interface cable 4/0 brief

Interface Config Grp Mbr Status
Ca4/0 Protect 1 1 standby

Router#
```

In Cisco IOS Release 12.2(8)BC2 and later 12.2 BC releases, the **brief** option also shows the amount of time left before the next resynchronization and the time left before a restore:

Router# **show hccp interface cable 4/0 brief**

| Interface | Config  | Grp | Mbr | Status  | WaitToResync | WaitToRestore |
|-----------|---------|-----|-----|---------|--------------|---------------|
| Ca4/0     | Protect | 1   | 1   | standby | 00:00:50.892 | 00:01:50.892  |

Router#

Tip

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

| Command          | Description                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>show hccp</b> | Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured. |

# show hccp group

To display information about groups associated with cable interfaces, use the **show hccp group** command in user EXEC or privileged EXEC mode.

**show hccp group member** { **CGD** | *mac-address* { **classifier** | **l2vpn** } | **channel-switch** | **detail** | **event-history** | **host** [**ipv6**] | **mcast sid** | **mlist** | **modem** [**ipv6**] | **multicast-session** | **qosparam** | **service-flow** [*sfid* [**classifier**]] | **sid** }

## Syntax Description

|                                                   |                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group</i>                                      | (Optional) Specifies a group number to be displayed. The valid range is from 1 to 255.                                                                                                                                                                                                                                                            |
| <i>member</i>                                     | (Optional, when displaying information for a particular group) Specifies the member ID of the Inter-database for the specified group. Each <i>member</i> denotes a working line card. For example, 50 is the member ID for slot 5/0, 51 is the member ID for slot 5/1, 81 is the member ID for slot 8/1.<br><br>The valid range is from 1 to 255. |
| <b>CGD</b>                                        | (Optional) Displays the channel group domain (CGD) information synchronized from the active line card to the standby line card. This information is saved in the Inter-database on the standby line card.                                                                                                                                         |
| <i>mac-address</i> <b>classifier</b>              | (Optional) Displays classifier information for the specified MAC address.                                                                                                                                                                                                                                                                         |
| <i>mac-address</i> <b>l2vpn</b>                   | (Optional) Displays l2vpn information for the specified MAC address.                                                                                                                                                                                                                                                                              |
| <b>channel-switch</b>                             | (Optional) Displays channel-switch information for this particular group and member.                                                                                                                                                                                                                                                              |
| <b>detail</b>                                     | (Optional) Displays a detailed summary of the groups, configuration types, member numbers, and status for cable interfaces, as well as the CLI commands that are being synchronized across interfaces.                                                                                                                                            |
| <b>event-history</b>                              | (Optional) Displays HCCP event history information.                                                                                                                                                                                                                                                                                               |
| <b>host</b>                                       | (Optional) Displays host information for this particular group and member.                                                                                                                                                                                                                                                                        |
| <b>mcast sid</b>                                  | (Optional) Displays the modular or integrated cable interface multicast service ID (SID) information synchronized from the active line card to the standby line card. This information is saved in the Inter-database on the standby line card.                                                                                                   |
| <b>mlist</b>                                      | (Optional) Displays ACL-MSAID information.                                                                                                                                                                                                                                                                                                        |
| <b>modem</b>                                      | (Optional) Displays cable modem information for this particular group and member.                                                                                                                                                                                                                                                                 |
| <b>multicast-session</b>                          | (Optional) Displays multicast session information.                                                                                                                                                                                                                                                                                                |
| <b>qosparam</b>                                   | (Optional) Displays quality of service (QoS) parameter information for this particular group and member.                                                                                                                                                                                                                                          |
| <b>service-flow</b> <i>sfid</i> <b>classifier</b> | (Optional) Displays service flow and classifier information for the specified service flow ID (SFID) for this particular group and member.                                                                                                                                                                                                        |
| <b>sid</b>                                        | (Optional) Displays service ID (SID) information for this particular group and member.                                                                                                                                                                                                                                                            |

## Command History

| Release     | Modification                                                                                                                                                                                                            |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(3a)EC  | This command was introduced.                                                                                                                                                                                            |
| 12.2(4)BC1  | The <b>detail</b> option was added.                                                                                                                                                                                     |
| 12.2(8)BC2  | The current time to resync and current wait to restore values were added to the display for the <b>brief</b> option.                                                                                                    |
| 12.2(11)BC1 | Support was added for the Cisco uBR-RFSW N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.                                                          |
| 12.2(15)BC2 | The output of the <b>show hccp detail</b> command was changed to show separate lists of the critical and non-critical CLI commands that are being synchronized for each Working and Protect interface and subinterface. |
| 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB and the output of the <b>show hccp detail</b> command was changed to show CMTS interface pre-critical config information.                                |
| 12.2(33)SCC | This command was integrated into Cisco IOS Release 12.2(33)SCC.                                                                                                                                                         |

## Examples

The following shows an example of the **show hccp** command to display QoS parameters for a particular member of a particular group:

```
Router# show hccp 1 1 qosparam
```

```
Cable5/0/0:
```

| Index | Name | Dir | Sched | Prio | MaxSusRate | MaxBurst | MinRsvRate |
|-------|------|-----|-------|------|------------|----------|------------|
| 1     |      | US  | BE    | 0    | 64000      | 0        | 0          |
| 2     |      | DS  | BE    | 0    | 1000000    | 0        | 0          |
| 3     |      | US  | BE    | 7    | 1024000    | 1522     | 0          |
| 4     |      | DS  | BE    | 0    | 10000000   | 1522     | 0          |

```
Router#
```

## Tip

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following example shows the service flow information for a cable interface line card on group 2 member 50:

```
Router# show hccp 2 50 service-flow
```

```
Cable8/0/1[grp:2, mem:50, P]:[HCCP inter-db: service flow]
```

| Sfid | Sid | Mac Address    | QoS Param |     |     | Index | Type | Dir | Curr State |

|---------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| show hccp           | Displays HCCP group information for a specific cable interface.                                                                      |
| show hccp interface | Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured. |

# show hccp linecard

To display information about groups associated with cable interfaces, use the **show hccp linecard** command in user EXEC or privileged EXEC mode.

```
show hccp linecard {brief | channel-switch | detail | fsm | nullfsm | subslot slot/subslot
 {channel-switch | detail | modem summary total}}
```

## Syntax Description

|                             |                                                                                                                                                                                  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>brief</b>                | (Optional) Displays a brief summary of HCCP for each line card.                                                                                                                  |
| <b>channel-switch</b>       | (Optional) Displays channel-switch information for each line card.                                                                                                               |
| <b>detail</b>               | (Optional) Displays a detailed summary of HCCP for each line card.                                                                                                               |
| <b>fsm</b>                  | (Optional) Displays the complete state transition flow. Each line card member in an HCCP group is controlled by a state machine, which controls the startup and switchover flow. |
| <b>nullfsm</b>              | (Optional) Displays the HCCP members that received unused or nonmeaningful event. This is used only for debugging.                                                               |
| <b>subslot slot/subslot</b> | (Optional) Specifies the subslot for the line card.                                                                                                                              |
| <b>channel-switch</b>       | (Optional) Displays line card-level channel switch summary.                                                                                                                      |
| <b>detail</b>               | (Optional) Displays details of the line card-level HCCP.                                                                                                                         |
| <b>modem summary total</b>  | (Optional) Displays modem information.                                                                                                                                           |

## Command Default

None.

## Command Modes

User EXEC, Privileged EXEC (#)

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCE | This command was introduced. |

## Usage Guidelines

The **show hccp linecard subslot slot/subslot modem summary total** command is used to show the modem summary information in the peer Inter-database and to check if the modem has successfully synchronized with the standby.

## Examples

This example shows the **brief** and **fsm** information for a cable interface line card:

```
Router# show hccp linecard brief
```

|          |         |     |         |              |              |               |
|----------|---------|-----|---------|--------------|--------------|---------------|
| Card     | Config  | Mbr | Role    | State        | WaitToResync | WaitToRestore |
| card 5/1 | Protect | 50  | Standby | Standby Warm | never        |               |
| card 5/0 | Working | 50  | Active  | Active Warm  | never        |               |

```
Router# show hccp linecard fsm
```

## ■ show hccp linecard

```

# show hw-module bay

To display information about the wideband channels or RF channels on a Wideband SPA, use the **show hw-module bay** command in privileged EXEC mode.

**Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA**

```
show hw-module bay {slot/subslot/bay | all} show-type
 {wideband-channel | rf-channel | modular-channel} [device-index] [verbose]
```

**Cisco IOS Release 12.2(33)SCB**

```
show hw-module bay {slot/bay/port | all} show-type
 {wideband-channel | rf-channel | modular-channel} [device-index] [verbose]
```

| Syntax Description      |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>             |  | The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs.                                                                                                                                                                                                                                                                                                                                                                               |
| <i>subslot</i>          |  | The subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>bay</i>              |  | The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>port</i>             |  | Specifies the interface number on the SPA.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>all</b>              |  | Specifies that the displayed information will be for both bay 1 and bay 0 if Wideband SPAs are installed in both bays.                                                                                                                                                                                                                                                                                                                                                        |
| <i>show-type</i>        |  | The type of information to display. Valid values are <b>association</b> , <b>config</b> , <b>counters</b> , and <b>mapping</b> . See the Usage Guidelines for more information on show types.                                                                                                                                                                                                                                                                                 |
| <b>wideband-channel</b> |  | Displays information for the wideband channel indicated by <i>device-index</i> .                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>rf-channel</b>       |  | Displays information for the RF channel indicated by <i>device-index</i> .                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>modular-channel</b>  |  | Displays information for the narrowband channel indicated by <i>device-index</i> .                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>device-index</i>     |  | (Optional) The wideband channel number or RF channel number or Baseline Privacy Interface (BPI) index number. <ul style="list-style-type: none"> <li>When the <b>wideband-channel</b> keyword is specified, valid values for <i>device-index</i> are 0 to 11.</li> <li>When the <b>rf-channel</b> keyword is specified, valid values for <i>device-index</i> are 0 to 23 depending on how the Wideband SPA is configured with the <b>annex modulation</b> command.</li> </ul> |
| <b>verbose</b>          |  | (Optional) Used with the <b>config</b> keyword. Shows more configuration information on the wideband channel or RF channel.                                                                                                                                                                                                                                                                                                                                                   |

**Command Default** No default values or behavior

**Command Modes** Privileged EXEC (#)

| Release     | Modification                                                                                                                                                                                  |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(21)BC  | This command was introduced for the Cisco uBR10012 router.                                                                                                                                    |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                                                                                               |
| 12.3(23)BC  | The <b>modular-channel</b> keyword was added. MC BW % column was added to the rf-channel keyword output.                                                                                      |
| 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB.<br>This command was modified to change the addressing format for a SPA from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> . |

**Usage Guidelines**

The type of information that **show hw-module bay** displays is determined by the value of the *show-type* argument. Table 0-1 describes the information shown for each *show-type*. In the table, the Allowed with Keyword column indicates whether the *show-type* can be used with the keyword wideband-channel, rf-channel or modular-channel.

If *device-index* is omitted from **show hw-module bay**, the command displays information for all wideband channels, RF channels, or BPI+ indexes depending on the keywords used.

The **association** *show-type* displays wideband-to-narrowband (traditional DOCSIS) channel association information only when the cable interface line card and Wideband SPA are physically present in the CMTS.

**Note**

- If you do not specify the **verbose** keyword, less detailed configuration information is displayed.
- Changes in Cisco IOS release 12.3(23)BC are not supported in Cisco IOS release 12.2(33)SCA.

**Table 207**      **Values for show-type**

| <i>show-type</i>   | Allowed with Keyword                                                    | Description                                                                                                                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>association</b> | <b>wideband-channel</b>                                                 | Displays wideband-to-narrowband (traditional DOCSIS) channel association information. The association of a wideband channel to a traditional DOCSIS downstream channel is made when a primary downstream channel for the fiber node is configured with the <b>downstream</b> command. |
| <b>config</b>      | <b>wideband-channel</b> or <b>rf-channel</b>                            | Displays wideband channel or RF channel configuration information depending on the keyword specified.                                                                                                                                                                                 |
| <b>counters</b>    | <b>wideband-channel</b> or <b>rf-channel</b>                            | Displays wideband channel or RF channel statistics depending on the keyword specified.                                                                                                                                                                                                |
| <b>mapping</b>     | <b>wideband-channel</b> , <b>rf-channel</b> , or <b>modular-channel</b> | Displays mapping of wideband channels to RF channels depending on the keyword specified.                                                                                                                                                                                              |

## Examples

The following examples display sample output for the **show hw-module bay** command for wideband channel 0 on the Wideband SPA located in slot 1, subslot 0, bay 0:

Router# **show hw-module bay 1/0/0 counters wideband-channel 0**

| SPA   | WB channel | Tx packets | Tx octets |
|-------|------------|------------|-----------|
| 1/0/0 | 0          | 29069      | 4032392   |

Router# **show hw-module bay 1/0/0 mapping wideband-channel 0**

| SPA   | WB channel | RF channel | BW % |
|-------|------------|------------|------|
| 1/0/0 | 0          | 0          | 100  |
|       |            | 1          | 100  |
|       |            | 2          | 100  |
|       |            | 3          | 100  |
|       |            | 4          | 100  |
|       |            | 5          | 100  |
|       |            | 6          | 100  |

Router# **show hw-module bay 1/0/0 association wideband-channel 0**

| WB channel            | BG ID | Bundle num | NB channel | NB chan ID | Reserved CIR | Total CIR |
|-----------------------|-------|------------|------------|------------|--------------|-----------|
| Wideband-Cable1/0/0:0 | 1     | 1          | Cable6/0/0 | 251        | 0            | 42064200  |

The following example shows sample output for the **show hw-module bay** command in Cisco IOS Release 12.3(21)BC:

Router# **show hw-module bay 1/0/0 association wideband-channel 0**

| WB channel            | BG ID | Bundle num | NB channel | NB chan ID | Reserved CIR | Avail CIR |
|-----------------------|-------|------------|------------|------------|--------------|-----------|
| Wideband-Cable1/0/0:0 | 1     | 1          | Cable6/0/0 | 251        | 0            | 0         |

The following example shows sample output for the **show hw-module bay** command in Cisco IOS Release 12.3(23)BC:

Router# **show hw-module bay 1/0/0 association wideband-channel 0**

| WB channel            | BG ID | Bundle num | NB channel | NB chan ID | Reserved CIR | Total CIR |
|-----------------------|-------|------------|------------|------------|--------------|-----------|
| Wideband-Cable1/0/0:0 | 1     | 140        | Cable6/0/0 | 30         | 0            | 42064200  |

Router# **show hw-module bay 3/0/0 mapping rf-channel**

| SPA   | RF channel | MC BW % | WB channel | WB BW % |
|-------|------------|---------|------------|---------|
| 3/0/0 | 0          | 2       | 0          | 90      |
|       |            |         | 1          | 2       |
| 3/0/0 | 1          | 2       | 0          | 90      |
|       |            |         | 1          | 2       |
| 3/0/0 | 3          | 0       | 3          | 50      |
| 3/0/0 | 4          | 0       | 3          | 100     |

In the preceding example, the following information is displayed for each wideband channel when the **association** keyword is specified.

- WB channel—Wideband-cable interface (wideband channel).
- BG ID—Bonding Group ID for the wideband channel.
- MC BW %—Percentage of rf-channel bandwidth assigned to the corresponding modular-cable interface.
- Bundle num—The number of the virtual bundle interface in which the wideband channel is a member.
- NB channel—The slot/subslot/port of the primary downstream channel (narrowband channel or traditional DOCSIS channel) for the wideband channel.
- NB channel ID—Channel ID for the primary downstream channel.
- Reserved CIR—The reserved committed information rate (CIR).
- Total CIR—The total CIR that is available.

**Note**

For Cisco IOS Release 12.3(21)BC, the descriptions for the Reserved CIR and Available CIR fields are as follows:

Reserved CIR—The reserved committed information rate (CIR). Because QoS is currently best effort for wideband traffic, reserved CIR is always 0.

Avail CIR—The part of the CIR that is available. Because QoS is currently best effort for wideband traffic, available CIR is always 0.

The following examples display **show hw-module bay** command output for wideband channels (0 to 11) on the Wideband SPA located in slot 1, subslot 0, bay 0:

Router# **show hw-module bay 1/0/0 counters wideband-channel**

| SPA   | WB channel | Tx packets | Tx octets |
|-------|------------|------------|-----------|
| 1/0/0 | 0          | 395        | 31590     |
| 1/0/0 | 1          | 0          | 0         |
| 1/0/0 | 2          | 0          | 0         |
| 1/0/0 | 3          | 0          | 0         |
| 1/0/0 | 4          | 0          | 0         |
| 1/0/0 | 5          | 0          | 0         |
| 1/0/0 | 6          | 0          | 0         |
| 1/0/0 | 7          | 0          | 0         |
| 1/0/0 | 8          | 0          | 0         |
| 1/0/0 | 9          | 0          | 0         |
| 1/0/0 | 10         | 0          | 0         |
| 1/0/0 | 11         | 0          | 0         |

Router# **show hw-module bay 1/0/0 config wideband-channel**

| WB channel             | BG ID | Bundle num | WB Host Slot/Subslot | Primary BG |
|------------------------|-------|------------|----------------------|------------|
| Wideband-Cable1/0/0:0  | 24    | 123        | 5/0                  | Yes        |
| Wideband-Cable1/0/0:1  | 25    | 123        | 5/0                  | Yes        |
| Wideband-Cable1/0/0:2  | 26    | 123        | 5/0                  | Yes        |
| Wideband-Cable1/0/0:3  | 27    | 123        | 5/0                  | Yes        |
| Wideband-Cable1/0/0:4  | 28    | 123        | 5/0                  | Yes        |
| Wideband-Cable1/0/0:5  | 29    | 123        | 5/0                  | Yes        |
| Wideband-Cable1/0/0:6  | 30    | 123        | 5/0                  | Yes        |
| Wideband-Cable1/0/0:7  | 31    | 123        | 5/0                  | Yes        |
| Wideband-Cable1/0/0:8  | 32    | 0          | 5/0                  | Yes        |
| Wideband-Cable1/0/0:9  | 33    | 0          | 5/0                  | Yes        |
| Wideband-Cable1/0/0:10 | 34    | 0          | 5/0                  | Yes        |

In the preceding example, the following information is displayed for each wideband channel when the **config** keyword is specified.

- **WB Channel**—Specifies the wideband channel slot, sub-slot, bay and wideband channel number.
- **BG ID**—Bonding Group ID.
- **Bundle num**—The number of the virtual bundle interface to which the wideband channel is a member.
- **WB Host Slot/Subslot**—The cable interface line card that has been configured for Wideband protocol operations. See the command **modular-host**.
- **Primary BG**—Yes indicates that the wideband channel is a primary bonding group (primary wideband channel).

The following examples display **show hw-module bay** command output for RF channel 0 on the Wideband SPA located in slot 1, subslot 0, bay 0:

```
Router# show hw-module bay 1/0/0 config rf-channel 0
```

| SPA   | RF<br>channel | Freq      | Mod   | Annex | IP Address     | MAC Address    | UDP<br>port |
|-------|---------------|-----------|-------|-------|----------------|----------------|-------------|
| 1/0/0 | 0             | 699000000 | 64qam | B     | 192.168.200.30 | 0011.920e.a9ff | 49152       |

In the preceding output, these fields provide information on the edge QAM device that is associated with the RF channel:

- **IP Address**—The IP address of the edge QAM device.
- **MAC address**—The MAC address of the next-hop device or edge QAM device.
- **UDP port**—The UDP port number for the edge QAM device that will be used for this RF channel.

```
Router# show hw-module bay 1/0/0 config rf-channel 0 verbose
```

```
SPA : Wideband-Cable 1/0/0
RF channel number : 0
Frequency : 699000000 Hz
Modulation : 64qam
Annex : B
IP address of next hop : 192.168.200.30
MAC address of EQAM : 000c.3033.2cbf
UDP port number : 49152
EQAM headroom : 0
```

The following example displays the **show hw-module bay counters rf-channel** command output for the RF channels of a Cisco Wideband SPA. Activity is seen on channels 1,2, and 3 as the MPEG Mbps field shows they are each transmitting at about 29 Mbps. Channel 1 is primary-capable as it is transmitting SYNC packets.

```
Router# show hw-module bay 3/3/0 counters rf-channel
```

| SPA   | RF<br>Chan | MPEG<br>Packets Tx | MPEG<br>bps | MPEG<br>Mbps | Sync<br>Packets Tx | MAP<br>Packets Tx |
|-------|------------|--------------------|-------------|--------------|--------------------|-------------------|
| 3/3/0 | 0          | 0                  | 0           | 0.000        | 0                  | 0                 |

Router# **show hw-module bay 1/0/0 mapping rf-channel 0**

| SPA   | RF<br>channel | WB<br>channel | BW % |
|-------|---------------|---------------|------|
| 1/0/0 | 0             | 0             | 100  |

The following example displays **show hw-module bay** command output for RF channels on the Wideband SPA located at slot 1, subslot 0, bay 0. In the example, the output is for only RF channels 0 to 8 because only those RF channels have been associated with a wideband channel. The BW % column is the percent of the RF channel bandwidth that is assigned to the wideband channel with the **cable rf-channel** command.

Router# **show hw-module bay 1/0/0 mapping rf-channel**

| SPA   | RF<br>channel | WB<br>channel | BW % |
|-------|---------------|---------------|------|
| 1/0/0 | 0             | 0             | 100  |
| 1/0/0 | 1             | 0             | 100  |
| 1/0/0 | 2             | 0             | 100  |

| <b>show hw-module bay oir</b> | Displays the operational status of a Wideband SPA. |

# show hw-module bay oir

To display the operational status of a SPA, use the **show hw-module bay oir** command in privileged EXEC mode.

## Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

```
show hw-module bay {slot/subslot/bay | all} oir [internal]
```

## Cisco IOS Release 12.2(33)SCB

```
show hw-module bay {slot/bay/port | all} oir [internal]
```

| Syntax Description |  |                                                                                                                                                  |
|--------------------|--|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>        |  | The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for a SIP.                                                 |
| <i>subslot</i>     |  | The subslot where the Wideband SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.                                         |
| <i>bay</i>         |  | The bay in the SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).                                                     |
| <i>port</i>        |  | Specifies the interface number on the SPA.                                                                                                       |
| <b>all</b>         |  | Displays OIR status for all Wideband SPAs in the system.                                                                                         |
| <b>internal</b>    |  | (Optional) Displays detailed diagnostic information. This option is intended for internal diagnostic use with Cisco technical support personnel. |

**Command Default** If you do not specify the **internal** keyword, detailed diagnostic information is not displayed.

**Command Modes** Privileged EXEC (#)

| Command History | Release     | Modification                                                                                                               |
|-----------------|-------------|----------------------------------------------------------------------------------------------------------------------------|
|                 | 12.3(21)BC  | This command was introduced for the Cisco uBR10012 router.                                                                 |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                            |
|                 | 12.2(33)SCB | This command was modified to change the addressing format for a SPA from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> . |

**Usage Guidelines** Use the **show hw-module bay oir** command to obtain operational status information about a Wideband SPA. To display information for a specific SPA, specify *slot/subslot/bay* for the SPA. To display information for all SPAs in the router, use the **all** keyword.

The optional **internal** keyword displays detailed diagnostic information that is recommended only for use with Cisco technical support personnel.

[Table 208](#) describes the possible values for the Operational Status field in the output.

**Table 208**      **Operational Status Field Descriptions**

| Operational Status               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| missing                          | SPA is not present in the SIP bay.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ok                               | SPA is operational.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| out of service ( <i>reason</i> ) | <p>The SPA is out of service for one of the following reasons:</p> <p><b>Note</b>    The following reasons are not applicable to every SPA and can be platform-specific.</p> <ul style="list-style-type: none"> <li>Analyze failed—Failed to create a SPA data structure, most likely due to a memory allocation problem.</li> <li>Authentication failed—SPA has failed hardware validation.</li> <li>Data structure create error—Failed to create a SPA data structure, most likely due to a memory allocation problem.</li> <li>Event corrupt—A SPA online insertion and removal (OIR) event has been corrupted. This could be caused by a corrupted message between the SIP and the Route Processor (RP) or some other software or hardware problem.</li> <li>Event sequence error—A SPA OIR event was received out of sequence. This could be caused by a corrupted message between the SIP and the Route Processor (RP) or some other software or hardware problem.</li> <li>Fail code not set—Failure code could not be read from a SPA OIR event message. This could be caused by a corrupted message between the SIP and the RP or some other software or hardware problem.</li> <li>Failed too many times—SPA is disabled because it has failed more than the allowable limit on the platform.</li> <li>FPD upgrade failed—A field-programmable device (FPD), such as the Field-Programmable Gate Array (FPGA), failed to automatically upgrade.</li> <li>H/W signal deasserted—The SPA_OK or PWR_OK hardware signal indicating that the SPA is accessible is no longer asserted.</li> <li>Heartbeat failed—Occurs when intelligent SPAs encounter heartbeat failures.</li> <li>Incompatible FPD—An FPGA version mismatch with the Cisco IOS software has been detected for the SPA.</li> </ul> |

**Table 208**      **Operational Status Field Descriptions (continued)**

| Operational Status | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## show hw-module bay transceiver

### Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCA | This command was introduced. |

### Examples

The following example is a sample output of the **show hw-module bay transceiver** command for wideband channel 0 on the Wideband SPA located in slot 1, subslot 0, bay 0:

```
Router# show hw-module bay 1/0/0 transceiver 0 idprom
```

```
IDPROM for transceiver SPA_TYPE_ETHER_1x10GE_V2:
 Description = XFP optics (type 6)
 Transceiver Type: = DWDM XFP 1530.33 (138)
 Product Identifier (PID) = DWDM-XFP-30.33
 Vendor Revision = 04
 Serial Number (SN) = FLJ1212G578
 Vendor Name = CISCO
 Vendor OUI (IEEE company ID) = 00.00.0E (14)
 CLEI code = IP9IAAZCAA
 Cisco part number = 10-2370-01
 Device State = Enabled.
 Date code (yy/mm/dd) = 08/03/25
 Connector type = LC.
 Encoding = 64B/66B
 SONET Scrambled
 NRZ
 Minimum bit rate = 9900 Mbits/s
 Maximum bit rate = 11100 Mbits/s
```

# show interface bundle

To display information about a specific virtual cable bundle, use the **show interface bundle** command in privileged EXEC mode.

```
show interface bundle number [accounting | controller | counters {protocol {status}}] | crb |
description | fair-queue | intercept | irb | mac-accounting | monitor interval | mpls-exp |
precedence | random-detect | stats | summary]
```

| Syntax Description             |  |                                                                                                                               |
|--------------------------------|--|-------------------------------------------------------------------------------------------------------------------------------|
| <i>number</i>                  |  | Specific virtual bundle. The valid values range from 1 to 255.                                                                |
| <b>accounting</b>              |  | Displays accounting information for the specified virtual interface bundle.                                                   |
| <b>controller</b>              |  | Displays information about interface status, configuration, and controller status for the specified virtual interface bundle. |
| <b>protocol</b>                |  | Displays information about interface protocol counters for the specified virtual interface bundle.                            |
| <b>status</b>                  |  | Displays information about the current status of enabled protocols.                                                           |
| <b>crb</b>                     |  | Displays the interface routing and bridging information.                                                                      |
| <b>description</b>             |  | Displays the specified virtual interface bundle description.                                                                  |
| <b>fair-queue</b>              |  | Displays the interface bundle Weighted Fair Queueing (WFQ) information.                                                       |
| <b>intercept</b>               |  | Displays the intercept streams information on the specified virtual interface bundle.                                         |
| <b>irb</b>                     |  | Displays the interface bundle routing and bridging information.                                                               |
| <b>mac-accounting</b>          |  | Displays the interface bundle MAC accounting information.                                                                     |
| <b>monitor</b> <i>interval</i> |  | Monitors the specified interface bundle continuously at the specified interval.                                               |
| <b>mpls-exp</b>                |  | Displays the MPLS experimental accounting information on the specified interface bundle.                                      |
| <b>precedence</b>              |  | Displays the interface precedence accounting information.                                                                     |
| <b>random-detect</b>           |  | Displays the interface Weighted Random Early Detection (WRED) information.                                                    |
| <b>stats</b>                   |  | Displays interface packets and octets, in and out, by the switching path.                                                     |
| <b>summary</b>                 |  | Displays the summary of activity on the specified interface bundle.                                                           |

**Command Default** No default behavior or values for this command.

**Command Modes** Privileged EXEC (#)

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCA | This command was introduced. |

## show interface bundle

| Release     | Modification                                                                                                                                              |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCB | Support for the <b>multicast-sessions</b> keyword was removed. Running the command with the <b>multicast-sessions</b> keyword does not display an output. |
| 12.2(33)SCE | The <b>multicast-sessions</b> keyword was removed.                                                                                                        |

### Usage Guidelines

Starting with Cisco IOS Release 12.2(33)SCB, the **multicast-sessions** keyword does not display any output, although it is available as part of the **show interface bundle** command.

### Examples

The following is an example of the **show interface bundle** command for bundle 1:

```
Router# show interface bundle 1
```

```
Load for five secs: 2%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:03:45.483 EDT Wed Oct 12 2011

Bundle1 is up, line protocol is up
 Hardware is Cable Virtual-bundle interface, address is 0013.5f03.a4e3 (bia 000
0.0000.0000)
 Internet address is 5.65.0.1/16
 MTU 1500 bytes, BW 26000 Kbit, DLY 1000 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation MCNS, loopback not set
 Keepalive set (10 sec)
 ARP type: ARPA, ARP Timeout 04:00:00
 Last input 00:00:25, output never, output hang never
 Last clearing of "show interface" counters never
 Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
 Interface Bundle1 queueing strategy: fifo
 5 minute input rate 0 bits/sec, 0 packets/sec
 5 minute output rate 0 bits/sec, 0 packets/sec
 1676 packets input, 283993 bytes, 0 no buffer
 Received 601 broadcasts (0 IP multicasts)
 0 runts, 0 giants, 0 throttles
 51 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
 4163 packets output, 379783 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 output buffer failures, 0 output buffers swapped out
```

The following is an example of the **show interface bundle accounting** command for bundle 1:

```
Router# show interface bundle 1 accounting
```

```
Load for five secs: 1%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:04:41.271 EDT Wed Oct 12 2011

Bundle1
 Protocol Pkts In Chars In Pkts Out Chars Out
 Other 1678 0 0 0
 IP 1406 270933 4209 384390
 ARP 294 17640 0 0
```

The following is an example of the **show interface bundle controller** command for bundle 1:

```
Router# show interface bundle 1 controller
```

```
Load for five secs: 1%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:04:58.539 EDT Wed Oct 12 2011
```

```

Bundle1 is up, line protocol is up
 Hardware is Cable Virtual-bundle interface, address is 0013.5f03.a4e3 (bia 000
0.0000.0000)
 Internet address is 5.65.0.1/16
 MTU 1500 bytes, BW 26000 Kbit, DLY 1000 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation MCNS, loopback not set
 Keepalive set (10 sec)
 ARP type: ARPA, ARP Timeout 04:00:00
 Last input 00:00:17, output never, output hang never
 Last clearing of "show interface" counters never
 Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
 Interface Bundle1 queueing strategy: fifo
 5 minute input rate 0 bits/sec, 0 packets/sec
 5 minute output rate 1000 bits/sec, 1 packets/sec
 1707 packets input, 289077 bytes, 0 no buffer
 Received 613 broadcasts (0 IP multicasts)
 0 runs, 0 giants, 0 throttles
 51 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
 4224 packets output, 386306 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 output buffer failures, 0 output buffers swapped out

```

The following is an example of the **show interface bundle counter protocol** command for bundle 1:

```

Router# show interface bundle 1 counters protocol status

Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:05:30.695 EDT Wed Oct 12 2011

Protocols allocated:
 Bundle1: Other, IP, ARP

```

The following is an example of the **show interface bundle crb** command for bundle 1:

```

Router# show interface bundle 1 crb

Load for five secs: 2%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:05:57.267 EDT Wed Oct 12 2011
Bundle1

Routed protocols on Bundle1:
 ip

```

The following is an example of the **show interface bundle description** command for bundle 1:

```

Router# show interface bundle 1 description

Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:06:22.243 EDT Wed Oct 12 2011

Interface Status Protocol Description
Bul up up

```

The following is an example of the **show interface bundle intercept** command for bundle 1:

```

Router# show interface bundle 1 intercept

Load for five secs: 2%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:06:56.763 EDT Wed Oct 12 2011
No interception active

```

## show interface bundle

The following is an example of the **show interface bundle multicast-sessions** command for bundle 1:

### Note

The **multicast-sessions** keyword is not available for Cisco IOS Release 12.2(33)SCE and later releases.

```
Router# show interface bundle 1 multicast-sessions
```

Multicast Sessions on Bundle1

| Group      | Interface | GC | SAID | SFID | GQC | GEn | RefCount | GC-Interface | State  |
|------------|-----------|----|------|------|-----|-----|----------|--------------|--------|

## Related Commands

| Command                           | Description                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show interface cable</b>       | Displays configuration and status information for the cable interface.                                                                      |
| <b>show interface cable modem</b> | Displays information about cable modems and associated customer premises equipment (CPE) devices connected to a particular cable interface. |

# show interface cable

To display the current configuration and status of a cable interface, use the **show interface cable** command in privileged EXEC mode.

```
show interface cable { slot/port \ slot/subslot/port } [options]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable { slot/cable-interface-index \ slot/subslot/cable-interface-index } [options]
```

| Syntax Description    |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| cable-interface-index | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards.<br><br>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.<br><br>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. |

---

*options*

Cable-specific options are documented in their own command reference pages:

- **show interface cable downstream**
- **show interface cable intercept**
- **show interface cable mac-scheduler**
- **show interface cable monitor**
- **show interface cable qos paramset**
- **show interface cable service-flow**
- **show interface cable sid**
- **show interface cable signal-quality**
- **show interface cable upstream**

A number of non-cable-specific options are also supported (but not all are meaningful for cable interfaces):

**accounting**—Displays the number of packets of each protocol type that was sent through the interface.

**crb**—Displays routing and bridging information.

**description**—Displays the description entered for the interface.

**fair-queue**—Displays distributed weighted fair queuing (DWFQ) statistics.

**irb**—Displays integrated routing bridge information.

**mac-accounting**—Displays Ethernet MAC accounting information.

**random-detect**—Displays weighted random early detection (WRED) information.

**rate-limit**—Displays rate-limit information.

**shape**—Displays Traffic Shape information.

**stats**—Displays numbers of packets that were switched.

---

**Note**

For information on the non-cable specific options, see the Cisco IOS Release 12.2 documentation on [Cisco.com](http://Cisco.com) and the Customer Documentation CD-ROM.

**Command History**

| Release     | Modification                                                                                                                                                                                                    |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.3 XA     | This command was introduced.                                                                                                                                                                                    |
| 12.0(3)T    | This command was ported to the mainline release.                                                                                                                                                                |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

---

**Examples**

The following is sample output for the **show interface cable** command:

```
CMTS01# show interface cable 6/0/0

Cable6/0 is up, line protocol is up
 Hardware is BCM3210 ASIC, address is 000a.13e8.1ca8 (bia 000a.13e8.1a60)
 Internet address is 1.1.1.3/24
 MTU 1500 bytes, BW 27000 Kbit, DLY 1000 usec, rely 255/255, load 1/255
 Encapsulation, loopback not set, keepalive not set
 ARP type: ARPA, ARP Timeout 04:00:00
 Last input 4d07h, output 00:00:00, output hang never
 Last clearing of "show interface" counters never
 Queueing strategy: fifo
 Output queue 0/40, 0 drops; input queue 0/75, 0 drops
 5 minute input rate 1834000 bits/sec, 2385 packets/sec
 5 minute output rate 1982000 bits/sec, 2431 packets/sec
 24461542 packets input, 2348214388 bytes, 0 no buffer
 Received 1979 broadcasts, 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
 24854257 packets output, 2536222931 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 output buffer failures, 0 output buffers swapped out
```

Table 0-209 describes the fields shown in the **show interface cable** display.

**Table 0-209**      *show interface cable Field Descriptions*

| Field                                                           | Description                                                                                                                                                |
|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cable slot/cable-interface-index is up/...administratively down | Indicates whether the interface hardware is currently active or taken down by the administrator.                                                           |
| line protocol is up/...administratively down                    | Indicates whether the software processes that handle the line protocol believe the interface is usable or if it has been taken down by the administrator.  |
| hardware                                                        | Hardware type and address.                                                                                                                                 |
| Internet address                                                | Internet address followed by subnet mask.                                                                                                                  |
| MTU                                                             | Maximum transmission unit (MTU) of the interface.                                                                                                          |
| BW                                                              | Bandwidth of the interface in kilobits per second.                                                                                                         |
| DLY                                                             | Delay of the interface in microseconds.                                                                                                                    |
| rely                                                            | Reliability of the interface as a fraction of 255, calculated as an exponential average over 5 minutes. (For example, 255/255 is 100 percent reliability.) |
| load                                                            | Load on the interface as a fraction of 255, calculated as an exponential average over 5 minutes. (For example, 255/255 is complete saturation.)            |
| Encapsulation                                                   | Encapsulation method assigned to this interface.                                                                                                           |
| ARP type                                                        | Type of Address Resolution Protocol (ARP) and timeout value assigned.                                                                                      |
| Last input                                                      | Number of hours, minutes, and seconds since the last packet was successfully received by an interface.                                                     |
| output                                                          | Number of hours, minutes, and seconds since the last packet was successfully sent by an interface.                                                         |

**Table 0-209**     *show interface cable Field Descriptions (continued)*

| Field                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last clearing of “show interface” counters        | Time at which the counters that measure cumulative statistics (such as number of bytes sent and received) were last reset to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Queueing strategy                                 | Displays the type of queueing configured for this interface. In the following example output, the type of queueing configured is first-in first-out (FIFO).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Output queue                                      | Number of packets in the output queue. The format of this number is A/B, where A indicates the number of packets in the queue, and B indicates the maximum number of packets allowed in the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| drops                                             | Indicates the number of packets dropped because of a full queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| input queue/drops                                 | Number of packets in the input queue. The format of this number is A/B, where A indicates the number of packets in the queue, and B indicates the maximum number of packets allowed in the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| drops                                             | Indicates the number of packets dropped because of a full queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Five minute input rate<br>Five minute output rate | Average number of bits and packets sent per second in the last five minutes. The five-minute interval is the default time period for statistics collection and can be changed for each individual cable interface using the <b>load-interval</b> command in interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Note</b>                                       | These statistics are calculated using a decayed averaging method, where only the average is stored over the interval period, not the individual samples. Every time a sample average is taken, a percentage of the sample and a percentage of the average are added together to create the new average. If traffic stops for a time period, these statistics do not immediately go to zero but drop with a decay rate of about 70 percent per time period.<br><br>For example, if the interface is passing 1,000 packets per second (pps) before traffic stops, the <b>show interface cable</b> command shows the rate being 300 pps at the end of the first time interval. The rate then drops to 90 pps at the end of the second time interval, and so forth. |
| packets input                                     | Total number of error-free packets received by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| bytes input                                       | Total number of bytes, including data and MAC encapsulation, in the error-free packets received by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Note</b>                                       | When using bundled cable interfaces on Cisco uBR7200 series routers, the input packet counters for the master interface also include the packet counts for slave interfaces, except when using a Broadband Processing Engine (BPE) cable interface (such as the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X). On BPE cards and on the Cisco uBR10012 router, the input counters for master and slave cable interfaces are not combined.                                                                                                                                                                                                                                                                                                                             |
| no buffer                                         | Number of received packets discarded because there was no buffer space in the main system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Received broadcast                                | Total number of broadcast or multicast packets received by the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| runts                                             | Number of packets that are discarded because they are smaller than the medium’s minimum packet size.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 0-209**     *show interface cable Field Descriptions (continued)*

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| giants                    | <p>Number of packets that are discarded because they are bigger than the standard Ethernet Maximum Transmission Unit (MTU) size. For Ethernet packets, RFC 1757 defines giants as “the total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.”</p> <p><b>Note</b>    In addition, to account for the different Ethernet and other packet encapsulations on the network, packets are considered giants when they exceed the configured MTU size plus 114 bytes.</p> |
| input errors              | Total number of errors received on the interface. This count includes runts and giants, which are shown above, as well as other errors, such as no buffers, and CRC, frame, overrun, and ignored counts. This count can also include DOCSIS protocol errors such as an invalid SID in the DOCSIS frame, a bad extended header length, corrupted concatenated packets, and invalid bandwidth requests.                                                                                                                                                             |
| CRC                       | Indicates the number of times the cyclic redundancy checksum (CRC) generated by the originating LAN station or far-end device does not match the checksum calculated from the data received.                                                                                                                                                                                                                                                                                                                                                                      |
| frame                     | Number of packets received incorrectly having a CRC error and a non-integer number of octets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| overrun                   | Number of times the receiver hardware was unable to forward received data to a hardware buffer because the input rate exceeded the receiver’s ability to handle the data.                                                                                                                                                                                                                                                                                                                                                                                         |
| ignored                   | Number of received packets ignored by the interface because the interface hardware ran low on internal buffers.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| packets output            | Total number of messages sent by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| bytes                     | Total number of bytes, including data and MAC encapsulation, sent by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| underruns                 | Number of times the sender has been running faster than the receiving device can handle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| output errors             | Sum of all errors that prevented the final transmission of packets out of the interface being examined.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| collisions                | Not applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| interface resets          | Number of times an interface has been completely reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| output buffer failures    | Number of times the output buffer has failed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| output buffer swapped out | Number of times the output buffer has been swapped out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Tip**

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**show interface cable**

| Related Commands | Command                                    | Description                                                                 |
|------------------|--------------------------------------------|-----------------------------------------------------------------------------|
|                  | <b>show interface cable downstream</b>     | Displays information about the downstream on the cable interface.           |
|                  | <b>show interface cable sid</b>            | Displays information by service identifier (SID) of each CM on the network. |
|                  | <b>show interface cable signal-quality</b> | Displays information about the cable signal quality.                        |
|                  | <b>show interface cable upstream</b>       | Displays information about one or all upstreams on the cable interface.     |

# show interface cable admission-control reservation

To display service flows, categorizations, and bandwidth consumption on the Cisco CMTS, for the specified interface, and the specified service flow direction, use the **show interface cable admission-control reservation** command in privileged EXEC mode.

```
show interface cable { slot/port | slot/subslot/port } admission-control reservation { downstream
| upstream } port-no
```

## Cisco IOS Release 12.2(33)SCE and later

```
show interface cable { slot/cable-interface-index | slot/subslot/cable-interface-index }
admission-control reservation { downstream | upstream } port-no
```

| Syntax Description           |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                  | Slot where the line card resides. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                       |
| <i>subslot</i>               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                 |
| <i>port</i>                  | Downstream port number. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                                   |
| <i>cable-interface-index</i> | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> |
| <b>downstream</b>            | Displays downstream service flow information for the designated cable interface.                                                                                                                                                                                                                                                                                                                                                             |
| <b>upstream</b>              | Displays upstream service flow information for the designated cable interface. The port number may be specified here for more limited display.                                                                                                                                                                                                                                                                                               |
| <i>port-no</i>               | Optional value allows you to specify the upstream port number for more limited information.                                                                                                                                                                                                                                                                                                                                                  |

## Defaults

No default behavior or values for this command. However, Cisco IOS Release 12.3(21)BC supports default operation and non-default configuration for feature on the Cisco CMTS.

## Command Modes

Privileged EXEC

## show interface cable admission-control reservation

### Command History

| Release     | Modification                                                                                                                                                                                                    |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(21)BC  | This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router.                                                                                                                      |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

### Usage Guidelines

For additional information about using this command, refer to the following documents on Cisco.com:

- *Admission Control for the Cisco CMTS*
- *Service Flow Admission Control for the Cisco CMTS*

### Examples

The following example illustrates sample output and status of the Service Flow Admission Control feature, and the **show interface cable admission-control reservation { downstream | upstream } port-no** command.

```
Router# show interface cable 5/1/1 admission-control reservation downstream.
SfId Mac Address Bucket Bucket Name State Current Reserv
4 0000.cad6.f052 8 act 0
88 0000.cad6.f052 8 act 2000
6 0000.cad6.eece 8 act 0

```

The following example illustrates further information for the Service Flow Admission Control feature with abbreviated command syntax. This example displays threshold levels and current reservation per bucket, and the oversubscribed bandwidth per bucket. Cisco IOS indicates implicitly calculated threshold with asterisk.

```
Router# sh cable admission-control interface ca 5/1/1 upstream 0
Interface Cable5/1/1
Upstream Bit Rate (bits per second) = 4096000
Resource - Upstream Bandwidth

Bucket Names Minor # of Major # of Excls # of Non-Ex Curr. Curr. Conf # of

|------------------|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>cable admission-control ds-bandwidth</b>               | Sets minor, major and exclusive thresholds for downstream voice or data bandwidth for each or all interfaces on the Cisco CMTS                                                                                 |
|                  | <b>cable admission-control preempt priority-voice</b>     | Changes the default PacketCable Emergency 911 call preemption functions on the Cisco CMTS, supporting throughput and bandwidth requirements for Emergency 911 calls above all other buckets on the Cisco CMTS. |
|                  | <b>cable admission-control us-bandwidth</b>               | Configures global or interface-level upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS.                                                                                 |
|                  | <b>cable application-type include</b>                     | Associates an application type with a specific and prioritized bucket on the Cisco CMTS.                                                                                                                       |
|                  | <b>cable application-type name</b>                        | Assigns an alpha-numeric name for the specified bucket.                                                                                                                                                        |
|                  | <b>debug cable admission-control flow-categorization</b>  | Displays service flow categorization results, enabled when a service flow is classified.                                                                                                                       |
|                  | <b>show application-buckets</b>                           | Displays rules for any or all buckets supporting Service Flow Admission Control on the Cisco CMTS.                                                                                                             |
|                  | <b>show interface cable admission-control reservation</b> | Displays service flows, categorizations, and bandwidth consumption on the Cisco CMTS, for the specified interface, and the specified service flow direction.                                                   |

# show interface cable cable-monitor

To display cable monitor flow information, use the **show interface cable cable-monitor** command in privileged EXEC mode.

```
show interface cable { slot/port | slot/subslot/port } cable-monitor
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable { slot/cable-interface-index | slot/subslot/cable-interface-index }
cable-monitor [cam | verbose]
```

| Syntax Description |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>slot</i>                  | Slot where the line card resides. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                       |
|                    | <i>subslot</i>               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                 |
|                    | <i>port</i>                  | Downstream port number. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                                   |
|                    | <i>cable-interface-index</i> | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> |
|                    | <b>cam</b>                   | (Optional) Displays detailed content addressable memory (CAM) information.                                                                                                                                                                                                                                                                                                                                                                   |
|                    | <b>verbose</b>               | (Optional) Displays detailed monitor flow information.                                                                                                                                                                                                                                                                                                                                                                                       |

|                 | 12.2(33)SCA | This command is introduced.                                                                                                                                                                                     |
|                 | 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

**Examples**

The following is a sample output from the **show interface cable cable-monitor** command:

```
Router# show interface cable 5/0 cable-monitor
```

| US/ DS | Time Stmp | Outbound Interface | Flow Type | Flow Type Identifier | Flow Extn. | Packet Type | MAC Extn. | MAC Type | Encap Type |
|--------|-----------|--------------------|-----------|----------------------|------------|-------------|-----------|----------|------------|
| us     | no        | Et1/2              | us-port   | 0                    | yes        | data        | no        | -        | docsis     |
| all    | no        | Et1/2              | acc-list  | 103                  | yes        | data        | no        | -        | docsis     |
| all    | yes       | Et1/2              | mac-addr  | 0050.0000.0000       | yes        | mac         | no        | -        | -          |

| Field                | Description                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| DS                   | Downstream. Indicates that only downstream flows are monitored.                                                                                         |
| UP                   | Upstream. Indicates that only upstream flows are monitored.                                                                                             |
| ALL                  | Indicates that all flows are monitored.                                                                                                                 |
| Time Stmp            | “Yes” indicates that forwarded packets have been time-stamped, with appended 4 bytes. “No” indicates that forwarded packets have not been time-stamped. |
| Outbound Interface   | Identifies the interfaces where the packets have been forwarded to (Ethernet or Fast Ethernet).                                                         |
| Flow Type            | Identifies the selected flow type, MAC-address, access-list number, or upstream port number.                                                            |
| Flow Type Identifier | MAC address, access-list number, or service ID.                                                                                                         |
| Flow Extn.           | “Yes” indicates that extended filters are configured, and “no” indicates that no extended filters have been configured.                                 |
| MAC Type             | Not applicable.                                                                                                                                         |
| Encap                | DOCSIS encapsulation.                                                                                                                                   |
| Type                 | Forwarded packets with Ethernet encapsulation.                                                                                                          |

**Tip**

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

| Command              | Description                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------|
| <b>cable monitor</b> | Enables the forwarding of selected packets on the cable interface to an external LAN analyzer. |

# show interface cable downstream

To display information about the downstreams on a cable interface, use the **show interface cable downstream** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} downstream
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} downstream
```

Syntax Description

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| slot                  | Slot where the line card resides. <ul style="list-style-type: none"><li>Cisco uBR7225VXR router—The valid value is 1 or 2.</li><li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li><li>Cisco uBR10012 router—The valid range is from 5 to 8.</li></ul>                                                                                                                                                                           |
| subslot               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                 |

Command History

| Release   | Modification                                                                                     |
|-----------|--------------------------------------------------------------------------------------------------|
| 11.3 XA   | This command was introduced.                                                                     |
| 12.0(3)T  | Command ported to the mainline release.                                                          |
| 12.1(4)CX | Output was expanded for <b>show interface cable downstream</b> command for DOCSIS 1.1 operation. |

| Release     | Modification                                                                                                                                                                                                    |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(4)BC1  | Support was added to the Release 12.2 BC train.                                                                                                                                                                 |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

## Examples

The following example is sample output from the **show interface cable downstream** command for Cisco IOS releases that support only DOCSIS 1.0 or 1.0+ operation:

```
CMTS01# show interface cable 6/0 downstream
```

```
Cable6/0: Downstream is up
 111947771 packets output, 1579682655 bytes, 0 discarded
 0 output errors
```

The following is sample output from the **show interface cable downstream** command for Cisco IOS releases that support only DOCSIS 1.1 operation:

```
Router# show interface cable 4/0 downstream
```

```
Cable4/0:Downstream is up
 54335436 packets output, 2854290447 bytes, 0 discarded
 0 output errors
 1 total active devices, 1 active modems
 Total downstream bandwidth: 27000000 bps
 Total downstream reserved bandwidth: 1000000 bps
 Worst case latency for low latency queue: 0 usecs
 Current Upper limit for worst case latency: 0 usecs
```

```
Router#
```

[Table 0-211](#) describes the fields shown in the **show interface cable downstream** display.

**Table 0-211** *show interface cable downstream Field Descriptions*

| Field                                     | Description                                                                                                                                                                                                               |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cable                                     | Indicates the location of the downstream interface.                                                                                                                                                                       |
| Downstream is up/...administratively down | Indicates the administrative state of the interface.                                                                                                                                                                      |
| packets output                            | Total number of data packets that have been transmitted on this downstream cable interface.                                                                                                                               |
| bytes                                     | The number of bytes for data packets that have been transmitted on this downstream cable interface.                                                                                                                       |
| discarded                                 | Total number of packets that were not transmitted on the downstream, because of an error, such as a buffer overrun, the Cisco CMTS running out of memory, or the frame being larger than the cable interface's MTU value. |
| output errors                             | Total number of packets that could not be transmitted on this downstream cable interface because of all errors.                                                                                                           |
| total active devices                      | Total number of active cable modems and customer premises equipment (CPE) devices that are connected to this downstream cable interface.                                                                                  |

**Table 0-211**      *show interface cable downstream Field Descriptions (continued)*

| Field                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| active modems                              | Total number of active cable modems that are connected to this downstream cable interface.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Total downstream bandwidth                 | Total bandwidth associated with this downstream cable interface, in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Total downstream reserved bandwidth        | Total bandwidth on this downstream cable interface that has been reserved by specifying a value for the Min Reserved Traffic Rate field for the downstream service flow in the cable modems' DOCSIS configuration files.                                                                                                                                                                                                                                                                                            |
| Worst case latency for low latency queue   | Worst case latency value, in microseconds, that is allowed on this downstream cable interface, as determined by the Max DS Latency field for the downstream service flow in the cable modems' DOCSIS configuration files.                                                                                                                                                                                                                                                                                           |
| Current Upper limit for worst case latency | <p>Lowest worst case latency value, in microseconds, that is allowed on this downstream cable interface. The Cisco CMTS uses the lowest specified Max DS Latency value that has been specified for a downstream service flow in any of the DOCSIS configuration files being used by cable modems on this downstream.</p> <p>If a cable modem tries to register a downstream service flow that uses a worst case latency that is greater than this value, the Cisco CMTS will refuse to admit that service flow.</p> |

**Tip**

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

| Command                                    | Description                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------------|
| <b>show interface cable</b>                | Displays configuration and status information for the cable interface.      |
| <b>show interface cable sid</b>            | Displays information by service identifier (SID) of each CM on the network. |
| <b>show interface cable signal-quality</b> | Displays information about the cable signal quality.                        |
| <b>show interface cable upstream</b>       | Displays information about one or all upstreams on the cable interface.     |

# show interface cable dsg downstream

To display interface configuration and status information for Advanced-mode DOCSIS Set-top Gateway (A-DSG) downstreams on a Cisco CMTS router, use the **show interface cable dsg downstream** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} dsg downstream [dcd | rule rule-id [cfr | clients | verbose] | tunnel tunnel-id]
```

**Cisco IOS Release 12.2(33)SCE and later**

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} dsg downstream [dcd | rule rule-id [cfr | clients | verbose] | tunnel tunnel-id]
```

| Syntax                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable</b>                   | Specifies details of a cable interface line card: <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the line card resides.</li> <li><i>subslot</i>—(Cisco uBR10012 only) Secondary slot number of the line card.</li> <li><i>port</i>—Downstream port number of the line card.</li> <li><i>cable-interface-index</i>—Downstream port or MAC domain index of the line card.</li> </ul> <p><a href="#">Table 212</a> in the Usage Guidelines section lists valid values for these arguments.</p> |
| <b>dcd</b>                     | (Optional) Displays downstream channel descriptor (DCD) messages for the A-DSG interface.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>rule</b> <i>rule-id</i>     | (Optional) Displays interface-level information for A-DSG rules on the Cisco CMTS router, such as rule state, tunnels, classifiers, client information, upstream channel identifier, and the number of vendors associated to a rule on a given downstream.                                                                                                                                                                                                                                                 |
| <b>cfr</b>                     | (Optional) Displays the list of classifiers associated to the A-DSG rule, such as classifiers associated with the rule-id under the interface.                                                                                                                                                                                                                                                                                                                                                             |
| <b>clients</b>                 | (Optional) Displays clients associated with the rule-id under the interface.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>verbose</b>                 | (Optional) Displays A-DSG downstream rule detail information.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>tunnel</b> <i>tunnel-id</i> | (Optional) Displays interface-level A-DSG downstream tunnel information. The valid range is from 1 to 65535.                                                                                                                                                                                                                                                                                                                                                                                               |

**Command Default** Displays configuration information for all DSG downstream channels on a cable interface.

**Command Modes** Privileged EXEC (#)

**Command History**

| Release      | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(13a)BC  | This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.                                                                                                                                                                                                                                                                                                                                              |
| 12.3(17a)BC  | This command was modified to support A-DSG 1.2 with the following changes: <ul style="list-style-type: none"> <li>• The <b>rule</b> keyword option is obsolete.</li> <li>• The tunnel group ID field (“TG id”) was added to the <b>show interfaces cable dsg downstream tunnel</b> form of the command.</li> <li>• The output display column headings of the <b>show interfaces cable dsg downstream tunnel</b> form of the command were changed.</li> </ul> |
| 12.2SCA      | This command was integrated into Cisco IOS Release 12.2SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                                                                                                                                                                                                                                                               |
| 12.2(33)SCB4 | This command was modified. The <b>show interface cable dsg downstream dcd</b> command output is changed to display interface level DCD statistics for all interfaces in the mac-domain such as cable interfaces, modular cable interfaces, and IC interfaces. The field IF name is added to the output to indicate the interface.                                                                                                                            |
| 12.2(33)SCE  | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.                                                                                                                                                                                                                                              |
| 12.2(33)SCG  | This command was modified. Support for the following keywords was removed: <ul style="list-style-type: none"> <li>• <b>rule rule-id</b></li> <li>• <b>cfr</b></li> <li>• <b>clients</b></li> <li>• <b>verbose</b></li> </ul>                                                                                                                                                                                                                                 |

**Usage Guidelines**

To use the **show interface cable dsg downstream** command, the tunnel group must be configured globally and also at the cable interface.

**Table 212**      **Interface Density Information**

| CMTS Router      | Line Card          | Slot   | Subslot | Port   | Cable Interface Index |
|------------------|--------------------|--------|---------|--------|-----------------------|
| Cisco uBR10012   | Cisco uBR-MC3GX60V | 5 to 8 | 0 or 1  | 0 to 4 | 0 to 14               |
|                  | Cisco UBR-MC20X20V |        |         |        | 0 to 4                |
|                  | Cisco uBR10-MC5X20 |        |         |        |                       |
| Cisco uBR7225VXR | All                | 1 or 2 | —       | 0 or 1 | —                     |
| Cisco uBR7246VXR | All                | 3 to 6 | —       | 0 or 1 | —                     |

## Examples

### Example: Displaying Information for all A-DSG Downstreams on a Cable Interface

The following example illustrates A-DSG downstream configuration information and the number of DSG tunnels, classifiers, clients and vender specific parameters.

```
Router# show interface cable 6/0 dsg downstream
```

| chan | chFreq | chan | timer | init    | oper    | twoWay | oneWay | num  | num    | num | num    | num |
|------|--------|------|-------|---------|---------|--------|--------|------|--------|-----|--------|-----|
| list | index  | freq | index | timeout | timeout | timer  | timer  | rule | tunnel | cfr | client | vsp |
| 1    | 2      | 666  | 1     | 1       | 2       | 3      | 4      | 9    | 6      | 4   | 6      | 2   |
|      | 3      | 500  |       |         |         |        |        |      |        |     |        |     |

### Example: Displaying DCD Information for all A-DSG Downstreams on a Cable Interface

The following example illustrates the DCD statistics for the given downstream channel for A-DSG version 1.1. DCD TLV information displays if the **debug cable dsg** command is active. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2.

```
Router# show interface cable 6/0 dsg downstream dcd
```

| dcd   | num of dcd | num of dcd | num of dcd | num of   |
|-------|------------|------------|------------|----------|
| state | sent       | fail       | change cnt | fragment |
| en    | 282        | 0          | 1          | 1        |

The following example shows the output for A-DSG debugging while running the same command:

```
Router# debug cable dsg
```

```
Router# show interface cable 6/0 dsg downstream dcd
```

| dcd   | num of dcd | num of dcd | num of dcd | num of   |
|-------|------------|------------|------------|----------|
| state | sent       | fail       | change cnt | fragment |
| en    | 2139       | 0          | 1          | 1        |

```
Router#
```

```

```

Beginning in Cisco IOS Release 12.3(17a)BC, this output was modified to add the “dcd Tx” field in support of A-DSG version 1.2 as shown below:

```
Router# show interfaces cable 5/0 dsg downstream dcd
```

| dcd   | dcd | num of dcd | num of dcd | num of dcd | num of   |
|-------|-----|------------|------------|------------|----------|
| state | Tx  | sent       | fail       | change cnt | fragment |
| en    | on  | 6502       | 0          | 28         | 1        |

The following output displays the DCD statistics on all the cable and modular interfaces. The “IF Name” field displays the interface type:

```
Router#show interface cable 5/1/0 dsg downstream dcd
```

| IF        | dcd   | dcd | num of dcd | num of dcd | num of dcd | num of   |
|-----------|-------|-----|------------|------------|------------|----------|
| Name      | state | Tx  | sent       | fail       | change cnt | fragment |
| Ca5/1/0   | en    | on  | 70         | 0          | 2          | 1        |
| Mo1/0/0:0 | en    | on  | 70         | 0          | 2          | 1        |

**Example: Displaying Rule Information for all A-DSG Downstreams on a Cable Interface****Note**

This command is obsolete beginning in Cisco IOS Release 12.3(17a)BC.

Router# **show interface cable 6/0 dsg downstream rule**

| rule id | rule state | rule pri | tunnel id | tunnel state | tunnel mac-addr | cfr id | cfr state | cfrIn dcd | client listId | vsp index |

# show interface cable dsg downstream tg

To display information for Advanced-mode DOCSIS Set-top Gateway (A-DSG) downstream tunnel groups on a Cisco CMTS router, use the **show interface cable dsg downstream tg** command in privileged EXEC mode.

**show interface cable** { *slot/port* | *slot/subslot/port* } **dsg downstream tg** [**channel** *channel-id*]

**Cisco IOS Release 12.2(33)SCE and later**

**show interface cable** { *slot/cable-interface-index* | *slot/subslot/cable-interface-index* } **dsg downstream tg** [**channel** *channel-id*]

## show interface cable dsg downstream tg

### Command History

| Release      | Modification                                                                                                                                                                                                    |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(17a)BC  | This command was introduced to support A-DSG on the Cisco uBR10012 router and Cisco uBR7200 series routers.                                                                                                     |
| 12.2(33)SCA  | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                              |
| 12.2(33)SCD5 | This command was modified. The output of the <b>show interface cable dsg downstream tg</b> command was changed.                                                                                                 |
| 12.2(33)SCE  | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

### Usage Guidelines

To use the **show interface cable dsg downstream tg** command, the tunnel group must be configured globally and also at the cable interface.

### Examples

#### Example: Displaying Information for all A-DSG Downstream Tunnel Groups on a Cable Interface

The following example shows output for all A-DSG downstream tunnel groups:

```
Router# show interfaces cable 5/0 dsg downstream tg
TG: 1 Chan: 1 state: en pri: 16 Vendor: 1 UCID: 1 2 3 4

 rule tunnel cfr client
I/F id state id state mac-addr id state dest-ip In-DCD listId
C5/0 1 en 1 en 0101.5e01.0001 1 en 230.1.0.1 yes 1
 6 en 231.1.1.6 no
 7 en 231.1.1.7 no
 8 en 231.1.1.8 no
 2 en 2 en 0101.5e01.0002 2 en 230.1.0.2 yes 2
 3 en 3 en 0101.5e01.0003 3 en 230.1.0.3 yes 3

TG: 2 Chan: 1 state: en pri: 11 Vendor: 2 UCID:

 rule tunnel cfr client
I/F id state id state mac-addr id state dest-ip In-DCD listId
C5/0 4 en 4 en 0002.0002.0001 4 en 230.2.2.1 no 1
 5 en 5 en 0002.0002.0002 5 en 230.2.2.2 no 2
 6 en 6 en 0002.0002.0003 9 en 231.1.1.9 no 21
```

#### Example: Displaying Information for a Specified A-DSG Downstream Tunnel Group on a Cable Interface

The following example shows output for a specified A-DSG downstream tunnel group:

```
Router# show interfaces cable 5/0 dsg downstream tg 1 channel 1
TG: 1 Chan: 1 state: en pri: 16 Vendor: 1 UCID: 1 2 3 4

 rule tunnel cfr client
I/F id state id state mac-addr id state dest-ip In-DCD listId
C5/0 1 en 1 en 0101.5e01.0001 1 en 230.1.0.1 yes 1
 6 en 231.1.1.6 no
 7 en 231.1.1.7 no
 8 en 231.1.1.8 no
 2 en 2 en 0101.5e01.0002 2 en 230.1.0.2 yes 2
 3 en 3 en 0101.5e01.0003 3 en 230.1.0.3 yes 3
```

**Example: Displaying Information for a Specified A-DSG Downstream Tunnel Group on a Cable Interface for Cisco IOS Release 12.2(33)SCD5**

The following example shows the output of the **show interfaces cable dsg downstream tg** command that displays the **ignore** option, introduced in Cisco IOS Release 12.2(33)SCD5, under the ‘In DCD’ column.

```
Router# show interfaces cable 7/0/0 dsg downstream tg

TG: 1 Chan: 1 State: en Pri: 0 Vendor: UCID:

 rule tunnel cfr In clients
id state id state mac-addr id state dest-ip DCD listId

1 en 1 en 0100.5e01.0101 1 en 230.1.1.1 ign 1
```

**Examples**      The following is a sample output of the **show interface cable dynamic-service statistics** command that shows dynamic service statistics based on the cable interface specified on the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCF:

```
Router# show interface cable 7/1/0 dynamic-service statistics

 Upstream Downstream
DSA REQ 0 5
DSA RSP 5 0
DSA ACK 0 5
DSC REQ 0 5
DSC RSP 5 0
DSC ACK 0 5
```

```

DSD REQ 0 0
DSD RSP 0 0

Retransmission counts
 Upstream Downstream
DSA REQ 0 0
DSA RSP 0 0
DSA ACK 0 0
DSC REQ 0 5
DSC RSP 5 0
DSC ACK 0 0
DSD REQ 0 0
DSD RSP 0 0

```

[Table 213](#) describes the significant fields shown in the **show interface cable dynamic-service statistics** command display.

**Table 213** *show interface cable dynamic-service statistics Field Descriptions*

| Field      | Description                                               |
|------------|-----------------------------------------------------------|
| Upstream   | Dynamic service packets sent in the upstream direction.   |
| Downstream | Dynamic service packets sent in the downstream direction. |
| DSA RSP    | Dynamic service add response.                             |
| DSA ACK    | Dynamic service add acknowledgement.                      |
| DSC REQ    | Dynamic service change request.                           |
| DSC RSP    | Dynamic service change response.                          |
| DSC ACK    | Dynamic service change acknowledgement.                   |
| DSD REQ    | Dynamic service delete request.                           |
| DSD RSP    | Dynamic service delete response.                          |

| <b>show interface cable packetcable statistics</b> | Displays PacketCable interprocess communication (IPC) statistics based on the specified cable interface. |

# show interface cable intercept

To display the cable modems for which traffic is currently being intercepted and forwarded to a data collector, use the **show interface cable intercept** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port | bundle} intercept
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index | bundle}
intercept
```

|                 | 12.0(6)SC | This command was introduced on the 12.0 SC train. |

| Release     | Modification                                                                                                                                                                                                    |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(2)EC   | This command was introduced on 12.1 EC train.                                                                                                                                                                   |
| 12.2(4)BC1  | This command was introduced on the 12.2 BC train.                                                                                                                                                               |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                      |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                                                                                                                 |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

## Examples

The following shows a display after a CM has been added to the intercept list:

```
router# configure terminal
router#(config) interface c6/0
router(config-if)# cable intercept 0080.fcaa.aabb 10.12.13.8 512
router(config-if)# exit
router(config)# exit
router# show interface c6/0 intercept
```

|                | Destination | Destination |
|----------------|-------------|-------------|
| MAC Address    | IP Address  | UDP Port    |
| 0080.fcaa.aabb | 3.12.13.8   | 512         |

The following shows a display when no CMs have been added to the intercept list:

```
router# show interface c6/0 intercept
```

No interception active

### Tip

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

|------------------------|---------------------------------------------------------------------------------------------------|
| <b>cable intercept</b> | Specifies that a copy of all traffic for a particular CM should be forwarded to a data collector. |

# show interface cable mac-scheduler

To display the current time-slot scheduling state, statistics, and weighted fair queuing (WFQ) parameters, use the **show interface cable mac-scheduler** command in privileged EXEC mode.

```
show interface cable { slot/port | slot/subslot/port } mac-scheduler [n]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable { slot/cable-interface-index | slot/subslot/cable-interface-index }
mac-scheduler [n]
```

|                 | 12.1(4)CX    | This command was introduced. (Much of the information shown in this command was previously shown by the <b>show interface cable</b> and <b>show interface cable upstream</b> commands.)                                                                                                                                      |
|                 | 12.2(4)BC1   | Support was added to the Cisco IOS Release 12.2 BC train.                                                                                                                                                                                                                                                                    |
|                 | 12.2(15)CX   | Support was added for the Cisco uBR-MC28U/X cable interface line card, including additional information about DOCSIS 2.0 A-TDMA and mixed modulation profiles.                                                                                                                                                               |
|                 | 12.2(15)BC2  | Additional information was added to the display for DOCSIS 2.0 A-TDMA and mixed modulation profiles on the Cisco uBR10-MC5X20S cable interface line card.                                                                                                                                                                    |
|                 | 12.3BC       | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                                                                                                                   |
|                 | 12.2(33)SCA  | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                                                                                                                           |
|                 | 12.2(33)SCC  | This command was modified. The command output was modified to show logical channels information when multiple logical channels are configured.                                                                                                                                                                               |
|                 | 12.2(33)SCD2 | This command was modified. The command output was modified to show weighted fair queuing (WFQ) parameters configured for upstream service flows.                                                                                                                                                                             |
|                 | 12.2(33)SCE  | This command was modified. The command output was modified to show the upstream scheduler output for a MAC domain configured with DPON. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

**Usage Guidelines** In releases prior to Cisco IOS Release 12.2 BC, information for the MAC scheduler was displayed using the **show interface cable** and **show interface cable upstream** commands. In Cisco IOS Release 12.2 BC, the MAC scheduler information is moved to this command.

**Examples** **Example of the show interface cable mac-scheduler Command Output for the Cisco uBR7246VXR and Cisco uBR7225VXR Routers**

The following is a sample output of the **show interface cable mac-scheduler** command for the upstream port 0 on the indicated cable interface:

```
Router# show interface cable 3/0 mac-scheduler 0
```

```
DOCSIS 1.1 MAC scheduler for Cable3/0/U0
Queue[Rng Polls] 0/64, 0 drops

| Adv Phy Short Grant Slots               | Number of slots granted on this upstream port for short advanced physical data requests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Adv Phy Long Grant Slots                | Number of slots granted on this upstream port for long advanced physical data requests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Adv Phy UGS Grant Slots                 | Number of UGS slots granted on this upstream port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Awacs Slots                             | Number of awacs slots granted on this upstream port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Fragmentation count                     | Number of frames received on this upstream port fragmented according to the DOCSIS 1.1 fragmentation technique.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Fragmentation test                      | Fragmentation statistics. If fragmentation is disabled, no statistics are available. If fragmentation is enabled, the fragmentation mode is displayed (multiple grant mode or piggyback mode), and the display shows the fragmentation threshold in the number of bytes and minislots.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Avg upstream channel utilization        | <p>Total upstream bandwidth currently used for upstream data traffic and DOCSIS management traffic, expressed as a short-term average percentage of total minislots used.</p> <p><b>Note</b>    Table 2 shows the theoretical maximum possible bandwidth for an upstream, based on the channel width and modulation scheme.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Avg percent contention slots            | <p>Approximate average unused capacity in the network. This field shows the total upstream bandwidth that is currently dedicated to providing bandwidth request opportunities, expressed as an average percentage of total minislots used. This value is calculated by dividing the number of scheduled contention slots by the total number of minislots.</p> <p><b>Note</b>    This value is approximately 100 percent minus the percentage of slots being used for upstream data, management traffic, and initial ranging slots.</p>                                                                                                                                                                                                                                                                                                                      |
| Avg percent initial ranging slots       | Total upstream bandwidth currently used on an average for initial ranging requests for cable modems coming online, expressed as an average percentage of total minislots used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Avg percent minislots lost on late MAPs | <p>Total upstream bandwidth currently lost and unused because the bandwidth allocation MAP message was sent late. This field shows how often allocation gaps occur in the MAP scheduler, where the Cisco CMTS allows significant amounts of time to pass before it schedules a new MAP.</p> <p>Ideally, the CMTS should schedule MAPs consecutively, so that no gaps occur between the MAPs. However, when a large number of cable modems are using different service flow schedules, gaps can appear in the MAP scheduler, resulting in wasted scheduling time.</p> <p><b>Tip</b>      A typical value is only a few percentage points. If this field shows larger values than this, use the <b>debug cable startalloc</b> command to display the number of minislots that are skipped every time the Cisco CMTS has to adjust its MAP scheduler timer.</p> |

**Table 214** *show interface cable mac-scheduler Field Descriptions (continued)*

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sched Table Rsv-State | Current status of reserved service flows (which typically indicates the number of voice grants): <ul style="list-style-type: none"> <li>Grants—Number of admitted UGS style upstream service flows.</li> <li>Reqpolls—Number of admitted Real Time Polling Service (RTPS) style upstream service flows.</li> </ul>                                                             |
| Sched Table Adm-State | Current status of admitted service flows (which typically indicates the number of voice grants): <ul style="list-style-type: none"> <li>Grants—Number of admitted UGS style upstream service flows.</li> <li>Reqpolls—Number of admitted RTPS style upstream service flows.</li> <li>Percentage of channel utilization that is associated with these service flows.</li> </ul> |
| UGS                   | Number of service IDs (SIDs) used for UGS service flows, and the current bandwidth reserved by these SIDs, in bits per second.                                                                                                                                                                                                                                                 |
| UGS-AD                | Number of SIDs used for UGS with Activity Detection (UGS-AD) service flows, and the current bandwidth reserved by these SIDs, in bits per second.                                                                                                                                                                                                                              |
| RTPS                  | Number of SIDs used for RTPS service flows, and the current bandwidth reserved by these SIDs, in bits per second.                                                                                                                                                                                                                                                              |
| NRTPS                 | Number of SIDs used for non-RTPS (NRTPS) service flows, and the current bandwidth reserved by these SIDs, in bits per second.                                                                                                                                                                                                                                                  |
| BE                    | Number of SIDs used for best-effort (BE) service flows, and the current bandwidth reserved by these SIDs, in bits per second.                                                                                                                                                                                                                                                  |
| MAP TSS               | MAP timestamp snapshot.                                                                                                                                                                                                                                                                                                                                                        |

**Note**

The sum of *Avg upstream channel utilization* and *Avg percent contention slots* need not be 100 percentage when rate-adapt is configured. These parameters may be in single digit when the remaining contention slots are assigned to other users and are not using any bandwidth.

[Table 2](#) shows the maximum usable bandwidth (total bandwidth minus header and MAC-layer overhead) for an upstream that is using a specific channel width and modulation scheme combination.

**Table 215** *Maximum Potential Upstream Bandwidth*

| Channel Width (MHz) | Modulation Scheme | Raw Speed (Mbps) | Usable Bandwidth (Mbps) |
|---------------------|-------------------|------------------|-------------------------|
| 1.6                 | QPSK              | 2.56             | 2.2                     |
| 1.6                 | 16 QAM            | 5.12             | 4.4                     |
| 3.2                 | 16 QAM            | 10.24            | 8.9                     |
| 3.2                 | 64 QAM            | 15.36            | 13.5                    |

**Table 215**      **Maximum Potential Upstream Bandwidth**

| Channel Width (MHz) | Modulation Scheme | Raw Speed (Mbps) | Usable Bandwidth (Mbps) |
|---------------------|-------------------|------------------|-------------------------|
| 6.4                 | 16 QAM            | 20.48            | 18                      |
| 6.4                 | 64 QAM            | 30.72            | 27.2                    |

For example, if the upstream is configured for a 3.2 MHz channel width and is using 16 QAM modulation, its maximum usable bandwidth is 8.9 Mbps. If the average channel utilization field shows that the upstream is at 50 percent, it indicates that cable modems on that upstream are currently using  $0.5 * 8.9$  Mbps or 4.45 Mbps.

**Tip**

In Cisco IOS Release 12.1(12)EC, Cisco IOS Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in the line configuration mode.

|--------------------------------------------|----------------------------------------------------------------------------|
| <b>show interface cable</b>                | Displays the configuration and status information for the cable interface. |
| <b>show interface cable sid</b>            | Displays SID information of each CM on the network.                        |
| <b>show interface cable signal-quality</b> | Displays the cable signal quality information.                             |
| <b>show interface cable upstream</b>       | Displays one or all of the cable interface upstream information.           |

# show interface cable modem

To display information about cable modems (CMs) and customer premise equipment (CPE) behind a CM on a specified cable interface, use the **show interface cable modem** command in privileged EXEC mode.

```
show interface cable { slot/port | slot/subslot/port } modem [sid | ipv6]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable { slot/cable-interface-index | slot/subslot/cable-interface-index } modem [sid | ipv6]
```

| Syntax Description | cable | Specifies details of a cable interface line card: <ul style="list-style-type: none"><li>slot—Slot where the line card resides.</li><li>subslot—(Cisco uBR10012 only) Secondary slot number of the line card.</li><li>port—Downstream port number of the line card.</li><li>cable-interface-index—Downstream port or MAC domain index of the line card.</li></ul> <p><a href="#">Table 216</a> in the Usage Guidelines section lists valid values for these arguments.</p> |
|--------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | sid   | (Optional) Specifies the service ID (SID) to be displayed. The valid range is from 0 to 8176.                                                                                                                                                                                                                                                                                                                                                                             |
|                    | ipv6  | (Optional) Specifies an IPv6 cable modem and connected host state.                                                                                                                                                                                                                                                                                                                                                                                                        |

|                 | 12.2(11)BC2 | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> <li>• Support for the Cisco uBR7225VXR router was added.</li> <li>• The “Dual IP” output field was added to indicate support of both IPv4 and IPv6 addressing.</li> <li>• Multicast information was added to the output.</li> <li>• The following new initialization states were added to show initialization of CMs and CPEs supporting IPv6: <ul style="list-style-type: none"> <li>– init6(s)—CMTS router has seen SOLICIT message</li> <li>– init6(a)—CMTS router has seen ADVERTISE message</li> <li>– init6(r)—CMTS router has seen REQUEST message</li> <li>– init6(i)—CMTS router has seen REPLY message</li> <li>– init6(o)—CMTS router has seen version 6 TFTP request</li> <li>– init6(t)—CMTS router has seen version 6 TOD request</li> </ul> </li> </ul> |
|                 | 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                 | 12.2(33)SCG | The <b>ipv6</b> keyword was added to this command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Usage Guidelines

The **show interface cable modem** command displays the cable modems that are known to be using or were last using the specified cable interface. When a cable modem goes offline, it remains associated with its last known cable interface and is shown as “offline” in the command’s display for 24 hours.

The CPE devices associated with offline cable modems remain in the command’s display either until their cable modem has been offline for 24 hours or until the device’s Address Resolution Protocol (ARP) entry times out (the default value is 4 hours), whichever comes first.

The **show interface cable modem** command shows similar information to the **show cable modem** command, but adds information about the privacy bits and IP addressing method.

The **show interface cable modem** command with the **ipv6** keyword also displays the IPv4 CM in the output if an IPv6 or dual stack CPE is behind the IPv4-only cable modem. In all other cases, only IPv6 data of a CM or CPE is displayed.

The IPv6 output of the **show interface cable modem** command differs from the IPv4 command. The privacy bits and the dual IP flag of the IPv4 command output are not present in the output of the **show interface cable modem** command.

**Table 216**      **Interface Density Information**

| CMTS Router      | Line Card          | Slot   | Subslot | Port   | Cable Interface Index |
|------------------|--------------------|--------|---------|--------|-----------------------|
| Cisco uBR10012   | Cisco uBR-MC3GX60V | 5 to 8 | 0 or 1  | 0 to 4 | 0 to 14               |
|                  | Cisco UBR-MC20X20V |        |         |        | 0 to 4                |
|                  | Cisco uBR10-MC5X20 |        |         |        |                       |

| Cisco uBR7246VXR | All                | 3 to 6 | —       | 0 or 1 | —                     |

**Examples**

The following example shows output from the **show interface cable modem** command for all SIDs on a particular cable interface on a Cisco 7200 series router.

Router# **show interface cable 6/0 modem**

| SID | Priv bits | Type  | State      | IP address | method | MAC address    |
|-----|-----------|-------|------------|------------|--------|----------------|
| 1   | 11        | modem | online(pt) | 1.2.3.2    | dhcp   | 0050.7366.1837 |
| 2   | 11        | modem | online(pt) | 1.2.3.3    | dhcp   | 0010.7b6b.71fd |
| 3   | 11        | modem | online(pt) | 1.2.3.4    | dhcp   | 0010.7bb3.fc3d |
| 4   | 00        | modem | init(r1)   | 1.2.3.238  | dhcp   | 0010.7b6b.71a9 |
| 5   | 11        | modem | online(pt) | 1.2.3.5    | dhcp   | 0010.7bed.a731 |
| 6   | 11        | modem | online(pt) | 1.2.3.20   | dhcp   | 0010.7bed.ab4b |
| 7   | 11        | modem | online(pt) | 1.2.3.18   | dhcp   | 0010.7b6b.71e3 |
| 8   | 11        | modem | online(pt) | 1.2.3.13   | dhcp   | 0010.7bed.ab6f |
| 9   | 11        | modem | online(pt) | 1.2.3.21   | dhcp   | 0010.7bed.a52f |
| 10  | 11        | modem | online(pt) | 1.2.3.14   | dhcp   | 0010.7b6b.7191 |
| 11  | 11        | modem | online(pt) | 1.2.3.6    | dhcp   | 0010.7bed.ab57 |

The following example shows output from the **show interface cable modem** command for an individual SID on a particular cable interface on a Cisco 7200 series router.

Router# **show interface cable 6/0 modem 9**

| SID | Priv bits | Type  | State      | IP address | method | MAC address    |
|-----|-----------|-------|------------|------------|--------|----------------|
| 9   | 11        | modem | online(pt) | 1.2.3.21   | dhcp   | 0010.7bed.a52f |

The following example shows output from the **show interface cable modem** command in Cisco IOS release 12.2(33)SCA on a particular cable interface on a Cisco uBR10012 router. None of the CMs or CPEs are supporting both IPv4 and IPv6 addressing, which is indicated by the “N” in the Dual IP output field.

Router# **show interface cable 8/0/0 modem 0**

| SID | Priv bits | Type  | State      | IP address  | method | MAC address    | Dual IP |
|-----|-----------|-------|------------|-------------|--------|----------------|---------|
| 1   | 11        | modem | online(pt) | 10.3.134.12 | dhcp   | 0008.0da6.1c47 | N       |
| 1   | 11        | host  | unknown    | 10.3.134.74 | static | 000b.bf95.f555 | N       |
| 2   | 00        | modem | init(o)    | 10.3.225.26 | dhcp   | 0007.0e07.27d7 | N       |
| 3   | 00        | modem | init(i)    | 10.3.225.19 | dhcp   | 0007.0e06.c769 | N       |
| 4   | 11        | modem | online(pt) | 10.3.134.3  | dhcp   | 0008.0da6.3447 | N       |
| 5   | 11        | modem | online(pt) | 10.3.134.38 | dhcp   | 0011.8065.e78e | N       |
| 6   | 00        | modem | init6(i)   | unavailable |        | 0018.6835.27dd | N       |
| 7   | 11        | modem | online(pt) | 10.3.134.10 | dhcp   | 0011.8065.e7a6 | N       |
| 8   | 00        | modem | init(i)    | 10.3.134.9  | dhcp   | 0006.53b6.57f5 | N       |

## show interface cable modem

```

9 11 modem online(pt) 10.3.134.27 dhcp 0006.53b6.581d N
10 11 modem online(pt) 10.3.134.5 dhcp 0007.0e04.ebfd N

```

The following is a sample output from the **show interface cable modem** command that shows multicast information:

```
Router# show interface cable 6/1/0 modem
```

| SID  | Priv bits | Type      | State      | IP address | method | MAC address    | Dual IP |
|------|-----------|-----------|------------|------------|--------|----------------|---------|
| 9    | 11        | modem     | online(pt) | 101.1.0.6  | dhcp   | 0006.28f9.8c79 | N       |
| 9    | 11        | host      | unknown    | 111.1.1.45 | dhcp   | 0018.1952.a859 | N       |
| 10   | 10        | modem     | online(pt) | 101.1.0.5  | dhcp   | 0006.5305.ac19 | N       |
| 10   | 10        | host      | unknown    | 111.1.0.3  | dhcp   | 0018.1952.a85a | N       |
| 13   | 10        | modem     | online(pt) | 101.1.0.3  | dhcp   | 0014.f8c1.fd1c | N       |
| 8195 | 10        | multicast | unknown    | 224.1.1.51 | static | 0000.0000.0000 | N       |
| 8195 | 10        | multicast | unknown    | 224.1.1.49 | static | 0000.0000.0000 | N       |
| 8195 | 10        | multicast | unknown    | 224.1.1.50 | static | 0000.0000.0000 | N       |

The following is a sample output of the **show interface cable modem** command with the **ipv6** keyword in Cisco IOS Release 12.2(33)SCG:

```
Router# show interface cable 7/0/0 modem ipv6
```

| SID | Type | State   | IPv6 Address                          | M MAC address    |
|-----|------|---------|---------------------------------------|------------------|
| 11  | CM   | online  | 2001:420:3800:809:3519:5F9C:B96A:D31  | D 0025.2e2d.743a |
| 11  | CPE  | unknown | 2001:420:3800:809:3DB2:8A6C:115F:41D8 | D 0011.2544.f33b |

**Table 217** *show interface cable modem Field Descriptions*

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID       | Identifies a SID currently defined and in use on this particular cable interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Priv bits | <p>Identifies the current settings of the two privacy bits in the Extended Header (EH) that is used for BPI-encrypted packets.</p> <ul style="list-style-type: none"> <li>First bit—Enable bit. Set to 1 when BPI or BPI+ is enabled.</li> <li>Second bit—Toggle bit. Matches the least significant bit (LSB) of the Key Sequence Number (KSN) in the EH.</li> </ul> <p>For example, a value of “00” indicates that BPI is not enabled. A value of “10” indicates that BPI is enabled and that the KSN is an even number. A value of “11” indicates that BPI is enabled and that the KSN is an odd number.</p> <p><b>Note</b> For more information on these bits, see the DOCSIS Baseline Privacy Interface Plus Interface Specification (SP-BPI+-I08-020301 or later).</p> |
| Type      | <p>Identifies the use for this SID:</p> <ul style="list-style-type: none"> <li>host—SID is used for a CPE device.</li> <li>modem—SID is used for a CM.</li> <li>multicast—SID is used for a multicast broadcast.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 217** *show interface cable modem Field Descriptions (continued)*

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State        | The current state of the MAC layer for this SID and CM (see <a href="#">Table 218</a> for descriptions of the possible states). For hosts or multicast broadcasts, the state will always be unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP address   | IP address for the CM using this SID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IPv6 Address | IPv6 address of the CM or CPE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| method or m  | Identifies the way that the IP address was assigned: <ul style="list-style-type: none"> <li>• dhcp—The Cisco CMTS first learned of this IP address through a DHCP packet that assigned the address to this device. This IP address is therefore assumed to have been dynamically assigned to the cable modem or CPE device by a DHCP server. (Per the DOCSIS specifications, DHCP is the only valid method for cable modems.)</li> <li>• pppoe—(CPE device only) IP addressing for the CPE device was handled by the Point-to-Point Protocol over Ethernet (PPPoE) protocol.</li> <li>• static—(CPE device only) The Cisco CMTS first learned of this IP address from non-DHCP traffic sent to or from this CPE device. This IP address is therefore assumed to be statically assigned to this particular CPE device.</li> </ul> <p><b>Note</b> The Cisco CMTS could identify a CPE device as having a static IP address, if the Cisco CMTS has been rebooted after the CPE device received its IP address from the DHCP server.</p> |
| MAC address  | Identifies the hardware (MAC) address for the CM using this SID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Dual IP      | Identifies whether or not (“Y” or “N”) the CM or CPE supports both IPv4 and IPv6 addressing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

[Table 218](#) shows the possible values for the MAC state field:

**Table 218** *Descriptions for the MAC State Field <sup>1</sup>*

| MAC State Value                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 218**      **Descriptions for the MAC State Field (continued)<sup>1</sup>**

| MAC State Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reject(m)       | <p>The CM attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the <b>cable shared-secret</b> command.</p> <p>In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the <b>cable tftp-enforce</b> command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so.</p>                                                                                                                                                                                                                   |
| reject(c)       | <p>The CM attempted to register, but registration was refused due to a number of possible errors:</p> <ul style="list-style-type: none"> <li>• The CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the <b>cable upstream admission-control</b> command.</li> <li>• The CM has been disabled because of a security violation.</li> <li>• A bad class of service (COS) value in the DOCSIS configuration file.</li> <li>• The CM attempted to create a new COS configuration but the CMTS is configured to not permit such changes.</li> <li>• The CM failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the CM and CMTS.)</li> </ul> |
| reject(pk)      | KEK key assignment is rejected, BPI encryption has not been established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| reject(pkd)     | <p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected.</p> <p><b>Note</b> This state is equivalent to the online(d) and reject(pk) states.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| reject(pt)      | TEK key assignment is rejected, BPI encryption has not been established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| reject(ptd)     | <p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected.</p> <p><b>Note</b> This state is equivalent to the online(d) and reject(pt) states.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Note</b>     | <p>In Cisco IOS Release 12.1(20)EC, Cisco IOS Release 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) even if BPI encryption fails. Use the <b>show cable modem mac-address</b> command to confirm whether BPI is enabled or disabled for a particular cable modem.</p>                                                                                                                                                                                                                                                                                                                                                                                            |
| reject(ts)      | <p>The CM attempted to register, but registration failed because the TFTP server timestamp in the CM registration request did not match the timestamp maintained by the CMTS. This might indicate that the CM attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 218**      *Descriptions for the MAC State Field (continued)<sup>1</sup>*

| MAC State Value | Description                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reject(ip)      | The CM attempted to register, but registration failed because the IP address in the CM request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.                       |
| reject(na)      | The CM attempted to register, but registration failed because the CM did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed. |

1. The CM MAC state field can also be retrieved using SNMP by getting the value of the cdxCmtsCmStatusValue object in the CISCO-DOCS-EXT-MIB.

| Command                 | Description                                                   |
|-------------------------|---------------------------------------------------------------|
| <b>show cable modem</b> | Displays information for the registered and unregistered CMs. |

# show interface cable monitor

Note

Effective with Cisco IOS Release 12.2(33)SCA the **show interface cable monitor** command is replaced by the **show interface cable cable-monitor** command.

To display cable monitor information, use the **show interface cable monitor** command in privileged EXEC mode.

**show interface cable {slot/port | slot/subslot/port} monitor**

Syntax Description

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| slot/port         | <p>Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers, where:</p> <ul style="list-style-type: none"> <li>slot—Specifies the chassis slot number of the cable interface line card.</li> <li>port—Specifies the downstream port number.</li> </ul> <p>Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.</p> |
| slot/subslot/port | <p>Displays information for all CMs on the specified cable interface on a Cisco uBR10012 router, where:</p> <ul style="list-style-type: none"> <li>slot—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8.</li> <li>subslot—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>port—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>                                                                                   |

Command Modes

Privileged EXEC (#)

Command History

| Release     | Modification                                                                 |
|-------------|------------------------------------------------------------------------------|
| 12.1(3a)EC  | This command was introduced.                                                 |
| 12.2(4)XF   | Support was added for the Cisco uBR10012 universal broadband router.         |
| 12.2(4)BC1  | Support was added to the Release 12.2 BC train.                              |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                   |
| 12.2(33)SCA | This command is replaced by the <b>show interface cable-monitor</b> command. |

Examples

The following is sample output from the **show interface cable monitor** command:

Router# **show interface cable 5/0 monitor**

| US/ DS | Time Stmp | Outbound Interface | Flow Type | Flow Identifier | Type | Packet Extn. Type | MAC Extn. Type | MAC Type | Encap Type |
|--------|-----------|--------------------|-----------|-----------------|------|-------------------|----------------|----------|------------|
|--------|-----------|--------------------|-----------|-----------------|------|-------------------|----------------|----------|------------|

```

all no Et1/2 acc-list 103 yes data no - docsis
all yes Et1/2 mac-addr 0050.0000.0000 yes mac no - -

```

**Table 219** *show interface cable monitor Field Descriptions*

| Field                | Description                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| DS                   | Downstream. Indicates that only downstream flows are monitored.                                                                                         |
| UP                   | Upstream. Indicates that only upstream flows are monitored.                                                                                             |
| ALL                  | Indicates that all flows are monitored.                                                                                                                 |
| Time Stmp            | “Yes” indicates that forwarded packets have been time-stamped, with appended 4 bytes. “No” indicates that forwarded packets have not been time-stamped. |
| Outbound Interface   | Identifies the interfaces where the packets have been forwarded to (Ethernet or Fast Ethernet).                                                         |
| Flow Type            | Identifies the selected flow type, MAC-address, access-list number, or upstream port number.                                                            |
| Flow Type Identifier | MAC address, access-list number, or service ID.                                                                                                         |
| Flow Extn.           | “Yes” indicates that extended filters are configured, and “no” indicates that no extended filters have been configured.                                 |
| MAC Type             | Not applicable.                                                                                                                                         |
| Encap                | DOCSIS encapsulation.                                                                                                                                   |
| Type                 | Forwarded packets with Ethernet encapsulation.                                                                                                          |

**Tip**

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

| Command              | Description                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------|
| <b>cable monitor</b> | Enables the forwarding of selected packets on the cable interface to an external LAN analyzer. |

# show interface cable multicast-sessions

To display information about the multicast sessions on a specific cable interface, use the **show interface cable multicast-sessions** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} multicast-sessions
```

Cisco IOS Release 12.2(33)SCE and later releases

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index}
multicast-sessions [group [ipv4-MQoS-group | ipv6-MQoS-group] | latency | sid [MQoS-sid]]
```

|                    |                                                 |                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command History

| Release     | Modification                                                                                                                                                                                                                                                     |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCA | This command was introduced.                                                                                                                                                                                                                                     |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the downstream port of the Cisco uBR10-MC5X20 or the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |
| 12.2(33)SCF | This command was modified. The <b>latency</b> keyword was added.                                                                                                                                                                                                 |

## Examples

The following example is a sample output from the **show interface cable multicast-sessions** command:

```
Router# show interface cable 7/0/0 multicast-sessions
```

```
Default Multicast Service Flow 3 on Cable7/0/0
```

```
Multicast Sessions on Cable7/0/0
```

| Group      | Interface | GC | SAID | SFID | GQC | GEn | RefCount | GC-Interface | State  |
|------------|-----------|----|------|------|-----|-----|----------|--------------|--------|
| 224.1.1.45 | Bundle1.1 | 1  | 8193 | 24   | 1   | 5   | 1        | Bundle1      | ACTIVE |
| 224.1.1.46 | Bundle1.1 | 1  | 8193 | 24   | 1   | 5   | 1        | Bundle1      | ACTIVE |
| 224.1.1.47 | Bundle1.1 | 1  | 8193 | 24   | 1   | 5   | 1        | Bundle1      | ACTIVE |

```
Aggregate Multicast Sessions on Cable7/0/0
```

```
Aggregate Sessions for SAID 8193 SFID 24 GQC 1 CurrSess 3
```

| Group      | Interface | GC | SAID | SFID | AggGQC | GEn | RefCount | GC-Interface |
|------------|-----------|----|------|------|--------|-----|----------|--------------|
| 224.1.1.45 | Bundle1.1 | 1  | 8193 | 24   | 1      | 5   | 1        | Bundle1      |
| 224.1.1.46 | Bundle1.1 | 1  | 8193 | 24   | 1      | 5   | 1        | Bundle1      |
| 224.1.1.47 | Bundle1.1 | 1  | 8193 | 24   | 1      | 5   | 1        | Bundle1      |

The following example is a sample output from the **show interface cable multicast-sessions latency** command:

```
Router# show interface cable 5/0/0 multicast-sessions latency
```

```
Session (S,G) : (*,230.1.2.4)
```

```
Fwd Intfc : Ca5/0/0
```

```
MQoS Entered at MQoS Exit at
```

```
Mar 6 23:13:14.387 Mar 6 23:13:14.387
```

```
GC SAID SFID SF req SF rsp
```

```
1 8197 17 Mar 6 23:13:14.387 Mar 6 23:13:14.391
```

The following example is a sample output from the **show interface cable multicast-sessions group** command:

```
Router# show interface cable 5/0/0 multicast-sessions group 230.1.2.4
```

```
Multicast Group : 230.1.2.4
```

```
Source : N/A

| <b>Usage Guidelines</b>   | The <b>show interface cable packetcable statistics</b> command provides IPC statistics for the PacketCable module for debugging purpose. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Examples

The following is a sample output of the **show interface cable packetcable statistics** command that shows PacketCable IPC statistics based on the cable interface specified on the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCF:

```
Router# show interface cable 7/1/0 packetcable statistics
```

Packetcable IPC Statistics on RP

|      |        |      |      |          |        |
|------|--------|------|------|----------|--------|
| Msg  | create | gate | gate | gate set | dsd    |
|      | gie    | set  | del  | notify   | notify |
| Sent | 0      | 10   | 0    | 0        | 0      |
| Rcvd | 0      | 0    | 0    | 10       | 0      |

Packetcable IPC Statistics on LC

|      |        |      |      |          |        |
|------|--------|------|------|----------|--------|
| Msg  | create | gate | gate | gate set | dsd    |
|      | gie    | set  | del  | notify   | notify |
| Sent | 0      | 0    | 0    | 10       | 0      |
| Rcvd | 0      | 10   | 0    | 0        | 0      |

[Table 213](#) describes the significant fields shown in the **show interface cable packetcable statistics** command display.

**Table 220** *show interface cable packetcable statistics Field Descriptions*

| Field           | Description                          |
|-----------------|--------------------------------------|
| Msg             | IPC messages sent and received.      |
| create gie      | Gate create request.                 |
| gate set        | Gate set request.                    |
| gate del        | Gate delete request.                 |
| gate set notify | Gate set notification.               |
| dsd notify      | Dynamic service delete notification. |

# show interface cable privacy

To display the baseline privacy information, use the **show interface cable privacy** command in privileged EXEC mode.

**show interface cable** { *slot/port* | *slot/subslot/port* } **privacy** { **all** | **eae-policy** | **tek** | **kek** | **hotlist** }

**Cisco IOS Release 12.2(33)SCE and later**

**show interface cable** { *slot/cable-interface-index* | *slot/subslot/cable-interface-index* } **privacy** { **all** | **eae-policy** | **tek** | **kek** }

| Syntax Description           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                  | Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                                                                  |
| <i>subslot</i>               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>port</i>                  | Downstream port number. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                                                                                |
| <i>cable-interface-index</i> | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</li> </ul> |
| <b>all</b>                   | Displays all privacy configuration details.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>eae-policy</b>            | Displays early authentication and encryption (EAE) configuration details.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>tek</b>                   | Displays the traffic encryption key (tek) values.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>kek</b>                   | Displays the key encryption key (kek) values.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>hotlist</b>               | Displays a list of cable modems detected as clones.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Command Modes** Privileged EXEC (#)

## ■ show interface cable privacy

### Command History

| Release     | Modification                                                                                                                                                                                                                                                                                                                 |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCC | This command was introduced.                                                                                                                                                                                                                                                                                                 |
| 12.2(33)SCD | A new keyword, <b>hotlist</b> , was added to display the cable modems detected as clones.                                                                                                                                                                                                                                    |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. The <b>hotlist</b> keyword was removed from this command and added to the <b>show cable privacy</b> command. |

### Usage Guidelines

The **show interface cable privacy** command is available only in IOS images that support Baseline Privacy Interface (BPI) and BPI+ encryption.

### Examples

The following is a sample output of the **show interface cable privacy** command with the **tek** keyword:

```
Router# show interface cable 3/0 privacy tek
```

```
Configured TEK life-time value = 56000
```

The following is a sample output of the **show interface cable privacy** command with the **kek** keyword:

```
Router# show interface cable 3/0 privacy kek
```

```
Configured KEK life-time value = 750000
```

The following is a sample output of the **show interface cable privacy** command with the **hotlist** keyword:

```
Router# show interface cable 5/1/0 privacy hotlist
```

| MAC Address    | Last Ranged On  | Type      |
|----------------|-----------------|-----------|
| 00a0.73b0.4c43 | Oct 27 21:57:39 | Permanent |
| 001a.c3ff.d2d4 | Oct 27 21:57:40 | Permanent |
| 0018.6852.7746 | Never           | Permanent |
| 000e.9bb3.b946 | Never           | Permanent |

The following is a sample output of the **show interface cable privacy** command with the **eae-policy** keyword:

```
Router# show interface cable 5/1/0 privacy eae-policy
```

```
EAE Configuration
Policy: EAE Ranging Enforcement
```

The following is a sample output of the **show interface cable privacy** command with the **all** keyword:

```
Router# show interface cable 5/1/0 privacy all
```

```
EAE Configuration
Policy: EAE Ranging Enforcement
```

```

Table 221 describes the significant fields shown in the **show interface cable privacy** command display:

**Table 221** *show interface cable privacy Command Field Description*

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configured TEK life-time value = | Number of seconds defining the length of the traffic encryption key lifetime. The valid range is from 1,800 to 6,048,000 seconds. The default value is 43,200 seconds (12 hours).                                                                                                                                                                                                                                                                                                                                                                                     |
| Configured KEK life-time value = | Number of seconds defining the length of the key encryption key lifetime. The valid range is from 86,400 to 6,048,000 seconds. The default value is 604,800 seconds (7 days).                                                                                                                                                                                                                                                                                                                                                                                         |
| MAC Address                      | MAC address of the cloned cable modem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Last Ranged On                   | Displays the time stamp when the cable modem last attempted registration on that interface. This value helps gauge the frequency with which the MAC address is attempting to be cloned, and manage the hotlist accordingly.                                                                                                                                                                                                                                                                                                                                           |
| Type                             | <ul style="list-style-type: none"> <li>Permanent—The cable modem entry can be configured as a permanent clone from the CLI by executing the <b>cable privacy hotlist cable modem</b> command. A cable modem marked as a permanent clone can only be removed from the hotlist by executing the <b>no</b> form of the <b>cable privacy hotlist cable modem</b> command.</li> <li>Temporary—The Cisco CMTS detects a duplicate cable modem MAC address. This duplicate MAC address is flagged as a clone and is prevented from coming online for 180 seconds.</li> </ul> |

| Command                          | Description                                                                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable privacy</b>             | Enables the operation of BPI/BPI+ encryption on the Cisco CMTS router.                                                                          |
| <b>cable privacy eae-exclude</b> | Forces a cable modem to register without an early authentication and encryption (EAE) policy.                                                   |
| <b>cable privacy eae-policy</b>  | Enables an early authentication and encryption policy for a cable modem registraion.                                                            |
| <b>cable privacy hotlist</b>     | Marks a CA certificate or cable modem certificate of a manufacturer as untrusted and adds it to the Cisco CMTS hotlist of invalid certificates. |
| <b>cable privacy kek</b>         | Sets the KEK lifetime values for baseline privacy.                                                                                              |
| <b>cable privacy tek</b>         | Sets the TEK lifetime values for baseline privacy.                                                                                              |
| <b>show cable privacy</b>        | Displays the BPI certificate information.                                                                                                       |

# show interface cable qos paramset

To display the attributes of the service flow quality of service (QoS) parameter set, use the **show interface cable qos paramset** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} qos paramset [paramset-index] [verbose]
```

**Cisco IOS Release 12.2(33)SCE and later releases**

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} qos
paramset [paramset-index | total] [verbose]
```

| Syntax Description           |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                  | Slot where the line card resides. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                       |
| <i>subslot</i>               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                 |
| <i>port</i>                  | Downstream port number. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                                   |
| <i>cable-interface-index</i> | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> |
| <i>paramset-index</i>        | (Optional) Service template index (1 to 255).                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>total</b>                 | (Optional) Displays the total number of service flows per service template.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>verbose</b>               | (Optional) Displays full details about the QoS parameter set.                                                                                                                                                                                                                                                                                                                                                                                |

## show interface cable qos paramset

### Command History

| Release     | Modification                                                                                                                                                                                                    |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(4)CX   | This command replaces the <b>show cable qos profile</b> command for DOCSIS 1.1 operation.                                                                                                                       |
| 12.2(4)BC1  | Support was added to the Release 12.2 BC train.                                                                                                                                                                 |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |
| 12.2(33)SCF | This command was modified. The <b>total</b> keyword was added to display the total number of service flows per service template.                                                                                |
| 12.2(33)SCG | The command output was modified to display the scheduling type as “N/A” for all downstream service flows.                                                                                                       |

### Usage Guidelines

The **show interface cable qos paramset** command displays the QoS parameter set for all the service flows on a particular cable interface.

#### Note

Parameter sets that contain a service-class name string are not in an “expanded” state and serve as provisioning envelopes of class-based service flows. The actual attributes of such parameter sets depend on the service class that is referenced at the time the parameter sets are expanded.

#### Note

Starting with Cisco IOS Release 12.2(33)SCG, the output of the **show interface cable qos paramset** command displays the scheduling type of all downstream service flows (DS-SF) as “N/A” to indicate that the DS-SFs do not have any scheduling type.

### Examples

#### Example of the show interface cable qos paramset Command Output

The following is a sample output of the **show interface cable qos paramset** command:

```
Router# show interface c6/0 qos paramset
```

| Index | Name | Dir | Sched | Prio | MaxSusRate | MaxBurst | MinRsvRate |
|-------|------|-----|-------|------|------------|----------|------------|
| 1     |      | US  | BE    | 0    | 64000      | 0        | 0          |
| 2     |      | DS  | BE    | 0    | 1000000    | 0        | 0          |
| 3     |      | US  | BE    | 7    | 1000000    | 1522     | 0          |
| 4     |      | DS  | BE    | 0    | 10000000   | 3044     | 0          |
| 128   |      | US  | BE    | 7    | 1000000    | 1522     | 0          |
| 129   |      | DS  | BE    | 0    | 10000000   | 3044     | 0          |

#### Note

In Cisco IOS Release 12.2(11)BC3 and later releases, the Cisco CMTS automatically maps the non-default DOCSIS 1.0 QoS profiles to profile numbers starting at 128, to facilitate their use in DOCSIS 1.1 networks.

#### Example of the show interface cable qos paramset verbose Command Output

The following is a sample output for the **verbose** form of the **show interface cable qos paramset** command:

```
Router# show interface c6/0 qos paramset 1 verbose
```

```

Index: 1
Name:
Direction: Upstream
Traffic Priority: 0
Maximum Sustained Rate: 64000 bits/sec
Max Burst: 0 bytes
Minimum Reserved Rate: 0 bits/sec
Minimum Packet Size 0 bytes
Maximum Concatenated Burst: 1522
Scheduling Type: Best Effort
Request/Transmission Policy: 0x0
Nominal Polling Interval: 0
Tolerated Poll Jitter: 0
Unsolicited Grant Size: 0 bytes
Nominal Grant Interval: 0 usecs
Tolerated Grant Jitter: 0 usecs
Grants per Interval: 0
IP ToS Overwrite [AND-mask,OR-mask]: 0x0,0x0

```

### Example of the show interface cable qos paramset total Command in Cisco IOS Release 12.2(33)SCF

The following is a sample output for the **total** option of the **show interface cable qos paramset** command:

Router# **show interfaces cable 6/1/0 qos paramset total**

| Index | SrvClassName    | Dir | Sched | MaxSusRate | MaxBurst | MinRsvRate | Total |
|-------|-----------------|-----|-------|------------|----------|------------|-------|
| 1     |                 | US  | BE    | 64000      | 0        | 0          | 50669 |
| 2     |                 | DS  | BE    | 1000000    | 0        | 0          | 50669 |
| 3     | def_sclass      | DS  | BE    | 10000000   | 3044     | 0          | 6     |
| 4     | us_srvclass_ts1 | US  | BE    | 0          | 3044     | 0          | 4     |
| 5     | us_srvclass_ts1 | US  | BE    | 0          | 3044     | 0          | 8     |
| 6     | us_srvclass_ts2 | US  | BE    | 0          | 3044     | 0          | 4     |
| 7     | us_srvclass_ts2 | US  | BE    | 0          | 3044     | 0          | 8     |
| 8     | ds_srvclass_ts1 | DS  | BE    | 0          | 3044     | 0          | 12    |
| 9     | ds_srvclass_ts2 | DS  | BE    | 0          | 3044     | 0          | 12    |

#### Tip

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Table 222 describes the significant fields shown in the display.

**Table 222** *show interface cable qos paramset Field Descriptions*

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dir          | Downstream (DS) or upstream (US) service flow.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Sched        | Identifies scheduling type of the service flow: <ul style="list-style-type: none"> <li>• BE—Best-Effort</li> <li>• N/A—Scheduling type is not applicable to a service flow.</li> <li>• NRTPS—Non-Real-Time Polling Service</li> <li>• RTPS—Real-Time Polling Service</li> <li>• RSVD—Reserved but not yet in use</li> <li>• UGS_AD—Unsolicited Grant Service with Activity Detection</li> <li>• UGS—Unsolicited Grant Service</li> <li>• UNDEF—Not yet defined.</li> </ul> |
| Prio         | Traffic priority (0 to 7) given to this service flow.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| MaxSusRate   | Maximum sustained rate value, in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| MaxBrst      | Maximum burst value, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MinRsvRate   | Minimum reserved rate, in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SrvClassName | Service class name associated with the service flow.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Total        | Total number of service flows per service template.                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Related Commands**

|                                  |                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------|
| <b>show cable qos permission</b> | Displays the status of permissions for changing QoS tables.                         |
| <b>show cable modem qos</b>      | Displays quality of service (QoS) and service flow information for a particular CM. |
| <b>show cable qos profile</b>    | Displays the QoS profiles that have been defined.                                   |

# show interface cable service-flow

To display the attributes of DOCSIS service flows on a cable interface, use the **show interface cable service-flow** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} service-flow [sfid [queue | classifiers | counters
| phs | qos [ds | us]]] [verbose]]
```

**Cisco IOS Release 12.2(33)SCE and later releases**

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} service-flow
[sfid [queue | classifiers | counters | phs | qos [ds | service-class | us]]] [verbose]]
```

| Syntax Description                 |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                        | Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                 |
| <i>subslot</i>                     | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                 |
| <i>port</i>                        | Downstream port number. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                               |
| <i>cable-interface-index</i>       | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> |
| <i>sfid</i>                        | (Optional) Identifies the service flow index (1 to 65535).                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>queue</b>                       | (Optional, Cisco 7100 and 7200 series routers only) Displays the downstream hierarchical queueing framework (HQF) queue information associated with this interface. To display detailed information of all the queues under this service flow, use the <b>verbose</b> option with this queue.                                                                                                                                                |
| <b>classifiers</b> [ <i>clid</i> ] | (Optional) Displays all classifiers associated with this service flow or optionally display information only for the specified classifier ID ( <i>clid</i> , 1 to 65535).                                                                                                                                                                                                                                                                    |
| <b>counters</b>                    | (Optional) Displays the real-time counters for the service flow for a specific SFID, to include the number of matches when used with the <b>verbose</b> keyword. <p>This counter remains initialized for upstream service flows. The match count for upstream classifiers is not supported and is replaced with null value - in such cases.</p>                                                                                              |

|                      |                                                                                                                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>phs</b>           | (Optional) Displays packet header suppression rules and packet counters for the service flow for a specific SFID.<br><br>The PHS packet counters are not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release. |
| <b>qos</b>           | (Optional) Displays QoS information for the service flow for a specific SFID.                                                                                                                                                                                   |
| <b>ds</b>            | (Optional) Displays QoS information for all the downstream service flows on the interface.                                                                                                                                                                      |
| <b>service-class</b> | (Optional) Displays service class names, along with other QoS information, for all the service flows on the interface.                                                                                                                                          |
| <b>us</b>            | (Optional) Displays QoS information for all the upstream service flows on the interface.                                                                                                                                                                        |
| <b>verbose</b>       | (Optional) Displays detailed information on the service flow for a specific SFID.                                                                                                                                                                               |

|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(4)CX      | This command was introduced.                                                                                                                                                                                                      |
| 12.2(4)BC1     | The command was changed so that the optional keywords are supported only when displaying information for a specific service flow index.                                                                                           |
| 12.2(8)BC1     | The command was changed to remove the ability to display all service flows, and a service flow index must now be specified.                                                                                                       |
| 12.3BC         | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                        |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                                |
| 12.2(33)SCB    | This command was modified to display either the downstream (DS) channel ID or the bonding group (BG) ID of the forwarding interface assigned to the downstream service flow.                                                      |
| 12.2(33)SCC    | This command was modified to display bonded service flow information.                                                                                                                                                             |
| 12.2(33)SCD    | This command was modified. The <b>queue</b> keyword was added to display downstream HQF queue information for the interface.                                                                                                      |
| 12.2(33)SCE    | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco UBR-MC20X20V, Cisco uBR-MC5X20 and Cisco uBR-MC3GX60V cable interface line cards. |
| 12.2(33)SCF    | This command was modified. The <b>service-class</b> keyword was added to display service class names for all the service flows on an interface.                                                                                   |
| 12.2(33)SCG    | The command output was modified to display the scheduling type as “N/A” for all downstream service flows.                                                                                                                         |

**Usage Guidelines**

In Cisco IOS Release 12.2(4)BC1 and later, the optional keywords **classifiers**, **counters**, **pbs**, **qos**, and **verbose** can be used only when requesting information for a specific service flow ID. When a service flow ID is specified, the **verbose** keyword can be used by itself or by any of the other optional keywords.

**Note**

When using the **counters** keyword with the **verbose** keyword, this command displays the number of matches for the classifier match counter. However, this counter remains initialized for upstream service flows when using the **verbose** keyword. The match count for upstream classifiers is not supported and is replaced with null value - in such cases.

**Note**

Starting with Cisco IOS Release 12.2(33)SCG, the output of the **show interface cable service-flow qos** command displays the scheduling type of all downstream service flows (DS-SF) as "N/A" to indicate that the DS-SFs do not have any scheduling type.

The following two **show** command examples illustrate counter information, with null value for the number of matches for the upstream service flow, when the **show interface cable service-flow** command is used with **verbose** keyword:

```
Router# show interface cable 6/0 service-flow 30191 verbose
```

```

### Examples

The following examples show a sample output of the **show interface cable service-flow** command.

```
Router# show interface c3/0 service-flow
```

| Sfid | Sid | Mac Address    | QoS Prov | Param Adm | Index Act | Type | Dir | Curr State | Active Time | BG / CH |
|------|-----|----------------|----------|-----------|-----------|------|-----|------------|-------------|---------|
| 12   | N/A | 0014.0496.3f9e | 4        | 4         | 4         | prim | DS  | act        | 3h17m       | CH 1    |
| 11   | 5   | 0014.0496.3f9e | 3        | 3         | 3         | prim | US  | act        | 3h17m       |         |
| 14   | N/A | 0014.0496.3f76 | 4        | 4         | 4         | prim | DS  | act        | 3h17m       | BG 102  |
| 13   | 6   | 0014.0496.3f76 | 3        | 3         | 3         | prim | US  | act        | 3h17m       |         |
| 16   | N/A | 0007.0e07.24af | 4        | 4         | 4         | prim | DS  | act        | 3h17m       | CH 1    |
| 15   | 7   | 0007.0e07.24af | 3        | 3         | 3         | prim | US  | act        | 3h17m       |         |
| 18   | N/A | 0007.0e06.e1b5 | 4        | 4         | 4         | prim | DS  | act        | 3h17m       | CH 3    |
| 17   | 8   | 0007.0e06.e1b5 | 3        | 3         | 3         | prim | US  | act        | 3h17m       |         |

Per normal operation, the counter in the Number of Matches field is not initialized for working dynamic service flows. For upstream service flows, the classifier match count is not updated for upstream packet classifiers, and displays no results.

```
Router# show interface c6/0 service-flow 30191 verbose
```

```
Sfid : 30191
Mac Address : 000a.739e.140a
Type : Secondary(Dynamic)
Direction : Upstream
Current State : Active

Source Port Low : 53456
Source Port High : 53456
```

Destination Port Low : 7052  
Destination Port High : 7052

**Note**

Per the DOCSIS 1.1 specification, the **show interface cable service-flow** command uses bytes allocated for a UGS service flow when calculating the throughput values for the service flow (see the Assumed Minimum Reserved Rate Packet Size parameter, TLV 11 in the upstream and downstream service flow configurations). Depending on the value of this parameter and the packet sizes of the actual traffic, this could result in throughput values that appear to be greater than the maximum sustained rate. You can use the **stats** option with the **show interface cable** command to display the actual byte counts.

**Sample Downstream Flow**

Router# **show interface c4/0 service-flow 12 qos verbose**

```
Sfid : 12
Current State : Active
Sid : N/A
Traffic Priority : 0
Maximum Sustained rate : 1000000 bits/sec
Maximum Burst : 0 bytes
Minimum Reserved rate : 0 bits/sec
Minimum Packet Size : 0 bytes
Maximum Latency : 0 usecs
Current Throughput : 0 bits/sec, 0 packets/sec
```

**Sample Upstream Flow**

Router# **show interface c4/0 service-flow 11 qos verbose**

```
Sfid : 11
Current State : Active
Sid : 5
Traffic Priority : 0
Maximum Sustained rate : 64000 bits/sec
Maximum Burst : 0 bytes
Minimum Reserved rate : 0 bits/sec
Minimum Packet Size : 0 bytes
Maximum Concatenated Burst : 1522
Scheduling Type : Best Effort
Unsolicited Grant Size : 0 bytes
Nominal Grant Interval : 20000 usecs
Grants per interval : 0
Tolerated Grant Jitter : 0 usecs
Nominal Polling Interval : 0 usecs
Tolerated Polling Jitter : 0 usecs
Request/Transmission policy : 0x0
IP ToS Overwrite[AND-mask, OR-mask] : 0x0, 0x0
Current Throughput : 0 bits/sec, 0 packets/sec
```

**Tip**

When PacketCable services are enabled to allow PacketCable-based Voice over IP (VoIP) traffic, the Nominal Grant Interval reflects the packetization interval that is configured on the VoIP call agent.

Router# **show interface c4/0 service-flow counters**

| Sfid | Packets | Bytes | PacketDrops | Bits/Sec | Packets/Sec |
|------|---------|-------|-------------|----------|-------------|

| QoS Parameter Index Prov | QoS parameter index for the Provisioned state of this flow.                                                                                                                                                                                                                                                                  |
| QoS Parameter Index Adm  | QoS parameter index for the Admitted state of this flow.                                                                                                                                                                                                                                                                     |
| QoS Parameter Index Act  | QoS parameter index for the Active state of this flow.                                                                                                                                                                                                                                                                       |
| Type                     | Indicates if the service flow is the primary flow or a secondary service flow. Secondary service flows are also identified by an “S” (created statically at the time of registration, using the DOCSIS configuration file) or “D” (created dynamically by the exchange of dynamic service messages between the CM and CMTS). |
| Dir                      | Downstream (DS) or upstream (US) service flow.                                                                                                                                                                                                                                                                               |
| Curr State               | Current run-time state of the service flow.                                                                                                                                                                                                                                                                                  |
| Active Time              | Length of time this service flow has been active.                                                                                                                                                                                                                                                                            |
| BG/CH                    | BGID or the DS channel ID of the forwarding interface assigned to the downstream service flow.                                                                                                                                                                                                                               |
| Len/Limit Pkts           | Length or limit of the packets.                                                                                                                                                                                                                                                                                              |
| Deqs Pkts                | Dequeue packets                                                                                                                                                                                                                                                                                                              |
| Drops Pkts               | Dropped packets.                                                                                                                                                                                                                                                                                                             |
| CIR Kbps                 | Committed information rate.                                                                                                                                                                                                                                                                                                  |

**Table 223** *show interface cable service-flow Field Descriptions (continued)*

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIR/PR Kbps  | Maximum information and peak rate.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Forwint      | Forwarding interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SFID         | Service flow identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Sched Type   | Identifies scheduling type of this service flow: <ul style="list-style-type: none"> <li>• BE—Best-Effort</li> <li>• N/A—Scheduling type is not applicable to a service-flow.</li> <li>• NRTPS—Non-Real-Time Polling Service</li> <li>• RTPS—Real-Time Polling Service</li> <li>• RSVD—Reserved but not yet in use</li> <li>• UGS_AD—Unsolicited Grant Service with Activity Detection</li> <li>• UGS—Unsolicited Grant Service</li> <li>• UNDEF—Not yet defined.</li> </ul> |
| Prio         | Traffic priority (0 to 7) given to this service flow.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| MaxSusRate   | Maximum sustained rate value, in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MaxBrst      | Maximum burst value, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| MinRsvRate   | Minimum reserved rate, in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Throughput   | Current throughput for this service flow, in packets per second.                                                                                                                                                                                                                                                                                                                                                                                                            |
| SrvClassName | Service class name associated with the service flow.                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Note**

The PHS packet counters are not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.

The following example shows upstream bonding information on a cable interface line card in Cisco IOS Release 12.2(33)SCC:

```
Routeru# show interface cable 5/0/1 service-flow 3070 verbose
```

```

Sfid : 3070
Mac Address : 001a.c3ff.d59c
Type : Secondary(Static)
Direction : Upstream
Current State : Active
Current QoS Indexes [Prov, Adm, Act] : [6, 6, 6]
Active Time : 07:48
Required Attributes : 0x00000000
Forbidden Attributes : 0x00000000
Aggregate Attributes : 0x00000000
Sid : 720
Traffic Priority : 0
Maximum Sustained rate : 1000000 bits/sec
Maximum Burst : 1522 bytes
Minimum Reserved Rate : 0 bits/sec
Minimum Packet Size : 0 bytes
Admitted QoS Timeout : 200 seconds
Active QoS Timeout : 0 seconds

```

```

Packets : 58381

```

The following example shows the output of the **show interface cable service-flow counters** command displaying the service flow counters on the cable interface at slot/subslot/port 7/1/0:

Router# **show interface cable 7/1/0 service-flow 7 counters**

| Sfid | Packets | Bytes | PacketDrop | Bits/Sec | Packet/Sec |
|------|---------|-------|------------|----------|------------|
| 7    | 16      | 8384  | 0          | 0        | 0          |

Table 224 shows the significant fields shown in the display for the **phs** option:

**Table 224** *show interface cable service-flow phs Field Descriptions*

| Field | Description                                                                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sfid  | Service flow identification number.<br><br><b>Note</b> Primary service flow IDs are displayed even for offline CMs because they are needed for modem re-registration. |
| PHSI  | PHS Index. Number that uniquely references the PHS rule.                                                                                                              |
| PHSS  | PHS Size. 8-bit value specifying the number of header bytes to be suppressed.                                                                                         |
| PHSV  | PHS Verify. Indicates whether PHS verification is enabled.                                                                                                            |
| PHSM  | PHS Mask. 5-bit PHS mask that defines the header bytes that should be suppressed.                                                                                     |
| PHSF  | PHS Field. 8-bit values that defines the header bytes that should be suppressed.                                                                                      |

 show interface cable service-flow

| Related Commands | Command                                        | Description                                                                                                             |
|------------------|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
|                  | <b>cable service class</b>                     | Sets the parameters for DOCSIS 1.1 cable service class.                                                                 |
|                  | <b>cable service flow inactivity-threshold</b> | Sets the inactivity threshold value for service flows using Unsolicited Grant Service with Activity Detection (UGS-AD). |
|                  | <b>cable service-flow inactivity-timeout</b>   | Sets the amount of time a dynamic service-flow can be present in the system without any activity.                       |
|                  | <b>show cable qos permission</b>               | Displays the status of permissions for changing QoS tables.                                                             |
|                  | <b>show cable qos profile</b>                  | Displays the QoS profiles that have been defined.                                                                       |

# show interface cable sid

To display the service identifier (SID) information for a cable modem (CM), use the **show interface cable sid** command in privileged EXEC mode.

```
show interface cable { slot/port | slot/subslot/port } sid id [association | connectivity | counters | qos | secondary-ip | rate-adapt] [verbose]
```

**Cisco IOS Release 12.2(33)SCE and later**

```
show interface cable { slot/cable-interface-index | slot/subslot/cable-interface-index } sid id [association | connectivity | counters | qos | secondary-ip | rate-adapt] [verbose]
```

| Syntax Description           |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                  | Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                 |
| <i>subslot</i>               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                 |
| <i>port</i>                  | Downstream port number. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                               |
| <i>cable-interface-index</i> | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> |
| <i>id</i>                    | The service identification information number. The valid range is 1-8176.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>association</b>           | Displays the virtual interfaces (VRF) or Interface Descriptor Blocks (IDBs).                                                                                                                                                                                                                                                                                                                                                                 |
| <b>connectivity</b>          | Displays the values of the per-SID connectivity statistics. (This option appears only in DOCSIS 1.0 and 1.0+ releases. Use the <b>show cable modem connectivity</b> command in DOCSIS 1.1 releases.)                                                                                                                                                                                                                                         |
| <b>counters</b>              | Displays the values of the per-SID usage counters. Same as the keyword <b>stats</b> that appeared in Cisco IOS Release 11.3(5)NA and earlier releases.                                                                                                                                                                                                                                                                                       |
| <b>qos</b>                   | Displays the QoS characteristics received by each SID.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>secondary-ip</b>          | Displays the secondary IP addresses associated with each SID.                                                                                                                                                                                                                                                                                                                                                                                |

|                   |                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rate-adapt</b> | (Cisco uBR7200 series and Cisco uBR10012 routers only) Displays the local or global upstream utilization optimization configuration parameters.                                |
| <b>verbose</b>    | Displays detailed information for the <b>counters</b> and <b>qos</b> options.                                                                                                  |
| <b>Note</b>       | The <b>verbose</b> option is supported by itself or with any of the other options, but it displays additional information only for the <b>counters</b> and <b>qos</b> options. |

|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.3 XA                              | This command was introduced.                                                                                                                                                                                                                                                                                                                            |
| 11.3(6)NA                            | The keyword <b>stats</b> was changed to <b>counters</b> .                                                                                                                                                                                                                                                                                               |
| 12.0(4)XI                            | The primary SID information was added.                                                                                                                                                                                                                                                                                                                  |
| 12.0(5)T                             | The command output was modified to identify secondary SIDs.                                                                                                                                                                                                                                                                                             |
| 12.0(7)XR and 12.0(7)T               | The <b>verbose</b> keyword was added to display additional information for the <b>counters</b> option.                                                                                                                                                                                                                                                  |
| 12.1(4)CX, 12.2(1)XF, and 12.2(4)BC1 | The <b>qos</b> keyword was added to display information on the QoS values received by the SID from the MAC scheduler. You can also use the <b>verbose</b> option with the <b>qos</b> keyword to display detailed information.<br><br>Also, the <b>connectivity</b> option was removed and replaced by the <b>show cable modem connectivity</b> command. |
| 12.1(11b)EC, 12.2(8)BC1              | The <b>association</b> keyword was added.                                                                                                                                                                                                                                                                                                               |
| 12.2(8)BC2                           | An explicit error message was added if this command is used with a cable subinterface, instructing the user to use the main interface instead.                                                                                                                                                                                                          |
| 12.1(13)EC                           | The <b>secondary-ip</b> keyword was added for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.                                                                                                                                                                                                                            |
| 12.2(11)BC1                          | Support for the <b>secondary-ip</b> keyword was added for the Cisco uBR10012 universal broadband router.                                                                                                                                                                                                                                                |
| 12.2(11)CY, 12.2(11)BC3              | Three codeword fields were added to the <b>verbose</b> counters display to support the Cisco uBR10-MC5X20S cable interface line card. These fields always display zero for the other cable interface line cards.                                                                                                                                        |
| 12.2(11)BC3                          | The <b>counters</b> option now displays the following counters: <ul style="list-style-type: none"> <li>Concatenated headers received</li> <li>Fragmentation headers received</li> <li>Fragmentation headers discarded</li> </ul> <b>Note</b> The Cisco uBR10-MC5X20S cable interface line card does not currently support these particular counters.    |

| Release     | Modification                                                                                                                                                                                                                                                                                         |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> <li>Support for the Cisco uBR7225VXR router was added.</li> <li>The “Dual IP” output field was added to indicate support of both IPv4 and IPv6 addressing.</li> </ul> |
| 12.3(23)BC2 | This command was modified to add two rate-adapt output fields to the <b>counters verbose</b> form of the command.                                                                                                                                                                                    |
| 12.2(33)SCB | The two rate-adapt output fields in the <b>counters verbose</b> form of the command were integrated into Cisco IOS Release 12.2(33)SCB.                                                                                                                                                              |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.                                                                                      |

### Usage Guidelines

Data transport over the radio frequency (RF) link uses the registered SID address rather than the Ethernet address. This allows multiple hosts to access the network via a single CM.

The **verbose** keyword can be used with any of the other options or by itself, but it displays additional information only when used with the **counters**, **qos**, and **rate-adapt** options.

#### Note

You can specify only a main interface with this command, not a subinterface.

#### Tip

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

### Examples

This section shows the output from the different forms of the **show interface cable sid** command.

The following example shows the error message that is displayed when you attempt to use this command on a subinterface:

```
Router# show interface cable 6/0.1 sid
```

```
Command not allowed on sub-interface
Please use main interface C6/0
```

#### show interface cable sid Examples

```
Router# show interface cable 4/0 sid
```

| Sid | Prim | MAC Address    | IP Address    | Type | Age     | Admin State | Sched Type | Sfid |
|-----|------|----------------|---------------|------|---------|-------------|------------|------|
| 5   |      | 0010.7b6b.58c1 | 10.20.114.34  | stat | 2d1h36m | enable      | BE         | 1    |
| 6   |      | 0010.7bed.9dc9 | 10.20.114.37  | stat | 2d1h36m | enable      | BE         | 13   |
| 7   |      | 0010.7bed.9dbb | 10.20.114.38  | stat | 2d1h36m | enable      | BE         | 15   |
| 8   |      | 0010.7b6b.58bb | 10.20.114.112 | stat | 2d1h34m | enable      | BE         | 17   |
| 9   |      | 0010.7b6b.58bb | 10.20.114.112 | dyna | 2d1h34m | enable      | BE         | 19   |

## show interface cable sid

The following example shows output from the **show interface cable modem** command in Cisco IOS Release 12.2(33)SCA for all SIDs on a particular cable interface on a Cisco uBR10012 router. None of the CMs or CPEs are supporting both IPv4 and IPv6 addressing, which is indicated by the “N” in the Dual IP output field.:

```
Router# show interface cable 8/0/0 sid
Sid Prim MAC Address IP Address Type Age Admin Sched Sfid Dual
 State Type
1 0008.0da6.1c47 50.3.134.12 stat 41:58 enable BE 3 N
2 0008.0da5.6e48 50.3.134.2 stat 41:58 enable BE 5 N
3 0008.0da6.0447 50.3.134.13 stat 41:55 enable BE 7 N
4 0008.0da6.3447 50.3.134.3 stat 41:56 enable BE 9 N
5 0011.8065.e78e 50.3.134.38 stat 40:52 enable BE 11 N
6 0000.cab7.8620 50.3.134.8 stat 41:25 enable BE 13 N
7 0011.8065.e7a6 50.3.134.10 stat 40:52 enable BE 15 N
8 0006.53b6.57f5 50.3.134.9 stat 41:34 enable BE 17 N
9 0006.53b6.581d 50.3.134.27 stat 41:08 enable BE 19 N
10 0007.0e04.ebfd 50.3.134.5 stat 41:04 enable BE 21 N
```

Table 227 describes the fields displayed by the **show interface cable sid** command.

**Table 225** *show interface cable sid Field Descriptions*

| Field       | Description                                                                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sid         | Service identification number.                                                                                                                                                                                                                                                         |
| Prim        | The primary service identifier (SID) assigned to the modem.                                                                                                                                                                                                                            |
| MAC address | MAC address of the modem owning this SID.                                                                                                                                                                                                                                              |
| IP address  | IP address of the modem owning this SID.                                                                                                                                                                                                                                               |
| Type        | Indicates whether this SID was created statically (“stat”) at the time of registration, or dynamically (“dyna”) by the exchange of dynamic service messages between the CM and CMTS.                                                                                                   |
| Age         | Length of time that the SID has been enabled.                                                                                                                                                                                                                                          |
| Admin State | Administrative state of the SID, where “Disable” means that the SID has been turned off. “Enable” is the normal state.                                                                                                                                                                 |
| Sched Type  | The service class schedule type, where:<br>2–Best-Effort Schedule Type<br>3–Non-Real-Time Polling Service Schedule Type<br>4–Real-Time Polling Service Schedule Type<br>5–Unsolicited Grant Service with Activity Detection Schedule Type<br>6–Unsolicited Grant Service Schedule Type |
| Sfid        | Service flow identifier.                                                                                                                                                                                                                                                               |
| Dual IP     | Identifies whether or not (“Y” or “N”) the CM or CPE supports both IPv4 and IPv6 addressing.                                                                                                                                                                                           |

## show interface cable sid qos Examples

```
Router# show interface cable 4/0 sid qos

### show interface cable sid qos verbose Examples

Router# **show interface cable 4/0 sid 5 qos verbose**

```

Sid : 5
Traffic Priority : 0
Maximum Sustained Rate : 64000
Maximum Burst : 0
Minimum Reserved Rate : 0
Minimum Packet Size : 0
Maximum Concatenated Burst : 1522
Scheduling Type : Best Effort
Nominal Grant Interval : 0
Tolerated Grant Jitter : 0
Nominal Polling Interval : 0
Tolerated Polling Jitter : 0
Unsolicited Grant Size : 0
Grants per Interval : 0
Request/Transmission Policy : 0x0
IP ToS Overwrite [AND-mask, OR-mask] : 0x0, 0x0
Current Throughput : 0 bits/sec, 0 packets/sec

```

### show interface cable sid counter Examples

When using DOCSIS 1.1 software, such as Cisco IOS Release 12.2 BC, the **show interface sid counter** command provides the following display:

Router# **show interface cable 5/0 sid counter**

| Sid | Req-polls issued | BW-reqs received | Grants issued | Packets received | Frag complete | Concatpkts received |
|-----|------------------|------------------|---------------|------------------|---------------|---------------------|
| 1   | 0                | 22               | 22            | 22               | 0             | 0                   |
| 2   | 0                | 3                | 3             | 2                | 0             | 0                   |
| 3   | 0                | 0                | 0             | 0                | 0             | 0                   |

When using DOCSIS 1.0 software, such as Cisco IOS Release 12.1 EC, the **show interface sid counter** command provides the following display:

Router# **show interface cable 5/0 sid counter**

| Sid | Inpackets | Inoctets | Outpackets | Outoctets | Ratelimit BWReqDrop | Ratelimit DSPktDrop |
|-----|-----------|----------|------------|-----------|---------------------|---------------------|
| 6   | 51        | 6559     | 42         | 3580      | 0                   | 0                   |
| 7   | 47        | 5993     | 40         | 3428      | 0                   | 0                   |
| 8   | 47        | 6136     | 36         | 3122      | 0                   | 0                   |
| 9   | 0         | 0        | 0          | 0         | 0                   | 0                   |

### show interface cable sid counter verbose Examples

The following example shows typical verbose output for the SID counters on a Cisco uBR-MCxC cable interface line card:

Router# **show interface cable 4/0 sid 3 counter verbose**

```

Sid : 3
Request polls issued : 0
BW requests received : 1

```

**show interface cable sid**

```

No grant buf BW request drops : 0
Rate exceeded BW request drops : 0
Grants issued : 1
Packets received : 0
Bytes received : 0
Fragment reassembly completed : 0
Fragment reassembly incomplete : 0
Concatenated packets received : 0
Queue-indicator bit statistics : 0 set, 0 granted
Good Codewords rx : 0
Corrected Codewords rx : 0
Uncorrectable Codewords rx : 0
Concatenated headers received : 0
Fragmentation headers received : 0
Fragmentation headers discarded: 0

```

The following example shows typical verbose output for the SID counters on the Cisco uBR10-MC5X20S cable interface line card:

Router# **show interface cable 4/0 sid 3 counters verbose**

```

Sid : 1
Request polls issued : 0
BWReqs {Cont,Pigg,RPoll,Other} : 0, 1052, 1052, 0
No grant buf BW request drops : 0
Rate exceeded BW request drops : 0
Grants issued : 1052
Packets received : 0
Bytes received : 0
Fragment reassembly completed : N/A
Fragment reassembly incomplete : N/A
Concatenated packets received : N/A
Queue-indicator bit statistics : 0 set, 0 granted
Good Codewords rx : 53
Corrected Codewords rx : 6110
Uncorrectable Codewords rx : 8540896
Concatenated headers received : 235
Fragmentation headers received : 0
Fragmentation headers discarded: 0

```

**Note**

Because the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U/H cable interface line cards do not support the fragmentation and concatenation packet counters, these counters always show zero for these particular cable interfaces. However, these interfaces do accurately count the number of concatenation headers, as shown above.

**show interface cable sid association Example**

The following example shows typical output for the **association** keyword:

Router# **show interface cable 5/0 sid association**

| Sid | Prim | Online  | IP Address     | MAC Address    | Interface | VRF Name |
|-----|------|---------|----------------|----------------|-----------|----------|
| 1   |      | online  | 192.168.129.20 | 0003.e38f.e993 | Ca5/0.50  | green    |
| 2   |      | online  | 192.168.129.17 | 0003.e38f.e89d | Ca5/0.50  | green    |
| 3   |      | init(t) | 192.168.129.12 | 00d0.baa2.fb93 | Ca5/0.50  | green    |

**Note**

The output of the **show interface cable sid association** command output will not display the updated interface name immediately after deleting a VRF. This is because the SID is not re-mapped automatically to the interface on which the CM comes online. If you want to view the updated interface name, reset the cable modem to re-map the interface name and then execute this show command.

The following example shows sample output for the **secondary-ip** keyword:

```
Router# show interface cable 5/0 sid secondary-ip
For sid 1 secondary ip list contains 2 address(es)
 192.168.129.20
 192.168.81.123
For sid 2 secondary ip list contains 2 address(es)
 192.168.129.17
 10.10.11.3
```

**Tip**

One possible situation that might occur is if a CM first assigns a secondary IP address to one CPE device, but later that same IP address is assigned to another CPE device behind a different CM. If this happens, the IP address will continue to show up as a secondary IP address for the original CM until that CM renews its public keys. This will not affect network connectivity for either CPE or CM. You can, however, clear the unneeded secondary IP address from the CMTS database using the **clear cable secondary-ip** command.

Table 228 describes the fields displayed by the **show interface cable sid** command.

**Table 226** *show interface cable sid Field Descriptions*

| Field                          | Description                                                                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sid                            | Service identification number.                                                                                                                                 |
| Prim Sid                       | The primary service identifier (SID) assigned to the modem.                                                                                                    |
| Type                           | Indicates that this SID was created statically at the time of registration or dynamically by the exchange of dynamic service messages between the CM and CMTS. |
| Online State<br>Offline State  | “Online” means that the modem owning this SID is processing traffic. “Offline” means that the modem owning this SID is not processing traffic.                 |
| Admin Status                   | “Disable” means that the SID has been turned off. “Enable” is the normal state.                                                                                |
| QoS                            | Quality of service.                                                                                                                                            |
| Create time                    | When the SID was created, number of seconds since the system booted.                                                                                           |
| Input octets (In octets)       | Number of octets received by using this SID.                                                                                                                   |
| Input packets (In packets)     | Number of packets received by using this SID.                                                                                                                  |
| Output octets (Out octets)     | Number of octets sent from this SID.                                                                                                                           |
| Output packets (Out packets)   | Number of packets sent from this SID.                                                                                                                          |
| IP address                     | IP address of the modem owning this SID.                                                                                                                       |
| MAC address                    | MAC address of the modem owning this SID.                                                                                                                      |
| BW requests received           | Number of bandwidth requests received by this SID.                                                                                                             |
| Grants issued                  | Number of bandwidth requests granted by this SID.                                                                                                              |
| Rate exceeded BW request drops | Number of bandwidth requests not granted by this SID.                                                                                                          |
| Rate exceeded DS packet drops  | Number of downstream packets lost by this SID.                                                                                                                 |
| Ratelimit BWReqDrop            | Number of bandwidth requests not granted by this SID.                                                                                                          |
| Ratelimit DSPktDrop            | Number of downstream packets lost by this SID.                                                                                                                 |

**Table 226**      *show interface cable sid Field Descriptions (continued)*

| Field                          | Description                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1st time online                | Time at which the modem with this SID connected.                                                                                                                                                                                                                                |
| Times online                   | Number of times the modem with this SID connected.                                                                                                                                                                                                                              |
| % online                       | Percentage of time the modem with this SID has been connected.                                                                                                                                                                                                                  |
| Online time                    | The minimum, average, and maximum number of hours and minutes the modem with this SID has been connected.<br><br><b>Note</b> A CM is considered online when it has completed the registration process and has communicated with the DHCP, TFTP, and TOD servers.                |
| Offline time                   | The minimum, average, and maximum number of hours and minutes the modem with this SID has been disconnected.<br><br><b>Note</b> A CM is considered offline after it has missed 16 consecutive station maintenance messages.                                                     |
| MaxSusRate                     | The maximum rate (0 to 4,294,967,295 bps).                                                                                                                                                                                                                                      |
| MinRsvRate                     | The minimum guaranteed rate (0 to 4,294,967,295 bps).                                                                                                                                                                                                                           |
| Sched Type                     | The service class schedule type:<br>2–Best-Effort Schedule Type<br>3–Non-Real-Time Polling Service Schedule Type<br>4–Real-Time Polling Service Schedule Type<br>5–Unsolicited Grant Service with Activity Detection Schedule Type<br>6–Unsolicited Grant Service Schedule Type |
| Grant Size                     | The grant size (0 to 65535 bytes).                                                                                                                                                                                                                                              |
| Grant Interval                 | The grant interval (0 to 4294967295 microseconds).                                                                                                                                                                                                                              |
| GPI                            | The grants per interval (0 to 127 grants).                                                                                                                                                                                                                                      |
| Poll Interval                  | The poll interval (0 to 4294967295 microseconds).                                                                                                                                                                                                                               |
| Throughput                     | The overall throughput for this SID.                                                                                                                                                                                                                                            |
| VRF Name                       | Name of the virtual interface that has been configured for Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) operation.                                                                                                                                        |
| Fragment reassembly completed  | Number of packets that were subject to DOCSIS fragmentation that were successfully reassembled.<br><br><b>Note</b> This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.                                   |
| Fragment reassembly incomplete | Number of packets that were subject to DOCSIS fragmentation that have not yet been successfully reassembled.<br><br><b>Note</b> This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.                      |

**Table 226** *show interface cable sid Field Descriptions (continued)*

| Field                           | Description                                                                                                                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concatenated packets received   | Number of packets that were subject to DOCSIS concatenation that were successfully received.<br><br><b>Note</b> This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release. |
| Good Codewords rx               | Number of FEC codewords received without error.                                                                                                                                                                                            |
| Corrected Codewords rx          | Number of FEC codewords received with errors that could be corrected.                                                                                                                                                                      |
| Uncorrectable Codewords rx      | Number of FEC codewords received with errors that could not be corrected.                                                                                                                                                                  |
| Concatenated packets received   | Number of concatenation headers received on an upstream service flow. (This field always shows 0 for the Cisco uBR10012 router, but you can use the docsQosUpstreamConcatBursts attribute in DOCS-QOS-MIB to get a current count.)         |
| Fragmentation headers received  | Number of fragmentation headers received on an upstream service flow, regardless of whether the fragment was correctly reassembled into a valid packet. (See docsQosUpstreamFragments in DOCS-QOS-MIB.)                                    |
| Fragmentation headers discarded | Number of upstream fragments discarded and not assembled into a valid upstream packet. (See docsQosUpstreamFragDiscards in DOCS-QOS-MIB.)                                                                                                  |

**Related Commands**

| Command                                    | Description                                                                               |
|--------------------------------------------|-------------------------------------------------------------------------------------------|
| <b>clear cable secondary-ip</b>            | Clears the router's table that links secondary IP addresses to the devices that use them. |
| <b>show cable modem connectivity</b>       | Displays connectivity statistics for one or more CMs.                                     |
| <b>show interface cable signal-quality</b> | Displays information about the cable signal quality.                                      |

# show interface cable sid

To display the service identifier (SID) information for a cable modem (CM), use the **show interface cable sid** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} sid id [association | connectivity | counters |
qos | secondary-ip | rate-adapt] [verbose]
```

**Cisco IOS Release 12.2(33)SCE and later**

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} sid id
[association | connectivity | counters | qos | secondary-ip | rate-adapt] [verbose]
```

## Syntax Description

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                  | Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                 |
| <i>subslot</i>               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                 |
| <i>port</i>                  | Downstream port number. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                               |
| <i>cable-interface-index</i> | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> |
| <i>id</i>                    | The service identification information number. The valid range is 1-8176.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>association</b>           | Displays the virtual interfaces (VRF) or Interface Descriptor Blocks (IDBs).                                                                                                                                                                                                                                                                                                                                                                 |
| <b>connectivity</b>          | Displays the values of the per-SID connectivity statistics. (This option appears only in DOCSIS 1.0 and 1.0+ releases. Use the <b>show cable modem connectivity</b> command in DOCSIS 1.1 releases.)                                                                                                                                                                                                                                         |
| <b>counters</b>              | Displays the values of the per-SID usage counters. Same as the keyword <b>stats</b> that appeared in Cisco IOS Release 11.3(5)NA and earlier releases.                                                                                                                                                                                                                                                                                       |
| <b>qos</b>                   | Displays the QoS characteristics received by each SID.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>secondary-ip</b>          | Displays the secondary IP addresses associated with each SID.                                                                                                                                                                                                                                                                                                                                                                                |

|                   |                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rate-adapt</b> | (Cisco uBR7200 series and Cisco uBR10012 routers only) Displays the local or global upstream utilization optimization configuration parameters.                                |
| <b>verbose</b>    | Displays detailed information for the <b>counters</b> and <b>qos</b> options.                                                                                                  |
| <b>Note</b>       | The <b>verbose</b> option is supported by itself or with any of the other options, but it displays additional information only for the <b>counters</b> and <b>qos</b> options. |

| Release                              | Modification                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.3 XA                              | This command was introduced.                                                                                                                                                                                                                                                                                                                            |
| 11.3(6)NA                            | The keyword <b>stats</b> was changed to <b>counters</b> .                                                                                                                                                                                                                                                                                               |
| 12.0(4)XI                            | The primary SID information was added.                                                                                                                                                                                                                                                                                                                  |
| 12.0(5)T                             | The command output was modified to identify secondary SIDs.                                                                                                                                                                                                                                                                                             |
| 12.0(7)XR and 12.0(7)T               | The <b>verbose</b> keyword was added to display additional information for the <b>counters</b> option.                                                                                                                                                                                                                                                  |
| 12.1(4)CX, 12.2(1)XF, and 12.2(4)BC1 | The <b>qos</b> keyword was added to display information on the QoS values received by the SID from the MAC scheduler. You can also use the <b>verbose</b> option with the <b>qos</b> keyword to display detailed information.<br><br>Also, the <b>connectivity</b> option was removed and replaced by the <b>show cable modem connectivity</b> command. |
| 12.1(11b)EC, 12.2(8)BC1              | The <b>association</b> keyword was added.                                                                                                                                                                                                                                                                                                               |
| 12.2(8)BC2                           | An explicit error message was added if this command is used with a cable subinterface, instructing the user to use the main interface instead.                                                                                                                                                                                                          |
| 12.1(13)EC                           | The <b>secondary-ip</b> keyword was added for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.                                                                                                                                                                                                                            |
| 12.2(11)BC1                          | Support for the <b>secondary-ip</b> keyword was added for the Cisco uBR10012 universal broadband router.                                                                                                                                                                                                                                                |
| 12.2(11)CY, 12.2(11)BC3              | Three codeword fields were added to the <b>verbose</b> counters display to support the Cisco uBR10-MC5X20S cable interface line card. These fields always display zero for the other cable interface line cards.                                                                                                                                        |
| 12.2(11)BC3                          | The <b>counters</b> option now displays the following counters: <ul style="list-style-type: none"> <li>Concatenated headers received</li> <li>Fragmentation headers received</li> <li>Fragmentation headers discarded</li> </ul> <b>Note</b> The Cisco uBR10-MC5X20S cable interface line card does not currently support these particular counters.    |

| Release     | Modification                                                                                                                                                                                                                                                                                         |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> <li>Support for the Cisco uBR7225VXR router was added.</li> <li>The “Dual IP” output field was added to indicate support of both IPv4 and IPv6 addressing.</li> </ul> |
| 12.3(23)BC2 | This command was modified to add two rate-adapt output fields to the <b>counters verbose</b> form of the command.                                                                                                                                                                                    |
| 12.2(33)SCB | The two rate-adapt output fields in the <b>counters verbose</b> form of the command were integrated into Cisco IOS Release 12.2(33)SCB.                                                                                                                                                              |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.                                                                                      |

### Usage Guidelines

Data transport over the radio frequency (RF) link uses the registered SID address rather than the Ethernet address. This allows multiple hosts to access the network via a single CM.

The **verbose** keyword can be used with any of the other options or by itself, but it displays additional information only when used with the **counters**, **qos**, and **rate-adapt** options.

#### Note

You can specify only a main interface with this command, not a subinterface.

#### Tip

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

### Examples

This section shows the output from the different forms of the **show interface cable sid** command.

The following example shows the error message that is displayed when you attempt to use this command on a subinterface:

```
Router# show interface cable 6/0.1 sid
```

```
Command not allowed on sub-interface
Please use main interface C6/0
```

#### show interface cable sid Examples

```
Router# show interface cable 4/0 sid
```

| Sid | Prim | MAC Address    | IP Address    | Type | Age     | Admin State | Sched Type | Sfid |
|-----|------|----------------|---------------|------|---------|-------------|------------|------|
| 5   |      | 0010.7b6b.58c1 | 10.20.114.34  | stat | 2d1h36m | enable      | BE         | 1    |
| 6   |      | 0010.7bed.9dc9 | 10.20.114.37  | stat | 2d1h36m | enable      | BE         | 13   |
| 7   |      | 0010.7bed.9dbb | 10.20.114.38  | stat | 2d1h36m | enable      | BE         | 15   |
| 8   |      | 0010.7b6b.58bb | 10.20.114.112 | stat | 2d1h34m | enable      | BE         | 17   |
| 9   |      | 0010.7b6b.58bb | 10.20.114.112 | dyna | 2d1h34m | enable      | BE         | 19   |

The following example shows output from the **show interface cable modem** command in Cisco IOS Release 12.2(33)SCA for all SIDs on a particular cable interface on a Cisco uBR10012 router. None of the CMs or CPEs are supporting both IPv4 and IPv6 addressing, which is indicated by the “N” in the Dual IP output field.:

```
Router# show interface cable 8/0/0 sid
Sid Prim MAC Address IP Address Type Age Admin Sched Sfid Dual
 State Type
1 0008.0da6.1c47 50.3.134.12 stat 41:58 enable BE 3 N
2 0008.0da5.6e48 50.3.134.2 stat 41:58 enable BE 5 N
3 0008.0da6.0447 50.3.134.13 stat 41:55 enable BE 7 N
4 0008.0da6.3447 50.3.134.3 stat 41:56 enable BE 9 N
5 0011.8065.e78e 50.3.134.38 stat 40:52 enable BE 11 N
6 0000.cab7.8620 50.3.134.8 stat 41:25 enable BE 13 N
7 0011.8065.e7a6 50.3.134.10 stat 40:52 enable BE 15 N

9 0006.53b6.581d 50.3.134.27 stat 41:08 enable BE 19 N
10 0007.0e04.ebfd 50.3.134.5 stat 41:04 enable BE 21 N
```

Table 227 describes the fields displayed by the **show interface cable sid** command.

**Table 227** *show interface cable sid Field Descriptions*

| Field       | Description                                                                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sid         | Service identification number.                                                                                                                                                                                                                                                         |
| Prim        | The primary service identifier (SID) assigned to the modem.                                                                                                                                                                                                                            |
| MAC address | MAC address of the modem owning this SID.                                                                                                                                                                                                                                              |
| IP address  | IP address of the modem owning this SID.                                                                                                                                                                                                                                               |
| Type        | Indicates whether this SID was created statically (“stat”) at the time of registration, or dynamically (“dyna”) by the exchange of dynamic service messages between the CM and CMTS.                                                                                                   |
| Age         | Length of time that the SID has been enabled.                                                                                                                                                                                                                                          |
| Admin State | Administrative state of the SID, where “Disable” means that the SID has been turned off. “Enable” is the normal state.                                                                                                                                                                 |
| Sched Type  | The service class schedule type, where:<br>2–Best-Effort Schedule Type<br>3–Non-Real-Time Polling Service Schedule Type<br>4–Real-Time Polling Service Schedule Type<br>5–Unsolicited Grant Service with Activity Detection Schedule Type<br>6–Unsolicited Grant Service Schedule Type |
| Sfid        | Service flow identifier.                                                                                                                                                                                                                                                               |
| Dual IP     | Identifies whether or not (“Y” or “N”) the CM or CPE supports both IPv4 and IPv6 addressing.                                                                                                                                                                                           |

```

**show interface cable sid counter Examples**

When using DOCSIS 1.1 software, such as Cisco IOS Release 12.2 BC, the **show interface sid counter** command provides the following display:

Router# **show interface cable 5/0 sid counter**

| Sid | Req-polls issued | BW-regs received | Grants issued | Packets received | Frag complete | Concatpkts received |
|-----|------------------|------------------|---------------|------------------|---------------|---------------------|
| 1   | 0                | 22               | 22            | 22               | 0             | 0                   |
| 2   | 0                | 3                | 3             | 2                | 0             | 0                   |
| 3   | 0                | 0                | 0             | 0                | 0             | 0                   |

When using DOCSIS 1.0 software, such as Cisco IOS Release 12.1 EC, the **show interface sid counter** command provides the following display:

Router# **show interface cable 5/0 sid counter**

| Sid | Inpackets | Inoctets | Outpackets | Outoctets | Ratelimit BWReqDrop | Ratelimit DSPktDrop |
|-----|-----------|----------|------------|-----------|---------------------|---------------------|
| 6   | 51        | 6559     | 42         | 3580      | 0                   | 0                   |
| 7   | 47        | 5993     | 40         | 3428      | 0                   | 0                   |
| 8   | 47        | 6136     | 36         | 3122      | 0                   | 0                   |
| 9   | 0         | 0        | 0          | 0         | 0                   | 0                   |

**show interface cable sid counter verbose Examples**

The following example shows typical verbose output for the SID counters on a Cisco uBR-MCxxC cable interface line card:

Router# **show interface cable 4/0 sid 3 counter verbose**

```

Sid : 3
Request polls issued : 0

```

```

BW requests received : 1

Fragment reassembly completed : 0
Fragment reassembly incomplete : 0
Concatenated packets received : 0
Queue-indicator bit statistics : 0 set, 0 granted
Good Codewords rx : 0
Corrected Codewords rx : 0
Uncorrectable Codewords rx : 0
Concatenated headers received : 0
Fragmentation headers received : 0
Fragmentation headers discarded: 0

```

The following example shows typical verbose output for the SID counters on the Cisco uBR10-MC5X20S cable interface line card:

Router# **show interface cable 4/0 sid 3 counters verbose**

```

Sid : 1
Request polls issued : 0
BWReqs {Cont,Pigg,RPoll,Other} : 0, 1052, 1052, 0
No grant buf BW request drops : 0
Rate exceeded BW request drops : 0
Grants issued : 1052
Packets received : 0
Bytes received : 0
Fragment reassembly completed : N/A
Fragment reassembly incomplete : N/A
Concatenated packets received : N/A
Queue-indicator bit statistics : 0 set, 0 granted
Good Codewords rx : 53
Corrected Codewords rx : 6110
Uncorrectable Codewords rx : 8540896
Concatenated headers received : 235
Fragmentation headers received : 0
Fragmentation headers discarded: 0

```

#### Note

Because the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U/H cable interface line cards do not support the fragmentation and concatenation packet counters, these counters always show zero for these particular cable interfaces. However, these interfaces do accurately count the number of concatenation headers, as shown above.

#### show interface cable sid association Example

The following example shows typical output for the **association** keyword:

Router# **show interface cable 5/0 sid association**

| Sid | Prim | Online  | IP Address     | MAC Address    | Interface | VRF Name |
|-----|------|---------|----------------|----------------|-----------|----------|
| 1   |      | online  | 192.168.129.20 | 0003.e38f.e993 | Ca5/0.50  | green    |
| 2   |      | online  | 192.168.129.17 | 0003.e38f.e89d | Ca5/0.50  | green    |
| 3   |      | init(t) | 192.168.129.12 | 00d0.baa2.fb93 | Ca5/0.50  | green    |

The following example shows sample output for the **secondary-ip** keyword:

Router# **show interface cable 5/0 sid secondary-ip**

```

For sid 1 secondary ip list contains 2 address(es)
 192.168.129.20
 192.168.81.123
For sid 2 secondary ip list contains 2 address(es)

```

# show interface cable sid

```
192.168.129.17
10.10.11.3
```

## Tip

One possible situation that might occur is if a CM first assigns a secondary IP address to one CPE device, but later that same IP address is assigned to another CPE device behind a different CM. If this happens, the IP address will continue to show up as a secondary IP address for the original CM until that CM renews its public keys. This will not affect network connectivity for either CPE or CM. You can, however, clear the unneeded secondary IP address from the CMTS database using the **clear cable secondary-ip** command.

Table 228 describes the fields displayed by the **show interface cable sid** command.

**Table 228** *show interface cable sid Field Descriptions*

| Field                          | Description                                                                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sid                            | Service identification number.                                                                                                                                 |
| Prim Sid                       | The primary service identifier (SID) assigned to the modem.                                                                                                    |
| Type                           | Indicates that this SID was created statically at the time of registration or dynamically by the exchange of dynamic service messages between the CM and CMTS. |
| Online State<br>Offline State  | “Online” means that the modem owning this SID is processing traffic. “Offline” means that the modem owning this SID is not processing traffic.                 |
| Admin Status                   | “Disable” means that the SID has been turned off. “Enable” is the normal state.                                                                                |
| QoS                            | Quality of service.                                                                                                                                            |
| Create time                    | When the SID was created, number of seconds since the system booted.                                                                                           |
| Input octets (In octets)       | Number of octets received by using this SID.                                                                                                                   |
| Input packets (In packets)     | Number of packets received by using this SID.                                                                                                                  |
| Output octets (Out octets)     | Number of octets sent from this SID.                                                                                                                           |
| Output packets (Out packets)   | Number of packets sent from this SID.                                                                                                                          |
| IP address                     | IP address of the modem owning this SID.                                                                                                                       |
| MAC address                    | MAC address of the modem owning this SID.                                                                                                                      |
| BW requests received           | Number of bandwidth requests received by this SID.                                                                                                             |
| Grants issued                  | Number of bandwidth requests granted by this SID.                                                                                                              |
| Rate exceeded BW request drops | Number of bandwidth requests not granted by this SID.                                                                                                          |
| Rate exceeded DS packet drops  | Number of downstream packets lost by this SID.                                                                                                                 |
| Ratelimit BWReqDrop            | Number of bandwidth requests not granted by this SID.                                                                                                          |
| Ratelimit DSPktDrop            | Number of downstream packets lost by this SID.                                                                                                                 |
| 1st time online                | Time at which the modem with this SID connected.                                                                                                               |
| Times online                   | Number of times the modem with this SID connected.                                                                                                             |
| % online                       | Percentage of time the modem with this SID has been connected.                                                                                                 |

**Table 228**      *show interface cable sid Field Descriptions (continued)*

| Field                          | Description                                                                                                                                                                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Online time                    | The minimum, average, and maximum number of hours and minutes the modem with this SID has been connected.<br><br><b>Note</b> A CM is considered online when it has completed the registration process and has communicated with the DHCP, TFTP, and TOD servers.                    |
| Offline time                   | The minimum, average, and maximum number of hours and minutes the modem with this SID has been disconnected.<br><br><b>Note</b> A CM is considered offline after it has missed 16 consecutive station maintenance messages.                                                         |
| MaxSusRate                     | The maximum rate (0 to 4,294,967,295 bps).                                                                                                                                                                                                                                          |
| MinRsvRate                     | The minimum guaranteed rate (0 to 4,294,967,295 bps).                                                                                                                                                                                                                               |
| Sched Type                     | The service class schedule type:<br><br>2–Best-Effort Schedule Type<br>3–Non-Real-Time Polling Service Schedule Type<br>4–Real-Time Polling Service Schedule Type<br>5–Unsolicited Grant Service with Activity Detection Schedule Type<br>6–Unsolicited Grant Service Schedule Type |
| Grant Size                     | The grant size (0 to 65535 bytes).                                                                                                                                                                                                                                                  |
| Grant Interval                 | The grant interval (0 to 4294967295 microseconds).                                                                                                                                                                                                                                  |
| GPI                            | The grants per interval (0 to 127 grants).                                                                                                                                                                                                                                          |
| Poll Interval                  | The poll interval (0 to 4294967295 microseconds).                                                                                                                                                                                                                                   |
| Throughput                     | The overall throughput for this SID.                                                                                                                                                                                                                                                |
| VRF Name                       | Name of the virtual interface that has been configured for Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) operation.                                                                                                                                            |
| Fragment reassembly completed  | Number of packets that were subject to DOCSIS fragmentation that were successfully reassembled.<br><br><b>Note</b> This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.                                       |
| Fragment reassembly incomplete | Number of packets that were subject to DOCSIS fragmentation that have not yet been successfully reassembled.<br><br><b>Note</b> This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.                          |
| Concatenated packets received  | Number of packets that were subject to DOCSIS concatenation that were successfully received.<br><br><b>Note</b> This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.                                          |
| Good Codewords rx              | Number of FEC codewords received without error.                                                                                                                                                                                                                                     |

**Table 228**      *show interface cable sid Field Descriptions (continued)*

| Field                           | Description                                                                                                                                                                                                                        |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Corrected Codewords rx          | Number of FEC codewords received with errors that could be corrected.                                                                                                                                                              |
| Uncorrectable Codewords rx      | Number of FEC codewords received with errors that could not be corrected.                                                                                                                                                          |
| Concatenated packets received   | Number of concatenation headers received on an upstream service flow. (This field always shows 0 for the Cisco uBR10012 router, but you can use the docsQosUpstreamConcatBursts attribute in DOCS-QOS-MIB to get a current count.) |
| Fragmentation headers received  | Number of fragmentation headers received on an upstream service flow, regardless of whether the fragment was correctly reassembled into a valid packet. (See docsQosUpstreamFragments in DOCS-QOS-MIB.)                            |
| Fragmentation headers discarded | Number of upstream fragments discarded and not assembled into a valid upstream packet. (See docsQosUpstreamFragDiscards in DOCS-QOS-MIB.)                                                                                          |

# show interface cable signal-quality

To display information about the signal quality of a downstream port on a cable interface line card in a Cisco CMTS, use the **show interface cable signal-quality** command in privileged EXEC mode.

**show interface cable** { *slot/port* | *slot/subslot/port* } **signal-quality** [*n*]

**Cisco IOS Release 12.2(33)SCE and later**

**show interface cable** { *slot/cable-interface-index* | *slot/subslot/cable-interface-index* }  
**signal-quality** [*n*]

| Syntax Description           |                                                                                                                                                           |                                                                                                                                                                                                                                                                                    |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                  | Slot where the line card resides.                                                                                                                         | <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                         |
| <i>subslot</i>               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                              |                                                                                                                                                                                                                                                                                    |
| <i>port</i>                  | Downstream port number.                                                                                                                                   | <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                             |
| <i>cable-interface-index</i> | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. | <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> |
| <i>n</i>                     | (Optional) Identifies a particular upstream on the selected interface.                                                                                    |                                                                                                                                                                                                                                                                                    |

| Command History | Release     | Modification                                                                                                                                                                                                    |
|-----------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 11.3 XA     | This command was introduced.                                                                                                                                                                                    |
|                 | 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

Examples

The following is sample output from the **show interface cable signal-quality** command:

```
CMTS01# show interface cable 6/0 signal-quality
```

```
Cable6/0: Upstream 0 is up includes contention intervals: TRUE
```

[Table 229](#) describes the fields shown in the **show interface cable signal-quality** display.

**Table 229** *show interface cable signal-quality Field Descriptions*

| Field                                        | Description                            |
|----------------------------------------------|----------------------------------------|
| Cable                                        | Interface name.                        |
| Upstream is up includes contention intervals | States whether this statement is true. |

Tip

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

|----------------------------------------|-------------------------------------------------------------------------|
| <b>show interface cable downstream</b> | Displays cable interface information.                                   |
| <b>show interface cable sid</b>        | Displays information by SID of each cable access router on the network. |

# show interface cable upstream

To display information about an upstream on a cable interface, use the **show interface cable upstream** command in privileged EXEC mode.

**show interface cable** { *slot/port* | *slot/subslot/port* } **upstream** [*n*] [**ugs statistics** | **rate-adapt**]

**show interface cable** { *slot/port* | *slot/subslot/port* } **upstream** [**bonding-group**]

## Cisco IOS Release 12.2(33)SCE and later releases

**show interface cable** { *slot/cable-interface-index* | *slot/subslot/cable-interface-index* } **upstream** [*n*] [**ugs statistics** | **rate-adapt**]

**show interface cable** { *slot/cable-interface-index* | *slot/subslot/cable-interface-index* } **upstream** [**bonding-group** [*index*]]

| Syntax                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                  | Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                                                                  |
| <i>subslot</i>               | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>port</i>                  | Downstream port number. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                                                                                |
| <i>cable-interface-index</i> | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</li> </ul> |
| <i>n</i>                     | (Optional) Specific upstream to be displayed. Valid values start with 0 for the first upstream port on the cable interface line card.                                                                                                                                                                                                                                                                                                                                                         |
| <b>ugs statistics</b>        | (Optional) Displays statistics related to Unsolicited Grant Service (UGS) flows on the upstream.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>rate-adapt</b>            | (Optional) Displays whether a specific upstream is enabled or disabled for upstream utilization optimization.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>bonding-group</b>         | (Optional) Displays the bonding groups configured on an upstream port.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>index</i>                 | (Optional) Bonding group index value. Valid values are from 1 to 65535.                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Command Default** If no upstream is specified, all upstreams on the given cable interface are shown.

**Command Modes** Privileged EXEC (#)

**Command History** This table includes the following release-specific history entries:

- [BC Release](#)
- [C Release](#)
- [SC Release](#)
- [T Release](#)
- [X Release](#)

| BC Release   | Modification                                                                                                                                                                                                    |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(4)BC1   | The MAC-related information in this command was moved to the <b>show interface cable mac-scheduler</b> command for DOCSIS 1.1 operations.                                                                       |
| 12.2(15)BC1a | The <b>ugs statistics</b> keywords were added to Cisco IOS Release 12.2BC.                                                                                                                                      |
| 12.3BC       | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                      |
| 12.3(23)BC2  | The <b>rate-adapt</b> keyword was added.                                                                                                                                                                        |
| C Release    | Modification                                                                                                                                                                                                    |
| 12.1(4)CX1   | The MAC-related information in this command was moved to the <b>show interface cable mac-scheduler</b> command for DOCSIS 1.1 operations.                                                                       |
| SC Release   | Modification                                                                                                                                                                                                    |
| 12.2(33)SCA  | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                              |
| 12.2(33)SCB  | The <b>rate-adapt</b> keyword was integrated into Cisco IOS Release 12.2(33)SCB.                                                                                                                                |
| 12.2(33)SCC  | This command was modified. The <b>bonding-group</b> keyword was added in Cisco IOS Release 12.2(33)SCC.                                                                                                         |
| 12.2(33)SCD2 | This command was modified. The command output was modified to display the multiple transmit channel (MTC) mode cable modems that share a particular upstream channel in their transmit channel set (TCS).       |
| 12.2(33)SCE  | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |
| 12.2(33)SCE5 | This command was modified. The <b>show interface cable upstream</b> command output was modified to display a warning message when no ports are configured on an upstream.                                       |
| 12.2(33)SCG  | This command was modified. The <i>index</i> argument was added to the <b>bonding-group</b> keyword.                                                                                                             |
| T Release    | Modification                                                                                                                                                                                                    |
| 12.0(3)T     | This command was integrated into Cisco IOS Release 12.0(3)T.                                                                                                                                                    |
| X Release    | Modification                                                                                                                                                                                                    |

|           |                              |
|-----------|------------------------------|
| 11.3XA    | This command was introduced. |
| 12.0(7)XR | The output was expanded.     |

## Examples

The following is a sample output of the **show interface cable upstream** command (DOCSIS 1.0 Cisco IOS software releases) for the upstream cable interface located in slot 6 and port 0:

```
Router# show interface cable 6/0 upstream 0

Cable6/0: Upstream 0 is up
Received 855 broadcasts, 147 multicasts, 408833 unicasts
0 discards, 925 errors, 0 unknown protocol
409835 packets input, 20 uncorrectable
884 noise, 0 microreflections
Total Modems On This Upstream Channel : 51 (51 active)
Default MAC scheduler
Queue[Rng Polls] 0/64, fifo queueing, 0 drops
Queue[Cont Mslots] 0/52, fifo queueing, 1 drops
Queue[CIR Grants] 0/64, fair queueing, 0 drops
Queue[BE Grants] 0/64, fair queueing, 0 drops
Queue[Grant Shpr] 0/64, calendar queueing, 0 drops
Reserved slot table currently has 0 CBR entries
Req IEs 8296144, Req/Data IEs 0
Init Mtn IEs 57962, Stn Mtn IEs 14413
Long Grant IEs 133168, Short Grant IEs 67845
Avg upstream channel utilization : 6%
Avg percent contention slots : 89%
Avg percent initial ranging slots : 2%
Avg percent minislots lost on late MAPs : 0%
Total channel bw reserved 0 bps
CIR admission control not enforced
Admission requests rejected 0
Current minislot count : 6788097 Flag: 0
Scheduled minislot count : 6788190 Flag: 0
```

The following is a sample output of the **show interface cable upstream** command (DOCSIS 1.1 Cisco IOS software releases) for the upstream cable interface located in slot 6 and port 0:

```
Router# show interface cable 6/0 upstream 0

Upstream 0 is up
Received 38085 broadcasts, 5758 multicasts, 17257229 unicasts
0 discards, 1451132592 errors, 0 unknown protocol
17301072 packets input, 48239157 uncorrectable
1071719720 noise, 0 microreflections
Total Modems On This Upstream Channel : 147 (142 active)
```

The following is a sample output for the upstream cable interface located for the Cisco uBR10-MC5X20S and Cisco uBR-MC28U/X line cards, which provides information about the error counters maintained by the card onboard MAC controller for each upstream interface:

```
Router# show interface cable 6/1/0 upstream 0

Cable6/1/0: Upstream 3 is up
Received 140 broadcasts, 2075 multicasts, 134502 unicasts
0 discards, 144954 errors, 0 unknown protocol
136717 packets input, 0 uncorrectable
0 noise, 0 microreflections
Total Modems On This Upstream Channel : 37 (35 active)
JIB counters for ifInErrors:
```

**show interface cable upstream**

```

us_error_frame_drop 72477
us_crc_error 4
us_hcs_error 72473
us_cont_collision 0
us_uncorr_cw_rcvd 14

```

The following shows the sample output for the **ugs statistics** option:

```
Router# show interface cable 6/1/0 upstream 3 ugs statistics
```

```

UGS Statistics for Upstream 3
of Active UGS on the Upstream : 4

```

|             | UGS Allocation Statistics |     |     |
|-------------|---------------------------|-----|-----|
|             | max                       | min | avg |
| Last 1 Hour | 14                        | 3   | 4   |
| Last 5 Min  | 12                        | 5   | 5   |

The following shows the sample output for the **rate-adapt** option:

```
Router# show interface cable 6/1/0 upstream 0 rate-adapt
```

```

Global:Enabled US[0]:Enabled rate-adapt_total: 0
local:maps 500 pri 6, rate 150000 bcs 10 (10) fcms Off

```

The following example shows the segment information for upstream ports on cable interface 7/0/1:

```
Router#show interface cable 7/1/0 upstream
```

```

Cable7/1/0: Upstream 0 is up
 Received 1236 broadcasts, 0 multicasts, 312274 unicasts
 0 discards, 37623 errors, 0 unknown protocol
 313510 packets input
 Codewords: 315034 good 82 corrected 1 uncorrectable
 0 noise, 0 microreflections
 Total NON-MTC Modems On This Upstream Channel : 3 (3 active)
 Segments: 0 valid, 0 discarded
Cable7/1/0: Upstream 1 is up
 Received 0 broadcasts, 0 multicasts, 0 unicasts
 0 discards, 0 errors, 0 unknown protocol
 0 packets input
 Codewords: 0 good 0 corrected 0 uncorrectable
 0 noise, 0 microreflections
 Total NON-MTC Modems On This Upstream Channel : 0 (0 active)
 Segments: 0 valid, 0 discarded

```

Beginning in Cisco IOS Release 12.2(33)SCD2, the output of the **show interface cable upstream** command was modified to display the MTC mode cable modems that share a particular upstream channel in their TCS as shown in the following example:

```
Router# show interface cable 7/1/0 upstream 1
```

```

Cable7/1/0: Upstream 1 is up
 Received 1236 broadcasts, 0 multicasts, 312274 unicasts
 0 discards, 37623 errors, 0 unknown protocol
 313510 packets input
 Codewords: 315034 good 82 corrected 1 uncorrectable
 0 noise, 0 microreflections
 Total NON-MTC Modems On This Upstream Channel : 0(0 active)
 Total MTC Modems On This Upstream Channel : 3 (3 active)
 Segments: 0 valid, 0 discarded

```

The following example shows the bonding groups configured for upstream ports on the cable interface 7/0/1:

```
Router# show interface cable 7/1/0 upstream bonding-group
```

```
Cable7/1/0: Upstream Bonding Group 2
 0 packets input, 0 octets input
 Segments: 0 valid, 0 discarded, 0 lost
 Reserved Bandwidth Max : 0 bits/sec
 Reserved Bandwidth : 0 bits/sec
 Available Bandwidth : 2560000 bits/sec
 Total Service Flows On This Bonding Group: 0
Cable7/1/0: Upstream Bonding Group 12
 0 packets input, 0 octets input
 Segments: 0 valid, 0 discarded, 0 lost
 Reserved Bandwidth Max : 0 bits/sec
 Reserved Bandwidth : 0 bits/sec
 Available Bandwidth : 2560000 bits/sec
 Total Service Flows On This Bonding Group: 0
Cable7/1/0: Upstream Bonding Group 235
 0 packets input, 0 octets input
 Segments: 0 valid, 0 discarded, 0 lost
 Reserved Bandwidth Max : 0 bits/sec
 Reserved Bandwidth : 0 bits/sec
 Available Bandwidth : 15360000 bits/sec
 Total Service Flows On This Bonding Group: 0
```

#### Example of show interface cable upstream Command for Cisco IOS Release 12.2(33)SCE5

Starting with Cisco IOS Release 12.2(33)SCE5, the **show interface cable upstream** command output is modified to display a warning message when no ports are configured on an upstream.

The following example displays the output of the **show interface cable upstream** command for upstream 0:

```
Router# show interface cable 7/0/0 upstream 0
```

```
No upstream configured on mac-domain Cable7/0/0
```

The following example displays the output of the **show interface cable upstream** command with **ugs statistics** option:

```
Router# show interface cable 7/0/0 upstream 0 ugs statistics
```

```
No upstream configured on mac-domain Cable7/0/0
```

The following example displays the output of the **show interface cable upstream** command with **rate-adapt** option:

```
Router# show interface cable 7/0/0 upstream 0 rate-adapt
```

```
No upstream configured on mac-domain Cable7/0/0
```

[Table 1](#) describes the significant fields shown in the display.

**Table 230** *show interface cable upstream Field Descriptions*

| Field                                       | Description                                     |
|---------------------------------------------|-------------------------------------------------|
| Cable                                       | Location of the upstream interface.             |
| Upstream is up/<br>...administratively down | Administrative state of the upstream interface. |

**Table 230**      *show interface cable upstream Field Descriptions (continued)*

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Received broadcasts | Number of broadcast packets received through this upstream interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| multicasts          | Number of multicast packets received through this upstream interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| unicasts            | Number of unicast packets received through this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| discards            | Number of packets discarded by this interface, typically because of buffer overruns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| errors              | <p>Total of all packets with errors that prevented the transmission of the packets through this upstream interface. This figure could include the following error packets:</p> <ul style="list-style-type: none"> <li>• Collisions of request and request/data packets</li> <li>• Damaged frames received during request and request data requests or slots, typically because they had bad forward error correction (FEC) header checksums (HCS)</li> <li>• Damaged frames received from ranging requests</li> <li>• Data packets with unique word, collision, or no energy</li> <li>• Number of upstream bursts whose preamble or unique word could not be correctly received</li> <li>• Packets with at least one frame with an uncorrectable error</li> </ul> <p>On Broadband Processing Engine (BPE) cable interface line cards, such as the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U line cards, this counter also counts conditions such as HCS/CRC errors and collisions that occur during initial ranging requests and bandwidth requests. Compare this counter with the uncorrectable error counter from the <b>show cable hop</b> command to determine whether a problem with noise exists, or whether the counter is high only because a large number of CMs are trying to register.</p> |
| unknown protocol    | Number of packets received that were using an unknown protocol (the packet was not an IP, ARP, or PPPoE packet). This counter also includes DOCSIS frames that could not be identified as DOCSIS frames because of malformed headers or invalid header options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| packets input       | Number of frames received (broadcast, multicast, and unicast) through this upstream interface that were free from errors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| corrected           | Number of frames received through this upstream interface that had errors that were corrected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 230** *show interface cable upstream Field Descriptions (continued)*

| Field                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uncorrectable                                 | <p>Number of frames received through this upstream interface that had errors that could not be corrected. This means the frame had at least one uncorrectable FEC block, making the whole frame uncorrectable. Nominally, you should expect at most 1 uncorrectable error per 10,000 packets, and typically, the uncorrectable error rate is much less in good environments.</p> <p><b>Note</b> This counter is not supported on Broadband Processing Engine (BPE) cable interface line cards, such as the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U/H line cards, because these line cards count only uncorrectable codewords, not frames. As a result, this field always shows 0 or N/A for these line cards, depending on the software release. Instead of this field, use the <b>show cable hop</b> command to display the number of uncorrectable errors per codeword.</p> |
| noise                                         | Number of upstream packets of any type that were corrupted by line noise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| microreflections                              | <p>Approximate number of upstream packets corrupted by microreflections. Microreflections are a type of impairment that is caused by impedance mismatches between amplifiers, couples, cables, and other equipment in the cable plant. Microreflections create copies of a signal that arrive at the receiver with different amounts of delay and attenuation, generating intersymbol interference (ISI) that can cause the receiver to improperly detect the amplitude and phase of the incoming signal.</p> <p><b>Note</b> This value is not exact but provides an approximate indication of the microreflections that have been received.</p>                                                                                                                                                                                                                                                      |
| Guaranteed-rate service queue depth           | Number of bandwidth requests queued up in the Guarantee-rate queue. This queue is available only to CMs that have a reserved minimum upstream rate in their class of service (CoS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Best-effort service queue depth               | Number of bandwidth requests queued up in the Best-effort queue. This queue is available to all CMs that do not have any reserved rate on the upstream.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Total Modems On This Upstream Channel         | Number of CMs currently sharing this upstream channel. | Field                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Avg percent minislots lost on late MAP    | Average percent of slots that were lost because a MAP interrupt was too late.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Current Total Bandwidth Reserved          | Total amount of bandwidth reserved by all CMs sharing this upstream channel that require bandwidth reservation. The CoS for these CMs specifies some nonzero value for the guaranteed-upstream rate. When one of these CMs is admitted on the upstream, this field value is incremented by this guaranteed-upstream rate value.                                                                                                                                                                                                                    |
| CIR admission control                     | Status of admission control on the upstream channel.<br><br>ENFORCED status allows users to enable admission control on a per-port basis. This controls how limited bandwidth is allocated. NOT ENFORCED status indicates that there is no admission control. Every modem that registers with a class of service (COS) specifying a minimum upstream rate is admitted by the CMTS, regardless of how much aggregate bandwidth is actually available.<br><br>Users enable admission control via the admission control command-line interface (CLI). |
| Subscription Level                        | Amount of oversubscription to allow on this upstream channel, as configured with the <b>cable upstream admission-control</b> command. Oversubscription is expressed as a percentage of the raw capacity of the channel.                                                                                                                                                                                                                                                                                                                            |
| Reservation Limit (with Oversubscription) | Maximum cumulative bandwidth reservation allowable before rejecting new CMs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Admission requests rejected               | Number of CMs that attempted to register on this interface but were rejected because of the admission control policy that has been configured with the <b>cable upstream admission-control</b> command.                                                                                                                                                                                                                                                                                                                                            |
| Virtual channel bw                        | Maximum virtual bandwidth of this capacity, in bits per second (b/s), when admission control is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Last Minislot Stamp (current_time_base)   | Current minislot count at the CMTS. FLAG indicates the timebase reference. This field is used only by developers.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Last Minislot Stamp (scheduler_time_base) | Furthest minislot count allocated at the indicated time. FLAG indicates the timebase reference. This field is used by developers.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| # of Active UGS on the Upstream           | Number of Unsolicited Grant Service (UGS) flows that are currently active on the upstream.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 230** *show interface cable upstream Field Descriptions (continued)*

| Field                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UGS Allocation Statistics (max, min, avg) | Maximum number of UGS service flows, minimum number of UGS service flows, and average number of UGS service flows that have been allocated on the upstream over the last hour and last five minute period.                                                                                                                                                                                                                                            |
| Rate-adapt                                | Rate-adapt is enabled and any local upstream (US) configuration information: <ul style="list-style-type: none"> <li>• global—Rate-adapt is enabled globally.</li> <li>• US—Rate-adapt is enabled locally on a specific US.</li> <li>• pri—Indicates the priority setting for the local US.</li> <li>• rate—Indicates the minimum max-rate setting for the local US.</li> <li>• bcs—Indicates the number of broadcast contention minislots.</li> </ul> |

Table 2 describes the significant fields shown in the display:

**Table 231** *show interface cable upstream bonding-group Field Descriptions*

| Field                                     | Description                                                                                    |
|-------------------------------------------|------------------------------------------------------------------------------------------------|
| packets input                             | Number of drops, errors, and total number of packets received on each upstream.                |
| octets input                              | Number of octets received on the upstream.                                                     |
| Segments                                  | Number of valid segments, discarded segments and lost segments transmitted on a bonding group. |
| Reserved Bandwidth Max                    | Maximum amount of bandwidth reserved for a bonding group.                                      |
| Reserved Bandwidth                        | Amount of bandwidth reserved by all CMs sharing this upstream channel.                         |
| Available Bandwidth                       | Amount of bandwidth available on a bonding group.                                              |
| Total Service Flows on this Bonding Group | Number of service flows assigned to a particular bonding group.                                |

**Tip**

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a time stamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following is a sample output of the **show interface cable upstream bonding-group** command showing bonding group 2 configuration on the cable interface 7/0/1 in Cisco IOS Release 12.2(33)SCG:

```
Router# show interface cable 7/1/0 upstream bonding-group 2
```

```
30 seconds input rate 515470 bits/sec, 1000 packets/sec.
```

**Related Commands**

| Command                                    | Description                                                                          |
|--------------------------------------------|--------------------------------------------------------------------------------------|
| <b>show interface cable</b>                | Displays configuration and status information for the cable interface.               |
| <b>show interface cable downstream</b>     | Displays information about the downstream cable interface.                           |
| <b>show interface cable sid</b>            | Displays information by service identifier (SID) of each cable modem on the network. |
| <b>show interface cable signal-quality</b> | Displays information about the cable signal quality.                                 |

# show interface cable upstream debug

To display information about the Service ID (SID) tracking on a cable interface, use the **show interface cable upstream debug** command in privileged EXEC mode.

```
show interface cable slot/subslot/port upstream debug sid-tracking sid-value start-index
count-number {summary | verbose}
```

```
show interface cable slot/subslot/port upstream debug sid-tracking sid-value clear
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable slot/subslot/cable-interface-index upstream debug sid-tracking sid-value
start-index count-number {summary | verbose}
```

```
show interface cable slot/subslot/cable-interface-index upstream debug sid-tracking sid-value
clear
```

| Syntax Description                   |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                          | Slot where the line card resides. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul>                                                                                                                                                                       |
| <i>subslot</i>                       | (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.                                                                                                                                                                                                                                                                                                                                 |
| <i>port</i>                          | Downstream port number. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1.</li> <li>Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                                                                                                                   |
| <i>cable-interface-index</i>         | Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> |
| <b>sid-tracking</b> <i>sid-value</i> | Specifies the SID number for which SID tracking details are displayed. The valid range is from 1 to 8191.                                                                                                                                                                                                                                                                                                                                    |
| <i>start-index</i>                   | First event you want to display. Valid values are from 0 to 40000.                                                                                                                                                                                                                                                                                                                                                                           |
| <i>count-number</i>                  | Total number of events you want to display. Valid values are from 0 to 40000.                                                                                                                                                                                                                                                                                                                                                                |
| <b>summary</b>                       | (Optional) Displays the summary of events.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>verbose</b>                       | (Optional) Displays queuing and token bucket information for bandwidth requests.                                                                                                                                                                                                                                                                                                                                                             |
| <b>clear</b>                         | Clears the SID tracking data.                                                                                                                                                                                                                                                                                                                                                                                                                |

**Command Modes** Privileged EXEC (#)

| Command History | Release     | Modification                                                                                                                                                                                                    |
|-----------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(33)SCC | This command was introduced in Cisco IOS Release 12.2(33)SCC.                                                                                                                                                   |
|                 | 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

### Examples

The following is a sample output of the **show interface cable upstream debug** command on a cable interface line card in slot 5, subslot 0, and port 1:

```
router# show cable 5/0/1 upstream debug sid-tracking 35 0 40000
```

```

|------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>debug cable interface</b> | Displays debugging messages for a specific cable interface, or for traffic related to a specific MAC address or Service ID on that cable interface. |
|                  | <b>show interface cable</b>  | Displays configuration and status information for the cable interface.                                                                              |

# show interface gigabitethernet

To display status of the gigabitethernet interface, its MAC and IP address details, and information about the Downstream External PHY Interface (DEPI) traffic, use the **show interface gigabitethernet** command in privilege EXEC mode.

```
show interface gigabitethernet slot/subslot/{bay | port}
```

| Syntax Description |                                                                                            |                                                                                                                                                                                                                                                                                                                                                                |

|                 | 12.2(33)SCE | This command was introduced.                                                                                                  |
|                 | 12.2(33)SCG | This command was modified. The status of the output flow-control and input flow-control in the output is displayed correctly. |

**Examples**

This is a sample output for the **show interface gigabitethernet** command:

```
Router# show interface gigabitethernet 6/1/0
GigabitEthernet6/1/0 is up, line protocol is up
Hardware is Gigabit Ethernet MAC Controller, address is 0013.5f06.7f74 (bia
0013.5f06.7f74)
Internet address is 56.1.1.1/24
MTU 1500 bytes, BW 10000 Kbit, DLY 10 usec,
 reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive not set
Full Duplex, 1000Mbps, link type is auto, media type is SX
output flow-control is unsupported, input flow-control is unsupported
ARP type: ARPA, ARP Timeout 04:00:00
Last input 00:00:01, output 00:00:00, output hang never
Last clearing of "show interface" counters never
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 8
Interface GigabitEthernet6/1/0 queueing strategy: PXF Class-based
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
 2557 packets input, 541995 bytes, 0 no buffer
 Received 0 broadcasts (0 IP multicasts)
 0 runs, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 watchdog, 0 multicast, 0 pause input
 723 packets output, 52113 bytes, 0 underruns
 0 output errors, 0 collisions, 1 interface resets
 0 babbles, 0 late collision, 0 deferred
 0 lost carrier, 0 no carrier, 0 pause output
 0 output buffer failures, 0 output buffers swapped out
Router#
```

Starting from Cisco IOS Release 12.2(33)SCG, the **show interface gigabitethernet** command was modified to display the correct status of the output and input flow-control parameters. This change is applicable only to Cisco SPA-5X1G and Cisco SPA-1X10G shared port adapters.

The following example shows the changed output of the **show interface gigabitethernet** command:

```
Router# show interface gigabitethernet1/2/3
Load for five secs: 5%/0%; one minute: 8%; five minutes: 8%
Time source is NTP, 14:25:51.761 CST Wed Feb 20 2013
GigabitEthernet1/2/3 is down, line protocol is down
Hardware is GigEther SPA, address is 649e.f366.b71d (bia 649e.f366.b71d)
MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
 reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
Full Duplex, 1000Mbps, link type is auto, media type is LX
output flow-control is on, input flow-control is on
ARP type: ARPA, ARP Timeout 04:00:00
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Interface GigabitEthernet1/2/3 queueing strategy: PXF Class-based
30 second input rate 0 bits/sec, 0 packets/sec
30 second output rate 0 bits/sec, 0 packets/sec
 0 packets input, 0 bytes, 0 no buffer
 Received 0 broadcasts (0 IP multicasts)
 0 runs, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 watchdog, 0 multicast, 0 pause input
 0 packets output, 0 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
```

show interface gigabitethernet

```
0 babbles, 0 late collision, 0 deferred
0 lost carrier, 0 no carrier, 0 pause output
0 output buffer failures, 0 output buffers swapped out
Router#
```

# show interface integrated-cable

To display the current configuration and status for an integrated channel, use the **show interface integrated-cable** command in privileged EXEC mode.

**Cisco uBR10012 Router**

**show interface integrated-cable** *slot/subslot/port: interface-number* [*options*]

**Cisco uBR7246VXR and Cisco uBR7225VXR Routers**

**show interface integrated-cable** *slot/port: interface-number* [*options*]

| Syntax Description | <i>slot/subslot/port</i> | <ul style="list-style-type: none"><li><i>slot</i>—Slot where the line card resides. The valid range is from 5 to 8.</li><li><i>subslot</i>—Subslot where the line card resides. The available slots are 0 or 1.</li><li><i>port</i>—Downstream controller number on the line card. The valid <i>port</i> values are 0 to 4.</li></ul>                                                                                     |
|--------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>slot/port</i>         | On the Cisco uBR7225VXR or Cisco uBR7246VXR routers: <ul style="list-style-type: none"><li><i>slot</i>—Slot where the line card resides.<ul style="list-style-type: none"><li>Cisco uBR7225VXR router—The valid range is from 1 to 2.</li><li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li></ul></li><li><i>port</i>—Downstream controller number on the line card. The valid values are 0 or 1.</li></ul> |
|                    | <i>interface-number</i>  | Integrated cable interface number. The valid range is from 0 to 3.                                                                                                                                                                                                                                                                                                                                                        |

---

*options*

The following non-cable specific options generate information for integrated cable interfaces:

- **accounting**—Displays the number of packets of each protocol type that is sent through the interface.
  - **controller**—Displays the status of the interface, configuration, and controller.
  - **counters**—Displays the integrated cable interface counters.
  - **crb**—Displays the interface routing and bridging information.
  - **db**s—Displays the Dynamic Bandwidth Sharing (DBS) scheduler information.
  - **description**—Displays the description entered for the interface.
  - **d**lm—Displays the DEPI Latency Measurement (DLM) statistics.
  - **downstream**—Displays the downstream information.
  - **fair-queue**—Displays the integrated cable interface Weighted Fair Queuing (WFQ) information.
  - **irb**—Displays the interface routing and bridging information.
  - **mac-accounting**—Displays the interface MAC accounting information.
  - **monitor**—Displays the status of the interface continuously.
  - **m**pls-exp—Displays the interface Multiprotocol Label Switching (MPLS) experimental accounting information.
  - **multicast-gcr**—Displays the multicast QoS (MQoS) GCR details.
  - **multicast-sessions**—Displays information about the multicast sessions on the integrated-cable interface.
  - **precedence**—Displays interface precedence accounting information.
  - **privacy**—Displays privacy group information.
  - **random-detect**—Displays the interface Weighted Random Early Detection (WRED) information.
  - **stats**—Displays packets that are switched.
  - **summary**—Displays interface summary information.
  - **switching**—Displays interface switching information.
-

**Command Modes**

Privileged EXEC (#)

**Command History**

| Release     | Modification                                                                                                                            |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCC | This command was introduced on the Cisco uBR10012 router.                                                                               |
| 12.2(33)SCD | This command was integrated on the Cisco uBR7246VXR and Cisco uBR7225VXR routers.                                                       |
| 12.2(33)SCF | This command was modified. The <b>downstream</b> keyword was enhanced to capture fairness across DOCSIS interfaces related information. |

**Usage Guidelines**

Some other non-cable specific options do not generate any meaningful information for integrated-cable interfaces. For information on the non-cable specific options, see the Cisco IOS Release 12.3 documentation on [Cisco.com](http://Cisco.com).

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to the **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Examples**

The following is a sample output of the **show interface integrated-cable accounting** command:

```
Router# show interface integrated-cable 7/0/0:0 accounting
```

| Protocol | Pkts In | Chars In | Pkts Out | Chars Out |
|----------|---------|----------|----------|-----------|
| IP       | 0       | 0        | 280      | 41606     |

The following is a sample output of the **show interface integrated-cable dbs** command:

```
Router# show interface integrated-cable 3/0:0 dbs
```

```
Dynamic Bandwidth Sharing is enabled
active 0
RF 0: tokens 23342, active 0, policer 4687 KB/s, max_tokens 23435
 deficit counter 0, quantum 6000
 ticks_limit: 62500, max_ticks:625000, policer(ticks): 312
```

The following is the sample output of the **show interface integrated-cable description** command:

```
Router# show interface integrated-cable 7/0/0:0 description
```

```
Interface Status Protocol Description
In7/0/0:0 up up
tfchan_ubr10k_1#show interface integrated-cable 7/0/0:0 downstream
In7/0/0:0: Downstream is up
 Total Modems 5 (5 active), Total Flows 6
 Total downstream bandwidth: 18750 Kbps
 Total downstream reserved/reservable bandwidth: 2002/15000 Kbps
```

The following is the sample output of the **show interface integrated-cable downstream** command:

```
Router# show interface integrated-cable 7/0/0:0 downstream
```

```
In7/0/0:0: Downstream is up
 Total Modems 5 (5 active), Total Flows 6
 Total downstream bandwidth: 18750 Kbps
 Total downstream reserved/reservable bandwidth: 2002/15000 Kbps
```

The following is the sample output of the **show interface integrated-cable irb** command:

## show interface integrated-cable

```
Router# show interface integrated-cable 7/0/0:0 irb
```

```
Integrated-Cable7/0/0:0
tfchan_ubr10k_1#show interface integrated-cable 7/0/0:0 multicast-gcr
Group Classifier Rules on Integrated-Cable7/0/0:0:
Classifier_id Group_id Group_Qos_id Sid SFID ref_count Key
1 1 1 8196 16 1 0
```

The following is a sample output of the **show interface integrated-cable multicast-gcr** command:

```
Router# show interface integrated-cable 5/1/2:0 multicast-gcr
```

```
Group Classifier Rules on Integrated-Cable7/0/0:0:
Classifier_id Group_id Group_Qos_id Sid SFID ref_count Key
1 1 1 8196 16 1 0
```

The following is a sample output of the **show interface integrated-cable multicast-sessions** command:

```
Router# show interface integrated-cable 5/1/2:0 multicast-sessions
```

```
Default Multicast Service Flow 53 on Integrated-Cable 5/1/2:0

 2 8252 64 31 2 1
 1 8253 65 32 1 1
```

### Example of the Updated show interface integrated-cable downstream Command Output in Cisco IOS Release 12.2(33)SCF

The following is a sample output of the **show interface integrated-cable downstream** command:

```
Router# show interface integrated-cable 6/1/0:0 downstream
```

```
In6/1/0:0: Downstream is up
Total Modems 1 (1 active), Total Flows 2
Total downstream bandwidth: 375 Kbps
Total downstream reserved/reservable bandwidth: 0/300 Kbps
Total downstream guaranteed/non-guaranteed bonus bandwidth: 20025/10012 Kbps
```

# show interface integrated-cable queue

To display the downstream hierarchical queueing framework (HQF) queue information for an integrated cable interface, use the **show interface integrated-cable queue** command in privileged EXEC mode.

**show interface integrated-cable** *slot/port:sub-interface* **queue** [**verbose** | **cblt** [*cblt\_index* | *priority*] | **pblt**]

| Syntax Description |                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot/port</i>   | <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router—The valid range is from 1 to 2.</li> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> </ul> </li> <li><i>port</i>—Downstream controller number on the line card. The valid <i>port</i> values are 0 or 1.</li> </ul> |
| <b>verbose</b>     | (Optional) Displays detailed information for all queues                                                                                                                                                                                                                                                                                                                                  |
| <b>cblt</b>        | (Optional) Displays detailed class layer bandwidth limited traffic (CBLT) stream information for normal downstream HQF queues.                                                                                                                                                                                                                                                           |
| <i>cblt_index</i>  | CBLT index information.                                                                                                                                                                                                                                                                                                                                                                  |
| <i>priority</i>    | Displays CBLT information for priority HQF queues. Priority queues do not have any indexes.                                                                                                                                                                                                                                                                                              |
| <b>pblt</b>        | (Optional) Displays detailed physical layer bandwidth limited traffic (PBLT) stream information for this interface.                                                                                                                                                                                                                                                                      |

[Table 232](#) describes the fields shown in the **show interface integrated-cable** command display.

**Table 232** *show interface integrated-cable – Field Description*

| Field          | Description                                                 |
|----------------|-------------------------------------------------------------|
| Len/Limit Pkts | Queue length and limit in packets.                          |
| Deqs Pkts      | Dequeue packets                                             |
| Drops Pkts     | Dropped packets.                                            |
| CIR Kbps       | Committed information rate, in kilobytes per second.        |
| MIR/PR Kbps    | Maximum information and peak rate, in kilobytes per second. |
| Forwint        | Forwarding interface.                                       |
| BE Queues      | Best effort queues.                                         |

**Table 232** *show interface integrated-cable – Field Description (continued)*

| Field              | Description                         |
|--------------------|-------------------------------------|
| CIR Queues         | Committed information rate queues.  |
| Low Latency Queues | Low latency queues.                 |
| sfid               | Service flow identification number. |

|---------------|---------------------|

| Command History | Release     | Modification                                                                                                                                                                                                   |
|-----------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.3(23)BC  | This command was introduced.                                                                                                                                                                                   |
|                 | 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> . |
|                 | 12.2(33)SCF | This command was modified. The <b>downstream</b> keyword was enhanced to capture fairness across DOCSIS interfaces related information.                                                                        |

## Examples

The following is sample output of the **show interface modular-cable** command:

```
Router# show interface modular-cable 1/0/0:0

Modular-Cable3/0/0:0 is up, line protocol is up
 Hardware is CMTS MC interface, address is 0011.9221.84be (bia 0011.9221.84be)
 MTU 1500 bytes, BW 539 Kbit, DLY 1000 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation MCNS, loopback not set
```

```

Keepalive set (10 sec)
ARP type: ARPA, ARP Timeout 04:00:00
Last input never, output 00:09:57, output hang never
Last clearing of "show interface" counters never
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: PXF First-In-First-Out
Output queue 0/64, 0 drops; input queue 0/75, 0 drops
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
 0 packets input, 0 bytes, 0 no buffer
 Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
 107 packets output, 16302 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 output buffer failures, 0 output buffers swapped out

```

The following is sample output of the **show interface modular-cable** command with **downstream** keyword:

```
Router# show interface modular-cable 1/0/0:1 downstream
```

```

Mol/0/0:1: Downstream is up
Total Modems 0 (0 active), Total Flows 1
Total downstream bandwidth: 3750 Kbps
Total downstream reserved/reservable bandwidth: 0/3000 Kbps
Total downstream guaranteed/non-guaranteed bonus bandwidth: 10644/10643 Kbps

```

|                 | 12.2(33)SCC | This command was introduced. |

Examples The following is sample output of the **show interface modular-cable dlm** command for the modular cable interface in slot 1, bay 0, port 0, and modular-cable interface number 6:

```
Router# show interface Modular-Cable 1/0/0:6 dlm

DEPI Latency Measurements for Modular-Cable1/0/0:6
Current CIN Delay: 146 usecs
Current DLM: 4566
Average DLM (last 10): 1514
Max DLM: 5115
Min DLM: 913
Ingress DLM
SysUpTime Delay (Ticks)
x-----x-----x-----
0 831149 949
1 831159 1168
2 831170 4566
3 831076 1005
4 831087 983
5 831097 1185
6 831108 1139
7 831118 1144
8 831128 2013
9 831139 996
```

Table 233 describes the significant fields shown in the display.

**Table 233** *show interface modular-cable Field Descriptions*

| Field                 | Description                            |
|-----------------------|----------------------------------------|
| Current CIN Delay     | Current CIN delay value.               |
| Current DLM           | Current DLM value.                     |
| Average DLM (last 10) | Average DLM value.                     |
| Max DLM               | Maximum DLM .                          |
| Min DLM               | Minimum DLM.                           |
| SysUpTime             | The system up or active time.          |
| Delay (Ticks)         | The delay measured as number of ticks. |

| <b>rf-channel network-delay</b>                | Configures the network delay for an RF channel on a Wideband SPA. |

# show interface modular-cable downstream

To display downstream information for the narrowband channel, use the **show interface modular-cable downstream** command in privileged EXEC mode.

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

**show interface modular-cable** {*slot/subslot/bay:nb-channel-number*} **downstream**

Cisco IOS Release 12.2(33)SCB

**show interface modular-cable** {*slot/bay/port:nb-channel-number*} **downstream**

Syntax Description

|                          |                                                                                                 |
|--------------------------|-------------------------------------------------------------------------------------------------|
| <i>slot</i>              | The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs. |
| <i>subslot</i>           | The subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.   |
| <i>bay</i>               | The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).      |
| <i>port</i>              | Specifies the interface number on the SPA.                                                      |
| <i>nb-channel-number</i> | Represents the narrowband channel number.                                                       |

|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(23)BC  | This command was introduced for the Cisco uBR10012 router.                                                                                                                                                     |
| 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> . |

Examples

The following is sample output from the **show interface modular-cable downstream** command for the modular cable interface in slot 1, subslot 0, bay 0, and narrowband channel number 0:

```
Router# show interface modular-cable 1/0/0:0 downstream
Mo1/0/0:0: Downstream is up
 Total Modems 5 (5 active), Total Flows 6
 Total downstream bandwidth: 1940 Kbps
 Total downstream reserved bandwidth: 200 Kbps
```

# show interface modular-cable stats

To display interface packets and octets that were switched, use the **show interface modular-cable stats** command in privileged EXEC mode.

## Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

**show interface modular-cable** {*slot/subslot/bay:nb-channel-number*} **stats**

## Cisco IOS Release 12.2(33)SCB

**show interface modular-cable** {*slot/bay/port:nb-channel-number*} **stats**

| Syntax Description       |  |                                                                                                 |
|--------------------------|--|-------------------------------------------------------------------------------------------------|
| <i>slot</i>              |  | The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs. |
| <i>subslot</i>           |  | The subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.   |
| <i>bay</i>               |  | The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).      |
| <i>port</i>              |  | Specifies the interface number on the SPA.                                                      |
| <i>nb-channel-number</i> |  | Represents the narrowband channel number.                                                       |

**Command Default** No default behavior or values

**Command Modes** Privileged EXEC (#)

| Command History | Release     | Modification                                                                                                                                                                                                   |
|-----------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.3(23)BC  | This command was introduced for the Cisco uBR10012 router.                                                                                                                                                     |
|                 | 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> . |

**Examples** The following is sample output from the **show interface modular-cable stats** command for the modular cable interface in slot 1, subslot 0, bay 0, and narrowband channel number 0:

```
Router# show interface modular-cable 1/0/0:0 stats
Modular-Cable1/0/0:0
 Switching path Pkts In Chars In Pkts Out Chars Out
 Processor 0 0 0 0
 Route cache 0 0 509 41582
 Total 0 0 509 41582
```

|-------------------------|-----------------------------------------------------------------------|

Examples

The following example shows a sample output for the **show interface multicast-gcr** command:

```
Router# show interface wideband-cable 1/1/0:0 multicast-gcr

Group Classifier Rules on Wideband-Cable1/1/0:0:
Classifier_id Group_id Group_Qos_id Sid SFID ref_count
7 1 1 8196 10 1
8 2 1 8197 11 1
```

Table 234 describes the significant fields shown in the display.

**Table 234** show interface multicast-gcr Field Descriptions

| Field         | Description                                                             |
|---------------|-------------------------------------------------------------------------|
| Classifier_id | Displays group classifier ID.                                           |
| Group_id      | Displays group ID number of the Group Classifier Rules.                 |
| Group_Qos_id  | Displays group QoS ID number of the Group Classifier Rules.             |
| Sid           | Displays information for the service identifier on the cable interface. |
| SFID          | Displays service flow identifier (SFID).                                |
| ref_count     | Displays the reference count.                                           |

| Command                           | Description                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| show interface cable service-flow | Displays the attributes of DOCSIS service flows on a given cable interface.                                     |
| show cable multicast db           | Displays the contents of multicast explicit tracking database.                                                  |
| show cable multicast qos          | Displays the configuration information for MQoS, (Group-Config, Group-QoS-Config, and Group-Encryption-Config). |

# show interface port-channel

To display the EtherChannel interfaces and channel identifiers, with their mode and operational status, use the **show interface port-channel** command in privileged EXEC mode.

```
show interface port-channel {number}
```

## Syntax Description

|        |                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------|
| number | Optional value enables the display of information for one port channel interface number. The range is from 1 to 64. |
|--------|---------------------------------------------------------------------------------------------------------------------|

## Defaults

No default behaviors or values.

## Command Modes

Privileged EXEC

## Command History

| Release     | Modification                                                |
|-------------|-------------------------------------------------------------|
| 12.2(11)BC3 | This command was introduced on the Cisco uBR7246VXR router. |
| 12.2(9a)BC  | This command was introduced on the Cisco uBR10012 router.   |

## Examples

The following example illustrates Gigabit EtherChannel (GEC) information for the port-channel interface of 2 as configured on a Cisco uBR10012 router with the PRE2 performance routing engine model.

This configuration is comprised of three GEC port channels as follows:

- Member 0 is the GEC interface bundle master.
- Member 2 is the final slave interface in this GEC group.
- These three port-channel interfaces (members) comprise one GEC group that is set up with a GEC peer on the network.

```
Router# show interface port-channel 2
Port-channel2 is up, line protocol is up
 Hardware is GEChannel, address is 8888.8888.8888 (bia 0000.0000.0000)
 Internet address is 101.101.101.1/16
 MTU 1500 bytes, BW 3000000 Kbit, DLY 10 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation ARPA, loopback not set
 Keepalive set (10 sec)
 ARP type: ARPA, ARP Timeout 04:00:00
 No. of members in this channel: 3
 No. of configured members in this channel: 3
 No. of passive members in this channel: 0
 No. of active members in this channel: 3
 Member 0 : GigabitEthernet1/0/0 , Full-duplex, 1000Mb/s
 Member 1 : GigabitEthernet3/0/0 , Full-duplex, 1000Mb/s
 Member 2 : GigabitEthernet2/0/0 , Full-duplex, 1000Mb/s
 No. of Non-active members in this channel: 0
```

**show interface port-channel**

```

Last input 00:00:02, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 0/225/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/120 (size/max)
30 second input rate 17292000 bits/sec, 9948 packets/sec
30 second output rate 17315000 bits/sec, 9935 packets/sec
 866398790 packets input, 3324942446 bytes, 0 no buffer
 Received 2 broadcasts, 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 watchdog, 0 multicast, 0 pause input
 0 input packets with dribble condition detected
866394055 packets output, 3323914794 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 babbles, 0 late collision, 0 deferred
 0 lost carrier, 0 no carrier, 0 pause output
 0 output buffer failures, 0 output buffers swapped out

```

The following example illustrates GEC information for the port-channel interface of 2 as configured on a Cisco uBR7246VXR router.

This configuration is comprised of three port-channel interfaces (members) as follows:

- Member 0 is the GEC interface bundle master.
- Member 2 is the final slave interface in this GEC group.
- These three port-channel interfaces (members) comprise one GEC group that is set up with a GEC peer on the network.

```

Router# show interfaces port-channel 2
Port-channel2 is up, line protocol is up
 Hardware is GEChannel, address is 000b.bf7d.9c01 (bia 000b.bf7d.9c00)
 Internet address is 101.101.101.2/16
 MTU 1500 bytes, BW 3000000 Kbit, DLY 10 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation ARPA, loopback not set
 Keepalive set (10 sec)
 ARP type: ARPA, ARP Timeout 04:00:00
 No. of members in this channel: 3
 No. of configured members in this channel: 3
 No. of passive members in this channel: 0
 No. of active members in this channel: 3
 Member 0 : GigabitEthernet0/3 , Full-duplex, 1000Mb/s
 Member 1 : GigabitEthernet0/2 , Full-duplex, 1000Mb/s
 Member 2 : GigabitEthernet0/1 , Full-duplex, 1000Mb/s
 No. of Non-active members in this channel: 0
 Last input 00:13:48, output never, output hang never
 Last clearing of "show interface" counters never
 Input queue: 0/225/0/0 (size/max/drops/flushes); Total output drops: 0
 Queueing strategy: fifo
 Output queue: 0/120 (size/max)
 30 second input rate 17358000 bits/sec, 9999 packets/sec
 30 second output rate 17359000 bits/sec, 10000 packets/sec
 868633935 packets input, 3809968911 bytes, 0 no buffer
 Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 watchdog, 0 multicast, 0 pause input
 0 input packets with dribble condition detected
 868642883 packets output, 3811242413 bytes, 0 underruns
 2 output errors, 0 collisions, 0 interface resets
 0 babbles, 0 late collision, 0 deferred
 2 lost carrier, 0 no carrier, 0 pause output
 0 output buffer failures, 0 output buffers swapped out

```

The following example illustrates FastEtherChannel (FEC) information for the specified port channel interface as configured on a Cisco uBR7246VXR router.

This configuration is comprised of four port channel interfaces (members) as follows:

- Member 0
- Member 0 is the GEC interface bundle master.
- Member 3 is the final slave interface in this FEC group.
- These four port-channel interfaces (members) comprise one FEC group that is set up with an FEC peer on the network.

```
Router# show interfaces port-channel 1
Port-channel1 is up, line protocol is up
 Hardware is FEChannel, address is 000b.bf7d.9c1c (bia 000b.bf7d.9c00)
 Description: test
 Internet address is 100.100.100.1/24
 MTU 1500 bytes, BW 400000 Kbit, DLY 100 usec,
 reliability 255/255, txload 11/255, rxload 11/255
 Encapsulation ARPA, loopback not set
 Keepalive set (10 sec)
 ARP type: ARPA, ARP Timeout 04:00:00
 No. of members in this channel: 4
 No. of configured members in this channel: 4
 No. of passive members in this channel: 0
 No. of active members in this channel: 4
 Member 0 : FastEthernet2/1 , Full-duplex, 100Mb/s
 Member 1 : FastEthernet2/0 , Full-duplex, 100Mb/s
 Member 2 : FastEthernet1/1 , Full-duplex, 100Mb/s
 Member 3 : FastEthernet1/0 , Full-duplex, 100Mb/s
 No. of Non-active members in this channel: 0
 Last input 00:14:48, output never, output hang never
 Last clearing of "show interface" counters never
 Input queue: 0/300/0/0 (size/max/drops/flushes); Total output drops: 0
 Queueing strategy: fifo
 Output queue: 0/160 (size/max)
 30 second input rate 17358000 bits/sec, 9998 packets/sec
 30 second output rate 17357000 bits/sec, 9998 packets/sec
 869366601 packets input, 3968956491 bytes
 Received 3 broadcasts, 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 watchdog
 0 input packets with dribble condition detected
 868944538 packets output, 3876736548 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 babbles, 0 late collision, 0 deferred
 0 lost carrier, 0 no carrier
 0 output buffer failures, 0 output buffers swapped out
```

# show interface rf-status

To display the logical UP and DOWN state for each of the configured RF channels for a wideband interface, use the **show interface rf-status** command in privileged EXEC mode.

**Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Routers**

```
show interface wideband-cable slot/port:wideband-channel rf-status
```

**Cisco uBR10012 Universal Broadband Router**

```
show interface wideband-cable slot/bay/port:wideband-channel rf-status
```

**Syntax Description**

|                         |                                                                                                                                                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>             | Slot where the line card resides.<br><br>Cisco uBR7246VXR router—The valid range is from 3 to 6.<br><br>Cisco uBR7225VXR router—The valid range is from 1 to 2.<br><br>Cisco uBR10012 router—The valid range is from 5 to 8. Slots 1 and 3 can be used for SIPs. |
| <i>bay</i>              | The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).                                                                                                                                                                       |
| <i>port</i>             | Specifies the downstream port number.                                                                                                                                                                                                                            |
| <i>wideband-channel</i> | Represents the wideband channel number.                                                                                                                                                                                                                          |

**Command Default**

The default logical state of each channel is UP.

**Command Modes**

Privileged EXEC (#)

**Command History**

| Release     | Modification                                                                                    |
|-------------|-------------------------------------------------------------------------------------------------|
| 12.2(33)SCB | This command was introduced.                                                                    |
| 12.2(33)SCD | This command was modified. Support was added for Cisco uBR7225VXR and Cisco uBR7246VXR routers. |

**Usage Guidelines**

The default logical state of each channel is UP. The state is set to DOWN when the threshold configured using **cable rf-change-trigger** command is reached.

**Examples**

The following is a sample output of the **show interface rf-status** command on a wideband cable interface on a Cisco uBR10012 router:

```
Router# show interface wideband-cable 1/0/0:3 rf-status
```

```

 Logical
RF Status
-- -----
17 UP
18 UP
19 UP

```

The following is a sample output of the **show interface rf-status** command on a wideband cable interface on a Cisco uBR7225VXR router:

```
Router# show interface Wideband-Cable 5/1:0 rf-status
```

```

 Logical
Resource RF Status

5/1 0 UP
 1 UP
 2 UP

```

[Table 235](#) describes the significant fields shown in the display.

**Table 235** *show interface rf-status Field Descriptions*

| Field          | Description                                                 |
|----------------|-------------------------------------------------------------|
| Resource       | The interface information.                                  |
| RF             | Cable interface line card or SPA downstream channel number. |
| Logical Status | The logical status of the RF channel. Default is UP.        |

**Related Commands**

| Command                     | Description                                    |
|-----------------------------|------------------------------------------------|
| <b>show cable rf-status</b> | Displays the logical state of all RF channels. |

# show interface wideband-cable

To display the current configuration and status for a wideband channel, use the **show interface wideband-cable** command in privileged EXEC mode.

### Syntax Description

|                         |                                                                                                                                                                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>             | Slot where a SIP or line card resides. <ul style="list-style-type: none"> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>Cisco uBR7225VXR router—The valid range is from 1 to 2.</li> <li>Cisco uBR10012 router—The valid range is from 5 to 8, and slots 1 and 3 can be used for SIP.</li> </ul> |
| <i>subslot</i>          | Subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.                                                                                                                                                                                                                               |
| <i>bay</i>              | Bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).                                                                                                                                                                                                                                  |
| <i>port</i>             | Specifies the port number. <ul style="list-style-type: none"> <li>Cisco uBR7246VXR router and Cisco uBR7225VXR router—The valid range is from 0 to 1.</li> <li>Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                      |
| <i>wideband-channel</i> | Represents the wideband channel number. Valid values are from 0 to 31. On the Cisco uBR7246VXR and Cisco uBR7225VXR routers, the valid values are from 0 to 5.                                                                                                                                                          |

*options*

The following non-cable specific options generate information for wideband cable interfaces:

- **accounting**—Displays the number of packets of each protocol type that was sent through the interface.
- **description**—Displays the description entered for the interface.
- **dbb**—Displays DBS scheduler information. The **dbb** option is available only on the Cisco uBR7225VXR and Cisco uBR7246VXR routers.
- **downstream**—Displays reserved and reservable bandwidth information.
- **multicast-sessions**—Displays information about the multicast sessions on a specific wideband-cable interface.
- **privacy**—Displays privacy group information.
- **service-flow**—Displays the attribute-based assignment of service flows on a cable interface.
- **stats**—Displays packets that were switched.
- **summary**—Displays interface summary information.

**Command Modes**

Privileged EXEC (#)

**Command History**

| Release     | Modification                                                                                                                                                  |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(21)BC  | This command was introduced on the Cisco uBR10012 router.                                                                                                     |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                                                               |
| 12.2(33)SCB | This command was modified to change the addressing format for a wideband cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .               |
| 12.2(33)SCD | This command was modified. Support was added for Cisco uBR7225VXR and Cisco uBR7246VXR routers. The <b>dbb</b> , and <b>service-flow</b> keywords were added. |
| 12.2(33)SCF | This command was modified. The <b>downstream</b> keyword was enhanced to capture fairness across DOCSIS interfaces related information.                       |

**Usage Guidelines**

Some of the non-cable specific options do not generate any meaningful information for wideband cable interfaces. For information on the non-cable specific options, see the Cisco IOS Release 12.3 documentation on [Cisco.com](http://Cisco.com).

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

## Examples

The following is a sample output for the **show interface wideband-cable** command:

```
Router# show interface wideband-cable 1/0/0:1

Wideband-Cable1/0/0:1 is up, line protocol is up
 Hardware is Wideband CMTS Cable interface, address is 0012.001a.8897 (bia
0012.001a.8897)
 MTU 1500 bytes, BW 74730 Kbit, DLY 1000 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation MCNS, loopback not set
 Keepalive set (10 sec)
 ARP type: ARPA, ARP Timeout 04:00:00
 Last input never, output 00:00:09, output hang never
 Last clearing of "show interface" counters never
 Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
 Queueing strategy: fifo
 Output queue: 0/40 (size/max)
 30 second input rate 0 bits/sec, 0 packets/sec
 30 second output rate 0 bits/sec, 0 packets/sec
 0 packets input, 0 bytes, 0 no buffer
 Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
 24224 packets output, 1222002 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 output buffer failures, 0 output buffers swapped out
```

The following is a sample output for the **show interface wideband-cable accounting** command:

```
Router# show interface wideband-cable 1/0/0:0 accounting

Wideband-Cable1/0/0:1
 Protocol Pkts In Chars In Pkts Out Chars Out
 IP 0 0 56493807 7909133546
```

The following is a sample output for the **show interface wideband-cable description** command:

```
Router# show interface wideband-cable 1/0/0:0 description

Interface Status Protocol Description
Wi1/0/0:1 up up
```

The following is a sample output for the **show interface wideband-cable dbs** command:

```
Router# show interface wideband-cable 3/0:0 dbs

Dynamic Bandwidth Sharing is enabled
bg_rf_channel_bitmap_local B, active 0
RF 0: tokens 23254, active 0, policer 4687 KB/s, max_tokens 23435
 deficit counter 0, quantum 2000
 ticks_limit: 62500, max_ticks:625000, policer(ticks): 312
RF 1: tokens 23249, active 0, policer 4687 KB/s, max_tokens 23435
 deficit counter 0, quantum 5000
 ticks_limit: 62500, max_ticks:625000, policer(ticks): 312
RF 3: tokens 23249, active 0, policer 4687 KB/s, max_tokens 23435
 deficit counter 0, quantum 10000
```

The following is a sample output for the **show interface wideband-cable downstream** command:

```
Router# show interface wideband-cable 1/0/0:1 downstream

Total downstream bandwidth 3235 Kbps
Total downstream reserved/reservable bandwidth 0/200 Kbps
Total downstream guaranteed/non-guaranteed bonus bandwidth 66618/9972 Kbps
```

The following is a sample output for the **show interface wideband-cable service-flow** command:

Router# **show interface wideband-cable 3/0:0 service-flow**

| Sfid | Sid  | Mac Address    | QoS  | Param | Index | Type | Dir | Curr  | Active | DS-ForwIf/ |
|------|------|----------------|------|-------|-------|------|-----|-------|--------|------------|

Table 236 describes the fields shown in the **show interface wideband-cable** display.

**Table 236** *show interface wideband-cable Field Descriptions*

| Field                                                                     | Description                                                                                                                                                |
|---------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wideband-Cable slot/subslot/bay:wb-channel is up/...administratively down | Indicates whether the interface hardware is currently active or taken down by the administrator.                                                           |
| line protocol is up/...administratively down                              | Indicates whether the software processes that handle the line protocol believe the interface is usable or if it has been taken down by the administrator.  |
| hardware                                                                  | Hardware type and address.                                                                                                                                 |
| Internet address                                                          | Internet address followed by subnet mask.                                                                                                                  |
| MTU                                                                       | Maximum transmission unit (MTU) of the interface.                                                                                                          |
| BW                                                                        | Bandwidth of the interface in kilobits per second.                                                                                                         |
| DLY                                                                       | Delay of the interface in microseconds.                                                                                                                    |
| rely                                                                      | Reliability of the interface as a fraction of 255, calculated as an exponential average over 5 minutes. (For example, 255/255 is 100 percent reliability.) |
| load                                                                      | Load on the interface as a fraction of 255, calculated as an exponential average over 5 minutes. (For example, 255/255 is complete saturation.)            |
| Encapsulation                                                             | Encapsulation method assigned to this interface.                                                                                                           |
| Keepalive set                                                             | Keepalive time interval.                                                                                                                                   |
| ARP type                                                                  | Type of Address Resolution Protocol (ARP) and timeout value assigned.                                                                                      |
| Last input                                                                | Number of hours, minutes, and seconds since the last packet was successfully received by an interface.                                                     |
| output                                                                    | Number of hours, minutes, and seconds since the last packet was successfully sent by an interface.                                                         |
| Last clearing of "show interface" counters                                | Time at which the counters that measure cumulative statistics (such as number of bytes sent and received) were last reset to zero.                         |

**Table 236**      *show interface wideband-cable Field Descriptions*

| Field                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queueing strategy                                 | Displays the type of queueing configured for this interface. In the following example output, the type of queueing configured is first-in first-out (FIFO).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Output queue                                      | Number of packets in the output queue. The format of this number is A/B, where A indicates the number of packets in the queue, and B indicates the maximum number of packets allowed in the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| drops                                             | Indicates the number of packets dropped because of a full queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| input queue/drops                                 | Number of packets in the input queue. The format of this number is A/B, where A indicates the number of packets in the queue, and B indicates the maximum number of packets allowed in the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| drops                                             | Indicates the number of packets dropped because of a full queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Five minute input rate<br>Five minute output rate | Average number of bits and packets sent per second in the last five minutes. The five-minute interval is the default time period for statistics collection and can be changed for each individual cable interface using the <b>load-interval</b> command in interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Note</b>                                       | <p>These statistics are calculated using a decayed averaging method, where only the average is stored over the interval period, not the individual samples. Every time a sample average is taken, a percentage of the sample and a percentage of the average are added together to create the new average. If traffic stops for a time period, these statistics do not immediately go to zero but drop with a decay rate of about 70 percent per time period.</p> <p>For example, if the interface is passing 1,000 packets per second (pps) before traffic stops, the <b>show interface cable</b> command shows the rate being 300 pps at the end of the first time interval. The rate then drops to 90 pps at the end of the second time interval, and so forth.</p> |
| packets input                                     | Total number of error-free packets received by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| bytes input                                       | Total number of bytes, including data and MAC encapsulation, in the error-free packets received by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| no buffer                                         | Number of received packets discarded because there was no buffer space in the main system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Received broadcast                                | Total number of broadcast or multicast packets received by the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| runt                                              | Number of packets that are discarded because they are smaller than the medium's minimum packet size.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 236**      *show interface wideband-cable Field Descriptions*

| Field          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| giants         | <p>Number of packets that are discarded because they are bigger than the standard Ethernet Maximum Transmission Unit (MTU) size. For Ethernet packets, RFC 1757 defines giants as “the total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.”</p> <p><b>Note</b> In addition, to account for the different Ethernet and other packet encapsulations on the network, packets are considered giants when they exceed the configured MTU size plus 114 bytes.</p> |
| input errors   | Total number of errors received on the interface. This count includes runs and giants, which are shown above, as well as other errors, such as no buffers, and CRC, frame, overrun, and ignored counts. This count can also include DOCSIS protocol errors such as an invalid SID in the DOCSIS frame, a bad extended header length, corrupted concatenated packets, and invalid bandwidth requests.                                                                                                                                                           |
| CRC            | Indicates the number of times the cyclic redundancy checksum (CRC) generated by the originating LAN station or far-end device does not match the checksum calculated from the data received.                                                                                                                                                                                                                                                                                                                                                                   |
| frame          | Number of packets received incorrectly having a CRC error and a non-integer number of octets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| overrun        | Number of times the receiver hardware was unable to forward received data to a hardware buffer because the input rate exceeded the receiver’s ability to handle the data.                                                                                                                                                                                                                                                                                                                                                                                      |
| ignored        | Number of received packets ignored by the interface because the interface hardware ran low on internal buffers.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| packets output | Total number of messages sent by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| bytes          | Total number of bytes, including data and MAC encapsulation, sent by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| underruns      | Number of times the sender has been running faster than the receiving device can handle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| output errors  | Sum of all errors that prevented the final transmission of packets out of the interface being examined.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| collisions     | Not applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 236** *show interface wideband-cable Field Descriptions*

| Field                     | Description                                                                                                                                                                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface resets          | Number of times an interface has been completely reset.                                                                                                                                                                                                                                                                 |
| output buffer failures    | Number of times the output buffer has failed.                                                                                                                                                                                                                                                                           |
| output buffer swapped out | Number of times the output buffer has been swapped out.                                                                                                                                                                                                                                                                 |
| sfid                      | Service flow identification number.                                                                                                                                                                                                                                                                                     |
| sid                       | Service identification number (upstream service flows only).                                                                                                                                                                                                                                                            |
| QoS Prov                  | QoS parameter index for the provisioned state of this flow.                                                                                                                                                                                                                                                             |
| Param Adm                 | QoS parameter index for the Admitted state of this flow.                                                                                                                                                                                                                                                                |
| Index Act                 | QoS parameter index for the Active state of this flow.                                                                                                                                                                                                                                                                  |
| Type                      | Indicates if the service flow is the primary flow or a secondary service flow. Secondary service flows are identified by an “S” (created statically at the time of registration, using the DOCSIS configuration file) or “D” (created dynamically by the exchange of dynamic service messages between the CM and CMTS). |
| Dir                       | Indicates if this service flow is downstream (DS) or upstream (US).                                                                                                                                                                                                                                                     |
| Curr State                | Current run-time state of the service flow.                                                                                                                                                                                                                                                                             |
| Active Time               | Length of time this service flow has been active.                                                                                                                                                                                                                                                                       |
| DS-ForwIf/US-BG/CH        | Bonding group ID or the downstream RFID of the forwarding interface assigned to the downstream service flow.                                                                                                                                                                                                            |

| Command                                    | Description                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------------|
| <b>show interface cable downstream</b>     | Displays information about the downstream on the cable interface.           |
| <b>show interface cable sid</b>            | Displays information by service identifier (SID) of each CM on the network. |
| <b>show interface cable signal-quality</b> | Displays information about the cable signal quality.                        |
| <b>show interface cable upstream</b>       | Displays information about one or all upstreams on the cable interface.     |

# show interface wideband-cable multicast-sessions

To display information about multicast sessions on a specific wideband-cable interface, use the **show interface wideband-cable multicast-sessions** command in privileged EXEC mode.

```
show interface wideband-cable {slot/{subslot | bay}/port:wideband-channel}
 [group [ipv4-MQoS-group | ipv6-MQoS-group] | latency | sid [MQoS-sid]]
```

| Syntax Description                                                     |                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                                                            | Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> </ul> |
| <i>subslot</i>                                                         | Subslot where a SIP resides. On the Cisco uBR10012 router, the subslot 0 is always specified.                                                                                                                                                                                |
| <i>bay</i>                                                             | Bay in a SIP where a SPA is located. The valid values are 0 (upper bay) and 1 (lower bay).                                                                                                                                                                                   |
| <i>port</i>                                                            | Downstream port number. <ul style="list-style-type: none"> <li>• Cisco uBR7246VXR router and Cisco uBR7225VXR router—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>               |
| <i>wideband-channel</i>                                                | Wideband channel number. The valid range is from 0 to 11. On the Cisco uBR7246VXR and Cisco uBR7225VXR routers, the valid range is from 0 to 5.                                                                                                                              |
| <b>group</b><br>[ <i>ipv4-MQoS-group</i>  <br><i>ipv6-MQoS-group</i> ] | Displays information about the specified IPv4 or IPv6 multicast quality of service (MQoS) group.                                                                                                                                                                             |
| <b>latency</b>                                                         | Displays information about the multicast session latency.                                                                                                                                                                                                                    |
| <b>sid</b> [ <i>MQoS-sid</i> ]                                         | Displays information about the MQoS service identifier (SID). The value of the SID ranges from 8192 to 12272.                                                                                                                                                                |

|                 | 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a wideband cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> . |
|                 | 12.2(33)SCF | This command was modified. The <b>latency</b> keyword was added.                                                                                                                                                |

**Examples**

The following is a sample output from the **show interface wideband-cable multicast-sessions** command:

```
Router# show interface wideband-cable 1/0/0:0 multicast-sessions

Default Multicast Service Flow 3 on Wideband-Cable1/1/0:0
Multicast Group : 230.1.2.3
 Source : N/A
 Act GCRs : 1
 Interface : Bu1 State: A GI: Bu1 RC: 0

[Table 237](#) describes the fields shown in the **show interface wideband-cable queue** command display.

**Table 237** *show interface wideband-cable queue Field Descriptions*

| Field              | Description                        |
|--------------------|------------------------------------|
| Len/Limit Pkts     | Queue length and limit in packets. |
| Deqs Pkts          | Dequeue packets                    |
| Drops Pkts         | Dropped packets.                   |
| CIR Kbps           | Committed information rate.        |
| MIR/PR Kbps        | Maximum information and peak rate. |
| Forwint            | Forwarding interface.              |
| BE Queues          | Best effort queues.                |
| CIR Queues         | Committed information rate queues. |
| Low Latency Queues | Low latency queues.                |

# show interfaces cable-modem

To display information about the cable interface, use the **show interfaces cable-modem** command in privileged EXEC mode.

**Cisco uBR904, uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter**

**show interfaces cable-modem** *number* [**accounting** | **counters** | **crb** | **irb** | **type**]

| Syntax Description |                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>number</b>      | Identifies the cable interface (always <b>0</b> ).                                                                                                                                                                                                                                                                                                                                                        |
| <b>accounting</b>  | (Optional) Displays the number of packets of each protocol type that has been sent through the router interface.                                                                                                                                                                                                                                                                                          |
| <b>counters</b>    | (Optional) Shows MIB counters on the cable interface.                                                                                                                                                                                                                                                                                                                                                     |
| <b>crb</b>         | (Optional) Displays concurrent routing and bridging information for each interface that has been configured for routing or bridging. This option does not really apply to the router but is included because it is part of the subsystem that provides DOCSIS-compliant bridging. For more information, see the <a href="#">Cisco IOS Bridging and IBM Networking Configuration Guide, Release 12.2</a> . |
| <b>irb</b>         | (Optional) Displays integrated routing and bridging information for each interface that has been configured for routing or bridging. This option does not really apply to the router but is included because it is part of the subsystem that provides DOCSIS-compliant bridging. For more information, see the <a href="#">Cisco IOS Bridging and IBM Networking Configuration Guide, Release 12.2</a> . |
| <b>type</b>        | (Optional) Designed to display information about virtual LANs associated with the interface; however, this option is not supported on the router.                                                                                                                                                                                                                                                         |

|                 |                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b> | When this command is entered without a keyword, general information about the cable interface is displayed. |
|-----------------|-------------------------------------------------------------------------------------------------------------|

|                      |                 |

|-----------------|------------|-----------------------------------------------------------------------|
|                 | 11.3(4)NA  | This command was introduced for the Cisco uBR904 cable access router. |
|                 | 12.0(4)XI1 | Support was added for the Cisco uBR924 cable access router.           |
|                 | 12.1(3)XL  | Support was added for the Cisco uBR905 cable access router.           |
|                 | 12.1(5)XU1 | Support was added for the Cisco CVA122 Cable Voice Adapter.           |
|                 | 12.2(2)XA  | Support was added for the Cisco uBR925 cable access router.           |

|                 |                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows typical output for the cable interface when traffic is passing through the interface: |
|-----------------|-------------------------------------------------------------------------------------------------------------------|

```
Router# show interfaces cable-modem 0
```

```

cable-modem0 is up, line protocol is up
Hardware is BCM3300, address is 0050.7366.2439 (bia 0050.7366.2439)
Internet address is 5.2.0.11/16
MTU 1500 bytes, BW 27000 Kbit, DLY 1000 usec,
 reliability 255/255, txload 1/255, rxload 1/255
Encapsulation DOCSIS, loopback not set
Keepalive set (10 sec)
ARP type:ARPA, ARP Timeout 04:00:00
Last input 00:00:00, output 00:00:00, output hang never
Last clearing of "show interface" counters 00:08:40
Queueing strategy:fifo
Output queue 40/40, 52787 drops; input queue 0/75, 0 drops
5 minute input rate 2000 bits/sec, 2 packets/sec
5 minute output rate 94000 bits/sec, 154 packets/sec
 1074 packets input, 418472 bytes, 0 no buffer
 Received 19 broadcasts, 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
 78771 packets output, 6326786 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 output buffer failures, 0 output buffers swapped out

```

Router#

Table 0-238 describes the significant fields shown in the display.

**Table 0-238** *show interfaces cable-modem Field Descriptions*

| Field                            | Description                                                                                                                                                                                                                                                                             |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cable-modem0 is up               | Indicates that the interface is currently active. “Disabled” indicates the interface has received more than 5000 errors in one keepalive interval (10 seconds by default if keepalive is set); “administratively down” indicates the interface has been taken down by an administrator. |
| line protocol is up              | Indicates that the software processes that handle the line protocol believe the interface is usable.                                                                                                                                                                                    |
| Hardware                         | Hardware type and MAC address.                                                                                                                                                                                                                                                          |
| Internet address                 | Internet address followed by the shorthand notation for the subnet mask.                                                                                                                                                                                                                |
| MTU                              | Maximum Transmission Unit (equivalent of the maximum packet size) for the interface.                                                                                                                                                                                                    |
| BW                               | Bandwidth of the interface in kilobits per second.                                                                                                                                                                                                                                      |
| DLY                              | Delay of the interface in microseconds.                                                                                                                                                                                                                                                 |
| reliability                      | Reliability of the interface, expressed as a fraction of 255, calculated as an exponential average over a 5-minute period. (255/255 equals 100% reliability.)                                                                                                                           |
| tx load/rx load                  | Load on the interface caused by transmitting and receiving, expressed as a fraction of 255, calculated as an exponential average over a 5-minute period.                                                                                                                                |
| Encapsulation/loopback/keepalive | Encapsulation method assigned to the interface.                                                                                                                                                                                                                                         |
| loopback                         | Indicates whether or not loopback is set.                                                                                                                                                                                                                                               |
| keepalive                        | Indicates whether or not keepalives are set.                                                                                                                                                                                                                                            |

**Table 0-238** *show interfaces cable-modem Field Descriptions (continued)*

| Field                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARP type                                    | Type of Address Resolution Protocol configured for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ARP Timeout                                 | Number of hours, minutes, and seconds an ARP cache entry will stay in the cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Last input/output                           | Number of hours, minutes, and seconds since the last packet was successfully received/transmitted by the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| output hang                                 | Number of hours, minutes, and seconds since the interface was last reset because of a transmission that took too long. When the number of hours in any of the “Last...” fields exceeds 24, the number of days and hours is displayed. If the field overflows, asterisks are printed.                                                                                                                                                                                                                                                                                                                                         |
| Last clearing of “show interface” counters  | Time at which the counters that measure cumulative statistics (such as number of bytes transmitted and received) shown in this report were last reset to zero. Note that variables that might affect routing (for example, load and reliability) are not cleared when the counters are cleared.<br><br>*** indicates the elapsed time is too large to be displayed.<br>0:00:00 indicates the counters were cleared more than $2^{31}$ milliseconds (and less than $2^{32}$ milliseconds) ago.                                                                                                                                |
| Queueing strategy                           | Type of queueing strategy in effect on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Output queue/drops                          | Number of packets in the output queue followed by the size of the queue and the number of packets dropped due to a full queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| input queue/drops                           | Number of packets in the input queue followed by the size of the queue and the number of packets dropped due to a full queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 5 minute input rate<br>5 minute output rate | Average number of bits and packets received and transmitted per second in the last 5 minutes. If the interface is not in promiscuous mode, it senses network traffic it sends and receives (rather than all network traffic).<br><br>The 5-minute input and output rates should be used only as an approximation of traffic per second during a given 5-minute period. These rates are exponentially weighted averages with a time constant of 5 minutes. A period of four time constants must pass before the average will be within two percent of the instantaneous rate of a uniform stream of traffic over that period. |
| packets input                               | Total number of error-free packets received by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| bytes                                       | Total number of bytes, including data and MAC encapsulation, in the error-free packets received by the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| no buffer                                   | Number of received packets discarded because there was no buffer space in the main system. Compare with ignored count. Broadcast storms on Ethernet networks and bursts of noise on serial lines are often responsible for no input buffer events.                                                                                                                                                                                                                                                                                                                                                                           |

**Table 0-238**     *show interfaces cable-modem Field Descriptions (continued)*

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Received broadcasts | Total number of broadcast or multicast packets received by the interface.                                                                                                                                                                                                                                                                                                         |
| runts               | Number of packets discarded because they were smaller than the medium's minimum packet size. For example, any Ethernet packet less than 64 bytes is considered a runt.                                                                                                                                                                                                            |
| giants              | Number of packets discarded because they were larger than the medium's maximum packet size. For example, any Ethernet packet larger than 1518 bytes is considered a giant.                                                                                                                                                                                                        |
| throttles           | Number of times the receiver on the port was disabled, possibly due to buffer or processor overload.                                                                                                                                                                                                                                                                              |
| input errors        | Includes runts, giants, no buffer, CRC, frame, overrun, and ignored counts. Other input-related errors can also cause the input errors count to be increased, and some datagrams may have more than one error; therefore, this sum may not balance with the sum of enumerated input error counts.                                                                                 |
| CRC                 | Number of cyclic redundancy checks (CRCs) generated by the originating LAN station or far-end device that do not match the checksum calculated from the data received. On a LAN, this field usually indicates noise or transmission problems on the LAN interface or the LAN bus itself. A high number of CRCs is usually the result of collisions or a station sending bad data. |
| frame               | Number of packets received incorrectly, having a CRC error and a noninteger number of octets. On a LAN, this value is usually the result of collisions or a malfunctioning Ethernet device.                                                                                                                                                                                       |
| overrun             | Number of times the receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver's ability to handle the data.                                                                                                                                                                                                            |
| ignored             | Number of received packets ignored by the interface because the interface hardware ran low on internal buffers. These buffers are different from the system buffers mentioned previously in the buffer description. Broadcast storms and bursts of noise can cause the ignored count to be increased.                                                                             |
| abort               | Number of packets whose receipt was aborted.                                                                                                                                                                                                                                                                                                                                      |
| packets output      | Total number of messages sent by the system.                                                                                                                                                                                                                                                                                                                                      |
| bytes               | Total number of bytes, including data and MAC encapsulation, sent by the system.                                                                                                                                                                                                                                                                                                  |
| underruns           | Number of times the transmitter has been running faster than the router can handle.                                                                                                                                                                                                                                                                                               |
| output errors       | Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this may not balance with the sum of the enumerated output errors, as some datagrams might have more than one error, and others might have errors that do not fall into any of the specifically tabulated categories.                                         |

**Table 0-238** *show interfaces cable-modem Field Descriptions (continued)*

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| collisions                 | Number of messages retransmitted due to an Ethernet collision. Collisions are usually the result of an overextended LAN (Ethernet or transceiver cable too long, more than two repeaters between stations, or too many cascaded multiport transceivers). A packet that collides is counted only once in output packets.                                                                                                                                                                                                                                   |
| interface resets           | Number of times an interface has been completely reset. A reset can happen if packets queued for transmission were not sent within several seconds. On a serial line, this can be caused by a malfunctioning modem that is not supplying the transmit clock signal, or by a cable problem. If the system notices that the carrier detect line of a serial interface is up, but the line protocol is down, it periodically resets the interface in an effort to restart it. Interface resets can also occur when an interface is looped back or shut down. |
| output buffer failures     | Number of times the output buffer has failed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| output buffers swapped out | Number of times the output buffer has been swapped out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

The following example shows typical output of the **show interfaces cable-modem accounting** command, which shows the number of packets and bytes of each protocol type that is passing through the cable interface:

```
Router# show interfaces cable-modem 0 accounting

cable-modem0
 Protocol Pkts In Chars In Pkts Out Chars Out
 IP 545 185502 159 90240
 Trans. Bridge 3878 964995 12597 1611142
 ARP 73 3066 86 4128

Router#
```

[Table 0-239](#) describes the significant fields shown in this display.

**Table 0-239** *show interfaces cable-modem accounting Field Descriptions*

| Field     | Description                                                   |
|-----------|---------------------------------------------------------------|
| Protocol  | List of protocols operating on the cable-modem interface.     |
| Pkts In   | Number of packets of each protocol received on the interface. |
| Chars In  | Number of bytes of each protocol received on the interface.   |
| Pkts Out  | Number of packets of each protocol sent on the interface.     |
| Chars Out | Number of bytes of cache protocol sent on the interface.      |

The following example shows typical output for the **show interfaces cable-modem counters** command:

```
Router# show interfaces cable-modem 0 counters

Cable specific counters:
Ranging requests sent : 50982
Downstream FIFO full : 0
Re-requests : 7277
```

```

DS MAC Message Overruns: 0
DS Data Overruns : 0
Received MAPs : 254339485
Received Syncs : 53059555

Table 0-240 describes the counters shown in this display.

**Table 0-240**      **Counters Shown in show interfaces cable-modem counters Display**

| Field                   | Description                                                                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ranging requests sent   | Number of ranging requests sent by the router to the CMTS.                                                                                                                                               |
| Downstream FIFO full    | Number of times the downstream input first-in first-out (FIFO) buffer became full on the router.                                                                                                         |
| Re-requests             | Number of times a bandwidth request generated by the router was not responded to by the CMTS.                                                                                                            |
| DS MAC Message Overruns | Number of times the DMA controller had a downstream MAC message and there were no free MAC message buffer descriptors to accept the message.                                                             |
| DS Data Overruns        | Number of times the DMA controller had downstream data and there were no free data PDU buffer descriptors to accept the data.                                                                            |
| Received MAPs           | Number of times a MAP message passed all filtering requirements and was received by the router.                                                                                                          |
| Received Syncs          | Number of times a time-stamp message was received by the router.                                                                                                                                         |
| Message CRC failures    | Number of times a MAC message failed a cyclic redundancy check (CRC).                                                                                                                                    |
| Header CRC failures     | Number of times a MAC header failed its 16-bit CRC check. The MAC header CRC is a 16-bit Header Check Sequence (HCS) field that ensures the integrity of the MAC header even in a collision environment. |
| Data PDUs               | Total number of data PDUs (protocol data units) of all types received by the router.                                                                                                                     |
| DS MAC messages         | Number of MAC messages received by the router.                                                                                                                                                           |
| Valid Headers           | Number of valid headers received by the router, including PDU headers, MAC headers, and headers only.                                                                                                    |
| Sync losses             | Number of times the router lost timebase sync with the CMTS.                                                                                                                                             |
| Pulse losses            | Number of times the router did not receive expected timestamp messages from the CMTS.                                                                                                                    |
| BW request failures     | Number of times the router sent the maximum number of re-requests for bandwidth allocation and the request was still not granted.                                                                        |

## show interfaces cable-modem

The following example shows typical output for the **show interfaces cable-modem crb** command, which displays information about the bridging and routing protocols being used on the cable interface:

```
Router# show interfaces cable-modem 0 crb

cable-modem0

Bridged protocols on cable-modem0:
ip

Software MAC address filter on cable-modem0
Hash Len Address Matches Act Type
0x00: 0 ffff.ffff.ffff 3877 RCV Physical broadcast
0x2A: 0 0900.2b01.0001 0 RCV DEC spanning tree
0x7A: 0 0010.7b43.aa01 573 RCV Interface MAC address
0xC2: 0 0180.c200.0000 0 RCV IEEE spanning tree
0xC2: 1 0180.c200.0000 0 RCV IBM spanning tree
Router#
```

Table 0-241 describes the fields shown in this display.

**Table 0-241** *show interfaces cable-modem crb Field Descriptions*

| Field   | Description                                                                                      |
|---------|--------------------------------------------------------------------------------------------------|
| Hash    | Hash key/relative position in the keyed list for this MAC address filter.                        |
| Len     | Length of this entry to the beginning element of this hash chain.                                |
| Address | Canonical (Ethernet ordered) MAC address of this filter.                                         |
| Matches | Number of received packets that match this MAC address.                                          |
| Act     | Action to be taken when this address is looked up; choices are to receive or discard the packet. |
| Type    | MAC address type.                                                                                |

### Tip

In Cisco IOS Release 12.2(8)T and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

### Related Commands

| Command                        | Description                                            |
|--------------------------------|--------------------------------------------------------|
| <b>show bridge cable-modem</b> | Displays bridging information for the cable interface. |

# show ip arp vrf

To view which virtual routing and forwarding (VRF) instance contains a specific cable modem in the Address Resolution Protocol (ARP) cache table, use the **show ip arp vrf** command in privileged EXEC mode.

**show ip arp vrf** *WORD*

| Syntax Description | <i>WORD</i> | VRF name. |
|--------------------|-------------|-----------|
|--------------------|-------------|-----------|

| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|

[Table 1](#) describes the significant fields shown in the display.

**Table 242** *show ip arp vrf Field Descriptions*

| Field         | Description                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol      | Protocol for network address in the Address field.                                                                                                            |
| Address       | The network address that corresponds to the IPv4 address.                                                                                                     |
| Age (min)     | Age of the cache entry (in minutes). A hyphen (-) means the address is local.                                                                                 |
| Hardware Addr | LAN hardware address of a MAC address that corresponds to the network address.                                                                                |
| Type          | Encapsulation type for the network address. The valid values include: <ul style="list-style-type: none"> <li>• ARPA</li> <li>• SNAP</li> <li>• SAP</li> </ul> |
| Interface     | Interface associated with the specified network address.                                                                                                      |

 show ip arp vrf**Related Commands**

| Command                                   | Description                                                                            |
|-------------------------------------------|----------------------------------------------------------------------------------------|
| <b>cable source-route</b>                 | Configures the VRF source route on the cable modem in subinterface configuration mode. |
| <b>cable vrf-steering<br/>cable-modem</b> | Steers or directs the cable modems to the specified VRF.                               |
| <b>ip vrf</b>                             | Defines a VRF instance and enters the interface configuration mode.                    |

# show ip interface brief

To display a brief summary of an interface's IP information and status, to include virtual interface bundle information, use the **show ip interface brief** command in privileged EXEC mode.

**show ip interface brief**

## Syntax Description

This command has no additional keywords or arguments.

## Command Default

Virtual Interface Bundling is enabled by default in Cisco IOS Release 12.3(21)BC and later releases.

## Command Modes

Privileged EXEC

## Command History

| Release    | Modification                                                                                                                 |
|------------|------------------------------------------------------------------------------------------------------------------------------|
| 12.3(21)BC | Support was added for virtual interface bundling configured with upgrade to Cisco IOS Release 12.3(21)BC and later releases. |

## Usage Guidelines

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- *Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS*

## Examples

The following example illustrates a virtual interface bundle with the **show ip interface brief** command:

```
Router# show ip interface brief
Interface IP-Address OK? Method Status Protocol
FastEthernet0/0/0 1.8.44.1 YES NVRAM up up
POS1/0/0 unassigned YES NVRAM up up
GigabitEthernet2/0/0 11.0.0.2 YES NVRAM up up
GigabitEthernet3/0/0 10.1.1.101 YES NVRAM up up
GigabitEthernet4/0/0 1.1.1.1 YES NVRAM down down
Cable8/1/0 unassigned YES NVRAM up up
Cable8/1/1 unassigned YES NVRAM up up
Cable8/1/2 unassigned YES NVRAM up up
Cable8/1/3 unassigned YES NVRAM up up
Cable8/1/4 unassigned YES NVRAM up up
Bundle1 10.44.50.1 YES TFTP up up
Router#
```

## Related Commands

| Command             | Description                                                                                |
|---------------------|--------------------------------------------------------------------------------------------|
| <b>cable bundle</b> | Configures a cable interface to belong to an interface bundle or virtual interface bundle. |
| <b>show arp</b>     | Displays the entries in the router's ARP table.                                            |

| Command                                          | Description                                                                                                                                                                        |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show cable bundle number forwarding-table</b> | Displays the MAC forwarding table for the specified bundle, showing the MAC addresses of each cable modem in a bundle and the physical cable interface that it is currently using. |
| <b>show cable modem</b>                          | Displays the cable modems that are online both before and after cable interface bundling has been configured.                                                                      |
| <b>show running-config interface cable</b>       | Displays the configuration for the specified cable interface.                                                                                                                      |

# show ipdr collector

To display the list of sessions that the Collector is associated, use the **show ipdr collector** command in the privileged EXEC mode.

**show ipdr collector** *collector\_name*

| Syntax Description | <i>collector_name</i> | The name of the Collector. |
|--------------------|-----------------------|----------------------------|
|--------------------|-----------------------|----------------------------|

| Command Default | No default behavior or values. |
|-----------------|--------------------------------|
|-----------------|--------------------------------|

| Command Modes | Privileged EXEC mode |

|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>show ipdr exporter</b> command displays information about the IPDR Exporter state. The information displayed indicates the Exporter states that are listed below. |
|                         | <ul style="list-style-type: none"><li>• started</li><li>• not started</li><li>• not initialized</li></ul>                                                                |

|                 |                                                                                          |
|-----------------|------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows the sample output for the <b>show ipdr exporter</b> command. |
|-----------------|------------------------------------------------------------------------------------------|

|                                                                                          |
|------------------------------------------------------------------------------------------|
| <pre>Router#configure terminal Router#show ipdr exporter IPDR exporter is started.</pre> |
|------------------------------------------------------------------------------------------|

|                         |                            |                                                                                                                               |
|-------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>             | <b>Description</b>                                                                                                            |
|                         | <b>show ipdr collector</b> | Displays the collector information, message statistics and event for all the sessions that are associated with the collector. |
|                         | <b>ipdr exporter start</b> | Starts the IPDR Exporter and connects to the collector.                                                                       |

# show ipdr session

To display the list of sessions and session details, use the **show ipdr session** command in the privileged EXEC mode.

**show ipdr session** {*all* | *session\_id*}

## Syntax Description

|                   |                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------|
| <i>all</i>        | Displays all the associated sessions and session details such as the session ID, description, and the session state. |
| <i>session_id</i> | Displays session details for a specific session ID. The valid range is 1 to 255.                                     |

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC mode

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCB | This command was introduced. |

## Usage Guidelines

The **show ipdr session** command displays the session details such as the session ID, description, and the session state for all sessions as well as for a specific session.

## Examples

The following example shows the sample output for the *all* option for the **show ipdr session** command.

```
Router#configure terminal
Router#show ipdr session all
Session ID: 1, Name: utilsta, Descr: test, Started: False
```

The following example shows the sample output for the *session\_id* option for the **show ipdr session** command.

```
Router#configure terminal
Router#show ipdr session 1
Session ID: 1, Name: utilsta, Descr: test, Started: False
```

| Command                    | Description                                                              |
|----------------------------|--------------------------------------------------------------------------|
| <b>show ipdr exporter</b>  | Displays information about the IPDR Exporter state.                      |
| <b>ipdr collector</b>      | Configures the Internet Protocol Detail Record (IPDR) Collector details. |
| <b>ipdr session</b>        | Adds a session to the IPDR Exporter.                                     |
| <b>ipdr exporter start</b> | Starts the IPDR Exporter and connects to the collector.                  |

# show ipdr session collector

To display the details of a collector that is associated with a specific session, use the **show ipdr session collector** command in the privileged EXEC mode.

**show ipdr session** *session\_id* **collector** *collector\_name*

## Syntax Description

|                       |                                                   |
|-----------------------|---------------------------------------------------|
| <i>session_id</i>     | The IPDR session ID. The valid range is 1 to 255. |
| <i>collector_name</i> | The name of the Collector.                        |

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC mode

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCB | This command was introduced. |

## Usage Guidelines

The **show ipdr session collector** command displays the details of a collector that is associated with a specific session. Since there can be multiple collectors associated to a session, this command is used to show a specific session-collector pair.

## Examples

The following example shows the sample output for the **show ipdr session collector** command.

```
Router#configure terminal
Router#show ipdr session 1 collector federal
Session ID: 1, Name: utilsta, Descr: test, Started: False
Collecotr Name: federal, IP: 192.0.2.0, Port: 0

2001-07-05T19:38:02 Collector in session 1 Statistics:
 Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
 Last Event: Event Id 0 WRONG_EVENT_ID
```

| <b>Command History</b> | Release      | Modification                 |
|------------------------|--------------|------------------------------|
|                        | 12.3(21a)BC3 | This command was introduced. |

|                 |                                                                 |
|-----------------|-----------------------------------------------------------------|
| <b>Examples</b> | The following example shows the output of the show cpd command: |
|-----------------|-----------------------------------------------------------------|

|                                                                                        |
|----------------------------------------------------------------------------------------|
| <pre>Router# show nls NLS enabled NLS Authentication enabled NLS resp-timeout 45</pre> |
|----------------------------------------------------------------------------------------|

| <b>Related Commands</b> | Command | Description  |
|-------------------------|---------|--------------|
|                         | cpd     | Enables CPD. |

# show nls ag-id

To display authorization group ID information, use the **show nls ag-id** command in privileged EXEC mode.

**show nls ag-id**

**Command Default** Authorization group ID information is displayed. The authentication key is saved encrypted and is not displayed.

**Command Modes** Privileged EXEC

| Command History | Release      | Modification                 |
|-----------------|--------------|------------------------------|
|                 | 12.3(21a)BC3 | This command was introduced. |

**Examples** The following example shows the output of the **show nls-sg-id** command:

```
Router# show nls ag-id
Auth Group Id
12345
```

| Related Commands | Command | Description  |
|------------------|---------|--------------|
|                  | cpd     | Enables CPD. |

# show nls flow

To display NLS active flow information, use the **show nls flow** command in privileged EXEC mode.

## show nls flow

|                        |                                                 |
|------------------------|-------------------------------------------------|
| <b>Command Default</b> | Information for NLS active flows are displayed. |
|------------------------|-------------------------------------------------|

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | Privileged EXEC |
|----------------------|-----------------|

| <b>Command History</b> | Release      | Modification                 |
|------------------------|--------------|------------------------------|
|                        | 12.3(21a)BC3 | This command was introduced. |

|                 |                                                                 |
|-----------------|-----------------------------------------------------------------|
| <b>Examples</b> | The following example shows the output of the show cpd command: |
|-----------------|-----------------------------------------------------------------|

```
Router# show nls flow
NLS flowid CPE IP CR Type CR ID NLS State
4294967295 16.16.1.1 1 1 PEND_B_RESP
```

| <b>Related Commands</b> | Command | Description  |
|-------------------------|---------|--------------|
|                         | cpd     | Enables CPD. |

# show packetcable cms

To display all gate controllers that are connected to the PacketCable client, use the **show packetcable cms** command in privileged EXEC mode.

**show packetcable cms** [**all** | **verbose**]

|                    |                |                                                                                                                                                      |
|--------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>all</b>     | (Optional) Specifies all gate controllers including the Common Open Policy Service (COPS) servers for which the PacketCable connection is gone down. |
|                    | <b>verbose</b> | (Optional) Provides detailed output with statistics for all gate controllers that are connected to the PacketCable client.                           |

**Command Default** All gate controllers currently connected to the PacketCable client are displayed.

**Command Modes** Privileged EXEC (#)

|                 |                               |                              |
|-----------------|-------------------------------|------------------------------|
| Command History | <b>Release</b>                | <b>Modification</b>          |
|                 | Cisco IOS Release 12.2(33)SCF | This command was introduced. |

**Usage Guidelines**

The **show packetcable cms** command displays various PacketCable counters including message exchanges and error frequency details to help detect any PacketCable errors. This command output can be periodically monitored to validate the overall health of a PacketCable solution.

In normal circumstances, the output of the **show packetcable cms all** command is not different from the output of the **show packetcable cms** command (default form of the command). However, the **show packetcable cms** command with the **all** keyword is used to capture all COPS servers including the servers for which the PacketCable connection is gone down.

**Examples**

The following is a sample output of the **show packetcable cms** command that shows all gate controllers that are currently connected to the PacketCable client in Cisco IOS Release 12.2(33)SCF:

```
Router# show packetcable cms

GC-Addr GC-Port Client-Addr COPS-handle Version PSID Key PDD-Cfg
1.100.30.2 47236 2.39.34.1 0x2FF9E268/1 4.0 0 0 0
2.39.26.19 55390 2.39.34.1 0x2FF9D890/1 1.0 0 0 2
```

The following is a sample output of the **show packetcable cms** command with the **all** keyword in Cisco IOS Release 12.2(33)SCF:

```
Router# show packetcable cms all
```

| GC-Addr    | GC-Port | Client-Addr | COPS-handle  | Version | PSID | Key | PDD-Cfg |
|------------|---------|-------------|--------------|---------|------|-----|---------|
| 1.100.30.2 | 47236   | 2.39.34.1   | 0x2FF9E268/1 | 4.0     | 0    | 0   | 0       |
| 2.39.26.19 | 55390   | 2.39.34.1   | 0x2FF9D890/1 | 1.0     | 0    | 0   | 2       |

|                  | <b>show cable dynamic-qos trace</b>       | Displays the number of subscribers for whom call trace is configured on the Cisco CMTS router.                   |

# show packetcable event

To display information the PacketCable event message (EM) server, use the **show packetcable event** command in user EXEC or privileged EXEC mode.

**show packetcable event { df-group | radius-server | rks-group }**

## Syntax Description

|                      |                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>df-group</b>      | Displays information about the Communications Assistance for Law Enforcement Act (CALEA) Delivery Function (DF) server groups that are configured on the router. |
| <b>radius-server</b> | Displays information about the EM Remote Authentication Dial In User Service (RADIUS) servers that are configured on the router.                                 |
| <b>rks-group</b>     | Displays information about the Record Keeping Server (RKS) groups that are configured on the router.                                                             |

## Command Modes

User EXEC, Privileged EXEC

## Command History

| Release     | Modification                                                                                         |
|-------------|------------------------------------------------------------------------------------------------------|
| 12.2(15)BC2 | This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers. |

## Usage Guidelines

This command displays information about the authentication, authorization, and accounting (AAA) servers that are configured on the Cisco CMTS router for PacketCable operations. These include DF servers (used for CALEA redirection of event messages and traffic), RADIUS servers (used for authentication), and RKS servers (used for billing).

## Examples

The following example shows typical output for the **show packetcable event df-group** command, which shows the IP address and UDP port of the DF server to which event messages are being forwarded for CALEA electronic surveillance.

```
Router# show packetcable event df-group
```

```
CDC-address CDC-port
10.9.62.12 1816
```

```
Router#
```

The following example shows a typical display for the **show packetcable event radius-server** command, which shows the IP address for each RADIUS server that is configured on the router for PacketCable operations, along with the UDP port number that it is using.

```
Router# show packetcable event radius-server
```

```
,
Server-address Port
10.9.62.12 1816
10.9.62.20 1813
10.9.62.12 1813
```

## show packetcable event

Router#

The following example shows a typical display for the **show packetcable event rks-group** command.

Router# **show packetcable event rks-group**

```
Pri-addr Pri-port Sec-addr Sec-port Ref-cnt Batch-cnt
1.9.62.12 1813 1.9.62.20 1813 2 0
```

Router#

Table 0-244 describes the major fields shown in the **show packetcable event rks-group** display.

**Table 0-244 show packetcable event rks-group Field Display**

| Field     | Description                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------|
| Pri-addr  | IP address for the primary RKS server.                                                                                          |
| Pri-port  | UDP port for the primary RKS server.                                                                                            |
| Sec-addr  | IP address for the secondary RKS server.                                                                                        |
| Sec-port  | UDP port for the secondary RKS server.                                                                                          |
| Ref-cnt   | Number of times that the router send single event messages to the RKS server.                                                   |
| Batch-cnt | Number of times that the router sent batch messages (multiple Event Messages within a single RADIUS message) to the RKS server. |

### Tip

For complete information about PacketCable event messaging, see the *PacketCable Event Messages Specification*, which is available at the PacketCable Event Messages Specification PacketCable web site at the following URL:

<http://www.packetcable.com>

### Related Commands

| Command                                      | Description                                                                                            |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>clear packetcable gate counter commit</b> | Resets the counters that track the total number of committed gates.                                    |
| <b>packetcable</b>                           | Enables PacketCable operations on the Cisco CMTS.                                                      |
| <b>show packetcable gate counter commit</b>  | Displays the total number of committed gates since system reset or since the counter was last cleared. |
| <b>show packetcable global</b>               | Displays the current PacketCable configuration.                                                        |

# show packetcable gate

To display information about one or more gates in the gate database, use the **show packetcable gate** command in user EXEC or privileged EXEC mode.

**show packetcable gate** [**downstream** | **upstream**] {**summary** | *gate-id*}

|                           |                   |                                                                                                                |
|---------------------------|-------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>downstream</b> | (Optional) Display information only for gates in the downstream direction.                                     |
|                           | <b>upstream</b>   | (Optional) Display information only for gates in the upstream direction.                                       |
|                           | <b>summary</b>    | Display a summary containing the gate ID, subscriber ID, subscriber IP address, and current state information. |
|                           | <i>gate-id</i>    | Display information for a specific gate ID. The valid range is 0 to 4294967295.                                |

**Command Default** Displays information about gates on both upstreams and downstreams, if **upstream** or **downstream** is not specified.

**Command Modes** User EXEC, Privileged EXEC

| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                                                                                                      |
|------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | 12.2(8)BC2     | This command was introduced for the Cisco uBR7200 series universal broadband router.                                                                     |
|                        | 12.2(11)BC3    | The output for the <b>summary</b> option was enhanced to display the cable interface and service flow IDs (SFIDs) associated with each PacketCable gate. |
|                        | 12.2(15)BC1    | Support was added for the Cisco uBR10012 router.                                                                                                         |

**Usage Guidelines** This command displays information about one or more gates in the gate database on the Cisco CMTS. You can display a summary for all currently active gates, for all downstream or all upstream gates, or you can display detailed information about a specific gate.

**Examples** The following example shows typical output for the **show packetcable gate summary** command, which displays all current gates on the CMTS:

```
Router# show packetcable gate summary
```

| GateID | Slot | SubscriberID | GC-Addr      | State  | SFID<br>(us) | SFID<br>(ds) |
|--------|------|--------------|--------------|--------|--------------|--------------|
| 2566   | 2/0  | 3.18.1.4     | 172.22.87.45 | COMMIT | 9            | 10           |
| 18950  | 2/0  | 3.18.1.5     | 172.22.87.45 | COMMIT | 7            | 8            |

```
Total number of gates = 2
```

```
Total Gates committed(since bootup or clear counter) = 2
```

The following example shows a typical display for a specific gate. Both downstream and upstream gates are shown unless you also specify either the **downstream** or **upstream** option.

Router# **show packetcable gate 196**

Table 0-245 describes the major fields shown in the **show packetcable gate** display.

**Table 0-245** *show packetcable gate Field Display*

| Field         | Description                                                           |
|---------------|-----------------------------------------------------------------------|
| GateID        | Unique number identifying the local gate.                             |
| Slot          | Cable interface on the Cisco CMTS.                                    |
| Subscriber ID | IP address for the subscriber for this service request.               |
| GC-Addr       | IP address for the gate controller that is responsible for this gate. |

**Table 0-245** *show packetcable gate Field Display (continued)*

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State                 | <p>Describes the current state of the gate in both the upstream and downstream directions. The possible state values are:</p> <ul style="list-style-type: none"> <li>• <b>ALLOC</b> = The CMTS has received a Gate-Alloc command from the gate controller and has created the gate in response. The CMTS must now wait for the request to be authorized.</li> <li>• <b>AUTH</b> = The CMTS has received a Gate-Set command from the gate controller that authorizes the resources needed for the gate request. The CMTS must now wait for the actual resources to be reserved.</li> <li>• <b>RSVD</b> = All required resources for the gate have been reserved.</li> <li>• <b>COMMIT</b> = All resources have been committed at both the local CMTS and remote CMTS. The local CMTS has also received a commit notification from the local MTA and has finished all gate coordination with the remote end. The gate can now pass traffic.</li> <li>• <b>INVLD</b> = The gate is invalid, typically because of an error condition or lack of resources. The CMTS will eventually delete the gate.</li> <li>• <b>UNKWN</b> = The gate is an unknown state.</li> </ul> |
| SFID (us)             | SFID for the upstream associated with this PacketCable gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SFID (ds)             | SFID for the downstream associated with this PacketCable gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Total number of gates | Displays the total number of gates that are currently allocated, authorized, reserved, or committed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Total Gates committed | Displays the total number of gates that the CMTS has committed since the CMTS was last reset or since the counters were last cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Tip**

For complete information about the State field, see section 5.4, Gate Control Protocol Operation, in the *PacketCable Dynamic Quality-of-Service Specification* (PKT-SP-DQOS-I03-020116).

|----------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>clear packetcable gate counter commit</b> | Resets the counters that track the total number of committed gates.                                    |
| <b>packetcable</b>                           | Enables PacketCable operations on the Cisco CMTS.                                                      |
| <b>show packetcable gate counter commit</b>  | Displays the total number of committed gates since system reset or since the counter was last cleared. |
| <b>show packetcable global</b>               | Displays the current PacketCable configuration.                                                        |

# show packetcable gate counter commit

To display the total number of gates that the CMTS has put into the COMMITTED state since the CMTS was last reset or since the counter was last cleared, use the **show packetcable gate counter commit** command in user EXEC or privileged EXEC mode.

**show packetcable gate counter commit**

**Syntax Description** This command has no keywords or arguments.

**Command Default** No default behavior or values.

**Command Modes** User EXEC, Privileged EXEC

| Command History | Release     | Modification                                                                         |
|-----------------|-------------|--------------------------------------------------------------------------------------|
|                 | 12.2(8)BC2  | This command was introduced for the Cisco uBR7200 series universal broadband router. |
|                 | 12.2(15)BC1 | Support was added for the Cisco uBR10012 router.                                     |

**Usage Guidelines** This command displays the total number of gates that have been committed since the Cisco uBR7200 series router was restarted or since the counter was last cleared with the **clear packetcable gate counter commit** command.

  
**Note**

This command displays only the count of committed gates. It does not include gates that were allocated, authorized, and reserved but that were not put into the COMMITTED state.

**Examples** The following example shows that 132 gates have been committed since the Cisco CMTS was last reset or since the counters were last cleared:

```
Router# show packetcable gate counter commit

Total Gates committed (since bootup or clear counter) = 132
Router#
```

Usage Guidelines This command provides a summary of all active gates (downstream or upstream gates) for IPv6 subscribers.

Examples The following is a sample output of the **show packetcable gate ipv6** command that shows a summary of all the active downstream and upstream gates for IPv6 subscribers on a Cisco CMTS router:

```
Router# show packetcable gate ipv6 summary

GateID i/f SubscriberID State SFID(us) SFID(ds)
13582 Ca8/1/0 2001:40:1:42:C0B4:84E5:5081:9B5C COMMIT 74
29962 Ca8/1/0 2001:40:1:42:C0B4:84E5:5081:9B5C COMMIT 73
46354 Ca8/1/0 2001:40:1:42:C0B4:84E5:5081:9B5C COMMIT 72
62738 Ca8/1/0 2001:40:1:42:C0B4:84E5:5081:9B5C COMMIT 69

TTotal number of gates = 4
Total Gates committed(since bootup or clear counter) = 8
```

The following is a sample output of the **show packetcable gate ipv6** command that shows a summary of all downstream gates for IPv6 subscribers on a Cisco CMTS router:

```
Router# show packetcable gate downstream ipv6 summary
```

| GateID | i/f     | SubscriberID                     | State  | SFID(us) | SFID(ds) |
|--------|---------|----------------------------------|--------|----------|----------|
| 62738  | Ca8/1/0 | 2001:40:1:42:C0B4:84E5:5081:9B5C | COMMIT |          | 69       |

Total number of DS gates = 1

Total Gates committed(since bootup or clear counter) = 8

The following is a sample output of the **show packetcable gate ipv6** command that shows a summary of all upstream gates for IPv6 subscribers on the Cisco CMTS router:

```
Router# show packetcable gate upstream ipv6 summary
```

| GateID | i/f     | SubscriberID                     | State  | SFID(us) | SFID(ds) |
|--------|---------|----------------------------------|--------|----------|----------|
| 13582  | Ca8/1/0 | 2001:40:1:42:C0B4:84E5:5081:9B5C | COMMIT | 74       |          |
| 29962  | Ca8/1/0 | 2001:40:1:42:C0B4:84E5:5081:9B5C | COMMIT | 73       |          |
| 46354  | Ca8/1/0 | 2001:40:1:42:C0B4:84E5:5081:9B5C | COMMIT | 72       |          |

Total number of US gates = 3

Total Gates committed(since bootup or clear counter) = 8

[Table 0-245](#) describes the significant fields shown in the command display.

**Table 246** *show packetcable gate Field Display*

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GateID        | Unique number identifying the local gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| i/f           | Cable interface on the Cisco CMTS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Subscriber ID | IPv6 address of the subscriber for this service request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| State         | Describes the state of the gate in both the upstream and downstream directions. The possible state values are: <ul style="list-style-type: none"> <li>• <b>ALLOC</b>—The CMTS has received a Gate-Alloc command from the gate controller and has created the gate in response. The CMTS must now wait for the request to be authorized.</li> <li>• <b>AUTH</b>—The CMTS has received a Gate-Set command from the gate controller that authorizes the resources needed for the gate request. The CMTS must now wait for the actual resources to be reserved.</li> <li>• <b>RSVD</b>—All required resources for the gate have been reserved.</li> <li>• <b>COMMIT</b>—All resources are committed at both the local CMTS and remote CMTS. The local CMTS has also received a commit notification from the local MTA and has completed all gate coordination with the remote end. The gate can now pass traffic.</li> <li>• <b>INVLD</b>—The gate is invalid, typically because of an error condition or lack of resources. The CMTS will eventually delete the gate.</li> <li>• <b>UNKWN</b>—The gate is in an unknown state.</li> </ul> |
| SFID (us)     | SFID for the upstream associated with this PacketCable gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SFID (ds)     | SFID for the downstream associated with this PacketCable gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

show packetcable gate ipv6

**Table 246** *show packetcable gate Field Display (continued)*

| Field                                                 | Description                                                                                                                                |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Total number of gates                                 | Displays the total number of PCMM gates that are allocated, authorized, reserved, or committed.                                            |
| Total Gates committed (since bootup or clear counter) | Displays the total number of PCMM gates that the CMTS has committed since the CMTS was last reset or since the counters were last cleared. |

**Related Commands**

| Command                                     | Description                                                                                                        |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>packetcable</b>                          | Enables PacketCable operations on a Cisco CMTS router.                                                             |
| <b>show packetcable gate</b>                | Displays information about one or more PacketCable gates in the gate database.                                     |
| <b>show packetcable gate counter commit</b> | Displays the total number of committed PacketCable gates since system reset or since the counter was last cleared. |
| <b>show packetcable global</b>              | Displays the PacketCable configuration.                                                                            |

# show packetcable gate multimedia

To display information about the total number of PacketCable Multimedia (PCMM) multicast gates, use the **show packetcable gate multimedia** command in privileged EXEC mode.

## show packetcable gate multimedia multicast summary

| Syntax Description | <b>multicast</b> | Displays PCMM multicast information.                                                                                 |
|--------------------|------------------|----------------------------------------------------------------------------------------------------------------------|
|                    | <b>summary</b>   | Provides a summary of PCMM multicast gate ID, subscriber ID, gate controller address, and current state information. |

| Command Default | None |
|-----------------|------|
|-----------------|------|

| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|
|---------------|---------------------|

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCE | This command was introduced. |

**Examples** The following is a sample output of the **show packetcable gate multimedia** command on a Cisco CMTS router:

```
Router# show packetcable gate multimedia multicast summary
```

Total number of Multimedia-MCAST gates = 1
```

```
Total Gates committed(since bootup or clear counter) = 1
```

[Table 0-245](#) describes the significant fields shown in the display.

**Table 247** *show packetcable gate multimedia Field Descriptions*

| Field         | Description                                                         |
|---------------|---------------------------------------------------------------------|
| GateID        | Unique number identifying the local PCMM multicast gate.            |
| i/f           | Cable interface on the Cisco CMTS router.                           |
| Subscriber ID | IP address of the subscriber for this service request.              |
| GC-Addr       | IP address of the gate controller that is responsible for the gate. |

**Table 247** *show packetcable gate multimedia Field Descriptions (continued)*

| Field                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State                                                 | <p>Describes the current state of the gate in the downstream direction. The possible state values are:</p> <ul style="list-style-type: none"> <li>• <b>ALLOC</b>—The CMTS has received a Gate-Alloc command from the gate controller and has created the gate in response. The CMTS must now wait for the request to be authorized.</li> <li>• <b>AUTH</b>—The CMTS has received a Gate-Set command from the gate controller that authorizes the resources needed for the gate request. The CMTS must now wait for the actual resources to be reserved.</li> <li>• <b>RSVD</b>—All required resources for the gate have been reserved.</li> <li>• <b>COMMIT</b>—All resources are committed at both the local CMTS and remote CMTS. The local CMTS has also received a commit notification from the local MTA and has completed all gate coordination with the remote end. The gate can now pass traffic.</li> <li>• <b>INVLD</b>—The gate is invalid, typically because of an error condition or lack of resources. The CMTS will eventually delete the gate.</li> <li>• <b>UNKWN</b>—The gate is in an unknown state.</li> </ul> |
| SFID (us)                                             | Service flow ID (SFID) for the upstream associated with this PCMM multicast gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SFID (ds)                                             | SFID for the downstream associated with this PCMM multicast gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Total number of Multimedia-MCAST gates                | Total number of PCMM multicast gates that are currently allocated, authorized, reserved, or committed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Total Gates committed (since bootup or clear counter) | Total number of PCMM multicast gates that are committed since the Cisco CMTS router was last reset or since the counters were last cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                 | 12.2(8)BC2  | This command was introduced for the Cisco uBR7200 series universal broadband router.                                                                                                                                                           |
|                 | 12.2(11)BC1 | Support was added to display the Element ID for the CMTS.                                                                                                                                                                                      |
|                 | 12.2(11)BC2 | Support was added to display whether non-PacketCable UGS service flows are authorized or not. The T2 and T5 timers were removed from the display to conform to the requirements of the PacketCable DQoS Engineering Change Notice (ECN) 02148. |
|                 | 12.2(15)BC1 | Support was added for the Cisco uBR10012 router.                                                                                                                                                                                               |

|                 |                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows a typical PacketCable configuration that is enabled and has the default values for all configurable parameters, except for the Element ID: |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
Router# show packetcable global

Packet Cable Global configuration:
Enabled : Yes
Element ID: 12456
Max Gates : 1048576
Allow non-PacketCable UGS
Default Timer value -

[Table 0-248](#) describes the fields shown in the **show packetcable global** display.

**Table 0-248** *show packetcable global Field Display*

| Field                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled                                                    | Displays whether PacketCable operation is enabled or disabled. (See the <b>packetcable</b> command.)                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Element ID                                                 | Displays the Element ID for the CMTS. If you do not manually configure this parameter with the <b>packetcable element-id</b> command, it defaults to a random value between 0 and 99,999 when PacketCable operations is enabled.                                                                                                                                                                                                                                                                                            |
| Max Gates                                                  | Displays the maximum number of gates that the CMTS supports. (See the <b>packetcable gate maxcount</b> command.)                                                                                                                                                                                                                                                                                                                                                                                                            |
| Allow non-PacketCable UGS or Not Allow non-PacketCable UGS | Displays whether non-PacketCable, DOCSIS-style UGS service flows are allowed when PacketCable operations are enabled. (See the <b>packetcable authorize vanilla-docsis-mta</b> command.)                                                                                                                                                                                                                                                                                                                                    |
| Default Timer value                                        | Displays the current values of the following DQoS timers that the CMTS maintains. (See the <b>packetcable timer</b> command.)                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>T0</b>                                                  | <p>T0 specifies the amount of time that a gate ID can remain allocated without any specified gate parameters. The timer begins counting when a gate is allocated with a Gate-Alloc command. The timer stops when a Gate-Set command marks the gate as Authorized. If the timer expires without a Gate-Set command being received, the gate is deleted.</p> <p>The valid range is 1 to 1,000,000,000 milliseconds, with a default value of 30000 milliseconds (30 seconds).</p>                                              |
| <b>T1</b>                                                  | <p>T1 specifies the amount of time that an authorization for a gate can remain valid. It begins counting when the CMTS creates a gate with a Gate-Set command and puts the gate in the Authorized state. The timer stops when the gate is put into the committed state. If the timer expires without the gate being committed, the CMTS must close the gate and release all associated resources.</p> <p>The valid range is 1 to 1,000,000,000 milliseconds, with a default value of 200000 milliseconds (200 seconds).</p> |

**Related Commands**

| Command                                         | Description                                                                                                                                          |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>packetcable</b>                              | Enables PacketCable operations on the Cisco CMTS.                                                                                                    |
| <b>packetcable authorize vanilla-docsis-mta</b> | Allows Unsolicited Grant Service (UGS) service flows without a proper PacketCable gate ID when PacketCable operations are enabled on the Cisco CMTS. |
| <b>packetcable element-id</b>                   | Configures the PacketCable Event Message Element ID on the Cisco CMTS.                                                                               |
| <b>packetcable gate maxcount</b>                | Changes the maximum number of PacketCable gate IDs in the gate database on the Cisco CMTS.                                                           |
| <b>packetcable timer</b>                        | Changes the value of the different PacketCable DQoS timers.                                                                                          |
| <b>show packetcable gate</b>                    | Displays information about one or more gates in the gate database.                                                                                   |
| <b>show packetcable gate counter commit</b>     | Displays the total number of committed gates since system reset or since the counter was last cleared.                                               |

# show pxf cable

To display information about the multicast echo, packet intercept, or source-verify features for one or all cable interfaces, use the **show pxf cable** command in user EXEC or privileged EXEC mode.

```
show pxf cable { feature-table [cx/y/z] | maptable cx/y/z [sid] |
multicast-echo ds-group | multicast-echo mcast-addr | source-verify [ip address]}
```

| Syntax Description                         |  |                                                                                                                                                                                                                                                                           |
|--------------------------------------------|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>feature-table</b> [cx/y/z]              |  | Displays the multicast echo and packet intercept status on the PXF processor. If given without any options, displays the status for all cable interfaces and subinterfaces. If given with an optional cable interface, displays the status for that particular interface. |
| <b>maptable</b> cx/y/z [sid]               |  | Displays memory and service ID (SID) information for a particular cable interface. If the optional <i>sid</i> parameter is specified, displays information for that particular SID.                                                                                       |
| <b>multicast-echo ds-group</b>             |  | Displays the cable interfaces that are associated with each downstream group, where each downstream group is a unique DOCSIS MAC domain. (Interfaces that are bundled together are considered one MAC domain.)                                                            |
| <b>multicast-echo</b><br><i>mcast-addr</i> |  | Displays the service flow ID (SFID) information for all multicast addresses that hash to the same index as the specified multicast IP address.                                                                                                                            |
| <b>source-verify</b><br>[ip-address]       |  | Displays the interface and SFID mapping tables that are maintained by the source-verify feature. If the optional <i>ip-address</i> parameter is specified, displays information only for that particular IP address.                                                      |

**Defaults** No default behavior or values.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

| Command History | Release                 | Modification                                                                                 |
|-----------------|-------------------------|----------------------------------------------------------------------------------------------|
|                 | 12.2(11)CY, 12.2(11)BC2 | This command was introduced as <b>show hardware pxf cable</b> for the Cisco uBR10012 router. |
|                 | 12.2(15)BC2             | This command was renamed from <b>show hardware pxf cable</b> to <b>show pxf cable</b> .      |
|                 | 12.3BC                  | This command was integrated into Cisco IOS release 12.3BC.                                   |
|                 | 12.2(33)SCA             | This command was integrated into Cisco IOS release 12.2(33)SCA.                              |
|                 | 12.2(33)SCB             | The command was modified and <b>verbose</b> option was removed.                              |

**Usage Guidelines** The **show pxf cable** command displays information about whether multicast echo and packet intercept are enabled on the cable interfaces. It can also be used to display the service flow ID (SFID) used for each multicast address that is being processed by the router.

**Note** The **source-verify** option is not supported on the PRE-2 module. Instead, use the **show pxf cpu cef verbose** command to display the primary SID information on the PRE-2 module.

## Examples

The following example shows a typical display for the **show pxf cable feature-table** command for all cable interfaces:

```
Router# show pxf cable feature-table
```

| Interface    | SWInterface | VCCI | McastEcho | Intercept | DSGroup | InterceptGroup |
|--------------|-------------|------|-----------|-----------|---------|----------------|
| Cable5/0/0   | Cable5/0/0  | 3    | On        | On        | 0       | 0              |
| Cable5/0/0.1 | Cable5/0/0  | 9    | On        | On        | 0       | 0              |
| Cable5/0/1   | Cable5/0/1  | 4    | On        | Off       | 255     | -              |
| Cable6/0/0   | Cable6/0/0  | 5    | On        | Off       | 255     | -              |
| Cable6/0/1   | Cable6/0/1  | 6    | On        | Off       | 255     | -              |
| Cable7/0/0   | Cable7/0/0  | 7    | On        | Off       | 1       | -              |
| Cable7/0/1   | Cable7/0/1  | 8    | On        | Off       | 2       | -              |

The following example shows a typical display for the **show pxf cable feature-table** option for a particular cable interface:

```
Router# show pxf cable feature-table c5/0/0
```

| Interface    | SWInterface | VCCI | McastEcho | Intercept | DSGroup | InterceptGroup |
|--------------|-------------|------|-----------|-----------|---------|----------------|
| Cable5/0/0   | Cable5/0/0  | 3    | On        | On        | 0       | 0              |
| Cable5/0/0.1 | Cable5/0/0  | 9    | On        | On        | 0       | 0              |

The following example shows a typical display for the **show pxf cable feature-table** option when a cable interface has a bundle interface configured without a corresponding master interface:

```
Router# show pxf cable feature-table
```

| Interface  | SWInterface                         | VCCI | McastEcho | Intercept | DSGrp | InterceptGrp |
|------------|-------------------------------------|------|-----------|-----------|-------|--------------|
| Cable5/0/0 | <No Cable Bundle Master Configured> |      |           |           |       |              |
| Cable5/0/1 | Cable5/0/1                          | 4    | On        | Off       | 11    | -            |
| Cable5/1/0 | <No Cable Bundle Master Configured> |      |           |           |       |              |
| Cable5/1/1 | Cable5/1/1                          | 6    | On        | Off       | 15    | -            |
| Cable6/0/0 | Cable6/0/0                          | 7    | On        | Off       | 0     | -            |
| Cable6/0/1 | Cable6/0/1                          | 8    | On        | Off       | 1     | -            |
| Cable6/1/0 | Cable6/1/0                          | 9    | On        | Off       | 6     | -            |
| Cable6/1/1 | Cable6/1/1                          | 10   | On        | Off       | 7     | -            |
| Cable7/0/0 | Cable7/0/0                          | 11   | On        | Off       | 8     | -            |
| Cable7/0/1 | Cable7/0/1                          | 12   | On        | Off       | 9     | -            |
| Cable7/1/0 | Cable7/1/0                          | 13   | On        | Off       | 4     | -            |
| Cable7/1/1 | Cable7/1/1                          | 14   | On        | Off       | 5     | -            |
| Cable8/0/0 | Cable8/0/0                          | 15   | On        | Off       | 255   | -            |
| Cable8/0/1 | Cable8/0/1                          | 16   | On        | Off       | 3     | -            |
| Cable8/1/0 | Cable8/1/0                          | 17   | On        | Off       | 12    | -            |
| Cable8/1/1 | Cable8/1/1                          | 18   | On        | Off       | 13    | -            |

Table 0-249 describes the fields shown by both forms of the **show pxf cable feature-table** command:

**Table 0-249** show pxf cable feature-table Field Descriptions

| Field       | Description                                                        |
|-------------|--------------------------------------------------------------------|
| Interface   | Identifies the cable interface or subinterface.                    |
| SWInterface | Identifies the master cable interface for bundled interfaces.      |
| McastEcho   | Displays whether multicast echo is enabled (On) or disabled (Off). |

**Table 0-249** *show pxf cable feature-table Field Descriptions (continued)*

| Field          | Description                                                                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VCCI           | Displays the Virtually Cool Common Index (VCCI) for this cable interface or subinterface. The VCCI is an index that uniquely identifies every interface or subinterface on the PXF processor, and that quickly maps that interface to the appropriate set of services and features.                                                                    |
| Intercept      | Displays whether packet intercept, as per the Communications Assistance of Law Enforcement Act (CALEA), is enabled (On) or disabled (Off).                                                                                                                                                                                                             |
| DSGroup        | Displays the downstream group (unique MAC domain) that is associated with this interface or subinterface. Interfaces that are bundled together are considered one MAC domain.<br><br><b>Note</b> A downstream group number of 255 indicates that the CMTS has not assigned the interface to a MAC domain, typically because the interface is shutdown. |
| InterceptGroup | Displays the intercept packet group assigned to this cable interface.                                                                                                                                                                                                                                                                                  |

The following example shows a typical display for the **show pxf cable mactable** command for a particular cable interface:

```
Router# show pxf cable mactable c5/1/0
```

|     |      |           |        |     |     |               |
|-----|------|-----------|--------|-----|-----|---------------|
| SID | VCCI | FIB Index | SrcVfy | Pri | SID | CM IP Address |
| 1   | 3    | 0         | On     | 1   |     | 10.10.11.31   |
| 2   | 3    | 0         | On     | 2   |     | 10.10.11.129  |

[Table 0-250](#) describes the fields shown by the **show pxf cable mactable** command:

**Table 0-250** *show pxf cable mactable Field Descriptions*

| Field         | Description                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID           | Identifies the service ID (SID).                                                                                                                                                                                                                                                    |
| VCCI          | Displays the Virtually Cool Common Index (VCCI) for this cable interface or subinterface. The VCCI is an index that uniquely identifies every interface or subinterface on the PXF processor, and that quickly maps that interface to the appropriate set of services and features. |
| FIB Index     | Identifies the forwarding information base (FIB) being used.                                                                                                                                                                                                                        |
| SrcVfy        | Identifies whether the source-verify feature (enabled with the <b>cable source-verify</b> command) is On or Off for this SID and interface.                                                                                                                                         |
| Pri SID       | Identifies the primary SID associated with this SID, in case this SID is a secondary or dynamic SID.                                                                                                                                                                                |
| CM IP Address | Displays the IP address for the CM that is associated with this SID.                                                                                                                                                                                                                |

The following example shows a typical display for the **show pxf cable multicast-echo ds-group** command, listing each downstream multicast group and its associated cable interface:

```
Router# show pxf cable multicast-echo ds-group
```

|          |            |
|----------|------------|
| DS Group | Interface  |
| 0        | Cable5/0/0 |
| 1        | Cable7/0/0 |

2 Cable7/0/1

The following example shows a typical display for the **show pxf cable multicast-echo** command for a particular multicast address:

```
Router# show pxf cable multicast-echo 230.1.1.1

Src I/f SFID DS Jib Header Packets Bytes
230.1.1.1 Cable7/0/1 16385 0x0000 0000 1000 0001 1000 321 2160
```

Table 0-251 describes the fields shown by the **show pxf cable multicast-echo** command:

**Table 0-251** *show pxf cable multicast-echo Field Descriptions*

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Src           | Multicast address being displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| I/F           | Cable interface being used for this multicast address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SFID          | Displays the service flow ID (SFID) for this particular multicast address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DS Jib Header | Shows the bitmask used for this multicast address on the PRE's MAC-layer processor. The bitmask consists of ten hexadecimal bytes in the following format (reading left to right, from most significant to least significant bit): <ul style="list-style-type: none"> <li>Bytes 9:8 = Specifies the key index for the downstream.</li> <li>Bytes 7:6 = Identifies the rule number used for packet header suppression (if enabled)</li> <li>Byte 5 = Bitmask that defines the type of packet transmitted: <ul style="list-style-type: none"> <li>Bit 4 = 1 if padding CRC for data packets, 0 if not padding the CRC</li> <li>Bit 3 = 1 if inserting an extended header (EH) for PHS processing</li> <li>Bit 2 = 1 if inserting an extended header (EH) for BPI+ processing</li> <li>Bits 1:0 = Specifies the packet type: <ul style="list-style-type: none"> <li>00 = Data packet</li> <li>01 = MAC management message for transmitted packets</li> <li>10 = Internal MAP message on upstream</li> <li>11 = Special packet</li> </ul> </li> </ul> </li> <li>Byte 4 = Bitmask that identifies the type of map control and key sequence for the packet: <ul style="list-style-type: none"> <li>Bits 6:4 = Destination upstream for the MAP message</li> <li>Bits 3:0 = BPI Key Sequence number</li> </ul> </li> <li>Bytes 3:2 = Index to obtain the downstream modem statistics.</li> <li>Byte 1 = Specifies the assumed minimum size of a packet data unit. Multiply this byte by 4 to get the actual minimum size in bytes.</li> <li>Byte 0 = Specifies the DOCSIS header size, with a maximum value of 0xE0 (248 decimal).</li> </ul> |
| Packets       | Number of packets sent to this address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Bytes         | Number of bytes sent to this address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

The following example shows a typical display for the **show pxf cable source-verify** command:

```
Router# show pxf cable source-verify
```

| IP Address | Interface  | Fib Index | Mac-Domain | SID |
|------------|------------|-----------|------------|-----|
| 50.1.1.3   | Cable5/0/0 | 0         | 0          | 1   |
| 50.1.1.29  | Cable5/0/0 | 0         | 0          | 2   |
| 50.1.1.32  | Cable5/0/0 | 0         | 0          | 2   |
| 50.1.2.6   | Cable8/0/0 | 0         | 6          | 1   |
| 50.1.2.19  | Cable8/0/0 | 0         | 6          | 1   |

Table 0-252 describes the fields shown by the **show pxf cable source-verify** command:

**Table 0-252** *show pxf cable source-verify Field Descriptions*

| Field      | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| IP Address | Identifies the IP addresses that have been verified by the source-verify feature. |
| Interface  | Identifies the cable interface or subinterface used for this IP address.          |
| FIB Index  | Identifies the forwarding information base (FIB) being used.                      |
| Mac-Domain | Identifies the MAC DOCSIS downstream domain for this IP address.                  |
| SID        | Identifies the service ID (SID).                                                  |

#### Related Commands

| Command                         | Description                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>cable source-verify</b>      | Enables verification of IP addresses for CMs and CPE devices on the upstream.                                                |
| <b>clear pxf</b>                | Clears the direct memory access (DMA) and error checking and correcting (ECC) error counters on the PXF processor.           |
| <b>debug pxf</b>                | Enables debugging of the PXF subsystems on the active PRE1 module on the Cisco uBR10012 router.                              |
| <b>show pxf cable interface</b> | Displays display DOCSIS-related information about a particular service ID (SID) on a particular cable interface.             |
| <b>show pxf cpu</b>             | Displays the display different statistics about the operation of the CPU processor during PXF processing.                    |
| <b>show pxf microcode</b>       | Displays identifying information for the microcode being used on the processor.                                              |
| <b>show pxf xcm</b>             | Displays the current state of error checking and correcting (ECC) for the External Column Memory (XCM) on the PXF processor. |

# show pxf cable controller

To display information about radio frequency (RF) channel Versatile Traffic Management System (VTMS) links and link queues, use the **show pxf cable controller** command in privileged EXEC mode.

**show pxf cable controller modular-cable slot/subslot/unit rf-channel channel [link queues]**

|                    |                          |                                                                                                                                                                                                                         |
|--------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>modular-cable</b>     | Specifies the modular cable interface.                                                                                                                                                                                  |
|                    | <i>slot/subslot/unit</i> | Identifies a cable interface on the Cisco uBR10012 router. The following are valid values: <ul style="list-style-type: none"><li>• <i>slot</i>—1 or 3</li><li>• <i>subslot</i>—0 or 1</li><li>• <i>unit</i>—0</li></ul> |
|                    | <b>rf-channel</b>        | Specifies the RF channel physical port on the Wideband SPA field-programmable gate array (FPGA).                                                                                                                        |
|                    | <i>channel</i>           | Specifies the number of the RF channel. The range is 0 to 23.                                                                                                                                                           |
|                    | <b>link queues</b>       | (Optional) Displays the link queue information for the specified RF channel.                                                                                                                                            |
|                    |                          |                                                                                                                                                                                                                         |

|               |                     |
|---------------|---------------------|
| Command Modes | Privileged EXEC (#) |

|                 | 12.3(23)BC1    | This command was introduced.                                    |
|                 | 12.2(33)SCB    | This command was integrated into Cisco IOS Release 12.2(33)SCB. |

|                  |                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | The <b>show pxf cable controller</b> command displays information about VTMS link queues only on the Cisco uBR10012 universal broadband router. |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|

|          |                                                                                                                                                      |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Examples | The following example using the <b>show pxf cable controller</b> command, omitting the <b>link queues</b> option, displays only VTMS-related output: |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|

Router# **show pxf cable controller modular-cable 1/0/0 rf-channel 3**

```
Link ID is 32259
 link next_send: 0x00000000 channel number: 0
 temporary bgbw: 0x00000000 reserved bgbw: 0x00000000
col.6 link bandwidth mult: 55778 shift: 18
col.7 link bandwidth mult: 55778 shift: 18
 link aggregate cir: 0x00000000 aggregate eir: 0x00000000
 bw reclaimed/trunc eir: 0/0 link cir_max: 0xFFFF
 link cir_sum: 70 link eir_sum: 2
 link bw_sum: 0 act. link q num: 0
```

The following example using the **show pxf cable controller** command including the **link queues** option, displays VTMS-related output as well as link queue-related output:

```
Router# show pxf cable controller modular-cable 1/0/0 rf-channel 3 link-queues
```

```
Link ID is 32259
 link next_send: 0x00000000 channel number: 0
 temporary bgbw: 0x00000000 reserved bgbw: 0x00000000
col.6 link bandwidth mult: 55778 shift: 18
col.7 link bandwidth mult: 55778 shift: 18
 link aggregate cir: 0x00000000 aggregate eir: 0x00000000
 bw reclaimed/trunc eir: 0/0 link cir_max: 0xFFFF
 link cir_sum: 70 link eir_sum: 2
 link bw_sum: 0 act. link q num: 0
```

Link Queues :

| QID | CIR(act/conf) | EIR | MIR         | WB Chan. | Status   |
|-----|---------------|-----|-------------|----------|----------|
| 420 | 13107/13107   | 1/1 | 65535/65535 | 0        | Inactive |
| 423 | 32768/32768   | 1/1 | 65535/65535 | 2        | Inactive |

See [Table 253](#) for descriptions of link queue fields.

**Table 253** *show pxf cable controller Link Queue Field Descriptions*

| Field          | Description                                                                                                                                                                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QID            | Displays the identification number of the link queue.                                                                                                                                                                                                                                                                                                   |
| CIR (act/conf) | Displays the information for the committed information rate (CIR) of link queues on this RF channel. <ul style="list-style-type: none"> <li>The first number, <i>act</i>, indicates the parameter that a link queue is actually using.</li> <li>The second number, <i>conf</i>, indicates the parameter that is configured for a link queue.</li> </ul> |
| EIR            | Displays the information for the excess information rate (EIR) of link queues on this RF channel. <ul style="list-style-type: none"> <li>The first number in the output indicates the parameter that a link queue is actually using.</li> <li>The second number in the output indicates the parameter that is configured for a link queue.</li> </ul>   |
| MIR            | Displays the information for the maximum information rate (MIR) of link queues on this RF channel. <ul style="list-style-type: none"> <li>The first number in the output indicates the parameter that a link queue is actually using.</li> <li>The second number in the output indicates the parameter that is configured for a link queue.</li> </ul>  |
| WB Chan        | The number of the wideband cable channel.                                                                                                                                                                                                                                                                                                               |
| Status         | Displays the state of the link queue.                                                                                                                                                                                                                                                                                                                   |

show pxf cable controller

| Related Commands | Command                     | Description                                                                                                      |
|------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------|
|                  | debug cr10k-rp<br>dbs-queue | Displays debug information for dynamic bandwidth sharing (DBS) on the Cisco uBR10012 universal broadband router. |
|                  | show pxf cpu queue          | Displays parallel express forwarding (PXF) queueing and link queue statistics.                                   |

# show pxf cable feature

To display multicast echo, packet intercept, or source-verify features for one or all cable interfaces, to include information for virtual interface bundles, use the **show pxf cable feature** command in privileged EXEC mode.

**show pxf cable feature**

**Syntax Description** This command has no additional arguments or keywords.

**Command Default** Display output without page breaks and remove passwords and other security information.

**Command Modes** User EXEC, Privileged EXEC

| Command History | Release    | Modification                                                                                        |

| Command                                    | Description                                                                                                                                                                        |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable bundle</b>                        | Configures a cable interface to belong to an interface bundle or virtual interface bundle.                                                                                         |
| <b>show arp</b>                            | Displays the entries in the router's ARP table.                                                                                                                                    |
| <b>show cable bundle forwarding-table</b>  | Displays the MAC forwarding table for the specified bundle, showing the MAC addresses of each cable modem in a bundle and the physical cable interface that it is currently using. |
| <b>show cable modem</b>                    | Displays the cable modems that are online both before and after cable interface bundling has been configured.                                                                      |
| <b>show running-config interface cable</b> | Displays the configuration for the specified cable interface.                                                                                                                      |

# show pxf cable interface

To display information about a particular service ID (SID) on a particular cable interface, use the **show pxf cable** command in user EXEC or privileged EXEC mode.

```
show pxf cable interface cable x/y/z sid {classifiers | mac-rewrite | queue | service-flow ds | service-flow us}
```

| Syntax Description        |  |                                                                                                                     |
|---------------------------|--|---------------------------------------------------------------------------------------------------------------------|
| <b>cable</b> <i>x/y/z</i> |  | Identifies the cable interface for which information should be displayed.                                           |
| <i>sid</i>                |  | Identifies the service ID (SID) for which information should be displayed. The valid range is 1 to 8191.            |
| <b>classifiers</b>        |  | Displays the packet classifiers used for this SID.                                                                  |
| <b>mac-rewrite</b>        |  | Displays the CPE MAC information for this SID.                                                                      |
| <b>queue</b>              |  | Displays the status of the queues being used by this SID.                                                           |
| <b>service-flow ds</b>    |  | Displays the service flow IDs (SFID) associated with the given SID on the downstream for the given cable interface. |
| <b>service-flow us</b>    |  | Displays the SFIDs associated with the given SID on the upstream for the given cable interface.                     |

**Command Default** No default behavior or values.

**Command Modes** User EXEC, Privileged EXEC

| Command History | Release     | Modification                                                                                                |
|-----------------|-------------|-------------------------------------------------------------------------------------------------------------|
|                 | 12.2(11)BC2 | This command was introduced as <b>show hardware pxf cable</b> for the Cisco uBR10012 router.                |
|                 | 12.2(15)BC2 | This command was renamed from <b>show hardware pxf cable interface</b> to <b>show pxf cable interface</b> . |

**Usage Guidelines** The **show pxf cable interface** command displays the DOCSIS-related information for a particular service ID (SID) on a particular cable interface.

**Examples** The following example shows a typical display for SID 1 on cable interface c8/0/0 for the **show pxf cable interface classifiers** command:

```
Router# show pxf cable interface c8/0/0 1 classifiers
CM Classifiers:

|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>clear pxf</b>          | Clears the direct memory access (DMA) and error checking and correcting (ECC) error counters on the PXF processor.           |
| <b>debug pxf</b>          | Enables debugging of the PXF subsystems on the active PRE1 module on the Cisco uBR10012 router.                              |
| <b>show pxf cable</b>     | Displays information about the multicast echo and packet intercept features for one or all cable interfaces.                 |
| <b>show pxf cpu</b>       | Displays the display different statistics about the operation of the CPU processor during PXF processing.                    |
| <b>show pxf microcode</b> | Displays identifying information for the microcode being used on the processor.                                              |
| <b>show pxf xcm</b>       | Displays the current state of error checking and correcting (ECC) for the External Column Memory (XCM) on the PXF processor. |

# show pxf cable multicast

To display information about multicast routes (mroute) in the PXF processor for a specified group, use the **show pxf cable multicast** command in privileged EXEC mode.

```
show pxf cable multicast [multicast-group]
```

|                    |                 |                                                      |
|--------------------|-----------------|------------------------------------------------------|
| Syntax Description | multicast-group | (Optional) Displays the name of the multicast group. |

|------------------|--------------------------|------------------------------------------------------------------------------------------------------------------|
|                  | show pxf cable interface | Displays display DOCSIS-related information about a particular service ID (SID) on a particular cable interface. |
|                  | show pxf cpu             | Displays the display different statistics about the operation of the CPU processor during PXF processing.        |

# show pxf cpu

To display the display different statistics about the operation of the CPU on the Performance Routing Engine (PRE1) module during Parallel eXpress Forwarding (PXF) processing, use the **show pxf cpu** command in user EXEC or privileged EXEC mode.

```
show pxf cpu {access-lists {qos | security} | buffers |
cef [mem | verbose | vrf ip-address mask] | context | mroute [ipaddress1] [ipaddress2] |
queue [interface] | schedule [interface | summary] | statistics [diversion [detail] | drop
[interface] | ip | mlp] | subblocks [interface]}
```

## Syntax Description

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access-lists {qos   security}</b>             | Displays information for either quality of service (QoS) access lists (ACLs) or security access lists.<br><br><b>Note</b> The PRE module automatically compiles all access lists into the turbo ACL format, so that they can be efficiently processed by the PXF processors. The only exception are very simple access lists that would require more processing time to be compiled than to be executed. |
| <b>buffers</b>                                   | Displays information about buffer usage on the processor.                                                                                                                                                                                                                                                                                                                                                |
| <b>cef [mem   verbose   vrf ip-address mask]</b> | Displays information about the memory usage and routing tables in the PXF processors for Cisco Express Forwarding (CEF) operation. Optionally displays detailed information about memory usage and about a particular entry in the virtual private network (VPN) routing/forwarding (VRF) tables.                                                                                                        |
| <b>context</b>                                   | Displays performance statistics on the processing of contexts on the processors. (A context is a unit of packet processing time on the PXF processor.)<br><br><b>Note</b> The <b>show pxf cpu context</b> command displays more useful information on the PXF processor's performance than the <b>show processor cpu command</b> that is used on other platforms.                                        |
| <b>mroute [ipaddress1] [ipaddress2]</b>          | Displays multicast static route (mroute) information for all groups, for one particular group, or for a range of groups.<br><br>Displays information about IP multicast routes in the PXF processor for a specified IP prefix. For a more user-friendly display of the same information, use the <b>show ip mroute</b> command.                                                                          |
| <b>queue [interface]</b>                         | Displays queue drop counters for all interfaces, or optionally for one selected interface. This can be useful in determining if traffic is being properly distributed among the correct interfaces.                                                                                                                                                                                                      |
| <b>schedule [interface   summary]</b>            | Displays the timing wheel dequeue schedule counters for all interfaces, or optionally for one interface, or optionally a summary of all interfaces.                                                                                                                                                                                                                                                      |

|                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>statistics</b><br><b>[diversion [detail]   drop [interface]   ip   mlp]</b> | <p>Displays statistics for the packets that the PXF has processed. The default is to display all packet statistics, or you can optionally specify one of the following keywords to display a particular type of statistics:</p> <ul style="list-style-type: none"> <li>• <b>diversion</b>—(Optional) Displays packets that the PXF diverted to the main route processor for special handling. Use the detail keyword to break down the statistics by the particular reason for the diversion.</li> <li>• <b>drop [interface]</b>—(Optional) Displays dropped packets and bytes. You can also optionally display the dropped packets for a particular interface.</li> <li>• <b>ip</b>—(Optional) Displays statistics for the processing of IP and ICMP packets.</li> <li>• <b>mlp</b>—(Optional) Displays statistics for multilink point-to-point protocol (MLPPP) packets.</li> </ul> |
| <b>subblocks [interface]</b>                                                   | Displays subblocks information for all interfaces, or optionally for one interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Command Default** No default behavior or values

**Command Modes** User EXEC, Privileged EXEC

| Command History | Release     | Modification                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(1)XF1  | This command was introduced as <b>show hardware pxf cpu</b> for the Cisco uBR10012 router.                                                                                                                                                                                                                                                                                     |
|                 | 12.2(11)BC2 | The MAC domain was added to the display of the <b>show pxf cpu subblocks</b> command for a particular cable interface.                                                                                                                                                                                                                                                         |
|                 | 12.2(15)BC2 | This command was renamed from <b>show hardware pxf cpu</b> to <b>show pxf cpu</b> . In addition, the <b>cef</b> option was enhanced to display CEF tag adjacency information. The <b>verbose</b> option was also added to the <b>cef</b> option to display more detailed information about the Forwarding Information Base (FIB) tables being maintained by the CEF subsystem. |
|                 | 12.3(X)BC   | The <b>detail</b> option and additional counters were added to the <b>show pxf cpu statistics diversion</b> command.                                                                                                                                                                                                                                                           |

**Examples** See the following sections for typical displays for the different forms of the **show pxf cpu** command.

**Access-Lists**

The following example shows a typical display for the **access-list qos** option, which displays information about the processing of quality-of-service (QoS) access-lists:

```
Router# show pxf cpu access qos

PXF QoS ACL statistics:
ACL State Tables Entries Config Fragment Redundant Memory
101 Operational 1 9 1 0 0 1Kb

Table 0-254 describes the fields shown in the **show pxf cpu access-list** command:

**Table 0-254 Field Descriptions for the show pxf cpu access-list Command**

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACL                       | Identifies the access list (ACL) in use, by either name or number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| State                     | Displays the current state of the access list: <ul style="list-style-type: none"> <li>• Copying—The ACL is in the process of being created or compiled.</li> <li>• Operational—ACL is active and filtering packets.</li> <li>• Out of acl private mem—ACL has run out of the private memory that was allocated exclusively to it.</li> <li>• Out of shared mem—ACL has run out of the memory that it shares with other ACLs.</li> <li>• Unknown Failure—ACL has failed because of an uncategorized reason.</li> <li>• Unneeded—ACL was allocated but is not currently in use.</li> </ul> |
| Tables                    | Displays the number of tables that the ACL is currently using.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Entries                   | Displays the number of table entry slots for the fields or values that the ACL is currently using to match packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Config                    | Displays the number of simple or extended entries for this ACL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Fragment                  | Displays the number of entries that were configured with the <b>fragments</b> keyword.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Redundant                 | Displays the number of duplicate entries for this ACL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Memory                    | Displays the total amount of memory, rounded up to the nearest kilobyte, that the ACL is currently using.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| First level lookup tables | Describes the blocks of memory that store the IP fields that are used to match packets for access list processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Block                     | Identifies the block of memory used for this particular lookup table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Use                       | Describes the IP packet field that is being matched.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Rows                      | Describes the number of table rows currently in use and the total number of rows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Columns                   | Describes the number of table columns currently in use and the total number of columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Memory used               | Describes the total amount of memory, in bytes, currently being used by the memory block.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Banknum                   | Identifies the block of memory used for this particular lookup table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Heapsize                  | Identifies the total amount of memory, in bytes, allocated for this block of memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Freesize                  | Identifies the amount of memory, in bytes, that is currently available for use by this block of memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| %Free                     | Identifies the percentage of memory that is free and available for use for this block of memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Buffers

The following example shows a typical display for the **buffers** option:

```
Router# show pxf cpu buffers
```

```
FP buffers
 pool size # buffer available allocate failures

 0 9216 3203 3203 0
 1 1536 6406 6406 0
 2 640 89432 89432 0
 3 256 76872 76872 0
 4 64 128120 128120 0
```

```
Router#
```

[Table 0-255](#) describes the fields shown in the **show pxf cpu buffers** command:

**Table 0-255** Field Descriptions for the show pxf cpu buffers Command

| Field             | Description                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------|
| pool              | Identifies the buffer pool.                                                                 |
| size              | Displays the size, in bytes, of each buffer in this particular pool.                        |
| # buffer          | Displays the total number of buffers in this particular pool.                               |
| available         | Displays the number of buffers that are currently available.                                |
| allocate failures | Displays the number of attempts to allocate a buffer that have failed since the last reset. |

## CEF

The following example shows a typical display for the **cef** option:

```
Router# show pxf cpu cef
```

```
Shadow 10-9-5-8 Toaster Mtrie:
 97 leaves, 3104 leaf bytes, 40 nodes, 41056 node bytes
 141 invalidations
 233 prefix updates
refcounts: 10293 leaf, 10144 node
```

```

FP CEF state: 2

**Note**

If the value in the Alloc column is equal to the number in the Total column, then the PXF has run out of its allocated memory for that level and the CEF entries for that particular level have been exhausted.

Table 0-256 describes the fields shown in the **show pxf cpu cef** command:

**Table 0-256** Field Descriptions for the show pxf cpu cef Command

| Field                            | Description                                                                                                                                                                                                                            |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shadow 10-9-5-8<br>Toaster Mtrie | Header for the memory used by the CEF switching tables, which use the optimized multiway tree (Mtrie) data structure format.                                                                                                           |
| leaves                           | Number of leaves in the CEF Mtrie table.                                                                                                                                                                                               |
| leaf bytes                       | Number of bytes used by the leaves in the Mtrie table.                                                                                                                                                                                 |
| nodes                            | Number of nodes in the Mtrie table.                                                                                                                                                                                                    |
| node bytes                       | Number of bytes used by the nodes in the Mtrie table.                                                                                                                                                                                  |
| invalidations                    | Number of times an existing entry in the adjacency table was invalidated because of updated information.                                                                                                                               |
| prefix updates                   | Number of updates made to the adjacency table.                                                                                                                                                                                         |
| refcounts                        | Number of references (leaves and nodes) to an adjacency that are currently stored in the adjacency table. There is one reference for each corresponding entry in the CEF table, plus a few others for maintenance and system purposes. |
| Prefix/Length                    | IP prefix and length (IP network or host number, with subnet) that is in the CEF adjacency table.                                                                                                                                      |
| Refcount                         | Number of times this prefix is referenced in the adjacency table.                                                                                                                                                                      |

**Table 0-256** Field Descriptions for the show pxf cpu cef Command (continued)

| Field                                                                                                                                 | Description                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Parent                                                                                                                                | Parent of this prefix's leaf or node entry in the adjacency table.                  |
| <b>FP CEF/MFIB/TFIB XCM Type usage—The following fields display the memory usage of the shadow forwarding information base (FIB).</b> |                                                                                     |
| Type                                                                                                                                  | Level number of this particular memory block.                                       |
| Name                                                                                                                                  | Identifier for this particular memory block.                                        |
| Total                                                                                                                                 | Total number of nodes available on each level and changes to other data structures. |
| Alloc                                                                                                                                 | Number of nodes currently allocated.                                                |
| Start, End                                                                                                                            | Starting and ending addresses for the memory block.                                 |
| Error                                                                                                                                 | Number of errors discovered in the memory block.                                    |

**Context**

The following example shows a typical display for the **context** option, which displays performance statistics for the PXF processors over the past 1-minute, 5-minute, and 60-minute periods:

Router# **show pxf cpu context**

```

FP context statistics count rate

 feed_back 2002946946 645161
 new_work 3992307360 1293715
 null 2261726736 708206

 2647082

FP average context/sec 1min 5min 60min

 feed_back 679377 707217 191844 cps
 new_work 1358758 1414842 391367 cps
 null 587560 520274 2171829 cps

 Total 2625695 2642333 2755040 cps

FP context utilization 1min 5min 60min

 Actual 77 % 80 % 21 %
 Theoretical 65 % 67 % 18 %
 Maximum 84 % 84 % 88 %

```

Router#

**Note**

The **show pxf cpu context** command displays more useful information on the processor's performance than the **show processor cpu command** that is used on other platforms.

This display shows statistics that are based on three counters on the PXF processors:

- **feed\_back**—Incremented each time the processor requires another processor cycle to process a packet. Each PXF processor contains 8 columns that perform different packet header processing tasks, such as ACL processing or QoS processing. A typical IP packet passes through all 8 columns

only once, but some types of packets can require more than one pass through these columns, and each additional pass through the PXF processor is referred to as feedback. This counter represents the amount of traffic that cannot be processed in an optimal manner.

- **new\_work**—Incremented for new packets that come into the PXF pipeline. This counter represents a snapshot of the amount of incoming traffic being processed by the processor.
- **null**—Incremented for every context during which the PXF pipe is not processing traffic. This counter represents the processor's potential to handle additional traffic. As the processor becomes more busy, the value for null decreases until it becomes 0, at which point the processor has reached its maximum usage.

Table 0-257 describes the fields shown in the **show pxf cpu context** command:

**Table 0-257 Field Descriptions for the show pxf cpu context Command**

| Field                         | Description                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FP context statistics</b>  |                                                                                                                                                                                                                                                                                                                                |
| feed_back                     | Displays the current value for the feed_back counter and the rate that the counter is increasing per second (the difference between the current value and the previous value divided by the time period between the two).                                                                                                      |
| new_work                      | Displays the current value for the new_work counter and the rate that the counter is increasing per second (the difference between the current value and the previous value divided by the time period between the two).                                                                                                       |
| null                          | Displays the current value for the null counter and the rate that the counter is increasing per second (the difference between the current value and the previous value divided by the time period between the two).                                                                                                           |
| <b>FP average context/sec</b> |                                                                                                                                                                                                                                                                                                                                |
| feed_back                     | Displays the rate, in terms of the number of contexts per second (cps) for the feed_back counter for the last 1-minute, 5-minute, and 60-minute time periods.                                                                                                                                                                  |
| new_work                      | Displays the rate, in terms of the number of contexts per second (cps) for the new_work counter for the last 1-minute, 5-minute, and 60-minute time periods.                                                                                                                                                                   |
| null                          | Displays the rate, in terms of the number of contexts per second (cps) for the null counter for the last 1-minute, 5-minute, and 60-minute time periods.                                                                                                                                                                       |
| <b>FP context utilization</b> |                                                                                                                                                                                                                                                                                                                                |
| Actual                        | Displays the actual percentage of processor usage per second, compared to the theoretical maximum, for the last 1-minute, 5-minute, and 60-minute time periods. The value for Actual = $(\text{new\_work} + \text{feed\_back}) * 100 / (\text{new\_work} + \text{feed\_back} + \text{null})$ .                                 |
| Theoretical                   | Displays the percentage of processor usage compared to the ideal theoretical capacities for the last 1-minute, 5-minute, and 60-minute time periods. The value for Theoretical = $(\text{new\_work} + \text{feed\_back}) * 100 / 3125000$ . (The theoretical maximum for the PXF processors is 3,125,000 contexts per second.) |
| Maximum                       | Displays the actual maximum percentage of processor usage that has occurred for the last 1-minute, 5-minute, and 60-minute time periods. The value for Actual = $(\text{new\_work} + \text{feed\_back} + \text{null}) * 100 / 3125000$ .                                                                                       |

## Mroute

The following example shows a typical display for the **mroute** option:

```
Router# show pxf cpu mroute
```

```
Shadow G/SG[5624]: s: 0.0.0.0 g: 224.0.1.40 uses: 0 bytes 0 flags: [D] LNJ

[Table 0-258](#) describes the fields shown in the **show pxf cpu mroute** command:

**Table 0-258** Field Descriptions for the **show pxf cpu mroute** Command

| Field      | Description                                                                                                                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | Cable interface or subinterface.                                                                                                                                                                                                                                       |
| vcci       | Virtually Cool Common Index (VCCI) for this cable interface or subinterface. The VCCI is an index that uniquely identifies every interface or subinterface on the PXF processor, and that quickly maps that interface to the appropriate set of services and features. |
| rw index   | Index used to read and write into the multicast table for this entry.                                                                                                                                                                                                  |
| mac_header | MAC header that is used when rewriting the packet for output.                                                                                                                                                                                                          |

## Queue

The following example shows a typical display for the **queue** option, which displays the chassis-wide counters for the PXF pipeline counters that show drops on the output side of the processor:

```
Router# show pxf cpu queue
```

```
FP queue statistics for RP
Queue number 0 Shared
 wq_avg_qlen 0 wq_flags_pd_offset 1B48001
 wq_drop_factor 74
 wq_buffer_drop 0 wq_limit_drop 0
 wq_invalid_enq_wqb_drop 0 wq_invalid_deq_wqb_drop 0
 wq_rnd_pkt_drop 0 wq_rnd_byte_drop 0
 wq_static_qlen_drop 0
 wq_len 0

 Packet xmit 804833 Byte xmit 487438911
Queue number 15 Shared High priority
 wq_avg_qlen 0 wq_flags_pd_offset 1BC8001
 wq_drop_factor 174
```

## ■ show pxf cpu

```

wq_buffer_drop 0 wq_limit_drop 0
wq_invalid_enq_wqb_drop 0 wq_invalid_deq_wqb_drop 0
wq_rnd_pkt_drop 0 wq_rnd_byte_drop 0
wq_static_qlen_drop 0
wq_len 0

Packet xmit 69647 Byte xmit 41230926

```

Router#

The following example shows a typical display for the **queue** option for a particular cable interface:

Router# **show pxf cpu queue c6/0/0**

FP queue statistics for Cable5/0/0

FP queue statistics for Cable6/0/0

```

Queue algorithm 0x0
Queue number 0 Shared
wq_avg_qlen 0 wq_flags_pd_offset 18A0001
wq_drop_factor 40
wq_buffer_drop 0 wq_limit_drop 0
wq_invalid_enq_wqb_drop 0 wq_invalid_deq_wqb_drop 0
wq_rnd_pkt_drop 0 wq_rnd_byte_drop 0
wq_static_qlen_drop 0
wq_len 0

Packet xmit 56414 Byte xmit 14322357

wq_drop_factor 1000
wq_buffer_drop 0 wq_limit_drop 0
wq_invalid_enq_wqb_drop 0 wq_invalid_deq_wqb_drop 0
wq_rnd_pkt_drop 0 wq_rnd_byte_drop 0
wq_static_qlen_drop 0
wq_len 0

Packet xmit 0 Byte xmit 0

```

Router#

### Schedule

The following example shows a typical display for the **schedule summary** option:

Router# **show pxf cpu schedule summary**

```

FP average dequeue schedule rate in pps
Interface Level 1 Level 2 maximum 1min 5min 60min

Total 32 / 32 1 / 1 3125000 0 % 0 % 0 %

```

Router#

The following example shows a typical display for the **schedule** option for a particular interface:

Router# **show pxf cpu schedule c5/0/0**

```

FP average dequeue schedule rate in pps
Interface Level 1 Level 2 maximum 1min 5min 60min

Cable5/0/0 1 / 32 1 / 1 97656 0 % 0 % 0 %

```

Router#

Table 0-259 describes the fields shown in the **show pxf cpu schedule** command:

**Table 0-259 Field Descriptions for the show pxf cpu schedule Command**

| Field     | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| Interface | Identifies the cable interface or subinterface.                                                                                       |
| Level 1   | Displays the number of occupied level 1 (port) wheel slots and the total number of wheel slots for this interface or subinterface.    |
| Level 2   | Displays the number of occupied level 2 (channel) wheel slots and the total number of wheel slots for this interface or subinterface. |
| maximum   | Displays the maximum number of packet dequeues per second.                                                                            |
| 1 min     | Displays the dequeue rate for the last 1-minute period.                                                                               |
| 5 min     | Displays the dequeue rate for the last 5-minute period.                                                                               |
| 60 min    | Displays the dequeue rate for the last 60-minute period.                                                                              |

### Statistics

The following example shows a typical display for the **statistics diversion** option, which shows chassis-wide statistics for PXF diversions, which occur whenever the PXF processor sends a packet to the main route processor for special processing (such as errored packets, address resolution protocol (ARP) packets, point-to-point protocol (PPP) control packets, an unsupported Layer 2 packet header, and so forth).

Router# **show pxf cpu statistics diversion**

| Cable8/0/1           | 0 packets    | 0 bytes      | Proc Enq |

Router#

**Note**

As shown in this display, the majority of dropped packets should typically be either local (sent to the router for routing), encap (encapsulated for another protocol), or multicast (IP multicast traffic). Also, the “Interface specific To RP punt statistics” counters appear only in Cisco IOS Release 12.3(X)BC and later releases.

The following example shows a typical display for the **statistics drop** option, which shows chassis-wide PXF drop statistics:

Router# **show pxf cpu statistics drop**

```

Router#

The following example shows a typical display for the **statistics drop** option for a particular cable interface, which shows the input-side drop statistics for that particular interface:

Router# **show pxf cpu statistics drop c7/1/0**

```

FP drop statistics for Cable7/1/0
 packets bytes
vcci undefined 0 0
vcci B
 bad hdlc addr 0 0
 mac length mismatch 0 0
 bad ip checksum 0 0
 ip length mismatch 0 0
 ip length short 0 0
 ip length long 0 0
 ip version mismatch 0 0
 bad rpf 0 0
 acl failure 0 0
 police 0 0
 ttl 0 0
 unreachable 0 0
 mlp_frag_received 0 0
 mlp_unexpected_pkt 0 0
 df_multicast 0 0
 encap_not_supported 0 0
 mtu_too_wee 0 0
 mtu_too_big 0 0
 atm_fp_rx_cell_size_err 0 0

Data Received 0 0

```

Router#

The following example shows a typical display for the **statistics ip** option, which displays chassis-wide PXF forwarding statistics for IP, multicast, fragmented, and ICMP packets:

Router# **show pxf cpu statistics ip**

```

FP ip statistics
 dropped 0
 forwarded 1291
 punted 11393
 input_packets 14049
 icmps_created 1365
 noadjacency 0
 noroute 300
 unicast_rpf 0
 unresolved 0

FP ip multicast statistics
 mcast total 69665
 mcast drops 0
 mcast rpf 0
 mcast inputacl 0
 mcast outputacl 0
 mcast punts 69665
 mcast switched 0
 mcast failed 0

FP ip frag statistics
 packets 0
 fragments 0
 fragfail 0
 dontfrag 0
 mcdontfrag 0

FP icmp statistics
 unreachable 0
 ttlsent 0
 echorep sent 0
 echorc v 0
 checksumerr 0

Router#

```

**Note**

The `noroute` counter increases whenever the router drops a packet because its destination IP address is 0.0.0.0. This counter also increases whenever the Cisco Express Forwarding (CEF) adjacency tables drop a packet because it has a null, discard, or drop adjacency.

**Subblocks**

The following example shows a typical display for the **subblocks** option for all interfaces:

```
Router# show pxf cpu subblocks
```

| Interface            | Status   | ICB   | WQB_ID | Fwding  | Encap | VCCI map | VCCI |
|----------------------|----------|-------|--------|---------|-------|----------|------|
| POS1/0/0             | initiali | 6000  | 6146   | disable | 5     | 81800000 | E    |
| GigabitEthernet3/0/0 | reset    | E000  | 6148   | disable | 1     | 81800004 | 1    |
| GigabitEthernet4/0/0 | up       | 12000 | 6150   | PXF     | 1     | 81800008 | 2    |
| Cable5/0/0           | down     | 14000 | 4096   | disable | 59    | 81805400 | 3    |
| Cable5/0/1           | down     | 14100 | 4097   | disable | 59    | 81805C00 | 4    |
| Cable5/1/0           | up       | 16000 | 4098   | PXF     | 59    | 81806400 | 5    |
| Cable6/0/0           | up       | 18000 | 4099   | PXF     | 59    | 81806C00 | 6    |
| Cable6/0/1           | up       | 18100 | 4100   | PXF     | 59    | 81807400 | 7    |
| Cable6/1/0           | up       | 1A000 | 4101   | PXF     | 59    | 81807C00 | 8    |
| Cable6/1/1           | up       | 1A100 | 4102   | PXF     | 59    | 81808400 | 9    |

| Cable7/1/0           | up       | 1E000 | 4104   | PXF     | 59    | 81809400 | B    |
| Cable7/1/1           | up       | 1E100 | 4105   | PXF     | 59    | 81809C00 | C    |

show pxf cpu

```
Cable7/1/1.1 up 1E100 4105 PXF 59 8180A400 D

Router#
```

The following example shows a typical display for the **subblocks** option for a particular cable interface:

```
Router# show pxf cpu subblocks c7/1/1

Cable7/1/1 is up
 ICB = 1E100, WQB_ID = 4105, interface PXF, enabled
 MAC Domain = 2
 IOS encapsulation type 59 MCNS
 Min mtu: 18 Max mtu: 1538
 VCCI mactable location = 81809C00
 VCCI C
 icmp ipaddress 0.0.0.0 timestamp 0

Router#
```

[Table 0-260](#) describes the fields shown in the display for the **show pxf cpu subblocks** command.

**Table 0-260** *show pxf cpu subblocks Field Descriptions*

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | Identifies the interface or subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Status     | Displays the status of the interface: <ul style="list-style-type: none"> <li>Administ—The interface has been shut down and is in the administrative down state.</li> <li>Deleted—The subinterface has been removed from the router’s configuration.</li> <li>Down—The interface is down because of a cable or other connectivity problem.</li> <li>Initiali—The interface is in the process of initializing.</li> <li>Reset—The interface is currently being reset.</li> <li>Up—The interface is up and passing traffic.</li> </ul> |
| ICB        | Displays the Interface Control Block (ICB) that is mapped to this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAC Domain | Displays the DOCSIS-layer domain for this interface or subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| WQB_ID     | Displays the Work Queue Block (WQB) identifier for this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Fwding     | Displays whether traffic is being forwarded (PXF) or not (disable).                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 0-260** *show pxf cpu subblocks Field Descriptions*

| Field    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encap    | <p>Identifies the type of encapsulation being used on the interface. The most common types of encapsulation are:</p> <ul style="list-style-type: none"> <li>0 = None</li> <li>1 = Ethernet ARPA</li> <li>2 = Ethernet SAP</li> <li>3 = 802.2 SNAP</li> <li>5 = Serial, raw HDLC</li> <li>8 = Serial, LAPB</li> <li>9 = Serial, X.25</li> <li>20 = Frame Relay</li> <li>21 = SMDS</li> <li>22 = MAC level packets</li> <li>27 = LLC 2</li> <li>28 = Serial, SDLC (primary)</li> <li>30 = Async SLIP encapsulation</li> <li>33 = ATM interface</li> <li>35 = Frame Relay with IETF encapsulation</li> <li>42 = Dialer encapsulation</li> <li>46 = Loopback interface</li> <li>51 = ISDN Q.921</li> <li>59 = DOCSIS (previously known as MCNS)</li> <li>61 = Transparent Mode</li> <li>62 = TDM clear channel</li> <li>64 = PPP over Frame Relay</li> <li>65 = IEEE 802.1Q</li> <li>67 = LAPB terminal adapter</li> <li>68 = DOCSIS Cable Modem</li> </ul> |
| VCCI map | Displays the memory address for the Virtually Cool Common Index (VCCI) map table for this particular VCCI. The VCCI is an index that uniquely identifies every interface or subinterface on the PXF processor and that quickly maps that interface to the appropriate set of services and features.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| VCCI     | Identifies the VCCI (in hexadecimal) that is assigned to the interface or subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Related Commands**

| Command                         | Description                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>clear pxf</b>                | Clears the direct memory access (DMA) and error checking and correcting (ECC) error counters on the PXF processor. |
| <b>debug pxf</b>                | Enables debugging of the PXF subsystems on the active PRE1 module on the Cisco uBR10012 router.                    |
| <b>show pxf cable</b>           | Displays information about the multicast echo and packet intercept features for one or all cable interfaces.       |
| <b>show pxf cable interface</b> | Displays information about a particular service ID (SID) on a particular cable interface.                          |
| <b>show pxf dma</b>             | Displays information for the current state of the PXF DMA buffers, error counters, and registers.                  |

| Command                   | Description                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------|
| <b>show pxf microcode</b> | Displays identifying information for the microcode being used on the processor.              |
| <b>show pxf xcm</b>       | Displays the current state of ECC for the External Column Memory (XCM) on the PXF processor. |
| <b>show ip mroute</b>     | Displays the contents of the IP multicast routing table.                                     |

# show pxf cpu drl-trusted-sites

To display the configured Divert-Rate-Limit (DRL) trusted sites, use the **show pxf cpu drl-trusted-sites** command in privileged EXEC mode.

**show pxf cpu drl-trusted-sites**

## Syntax Description

This command has no keywords or arguments.

## Command Default

No default behavior or values

## Command Modes

Privileged EXEC (#)

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCB | This command was introduced. |

## Usage Guidelines

Use this command to display the configured DRL trusted sites.

## Examples

The following example shows sample output for the **show pxf cpu drl-trusted-sites** command:

```
Router# show pxf cpu drl-trusted-sites
Divert-Rate-Limit Trusted-Site list
 IP-addr IP-addr mask ToS ToS mask VRF
 50.0.0.0 255.255.255.0 0x18 0xF8 global internet
 50.0.1.0 255.255.0.0 0x01 0xFF all
 60.0.1.0 255.255.255.0 0x18 0xF8 blue
```

[Table 261](#) describes the significant fields shown in the display.

**Table 261** *show pxf cpu drl-trusted-sites Field Descriptions*

| Field        | Description                                                                   |
|--------------|-------------------------------------------------------------------------------|
| IP-addr      | The IP address of the host or CM.                                             |
| IP-addr mask | The IP address mask of the host or CM.                                        |
| ToS          | Type of Service value to be matched by the filter.                            |
| ToS Mask     | Type of Service mask to be matched by the filter.                             |
| VRF          | Name of the virtual interface that has been configured for DRL trusted sites. |

## Related Commands

|                 | 12.2S       | This command was introduced.                                                                                                                                                                      |
|                 | 12.2(28)SB  | This command was integrated into Cisco IOS Release 12.2(28)SB.                                                                                                                                    |
|                 | 12.3(7)XI1  | This command was integrated into Cisco IOS Release 12.3(7)XI1.                                                                                                                                    |
|                 | 12.3(23)BC1 | The “Link Queues” output field for dynamic bandwidth sharing-enabled modular cable and wideband cable interfaces was added on the Cisco uBR10012 universal broadband router.                      |
|                 | 12.2(33)SB  | This command was modified for virtual access interfaces (VAIs) and the output was modified for the <b>summary</b> option, and implemented on the Cisco 10000 series router for the PRE3 and PRE4. |
|                 | 12.2(33)SCB | The output of this command has been updated or re-arranged (compared to the VTMS version) for DOCSIS Weighted Fair Queuing (WFQ) Scheduler feature and implemented on the Cisco uBR10012 router.  |

|                  |                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | When neither the interface or QID is specified, the command displays queuing statistics for the route processors (RPs). |
|------------------|-------------------------------------------------------------------------------------------------------------------------|

### Cisco 10000 Series Router

The Cisco 10000 series router high-speed interfaces work efficiently to spread traffic flows equally over the queues. However, using single traffic streams in a laboratory environment might result in less-than-expected performance. To ensure accurate test results, test the throughput of the Gigabit Ethernet, OC-48 POS, or ATM uplink with multiple source or destination addresses. To determine if traffic is being properly distributed, use the **show pxf cpu queue** command.

In Cisco IOS Release 12.2(33)SB and later releases, the router no longer allows you to specify a virtual access interface (VAI) as **viX.Y** in the **show pxf cpu queue** command. Instead, you must spell out the VAI as **virtual-access**.

For example, the router accepts the following command:

```
Router# show pxf cpu queue virtual-access2.1
```

In releases prior to Cisco IOS Release 12.2(33)SB, the router accepts the abbreviated form of the VAI. For example, the router accepts the following command:

```
Router# show pxf cpu queue vi2.1
```

In Cisco IOS Release 12.2(33)SB and later releases, the output from the **show pxf cpu queue interface summary** command displays only the physical interface and the number of logical links. The output does not display the number of priority queues, class queues, and so on. This modification applies to the PRE3 and PRE4.

### Cisco uBR10012 Universal Broadband Router

If dynamic bandwidth sharing (DBS) is enabled, the link queue information that is displayed refers to the specific type of interface that is configured—modular cable or wideband cable. The **summary** keyword option is not supported for the Cisco uBR10012 universal broadband router for wideband cable or modular cable interfaces. The **ATM** interface output is not available for this router.

See [Table 262](#) for descriptions of the **interface** keyword fields.

**Table 262** *show pxf cpu queue Interface Option Field Descriptions*

| Field           | Description                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-131071>      | QID (queue identifier)                                                                                                                           |
| ATM             | Asynchronous transfer mode interface<br><b>Note</b> The ATM interface output is not available for the Cisco uBR10012 universal broadband router. |
| BVI             | Bridge-group virtual interface                                                                                                                   |
| Bundle          | Cable virtual bundle interface                                                                                                                   |
| CTunnel         | CTunnel interface                                                                                                                                |
| Cable           | Cable modem termination service (CMTS) interface                                                                                                 |
| DTI             | Digital trunk interface                                                                                                                          |
| Dialer          | Dialer interface                                                                                                                                 |
| Ethernet        | IEEE 802.3                                                                                                                                       |
| FastEthernet    | FastEthernet IEEE 802.3                                                                                                                          |
| GigabitEthernet | GigabitEthernet IEEE 802.3z                                                                                                                      |
| Group-Async     | Async group interface                                                                                                                            |
| Loopback        | Loopback interface                                                                                                                               |

**Table 262** *show pxf cpu queue Interface Option Field Descriptions (continued)*

| Field             | Description                                          |
|-------------------|------------------------------------------------------|
| MFR               | Multilink frame relay bundle interface               |
| Modular-Cable     | Modular cable interface                              |
| Multilink         | Multilink group interface                            |
| Null              | Null interface                                       |
| Port-channel      | Ethernet channel of interfaces                       |
| RP                | Forwarding path (FP) to route processing (RP) queues |
| Tunnel            | Tunnel interface                                     |
| Vif               | Pragmatic general multicast (PGM) host interface     |
| Virtual-Template  | Virtual template interface                           |
| Virtual-TokenRing | Virtual token ring                                   |
| WB-SPA            | line card to line card (LC-LC) queues                |
| Wideband-Cable    | Wideband CMTS interface                              |

### Examples

The following example shows PXF queueing statistics for an ATM interface when a QID is not specified. The sample output includes the dropped and dequeued packets for the VCs, and for classes associated with sessions that inherit queues from VCs.

Router# **show pxf cpu queue atm 5/0/2**

VCCI 2517: ATM non-aggregated VC 1/229, VCD 1, Handle 1, Rate 500 kbps

| VCCI/ClassID | ClassName     | QID | Length/Max | Res | Dequeues | Drops |
|--------------|---------------|-----|------------|-----|----------|-------|
| 0 2517/0     | class-default | 269 | 0/4096     | 11  | 3        | 0     |
| 0 2517/31    | pak-priority  | 268 | 0/32       | 11  | 4        | 0     |

Queues Owned but Unused by VC (inheritable by sessions)

| ClassID | ClassName     | QID | Length/Max | Res | Dequeues | Drops |
|---------|---------------|-----|------------|-----|----------|-------|
| 0       | class-default | 275 | 0/32       | 11  | 100      | 0     |
| 31      | pak-priority  | 268 | 0/32       | 11  | 4        | 0     |

VCCI 2517: ATM non-aggregated VC 1/233, VCD 4, Handle 4, Rate 50 kbps

| VCCI/ClassID | ClassName     | QID | Length/Max | Res | Dequeues | Drops |
|--------------|---------------|-----|------------|-----|----------|-------|
| 0 2517/0     | class-default | 269 | 0/4096     | 11  | 3        | 0     |
| 0 2517/31    | pak-priority  | 268 | 0/32       | 11  | 4        | 0     |

Queues Owned but Unused by VC (inheritable by sessions)

| ClassID | ClassName     | QID | Length/Max | Res | Dequeues | Drops |
|---------|---------------|-----|------------|-----|----------|-------|
| 0       | class-default | 274 | 0/32       | 11  | 0        | 0     |
| 31      | pak-priority  | 268 | 0/32       | 11  | 4        | 0     |

VCCI 2520: ATM non-aggregated VC 1/232, VCD 3, Handle 3, Rate 500 kbps

| VCCI/ClassID | ClassName     | QID | Length/Max | Res | Dequeues | Drops |
|--------------|---------------|-----|------------|-----|----------|-------|
| 0 2520/0     | class-default | 273 | 0/32       | 11  | 0        | 0     |
| 0 2520/31    | pak-priority  | 268 | 0/32       | 11  | 4        | 0     |

VCCI 2519: ATM non-aggregated VC 1/231, VCD 2, Handle 2, Rate 500 kbps

| VCCI/ClassID | ClassName     | QID | Length/Max | Res | Dequeues | Drops |
|--------------|---------------|-----|------------|-----|----------|-------|
| 0 2519/0     | class-default | 272 | 0/32       | 11  | 0        | 0     |
| 0 2519/31    | pak-priority  | 268 | 0/32       | 11  | 4        | 0     |

The following example displays PXF queuing statistics for QID 267:

Router# **show pxf cpu queue 267**

```

ID : 267
Priority : Lo
CIR (in-use/configured) : 0/65535
EIR (in-use/configured) : 0/0
MIR (in-use/configured) : 0/65535
Maximum Utilization configured : no
Link : 2
Flowbit (period/offset) : 32768/32768
Burst Size : 1024 bytes
Bandwidth : 133920 Kbps
Channel : 0
Packet Descriptor Base : 0x00000100
ML Index : 0
Length/Average/Alloc : 0/0/32
Enqueues (packets/octet) : 293352/9280610
Dequeues (packets/octet) : 293352/9280610
Drops (tail/random/max_threshold) : 0/0/0
Drops (no_pkt_handle/buffer_low) : 0/0
WRED (weight/avg_smaller) : 0/0
WRED (next qid/drop factor) : 0/0
WRED (min_threshold/max_threshold/scale/slope):
precedence 0 : 0/0/0/0
precedence 1 : 0/0/0/0
precedence 2 : 0/0/0/0
precedence 3 : 0/0/0/0
precedence 4 : 0/0/0/0
precedence 5 : 0/0/0/0
precedence 6 : 0/0/0/0
precedence 7 : 0/0/0/0

```

### Cisco uBR10012 Universal Broadband Router

The following examples show link queue information for specific wideband cable and modular cable interfaces when dynamic bandwidth sharing is enabled.

#### Modular Cable Interface

```

Router(config)# interface modular-cable 1/0/0:1
.
.
.

```

```

Router(config-if)# cable dynamic-bw-sharing
.
.
.

```

Router# **show pxf cpu queue modular-cable 1/0/0:1**

```

Link Queues :
QID CIR(act/conf) EIR MIR RF Chan. Status

```

```
420 19661/19661 1/1 65535/65535 0 Inactive
```

### Wideband Cable Interface

```
Router(config)# interface wideband-cable 1/0/0:0
```

```
.
.
.
```

```
Router(config-if)# cable dynamic-bw-sharing
```

```
.
.
.
```

```
Router# show pxf cpu queue wideband-cable 1/0/0:0
```

```
Link Queues :
```

| QID | CIR(act/conf) | EIR | MIR         | RF Chan. | Status   |
|-----|---------------|-----|-------------|----------|----------|
| 419 | 32768/32768   | 1/1 | 65535/65535 | 0        | Inactive |
| 566 | 19661/19661   | 1/1 | 65535/65535 | 1        | Inactive |

The following example shows service flow queue information for modular cable interfaces.

```
Router# show pxf cpu queue modular-cable 1/2/0:0
```

```
Cable Interface Queues:
```

| QID    | Len/Max | Dequeues | TailDrops | MinRt<br>(Kbps) | Wt/Quantum | ShapeRt<br>(Kbps) | FlowId |
|--------|---------|----------|-----------|-----------------|------------|-------------------|--------|
| 131147 | 0/255   | 190      | 0         | 0               | 1/240      | 0                 | 58     |
| 131148 | 0/255   | 33820    | 0         | 0               | 1/10000    | 0                 | 32824  |

```
Cable Service Flow Queues:
```

```
* Best Effort Queues
```

| QID    | Len/Max | Dequeues | TailDrops | MinRt<br>(Kbps) | Wt/Quantum | ShapeRt<br>(Kbps) | FlowId |
|--------|---------|----------|-----------|-----------------|------------|-------------------|--------|
| 131241 | 0/255   | 0        | 0         | 0               | 1/240      | 0                 | 32881  |

```
* CIR Queues
```

| QID  | Len/Max | Dequeues | TailDrops | MinRt<br>(Kbps) | Wt/Quantum | ShapeRt<br>(Kbps) | FlowId |
|------|---------|----------|-----------|-----------------|------------|-------------------|--------|
| 2049 | 254/255 | 131018   | 485751    | 99              | 1/1920     | 0                 | 32880  |

```
* Low Latency Queues
```

| QID | Len/Max | Dequeues | TailDrops |
|-----|---------|----------|-----------|
|-----|---------|----------|-----------|

| Command History    | Release                                                                                                                                                                                                                                                                                                                                          | Modification                                         |
|                    | 12.3(23)BC                                                                                                                                                                                                                                                                                                                                       | This command was introduced for the uBR10012 router. |
| Usage Guidelines   | A virtual time management system (VTMS) link and two queues are set up for each Wideband SPA allowing MAC Management Messages (MMM) to be sent from the uBR10-MC 5x20 line card to the Wideband SPA, which in turn sends the messages to the appropriate RF channels.                                                                            |                                                      |
|                    | In addition to this, another VTMS link and two queues are set up for each uBR10-MC 5x20 line card so that the SIP can send statistics IPC messages and cable monitor packets to the uBR10-MC 5x20 line card. The queue and service flow information for these data paths can be displayed by using the <b>show pxf cpu queue wb-spa</b> command. |                                                      |
|                    | The output of this command shows the two RP service flows for each SPA, including the RP service flow index and the associated queue ID. Refer to the <b>show pxf cpu queue qid</b> command for more information.                                                                                                                                |                                                      |

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |

Table 263 describes the fields shown in the **show pxf cpu queue WB-SPA** command display.

**Table 263** show pxf cpu queue WB-SPA Field Descriptions

| Field          | Description                                         |
|----------------|-----------------------------------------------------|
| QID            | CPU Queue ID.                                       |
| Len/Max        | Current CPU queue length/ CPU maximum queue length. |
| TailDrops      | Number of CPU queue packet drops.                   |
| ShapeRt (Kbps) | Queue packet rate shaping.                          |
| FlowId         | Service flow ID.                                    |

# show pxf cpu statistics

To display Parallel eXpress Forwarding (PXF) CPU statistics, use the **show pxf cpu statistics** command in privileged EXEC mode.

```
show pxf cpu statistics [atom | backwalk | clear | diversion | drop [interface | vcci] | ip | ipv6 |
l2tp | mlp | qos [interface] | queue [OCQ | high Flowoff | low Flowoff] | rx [vcci] | security |
arp-filter | drl [cable-wan-ip | wan-non-ip]]
```

## Cisco 10000 Series Router

```
show pxf cpu statistics diversion [pxf [interface {interface | vcci}] | top number]
```

| Syntax                         | Description                                                                                                                                                                                          |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>atom</b>                    | (Optional) Displays Any Transport over MPLS (AToM) statistics.                                                                                                                                       |
| <b>backwalk</b>                | (Optional) Displays backwalk requests statistics.                                                                                                                                                    |
| <b>clear</b>                   | (Optional) Clears PXF CPU statistics.                                                                                                                                                                |
| <b>diversion</b>               | (Optional) Displays packets that the PXF diverted to the Route Processor (RP) for special handling.                                                                                                  |
| <b>drop</b> [interface] [vcci] | (Optional) Displays packets dropped by the PXF for a particular interface or Virtual Circuit Connection Identifier (VCCI).                                                                           |
| <b>ip</b>                      | (Optional) Displays IP statistics.                                                                                                                                                                   |
| <b>ipv6</b>                    | (Optional) Displays IPv6 statistics.                                                                                                                                                                 |
| <b>l2tp</b>                    | (Optional) Displays packet statistics for an L2TP Access Concentrator (LAC) (Optional) and L2TP Network Server (LNS).                                                                                |
| <b>mlp</b>                     | (Optional) Displays multilink PPP (MLP) statistics.                                                                                                                                                  |
| <b>pxf</b>                     | (Optional) Displays packets that the PXF diverted to the Route Processor (RP). Available on the Cisco 10000 series router only.                                                                      |
| <b>pxf interface</b> interface | (Optional) Displays per-interface PXF statistical information for the divert cause policer on a particular interface. Available on the Cisco 10000 series router only.                               |
| <b>pxf interface</b> vcci      | (Optional) Displays per-VCCI PXF statistical information for the divert cause policer on a particular Virtual Circuit Connection Identifier (VCCI). Available on the Cisco 10000 series router only. |
| <b>qos</b> [interface]         | (Optional) Displays match statistics for a service policy on an interface.                                                                                                                           |
| <b>queue</b>                   | (Optional) Displays queueing counters for all interfaces.                                                                                                                                            |
| <b>OCQ</b>                     | (Optional) Displays the OCQ statistics.                                                                                                                                                              |
| <b>high Flowoff</b>            | (Optional) Displays high priority flowoff statistics.                                                                                                                                                |
| <b>low Flowoff</b>             | (Optional) Displays low priority flowoff statistics.                                                                                                                                                 |
| <b>rx</b> [vcci]               | (Optional) Displays receive statistics for a VCCI.                                                                                                                                                   |
| <b>security</b>                | (Optional) Displays ACL matching statistics.                                                                                                                                                         |
| <b>top</b> number              | (Optional) Displays PXF statistical information for the number of top punters you specify. Available on the Cisco 10000 series router only. Valid values are from 1 to 100.                          |
| <b>arp-filter</b>              | (Optional) Displays the ARP filter statistics.                                                                                                                                                       |
| <b>drl</b>                     | (Optional) Displays the divert rate limit.                                                                                                                                                           |

|                     |                                                                    |
|---------------------|--------------------------------------------------------------------|
| <b>cable-wan-ip</b> | (Optional) Displays cable / wan-ip statistics for dropped packets. |
| <b>wan-non-ip</b>   | (Optional) Displays DRL wan-non-ip statistics for dropped packets. |

|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(7)XI1  | This command was integrated into Cisco IOS Release 12.3(7)XI1.                                                                                                                                                                                                                                                                                                             |
| 12.2(28)SB  | This command was introduced on the Cisco 10000 series router and integrated into Cisco IOS Release 12.2(28)SB.                                                                                                                                                                                                                                                             |
| 12.2(31)SB2 | This command was integrated into Cisco IOS Release 12.2(31)SB2.                                                                                                                                                                                                                                                                                                            |
| 12.2(33)SB  | This command was enhanced to display per-interface or per-VCCI PXF statistical information for the divert cause policer on a particular interface or VCCI, to display the top punters on an interface, and to display the provisioned burst size for any divert causes. These enhancements were implemented on the Cisco 10000 series router for the PRE2, PRE3, and PRE4. |
| 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB on the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers. Support for the Cisco uBR7225VXR router was added. The <b>arp-filter</b> , <b>drl</b> , <b>cable-wan-ip</b> , and <b>wan-non-ip</b> keywords were added .                                                                           |
| 12.2(33)SCE | This command was modified in Cisco IOS Release 12.2(33)SCE. The <b>cable-wan-ip</b> keyword was removed.                                                                                                                                                                                                                                                                   |
| 12.2(33)SCG | This command was modified in Cisco IOS Release 12.2(3)SCG. The <b>OCQ</b> , <b>high Flowoff</b> , and <b>low Flowoff</b> keywords were added.                                                                                                                                                                                                                              |

**Usage Guidelines****Cisco 10000 Series Router Usage Guidelines**

- The **show pxf cpu statistics diversion** command displays statistical information about diverted packets. Divert causes with the string "ipv6..." display as "v6..." in the output of all **show pxf cpu statistics diversion** commands
- The output from the **show pxf cpu statistics diversion pxf** command was enhanced in Cisco IOS Release 12.2(33)SB to display the provisioned burst size for any divert causes.
- The **show pxf cpu statistics diversion pxf interface *interface*** command displays statistical information about the divert cause policer on a specific interface. The output of this command is similar to the output displayed at the aggregated level. This command enables you to see the traffic types being punted from an inbound interface, subinterface, and session.
- The **show pxf cpu statistics diversion pxf interface *vcci*** command displays statistical information about the divert cause policer on a specific VCCI. The output of this command is similar to the output displayed at the aggregated level. This command enables you to see the traffic types being punted from an inbound interface, subinterface, and session.
- The **show pxf cpu statistics diversion top *number*** command displays the interfaces, subinterfaces, and sessions with the highest number of punter packets.

**Examples**

The following example shows PXF queueing counters information. These are aggregate counters for all interfaces. The Total column is the total for all columns.

**Note**

If you are troubleshooting link utilization issues, the `deq_vtp_req`, `deq_flow_off`, and `deq_ocq_off` counters may indicate what is causing the versatile time management scheduler (VTMS) to slow down.

If you are troubleshooting overall PXF throughput issues, look at the High Next Time, Low Next Time, High Wheel Slot, and Low Wheel Slot counters.

Router# **show pxf cpu statistics queue**

Column 6 Enqueue/Dequeue Counters by Rows:

| dbg Counters    | 0          | 1          | 2          | 3          | 4          | 5          | 6          | 7          |

Table 264 describes the significant fields shown in the display.

**Table 264** show pxf cpu statistics queue Field Descriptions

| Field                                      | Description                                                                   |
|--------------------------------------------|-------------------------------------------------------------------------------|
| Column 6 Enqueue/Dequeue Counters by Rows: |                                                                               |
| enq_pkt                                    | Packets the PXF enqueued.                                                     |
| tail_drop_pkt                              | Packets the PXF tails dropped.                                                |
| deq_pkt                                    | Packets the PXF dequeued.                                                     |
| deq_vtp_req                                | Number of times a dequeue was inhibited due to the virtual traffic policer.   |
| deq_flow_off                               | Numbers of times a dequeue was inhibited due to a flowoff from the line card. |
| deq_ocq_off                                | Number of times a dequeue was inhibited due to link level flow control.       |
| enqdeq_conflict                            | Shows a dequeue failed due to an enqueue to the same queue in progress.       |
| bndl_pkt                                   | Count of packets that were fragmented.                                        |
| frag_pkt                                   | Count of fragments sent.                                                      |

**Table 264** *show pxf cpu statistics queue Field Descriptions (continued)*

| Field                                         | Description                                                                                          |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------|
| dbg_frag_drop                                 | Count of invalid multilink PPP (MLP) fragment handles.                                               |
| dbg_bndl_sem                                  | Count of semaphore collision (used for MLP).                                                         |
| context_inhibit                               | Number of times multilink transmit fragment processing was inhibited due to a lack of DMA resources. |
| bfifo_enq_fail                                | Count of bundle FIFO (BFIFO) enqueue failures.                                                       |
| Column 7 Rescheduling State Counters by Rows: |                                                                                                      |
| High Next Time                                | Current next send time for the high priority wheel.                                                  |
| Low Next Time                                 | Current next send time for the low priority wheel.                                                   |
| High Wheel Slot                               | Current high priority slot number.                                                                   |
| Low Wheel Slot                                | Current low priority slot number.                                                                    |
| DEQ_WHEEL                                     | Count of successful dequeues from the timing wheel.                                                  |
| DQ-lock Fails                                 | Count of timing wheel dequeue failures (both queue empty and race conditions).                       |
| TW ENG Fails                                  | Timing wheel enqueue failures.                                                                       |
| Q_SCHED                                       | Count of queues scheduled/rescheduled onto the timing wheel.                                         |
| FAST_SCHED                                    | Count of queues fast scheduled/rescheduled onto the timing wheel.                                    |
| Q_DEACT                                       | Count of queue deactivations.                                                                        |
| Q_ACTIVATE                                    | Count of queue activations (activate state).                                                         |
| Q_CHANGE                                      | Count of queue changes; for example, Route Processor (RP) inspired rates changes.                    |

The following example displays PXF L2TP packet statistics.

**Note**

For L2TP Access Concentrator (LAC) operation, all statistics are applicable. For L2TP Network Server (LNS) operation, only the PPP Control Packets, PPP Data Packets, and PPP Station Packets statistics are meaningful.

```
Router# show pxf cpu statistics l2tp

LAC Switching Global Debug Statistics:
 PPP Packets 51648
 PPP Control Packets 51647
 PPP Data Packets 1
 Not IPv4 Packets 1
 IP Short Hdr Packets 1
 IP Valid Packets 0
 IP Invalid Packets 1
 DF Cleared Packets 0
 Path MTU Packets 0
 No Path MTU Packets 0
 Within PMTU Packets 0
 Fraggable Packets 0
 PMTU Pass Packets 0
```

## ■ show pxf cpu statistics

```

PMTU Fail Packets 0
Encapped Packets 51648

```

## L2TP Classification Global Debug Statistics:

```

LAC or Multihop Packets 151341
Multihop Packets 0
PPP Control Packets 51650
PPP Data Packets 99691
PPP Station Packets 151341

```

The following example displays match statistics for the police\_test policy on an ATM interface. The Classmap Index differentiates classes within a policy while the Match Number differentiates match statements within a class.

```
Router# show pxf cpu statistics qos atm 6/0/0.81801
```

| Classmap<br>Index                     | Match<br>Number | Pkts<br>Matched | Bytes<br>Matched |
|---------------------------------------|-----------------|-----------------|------------------|
| police_test (Output) service-policy : |                 |                 |                  |
| police_class (0)                      | 0               | 0               | 0                |
|                                       | 1               | 0               | 0                |
|                                       | 2               | 0               | 0                |
|                                       | 3               | 0               | 0                |
| class-default (1)                     | 0               | 0               | 0                |

The following is a sample output of the **show pxf cpu statistics queue ocq** command for Cisco IOS Release 12.2(33)SCG:

```
Router# show pxf cpu statistics queue ocq
```

## OCQ counter per resource

| resource | flowResource | slot  | counter |
|----------|--------------|-------|---------|
| 00       | 00           |       | 0x0 (0) |
| 01       | 01           | to RP | 0x0 (0) |

### Cisco 10000 Series Router

The following example displays the top 10 packet types diverted to the RP. The output displays the top punters by interface and by Layer 2 packet flow.

Router# **show pxf cpu statistics diversion top 10**

Top 10 punters by interface are:

```

Rate (pps) Packets (diverted/dropped) vcci Interface
1 10/0 2606Virtual-Access2.1
Last diverted packet type is none.

```

Top 10 punters by Layer 2 flow are:

```

Rate (pps) Packets (diverted/dropped) Interface Layer 2 info
1 15/0 ATM2/0/3 vpi 128/vci 4096/vcci 2591
Last diverted packet type is oam_f4.
1 15/0 ATM2/0/3 vpi 128/vci 4096/vcci 2593
Last diverted packet type is oam_f4.

```

**Examples**

The following examples indicate the statistics of upstream cable packets that are dropped from the CMTS.

```

Router# show pxf cpu statistics drl us-cable
Divers-Rate-Limit US-cable statistics
 dropped identifier
 361 interface: Cable6/0/1 SID: 28
 2457 interface: Cable6/0/0 SID: 1

Router# show pxf cpu statistics drl us-cable threshold 400
Divers-Rate-Limit US-cable statistics :: threshold = 400
 dropped identifier
 2457 interface: Cable6/0/0 SID: 1

Router#

```

|------------------|----------------------------------------------------|----------------------------------------------------------|
|                  | <b>clear pxf statistics drl us-cable</b>           | Clears all the entries in the US-cable statistics table. |
|                  | <b>service divert-rate-limit trusted-site-ipv6</b> | Adds IPv6-specific entries to the trusted site list.     |
|                  | <b>show pxf cpu statistics drl ipv6</b>            | Verifies the drop counters for WAN-IPv6 packets.         |
|                  | <b>show pxf cpu statistics drl ipv4</b>            | Verifies the drop counters for WAN-IPv4 packets.         |

# show pxf dma

To display information for the current state of the direct memory access (DMA) buffers, error counters, and registers on the Parallel eXpress Forwarding (PXF) processor, use the **show pxf dma** command in user EXEC or privileged EXEC mode.

**show pxf dma** [**buffers** | **counters** | **registers**]

|                    |                  |                                                                   |
|--------------------|------------------|-------------------------------------------------------------------|
| Syntax Description | <b>buffers</b>   | (Optional) Displays information about the DMA buffers.            |
|                    | <b>counters</b>  | (Optional) Displays packet and error counters for the DMA engine. |
|                    | <b>registers</b> | (Optional) Displays information about the DMA registers.          |

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| Command Default | If given without any options, displays all information. |
|-----------------|---------------------------------------------------------|

|               |                            |

| Command Modes | User EXEC, Privileged EXEC |
|---------------|----------------------------|

| Command History | Release     | Modification                                                                               |
|-----------------|-------------|--------------------------------------------------------------------------------------------|
|                 | 12.2(1)XF1  | This command was introduced as <b>show hardware pxf dma</b> for the Cisco uBR10012 router. |
|                 | 12.2(15)BC2 | This command was renamed from <b>show hardware pxf dma</b> to <b>show pxf dma</b> .        |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | The <b>show pxf dma</b> command displays technical information about the current state of the DMA engine onboard the PXF processor. The <b>buffers</b> and <b>registers</b> options display information that is useful primarily to Cisco TAC engineers that are troubleshooting problems. The <b>counters</b> option displays a set of packet and error counters that can help diagnose and resolve problems with memory on the PXF processor. |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|          |                                                                                  |
|----------|----------------------------------------------------------------------------------|
| Examples | The following example shows a typical display for the <b>dma buffers</b> option: |
|----------|----------------------------------------------------------------------------------|

Router# **show pxf dma buffers**

Router#

Table 0-265 describes the fields shown in the **show pxf dma buffers** command:

**Table 0-265** Field Descriptions for the show pxf dma buffers Command

| Field              | Description                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Descriptor Address | Memory address pointing to the descriptor for this buffer.                                                                     |
| Buffer Address     | Address of this buffer in memory.                                                                                              |
| Buffer Length      | Length, in bytes, of this particular buffer.                                                                                   |
| Descriptor Flags   | Internal flags identifying this buffer's use and status.                                                                       |
| Context Bit        | State of the context bit, which is set when the buffer is currently in use by a context (the basic unit of packet processing). |

| <b>Command Default</b> | No default behavior or values |
|------------------------|-------------------------------|

|                      |                            |
|----------------------|----------------------------|
| <b>Command Modes</b> | User EXEC, Privileged EXEC |
|----------------------|----------------------------|

| Command History | Release     | Modification                                                                                     |
|-----------------|-------------|--------------------------------------------------------------------------------------------------|
|                 | 12.2(4)XF1  | This command was introduced as <b>show hardware pxf microcode</b> for the Cisco uBR10012 router. |
|                 | 12.2(15)BC2 | This command was renamed from <b>show hardware pxf microcode</b> to <b>show pxf microcode</b> .  |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The PXF processors onboard the Performance Routing Engine (PRE1) module automatically load their microcode at the same time that the Cisco IOS image is loaded into the PRE1 module. A fault situation can cause one or both of the PXF processors to reload the microcode as needed. You can use the <b>show pxf microcode</b> command to display the version of microcode currently loaded, as well as the number of times the microcode has been loaded since the Cisco IOS software was loaded at system bootup. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                          |
|-----------------|------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows a typical display for the <b>show pxf microcode</b> command: |
|-----------------|------------------------------------------------------------------------------------------|

```
Router# show pxf microcode

Router#

Table 0-266 describes the fields shown in the **show pxf microcode** command:

**Table 0-266** Field Descriptions for the show pxf microcode Command

| Field                    | Description                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PXF complex              | Describes the number of PXF (Toaster) processors, their associate memory columns, and their current status.                                                                                                                          |
| Loaded microcode         | Describes the source and filename for the microcode that is currently loaded on the PXF processor.                                                                                                                                   |
| Version                  | Identifies the major and minor version numbers for the current release of microcode.                                                                                                                                                 |
| Release Software created | Identifies the time and date the current microcode was compiled.                                                                                                                                                                     |
| Microcode load attempted | Identifies the number of times the PXF processor has loaded the microcode since the Cisco IOS image was loaded at system bootup. Also shows the time (in days and hours) since the last successful load of the microcode.            |
| DISABLE_BOOTSTRAP        | Displays the current state of operation for the PXF processor. During normal operation, this line shows “DISABLE_BOOTSTRAP_CLEAR”.                                                                                                   |
| tmc0, tmc1               | Identifies the current program counters and configuration for the two PXF processors.                                                                                                                                                |
| Cobalt registers         | Provides a hexadecimal dump of the current contents of the register for the Cobalt support chip, which manages the interface between the PXF processors and the backplane, and which also manages the memory for the packet buffers. |

|-----------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(4)XF1  | This command was introduced as <b>show hardware pxf xcm</b> to support the Performance Routing Engine (PRE1) module on the Cisco uBR10012 router. |
|                 | 12.2(15)BC2 | This command was renamed from <b>show hardware pxf xcm</b> to <b>show pxf xcm</b> .                                                               |

**Usage Guidelines** The **show pxf xcm** command displays the register contents and error counters for the ECC function on the processor's XCM memory columns. Each PXF processor contains four memory columns, and ECC is enabled by default for each column.

**Note** The **show pxf xcm** command is supported only on the PRE1 and later processors for the Cisco uBR10012 router. This command is not supported on the PRE module.

**Examples** The following example shows a typical display for the **show pxf xcm** command for a PRE1 module:

```
Router# show pxf xcm

Toaster 0:
 Number of Columns: 4
 Proc ID: 0x00000002 = TMC
 ASIC Revision: 0x00000002 = T2-ECC
 XCM0 type:SDRAM, size = 67108864
 ECC is enabled for column 0
 XCM Control Register: 0x00000001
 XCM Exception Type Register: 0x00000000
 SDRAM-A Counters
 Number of ECC single bit errors: 0

Table 0-267 describes the fields displayed by the **show pxf xcm** command.

**Table 0-267** *show pxf xcm Field Descriptions*

| Field                                                         | Description                                                                                                    |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>The following fields appear for each PXF processor</b>     |                                                                                                                |
| Toaster 0, Toaster 1                                          | Identifies the PXF processor.                                                                                  |
| Number of Columns                                             | Identifies the number of memory columns on the PXF processor. Each PXF processor contains 4 columns of memory. |
| Proc ID:                                                      | Identifies the type of processor (TMC=Toaster Memory Column).                                                  |
| ASIC Revision                                                 | Identifies the internal version number of the PXF processor.                                                   |
| <b>The following fields appear for each XCM memory column</b> |                                                                                                                |
| XCM type                                                      | Identifies the type and size, in bytes, of memory used in this particular column.                              |
| ECC is enabled for column                                     | Identifies whether ECC checking is enabled or disabled for this memory column.                                 |
| XCM Control Register and Exception Type Register              | Identifies the contents of these two registers for the memory column.                                          |
| Number of ECC single bit errors                               | Identifies the number of single-bit errors that have been detected in the A and B banks of memory              |

The following example shows the error message that is displayed when this command is used on a PRE1 module:

```
Router# show pxf xcm

ECC is not supported for this revision

Router#
```

## Related Commands

| Command                         | Description                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>clear pxf</b>                | Clears the direct memory access (DMA) and error checking and correcting (ECC) error counters on the PXF processor. |
| <b>debug pxf</b>                | Enables debugging of the PXF subsystems on the active PRE1 module on the Cisco uBR10012 router.                    |
| <b>show pxf cable</b>           | Displays information about the multicast echo and packet intercept features for one or all cable interfaces.       |
| <b>show pxf cable interface</b> | Displays information about a particular service ID (SID) on a particular cable interface.                          |
| <b>show pxf cpu</b>             | Displays the display different statistics about the operation of the CPU processor during PXF processing.          |
| <b>show pxf microcode</b>       | Displays identifying information for the microcode being used on the processor.                                    |
| <b>show pxf dma</b>             | Displays the current state of ECC for the External Column Memory (XCM) on the PXF processor.                       |

# show redundancy (ubr10012)

To display the current redundancy status, use the **show redundancy** command in user EXEC or privileged EXEC mode.

**show redundancy** [**clients** | **counters** | **history** | **states**]

|                    |                 |                                                               |
|--------------------|-----------------|---------------------------------------------------------------|
| Syntax Description | <b>clients</b>  | (Optional) Displays the Redundancy Facility (RF) client list. |
|                    | <b>counters</b> | (Optional) Displays RF operational counters.                  |
|                    | <b>history</b>  | (Optional) Summarizes RF history.                             |
|                    | <b>states</b>   | (Optional) Displays RF states for active and standby modules. |

**Defaults** No default behavior or values

**Command Modes** User EXEC, Privileged EXEC

| Command History | Release     | Modification                                                                                                                                                                                                           |
|-----------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(4)XF1  | This command was introduced for the Cisco uBR10012 router.                                                                                                                                                             |
|                 | 12.2(11)BC3 | The <b>clients</b> , <b>counters</b> , <b>history</b> , and <b>states</b> option were added, and the default display was enhanced to show the version of Cisco IOS software that is running on the standby PRE module. |
|                 | 12.2(15)BC2 | The default display includes additional information about the history of switchovers, as well as a stack trace from the secondary PRE module's ROMMON for when it last crashed, if ever.                               |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                                                                                                                        |

**Usage Guidelines** The **show redundancy** command shows whether the PRE A slot or PRE B slot contains the active (primary) Performance Routing Engine (PRE1) module, the status of the standby (secondary) PRE1 module, and the values for the standby PRE1 module's boot variables and configuration register. In Cisco IOS Release 12.2(13)BC1 and later releases, it also shows the version of Cisco IOS software that is running on the standby PRE module.

**Note** The **show redundancy** command always shows the correct location of the active PRE1 module. The other PRE slot will always be marked as **Secondary**, even if a standby PRE1 module is not installed.

**Examples** This section contains examples of typical displays for each of the options that are available for the **show redundancy** command.

**Default Displays**

The following example shows a typical display from the show redundancy command in Cisco IOS Release 12.2(15)BC2 and later releases:

```

PRE A : Secondary
PRE B (This PRE) : Primary

Uptime since this PRE switched to active : 5 minutes
Total system uptime from reload : 37 minutes
Switchovers this system has experienced : 5
Secondary failures since this PRE active : 0
The secondary PRE has been up for : 1 minute
The reason for last switchover: ACTIVE RP CRASHED

Secondary PRE information....
Secondary is up.
Secondary has 524288K bytes of memory.
Secondary BOOT variable = slot0:ubr10k-k8p6-mz.122-11.CY,12;
Secondary CONFIG_FILE variable = bootflash:030227.config
Secondary BOOTLDR variable =
Secondary Configuration register is 0x0

Router#

The following example shows a typical display from the **show redundancy** command in Cisco IOS Release 12.2(15)BC1 and earlier releases. The active PRE1 module is in PRE slot A, and the standby PRE1 module is in PRE slot B:

```

Router# show redundancy

PRE A (This PRE) : Primary
PRE B : Secondary

Redundancy state is REDUNDANCY_PEERSECONDARY_INITED

Secondary PRE information....
Secondary is up.
Secondary has 524288K bytes of memory.
Secondary BOOT variable = bootflash:ubr10k-k8p6-mz

```

## ■ show redundancy (ubr10012)

```

Secondary CONFIG_FILE variable =
Secondary BOOTLDR variable = bootflash:c10k-eboot-mz
Secondary Configuration register is 0x2102

Secondary version:
Cisco Internetwork Operating System Software
IOS (tm) 10000 Software (UBR10K-K8P6-M), Released Version 12.2(11)BC3

Compiled Mon 03-Mar-03 11:28 by texbnt

```

Router#

The following example shows the same display but after a switchover has occurred. The **show redundancy** command now shows that the active (primary) PRE has changed slots (in this case, moving from slot A to slot B):

Router# **show redundancy**

```

PRE A : Secondary
PRE B (This PRE) : Primary

Redundancy state is REDUNDANCY_PEERSECONDARY_INITED

Secondary PRE information...
Secondary is up.
Secondary BOOT variable = bootflash:ubr10k-k8p6-mz
Secondary CONFIG_FILE variable =
Secondary BOOTLDR variable = bootflash:c10k-eboot-mz
Secondary Configuration register is 0x2

Secondary version:
Cisco Internetwork Operating System Software
IOS (tm) 10000 Software (UBR10K-K8P6-M), Released Version 12.2(13)BC2
Copyright (c) 1986-2003 by cisco Systems, Inc.
Compiled 26 08-Feb-03 11:28 by texbnt

```

Router#

The following example shows a typical display when the standby PRE1 module is not installed or is not operational. The standby (secondary) PRE1 module is shown as not up, and its boot variables and configuration register are not shown.

Router# **show redundancy**

```

PRE A (This PRE) : Primary
PRE B : Secondary

Redundancy state is REDUNDANCY_PEERSECONDARY_NONOPERATIONAL

Secondary PRE information...
Secondary PRE is not up

```

Router#

### Clients Display

The following example shows a typical display for the **show redundancy clients** command:

Router# **show redundancy clients**

```

clientID = 0 clientSeq = 0 RF_INTERNAL_MSG
clientID = 25 clientSeq = 130 CHKPT RF
clientID = 5 clientSeq = 170 RFS client
clientID = 50 clientSeq = 530 Slot RF

```

```
clientID = 65000 clientSeq = 65000 RF_LAST_CLIENT
```

### Counters Display

The following example shows a typical display for the **show redundancy counters** command:

```
Router# show redundancy counters
```

```
Redundancy Facility OMs
 comm link up = 1
 comm link down down = 0

 invalid client tx = 0
 null tx by client = 0
 tx failures = 0
 tx msg length invalid = 0

 client not rxing msgs = 0
 rx peer msg routing errors = 0
 null peer msg rx = 0
 errored peer msg rx = 0

 buffers tx = 1009
 tx buffers unavailable = 0
 buffers rx = 1006
 buffer release errors = 0

 duplicate client registers = 0
 failed to register client = 0
 Invalid client syncs = 0
```

### History Display

The following example shows a typical display for the **show redundancy history** command:

```
Router# show redundancy history
```

```
00:00:00 client added: RF_INTERNAL_MSG(0) seq=0
00:00:00 client added: RF_LAST_CLIENT(65000) seq=65000

00:00:16 RF_EVENT_GO_ACTIVE(512) op=0 rc=0
00:00:16 *my state = ACTIVE-FAST(9) peer state = DISABLED(1)
00:00:16 RF_STATUS_MAINTENANCE_ENABLE(403) CHKPT RF(25) op=0 rc=0
00:00:16 RF_STATUS_MAINTENANCE_ENABLE(403) RFS client(5) op=0 rc=0
00:00:16 RF_STATUS_MAINTENANCE_ENABLE(403) Slot RF(50) op=0 rc=0
00:00:16 RF_PROG_ACTIVE_FAST(200) RF_INTERNAL_MSG(0) op=0 rc=11
00:00:16 RF_PROG_ACTIVE_FAST(200) CHKPT RF(25) op=0 rc=11
00:00:16 RF_PROG_ACTIVE_FAST(200) RFS client(5) op=0 rc=11
00:00:16 RF_PROG_ACTIVE_FAST(200) Slot RF(50) op=0 rc=11
00:00:16 RF_PROG_ACTIVE_FAST(200) RF_LAST_CLIENT(65000) op=0 rc=11
00:00:16 *my state = ACTIVE-DRAIN(10) peer state = DISABLED(1)
00:00:16 RF_PROG_ACTIVE_DRAIN(201) RF_INTERNAL_MSG(0) op=0 rc=11
00:00:16 RF_PROG_ACTIVE_DRAIN(201) CHKPT RF(25) op=0 rc=11
00:00:16 RF_PROG_ACTIVE_DRAIN(201) RFS client(5) op=0 rc=11
00:00:16 RF_PROG_ACTIVE_DRAIN(201) Slot RF(50) op=0 rc=11
```

### States Display

The following example shows a typical display for the **show redundancy states** command:

```
Router# show redundancy states
 my state = 13 -ACTIVE
 peer state = 8 -STANDBY HOT
 Mode = Duplex
 Unit = Primary
 Unit ID = 0

 Redundancy Mode = Hot Standby Redundancy
 Maintenance Mode = Disabled
 Manual Swact = Enabled
 Communications = Up

 client count = 5
 client_notification_TMR = 30000 milliseconds
 RF debug mask = 0x0
```

| <b>redundancy</b>                         | Enters redundancy configuration mode.                                                                        |
| <b>redundancy force-failover main-cpu</b> | Forces a manual switchover between the active and standby PRE1 modules.                                      |
| <b>redundancy force-switchover</b>        | Forces the standby PRE to assume the role of the active PRE.                                                 |
| <b>show redundancy config-sync</b>        | Displays failure information generated during a bulk synchronization from the active PRE to the standby PRE. |
| <b>show redundancy platform</b>           | Displays active and standby PRE and software information.                                                    |

# show redundancy config-sync

To display failure information generated during a bulk synchronization from the active Performance Routing Engine (PRE) to the standby PRE, use the **show redundancy config-sync** command in user EXEC or privileged EXEC modes.

**show redundancy config-sync {failures {bem | mcl | prc} | ignored failures mcl}**

| Syntax Description | <b>failures</b>             | Displays failures related to bulk synchronisation of the standby PRE. |
|--------------------|-----------------------------|-----------------------------------------------------------------------|
|                    | <b>bem</b>                  | Displays Best Effort Method (BEM) failure list.                       |
|                    | <b>mcl</b>                  | Displays Mismatched Command List (MCL) failure list.                  |
|                    | <b>prc</b>                  | Displays Parser Return Code (PRC) failure list.                       |
|                    | <b>ignored failures mcl</b> | Displays mismatched commands in the MCL that are ignored.             |

|                 |                                |
|-----------------|--------------------------------|
| Command Default | No default behavior or values. |
|-----------------|--------------------------------|

|               |                                      |
|---------------|--------------------------------------|
| Command Modes | User EXEC (>)<br>Privileged EXEC (#) |
|---------------|--------------------------------------|

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCA | This command was introduced. |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | <p>This command is used on the active PRE only.</p> <p>If there are mismatched commands between the active and standby PRE, remove the configuration lines that are not supported on the standby image. If it is not possible to remove the mismatched lines, or it has been determined that the mismatched lines are not critical to the operation of the system, use the command <b>redundancy config-sync ignore mismatched-commands</b> to temporarily ignore them.</p> |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|          |                                                                  |
|----------|------------------------------------------------------------------|
| Examples | <p>The following example displays a mismatched command list:</p> |
|----------|------------------------------------------------------------------|

```
Router# show redundancy config-sync failures mcl

Mismatched Command List

- tacacs-server host 209.165.200.225 timeout 5
```

The following example shows that no mismatched commands are ignored:

```
router# show redundancy config-sync ignored failures mcl

Ignored Mismatched Command List

The list is Empty
```

The following example displays a Parser Return Code failure list:

```
router# show redundancy config-sync failures prc

PRC Failed Command List

router bgp 999
address-family ipv4 vrf TEST2
- bgp dampening 44 66 66 44
! </submode> "address-family"
address-family ipv4 vrf TEST1
- bgp dampening 44 66 66 44
! </submode> "address-family"
```

The following example displays a Best Effort Method failure list:

```
router# show redundancy config-sync failures bem

BEM Failed Command List

interface Tunnel0
- tunnel mpls traffic-eng priority 7 7
! </submode> "interface"
- next-address loose 10.165.202.158
- next-address loose 10.165.202.129
```

|------------------|-----------------------------|--------------------------------------------------------------|
|                  | redundancy force-switchover | Forces the standby PRE to assume the role of the active PRE. |
|                  | show redundancy             | Displays current active and standby PRE redundancy status.   |
|                  | show redundancy platform    | Displays active and standby PRE and software information.    |

# show redundancy platform

To display active and standby Performance Routing Engine (PRE) and software information, use the **show redundancy platform** command in user EXEC or privileged EXEC modes.

## show redundancy platform

**Syntax Description** This command has no keywords or arguments.

**Command Default** No default behavior or values.

**Command Modes** User EXEC (>  
Privileged EXEC (#)

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCA | This command was introduced. |

**Examples** The following example displays active and standby PRE information such as PRE states, reason for last failover, total system uptime, Cisco IOS release version, and so on:

```
Router# show redundancy platform

PRE A (This PRE) : Active
PRE B : Standby
 Operating mode : SSO
Uptime since this PRE became active from reload : 13 minutes
 Standby failures since this PRE active : 0
 The standby PRE has been up for : 3 minutes
Previous rp_cre_redun_reg bits - 1057h
Current rp_cre_redun_reg bits - 1041h
Previous peer_ready_reg - 01
Current peer_ready_reg - 11
Standby PRE information....
Standby is up
Standby has 1044480K bytes of memory
Standby BOOT variable = disk1:ubr10k2-k9p6u2-mz.Prednld-prototype-2,12;
Standby CONFIG_FILE variable =
Standby BOOTLDR variable =
Standby Configuration register is 0x0
Standby version:

|                  | <b>show redundancy config-sync</b> | Displays failure information generated during a bulk synchronization from the active PRE to the standby PRE. |

# show running-config interface cable

To display the bundles that are configured on a Cisco CMTS router and display the running configuration for each of the cable interfaces, use the **show running-config interface cable** command in privileged EXEC mode.

```
show running-config interface cable {slot/port | slot/subslot/port }
```

**Cisco IOS Release 12.2(33)SCE and later**

```
show running-config interface cable {slot/cable-interface-index |
slot/subslot/cable-interface-index }
```

| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                                                                                                                 |
| 12.2(33)SCC | The command output was modified to display profile description for the specified profile.                                                                                                                       |
| 12.2(33)SCE | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |

## Examples

The following example displays typical output for the **show running-config** command for a specified cable interface:

```
Router# show running-config interface cable 8/1/0

Building configuration...

Current configuration : 1563 bytes
!
interface Cable8/1/0
 downstream Modular-Cable 1/3/0 rf-channel 0 upstream 0-4
 no cable packet-cache
 cable bundle 1
 cable downstream channel-id 203
 cable downstream annex B
 cable downstream modulation 64qam
 cable downstream interleave-depth 32
 cable downstream frequency 525000000
 cable downstream rf-shutdown
 cable upstream max-ports 4
 cable upstream 0 connector 0
 cable upstream 0 frequency 5800000
 cable upstream 0 channel-width 1600000 1600000
 cable upstream 0 docsis-mode tdma
 cable upstream 0 minislots-size 4
 cable upstream 0 range-backoff 3 6
 cable upstream 0 modulation-profile 21
 cable upstream 0 attribute-mask 20000000
 no cable upstream 0 shutdown
 cable upstream 1 connector 1
 cable upstream 1 channel-width 1600000 1600000
 cable upstream 1 docsis-mode tdma
 cable upstream 1 minislots-size 4
 cable upstream 1 range-backoff 3 6
 cable upstream 1 modulation-profile 21
 cable upstream 1 attribute-mask 20000000
 no cable upstream 1 shutdown
 cable upstream 2 connector 2
 cable upstream 2 channel-width 1600000 1600000
 cable upstream 2 docsis-mode tdma
 cable upstream 2 minislots-size 4
 cable upstream 2 range-backoff 3 6
 cable upstream 2 modulation-profile 21
 cable upstream 2 attribute-mask 20000000
 cable upstream 2 shutdown
 cable upstream 3 connector 3
```

```

cable upstream 3 channel-width 1600000 1600000
cable upstream 3 docsis-mode tdma
cable upstream 3 minislot-size 4
cable upstream 3 range-backoff 3 6
cable upstream 3 modulation-profile 21
cable upstream 3 attribute-mask 20000000
cable upstream 3 shutdown
end

```

The following example displays the virtual bundle information for the specified bundle:

```
Router# show running-config interface Bundle 1
```

Building configuration...

```

Current configuration : 158 bytes
!
interface Bundle1
 ip address 1.60.0.1 255.255.255.0
 cable arp filter request-send 3 2
 cable arp filter reply-accept 3 2
 no cable ip-multicast-echo
end

```

The following examples displays subinterface information for the specified bundle on a Cisco uBR10012 router:

```
Router# show ip interface brief | include Bundle
```

|                       |            |     |       |    |
|-----------------------|------------|-----|-------|----|
| Wideband-Cable8/0/0:0 | Bundle2    | YES | unset | up |
| In8/0/0:0             | Bundle2    | YES | unset | up |
| Bundle1               | 1.60.0.1   | YES | NVRAM | up |
| Bundle2               | 1.80.0.1   | YES | NVRAM | up |
| Bundle5               | unassigned | YES | NVRAM | up |

```
Router# show runrunning interface Bundle150.1
```

Building configuration...

```

Current configuration : 93 bytes
!
interface Bundle150.1
 ip address 30.0.0.1 255.0.0.0
 cable helper-address 1.8.35.200
end

```

The following example displays the profile description specified for a interface on a Cisco uBR10012 router:

```
Router#show running-config | include gold
```

```

cable multicast auth profile gold
 profile-description gold profile for higher bandwidth
 bootfile goldl1_bpi.cm
tftp-server disk0:gold2.cm alias gold2.cm
tftp-server disk0:goldl1_bpi.cm alias goldl1_bpi.cm
tftp-server disk0:goldl1_bpi.cm

```

| Command                                                           | Description                                                                                                                                                                        |
|-------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable bundle</b>                                               | Configures a cable interface to belong to an interface bundle or virtual interface bundle.                                                                                         |
| <b>profile description</b>                                        | Configures profile descriptions for each profile in the selected cable multicast authorization profile.                                                                            |
| <b>show arp</b>                                                   | Displays the entries in the router's ARP table.                                                                                                                                    |
| <b>show cable bundle</b> <i>number</i><br><b>forwarding-table</b> | Displays the MAC forwarding table for the specified bundle, showing the MAC addresses of each cable modem in a bundle and the physical cable interface that it is currently using. |
| <b>show cable modem</b>                                           | Displays the cable modems that are online both before and after cable interface bundling has been configured.                                                                      |

# show tech-support

To display general information about the Cisco CMTS router when reporting a problem to Cisco technical support, use the **show tech-support** command in privileged EXEC mode.

**show tech-support** [**page**] [**password**] [**cef** | **ipmulticast** | **isis** | **rsvp**]

| Syntax Description |                                                                                                                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>page</b>        | (Optional) Displays one-page of information at a time. Press <b>Return</b> key to display the next line of output or use the space bar to display the next page of information. If this keyword is not used, the output can be scrolled manually (that is, does not stop for page breaks).                                  |
| <b>password</b>    | (Optional) Displays the output without passwords and other security information in the output. If this keyword is not used, passwords and other security-sensitive information in the output are replaced with the label "<removed>" (this is the default).                                                                 |
| <b>cef</b>         | (Optional) Displays information about the Cisco Express Forwarding (CEF) protocol configuration and status.                                                                                                                                                                                                                 |
| <b>ipmulticast</b> | (Optional) Displays information about the IP multicast configuration and status.                                                                                                                                                                                                                                            |
| <b>isis</b>        | (Optional) Displays information about the Connectionless Network Service (CLNS) and Intermediate System-to-Intermediate System (IS-IS) routing protocol configuration and status.<br><br><b>Note</b> IS-IS support is provided only on CMTS platforms running Cisco IOS images that have a “-p-” as part of the image name. |
| <b>rsvp</b>        | (Optional) Displays information about the IP Resource Reservation Protocol (RSVP) configuration and status.                                                                                                                                                                                                                 |

**Command Default** Displays output without page breaks, passwords, and other security information.

**Command Modes** Privileged EXEC (#)

| Command History | Release    | Modification                                                                         |
|-----------------|------------|--------------------------------------------------------------------------------------|
|                 | 11.2       | This command was introduced.                                                         |
|                 | 12.0 T     | This command was introduced for the Cisco 1700 series router.                        |
|                 | 12.0 T     | This command was introduced for the Cisco 800 series router.                         |
|                 | 12.1(3a)XL | This command was introduced for the Cisco uBR905 cable access router.                |
|                 | 12.1(3)T   | Encryption module <b>show</b> commands were added for the Cisco 1700 series routers. |
|                 | 12.2(2)XA1 | This command was introduced for the Cisco uBR925 cable access router.                |

| Release     | Modification                                                                                                                                                                                                                                                                      |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(4)YA   | This command was enhanced for the Cisco 806, Cisco 826, Cisco 827, and Cisco 828 routers, the Cisco 1700 series routers, and the Cisco uBR905 and Cisco uBR925 cable access routers by adding the output of Cisco Easy VPN, IPSec, access list, and NAT/PAT <b>show</b> commands. |
| 12.2(15)BC2 | This command added the <b>show pxf microcode</b> command to the output display on the Cisco uBR10012 router.                                                                                                                                                                      |
| 12.3(9a)BC  | The output from this command was shortened to allows users with large numbers of online cable modems to collect information without consuming the console session for a long period of time. Several commands from the <b>show cable tech-support</b> command were added.         |
| 12.3(33)SCG | The <b>show issu state detail</b> command was added to the <b>show tech-support</b> command on the Cisco uBR10012 router.                                                                                                                                                         |

### Usage Guidelines

The **show tech-support** command displays a large amount of configuration, run-time status, and other information about the Cisco CMTS for troubleshooting problems. The output of this command can be provided to technical support representatives when reporting a problem.

#### Note

The **show tech-support** command includes most of the information shown in the **show cable tech-support** command.

The **show tech-support** command automatically displays the output of a number of different **show** commands. The exact output depends on the platform, configuration, and type of protocols being used. Typically, the output includes the output from the following commands:

- **show version**
- **show running-config**
- **show stacks**
- **show chassis**
- **show pxf microcode** (Cisco uBR10012 only)
- **show pxf cpu statistics** (Cisco uBR10012 only)
- **show pxf cpu subblocks** (Cisco uBR10012 only)
- **show pxf cpu buffer** (Cisco uBR10012 only)
- **show pxf dma** (Cisco uBR10012 only)
- **show pxf cpu cef memory** (Cisco uBR10012 only)
- **show pxf cpu queue** (Cisco uBR10012 only)
- **show pxf cpu statistics drop** (Cisco uBR10012 only)
- **show interfaces**
- **show controllers** (for all cable interfaces)
- **show cable modem**
- **show cable flap-list**
- **show cable qos profile**

- **show cable modulation-profile**
- **show cable spectrum-group**
- **show cable hop**
- **show interface cable sid** (for each cable interface)
- **show interface cable sid connectivity** (for each cable interface)
- **show interface cable downstream**
- **show interface cable upstream**
- **show interface cable mac-scheduler**
- **show interface cable modem**
- **show issu state detail**
- **show process memory**
- **show process cpu**
- **show controllers** (for all non-cable interfaces)
- **show hccp detail**
- **show region**
- **show buffers**
- **show diag**
- **show pci hardware**
- **show pci controller**

**Tip**

Depending on the platform and configuration, the output from the **show tech-support** command can easily exceed the buffers found in most communications programs. To capture this output so it can be sent to Cisco TAC, use a Telnet program that allows you to capture the output directly to a disk.

**Tip**

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to the **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Examples**

The following is a sample output of the **show tech-support** command:

```
Router# show tech-support
```

**Related Commands**

| Command                                | Description                                                                                                             |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>show cable tech-support</b>         | Displays the output from <b>show</b> commands that display information about the cable interfaces and cable operations. |
| <b>show controllers cable</b>          | Displays information about interface controllers of a specific line card..                                              |
| <b>show interface cable downstream</b> | Displays information about the cable interface.                                                                         |
| <b>show running-config</b>             | Displays the current run-time configuration.                                                                            |

| Command                    | Description                                                                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>show startup-config</b> | Displays the configuration that was used to initially configure the Cisco CMTS at system startup.                                       |
| <b>show version</b>        | Displays the configuration of the system hardware, the software version, names and sources of configuration files, and the boot images. |

# show voice port

To display configuration information about a specific voice port, use the **show voice port** command in privileged EXEC mode.

**Cisco uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter**

**show voice port** *number*

| Syntax Description | <i>number</i> | Identifies the voice port. Valid entries are <b>0</b> (which corresponds to the RJ-11 connector labeled V1) and <b>1</b> (which corresponds to the RJ-11 connector labeled V2). |
|--------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|--------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Command Modes | Privileged EXEC |
|---------------|-----------------|
|---------------|-----------------|

| Command History | Release    | Modification                                                          |
|-----------------|------------|-----------------------------------------------------------------------|
|                 | 12.0(4)XL  | This command was introduced for the Cisco uBR924 cable access router. |
|                 | 12.1(5)XU1 | Support was added for the Cisco CVA122 Cable Voice Adapter.           |
|                 | 12.2(2)XA  | Support was added for the Cisco uBR925 cable access router.           |

**Examples** The following example shows typical output from the **show voice port** command for a cable access router:

```
Router# show voice port 0

Foreign Exchange Station 0
Type of VoicePort is FXS
Operation State is DORMANT
Administrative State is UP
No Interface Down Failure
Description is not set
Noise Regeneration is enabled
Non Linear Processing is enabled
Music On Hold Threshold is Set to -38 dBm
In Gain is Set to -2 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is enabled
Echo Cancel Coverage is set to 8 ms
Connection Mode is normal
Connection Number is not set
Initial Time Out is set to 10 s
Interdigit Time Out is set to 10 s
Call-Disconnect Time Out is set to 60 s
Ringing Time Out is set to 180 s
Region Tone is set for US

Analog Info Follows:
Currently processing none
Maintenance Mode Set to None (not in mtc mode)
Number of signaling protocol errors are 0
Impedance is set to 600r Ohm
```

```

Voice card specific Info Follows:
Signal Type is loopStart
Ring Frequency is 25 Hz
Hook Status is On Hook
Ring Active Status is inactive
Ring Ground Status is inactive
Tip Ground Status is inactive
Digit Duration Timing is set to 100 ms
InterDigit Duration Timing is set to 100 ms
Router#

```

Table 268 describes the fields shown in this display.

**Table 268** *show voice port Field Descriptions*

| Field                               | Description                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------|
| Type of VoicePort                   | Type of voice port: always FXS for the cable access router.                               |
| Operations State                    | Operation state of the port.                                                              |
| Administrative State                | Administrative state of the voice port.                                                   |
| Interface Down Failure              | Last interface down failure that was reported, if any.                                    |
| Description                         | Description of the voice port, if any.                                                    |
| Noise Regeneration                  | Whether or not background noise should be played to fill silent gaps if VAD is activated. |
| Non Linear Processing               | Whether or not nonlinear processing is enabled for this port.                             |
| Music On Hold Threshold             | Configured music-on-hold threshold value for this interface.                              |
| In Gain                             | Amount of gain inserted at the receiver side of the interface.                            |
| Out Attenuation                     | Amount of attenuation inserted at the transmit side of the interface.                     |
| Echo Cancellation                   | Whether or not echo cancellation is enabled for this port.                                |
| Echo Cancel Coverage                | Echo cancel coverage for this port.                                                       |
| Connection Mode                     | Connection mode of the interface.                                                         |
| Connection Number                   | Full E.164 telephone number used to establish a connection with the trunk or PLAR mode.   |
| Initial Time Out                    | Amount of time the system waits for an initial input digit from the caller.               |
| Interdigit Time Out                 | Amount of time the system waits for a subsequent input digit from the caller.             |
| Call-Disconnect Time Out            | Number of seconds for an idle call to be disconnected.                                    |
| Ringing Time Out                    | Ringing time out duration.                                                                |
| Region Tone                         | Configured regional tone for this interface.                                              |
| Currently Processing                | Type of call currently being processed: none, voice, or fax.                              |
| Maintenance Mode                    | Maintenance mode of the voice port.                                                       |
| Number of signaling protocol errors | Number of signalling protocol errors.                                                     |
| Impedance                           | Configured terminating impedance for the E&M interface.                                   |

**Table 268** *show voice port Field Descriptions (continued)*

| Field                            | Description                                                                                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------|
| Signal Type                      | Type of signalling for a voice port: loop-start, ground-start, wink-start, immediate, and delay-dial. |
| Ring Frequency                   | Configured ring frequency for this interface.                                                         |
| Hook Status                      | Hook status of the FXO/FXS interface.                                                                 |
| Ring Active Status               | Ring active indication.                                                                               |
| Ring Ground Status               | Ring ground indication.                                                                               |
| Tip Ground Status                | Tip ground indication.                                                                                |
| Digit Duration Timing            | DTMF digit duration in milliseconds.                                                                  |
| InterDigit Duration Timing       | DTMF interdigit duration in milliseconds.                                                             |
| InterDigit Pulse Duration Timing | Pulse dialing interdigit timing in milliseconds.                                                      |
| Alias                            | User-supplied alias for this voice port, if any.                                                      |
| Coder Type                       | Voice compression mode used.                                                                          |
| Hook Flash Duration Timing       | Maximum length of hook flash signal.                                                                  |
| Ring Cadence                     | Configured ring cadence for this interface.                                                           |

**Tip**

In Cisco IOS Release 12.2(8)T and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

| Command                        | Description                                                            |
|--------------------------------|------------------------------------------------------------------------|
| <b>show call active voice</b>  | Displays the contents of the active call table.                        |
| <b>show call history voice</b> | Displays the contents of the call history table.                       |

# Cable Commands: snmp through w

Revised: August 12, 2013, OL-15510-17

## New Commands

| Command                               | Cisco IOS Software Release |
|---------------------------------------|----------------------------|
| test cable voice                      | 12.3(23)BC                 |
| tos (multicast qos)                   | 12.2(33)SCA                |
| vrf (multicast qos)                   | 12.2(33)SCA                |
| weekend duration                      | 12.3(23)BC2                |
| weekend off                           | 12.3(23)BC2                |
| weekend peak-time1                    | 12.3(23)BC2                |
| tag                                   | 12.2(33)SCC                |
| threshold                             | 12.2(33)SCC                |
| tos                                   | 12.2(33)SCC                |
| upstream                              | 12.2(33)SCC                |
| upstream(config-lb-group)             | 12.2(33)SCC                |
| upgrade fpga auto-upgrade             | 12.2(33)SCG                |
| upgrade fpga file                     | 12.2(33)SCG                |
| snmp-server enable traps docsis-resil | 12.2(33)SCG2               |
| snmp-server host traps docsis-resil   | 12.2(33)SCG2               |
| tlv                                   | 12.2(33)SCH                |

## Modified Commands

| Command                            | Cisco IOS Software Release |
|------------------------------------|----------------------------|
| upstream cable connector           | 12.2(33)SCB                |
| upgrade hw-module subslot fpd file | 12.2(33)SCB                |
| weekend duration                   | 12.2(33)SCB                |
| weekend off                        | 12.2(33)SCB                |

| Command                        | Cisco IOS Software Release |
|--------------------------------|----------------------------|
| weekend peak-time1             | 12.2(33)SCB                |
| upstream cable connector       | 12.2(33)SCD                |
| weekend duration               | 12.2(33)SCD2               |
| weekend peak-time1             | 12.2(33)SCD2               |
| snmp-server enable traps cable | 12.2(33)SCG                |

# snmp manager

To create a DOCSIS configuration file that specifies the IP address for the Simple Network Management Protocol (SNMP) manager, use the **snmp manager** command in cable config-file configuration mode. To disable this function, use the **no** form of this command.

**snmp manager** *ip-address*

**no snmp manager**

## Syntax Description

|                   |                                               |
|-------------------|-----------------------------------------------|
| <i>ip-address</i> | Specifies an IP address for the SNMP manager. |
|-------------------|-----------------------------------------------|

## Defaults

No SNMP manager is defined.

## Command Modes

Cable config-file configuration (config-file)

## Command History

| Release    | Modification                                    |
|------------|-------------------------------------------------|
| 12.1(2)EC1 | This command was introduced.                    |
| 12.2(4)BC1 | Support was added to the Release 12.2 BC train. |

## Usage Guidelines

For SNMP commands that affect the operation of the CMTS, see the *Cisco IOS Configuration Fundamentals Command Reference Guide*.

## Examples

The following example shows how to specify the IP address of the SNMP manager in a DOCSIS configuration file:

```
router(config)# cable config-file snmp.cm
router(config-file)# snmp manager 10.10.1.1
router(config-file)# exit
router(config)#
```

## Related Commands

| Command                  | Description                                                             |
|--------------------------|-------------------------------------------------------------------------|
| <b>cable config-file</b> | Creates a DOCSIS configuration file and enters configuration file mode. |
| <b>access-denied</b>     | Disables access to the network.                                         |
| <b>channel-id</b>        | Specifies upstream channel ID.                                          |
| <b>cpe max</b>           | Specifies CPE information.                                              |
| <b>download</b>          | Specifies download information for the configuration file.              |
| <b>frequency</b>         | Specifies downstream frequency.                                         |
| <b>option</b>            | Provides config-file options.                                           |

| Command              | Description                                                     |
|----------------------|-----------------------------------------------------------------|
| <b>privacy</b>       | Specifies privacy options for baseline privacy images.          |
| <b>service-class</b> | Specifies service class definitions for the configuration file. |
| <b>timestamp</b>     | Enables time-stamp generation.                                  |

# snmp-server enable traps cable

To enable the sending of Simple Network Management Protocol (SNMP) traps for cable related events, use the **snmp-server enable traps cable** command in global configuration mode. To disable the sending of traps, use the **no** form of this command.

## Cisco uBR10012 Universal Broadband Router

```
snmp-server enable traps cable [admission_control] [cm-chover] [cm-onoff]
[cm-remote-query] [dmic-lock] [enfrule-violation] [hccp-failover] [hopping] [metering]
[rfswitch-polling] [sfp-link]
```

```
no snmp-server enable traps cable [admission_control] [cm-chover] [cm-onoff]
[cm-remote-query] [dmic-lock] [enfrule-violation] [hccp-failover] [hopping] [metering]
[rfswitch-polling] [sfp-link]
```

## Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Routers

```
snmp-server enable traps cable [admission_control] [cm-chover] [cm-onoff]
[cm-remote-query] [dmic-lock] [enfrule-violation] [hccp-failover] [hopping] [metering]
```

```
no snmp-server enable traps cable [admission_control] [cm-chover] [cm-onoff]
[cm-remote-query] [dmic-lock] [enfrule-violation] [hccp-failover] [hopping] [metering]
```

| Syntax Description       |  |                                                                                                                                                                                   |
|--------------------------|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>admission_control</b> |  | Enables traps for Service Flow Admission Control (SFAC), as defined in CISCO-CABLE-ADMISSION-CTRL-MIB.                                                                            |
| <b>cm-chover</b>         |  | Enables traps that are sent upon completion of CMTS channel override operations, as defined in CISCO-DOCS-EXT-MIB.                                                                |
| <b>cm-onoff</b>          |  | Enables traps for CM online/offline status changes, as defined in CISCO-DOCS-EXT-MIB.                                                                                             |
| <b>cm-remote-query</b>   |  | Enables traps that are sent when the remote polling of CMs has been completed, as defined in CISCO-DOCS-REMOTE-QUERY-MIB.                                                         |
| <b>dmic-lock</b>         |  | Enables traps that are sent when a cable modem fails the dynamic shared-secret security checks, as defined in CISCO-DOCS-EXT-MIB.                                                 |
| <b>enfrule-violation</b> |  | Enables traps that are sent when a user violates their quality of service (QoS) profile, as defined in the CISCO-CABLE-QOS-MONITOR-MIB.                                           |
| <b>hccp-failover</b>     |  | Enables traps for Hot Standby Connection-to-Connection Protocol (HCCP) redundancy switchover events, as defined in CISCO-CABLE-AVAILABILITY-MIB.                                  |
| <b>hopping</b>           |  | Enables traps for spectrum hopping events, as defined in CISCO-CABLE-SPECTRUM-MIB.                                                                                                |
| <b>metering</b>          |  | Enables traps that are sent to indicate success or failure in creating the metering record file or streaming it to the collection server, as defined in CISCO-CABLE-METERING-MIB. |

|                         |                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rfswitch-polling</b> | Enables traps that are sent when the connectivity between the Cisco CMTS and the Cisco RF Switch is lost, as defined in CISCO-CABLE-AVAILABILITY-MIB.                             |
| <b>sfp-link</b>         | Enables the traps that are sent when the SFP port link status changes on the Cisco Wideband SPA, and on the Cisco uBR-MC3GX60V line card, as defined in CISCO-CABLE-WIDEBAND-MIB. |

**Command Default**

No SNMP traps for cable-related events are enabled. You can specify one type of trap or any combination of traps. When the **snmp-server enable traps cable** command is given without any options, all cable-related traps are enabled.

**Command Modes**

Global configuration (config)

**Command History**

| Release              | Modification                                                                                                                             |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 12.0(5)T             | This command, with the <b>cm-chover</b> and <b>cm-onoff</b> options, was added.                                                          |
| 12.0(7)XR2, 12.1(1)T | The <b>cm-remote-query</b> option, along with the CISCO-DOCS-REMOTE-QUERY-MIB MIB, was introduced.                                       |
| 12.1(2)EC1           | This command was supported on the 12.1 EC train.                                                                                         |
| 12.1(7)CX1           | The <b>hopping</b> and <b>cmts-event</b> options were introduced.                                                                        |
| 12.2(4)BC1           | This command was supported on the Cisco uBR10012 universal broadband router. The <b>cmts-event</b> option was also removed as redundant. |
| 12.2(8)BC1           | The <b>hccp-failover</b> option was supported on the Cisco uBR10012 router.                                                              |
| 12.2(11)BC1          | The <b>hccp-failover</b> option was supported on the Cisco uBR7200 series router.                                                        |
| 12.2(15)BC1          | The <b>enforce-rule</b> option was added to generate traps for subscribers who violate their enforce-rule QoS profile.                   |
| 12.2(15)BC21         | The <b>dmic-lock</b> and <b>usage</b> options were added.                                                                                |
| 12.3BC               | The <b>admission_control</b> , <b>metering</b> , and <b>rfswitch-polling</b> options were added.                                         |
| 12.2(33)SCG          | The <b>sfp-link</b> option was added to generate traps when the SFP port link status changed on the Cisco uBR10012 router.               |

**Usage Guidelines**

For other SNMP commands that affect the operation of the CMTS, see the [Cisco CMTS Universal Broadband Router Series MIB Specifications Guide](#).

**Examples**

The following example shows how to enable all traps for cable-related events except HCCP switchover on the CMTS:

```
Router# configure terminal
Router(config)# snmp-server enable traps cable cm-chover cm-onoff cm-remote-query hopping
Router(config)#
```

The following example shows how to enable traps for any HCCP switchovers that occur on the CMTS:

```
Router# configure terminal
Router(config)# snmp-server enable traps cable hccp-failover
Router(config)#
```

The following example shows how to enable traps for when a user violates the maximum bandwidth for the quality of service (QoS) profile specified by their enforce-rule.

```
Router# configure terminal
Router(config)# snmp-server enable traps cable enforce-rule
Router(config)#
```

The following example shows how to enable traps for to see the SFP port link status on the Cisco uBR10012 router

```
Router# configure terminal
Router(config)# snmp-server enable traps cable sfp-link
Router(config)#
```

#### Related Commands

| Command                              | Description                                                                                      |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>cable modem remote-query</b>      | Enables and configures the remote-query feature to gather CM performance statistics on the CMTS. |
| <b>debug cable remote-query</b>      | Turns on debugging to gather information from remote CMs.                                        |
| <b>show cable modem remote-query</b> | Displays the statistics accumulated by the remote-query feature.                                 |

# snmp-server enable traps docsis-cm

To enable one or more Simple Network Management Protocol (SNMP) traps for DOCSIS 1.1 events, use the **snmp-server enable traps docsis-cm** command in global configuration mode. To disable the SNMP traps, use the **no** form of this command.

**Cisco uBR905 and Cisco uBR925 cable access routers, and Cisco CVA122 Cable Voice Adapter**

**snmp-server enable traps docsis-cm [bpi | bpkm | dccack | dccreq | dccrsp | dhcp | dsack | dsreq | dsrsp | dynsa | swupevc | swupfail | swupinit | swupsucc | tlv]**

**no snmp-server enable traps docsis-cm [bpi | bpkm | dccack | dccreq | dccrsp | dhcp | dsack | dsreq | dsrsp | dynsa | swupevc | swupfail | swupinit | swupsucc | tlv]**

| Syntax Description |                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------|
| <b>bpi</b>         | (Optional) Enables Baseline Privacy Interface (BPI) initialization failure traps.             |
| <b>bpkm</b>        | (Optional) Enables Baseline Privacy Key Management (BPKM) initialization failure traps.       |
| <b>dccack</b>      | (Optional) Enables dynamic channel change acknowledgement failure traps.                      |
| <b>dcclreq</b>     | (Optional) Enables dynamic channel change request failure traps.                              |
| <b>dcclrsp</b>     | (Optional) Enables dynamic channel change response failure traps.                             |
| <b>dhcp</b>        | (Optional) Enables DHCP failure traps.                                                        |
| <b>dsack</b>       | (Optional) Enables dynamic service acknowledgement failure traps.                             |
| <b>dsreq</b>       | (Optional) Enables dynamic service request failure traps.                                     |
| <b>dsrsp</b>       | (Optional) Enables dynamic service response failure traps.                                    |
| <b>dynsa</b>       | (Optional) Enables dynamic SA failure traps.                                                  |
| <b>swupevc</b>     | (Optional) Enables secure software upgrade code verification certificate (CVC) failure traps. |
| <b>swupfail</b>    | (Optional) Enables secure software upgrade failure traps.                                     |
| <b>swupinit</b>    | (Optional) Enables secure software upgrade initialization failure traps.                      |
| <b>swupsucc</b>    | (Optional) Enables secure software upgrade success traps.                                     |
| <b>tlv</b>         | (Optional) Enables unknown Type/Length/Value (TLV) traps.                                     |

**Defaults** No traps are enabled. If no options are specified, all DOCSIS-related traps are enabled.

**Command Modes** Global configuration

| Command History | Release    | Modification                                                                                                                     |
|-----------------|------------|----------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(15)CZ | This command was introduced on the Cisco uBR905 and Cisco uBR925 cable access routers, and the Cisco CVA122 Cable Voice Adapter. |

**Usage Guidelines**

This command enables the sending of SNMP traps when DOCSIS-related events occur. Multiple traps can be enabled at the same time.

**Note**

The traps are described in the DOCS-CABLE-DEVICE-TRAP-MIB MIB, which is an extension of the CABLE DEVICE MIB that is defined in RFC 2669.

**Examples**

The following example shows the BPI+ and secure software download traps being enabled:

```
Router# config terminal
Router(config)# snmp-server enable traps docsis-cm bpi bpkw swupcvc swupfail swupinit
swupsucc
Router(config)#
```

**Related Commands**

# snmp-server enable traps docsis-cmts

To enable the sending of Simple Network Management Protocol (SNMP) traps for DOCSIS-related events, use the **snmp-server enable traps docsis-cmts** command in global configuration mode. To disable the sending of traps, use the **no** form of this command.

**snmp-server enable traps docsis-cmts** [*docsis-events*]

**no snmp-server enable traps docsis-cmts** [*docsis-events*]

# snmp-server enable traps docsis-resil

To enable Simple Network Management Protocol (SNMP) traps for Wideband Resiliency specific events on the Cisco CMTS, use the **snmp-server enable traps docsis-resil** command in global configuration mode. To disable SNMP traps, use the **no** form of this command.

**snmp-server enable traps docsis-resil** [*resil-events*]

**no snmp-server enable traps docsis-resil** [*resil-events*]

| Syntax Description | <i>resil-events</i> | Specifies one or more of the following wideband resiliency specific event types:                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    |                     | <ul style="list-style-type: none"> <li>• <b>cm-pmode</b>—Enables the wideband resiliency cable modem partial service trap.</li> <li>• <b>cm-recover</b>—Enables the wideband resiliency cable modem full service trap.</li> <li>• <b>event</b>—Enables the wideband resiliency event trap.</li> <li>• <b>rf-down</b>—Enables the wideband resiliency RF channel down status trap.</li> <li>• <b>rf-up</b>—Enables the wideband resiliency RF channel up status trap.</li> </ul> |

| Defaults | No SNMP traps for wideband resiliency specific events are enabled. When the <b>snmp-server enable traps docsis-resil</b> command is given without any options, all wideband resiliency specific traps are enabled. |

|                  | <code>cable resiliency traps-interval</code> | Sets the interval at which traps must be sent for Wideband Resiliency related events for each cable modem on the Cisco CMTS. |
|                  | <code>show cable modem resiliency</code>     | Displays resiliency status of the cable modem in resiliency mode on the Cisco CMTS router.                                   |
|                  | <code>snmp-server enable traps cable</code>  | Enables traps for cable-related events on the Cisco CMTS.                                                                    |

# snmp-server host traps docsis-resil

To enable Wideband Resiliency trap notifications to a specific Simple Network Management Protocol (SNMP) host on the Cisco CMTS, use the **snmp-server host traps docsis-resil** command in global configuration mode. To disable Wideband Resiliency trap notifications to a specific SNMP host, use the **no** form of this command.

**snmp-server host *ipaddr* traps *string* docsis-resil**

**no snmp-server host *ipaddr* traps *string***

|                            |                                                                                                                                                                                                                           |                                                                                                                              |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b>  | <i>ipaddr</i>                                                                                                                                                                                                             | IPv4 or IPv6 address of the SNMP notification host.                                                                          |
|                            | <i>string</i>                                                                                                                                                                                                             | SNMPv1 community string, SNMPv2c community string, or SNMPv3 username.                                                       |
| <b>Command Default</b>     | Wideband Resiliency trap notifications are not sent to an SNMP host.                                                                                                                                                      |                                                                                                                              |

# switchover pxf restart

To configure the maximum number of PXF crashes that are allowed within a specified time period, use the **switchover pxf restart** command in redundancy configuration (main-cpu) mode. To reset the router to its default values, use the **no** form of this command.

**switchover pxf restart** *number-of-crashes time-period*

**no switchover pxf restart**

## Syntax Description

|                          |                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number-of-crashes</i> | Maximum number of PXF crashes that are allowed within the specified time period. If the PXF processors crash this many times within the given time period, the router switches over to the redundant PRE1 module. The valid range is 1 to 25, with a default of 2. |
| <i>time-period</i>       | Time period, in hours, that PXF crashes are monitored. The valid range is 0 to 120 hours, with a default of 5.                                                                                                                                                     |

## Defaults

2 PXF crashes within 5 hours are allowed (**switchover pxf restart 2 5**)

## Command Modes

Redundancy configuration, main-cpu mode (config-r-mc)

## Command History

| Release     | Modification                                               |
|-------------|------------------------------------------------------------|
| 12.2(15)BC2 | This command was introduced for the Cisco uBR10012 router. |

## Usage Guidelines

The PXF processors that are onboard the PRE1 module automatically restart themselves if a crash occurs. Occasional crashes could be expected, but repeated crashes could indicate a hardware problem.

The **switchover pxf restart** command specifies the maximum number of times that a PXF processor can crash during a specified time period before the router switches over to the redundant PRE1 module. If the PXF processors crash this number of times, the router assumes a hardware problem and initiates a switchover to the redundant PRE1 module.

### Note

When a switchover occurs because of repeated PXF crashes, the router displays the following system message: C10KEVENTMGR-3-PXF\_FAIL\_SWITCHOVER: Multiple PXF failures, switchover to redundant PRE initiated.

## Examples

The following example shows how to configure the router so that if five PXF crashes occur within a one-hour period, the router should initiate a switchover to the redundant PRE1 module.

```
Router# config t
Router(config)# redundancy
Router(config-r)# main-cpu
Router(config-r-mc)# switchover pxf restart 5 1
Router(config-r-mc)# exit
```

```
Router(config-f)# exit
Router(config)#
```

**Related Commands**

| Command                                           | Description                                                                                                                                                       |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>main-cpu</b>                                   | Enters main-CPU redundancy configuration mode, so that you can configure the synchronization of the active and standby Performance Routing Engine (PRE1) modules. |
| <b>redundancy</b>                                 | Configures the synchronization of system files between the active and standby PRE1 modules.                                                                       |
| <b>redundancy<br/>force-failover<br/>main-cpu</b> | Forces a manual switchover between the active and standby PRE1 modules.                                                                                           |

# switchover timeout

To configure the switchover timeout period of the PRE1 module, use the **switchover timeout** command in redundancy configuration (main-cpu) mode. To reset the timeout period to its default value, use the **no** form of this command.

**switchover timeout** *timeout-period*

**no switchover timeout**

|                           |                       |                                                                                                                                       |
|---------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>timeout-period</i> | Specifies the timeout, in milliseconds. The valid range is 0 to 25000 milliseconds (25 seconds), where 0 specifies no timeout period. |

|                        | 12.2(11)BC3    | This command was introduced for the Cisco uBR10012 router. |

|                         |                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>switchover timeout</b> command specifies how long the standby PRE module should wait when it does not detect a heartbeat from the active PRE module before initiating a switchover and assuming responsibility as the active PRE module. If set to 0, the standby PRE module initiates a switchover immediately when the active PRE module misses a scheduled heartbeat. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                               |
|-----------------|-------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows how to set the timeout period to 60 milliseconds: |
|-----------------|-------------------------------------------------------------------------------|

```
Router# config t
Router(config)# redundancy
Router(config-r)# main-cpu
Router(config-r-mc)# switchover timeout 60
Router(config-r-mc)# exit
Router(config-f)# exit
Router(config)#
```

| <b>redundancy</b>                                 | Configures the synchronization of system files between the active and standby PRE1 modules. |
| <b>redundancy<br/>force-failover<br/>main-cpu</b> | Forces a manual switchover between the active and standby PRE1 modules.                     |

# tag

To add a tag to a restricted load balancing group (RLBG), use the **tag** command in the config-lb-group configuration mode. To remove the tag, use the **no** form of this command.

**tag** *tag-name*

**no tag** *tag-name*

## Syntax Description

|                 |                                                                                        |
|-----------------|----------------------------------------------------------------------------------------|
| <i>tag-name</i> | The name of the tag that has been created and configured for the load balancing group. |
|-----------------|----------------------------------------------------------------------------------------|

## Command Default

No default behavior or values.

## Command Modes

DOCSIS load balancing group mode (config-lb-group)

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCC | This command was introduced. |

## Usage Guidelines

You can use the **tag** command to add a tag to a RLBG, only if the tag is already created using the **cable tag** command for the DOCSIS load balancing group on the CMTS.

## Examples

The following example shows how to add a tag to a RLBG using the **tag** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# restricted
Router(config-lb-group)# tag CSCO
Router(config-lb-group)#
```

## Related Commands

|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
| <b>show cable load-balance docsis-group</b> | Displays real-time configuration, statistical, and operational information for load balancing operations on the router. |
| <b>cable tag</b>                            | Configures a tag for a DOCSIS load balancing group on the CMTS.                                                         |

## test cable dcc (Supporting Dynamic Channel Change)

To move a specified cable modem or a group of cable modems to another channel, or to test Dynamic Channel Change (DCC) for load balancing on the Cisco CMTS, use the following command in privileged EXEC mode.

```
test cable dcc {source-interface [cable slot/subslot/cable-interface-index | integrated-cable
slot/subslot/cable-interface-index | modular-cable slot/subslot/cable-interface-index] | sid |
ip-addr | mac-addr | frequency frequency}
{destination-interface [cable slot/subslot/cable-interface-index | integrated-cable
slot/subslot/cable-interface-index | modular-cable slot/subslot/cable-interface-index]
upstream-port}
{init-tech | force | tlv}
```

### Syntax Description

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>source-interface</i>           | Source interface of the cable modem. Use any one of the following options: <ul style="list-style-type: none"> <li><b>cable</b>—Specifies the name of the source downstream interface for the DCC transaction.</li> <li><b>integrated-cable</b>—Specifies the name of the integrated-cable interface to which the cable modem belongs.</li> <li><b>modular-cable</b>—Specifies the name of the modular-cable interface to which the cable modem belongs.</li> <li><i>slot/subslot/cable-interface-index</i>—Slot, subslot, and downstream controller number assigned to the cable modem.</li> </ul>                                                      |
| <b>sid</b>                        | (Optional) Specifies the primary Service ID (sid) value of the cable modem for that interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ip-addr</b>                    | Specifies the IP address of the cable modem to be moved for DCC test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>mac-addr</b>                   | Specifies the MAC address of the cable modem to be moved for DCC test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>frequency</b> <i>frequency</i> | Specifies the DCC downstream frequency parameter.<br><br><i>frequency</i> —New downstream frequency in Hz. The valid range is between 55000000 to 1050000000 Hz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>destination-interface</i>      | Destination interface of the cable modem. Use any one of the following options: <ul style="list-style-type: none"> <li><b>cable</b>—Specifies the name of the target or destination downstream interface to which the cable modem should be moved.</li> <li><b>integrated-cable</b>—Specifies the name of the integrated-cable interface to which the cable modem should be moved.</li> <li><b>modular-cable</b>—Specifies the name of the modular-cable interface to which the cable modem should be moved.</li> <li><i>slot/subslot/cable-interface-index</i>—Slot, subslot, and downstream controller number assigned to the cable modem.</li> </ul> |
| <b>upstream-port</b>              | Specifies the upstream port of the destination interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>init-tech</i> | (Optional) DOCSIS 3.0 GLBG DCC initialization techniques. The valid range is from 1 to 4.<br><br><b>Note</b> If <i>init-tech</i> is not specified, its value is taken as 0.                                                                                                                                                                                                                                                       |
| <i>force</i>     | (Optional) Target modem or group of modems that are forced to move to the specified downstream interface or upstream channel.<br><br><b>Note</b> This option is available only when <i>init-tech</i> is set to 0 and is used to move cable modems with Internet Group Management Protocol (IGMP) or Resource-reservation protocol (RSVP) configuration.<br><br><b>Note</b> This option cannot be used with the <i>tlv</i> option. |
| <i>tlv</i>       | (Optional) Specifies the type-length-value (TLV) in a DCC request message. This is represented as HEX data.<br><br><b>Note</b> <i>force</i> option is not available if the <i>tlv</i> option is used.                                                                                                                                                                                                                             |

**Command Default**

Test functions are disabled by default.

**Command Modes**

Privileged EXEC (#)

**Command History**

| Release      | Modification                                                                                                                                                                                           |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(17a)BC  | This command was introduced on the Cisco uBR10012 router and the Cisco uBR7246VXR router, with supporting broadband processing engines (BPEs) or cable interface line cards on the respective routers. |
| 12.2(33)SCF2 | The <i>force</i> argument was introduced.                                                                                                                                                              |

**Examples**

The following examples illustrate DCC verification, using the **test cable dcc** command.

The following example shows how to move a target cable modem, specified by MAC address, IP address, or the primary SID value on the source interface to a target downstream with the specified frequency using DCC initialization technique 0:

```
Router# test cable dcc [<mac-addr>|<ip-addr>|<cable-if-src><sid>] frequency <freq-value>
Frequency-value: <55000000-858000000> New Downstream Frequency in HZ.
```

The following example shows how to move a target cable modem, specified by MAC address, IP address, or the primary SID value on the source interface to a upstream channel on a target downstream with the DCC-REQ TLV given in the specified HEX data.

```
Router# test cable dcc [<mac-addr>|<ip-addr>|<cable-if-src><sid>] TLV <Hex-data>
```

The following example shows how to move all cable modems on a source interface to a target downstream with the specified frequency using DCC initialization technique 0.

```
Router# test cable dcc <cable-if-src> frequency <frequency-value>
Frequency-value: <55000000-858000000> New Downstream Frequency in HZ.
```

## test cable dcc (Supporting Dynamic Channel Change)

The following example shows how to force a cable modem to move to a modular-cable interface 7/0/0:2 with init-tech set to 0:

```
Router# test cable dcc 0023.4ed0.db25 modular-Cable 7/0/0:0 0 0 force
Router# show cable modem 0023.4ed0.db25
```

### Usage Guidelines

This command is subject to the restrictions and prerequisites described in [Load Balancing, Dynamic Channel Change, and Dynamic Bonding Change on the Cisco CMTS Routers](#).

The Cisco CMTS does not support the *force* option for **test cable dcc tlv** command where *tlv* is a HEXDATA node.

| <b>cable load-balance group (Supporting Dynamic Channel Change)</b>                    | Sets multiple parameters for load balancing with DCC.                                                                                           |
| <b>cable load-balance group dcc-init-technique (Supporting Dynamic Channel Change)</b> | Sets the initialization technique for Dynamic Channel Change (DCC) for load balancing.                                                          |
| <b>cable load-balance group policy (Supporting Dynamic Channel Change)</b>             | Sets the type of service flow policy (PacketCable MultiMedia (PCMM) or Unsolicited Grant Service (UGS)) for use with load balancing and DCC.    |
| <b>cable load-balance group threshold (Supporting Dynamic Channel Change)</b>          | Sets the threshold levels for corresponding service flow types for the specified load balancing group, supporting Dynamic Channel Change (DCC). |
| <b>show controllers cable</b>                                                          | Displays statistics for Dynamic Channel Change (DCC) for load balancing.                                                                        |
| <b>show cable modem</b>                                                                | Displays the information about registered and unregistered cable modems.                                                                        |

# test cable voice

To manually set voice tag of a cable modem, use the test cable voice command in privileged EXEC mode.

```
test cable voice {mac-addr | ip-addr}
```

|                           |                 |                                                                                               |
|---------------------------|-----------------|-----------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>mac-addr</i> | Specifies the MAC address of an individual CM, or of any CPE devices or hosts behind that CM. |
|                           | <i>ip-addr</i>  | Specifies the IP address of an individual CM, or of any CPE devices or hosts behind that CM.  |

|                        |                           |
|------------------------|---------------------------|
| <b>Command Default</b> | No voice tags are enabled |
|------------------------|---------------------------|

|                      |                     |
|----------------------|---------------------|

|                         | <b>show cable modem voice</b>  | Displays the detected voice-enabled modems.         |
|                         | <b>clear cable modem voice</b> | Clears the voice tag that is set for a cable modem. |

# test packetcable gate create

To create a test PacketCable or PCMM gate, use the **test packetcable gate create** command in privileged EXEC mode. The number of requested gates is created with the subscriber address, which must be specified. The gates created with this command are used by other test commands, such as gate-info or gate-delete, to test functionality.

**test packetcable gate create** *subscriber addr* [**dqos** | **multimedia**] [ *# of gates* ]

## Syntax Description

|                        |                                                                             |
|------------------------|-----------------------------------------------------------------------------|
| <i>subscriber addr</i> | IP address of the subscriber for whom to create test packets.               |
| <b>dqos</b>            | Specifies a PacketCable Dynamic Quality of Service (DQoS) CMS.              |
| <b>multimedia</b>      | Specifies a PCMM CMS.                                                       |
| <i># of gates</i>      | Designates the number of test gates to create for the specified IP address. |

## Command Modes

Privileged EXEC (#)

## Command History

| Release     | Modification                                                                                            |
|-------------|---------------------------------------------------------------------------------------------------------|
| 12.3(13a)BC | This command was enhanced to support PCMM on the Cisco uBR10012 router and the Cisco uBR7246VXR router. |

## Usage Guidelines

This command is supported for PC or PCMM on the Cisco CMTS.

## Related Commands

|------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>test packetcable gc client-accept</b>       | Sends a client-accept request to a Packetcable or PCMM Call Management Server (CMS).           |
| <b>test packetcable gc gate-alloc</b>          | Sends a gate allocation message to the Packetcable DQoS processor                              |
| <b>test packetcable gc gate-delete</b>         | Sends a gate-delete request to either the Packetcable Multimedia or PC DQoS message processor. |
| <b>test packetcable gc gate-info</b>           | Sends a gate information request to the Packetcable Multimedia message processor               |
| <b>test packetcable gc gate-set multimedia</b> | Send a test gate-set request to the Packetcable Multimedia message processor.                  |
| <b>test packetcable gc initiate</b>            | Adds a test Call Management Server (CMS) for either PacketCable (DQoS) or PCMM.                |

# test packetcable gc client-accept

To send a client-accept request to a Packetcable or PCMM Call Management Server (CMS), and to initiate a session with that server, use the **test packetcable gc client-accept** command in Privileged EXEC mode.

**test packetcable gc client-accept**

**Command Modes** Privileged EXEC (#)

| Command History | Release     | Modification                                                                                            |
|-----------------|-------------|---------------------------------------------------------------------------------------------------------|
|                 | 12.3(13a)BC | This command was enhanced to support PCMM on the Cisco uBR10012 router and the Cisco uBR7246VXR router. |

**Usage Guidelines** This command is supported for PC or PCMM on the Cisco CMTS. The CMS-to-client session that starts as a result of using this command can be viewed with multiple **show**, **debug** and **test** commands.

**Examples** The following example illustrates a test client-accept request:

```
Router# test packetcable gc client-accept
```

|                  | <b>test packetcable gc gate-delete</b>         | Sends a gate-delete request to either the Packetcable Multimedia or PC DQoS message processor. |
|                  | <b>test packetcable gc gate-info</b>           | Sends a gate information request to the Packetcable Multimedia message processor               |
|                  | <b>test packetcable gc gate-set multimedia</b> | Send a test gate-set request to the Packetcable Multimedia message processor.                  |
|                  | <b>test packetcable gc initiate</b>            | Adds a test Call Management Server (CMS) for either PacketCable (DQoS) or PCMM.                |
|                  | <b>test packetcable gate create</b>            | Creates a test PacketCable or PCMM gate.                                                       |

# test packetcable gc gate-alloc

To send a gate allocation message to the Packetcable DQoS processor, use the **test packetcable gc gate-alloc** command in privileged EXEC mode. This test message generates from the gate controller that is specified by the GC address value. The gate is allocated for the subscriber address specified in the command.

**test packetcable gc gate-alloc** *gc-addr subscriber-addr*

| Syntax Description | <i>gc-addr</i>         | IP address for the gate controller to test. |
|--------------------|------------------------|---------------------------------------------|
|                    | <i>subscriber-addr</i> | IP address for the subscriber to test.      |

| Command Modes | Privileged EXEC (#) |

|                  | <b>test packetcable gc gate-delete</b>         | Sends a gate-delete request to either the Packetcable Multimedia or PC DQoS message processor. |
|                  | <b>test packetcable gc gate-info</b>           | Sends a gate information request to the Packetcable Multimedia message processor               |
|                  | <b>test packetcable gc gate-set multimedia</b> | Send a test gate-set request to the Packetcable Multimedia message processor.                  |
|                  | <b>test packetcable gc initiate</b>            | Adds a test Call Management Server (CMS) for either PacketCable (DQoS) or PCMM.                |
|                  | <b>test packetcable gate create</b>            | Creates a test PacketCable or PCMM gate.                                                       |

# test packetcable gc gate-delete

To send a gate-delete request to either the Packetcable Multimedia or PC DQoS message processor, use the **test packetcable gc gate-delete** command in privileged EXEC mode. The request includes the subscriber ID and gate ID specified in the command. The message is sent to either the DQoS or PCMM processor depending on the type of server that was used when the GC address was added.

```
test packetcable gc gate-delete gc-addr subscriber-id gate-id
```

|                         | <b>test packetcable gc gate-set multimedia</b> | Send a test gate-set request to the Packetcable Multimedia message processor.        |
|                         | <b>test packetcable gc initiate</b>            | Adds a test Call Management Server (CMS) for either PacketCable (DQoS) or PCMM.      |
|                         | <b>test packetcable gate create</b>            | Creates a test PacketCable or PCMM gate.                                             |

# test packetcable gc gate-info

To send a gate information request to the Packetcable Multimedia message processor, as if originating from the gate controller address specified, use the **test packetcable gc gate-info** command in privileged EXEC mode. The gate ID must be specified when using this command.

**test packetcable gc gate-info** *gc-addr gate-id*

## Syntax Description

|                |                                                               |
|----------------|---------------------------------------------------------------|
| <i>gc addr</i> | IP address of the gate controller.                            |
| <i>gate-id</i> | Gate identifier for the gate that generates the test message. |

## Command Modes

Privileged EXEC (#)

# test packetcable gc gate-set multimedia

To send a test gate-set request to the Packetcable Multimedia message processor, as if it comes from the gate controller, use the **test packetcable gc gate-set multimedia** command in privileged EXEC mode.

The gate ID, subscriber ID, gate state and traffic profile information are included in the test gate-set message. Other traffic profile information, like traffic profile details, display static values by default.

```
test packetcable gc gate-set gc-addr multimedia subscriber-id state gate-id traffic-type
service-class-name
```

|                         | <b>test packetcable gc client-accept</b>       | Sends a client-accept request to a Packetcable or PCMM Call Management Server (CMS).           |
|                         | <b>test packetcable gc gate-alloc</b>          | Sends a gate allocation message to the Packetcable DQoS processor                              |
|                         | <b>test packetcable gc gate-delete</b>         | Sends a gate-delete request to either the Packetcable Multimedia or PC DQoS message processor. |
|                         | <b>test packetcable gc gate-info</b>           | Sends a gate information request to the Packetcable Multimedia message processor               |
|                         | <b>test packetcable gc gate-set multimedia</b> | Send a test gate-set request to the Packetcable Multimedia message processor.                  |
|                         | <b>test packetcable gate create</b>            | Creates a test PacketCable or PCMM gate.                                                       |

# threshold

To specify the load limit beyond which load balancing occurs, use the **threshold** command in the config-lb-group configuration mode. To remove the specified load limit, use the **no** form of this command.

```
threshold {load {minimum 1-100 | 1-100} | pcmm 1-100 | stability 0-100 | ugs 1-100}
```

```
no threshold {load {minimum | 1-100} | pcmm 1-100 | stability 0-100 | ugs 1-100}
```

## Syntax Description

|                       |                                                                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>load {minimum}</b> | Specifies interface load threshold settings as a percentage value. You can also set minimum number of modems/flows difference ranging from 1 to 100 before load balancing starts. |
| <b>pcmm</b>           | Specifies PCMM service flow threshold as a percentage value.                                                                                                                      |
| <b>stability</b>      | Specifies stability condition detection threshold as a percentage value.                                                                                                          |
| <b>ugs</b>            | Specifies stability detection threshold as a percentage value.                                                                                                                    |

## Command Default

No default behavior or values.

## Command Modes

DOCSIS load balancing group mode (config-lb-group)

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCC | This command was introduced. |

## Examples

The following example shows how to configure the threshold of the DOCSIS LBG using the **threshold** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# threshold load minimum 10
Router(config-lb-group)#
```

## Related Commands

| Command                                     | Description                                                                                                             |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
| <b>show cable load-balance docsis-group</b> | Displays real-time configuration, statistical, and operational information for load balancing operations on the router. |

# timestamp

To create a DOCSIS configuration file that enables timestamp generation, use the **timestamp** command in cable config-file configuration mode. To disable this function, use the **no** form of this command.

**timestamp**

**no timestamp**

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behaviors or values

**Command Modes** Cable config-file configuration (config-file)

| Command History | Release    | Modification                                    |
|-----------------|------------|-------------------------------------------------|
|                 | 12.1(2)EC1 | This command was introduced.                    |
|                 | 12.2(4)BC1 | Support was added to the Release 12.2 BC train. |
|                 |            |                                                 |

**Usage Guidelines** The DOCSIS specification supports the optional time-stamping of DOCSIS configuration files by adding a field to the file that shows the time that the file was sent to the CM. This prevents someone from trying to subvert DOCSIS security by replaying a valid DOCSIS configuration file to another CM. The timestamp is expressed as the number of seconds since midnight on January 1, 1900.

**Examples** The following example shows how to enable timestamp generation for the DOCSIS configuration file.

```
router(config)# cable config-file upgrade.cm
router(config-file)# timestamp
router(config-file)# exit
router(config)#
```

| Related Commands | Command                  | Description                                                             |

| Command Modes      | DEPI tunnel configuration                                                                                                                                                                      |  |         |              |                    |                                                                                      |
| Command History    | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>12.2(33)SCC</td><td>This command was introduced.</td></tr></table>                                                                |  | Release | Modification | 12.2(33)SCC        | This command was introduced.                                                         |
| Release            | Modification                                                                                                                                                                                   |  |         |              |                    |                                                                                      |
| 12.2(33)SCC        | This command was introduced.                                                                                                                                                                   |  |         |              |                    |                                                                                      |
| Usage Guidelines   | The <b>tos</b> command allows you to manually configure the value of the ToS byte used in the headers of Layer 2 tunneled packets.                                                             |  |         |              |                    |                                                                                      |
| Examples           | The following example shows how to assign a ToS value of 100:<br><br>Router# <b>configure terminal</b><br>Router(config)# <b>depi-tunnel rf6</b><br>Router(config-depi-tunnel)# <b>tos 100</b> |  |         |              |                    |                                                                                      |
| Related Commands   | <table><tr><th>Command</th><th>Description</th></tr><tr><td><b>depi-tunnel</b></td><td>Specifies the name of the depi-tunnel and enters the DEPI tunnel configuration mode.</td></tr></table>  |  | Command | Description  | <b>depi-tunnel</b> | Specifies the name of the depi-tunnel and enters the DEPI tunnel configuration mode. |
| Command            | Description                                                                                                                                                                                    |  |         |              |                    |                                                                                      |
| <b>depi-tunnel</b> | Specifies the name of the depi-tunnel and enters the DEPI tunnel configuration mode.                                                                                                           |  |         |              |                    |                                                                                      |

## tos (multicast qos)

To set type of service (ToS) low byte, high byte, and mask values within a multicast QoS group, use the **tos** command in multicast QoS configuration mode. To disable the type of service, use the **no** form of this command.

**tos** *low-byte high-byte mask*

**no tos** *low-byte high-byte mask*

|                           |                  |                                                                                           |
|---------------------------|------------------|-------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>low-byte</i>  | Specifies the minimum ToS data bytes for a multicast QoS group. The valid range is 0–255. |
|                           | <i>high-byte</i> | Specifies the maximum ToS data bytes for a multicast QoS group. The valid range is 0–255. |
|                           | <i>mask</i>      | Specifies the ToS mask for a multicast QoS group. The valid range is 0–255.               |

|                        |                                                                    |
|------------------------|--------------------------------------------------------------------|
| <b>Command Default</b> | ToS parameters are not defined for a specific multicast QoS group. |
|------------------------|--------------------------------------------------------------------|

|                      |                                           |
|----------------------|-------------------------------------------|
| <b>Command Modes</b> | Multicast QoS configuration (config-mqos) |
|----------------------|-------------------------------------------|

|                        |                |                              |
|------------------------|----------------|------------------------------|
| <b>Command History</b> | <b>Release</b> | <b>Modification</b>          |
|                        | 12.2(33)SCA    | This command was introduced. |

|                         |                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The three precedence bits in the ToS byte in the IP header specifies a class of service assignment for each packet. Those packets with the precedence bit set in the ToS field are given higher priority. |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example defines the low and high ToS rates and the mask value using the <b>tos</b> command:<br><br>Router(config)# <b>cable multicast qos group 20 priority 55 global</b><br>Router(config-mqos)# <b>tos 1 6 15</b> |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                         |                                                 |                                                                             |
|-------------------------|-------------------------------------------------|-----------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                                  | <b>Description</b>                                                          |
|                         | <b>cable multicast qos group</b>                | Specifies and configures a cable multicast QoS group.                       |
|                         | <b>show interface bundle multicast-sessions</b> | Displays multicast session information for a specific virtual cable bundle. |
|                         | <b>show interface cable multicast-sessions</b>  | Displays multicast session information for a specific cable interface.      |

# upgrade fpga auto-upgrade

To perform a firmware Field-Programmable Gate Array (FPGA) automatic upgrade on the PRE4 module on the Cisco uBR10012 router, use the **upgrade fpga auto-upgrade** command in privileged EXEC mode.

**upgrade fpga auto-upgrade { debug-off | debug-on | disable | enable | show }**

| Syntax Description | <b>debug-off</b> | Turns off debugging of the firmware FPGA auto upgrade of the PRE4 module. |
|--------------------|------------------|---------------------------------------------------------------------------|
|                    | <b>debug-on</b>  | Turns on debugging of the firmware FPGA auto upgrade of the PRE4 module.  |
|                    | <b>disable</b>   | Disables auto upgrade of the FPGA.                                        |
|                    | <b>enable</b>    | Enables auto upgrade of the FPGA.                                         |
|                    | <b>show</b>      | Displays information on the FPGA upgrade on the Cisco uBR10012 router.    |

|                        |                                          |
|------------------------|------------------------------------------|
| <b>Command Default</b> | FPGA auto upgrade is enabled by default. |
|------------------------|------------------------------------------|

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCG | This command was introduced. |

|                         |                                                                                                                                                                                                                           |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The FPGA auto upgrade feature enables automatic upgrade of the FPGA image on the PRE4 module on the Cisco uBR10012 router. To disable auto upgrade of the FPGA, use the <b>upgrade fpga auto-upgrade disable</b> command. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows how to activate the FPGA debugging on the Cisco uBR10012 router: |
|-----------------|----------------------------------------------------------------------------------------------|

```
Router# upgrade fpga auto-upgrade debug-on
Router#
```

The following example shows how to disable automatic upgrade of the FPGA firmware on the Cisco uBR10012 router:

```
Router# upgrade fpga auto-upgrade disable
```

The following example shows how to display the FPGA version, which is the FPGA in the flash on the PRE4 module:

```
Router# upgrade fpga auto-upgrade show

Alternative IOFPGA Running, version - 0x05111800
Default IOFPGA version - 0x00000000
Alternative IOFPGA version - 0x00000000
Bundle IOFPGA version - 0x0A0A0D01
IOFPGA auto-upgrade enabled - No
IOFPGA auto-upgrade debug - No
IOFPGA auto-upgrade test mode - (Default IOFPGA:flash image verify error)
```

Table 269 describes the significant fields shown in the display.

**Table 269** upgrade fpga auto-upgrade show Field Descriptions

| Field                               | Description                                                |
|-------------------------------------|------------------------------------------------------------|
| Alternative IOFPGA Running, version | Alternative IOFPGA image that is running, and its version. |
| Default IOFPGA version              | Default IOFPGA version.                                    |
| Alternative IOFPGA version          | Alternative IOFPGA version.                                |
| Bundled IOFPGA version              | Bundled IOFPGA version.                                    |
| IOFPGA auto-upgrade enabled         | IOFPGA auto-upgrade is enabled.                            |
| IOFPGA auto-upgrade debug           | IOFPGA debug is turned on.                                 |
| IOFPGA auto-upgrade test mode       | IOFPGA test mode is turned on.                             |

#### Associated Features

The **upgrade fpga auto-upgrade** command is used to automatically upgrade of the FPGA on the PRE4 module on the Cisco uBR10012 router.

|--------------------------|--------------------------------------------------------------------|
| <b>upgrade fpga file</b> | Upgrades the FPGA on the PRE4 module on the Cisco uBR10012 router. |

# upgrade fpga file

To upgrade the Field-Programmable Gate Array (FPGA) image on the Performance Routing Engine 4 (PRE4) module on the Cisco uBR10012 router, use the **upgrade fpga file** command in privileged EXEC mode.

**upgrade fpga** **{alt | def}** **file** *{url}* *{version}*

|                    |                |                                           |
|--------------------|----------------|-------------------------------------------|
| Syntax Description | <b>alt</b>     | Specifies the alternative IOFPGA version. |
|                    | <b>def</b>     | Specifies the default IOFPGA version.     |
|                    | <i>url</i>     | URL of the IOFPGA file.                   |
|                    | <i>version</i> | Version of the IOFPGA file.               |

**Command Default** FPGA is disabled by default.

**Command Modes** Privileged EXEC (#)

|                 |                |                                                                                |
|-----------------|----------------|--------------------------------------------------------------------------------|
| Command History | <b>Release</b> | <b>Modification</b>                                                            |
|                 | 12.2(33)SCB    | This command was introduced.                                                   |
|                 | 12.2(33)SCG    | This command is modified. The argument <i>version</i> is added to the command. |

**Usage Guidelines** Use this command to upgrade the FPGA image on the PRE4 module on the Cisco uBR10012 router.

## Note

In Cisco IOS Releases 12.2(33)SCG, you must specify the version of the IOFPGA file to manually upgrade the PRE4 module.

If you are using a PRE4 VE board and running Cisco IOS Release 12.2(33)SCG, use the **upgrade fpga {alt | def} file {url}** command to upgrade the PRE4 module.

**Examples** The following example shows how to upgrade the FPGA on the Cisco uBR10012 router:

```
Router# upgrade fpga alt file disk0:pre4_iofpga.bin 0x0A0A0D01
```

**Associated Features** The **upgrade fpga file** command is used to manually upgrade the FPGA on the PRE4 module on the Cisco uBR10012 router. For more information, see

|------------------|--------------------------------------|-------------------------------------------------------------------------------------------|
|                  | <b>upgrade fpga<br/>auto-upgrade</b> | Performs automatic upgrade of the IOFPGA on the PRE4 module on the Cisco uBR10012 router. |

# upstream

To add upstream channels to an upstream bonding group, use the **upstream** command in upstream bonding configuration submode. To disable this configuration, use the **no** form of this command.

**upstream** *number*

**no upstream** *number*

## Syntax Description

|               |                                                          |
|---------------|----------------------------------------------------------|
| <i>number</i> | Upstream channel number. The valid range is from 0 to 7. |
|---------------|----------------------------------------------------------|

## Command Default

None

## Command Modes

Upstream bonding configuration submode (config-upstream-bonding)

## Command History

| Release     | Modification                                                  |
|-------------|---------------------------------------------------------------|
| 12.2(33)SCC | This command was introduced in Cisco IOS Release 12.2(33)SCC. |

## Usage Guidelines

DOCSIS 3.0-certified cable modems can support only four upstream channels on an upstream bonding group. These cable modems cannot accept additional upstream channels that you have added to an upstream bonding group.

## Examples

The following example shows how to add upstream channels to an upstream bonding group on a cable interface line card on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable7/1/0
Router(config-if)# cable upstream bonding-group 20
Router(config-upstream-bonding)# upstream 0
Router(config-upstream-bonding)# upstream 1
Router(config-upstream-bonding)# upstream 2
Router(config-upstream-bonding)# upstream 3
```

## Related Commands

| Command                             | Description                                                          |
|-------------------------------------|----------------------------------------------------------------------|
| <b>cable upstream bonding-group</b> | Creates an upstream bonding group on a cable interface.              |
| <b>cable fiber-node</b>             | Creates a fiber node and enters cable fiber-node configuration mode. |

## upstream (config-lb-group)

To set upstream channels in a DOCSIS load balancing group, use the **upstream** command in the config-lb-group configuration mode. To disable the upstream channel configuration, use the **no** form of this command.

### Cisco uBR10012 Router

**upstream cable** *slot/subslot/port upstream-list*

**no upstream cable** *slot/subslot/port upstream-list*

### Cisco uBR7225VXR and Cisco uBR7246VXR Routers

**upstream cable** *slot/port upstream-list*

**no upstream cable** *slot/port upstream-list*

| Syntax Description                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable</b> <i>slot/subslot/port</i> | Specifies the CMTS interface slot, subslot, and port number parameters. <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the line card resides. Ther permitted range is from 5 to 8.</li> <li><i>subslot</i>—Subslot where the line card resides. The available slots are 0 or 1.</li> <li><i>port</i>—The downstream controller number on the line card. The permitted <i>port</i> range is from 0 to 4.</li> </ul>                                                                                           |
| <b>cable</b> <i>slot/port</i>         | Specifies the CMTS interface slot and port number parameters on the Cisco uBR7246VXR or Cisco uBR7225VXR router. <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the line card resides.               <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router—The valid range is from 1 to 2.</li> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> </ul> </li> <li><i>port</i>—Downstream controller number on the line card. The permitted <i>port</i> values are 0 or 1.</li> </ul> |
| <i>upstream-list</i>                  | Upstream channel list ranging from 0 to 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Command Default** None

**Command Modes** DOCSIS load balancing group mode (config-lb-group)

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCC | This command was introduced. |

---

**Examples**

The following example shows how to set upstream channels in a DOCSIS LBG using the upstream command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# upstream cable 1/0/1 2
Router(config-lb-group)#
```

---

|-------------------------------------|----------------------------------------------------------------------|
| <b>cable upstream bonding-group</b> | Creates an upstream bonding group on a cable interface line card.    |
| <b>cable fiber-node</b>             | Creates a fiber node and enters cable fiber-node configuration mode. |

# upstream freq-range

To configure the Cisco CMTS router for the range of frequencies that are acceptable on upstreams, use the **upstream freq-range** command in global configuration mode. To restore the default value of North American ranges, use the **no** form of this command.

**upstream freq-range** [european | japanese | north american]

**no upstream freq-range**

## Syntax Description

|                       |                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>european</b>       | Configures the Cisco CMTS router to accept upstream frequency ranges that conform with the EuroDOCSIS specifications (5 MHz to 65 MHz).  |
| <b>japanese</b>       | Configures the Cisco CMTS router to accept upstream frequency ranges that conform to the expanded range used in Japan (5 MHz to 55 MHz). |
| <b>north american</b> | Configures the Cisco CMTS router to accept upstream frequency ranges that conform to the DOCSIS specifications (5 MHz to 42 MHz).        |

## Defaults

North American (DOCSIS, 5 MHz to 42 MHz)

## Command Modes

Global configuration

## Command History

| Release     | Modification                                                                                         |
|-------------|------------------------------------------------------------------------------------------------------|
| 12.2(15)BC2 | This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers. |

## Usage Guidelines

In Cisco IOS Release 12.2(15)BC2 and later, the Cisco CMTS router supports three different modes of operation, depending on the cable interface line cards being used. The range of frequencies that are allowed in each mode are as follows:

- North American DOCSIS (Annex B)—Upstreams use frequencies between 5 MHz and 42 MHz.
- European EuroDOCSIS (Annex A)—Upstreams use frequencies between 5 MHz and 65 MHz.
- Japanese Expanded Range (Annex B)—Upstreams use frequencies between 5 MHz and 55 MHz.

To configure the router so that it supports the proper range of upstream frequencies, use the **upstream freq-range** command. After you have configured the router with the **upstream freq-range** command, the **cable upstream frequency** command then accepts only frequencies that are in the configured range.

### Note

This command configures only the range of frequencies that can be configured on an upstream. It does not configure the upstreams for the DOCSIS (Annex B) or EuroDOCSIS (Annex A) modes of operation, which is done using the **cable downstream annex** interface command. (Annex C mode is not supported.)

The allowable range for the upstream channel frequency depends on the cable interface line card and Cisco IOS software release being used. See **Table 2-12 on page 2-367** for the currently supported values.

## Examples

The following example shows how to configure the Cisco CMTS router to support the EuroDOCSIS upstream frequency range of 5 MHz to 65 MHz:

```
Router# configure terminal
Router(config)# upstream freq-range european
Router(config)#
```

The following example shows how to configure the Cisco CMTS router to support the expanded Japanese upstream frequency range of 5 MHz to 55 MHz:

```
Router# configure terminal
Router(config)# upstream freq-range japanese
Router(config)#
```

The following example shows how to configure the Cisco CMTS router for its default configuration (DOCSIS upstream frequency range of 5 MHz to 42 MHz):

```
Router# configure terminal
Router(config)# upstream freq-range north american
Router(config)#
```

The following example shows all of the commands that are needed to configure the cable interface and upstream on a Cisco uBR-MC28U/X cable interface line card to support a frequency in the EuroDOCSIS upstream frequency range of 5 MHz to 65 MHz:

```
Router# configure terminal
Router(config)# upstream freq-range european
Router(config)# interface 3/0
Router(config-if)# cable downstream annex a
Router(config-if)# cable upstream 0 frequency 62500000
Router(config-if)#
```

# vrf (multicast qos)

To specify the name for a virtual routing and forwarding (VRF) instance, use the **vrf** command in multicast QoS configuration mode. To disable the VRF instance, use the **no** form of this command.

**vrf** *name*

**no vrf** *name*

## Syntax Description

|             |                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | Specifies the routing and forwarding instance that is populated with multicast Virtual Private Network (MVPN) routes. |
|-------------|-----------------------------------------------------------------------------------------------------------------------|

## Command Default

A VRF name is not defined for the multicast QoS group.

## Command Modes

Multicast QoS configuration (config-mqos)

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCA | This command was introduced. |

## Usage Guidelines

If a multicast QoS (MQoS) group is not defined for the named VRF instance, you will see an error message. You must either define a specific MQoS group for each VRF instance, or define a default MQoS that can be assigned in those situations where no matching MQoS group is found.

## Examples

The following example identifies a multicast QoS group VRF name using the **vrf** command:

```
Router(config)# cable multicast qos group 20 priority 55 global
Router(config-mqos)# vrf name1
```

## Related Commands

|-------------------------------------------------|-----------------------------------------------------------------------------|
| <b>cable multicast qos group</b>                | Specifies and configures a cable multicast QoS group.                       |
| <b>show interface bundle multicast-sessions</b> | Displays multicast session information for a specific virtual cable bundle. |
| <b>show interface cable multicast-sessions</b>  | Displays multicast session information for a specific cable interface.      |

## weekend duration

To configure different subscriber monitoring options over weekends on a Cisco CMTS router, use the **weekend duration** command in enforce-rule configuration mode. To remove the weekend monitoring configuration and to return to the same monitoring conditions for all days of the week, use the **no weekend** form of this command.

**weekend duration** *minutes* **avg-rate** *rate* **sample-interval** *interval* [**penalty** *duration*]  
{ **downstream** | **upstream** } [**enforce**]

**no weekend duration** *minutes* **avg-rate** *rate* **sample-interval** *interval* [**penalty** *duration*]  
{ **downstream** | **upstream** } [**enforce**]

**no weekend**

| Syntax Description |                                        |                                                                                                                                                                               |
|--------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>minutes</i>                         | Specifies the size of the sliding window (in minutes) during which subscriber usage is monitored. The valid range is 10 to 44640 with a default of 360 minutes (6 hours).     |
|                    | <b>avg-rate</b> <i>rate</i>            | Specifies the average sampling rate in kilobits per second for the specified duration. The valid range is 1 to 400000 kilobits with no default.                               |
|                    | <b>sample-interval</b> <i>interval</i> | Specifies how often (in minutes) the CMTS router should sample a service flow to get an estimate of subscriber usage. The valid range is 1 to 30, with a default value of 15. |
|                    | <b>penalty</b> <i>minutes</i>          | (Optional) Specifies the period (in minutes) during which a cable modem (CM) can be under penalty. The valid range is 1 to 10080.                                             |
|                    | <b>downstream</b>                      | Specifies monitoring of traffic in the downstream direction.                                                                                                                  |
|                    | <b>upstream</b>                        | Specifies monitoring of traffic in the upstream direction.                                                                                                                    |
|                    | <b>enforce</b>                         | (Optional) Specifies that the enforce-rule QoS profile should be applied automatically if a user violates their registered QoS profile.                                       |

**Command Default** Weekend monitoring is disabled.

**Command Modes** Enforce-rule configuration (enforce-rule)

| Command History | Release      | Modification                                 |
|-----------------|--------------|----------------------------------------------|
|                 | 12.3(23)BC2  | This command was introduced.                 |
|                 | 12.2(33)SCD2 | The <b>penalty</b> keyword option was added. |

## Usage Guidelines

### Note

This command is applicable only after the **monitoring-basics** command is configured with the keyword **legacy**.

The **weekend duration** command works similarly to the **duration** command for subscriber traffic monitoring. Use the **weekend duration** command when you want to configure different monitoring parameters for subscribers on weekends.

This command can only be used when you have already configured the **duration** or **peak-time1** commands as weekday monitoring conditions for an enforce-rule.

If you still want to monitor traffic over the weekend, but want to return to the same monitoring conditions for every day of the week, use the **no weekend** command. This command removes the weekend monitoring conditions, but still performs monitoring over the weekends according to the other monitoring options that you have configured in the enforce-rule.

If you want to disable monitoring entirely over the weekend, use the **weekend off** command.

The **penalty** duration, which is configured using the **weekend duration** command, is unique to weekends, and takes precedence over the global penalty duration configured using the **penalty-period** command.

## Examples

The following example specifies automatic monitoring of upstream traffic over the weekend if a subscriber is identified as violating their QoS profile. The monitoring will take place every 10 minutes and last for 5 minutes, with traffic sampled at an average rate of 2 kb/s:

```
Router(enforce-rule)# weekend duration 5 avg-rate 2 sample-interval 10 penalty 11 upstream
enforce
```

## Related Commands

| Command                   | Description                                                                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>duration</b>           | Specifies the time period and sample rate to be used for monitoring subscribers.                                                                            |
| <b>peak-time1</b>         | Specifies peak and offpeak monitoring times on a Cisco CMTS router.                                                                                         |
| <b>penalty-period</b>     | Specifies the period during which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile. |
| <b>weekend off</b>        | Disables peak and offpeak monitoring on weekends on a Cisco CMTS router.                                                                                    |
| <b>weekend peak-time1</b> | Configures peak and offpeak subscriber monitoring over weekends on a Cisco CMTS router.                                                                     |

# weekend off

To disable peak and offpeak monitoring on weekends on a Cisco CMTS router, use the **weekend off** command in enforce-rule configuration mode. To re-enable the configuration for weekend monitoring, use the **no** form of this command.

**weekend off**

**no weekend off**

## Syntax Description

This command has no arguments or keywords.

## Command Default

Weekend monitoring is enabled once you configure the **weekend duration** or **weekend peak-time1** commands.

## Command Modes

Enforce-rule configuration (enforce-rule)

## Command History

| Release     | Modification                                                                                                       |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| 12.3(23)BC2 | This command was introduced.                                                                                       |
| 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added. |

## Usage Guidelines

Use the **weekend off** command to disable previously configured weekend monitoring and stop the CMTS router from monitoring cable modems (CMs) with that enforce-rule over the weekend. This command allows you to retain or modify your weekend monitoring configuration without enabling it for actual monitoring use on the CMTS router.

To perform weekend monitoring according to the same parameters used for weekday monitoring, use the **no weekend** command.

## Examples

The following example shows how to disable weekend monitoring when weekend peak-time monitoring has previously been configured on a Cisco CMTS router:

```
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# weekend peak-time1 8 duration 60 avg-rate 100 peak-time2 20 duration
60 avg-rate 10000 duration 90 avg-rate 20000 sample-interval 20 downstream enforce
Router(enforce-rule)# weekend off
```

|---------------------------|------------------------------------------------------------------------------------------|
| <b>weekend duration</b>   | Configures different subscriber monitoring options over weekends on a Cisco CMTS router. |
| <b>weekend peak-time1</b> | Configures peak and offpeak subscriber monitoring over weekends on a Cisco CMTS router.  |

# weekend peak-time1

To configure peak and offpeak subscriber monitoring over weekends on a Cisco CMTS router, use the **weekend peak-time1** command in enforce-rule configuration mode. To remove the peak and offpeak weekend monitoring configuration, use the **no** form of this command.

**weekend peak-time1** {*hour* | *hour:minutes*} **duration** *minutes* **avg-rate** *rate* [**peak-time2** {*hour* | *hour:minutes*} **duration** *minutes* **avg-rate** *rate*] [**duration** *offpeak-minutes* **avg-rate** *offpeak-rate*] **sample-interval** *minutes* [**penalty** *minutes*] {**downstream** | **upstream**}[**enforce**]

**no weekend peak-time1** {*hour* | *hour:minutes*} **duration** *minutes* **avg-rate** *rate* [**peak-time2** {*hour* | *hour:minutes*} **duration** *minutes* **avg-rate** *rate*][**duration** *offpeak-minutes* **avg-rate** *offpeak-rate*] **sample-interval** *minutes* [**penalty** *minutes*] {**downstream** | **upstream**}[**enforce**]

## Syntax Description

|                                        |                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>hour</i>   <i>hour:minutes</i>      | Specifies the time of day, in either hh or hh:mm format, during which monitoring occurs for the peak time.<br><br>If the time is specified in hour (hh), the valid range is 1 to 23 using a 24-hour clock.<br><br>If the time is specified in hour:minutes (hh:mm), the valid range for hour is 1 to 23 using a 24-hour clock, and the valid range for minutes is 0 to 59. |
| <b>duration</b> <i>minutes</i>         | Specifies the size of the sliding window (in minutes) during which the subscriber usage is monitored for the first peak time, and optionally for a second peak time when used with the <b>peak-time2</b> keyword. The valid range is 60 to 1440.                                                                                                                           |
| <b>avg-rate</b> <i>rate</i>            | Specifies the average sampling rate in kilobits per second for the specified duration. The valid range is 1 to 400000 kilobits with no default.                                                                                                                                                                                                                            |
| <b>duration</b> <i>offpeak-minutes</i> | (Optional) Specifies the size of the sliding window during which the subscriber usage is monitored for the remaining offpeak time (time not specified for peak monitoring). Valid range is 60 to 1440 minutes.                                                                                                                                                             |
| <b>avg-rate</b> <i>offpeak-rate</i>    | Specifies the average sampling rate in kilobits per second for the specified offpeak duration. The valid range is 1 to 400000 kilobits with no default.                                                                                                                                                                                                                    |
| <b>peak-time2</b>                      | (Optional) Specifies the time of day during which monitoring occurs for a second peak time. The time can be specified either in hours or hour:minutes format.                                                                                                                                                                                                              |
| <b>sample-interval</b> <i>minutes</i>  | Specifies how often (in minutes) the CMTS router should sample a service flow to get an estimate of subscriber usage. The valid range is 1 to 30, with a default value of 15.                                                                                                                                                                                              |
| <b>penalty</b> <i>minutes</i>          | (Optional) Specifies the period (in minutes) during which a cable modem can be under penalty. The range is 1 to 10080.                                                                                                                                                                                                                                                     |
| <b>downstream</b>                      | Specifies monitoring of traffic in the downstream direction.                                                                                                                                                                                                                                                                                                               |
| <b>upstream</b>                        | Specifies monitoring of traffic in the upstream direction.                                                                                                                                                                                                                                                                                                                 |
| <b>enforce</b>                         | (Optional) Specifies that the enforce-rule QoS profile should be applied automatically if a user violates their registered QoS profile.                                                                                                                                                                                                                                    |

## Command Default

Weekend monitoring is disabled. The only default value for the **weekend peak-time1** command is the 15-minute sample interval.

**Command Modes** Enforce-rule configuration (enforce-rule)

| Command History | Release      | Modification                                                                                                                                         |
|-----------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.3(23)BC2  | This command was introduced.                                                                                                                         |
|                 | 12.2(33)SCD2 | The minute-level granularity (hh:mm) for <b>weekend peak-time1</b> and <b>peak-time2</b> duration, and the <b>penalty</b> keyword option were added. |

### Usage Guidelines

#### Note

This command is applicable only after the **monitoring-basics** command is configured with the keyword **peak-offpeak**.

The **weekend peak-time1** command is similar to the **peak-time1** command for subscriber traffic monitoring. Use the **weekend peak-time1** command when you want to configure different peak and offpeak monitoring parameters for subscribers on weekends.

This command can only be used when you have already configured the **duration** or **peak-time1** commands as weekday monitoring conditions for an enforce-rule.

The **penalty** duration, which is configured using the **weekend peak-time1** command, is unique to weekends, and takes precedence over the global penalty duration configured using the **penalty-period** command.

### Examples

The following example shows configuration of two peak monitoring windows on the weekend, with the first monitoring period beginning at 8:00 A.M. for one hour and the second monitoring period beginning at 8:00 P.M. for one hour, and monitoring at all other times of the weekend for 1-1/2 hours (90 minutes) for downstream traffic. The unique penalty period for both **weekend peaktime1** and **peaktime2** is configured as 60 minutes:

```
Router(enforce-rule)# weekend peak-time1 8 duration 60 avg-rate 10000 peak-time2 20
duration 60 avg-rate 100 duration 90 avg-rate 20000 sample-interval 20 penalty 60
downstream enforce
```

| Related Commands | Command                 | Description                                                                                                                                              |
|------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>peak-time1</b>       | Specifies peak and offpeak monitoring times on a Cisco CMTS router.                                                                                      |
|                  | <b>weekend duration</b> | Configures different subscriber monitoring options over weekends on a Cisco CMTS router.                                                                 |
|                  | <b>penalty-period</b>   | Specifies the period for which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile. |
|                  | <b>weekend off</b>      | Disables peak and offpeak monitoring on weekends on a Cisco CMTS router.                                                                                 |

■ weekend peak-time1

## Appendix A: Cable Debug Commands

**Revised: August 12, 2013, OL-15510-17**

Additional **debug** commands are documented in the *Cisco IOS Debug Command Reference*, available on Cisco.com and the Documentation CD-ROM.

**Caution**

The **debug** commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic. You should use caution when enabling debug messages because sending these messages to the console consumes system resources. Turning on too many types of debug messages can adversely affect the router's network performance, depending on what messages are being displayed and the type of traffic that is occurring.

### New Commands

| Command                                     | Cisco IOS Software Release |
|---------------------------------------------|----------------------------|
| <b>debug cable ipv6</b>                     | 12.2(33)SCA                |
| <b>debug cable service-ds-selection</b>     | 12.3(23)BC                 |
| <b>debug cr10k-rp dbs-queue</b>             | 12.3(23)BC1                |
| <b>debug ehhsa</b>                          | 12.2(33)SCA                |
| <b>debug cable wbcmts resiliency</b>        | 12.2(33)SCB                |
| <b>debug cable cm-ctrl</b>                  | 12.2(33)SCC                |
| <b>debug cable cm-status</b>                | 12.2(33)SCC                |
| <b>debug cable mdd</b>                      | 12.2(33)SCC                |
| <b>debug cable md-sg</b>                    | 12.2(33)SCC                |
| <b>debug cable ubg</b>                      | 12.2(33)SCC                |
| <b>debug cable wbcmts admission-control</b> | 12.2(33)SCC                |
| <b>debug pxf atom</b>                       | 12.2(33)SCC                |
| <b>debug cable dbs</b>                      | 12.2(33)SCD                |
| <b>debug cable multicast counter clear</b>  | 12.2(33)SCE                |
| <b>debug cable multicast counter start</b>  | 12.2(33)SCE                |
| <b>debug cable multicast counter stop</b>   | 12.2(33)SCE                |
| <b>debug cable multicast forwarding</b>     | 12.2(33)SCE                |

| Command                            | Cisco IOS Software Release |
|------------------------------------|----------------------------|
| debug cable multicast latency      | 12.2(33)SCE                |
| debug cable acfe filter            | 12.2(33)SCF                |
| debug cable acfe                   | 12.2(33)SCF                |
| debug cable dynamic-qos subscriber | 12.2(33)SCF                |
| debug cable dynamic-qos trace      | 12.2(33)SCF                |
| debug cmts ipc-cable base          | 12.2(33)SCF                |
| debug cmts ipc-cable client        | 12.2(33)SCF                |
| debug hccp rfs switch              | 12.2(33)SCG                |

#### Modified Commands

| Command                     | Cisco IOS Software Release |
|-----------------------------|----------------------------|
| debug cable wbcmts          | 12.2(33)SCB                |
| debug cr10k-rp dbs-queue    | 12.2(33)SCB                |
| debug hw-module all upgrade | 12.2(33)SCB                |
| debug hw-module bay         | 12.2(33)SCB                |
| debug hw-module subslot     | 12.2(33)SCB                |
| debug cable interface       | 12.2(33)SCC                |
| debug cable mac-scheduler   | 12.2(33)SCC                |
| debug cable tlvs            | 12.2(33)SCC                |
| debug cable ipv6            | 12.2(33)SCF1               |
| debug cable dsg             | 12.2(33)SCG                |

# debug c10k-jacket

To enable debugging information for the Wideband SIP, use the **debug c10k-jacket** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug c10k-jacket [events | plugin | spa-audits | spa-events | spa-vft]**

**no debug c10k-jacket**

|                    |                   |                                                                |
|--------------------|-------------------|----------------------------------------------------------------|
| Syntax Description | <b>events</b>     | Displays event information for the Wideband SIP.               |
|                    | <b>plugin</b>     | Displays plugging processing information for the Wideband SIP. |
|                    | <b>spa-audits</b> | Displays audit information for the Wideband SIP.               |
|                    | <b>spa-events</b> | Displays event information for the Wideband SIP.               |
|                    | <b>spa-vft</b>    | Displays vft information for the Wideband SIP.                 |

|                 |                                             |
|-----------------|---------------------------------------------|
| Command Default | No Wideband SIP debug messages are enabled. |
|-----------------|---------------------------------------------|

|               |                     |
|---------------|---------------------|
| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|

|                 |                |                                                            |
|-----------------|----------------|------------------------------------------------------------|
| Command History | <b>Release</b> | <b>Modification</b>                                        |
|                 | 12.3(21)BC     | This command was introduced for the Cisco uBR10012 router. |

|                  |                                                                                                |
|------------------|------------------------------------------------------------------------------------------------|
| Usage Guidelines | The <b>debug c10k-jacket</b> command is intended for use by Cisco technical support personnel. |
|------------------|------------------------------------------------------------------------------------------------|

**Caution**

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco Systems technical support personnel. Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

|          |                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------|
| Examples | The following example shows how to enable the <b>debug c10k-jacket spa-vft</b> debug messages for the Wideband SIP. |
|----------|---------------------------------------------------------------------------------------------------------------------|

```
Router# debug c10k-jacket spa-vft
c10k jacket SPA VFT calls debugging is on
Router#
Sep 6 17:10:47.410: cr10k_wbcmts_rcv_spa_event: wbcmts spa event recv of type 3
Sep 6 17:10:47.410: NB chan stats: 1 entries.
Sep 6 17:10:47.414: cr10k_wbcmts_rcv_spa_event: wbcmts spa event recv of type 2
Sep 6 17:10:47.414: WB chan stats: 1 entries.
```

Related Commands

| Command             | Description                                          |
|---------------------|------------------------------------------------------|
| debug cable fn      | Enables debugging information for cable fiber nodes. |
| debug cable wbcmts  | Enables debugging information for the wideband CMTS. |
| debug hw-module bay | Enables debugging information for a Wideband SPA.    |

# debug cable

To enable debugging of the cable interface, use the **debug cable** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cable**

**no debug cable**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 11.3 XA | This command was introduced. |

**Usage Guidelines** This command enables debugging of the cable interfaces. To avoid excessive output that could interfere with router performance, you should limit debugging to a particular cable interface, using the **debug cable interface** command, before giving the **debug cable** command.

**Examples** The following shows sample output from the **debug cable bpiatp** command:

```
Router# debug cable
Router# debug cable interface c3/0
CMTS interface debugging is on

Router#
Jun 25 08:36:37.339: cmts_helper_forward 00e0.a3b6.f0af no match

Jun 25 08:36:37.339: cmts_dhcp_glean: type=2 sid 0 IP=221.222.151.182 dhcp mac=0
Jun 25 08:36:40.339: cmts_helper_forward 00e0.a3b6.f0af no match

Jun 25 08:39:13.419: Failed to find CM with mac address 0006.28dc.37fd
Jun 25 08:39:13.419: Failed to find CM with mac address 00d0.bad3.c0cd
Jun 25 08:39:13.419: Failed to find CM with mac address 0003.e350.9cdb

Jun 25 08:39:40.527: Lookup failed - unable to find CM with SID 0

Jun 25 08:38:53.583: Lookup failed - unable to find CM with SID 0
```

**Note**

The last message displayed above, “unable to find CM with SID 0,” is typically generated by the **show cable** commands and can be ignored.

| Related Commands | Command                      | Description                                      |
|------------------|------------------------------|--------------------------------------------------|
|                  | <b>debug cable interface</b> | Enables debugging on a specific cable interface. |

**■**    **debug cable**

# debug cable acfe

To show the debug information related to the algorithm or interaction with the system, use the **debug cable acfe** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable acfe** [**algorithm** | **all** | **filter** | **hccp** | **process** | **read** | **topology** | **verbose** | **write**]

**no debug cable acfe**

| Syntax Description |  |                                                                                                                                           |
|--------------------|--|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>algorithm</b>   |  | Displays internal operations of Fairness Across DOCSIS Interfaces feature algorithms.                                                     |
| <b>all</b>         |  | Displays debugging messages for all cable Fairness Across DOCSIS Interfaces feature events.                                               |
| <b>filter</b>      |  | Applies the filter to limit the debug output. See the <b>debug cable acfe filter</b> command.                                             |
| <b>hccp</b>        |  | Displays Fairness Across DOCSIS Interfaces feature high availability and Hot Standby Connection-to-Connection Protocol (HCCP) activities. |
| <b>process</b>     |  | Displays Fairness Across DOCSIS Interfaces feature process activities.                                                                    |
| <b>read</b>        |  | Displays input from system.                                                                                                               |
| <b>topology</b>    |  | Displays cluster building information.                                                                                                    |
| <b>verbose</b>     |  | Displays all Fairness Across DOCSIS Interfaces feature internal data.                                                                     |
| <b>write</b>       |  | Displays output to system.                                                                                                                |

|                        |                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------|
| <b>Command Default</b> | Debug is disabled and Fairness Across DOCSIS Interfaces feature messages are not displayed. |
|------------------------|---------------------------------------------------------------------------------------------|

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCF | This command was introduced. |

|                         |                                                                                                                                                                                                                           |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | You should run the <b>debug cable acfe</b> command first to enable other debug options available in this command. Avoid enabling <b>all</b> and <b>verbose</b> options because they put a strain on the system resources. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following examples shows how to enable debug messages for Fairness Across DOCSIS Interfaces feature. |
|-----------------|----------------------------------------------------------------------------------------------------------|

# debug cable acfe filter

To apply filters to the Fairness Across DOCSIS Interfaces feature debug information and limit the output to a specific controller, cluster, or interface, use the **debug cable acfe** command in privileged EXEC mode. To disable the debugging output, use the **no** form of this command.

```
debug cable acfe filter {controller {modular-cable slot/subslot/controller-unit cluster
 cluster-index} | interface {integrated-cable | modular-cable | wideband-cable }
 slot/subslot/port:interface-num}
```

```
no debug cable acfe
```

| Syntax Description | filter     | Applies a filter to limit the debug output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Usage Guidelines**

You should run the **debug cable acfe** command first to enable the debug option. Avoid enabling **all** and **verbose** options because they put a strain on the system resources.

**Examples**

The following examples show how to enable debug messages for Fairness Across DOCSIS Interfaces feature.

The following is sample output from the **debug cable acfe filter** command with the **controller** keyword:

```
Router# debug cable acfe filter controller modular-Cable 1/0/0 cluster 0
```

The following is sample output from the **debug cable acfe filter** command with the **interface** keyword:

```
Router# debug cable acfe filter interface modular-Cable 1/0/0:0
```

**Related Commands**

| debug cable acfe | Enables debug operation for Fairness Across DOCSIS Interfaces feature. |

# debug cable admission-control

To enable automatic Admission Control troubleshooting processes on the Cisco CMTS, use the **debug cable admission-control** command in privileged EXEC mode. To disable debugging mode, use the **no** form of this command.

```
debug cable admission-control {cpu | memory | us-bandwidth | ds-bandwidth}
no debug cable admission-control
```

## Syntax Description

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <b>cpu</b>          | Keyword displays CPU debugging information and processes.             |
| <b>memory</b>       | Keyword displays physical memory debugging information and processes. |
| <b>us-bandwidth</b> | Keyword displays upstream debugging information and processes.        |
| <b>ds-bandwidth</b> | Keyword displays downstream debugging information and processes.      |

## Command Default

Admission Control and Service Flow Admission Control debugging is disabled by default.

## Command Modes

Privileged EXEC

## Command History

| Release     | Modification                                                                                                                               |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(13a)BC | This command was introduced on the Cisco uBR10012 and the Cisco uBR7246VXR router.                                                         |
| 12.3(21)BC  | This command continues on the Cisco uBR10012 router and the Cisco uBR7246VXR router to support the Service Flow Admission Control feature. |

## Usage Guidelines

Admission Control debugging processes have some impact to resources on the Cisco CMTS. Any one of the command options can be used for selective debugging and to minimize impact.

For additional Admission Control feature information, refer to the following document on Cisco.com:

- *Admission Control for the Cisco Cable Modem Termination System*

For additional information for Service Flow Admission Control, commencing in Cisco IOS Release 12.3(21)BC, refer to the following document on Cisco.com:

- *Service Flow Admission Control for the Cisco Cable Modem Termination System*

## Examples

The following example illustrates CPU debugging with Admission Control:

```
Router# debug cable admission control cpu
*Sep 12 23:08:53.255: CPU admission control check succeeded
*Sep 12 23:08:53.255: System admission control check succeeded
*Sep 12 23:08:53.255: CPU admission control check succeeded
*Sep 12 23:08:53.255: System admission control check succeeded
```

The following example illustrates memory debugging with Admission Control:

```
Router# debug cable admission control memory
*Sep 12 23:08:53.255: CPU admission control check succeeded
*Sep 12 23:08:53.255: System admission control check succeeded
*Sep 12 23:08:53.255: CPU admission control check succeeded
*Sep 12 23:08:53.255: System admission control check succeeded
```

The following example illustrates event debugging with Admission Control:

```
Router# debug cable admission control event
*Sep 12 23:15:22.867: Entering admission control check on PRE and it's a cm-registration
*Sep 12 23:15:22.867: Admission control event check is TRUE
```

The following example illustrates upstream throughput debugging with Admission Control:

```
Router# debug cable admission control us-bandwidth
Oct 8 23:29:11: Failed to allocate US bandwidth for CM 0007.0e01.9b45 in adding a new
service entry
```

The following example illustrates downstream throughput debugging with Admission Control:

```
Router# debug cable admission control ds-bandwidth
Oct 8 23:29:11: Failed to allocate DS bandwidth for CM 0007.0e01.1db5 in adding a new
service entry
```

#### Related Commands

| Command                                       | Description                                                                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>cable admission-control</b>                | Configures the CPU and memory thresholds for the Cisco CMTS and supporting broadband processing engines (BPEs)          |
| <b>cable admission-control event</b>          | Configures and enables Admission Control event types on the Cisco CMTS.                                                 |
| <b>cable admission-control ds-bandwidth</b>   | Configures Admission Control downstream bandwidth thresholds on the Cisco CMTS.                                         |
| <b>cable admission-control us-bandwidth</b>   | Configures Admission Control upstream bandwidth thresholds on the Cisco CMTS.                                           |
| <b>clear cable admission control counters</b> | Clears all Admission Control resource counters on the Cisco CMTS.                                                       |
| <b>show cable admission-control</b>           | Displays status information for running configuration, traffic metrics, and Admission Control events on the Cisco CMTS. |

# debug cable admission-control flow-categorization

To display service flow categorization results, enabled when a service flow is classified, use the **debug cable admission-control flow categorization** command in Privileged EXEC mode. This command displays the application by which it was categorized, along with which rule is matched. Use the **no** form of this command to disable this debugging.

**debug cable admission-control flow-categorization**

**no debug cable admission-control flow-categorization**

## Command Default

Debugging for Service Flow Admission Control is disabled by default on the Cisco CMTS, through Cisco IOS Release 12.3(21a) enables this feature by default, with associated default functions.

## Command Modes

Privileged EXEC

## Command History

| Release    | Modification                                                                               |
|------------|--------------------------------------------------------------------------------------------|
| 12.3(21)BC | This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router. |

## Usage Guidelines

For additional information for Service Flow Admission Control, commencing in Cisco IOS Release 12.3(21)BC, refer to the following document on Cisco.com:

- *Service Flow Admission Control for the Cisco Cable Modem Termination System*

## Examples

Below is a shortened example of the information displayed when the **debug cable admission-control flow-categorization** command is enabled on the Cisco CMTS. This command displays interface-level information.

```
Router# debug cable admission-control flow-categorization

int ca 5/1/1 sfid 55 identified as video pcmm priority 6 matched.
```

## Related Commands

| Command                                               | Description                                                                                                                                                                                                    |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable admission-control ds-bandwidth</b>           | Sets minor, major and exclusive thresholds for downstream voice or data bandwidth for each or all interfaces on the Cisco CMTS                                                                                 |
| <b>cable admission-control preempt priority-voice</b> | Changes the default PacketCable Emergency 911 call preemption functions on the Cisco CMTS, supporting throughput and bandwidth requirements for Emergency 911 calls above all other buckets on the Cisco CMTS. |
| <b>cable admission-control us-bandwidth</b>           | Configures global or interface-level upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS.                                                                                 |
| <b>cable application-type include</b>                 | Associates an application type with a specific and prioritized bucket on the Cisco CMTS.                                                                                                                       |
| <b>cable application-type name</b>                    | Assigns an alpha-numeric name for the specified bucket.                                                                                                                                                        |

| Command                                                   | Description                                                                                                                                                  |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable admission-control us-bandwidth</b>               | Configures per-upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS.                                                     |
| <b>debug cable admission-control flow-categorization</b>  | Displays service flow categorization results, enabled when a service flow is classified.                                                                     |
| <b>show application-buckets</b>                           | Displays rules for any or all buckets supporting Service Flow Admission Control on the Cisco CMTS.                                                           |
| <b>show interface cable admission-control reservation</b> | Displays service flows, categorizations, and bandwidth consumption on the Cisco CMTS, for the specified interface, and the specified service flow direction. |

# debug cable arp

To enable debugging of the Address Resolution Protocol (ARP) when it is used on the cable interface, use the **debug cable arp** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cable arp**

**no debug cable arp**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(11)BC3 | This command was introduced. |

**Usage Guidelines** The debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic. In particular, avoid using the **debug cable arp** command on an interface with a significant number of CMs, because the resulting volume of debug output could impact system performance. Cisco recommends that when you use the **debug cable arp** command, you limit its output to a particular interface or CM, using the **debug cable interface** or **debug cable mac-address** commands.

**Examples** The following shows typical output for a particular cable modem using the **debug cable arp** command:

```
Router# debug cable arp
CMTS arp debugging is on
```

```
Router# debug cable mac-address 0020.4072.7418
```

```
ARPGLEAN cmts glean idb Cable3/0 MAC 0020.4072.7418 SID 2 ipaddr 31.0.0.2
```

| Related Commands | Command                        | Description                                                                              |
|------------------|--------------------------------|------------------------------------------------------------------------------------------|
|                  | <b>debug cable dhcp</b>        | Enables debugging of the Dynamic Host Configuration Protocol on the cable interface.     |
|                  | <b>debug cable encap</b>       | Enables debugging of encapsulated packets that are transmitted over the cable interface. |
|                  | <b>debug cable interface</b>   | Enables debugging on a specific cable interface.                                         |
|                  | <b>debug cable mac-address</b> | Enables debugging for a particular CM.                                                   |

# debug cable arp filter

To display debugging messages about the filtering of Address Resolution Protocol (ARP) broadcasts, use the **debug cable arp filter** command in privileged EXEC mode. To the debugging messages, use the **no** form of this command.

- debug cable arp filter**
- no debug cable arp filter**

**Syntax Description**    This command has no arguments or keywords.

**Command Default**    No default behavior or values.

**Command Modes**    Privileged EXEC

| Command History | Release     | Modification                                                                                         |
|-----------------|-------------|------------------------------------------------------------------------------------------------------|
|                 | 12.2(15)BC2 | This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers. |

**Usage Guidelines**    If you suspect a particular CM is generating a large volume of ARP traffic, you can enable debugging for that particular CM using the **debug cable arp** command. If the ARP traffic is excessive, you can enable ARP filtering on the associated cable interface using the **cable arp filter** command. To show the results of that ARP filtering, use the **debug cable arp filter** command.

Tip

Because this command can produce a large volume of debug information, it does not produce any output until you first limit debugging output to a particular Service ID (SID) or one or more particular CM MAC addresses, using the **debug cable interface sid** or **debug cable mac-address** commands, respectively.

**Examples**    The following example shows how to enable debugging messages for ARP filtering for a particular MAC address, and samples of the typical messages that can be displayed:

```
Router# debug cable mac-address 000C.0102.0304
Router# debug cable arp filter

CMTS arp filter debugging is ON

Router#

ARP Req Filter = T shdw 000C.0102.0304 sip 10.11.13.1 dhdw 00C0.0809.0A0B dip
192.168.100.14 cnt 2
ARP Req Filter = T src_ip 10.11.13.1 dst_ip 192.168.100.14
```

The following example shows how to enable debugging messages for ARP filtering for a particular SID on a cable interface:

```
Router# debug cable interface cable c5/0 sid 31
Router# debug cable arp filter
```

```
CMTS arp filter debugging is ON
```

```
Router#
```

**Related Commands**

| Command                        | Description                                                                                                                                       |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable arp</b>               | Activates cable Address Resolution Protocol (ARP).                                                                                                |
| <b>cable arp filter</b>        | Controls the number of ARP packets that are allowable for each Service ID (SID) on a cable interface.                                             |
| <b>cable proxy-arp</b>         | Activates cable proxy ARP on the cable interface.                                                                                                 |
| <b>cable arp</b>               | Clears the ARP table on the router.                                                                                                               |
| <b>clear counters</b>          | Clears the packet counters on all interfaces or on a specific interface.                                                                          |
| <b>debug cable arp</b>         | Enables debugging of ARP traffic on a cable interface.                                                                                            |
| <b>debug cable interface</b>   | Enables debugging for a particular Service ID (SID) on a specific cable interface.                                                                |
| <b>debug cable mac-address</b> | Enables debugging for a particular CM.                                                                                                            |
| <b>show cable arp-filter</b>   | Displays the total number of ARP replies and requests that have been sent and received, including the number of requests that have been filtered. |

# debug cable bpiatp

To enable debugging of the Baseline Privacy Interface (BPI) handler, use the **debug cable bpiatp** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cable bpiatp**  
**no debug cable bpiatp**

**Syntax Description**    This command has no arguments or keywords.

**Command Modes**    Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 11.3 XA | This command was introduced. |

**Usage Guidelines**    This command activates debugging of the BPI feature. When this command is activated, the Cisco CMTS displays debugging information for any BPI-related messages that the CMTS sends or receives.

**Note**    This command is supported only on images that support BPI or BPI+ encryption.

**Tip**    Debugging must be enabled for one or more cable interfaces, using the **debug cable interface** command, before the **debug cable bpiatp** command displays any output.

**Examples**    The following shows sample output from the **debug cable bpiatp** command:

```
Router# debug cable interface c3/0
Router# debug cable bpiatp

CMTS bpi_atp debugging is on
Router#

# debug cable bundle

To enable debugging of the bundling of cable interfaces, use the **debug cable bundle** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

```
debug cable bundle [pkt]

no debug cable bundle [pkt]
```

|                    |                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------|
| Syntax Description | pkt (Optional) Displays detailed information about packets that are transmitted over the cable bundle. |

|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | This command activates debugging for cable interfaces that are bundled together into a master/slave relationship, using the <b>cable bundle</b> command. |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|

Note

The **debug cable bundle pkt** command does not display information about multicast packets on the Cisco uBR10012 router. Use the **show ip mroute count** and **show hardware pxf cpu mroute** commands to display this information on the Cisco uBR10012 router.

Tip

This command can generate a significant amount of output. To limit the debug output to a specific cable interface, use the **debug cable interface** command, before using the **debug cable bundle** command.

|          |                                                                                                                 |
|----------|-----------------------------------------------------------------------------------------------------------------|
| Examples | The following shows typical output from the <b>debug cable bundle</b> command for a particular cable interface: |
|----------|-----------------------------------------------------------------------------------------------------------------|

```

# debug cable cm-status

To enable debugging information for cable modem (CM) status messages on the Cisco CMTS routers, use the **debug cable cm-status** command in privileged EXEC mode. To stop the display of debug messages, use the **no** form of this command.

```
debug cable cm-status

no debug cable cm-status
```

**Syntax Description**      This command has no arguments or keywords.

**Command Modes**          Privileged EXEC (#)

| Command History | Release     | Modification                                                  |

|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | <p>The <b>debug cable classifiers</b> command provides detailed information about the allocation, removal, activation and deactivation of packet classifiers. Generally, classifiers are used to identify IP packets by source port, destination port, or type of service. Classifiers are associated with service flows. For example, packet classifiers are dynamically created in most VOIP deployments and this debug command can be used to troubleshoot issues related to these classifiers as VOIP calls are created and torn down.</p> <p>Because this command can produce a large volume of debug information, use this command only when you have also enabled debugging for a particular MAC address, set of MAC addresses, or a MAC address mask, using the <b>debug cable mac-address</b> command.</p> |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                              |
|-----------------|------------------------------------------------------------------------------|
| <b>Examples</b> | The following example enables classifier debugging for a single MAC address: |
|-----------------|------------------------------------------------------------------------------|

```
Router# debug cable mac-address 000a.73fa.dbaa
Router# debug cable classifiers
CMTS Packet Classifiers debugging is on
```

The following enables classifier debugging for all MAC addresses with Organizational Unique Identifier (OUI) OUI 0013.11:

```
Router# debug cable mac-addr 0013.1100.0000 ffff.ff00.0000
Routerv# debug cable classifiers
CMTS Packet Classifiers debugging is on
```

The following example illustrates sample output of the **debug cable classifiers** command for the given MAC addresses:

```

# debug cable config-file

To display information about the DOCSIS configuration files that CMTS generates internally, use the **debug cable config-file** command in the Privileged EXEC mode. To disable the debugging output, use the **no** form of this command.

**Note**

This command applies to configuration files created using the internal DOCSIS configuration file editor and the “cable dynamic-secret” functionality.

**debug cable config-file**

**no debug cable config-file**

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

No default behavior or values.

**Command Modes**

Privileged EXEC (#)

**Command History**

| Release     | Modification                                                             |
|-------------|--------------------------------------------------------------------------|
| 12.1(2)EC   | This command was introduced for Cisco uBR7200 series routers.            |
| 12.1(5)EC   | Support for this command was added for the Cisco uBR7100 series routers. |
| 12.2(4)BC1  | Support was added to the Release 12.2 BC.                                |
| 12.2(11)BC2 | Support for this command was added to the Release 12.2 BC.               |

**Usage Guidelines**

This command shows the DOCSIS configuration files debug messages that the Cisco CMTS generated internally. These configuration files may be generated with the internal configuration file editor using the **cable config-file** command and its subcommands, or through the “dynamic shared secret” functionality using the **cable dynamic-secret** command.

**Caution**

The debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic.

Examples

The following example enables debugging for the internally generated configuration files using the conditional and config-file debug command.

Enable conditional debugs using one of the following commands:

```
Router# debug cable mac-address 0000.aaaa.bbbb
```

or

```
Router# debug cable interface cable 6/1/0 verbose
```

Enable the config-file debug using the following commands:

```
Router# debug cable config-file
```

```
CMTS config file debugging is on
```

```
Router# show debug
```

```
CMTS:
```

```
 CMTS config file debugging is on
```

```
CMTS specific:
```

```
 Debugging is on for Address 0000.aaaa.bbbb, Mask ffff.ffff.ffff
```

```
Router#
```

When debugging is turned on and the Cisco CMTS internally generates a DOCSIS configuration file for transmission to a CM that matches the conditional debug, the CMTS displays the following message:

```
Server instance created for modem 001a.c3ff.e3f0. Local 3.0.0.1 Read request from CM
001a.c3ff.e3f0 (3.0.0.119) File successfully downloaded to CM 001a.c3ff.e3f0
```

When debugging is turned on and a **verbose** keyword is used in the conditional debugs, the Cisco CMTS displays the following message:

```
Server instance created for modem 001a.c3ff.e3f0. Local 3.0.0.1
config: Searching download image for 001a.c3ff.e3f0: not found Generated tftp config file:

| <b>time-stamp</b>              | Enables time-stamp generation.                                                                                                                  |
| <b>show running-config</b>     | Displays the current run-time configuration, which includes defined configuration files.                                                        |
| <b>show startup-config</b>     | Displays the current saved configuration, which includes defined and saved configuration files.                                                 |

# debug cable dbs

To display debugging messages for Dynamic Bandwidth Sharing (DBS), use the **debug cable dbs** command in privileged EXEC mode. To disable DBS debugging, use the **no** form of this command.

**debug cable dbs**

**no debug cable dbs**

**Syntax Description**    This command has no arguments or keywords.

**Command Default**    DBS debugging is disabled.

**Command Modes**    Privileged EXEC (#)

| Command History | Release     | Modification                                                                      |
|-----------------|-------------|-----------------------------------------------------------------------------------|
|                 | 12.2(33)SCD | This command was introduced on the Cisco uBR7225VXR and Cisco uBR7246VXR routers. |

**Usage Guidelines**    This command is used only on the Cisco uBR7225VXR and Cisco uBR7246VXR routers.

Because this command can produce a large volume of information, use this command only when you have also enabled debugging for a particular interface, using the **debug cable interface** command.

**Examples**    The following example shows how to enable debugging output using the **debug cable dbs** command:

```
Router# debug cable dbs

DBS for cable 8x8 LC debugging is on

The following sample shows the DBS debug output:

Router# conf t
Router(config)# interface integrated-Cable 5/0:0
Router(config-if)# shutdown
Router(config-if)# cable dynamic-bw-sharing
Router(config-if)# no shutdown
Router(config-if)# cable rf-bandwidth-percent 30
Router(config-if)# exit
Router(config)# exit
Router# debug cable dbs

# debug cable dcc

To display information about DOCSIS 1.1 Dynamic Channel Change (DCC) messages, use the **debug cable dcc** command in Privileged EXEC mode. To disable debugging output for DCC messages, use the **no** form of this command.

```
debug cable dcc
no debug cable dcc
```

**Syntax Description**    This command has no arguments or keywords.

**Command Default**    No default behavior or values.

**Command Modes**    Privileged EXEC

| Command History | Release    | Modification                                          |
|-----------------|------------|-------------------------------------------------------|
|                 | 12.1(7)CX  | This command was introduced for DOCSIS 1.1 operation. |
|                 | 12.2(4)BC1 | Support was added to the Release 12.2 BC train.       |

**Usage Guidelines**    This command shows debugging messages about the DCC Request (DCC-REQ) message that the CMTS sends to the CM, and about the DCC Response (DCC-RSP) message that the CM sends in reply.

**Caution**

The debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic. In particular, avoid using the **debug cable dcc** command on an interface with a significant number of CMs, because the resulting volume of debug output could impact system performance. Cisco recommends that when you use the **debug cable dcc** command, you limit its output to a particular interface or CM, using the **debug cable interface** command.

**Tip**

To display the contents of the DCC messages, enable TLV debugging with the **debug cable tlvs** command.

**Note**

See the DOCSIS 1.1 specification (revision SP-RF1v1.1-I05-000714 and above) for information on the content and format of the DCC-REQ and DCC-RSP messages.

**Examples**

The following examples show typical output for the **debug cable dcc** command. The following example shows the debug output from a DCC-REQ message that instructs the CM to change its upstream channel to channel 1, using the default initialization technique (option 0, the CM is to reinitialize its MAC layer, requiring a complete reregistration):

```
Router# debug cable int c3/0
Router# debug cable dcc
CMTS DCC encodings debugging is on
Router#
00:02:57: Found DCC TLV
00:02:57: US Channel ID 1
00:02:57: received a DCC_RSP. upstream = 1.
```

The following example shows the debug output from a DCC-REQ message that instructs the CM to change its upstream channel to channel 1, using initialization technique 4 (the CM is to continue its normal operations after synchronizing to the new channel).

```
00:04:29: Found DCC TLV
00:04:29: US Channel ID 1
00:04:29: Found DCC TLV
00:04:29: Init Tech 4
00:04:29: received a DCC_RSP. upstream = 1.
00:04:29: CM new state = 15
00:04:30: DCC-RSP-NEW-TIMEOUT: CmMac->00ac.0000.0070 OrgId->32770
00:04:30: DCC-RSP-ARRIVE is lost.
00:04:30: received a DCC_RSP. upstream = 0.
00:04:30: ERROR: Received DCC-RSP-ARRIVE w/o DCC-REQ.
00:04:30: DCC-ACK Message Contents:
00:04:30: 0x0000: C2 00 00 1A 00 00 00 30 EB 15 2E 97 00 AC 00 00
00:04:30: 0x0010: 00 70 00 08 00 00 03 02 19 00 80 02
00:04:30: DCC-ACK-SENT: CM->0030.eb15.2e97 TranscId->32770
```

The following example shows the debug output from a DCC-REQ message that instructs the CM to change its upstream channel to channel 2, using initialization technique 4, and substituting a new service flow ID (SFID) of 160 for the current SFID of 14.

```
00:05:19: Found DCC TLV
00:05:19: US Channel ID 2
00:05:19: Found DCC TLV
00:05:19: Init Tech 4
00:05:19: Found DCC TLV
00:05:19: SFID Substitute old 14 new 160
00:05:19: received a DCC_RSP. upstream = 0.
00:05:19: CM new state = 15
00:05:20: DCC-RSP-NEW-TIMEOUT: CmMac->00ac.0000.0070 OrgId->32771
00:05:20: DCC-RSP-ARRIVE is lost.
00:05:20: received a DCC_RSP. upstream = 1.
00:05:20: ERROR: Received DCC-RSP-ARRIVE w/o DCC-REQ.
00:05:20: DCC-ACK Message Contents:
00:05:20: 0x0000: C2 00 00 1A 00 00 00 30 EB 15 2E 97 00 AC 00 00
00:05:20: 0x0010: 00 70 00 08 00 00 03 02 19 00 80 03
00:05:20: DCC-ACK-SENT: CM->0030.eb15.2e97 TranscId->32771
```

The following example shows the debug output from a DCC-REQ message that specifies an upstream channel with a frequency that is not a multiple of 62,500 Hz, which is required by the DOCSIS specification:

```
00:07:28: Found DCC TLV
00:07:28: US Channel ID 2
00:07:28: Found DCC TLV
00:07:28: Init Tech 4
00:07:28: Found DCC TLV
00:07:28: ERROR: DS frequency not a multiple of 62500Hz.
```

**debug cable dcc**

00:07:28: Not able to parse the TLVs.

|                         |                                                                                                                                                                                                                                                  |                         |                                                                                                                        |

# debug cable dci

To display information about DOCSIS 1.1 Device Class Identification (DCI) messages, use the **debug cable dci** command in privileged EXEC mode. To disable debugging output for DCI messages, use the **no** form of this command.

**debug cable dci**

**no debug cable dci**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release    | Modification                                          |
|-----------------|------------|-------------------------------------------------------|
|                 | 12.1(4)CX  | This command was introduced for DOCSIS 1.1 operation. |
|                 | 12.2(4)BC1 | Support was added to the Release 12.2 BC train.       |

**Usage Guidelines** This command shows debugging messages about the DCI-REQ messages that the Cisco CMTS receives from CMs.

**Note**

See the DOCSIS 1.1 specification (revision SP-RF1v1.1-I05-000714 and above) for additional information on the DCI-REQ, DCI-RSP, and Upstream Transmitter Disable (UP-DIS) messages.

**Examples** The following example shows typical output displayed by the **debug cable dci** command:

```
Router# debug cable interface c3/0
Router# debug cable dci
CMTS dci debugging is on
Router#
DCI-REQ: CM->1234.5678.abcd SID->1
Device Class 1st half->0000000000000000 Device Class 2nd half->0000000000000001
```

| Related Commands | cable dci-response         | Configures how a cable interface responds to DCI-REQ messages coming from CMs on that interface.                                                        |
|------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | cable dci-upstream-disable | Configures the cable interface so that it sends an Upstream Transmitter Disable (UP-DIS) message in response to a DCI-REQ message from a particular CM. |

# debug cable dhcp

To enable debugging of the Dynamic Host Configuration Protocol (DHCP) when it is used on the cable interface, use the **debug cable dhcp** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cable dhcp**

**no debug cable dhcp**

**Syntax Description**    This command has no arguments or keywords.

**Command Modes**    Privileged EXEC

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(11)BC3 | This command was introduced. |

**Usage Guidelines**    The debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic. In particular, avoid using the **debug cable dhcp** command on an interface with a significant number of CMs, because the resulting volume of debug output could impact system performance. Cisco recommends that when you use the **debug cable dhcp** command, you limit its output to a particular interface or CM, using the **debug cable interface** or **debug cable mac-address** commands.

**Examples**    The following shows typical debugging messages for the **debug cable dhcp** command for a particular cable modem that is acquiring a DHCP address:

```
Router# debug cable dhcp
CMTS dhcp debugging is on

Router# debug cable mac-address 0020.4072.7418
Router# clear cable modem 0020.4072.7418 reset

| <b>debug cable mac-address</b> | Enables debugging for a particular CM.                                                         |

# debug cable dsg

To enable general, downstream channel descriptor (DCD), or packet-related debugging for Advanced-Mode DOCSIS Set-Top Gateway (A-DSG) on a Cisco CMTS router, use the **debug cable dsg** command in privileged EXEC mode. To disable A-DSG debugging, use the **no** form of this command.

**debug cable dsg** [**dcd** | **pkt** | **name**]

**no debug cable dsg**

## Syntax Description

|             |                                                                                |
|-------------|--------------------------------------------------------------------------------|
| <b>dcd</b>  | (Optional) Enables DCD-related debugging. Can be combined with <b>pkt</b> .    |
| <b>pkt</b>  | (Optional) Enables packet-related debugging. Can be combined with <b>dcd</b> . |
| <b>name</b> | (Optional) Enables DSG host name-related debugging.                            |

## Command Modes

Privileged EXEC (#)

## Command History

| Release     | Modification                                                                                                                                                                 |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(15)BC2 | This command was introduced for the Cisco uBR7100 series and Cisco uBR7246VXR routers.                                                                                       |
| 12.3(9a)BC  | This command was introduced for the Cisco uBR10012 router.                                                                                                                   |
| 12.3(13a)BC | This command was modified to begin support of A-DSG on the Cisco uBR10012 router and Cisco uBR7200 series routers. The <b>dcd</b> and <b>pkt</b> keyword options were added. |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                           |
| 12.2(33)SCG | This command was modified. A new keyword, <b>name</b> , was added to enable DSG name-related debugging.                                                                      |

## Usage Guidelines

Debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic because the resulting volume of debug output could impact system performance. Because this command can produce a large volume of information, use this command only when you have also enabled debugging for a particular interface or MAC address, using the **debug cable interface** and **debug cable mac-address** commands, respectively.

When using the **debug cable dsg** command with the **dcd** keyword, it shows DCD counters. If the configuration is changed, the whole DCD message content is displayed, including the MAC header.

## Related Commands

|--------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>show cable dsg tunnel</b>               | Displays information about A-DSG tunnel configuration on a Cisco CMTS router.                         |
| <b>show interface</b>                      | Displays general interface information for the specified or all interfaces.                           |
| <b>show interface cable dsg downstream</b> | Displays interface configuration and status information for A-DSG downstreams on a Cisco CMTS router. |

# debug cable dynamic-qos subscriber

To enable debugging of the call trace functionality on the Cisco CMTS router for a particular subscriber, use the **debug cable dynamic-qos subscriber** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug cable dynamic-qos subscriber** [ipv4-address [mask-address] | ipv6-address] [verbose]

**no debug cable dynamic-qos subscriber** [ipv4-address [mask-address] | ipv6-address] [verbose]

## Syntax Description

|                     |                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv4-address</i> | (Optional) IPv4 address of the subscriber.                                                                                               |
| <i>mask-address</i> | (Optional) IPv4 mask for the specified IPv4 address. If you do not specify the mask address, the default mask (255.255.255.255) is used. |
| <i>ipv6-address</i> | (Optional) IPv6 address of the subscriber.                                                                                               |
| <b>verbose</b>      | (Optional) Provides detailed debugging information with the verbose output.                                                              |

## Command Default

Debugging is not enabled for any of the subscribers.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS Release 12.2(33)SCF | This command was introduced. |

## Usage Guidelines

The **debug cable dynamic-qos subscriber** command enables debugging for a particular subscriber. For the debugs to get printed, you must enable call trace debugging using the **debug cable dynamic-qos trace** command.

The following two debug commands enable most of the subscriber-based debug logs relevant to PacketCable, PacketCable Multimedia (PCMM), and dynamic quality of service (DQoS) lite subscriber debugging:

- **debug cable dynamic-qos trace**
- **debug cable dynamic-qos subscriber**

## Examples

The following example shows debugging information for all the configured subscribers on the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCF:

```
Router# debug cable dynamic-qos subscriber

| <b>show cable dynamic-qos trace</b>  | Displays the number of subscribers for whom call trace is enabled on the Cisco CMTS router.                                  |

# debug cable dynamic-qos trace

To enable debugging of the call trace functionality on the Cisco CMTS router for all the subscribers for whom call trace is configured, use the **debug cable dynamic-qos trace** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug cable dynamic-qos trace** [verbose]

**no debug cable dynamic-qos trace**

| Cisco IOS Release 12.2(33)SCF | This command was introduced.                                                                                                                      |         |              |                               |                              |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | <p>The <b>debug cable dynamic-qos trace</b> command helps in debugging intermittent issues, which could be reproduced on any of the subscribers. Because the cable operator does not know which subscriber is likely to get intermittent issues, the operator cannot enable debugging for a particular subscriber. If debugging is enabled for all subscribers, this might impact the system performane due to huge volume of debugging output. With the PacketCable and PacketCable Multimedia (PCMM) call trace functionality, you can enable debugging only for the configured number of subscribers based on first-come first-served basis when a PacketCable call or PCMM session is attempted. The operator can periodically check if any of the subscribers is getting intermittent issues from the debug, or clear the logs and wait for the issue to surface on one of the subscribers having active trace.</p> <p>We recommend that you use the <b>debug cable dynamic-qos trace</b> command during off-peak hours or under lower CPU utilization.</p> <p>The following two debug commands enable most of the subscriber-based debug logs relevant to PacketCable, PCMM, and dynamic quality of service (DQoS) lite subscriber debugging:</p> <ul style="list-style-type: none"><li><b>debug cable dynamic-qos trace</b></li><li><b>debug cable dynamic-qos subscriber</b></li></ul> |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Examples**

The following example shows call trace debugging information for all subscribers on the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCF:

```
Router# debug cable dynamic-qos trace
```

```
CMTS dynqos trace debugging is on ubr10k#
```

```

|-------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>cable dynamic-qos trace</b>            | Enables the call trace functionality on the Cisco CMTS router for PacketCable or PCMM service subscribers. |
| <b>debug cable dynamic-qos subscriber</b> | Enables debugging of the call trace functionality on the Cisco CMTS router for a particular subscriber.    |
| <b>show cable dynamic-qos trace</b>       | Displays the number of subscribers for whom call trace is enabled on the Cisco CMTS router.                |

# debug cable dynamic-secret

To display debugging messages for the Dynamic Shared Secret feature, use the **debug cable dynamic-secret** command in privileged EXEC mode. To stop the display of debugging messages, use the **no** form of this command.

**debug cable dynamic-secret**

**no debug cable dynamic-secret**

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                                                                                            |
|-----------------|-------------|---------------------------------------------------------------------------------------------------------|
|                 | 12.2(15)BC1 | This command was introduced for Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers. |

## Usage Guidelines

### Tip

Because this command can produce a large volume of debug information, use this command only when you have also enabled debugging for a particular interface or MAC address, using the **debug cable interface** and **debug cable mac-address** commands, respectively.

## Examples

The following example shows how to enable debugging output using the **debug cable dynamic-secret** command:

```
Router# debug cable dynamic-secret
```

```
CMTS dynamic-secret debugging is on
```

```
Router#
```

The following example shows typical output for a cable modem that is reset and reregisters while the Dynamic Shared Secret feature is enabled:

```
02:15:59: Closing file for modem 00c0.2345.6789: New modem state from resetting to offline
02:16:10: Found file name in BOOT_FILE option
02:16:10: Parsing IP address from 10.10.35.200, len 10.. Got 10.10.35.200
Setting 10 bytes to PAD
```

```
02:16:10: Config file for 00c0.2345.6789 set to 10.8.35.200:/cm/UBsgvca698. Was
10.10.35.200:/cm/config.cm
```

```

02:16:10: Discarding contents of /cm/config.cm @ 10.10.35.200
02:16:10: File /cm/config.cm from 10.10.35.200 read successfully
02:16:10: Found file name in BOOT_FILE option
02:16:10: Parsing IP address from 10.10.35.200, len 10.. Got 10.10.35.200
Setting 10 bytes to PAD

02:16:10: Config file for 00c0.2345.6789 set to 10.10.35.200:/cm/wrkldJKDHS. Was
10.10.35.200:/cm/config.cm

```

```
Router#
```

The following example shows the typical messages that are shown when you use the **clear cable modem lock** command to clear the lock on one or more cable modems that have failed the Dynamic Shared Secret checks and were locked into restrictive quality of service (QoS) configurations:

```
Router# clear cable modem all lock
```

```
01:46:37: Closing file for modem 00c0.2854.73f5: New modem state from online to offline
01:46:37: Closing file for modem 00c0.734e.b4aa: New modem state from online(pt) to
offline
01:46:37: Closing file for modem 00c0.7366.17cb: New modem state from init(d) to offline
01:46:37: Closing file for modem 00c0.80bc.22b5: New modem state from online to offline
```

```
Router#
```

The following debug message is displayed when the CMTS has verified the CMTS MIC in a Data-over-Cable Service Interface Specifications (DOCSIS) configuration file against the shared secret that is configured on a cable interface:

```
Validated against Shared secret
```

The CMTS displays the following debug message when the CMTS has verified the CMTS MIC in a DOCSIS configuration file against one of the 16 possible secondary shared secrets that are configured on a cable interface:

```
Validated against secondary secret 11
```

The CMTS displays the following debug message when the CMTS obtains a new DOCSIS configuration file from the TFTP server. The CMTS keeps this file in its internal cache for 30 seconds, so that it can be used for other cable modems that might request it.

```
Creating new cache for config-file.cm @ 10.10.10.21
```

The CMTS displays the following debug messages when it receives a registration request or TFTP request for a DOCSIS configuration file from a device that is not a cable modem. This can indicate that a user is trying to manually download a DOCSIS configuration file so that it can be decoded and modified.

```
MAC address 0102.0304.0506 not of a CM
MAC Address 0102.0304.0506, IP address 10.10.10.13 is not a modem
```

The CMTS displays the following debug message when it receives a TFTP request for an unknown TFTP server. This can indicate that a user is trying to download a DOCSIS configuration file from a local TFTP server.

```
TFTP server unknown for CM 0102.0304.0506
```

The CMTS displays the following debug message when it receives a TFTP request for a non-cable interface. This can indicate that a user is trying to spoof an IP or Ethernet MAC address, and is trying to access a TFTP server through the Internet or a local network.

```
TFTP request from a non-cable interface GE1/0/0 ignored
```

The CMTS displays the following debug messages when it receives a TFTP request for a DOCSIS configuration file that is not available on the TFTP server:

```
16:11:33: Could not locate bootfile name for 0102.0304.0506
16:11:33: Cannot locate config-file.cm requested by CM 0102.0304.0506
16:11:33: Closing file for modem 0102.0304.0506: New modem state from init(rc) to offline
```

|------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>cable dynamic-secret</b>          | Enables the Dynamic Shared Secret feature, so that DOCSIS configuration files are verified with a Message Integrity Check (MIC) that has been created with a dynamically generated shared secret.                        |
|                  | <b>cable shared-secondary-secret</b> | Configures one or more secondary shared secret keys that CMs can use to successfully process the DOCSIS configuration file and register with the CMTS.                                                                   |
|                  | <b>cable shared-secret</b>           | Configures an authentication shared secret key that CMs must use to successfully process the DOCSIS configuration file and register with the CMTS.                                                                       |
|                  | <b>cable tftp-enforce</b>            | Requires that all CMs on a cable interface attempt to download a DOCSIS configuration file using the Trivial File Transfer Protocol (TFTP) through the cable interface before being allowed to register and come online. |
|                  | <b>show cable modem rogue</b>        | Displays a list of cable modems that have been marked, locked, or rejected because they failed the dynamic shared-secret authentication checks.                                                                          |
|                  | <b>debug cable interface</b>         | Enables debugging output for a specific cable interface.                                                                                                                                                                 |
|                  | <b>debug cable mac-address</b>       | Enables debugging output for the cable modems that match the specified hardware (MAC) address or range of addresses.                                                                                                     |

# debug cable dynsrv

To display information about DOCSIS 1.1 dynamic service flow messages, use the **debug cable dynsrv** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable dynsrv**

**no debug cable dynsrv**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC

## Command History

| Release                  | Modification                                           |
|--------------------------|--------------------------------------------------------|
| 12.0(7)XR and 12.1(1a)T1 | This command was introduced for DOCSIS 1.0+ operation. |
| 12.1(4)CX                | This command was enhanced for DOCSIS 1.1 operation.    |
| 12.2(4)BC1               | Support was added to the Release 12.2 BC train.        |

## Usage Guidelines

This command activates dynamic service flow debugging, which displays a debugging message whenever one of the following DOCSIS 1.1 dynamic service messages is processed:

- Dynamic Service Add (DSA)—This message is used to create a new service flow.
- Dynamic Service Change (DSC)—This message is used to change the attributes of an existing service flow.
- Dynamic Service Deletion (DSD)—This message is used to delete an existing service flow.

Each type of dynamic service message includes a request (DSA-REQ, DSC-REQ, DSD-REQ) and a response (DSA-RSP, DSC-RSP, DSD-RSP).

Do not use this command when you have a large number of active CMs on your network, because it could generate a huge amount of output to the console port.

### Note

Debugging must be enabled for one or more cable interfaces, using the **debug cable interface** command, before the **debug cable dynsrv** command will display any output.

### Tip

If using the **debug cable dynsrv** command, also use the **debug cable mac-address** and the **debug cable tlvs** command to enable full DOCSIS MAC-layer debugging.

## Examples

The following example shows typical output displayed by the **debug cable dynsrv** command:

```
Router# debug cable interface c3/0
Router# debug cable dynsrv
CMTS dynsrv debugging is on
```

```

|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | <p>The <b>debug cable encap</b> command displays debugging messages about the following types of encapsulated packets:</p> <ul style="list-style-type: none"><li>• Debug messages prefixed with ENCAPSTR display information about CEF adjacency operations.</li><li>• Debug messages prefixed with VENCAP display information about MAC-layer encapsulation for switched packets (such as PPPoE and IP packets).</li></ul> |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic. In particular, avoid using the **debug cable encap** command on an interface with a significant number of CMs, because the resulting volume of debug output could impact system performance. Cisco recommends that when you use the **debug cable encap** command, you limit its output to a particular interface or CM, using the **debug cable interface** or **debug cable mac-address** commands.

|                 |                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# debug cable envm

To display information about the Cisco CMTS physical environment, including internal temperature, midplane voltages, fan performance, and power supply voltages, use the **debug cable env** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable envm**

**no debug cable envm**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 11.3NA  | This command was introduced. |

**Usage Guidelines** This command is used to debug the sensor circuitry used to measure internal temperature, midplane voltages, fan performance, and power supply voltages on the Cisco CMTS console.

**Examples** The following example shows sample output displayed by the **debug cable envm** command

```
Router# debug cable envm
ENVM: ps id=0xFF0, v=0x2050, r=0xC0AB, pstype=1
ENVM: ps id=0x2FD0, v=0x2050, r=0x24201, pstype=27
NVM: Sensor 0: a2dref=131, a2dact=31, vref=12219, vact=1552 Alpha=8990, temp=27
```

Table 270 provides description for the output.

**Table 270** Sample Output for the debug cable envm Command

| Field  | Description                                                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| ps id  | Power supply raw voltage reading.                                                                                                                       |
| pstype | Power supply type determined from ps ID, v, and r. If the Cisco CMTS contains dual power supplies, the ID information for two types is usually printed. |
| Sensor | Sensor number.                                                                                                                                          |
| a2dref | Analog-to-digital converter reference reading.                                                                                                          |

|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command displays unexpected DOCSIS MAC protocol messages. When the Cisco CMTS does not expect to receive a specific MAC message, or if a packet contains errors in size or content, an error message and a hex dump of the packet are printed. Other miscellaneous error conditions may also show up in output. |

```

# debug cable flap

To display information about the operation of the CM flap list that is maintained for the cable interfaces, use the **debug cable flap** command in the Privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug cable flap
no debug cable flap
```

**Syntax Description**    This command has no arguments or keywords.

**Defaults**    No default behavior or values.

**Command Modes**    Privileged EXEC (#)

| Command History | Release             | Modification                                                             |
|-----------------|---------------------|--------------------------------------------------------------------------|
|                 | 11.3(8)NA, 12.0(4)T | This command was introduced for Cisco uBR7200 series routers.            |
|                 | 12.0(6)SC           | Support for this command was added to the Release 12.0 SC.               |
|                 | 12.1(5)EC           | Support for this command was added for the Cisco uBR7100 series routers. |
|                 | 12.2(4)BC1          | Support was added to the Release 12.2 BC.                                |
|                 | 12.2(11)BC2         | Support for this command was added to the Release 12.2 BC.               |

**Usage Guidelines**    This command shows debugging messages about the operation of the CM flap list that is maintained for the cable interfaces.

  
**Caution**

The debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic.

**Examples**    The following example enables debugging for the CM flap list:

```
Router# debug cable flap

CMTS flap debugging is on

Router# show debug
CMTS:
 CMTS flap debugging is on
Router#
```

When debugging is turned on and a CM is added to the flap list the Cisco CMTS displays the following message:

```
Cable modem <<mac address>> added to flap-list
```

When debugging is turned on and a CM is removed from the flap list, the Cisco CMTS displays the following message:

```
Cable modem <<mac address>> removed from flap-list (<<number>> seconds after last flap)
```

When debugging is turned on and the Cisco CMTS checks the flap list for aged out CMs that need to be removed from the list, the CMTS displays the following message:

```
CMTS flap list aging check (interval = 120 min)
```

|-----------------------------------------------|----------------------------------------------------------------------------------------------------|
| <b>cable flap-list aging</b>                  | Specifies the number of days to keep a CM in the flap-list table before aging it out of the table. |
| <b>cable flap-list insertion-time</b>         | Sets the insertion time interval that determines whether a CM is placed in the flap list.          |
| <b>cable flap-list miss-threshold</b>         | Specifies miss threshold for recording a flap-list event.                                          |
| <b>cable flap-list power-adjust threshold</b> | Specifies the power-adjust threshold for recording a CM flap-list event.                           |
| <b>cable flap-list size</b>                   | Specifies the maximum number of CMs that can be listed in the flap-list table.                     |
| <b>clear cable flap-list</b>                  | Clears all the entries in the flap-list table.                                                     |
| <b>ping docsis</b>                            | Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.                  |
| <b>show cable flap-list</b>                   | Displays the current contents of the flap list.                                                    |

# debug cable fn

To enable debugging information for cable fiber nodes, use the **debug cable fn** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable fn**

**no debug cable fn**

**Syntax Description** This command has no keywords or arguments.

**Command Default** No cable fiber node debug messages are enabled.

**Command Modes** Privileged EXEC (#)

| Command History | Release    | Modification                                               |
|-----------------|------------|------------------------------------------------------------|
|                 | 12.3(21)BC | This command was introduced for the Cisco uBR10012 router. |

**Usage Guidelines** The **debug cable fn** command is intended for use by Cisco technical support personnel.

**Caution**

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support personnel. Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

For general (non-wideband) information on CMTS debugging commands, see the *Cisco Broadband Cable Command Reference Guide*.

**Examples**

The following example shows how to enable debug messages for cable fiber nodes:

```
Router# debug cable fn

CMTS fiber node debugging is on

...
```

The following sample messages are displayed when RF channels 0 and 1 are removed from fiber node 1:

```
Router(config)# cable fiber 1

# debug cable freqhop

To display debug messages for frequency hopping, use the **debug cable freqhop** command in privileged EXEC mode. Use the **no** form of this command to disable debugging output.

```
debug cable freqhop

no debug cable freqhop
```

Syntax Description

This command has no arguments or keywords.

| Command History | Release   | Modification                 |
|-----------------|-----------|------------------------------|
|                 | 12.0(4)XI | This command was introduced. |

Examples

The following example shows how to display debug messages for frequency hopping:

```
router# debug cable interface c6/0
router# debug cable freqhop
CMTS freqhop debugging is on
router#
Sep 27 10:36:41.202: Cable5/0 U0: last hop delta: 1
Sep 27 10:36:42.202: Cable5/0 U0: last hop delta: 2
```

# debug cable hw-spectrum

To display debug messages for spectrum management (frequency agility), use the **debug cable hw-spectrum** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cable hw-spectrum**

**no debug cable hw-spectrum**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release   | Modification                                                              |

# debug cable interface

To display debug messages for a specific cable interface, or for traffic related to a specific MAC address or Service ID (SID) on that interface, use the **debug cable interface** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug cable interface cable {slot/port | slot/subslot/port} [mac-address address [mask] | sid
number [track] | [verbose]]

no debug cable interface cable {slot/port | slot/subslot/port} [mac-address address [mask] | sid
number [track] | [verbose]]
```

|                    |                          |                                                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | slot/port                | Identifies the cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers.<br><br>On the Cisco uBR7100 series router, the only valid value is <b>1/0</b> . On the Cisco uBR7200 series router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.   |
|                    | slot/subslot/port        | Identifies the cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"><li>slot = 5 to 8</li><li>subslot = 0 or 1</li><li>port = 0 to 4 (depending on the cable interface)</li></ul>                                                                                           |
|                    | mac-address address mask | (Optional) Specifies that debugging is to be done only on traffic related to the specified MAC <i>address</i> . An optional <i>mask</i> can be specified to indicate a range of MAC addresses. The <i>mask</i> is ANDed with the <i>address</i> to determine which bits of the address must match to be included in the debugging display. |
|                    | sid number               | (Optional) Specifies that debugging is to be done only on traffic related to the specified SID. The valid range is from 1 to 8191.                                                                                                                                                                                                         |
|                    | track                    | (Optional) Enables SID tracking on a cable interface line card.                                                                                                                                                                                                                                                                            |
|                    | verbose                  | (Optional) Displays detailed debug information.                                                                                                                                                                                                                                                                                            |
|                    |                          |                                                                                                                                                                                                                                                                                                                                            |

|          |                                                                                                                                                                           |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Defaults | Debugging for the cable interfaces is not enabled, which means most of the other <b>debug cable</b> commands will not display any output, even when debugging is enabled. |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|               |                 |
|---------------|-----------------|
| Command Modes | Privileged EXEC |
|---------------|-----------------|

| Command History | Release     | Modification                                                                                                                                                   |
|-----------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.0(6)T    | This command was introduced.                                                                                                                                   |
|                 | 12.2(33)SCC | This command was integrated into Cisco IOS Release 12.2(33)SCC. A new keyword, <b>track</b> , was added to enable SID tracking on a cable interface line card. |

### Usage Guidelines

The **debug cable interface** command must be used to enable debugging on a cable interface before other **debug** commands can be used on that interface. The **mac-address** and **sid** options can be used to restrict the debug output to only those messages that are related to a specific MAC address or SID, so that the volume of debug messages does not affect system performance.

### Examples

The following example shows how to enable debugging on the cable interface in slot 6:

```
Router# debug cable interface c6/0
Router# show debug
CMTS specific:
Debugging is on for Cable6/0
Router#
```

The following shows how to enable verbose debugging on the cable interface in slot 6:

```
Router# debug cable interface c6/0 verbose
Router# show debug
CMTS specific:
Debugging is on for Cable6/0 (verbose)
Router#
```

The following example shows how to enable debugging on the cable interface in slot 6 for all traffic coming from CMs and other devices with MAC addresses that match the address range 0010.0000.0000 through 0010.00FF.FFFF (0010.00xx.xxxx):

```
Router# debug cable interface c6/0 mac-address 0010.0000.0000 FFFF.FF00.0000
Router# show debug
CMTS specific:
Debugging is on for Cable6/0, Address 0010.0000.0000, Mask ffff.ff00.0000
Router#
```

|--------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>debug cable dynsrv</b>      | Displays debugging information about DOCSIS 1.1 dynamic service flow messages.                                |
| <b>debug cable mac-address</b> | Enables debugging on traffic from CMs with the specific MAC address or within the specific MAC address range. |

# debug cable ipv6

To enable debugging of IPv6 transactions on a cable interface on a Cisco CMTS router, use the **debug cable ipv6** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cable ipv6** [**db** | **dhcp** | **ha** | **lq** | **nd** | **source-verify**]

**no debug cable ipv6**

## Syntax Description

|                      |                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------|
| <b>db</b>            | (Optional) Displays messages associated with host database transactions.                                   |
| <b>dhcp</b>          | (Optional) Displays messages associated with Dynamic Host Control Protocol for IPv6 (DHCPv6) transactions. |
| <b>ha</b>            | (Optional) Displays messages associated with high availability (HA) IPv6 transactions.                     |
| <b>lq</b>            | (Optional) Displays messages associated with leasequery (LQ) transactions.                                 |
| <b>nd</b>            | (Optional) Displays messages associated with Neighbor Discovery (ND) transactions.                         |
| <b>source-verify</b> | (Optional) Displays messages associated with source verification transactions.                             |

## Command Modes

Privileged EXEC (#)

## Command History

| Release      | Modification                                                                                   |
|--------------|------------------------------------------------------------------------------------------------|
| 12.2(33)SCA  | This command was introduced.                                                                   |
| 12.2(33)SCF1 | This command was modified. The <b>lq</b> keyword was added to display leasequery transactions. |

## Usage Guidelines

The debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic. In particular, avoid using the **debug cable ipv6** command on an interface with a significant number of CMs, because the resulting volume of debug output could impact system performance. We recommend that when you use the **debug cable ipv6** command, you limit its output to a particular interface or cable modem (CM), using the **debug cable interface** or **debug cable mac-address** commands.

## Related Commands

| <b>debug cable interface</b>   | Enables debugging on a specific cable interface.                                               |
| <b>debug cable mac-address</b> | Enables debugging on a particular CM.                                                          |

# debug cable keyman

To activate debugging of TEK and KEK BPI key management, use the **debug cable keyman** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cable keyman**

**no debug cable keyman**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 11.3NA  | This command was introduced. |

**Usage Guidelines** This command activates debugging of the TEK and KEK baseline privacy key activity. When this command is activated, all activity related to KEK and TEK keys is displayed on the Cisco CMTS console. This command is used to display encryption key management debugging output.

**Note**

This command is supported only on images that support BPI or BPI+ encryption.

**Examples** The following shows typical output from the **debug cable keyman** command.

```
Router# debug cable keyman
Router#

# debug cable l2-vpn

To display debugging messages for the Layer 2 mapping of cable modems to particular permanent virtual connections (PVC) or to a virtual local area network (VLAN), use the **debug cable l2-vpn** command in privileged EXEC mode. To stop the display of debugging messages, use the **no** form of this command.

**debug cable l2-vpn [conditional]**

**no debug cable l2-vpn [conditional]**

## Note

This command is not supported for the Cisco uBR10012 router, through release 12.3(13a)BC.

## Syntax Description

**conditional** (Optional) Displays the packets that are sent or received for a particular cable modem or cable interface.

**Note** The **conditional** option does not display any output until you have also enabled debugging for a particular interface, using the **debug cable interface** command, or for a particular MAC address, using the **debug cable mac-address** command.

## Command Default

No default behavior or values

## Command Modes

Privileged EXEC

## Command History

| Release     | Modification                                                                                                                                                                                                  |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(11)BC3 | This command was introduced for Cisco uBR7100 series and Cisco uBR7246VXR universal broadband routers to debug the Layer 2 mapping of cable modems to a PVC on an Asynchronous Transfer Mode (ATM) interface. |
| 12.2(15)BC2 | Support was added for the debugging of the Layer 2 mapping of cable modems to a virtual local area network (VLAN) on an outbound Ethernet interface.                                                          |

## Usage Guidelines

The **debug cable l2-vpn** command displays status information for the mapping of cable modems to PVCs on an ATM interface (see the **cable vc-map** command) or to a VLAN on an Ethernet, Fast Ethernet, or Gigabit Ethernet interface (see the **cable dot1q-vc-map** command). The debug messages show when a cable modem is mapped to a PVC or VLAN, when the mapping is changed or removed, and when packets are sent and received over the mapping.

The **conditional** option displays information for each packet that is sent and received over an ATM PVC or VLAN mapping. Because this can produce a large volume of debug information, the **conditional** option can be used only when you have also enabled debugging for a particular interface or MAC address, using the **debug cable interface** and **debug cable mac-address** commands, respectively.

**Examples**

The following example shows typical output for the **debug cable l2-vpn** command when a cable modem is mapped to an ATM PVC:

```
Router# debug cable l2-vpn

CMTS L2 VPN debugging is on

Router# configure terminal
Router(config)# cable l2-vpn-service atm-vc
Router(config)# cable vc-map 0007.0e03.69f9 ATM2/0 1/1

6d00h: Associating vc ATM2/0.1 1/1 to CM 0007.0e03.69f9 sid 0x1
6d00h: Writing vc-map info to sid 0x1

Router(config)#
```

The following example shows typical output for the **debug cable l2-vpn** command when a cable modem is mapped to an IEEE 802.1Q VLAN:

```
Router# debug cable l2-vpn

CMTS L2 VPN debugging is on

Router# configure terminal
Router(config)# cable l2-vpn-service dot1q
Router(config)# cable dot1q-vc-map 0007.0e03.69f9 FastEthernet0/0 5
Router(config)#

Set promiscuous mode for FastEthernet0/0
Mapped DS srv flow 13 on Cable5/0 to FastEthernet0/0 VLAN 5
Mapped US srv flow 11 sid 31 on Cable5/0 to FastEthernet0/0 VLAN 5
```

The following example shows typical output for the **debug cable l2-vpn** command when a mapping is deleted:

```
Router# debug cable l2-vpn

CMTS L2 VPN debugging is on

Router# configure terminal
Router(config)# no cable vc-map 0007.0e03.69f9 ATM2/0 1/1

6d00h: Disassociating vc ATM2/0.1 1/1 from CM 0007.0e03.69f9 sid 0x1
6d00h: Erasing vc-map info to sid 0x1

Router(config)#
```

The following example shows typical output for the **conditional** option. This example shows output for traffic to and from one particular cable modem. Each debug message shows the size of the packet, the source and destination MAC addresses, the cable interface and SID being used, and the ATM interface and PVC/PVI being used.

```
Router# debug cable mac-address 000C.0807.06.05
Router# debug cable l2-vpn conditional

CMTS L2 VPN conditional debugging is on

6d00h: Fwd pkt size 74 from 000C.0807.0605 on Cable4/0:0x1 to 0900.2b00.000f on ATM2/0:1/1
6d00h: Fwd pkt size 74 from 000C.0807.0605 on Cable4/0:0x1 to 0900.07ff.ffff on ATM2/0:1/1
6d00h: Fwd pkt size 1028 from 000C.0807.0605 on Cable4/0:0x1 to 0002.4a1d.dc1d on
ATM2/0:1/1
```

```

6d00h: Send pkt size 1020 encsize 6 from 0002.4a1d.dc1d on ATM2/0:1/1 to 000C.0807.0605 on
Cable4/0:0x1
6d00h: Fwd pkt size 74 from 000C.0807.0605 on Cable4/0:0x1 to 0900.07ff.ffff on ATM2/0:1/1

Router#

```

| Related Commands | Command                               | Description                                                                                                                                                                                             |
|------------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>cable dot1q-vc-map</b>             | Maps a cable modem to a particular Virtual Local Area Network (VLAN) on a local outbound Ethernet interface.                                                                                            |
|                  | <b>cable l2-vpn-service atm-vc</b>    | Enables the use of Layer 2 tunnels for the Customer Premises Equipment (CPE) traffic that is behind cable modems, so that individual CPE traffic can be routed to a particular PVC on an ATM interface. |
|                  | <b>cable l2-vpn-service dot1q</b>     | Enables the use of Layer 2 tunnels so that traffic for individual cable modems can be routed over a particular Virtual Local Area Network (VLAN).                                                       |
|                  | <b>cable vc-map</b>                   | Maps a cable modem to a particular PVC on an ATM interface.                                                                                                                                             |
|                  | <b>debug cable interface</b>          | Enables debugging output for a specific cable interface.                                                                                                                                                |
|                  | <b>debug cable mac-address</b>        | Enables debugging output for the cable modems that match the specified hardware (MAC) address or range of addresses.                                                                                    |
|                  | <b>show cable l2-vpn dot1q-vc-map</b> | Displays the mapping of one or all cable modems to IEEE 802.1Q Virtual Local Area Networks (VLANs) on the router's Ethernet interfaces.                                                                 |
|                  | <b>show cable l2-vpn vc-map</b>       | Displays the mapping of one or all cable modems to PVCs on the ATM interfaces.                                                                                                                          |

# debug cable load-balance

To display debugging messages for load-balancing operations on the router, use the **debug cable load-balance** command in privileged EXEC mode. To stop the display of debugging messages, use the **no** form of this command.

- debug cable load-balance [error]**
- no debug cable load-balance [error]**

|                    |              |                                                                                                                                                                    |

| 12.2(15)BC1     | This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.                                                                                                    |         |              |             |                                                                                  |

|                  |                                                                                                                                                                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | The <b>debug cable load-balance</b> command displays debugging output for when cable modems come online those cable interfaces that are part of a load balance group. It also displays debugging messages when cable modems are moved to achieve balanced loads on those cable interfaces. |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Tip

Because this command can produce a large volume of debug information, Cisco recommends that you limit debugging output to a particular interface or MAC address, using the **debug cable interface** and **debug cable mac-address** commands, respectively.

|          |                                                                                                                              |
|----------|------------------------------------------------------------------------------------------------------------------------------|
| Examples | The following example shows typical output for the <b>debug cable load-balance</b> command for a particular cable interface: |
|----------|------------------------------------------------------------------------------------------------------------------------------|

```
Router# debug cable interface c3/0
Router# debug cable load-balance

CMTS load balancing debugging is on

*Feb 13 13:39:21.594 PDT: lb: Removing Modem entry 0050.7318.e615: at target (upstream)

*Feb 13 13:39:50.754 PDT: lb: US request from Cable3/0/U0[0050.7366.1f7b]: target U3

*Feb 13 12:53.010 PDT: lb: Moving Modem 0050.7366.218b from Cable3/0/U0 to U2
```

```
*Feb 13 13:40:03.034 PDT: lb: Moving Modem 0050.7366.1c7f from Cable3/0/U1 to U2
*Feb 13 13:40:04.790 PDT: lb: US request from Cable3/0/U1[0050.7318.e615]: target U2
[enforce], 0 retries
*Feb 13 13:40:11.150 PDT: lb: Removing Modem entry 0050.7318.e615: at target (upstream)
*Feb 13 13:40:23.042 PDT: lb: Moving Modem 0050.7366.21c7 from Cable3/0/U0 to U3
*Feb 13 13:40:23.042 PDT: lb: Moving Modem 0050.7366.2197 from Cable3/0/U0 to U3
*Feb 13 13:40:23.042 PDT: lb: Moving Modem 0050.7366.1f75 from Cable3/0/U0 to U3
```

Router#

The following example shows typical output for the **debug cable load-balance** command when the **error** option is used to display messages about possible errors in the number of CMs that are active on the interface.

```
Router# debug cable interface c5/1/0
Router# debug cable load-balance error
```

Router#

CMTS load balancing error debugging is on

```
lb: c5/1/0/U4: Total modems: 126 active modems: 123
c5/1/0: delete_sid_state on modem 0001.0203.0405 in state offline
```

## Related Commands

| Command                                                   | Description                                                                                                                           |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable load-balance exclude</b>                         | Excludes a particular cable modem, or all cable modems from a particular vendor, from one or more types of load-balancing operations. |
| <b>cable load-balance group (global configuration)</b>    | Creates and configures a load-balance group.                                                                                          |
| <b>cable load-balance group (interface configuration)</b> | Assigns a downstream to a load-balance group.                                                                                         |
| <b>cable load-balance group interval</b>                  | Configures the frequency of the load-balancing policy updates.                                                                        |
| <b>cable load-balance group policy ugs</b>                | Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (USG) service flows.             |
| <b>cable load-balance group threshold</b>                 | Configures the threshold values that a load-balance group should use for load-balancing operations.                                   |
| <b>cable upstream load-balance group</b>                  | Assigns an upstream to a load-balance group.                                                                                          |
| <b>clear cable load-balance</b>                           | Clears the counters or state machine used to track load-balancing operations.                                                         |
| <b>debug cable interface</b>                              | Enables debugging output for a specific cable interface.                                                                              |
| <b>debug cable l2-vpn</b>                                 | Displays debugging messages for load-balancing operations on the router.                                                              |
| <b>debug cable mac-address</b>                            | Enables debugging output for the cable modems that match the specified hardware (MAC) address or range of addresses.                  |
| <b>show cable load-balance</b>                            | Displays real-time statistical and operational information for load-balancing operations.                                             |

# debug cable mac-address

To display debug information for a specific CM, use the **debug cable mac** command in privileged EXEC mode. The **no** form of this command disables debugging output.

```
debug cable mac-address address [address-mask] [verbose]

no debug cable mac-address address [address-mask] [verbose]
```

Syntax Description

|                     |                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>address</i>      | Specifies the particular MAC address to debug.                                                                                                                                                            |
| <i>address-mask</i> | Specifies an address mask to indicate a range of addresses to debug. This mask is bit-ANDed with the given address, and debug messages are displayed for any CM that matches the resulting non-zero bits. |
| <b>verbose</b>      | Specifies detailed output for the particular MAC address.                                                                                                                                                 |

Command Modes

Privileged EXEC

Command History

| Release | Modification                 |
|---------|------------------------------|
| 12.1 T  | This command was introduced. |

Usage Guidelines

You can repeat this command for other MAC addresses. Each time you specify a different MAC address, debugging is turned on for that particular MAC address.

If you enter two commands with the same MAC address, but with different values for the *mask* or **verbose** keywords, the router treats both commands as the same. In this case, the latest debugging information supersedes the previous debugging information.

Note

Do not use this command if you have a large number of CMs on your network. The Cisco CMTS will become flooded with console printouts.

Examples

The following example demonstrates how to enable debugging for all traffic coming from cable interface 3/0 of CMs with the MAC address 00E0.1Exx.xxxx:

```
Router# debug cable interface c3/0
Router# debug cable mac-address 00E0.1E00.0000 ffff.ff00.0000
Router#
004042: Jul 2 08:47:13.656: Ranging Modem 00E0.1E23.4567, SID 73 on Interface Cable3/U0
004043: Jul 2 08:47:13.656: Ranging request from 00E0.1E23.4567, SID 73 [73] on Interface
Cable3/U0
004044: Jul 2 08:47:13.656: Timing error 0, power error 0.25dB, freq error 4 (adjust 0)
004045: Jul 2 08:47:13.656: Ranging successful
```

Tip

To monitor a specific CM when it comes online, use the **debug cable mac-address**, **debug cable mac-protocol**, and **debug cable registration** commands.

**Table 0-271** *debug cable mac Command Field Descriptions*

| Field                       | Description                                                                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID value is....            | Reports the service ID of the modem. The range is from 1 through 891. The information on this line should agree with the first line of the return (that is, Ranging Modem with Sid...).                                                       |
| CM mac address....          | The MAC address of the specified CM.                                                                                                                                                                                                          |
| Timing offset is....        | The time by which to offset the frame transmission upstream so that the frame arrives at the expected minislot time at the CMTS.                                                                                                              |
| Power value is FE0, or 0 dB | The raw value derived from the 3137 Broadcom chip. Alternatively, the dB value specifies the relative change in the transmission power level that the CM needs to make sure that transmissions arrive at the CMTS at the desired power level. |
| Freq Error = ....           | The raw value derived from the 3137 Broadcom chip.                                                                                                                                                                                            |
| Freq offset is ....         | Specifies the relative change in the transmission frequency that the CM will make to match the CMTS.                                                                                                                                          |

|----------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>debug cable dynsrv</b>        | Displays debugging information about DOCSIS 1.1 dynamic service flow messages.                            |
| <b>debug cable interface</b>     | Enables debugging output for a specific cable interface.                                                  |
| <b>debug cable mac-protocol</b>  | Displays debugging output for the MAC layer protocol.                                                     |
| <b>debug cable mac-scheduler</b> | Displays debugging output for the MAC layer scheduler and admission control activities.                   |
| <b>debug cable registration</b>  | Displays debugging output for the registration messages sent when a CM comes online with the CMTS.        |
| <b>debug cable tlvs</b>          | Enables debugging for the Type/Length/Value encodings (TLVs) parsed by the DOCSIS 1.1 TLV parser/encoder. |
| <b>show controllers cable</b>    | Displays interface controller information for the specified slot.                                         |

# debug cable mac-protocol

To display MAC-layer information for a specific CM, use the **debug cable mac** command in privileged EXEC mode. The **no** form of this command disables debugging output.

**debug cable mac-protocol**  
**no debug cable mac-protocol**

**Syntax Description**    This command has no arguments or keywords.

**Command Modes**    Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 12.1 T  | This command was introduced. |

**Usage Guidelines**    Do not use this command if you have a large number of CMs on your network. The Cisco CMTS will become flooded with console printouts.

**Examples**    The following example shows the return for the MAC layer:

```
router# debug cable mac-protocol

CMTS mac debugging is on
19:46:27: Ranging Modem with Sid 1 on i/f : Cable6/0/U0

19:46:27: Got a ranging request
19:46:27: SID value is 1 on Interface Cable6/0/U0
19:46:27: CM mac address 00:E0:1E:B2:BB:07
19:46:27: Timing offset is 0
19:46:27: Power value is FE0, or 0 dB
19:46:27: Freq Error = 0, Freq offset is 0
19:46:27: Ranging has been successful for SID 1 on Interface Cable6/0/U0

19:46:29: Ranging Modem with Sid 2 on i/f : Cable6/0/U0
19:46:29: Got a ranging request
19:46:29: SID value is 2 on Interface Cable6/0/U0
19:46:29: CM mac address 00:E0:1E:B2:BB:8F
19:46:29: Timing offset is 1
19:46:29: Power value is 1350, or 0 dB
19:46:29: Freq Error = 0, Freq offset is 0
19:46:29: Ranging has been successful for SID 2 on Interface Cable6/0/U0

19:46:32: Ranging Modem with Sid 3 on i/f : Cable6/0/U0

19:46:32: Got a ranging request
19:46:32: SID value is 3 on Interface Cable6/0/U0
19:46:32: CM mac address 00:E0:1E:B2:BB:B1
19:46:32: Timing offset is FFFFFFFF
19:46:32: Power value is 1890, or -1 dB
```

```

19:46:32: Freq Error = 0, Freq offset is 0
19:46:32: Ranging has been successful for SID 3 on Interface Cable6/0/U0

19:46:34: Ranging Modem with Sid 5 on i/f : Cable6/0/U0

```

**Tip**

To monitor a specific CM when it comes online, use the **debug cable mac-address**, **debug cable mac-protocol**, and **debug cable registration** commands.

**Table 0-272**     *debug cable mac-protocol Command Field Descriptions*

| Field                       | Description                                                                                                                                                                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID value is....            | Reports the service ID of the modem. The range is from 1 through 8191. The information on this line should agree with the first line of the return (that is, Ranging Modem with Sid...).                                             |
| CM mac address....          | The MAC address of the specified CM.                                                                                                                                                                                                 |
| Timing offset is....        | The time by which to offset the frame transmission upstream so that the frame arrives at the expected minislot time at the CMTS.                                                                                                     |
| Power value is FE0, or 0 dB | The raw value derived from the Broadcom chip. Alternately, the dB value specifies the relative change in the transmission power level that the CM needs to make so that transmissions arrive at the CMTS at the desired power level. |
| Freq Error = ....           | The raw value derived from the Broadcom chip.                                                                                                                                                                                        |
| Freq offset is ....         | Specifies the relative change in the transmission frequency that the CM will make to match the CMTS.                                                                                                                                 |

#### Related Commands

| Command                          | Description                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------|
| <b>debug cable interface</b>     | Enables debugging output for a specific cable interface.                                           |
| <b>debug cable mac-address</b>   | Displays debugging output for the CMs that match the specified address or range of addresses.      |
| <b>debug cable mac-scheduler</b> | Displays debugging output for the MAC layer scheduler and admission control activities.            |
| <b>debug cable registration</b>  | Displays debugging output for the registration messages sent when a CM comes online with the CMTS. |
| <b>show controllers cable</b>    | Displays interface controller information for the specified slot.                                  |

# debug cable mac-scheduler

To display information for the MAC layer’s scheduler and admission control activities, use the **debug cable mac-scheduler** command in privileged EXEC mode. The **no** form of this command disables debugging output.

```
debug cable mac-scheduler [admission control | upstream-utilization | ubg]

no debug cable mac-scheduler [admission control | upstream-utilization | ubg]
```

Syntax Description

|                      |                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admission-control    | (Optional) Displays debugging output for the MAC scheduler’s admission control activities, which controls the percentage of overbooking allowed on the upstream channel. |
| upstream-utilization | (Optional) Displays debugging output for upstream utilization.                                                                                                           |
| ubg                  | (Optional) Displays debugging output for all upstream bonding groups.                                                                                                    |

Command Modes

Privileged EXEC

Command History

| Release     | Modification                                                                            |
|-------------|-----------------------------------------------------------------------------------------|
| 12.1(4)CX   | This command was introduced for the Cisco uBR10012 router.                              |
| 12.2(4)BC1  | Support for this command was added to the Release 12.2 BC train.                        |
| 12.2(33)SCC | A new keyword, <b>ubg</b> , was added to this command in Cisco IOS Release 12.2(33)SCC. |

Usage Guidelines

Do not use this command if you have a large number of CMs on your network. The Cisco CMTS will become flooded with console printouts.

Caution

The debug commands are primarily intended for use in controlled test and troubleshooting situations with a limited volume of traffic. In particular, avoid using the **debug cable mac-scheduler** command on an interface with a significant number of CMs, because the resulting volume of debug output could impact system performance. Cisco recommends that when you use the **debug cable mac-scheduler** command, you limit its output to a particular interface or CM, using the **debug cable mac-address** or **debug cable interface** commands.

Examples

The following example shows debugging being turned on for the MAC scheduler:

```
Router# debug cable mac-scheduler
CMTS scheduler debugging is on

Router#
```

The following example shows admission-control debugging being turned on for a particular CM with the MAC address of 000C.1234.5678, and the typical messages that appear if the CM cannot register because the channel is oversubscribed.

```

Router# debug cable mac-address 000C.1234.5678 verbose
Router# debug cable mac-scheduler admission-control
CMTS scheduler debugging is on

Router#

Oct 23 09:38:56.701: MSCHED_CAC: Admit req for US service flow.
Oct 23 09:38:56.701: SFID=3 SID=1 AdmQoS=5
Oct 23 09:38:56.701: Admission check for BE service
Oct 23 09:38:56.701: Min rsvd rate : 1800000 bps
Oct 23 09:38:56.701: Failed to allocate bandwidth
Oct 23 09:38:56.701: Admit req rejected.

```

The following example shows the debugging output for upstream bonding groups on a particular CM with the MAC address of 001e.6bfb.153c:

```

Router# debug cable mac-address 001e.6bfb.153c verbose
Router# debug cable mac-scheduler ubg

CMTS mac-scheduler ubg debugging is on

# debug cable map

To display debugging messages for DOCSIS MAC-layer MAP messages, use the **debug cable map** command in privileged EXEC mode. The **no** form of this command disables debugging output.

**debug cable map** [**error** | **sid** [*sid-num*] ]

**no debug cable map** [**error** | **sid** [*sid-num*] ]

Syntax Description

|                               |                                                                                                                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>error</b>                  | Displays debugging messages about DOCSIS MAP messages that were received with errors.                                                                                                                                             |
| <b>sid</b> [ <i>sid-num</i> ] | Specifies the specific service ID (SID) to be debugged in DOCSIS MAP messages. The valid range for the optional <i>sid-num</i> value is 1 to 8191. If <i>sid-num</i> is not specified, debugging messages are shown for all SIDs. |

# debug cable metering

To enable debugging of usage-based billing operations, use the **debug cable metering** command in privileged EXEC mode. To turn off debugging messages, use the **no** form of this command.

- debug cable metering**
- no debug cable metering**

**Syntax Description**    This command has no arguments or keywords.

**Command Modes**    Privileged EXEC

| Command History | Release    | Modification                 |
|-----------------|------------|------------------------------|
|                 | 12.3(9a)BC | This command was introduced. |

**Examples**    The following example shows how to enable debugging for usage-based billing on the Cisco CMTS, and then shows examples of the debugging messages that can be displayed.

```
Router# debug cable metering
CMTS metering debug is ON

Router#

Cannot get Metering CMTS IP/MAC Addresses.

|                 | 12.2(33)SCE    | This command was introduced. |

**Usage Guidelines**

When enabled, this debug command does not provide any debugging output for counter values. When you use this command to reset debug counters associated with a multicast group IP address or MAC address, the command does not return any debugging messages. You will have to use the **show cable multicast debug** command to verify the debug counters.

**Examples**

The following is a sample output of the **debug cable multicast counter clear** command with the keyword **all**:

```
Router# debug cable multicast counter clear all
```

All multicast debug counters cleared.

|                  |                                            |                                                                                                                          |

|                         | <b>debug cable multicast counter clear</b> | Resets debugging of multicast counters.                          |
|                         | <b>debug cable multicast counter stop</b>  | The Cisco CMTS router stops collecting multicast debug counters. |
|                         | <b>show cable multicast debug</b>          | Displays information about debug counters.                       |

# debug cable multicast counter stop

To stop the Cisco CMTS router from collecting multicast debug counters, use the **debug cable multicast counter stop** command in privileged EXEC mode.

**debug cable multicast counter stop**

**Syntax Description**    This command has no arguments or keywords.

**Command Default**    None

**Command Modes**    Privileged EXEC(#)

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCE | This command was introduced. |

**Usage Guidelines**    When enabled, this debug command does not provide any debugging output or messages. You must use the **show cable multicast debug** command to verify the debug counters.

**Examples**    The following is a sample output of the **debug cable multicast counter stop** command on the Cisco uBR10012 router:

```
Router# debug cable multicast counter stop
```

|                  | debug cable multicast counter clear | Resets debugging of multicast counters.                                                                                  |
|                  | debug cable multicast counter start | The Cisco CMTS router starts collecting multicast debug counters based on a particular multicast group or a cable modem. |
|                  | show cable multicast debug          | Displays information about debug counters.                                                                               |

# debug cable multicast forwarding

To display debugging messages about downstream forwarding interfaces for cable modems that are wideband online (w-online) and multicast quality of service (MQoS) enabled, use the **debug cable multicast forwarding** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug cable multicast forwarding [verbose]**

**no debug cable multicast forwarding**

# debug cable phs

To display the activities of the payload header suppression and restoration (PHS) driver, use the **debug cable phs** command in privileged EXEC mode. The **no** form of this command disables debugging output.

**debug cable phs**

**no debug cable phs**

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC

| Command History | Release    | Modification                                    |
|-----------------|------------|-------------------------------------------------|
|                 | 12.1(4)CX  | This command was introduced.                    |
|                 | 12.2(4)BC1 | Support was added to the Release 12.2 BC train. |

Usage Guidelines

Do not use this command when you have a large number of active CMs on your network, because it could generate a huge amount of output to the console port.

This command displays the output for both the upstream and downstream drivers. The upstream receive driver restores headers that have been suppressed by CMs, and the downstream driver suppresses specific fields in packet header before forwarding a frame to the CM.

Examples

The following example shows typical output from PHS debugging:

```
Router# debug cable phs
CMTS payload header suppression debugging is on

00:02:55: New PHS rule: 1 (SFID: 9)
 size : 34
 mask : 00 00 00 03 FC 00 00 00 field: 00 00 00 00 00 00 00 00
Add PHS rule 1 to CFR ID 1

00:02:57: New PHS rule: 1 (SFID: 11)
 size : 34
 mask : 00 00 00 03 FC 00 00 00 field: 00 00 00 00 00 00 00 00
Add PHS rule 1 to CFR ID 1
Router#
```

# debug cable phy

To activate debugging of messages generated in the cable physical layer, use the **debug cable phy** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cable phy**

**no debug cable phy**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |

|                         |                                                                                                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command activates debugging of messages generated in the PHY system, which is the physical layer where upstream and downstream activity between the Cisco CMTS and the HFC network is controlled. When this command is activated, any messages generated in the PHY system are displayed on the Cisco CMTS console. |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                          |
|-----------------|--------------------------------------------------------------------------|
| <b>Examples</b> | The following is typical output from the <b>debug cable phy</b> command. |
|-----------------|--------------------------------------------------------------------------|

```
cmts_phy_init: mac_version == BCM3210_FPGA
bcm3033_set_tx_sym_rate(5056941)
stintctl = 0x54484800
bcm3033_set_tx_if_freq(44000000)
stfreqctl = 0x5BAAAAAA
cmts_phy_init_us: U0 part_id = 0x3136, rev_id = 0x05, rev_id2 = 0x64
cmts_phy_init: mac_version == BCM3210_FPGA
Media access controller chip version.
bcm3033_set_tx_sym_rate(5056941)
stintctl = 0x54484800
Physical layer symbol rate register value.
00:51:49: bcm3033_set_tx_if_freq(44000000)
00:51:49: stfreqctl = 0x5BAAAAAA
Physical layer intermediate frequency (IF) register value.
00:51:49: cmts_phy_init_us: U0 part_id = 0x3136, rev_id = 0x05, rev_id2 = 0x64
Physical layer receiver chip part version.
```

# debug cable privacy

To activate debugging of baseline privacy, use the **debug cable privacy** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

- debug cable privacy**
- no debug cable privacy**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 11.3 XA | This command was introduced. |

**Usage Guidelines** This command activates debugging of the Baseline Privacy Interface (BPI) feature. When this command is activated, the BPI handler generates a debugging message whenever the BPI state changes or a BPI-related event occurs.

Tip

Debugging must be enabled for one or more cable interfaces, using the **debug cable interface** command, before the **debug cable privacy** command displays any output. BPI debugging can be done only on a per-interface basis, not on the basis of a CM’s MAC address.

Note

This command is supported only on images that support BPI or BPI+ encryption.

**Examples** The following is typical output from the **debug cable privacy** command:

```
02:32:08: CMTS Received AUTH REQ.
02:32:08: Created a new CM key for 0030.96f9.65d9.

```

## Related Commands

| Command                      | Description                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------|
| <b>debug cable bpiatp</b>    | Displays debugging information about the BPI-related messages that the CMTS sends or receives. |
| <b>debug cable interface</b> | Enables debugging output for a specific cable interface.                                       |
| <b>debug cable keyman</b>    | Displays debugging information about BPI key management.                                       |

# debug cable qos

To activate quality-of-service (QoS) debugging, use the **debug cable qos** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug cable qos

no debug cable qos
```

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 11.3NA  | This command was introduced. |

Usage Guidelines

This command activates debugging of QoS. When this command is activated, any messages related to QoS parameters are displayed on the Cisco CMTS console.

Examples

The following is typical output from the **debug cable qos** command:

CMTS\_QOS\_LOG\_NO\_MORE\_QOS\_INDEX
Modems cannot add more entries to the class of service table.
CMTS\_QOS\_LOG\_NOMORE\_QOSPRF\_MEM
Memory allocation error when creating class of service table entry.
CMTS\_QOS\_LOG\_NO\_CREATION\_ALLOWED
Class of service entry cannot be created by modem. Use CLI or SNMP
interface instead of the modem's TFTP configuration file.
CMTS\_QOS\_LOG\_CANNOT\_REGISTER\_COS\_SID
A service identifier (SID) could not be assigned to the registering modem.
CMTS\_QOS\_LOG\_CANNOT\_DEREGISTER\_COS\_SID
The modem's service identifier (SID) was already removed.
CMTS\_QOS\_LOG\_MSLLOT\_TIMEBASE\_WRAPPED
The 160 KHz timebase clock drives a 26-bit counter which wraps around
approximately every 7 minutes. This message is generated every time it
wraps around.

# debug cable range

To display ranging messages from CMs on the HFC network, use the **debug cable range** command in privileged EXEC mode. To disable debugging output, the **no** form of the command.

**debug cable range**

**no debug cable range**

|                           |                                            |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command activates debugging of ranging messages from CMs on the HFC network. When this command is activated, any ranging messages generated when CMs request or change their upstream frequencies are displayed on the Cisco CMTS console. Use this command to display the details of the initial and station maintenance procedures. The initial maintenance procedure is used for link establishment. The station maintenance procedure is used for link keepalive monitoring. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                               |
|-----------------|-------------------------------------------------------------------------------|
| <b>Examples</b> | The following shows typical output from the <b>debug cable range</b> command. |
|-----------------|-------------------------------------------------------------------------------|

```
Got a ranging request
SID value is 0 on Interface Cable3/0/U0
CM mac address 00:10:7B:43:AA:21 Timing offset is 3312
3E 1E 3F FF 00 00 59 BF 01 15 F8 01 A7 00 0C F0
```

The following output shows typical output when a CM first seeks to establish a link to the Cisco CMTS. The service identifier (SID) value of 0 indicates that the modem has no assigned SID. The CM mac address is the MAC address of the modem's radio frequency (RF) interface, not its Ethernet interface. The Timing offset is a measure of the distance between the modem and the Cisco CMTS, expressed in 10.24 MHz clocks. This value is adjusted down to zero by the maintenance procedures. The first 16 bytes of the prepended header of the message are dumped in hexadecimal.

```
CM mac address 0010.7b43.aa21
found..Assigned SID #2 on Interface Cable3/0/U0
Timing offset is CF0
Power value is 15F8, or -1 dB
Freq Error = 423, Freq offset is 1692
Ranging Modem with Sid 2 on i/f : Cable3/0/U0
```

The following is typical output when the CM is first assigned a SID during initial maintenance:

```
Initial Range Message Received on Interface Cable3/0/U0
CMTS reusing old sid : 2 for modem : 0010.7b43.aa21
Timing offset is CF0
Power value is 15F8, or -1 dB
```

```
Freq Error = 423, Freq offset is 1692
Ranging Modem with Sid 2 on i/f : Cable3/0/U0
```

The following is typical output when the modem is reassigned the same SID during initial maintenance.

```
Ranging Modem with Sid 2 on i/f : Cable3/0/U0
```

```
Got a ranging request
SID value is 2 on Interface Cable3/0/U0
CM mac address 00:10:7B:43:AA:21
Timing offset is 0
Power value is 1823, or -1 dB
Freq Error = 13, Freq offset is 0
Ranging has been successful for SID 2 on Interface Cable3/0/U0
```

Output occurs when the modem is polled by the CMTS during station maintenance. Polling happens at a minimum rate of once every 10 seconds.

# debug cable receive

To display debug messages for messages received on the upstream from a CM, use the **debug cable receive** command in privileged EXEC mode. To stop displaying debug messages, use the **no** form of this command.

**debug cable receive**

**no debug cable receive**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC

## Command History

| Release              | Modification                 |
|----------------------|------------------------------|
| 12.0(7)XR            | This command was introduced. |
| 12.1(1)T, 12.1(2)EC1 | This command was disabled.   |
| 12.1(11b)EC          | This command was removed.    |

## Examples

The following command enables debugging of upstream messages:

```
router# debug cable receive
CMTS debug Rx debugging is on
```

The **debug cable receive** command was disabled in Cisco IOS Release 12.1 T, 12.1 EC, and later releases, although it still appears in the CLI until Cisco IOS Release 12.1(11b)EC. To monitor the packets received from the CMs, use the **debug ip packet** command instead.

Because the **debug ip packet** command produces a large volume of messages, you must use it together with an access list to restrict the messages to a particular CM or CPE device to avoid affecting system performance. For example, the following commands would set up an access list that monitors all traffic being sent between the hosts with the two specified IP addresses:

```
router# configure terminal
router(config)# access-list 150 permit ip host ip-address-1 host ip-address-2
router(config)# access-list 150 permit ip host ip-address-2 host ip-address-1
router(config)# exit
router# debug ip packet 150 detail
```

## Related Commands

| Command                     | Description                                                             |
|-----------------------------|-------------------------------------------------------------------------|
| <b>debug cable transmit</b> | Enables debugging for transmitted packets.                              |
| <b>debug ip packet</b>      | Enables debugging of IP packets received and transmitted by the router. |

# debug cable registration

To display debug messages for the CM registration process, use the **debug cable registration** command in privileged EXEC mode. To stop displaying debug messages, use the **no** form of this command.

**debug cable registration**

**no debug cable registration**

**Syntax Description**    This command has no arguments or keywords.

**Command Modes**    Privileged EXEC

| Command History | Release   | Modification                 |
|-----------------|-----------|------------------------------|
|                 | 12.0(7)XR | This command was introduced. |

**Usage Guidelines**    The **debug cable registration** command displays messages about the registration request and response messages sent and received by the CMTS when a CM initiates the DOCSIS registration process. To see the relevant messages, you must also enable debugging for a particular interface or CM using the **debug cable interface** or **debug cable mac-address** commands.

**Examples**    The following shows typical debugging output from a registration process:

```
router# debug cable interface c3/0 verbose
router# debug cable registration
CMTS registration debugging is on

```

The following example shows what can occasionally occur when a shared secret has been implemented. Some CMs calculate the MD5 Message Integrity Check (MIC) over the length of the registration TLV parameters as well as the length of the shared secret itself, while other CMS calculate the MIC value only over the length of the registration TLV parameters. The Cisco CMTS attempts to verify the MIC and shared secret values using the first technique, and if that fails, the CMTS then uses the second technique to verify the CM.

```

```

Tip

To monitor a specific CM when it comes online, use the **debug cable mac-address**, **debug cable mac-protocol**, and **debug cable registration** commands.

```

# debug cable rfmib

To display debugging messages about when the DOCSIS-IF-MIB MIB is updated, use the **debug cable rfmib** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable rfmib**

**no debug cable rfmib**

**Syntax Description**    This command has no arguments or keywords.

**Command Modes**    Privileged EXEC

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(15)BC1 | This command was introduced. |

**Usage Guidelines**    This command displays debugging messages when the counters in the DOCSIS-IF-MIB are updated.

**Note**

For more information about the information displayed by this command, see [RFC 2670](#) and the DOCS-IF-MIB MIB at the following URL:

<http://www.cisco.com/go/mibs>

**Examples**    The following shows typical output from the **debug cable rfmib** command:

```
Router# debug cable rfmib
CMTS RFMIB debugging is on
Router#

CMTS is calculating utilization.

Calculating all utilization data.

Polling and calculating all channels utilization data.

Polling and calculating all channels utilization data.

# debug cable service-ds-selection

To enable the debugging for downstream selection, use the **debug cable service** command in privileged EXEC mode. To disable debugging for downstream-selection, use the **no** form of the command.

```
debug cable service-ds-selection {event|timer}

no debug cable service {event|timer}
```

| Syntax Description | event | Enables debug messages for Cable downstream selection events. |
|--------------------|-------|---------------------------------------------------------------|
|                    | timer | Enables debug messages for Cable downstream selection timer.  |

| Command Default | No debug messages for downstream selection are enabled. |
|-----------------|---------------------------------------------------------|
|-----------------|---------------------------------------------------------|

| Command Modes | Privileged EXEC |
|---------------|-----------------|
|---------------|-----------------|

| Command History | Release    | Modification                                               |
|-----------------|------------|------------------------------------------------------------|
|                 | 12.3(23)BC | This command was introduced for the Cisco uBR10012 router. |

| Usage Guidelines | The <b>debug cable service</b> command is intended for use by Cisco Systems technical support personnel. |
|------------------|----------------------------------------------------------------------------------------------------------|
|------------------|----------------------------------------------------------------------------------------------------------|

| Examples | <p>The following example shows how to enable debugging for downstream selection events:</p> <pre>Router debug cable service-ds-selection event</pre> |

|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|

| Related Commands | Command          | Description                                                                                             |
|------------------|------------------|---------------------------------------------------------------------------------------------------------|
|                  | test cable voice | Manually set voice tag of a cable modem to test downstream channel selection for a voice-enabled modem. |

# debug cable specmgmt

To debug spectrum management (frequency agility) on the HFC network, use the **debug cable specmgmt** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable specmgmt**

**no debug cable specmgmt**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release   | Modification                                                                         |
|-----------------|-----------|--------------------------------------------------------------------------------------|
|                 | 11.3NA    | This command was introduced.                                                         |
|                 | 12.0(4)XI | This command was removed and replaced by the <b>debug cable hw-spectrum</b> command. |

**Usage Guidelines** This command activates debugging of spectrum management (frequency agility) on the HFC network. When this command is activated, any messages generated due to spectrum group activity will be displayed on the Cisco CMTS console. Spectrum group activity can be additions or changes to spectrum groups, or frequency and power level changes controlled by spectrum groups.

**Examples** The following shows sample output from the **debug cable specmgmt** command:

```
Router# debug cable specmgmt
CMTS specmgmt debugging is on
Router#
reassign-blind: U0 not present or shutdown
```

# debug cable startalloc

To debug channel allocations on the HFC network, use the **debug cable startalloc** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

- debug cable startalloc**
- no debug cable startalloc**

**Syntax Description**    This command has no arguments or keywords.

**Command Modes**    Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 11.3NA  | This command was introduced. |

**Usage Guidelines**    This command activates debugging of the channel allocations on the HFC network. When this command is activated, any messages generated when channels are allocated to CMs on the HFC network are displayed on the Cisco CMTS console.

  
**Caution**

This command should be used for development testing only, not in production setting.

**Examples**    The following shows sample output from the **debug cable startalloc** command:

```
Router# debug cable startalloc
Router#
00:53:27: Cable3/U0 MAP startalloc adjusted by 1 mslots
00:53:27: Cable4/U0 MAP startalloc adjusted by 3 mslots
00:53:27: Cable3/U0 MAP startalloc adjusted by 5 mslots
00:53:27: Cable4/U0 MAP startalloc adjusted by 4 mslots
00:53:28: Cable3/U0 MAP startalloc adjusted by 4 mslots
00:53:28: Cable4/U0 MAP startalloc adjusted by 5 mslots
```

# debug cable subscriber-monitoring

To display enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers, use the **debug cable subscriber-monitoring** command in privileged EXEC mode. To stop the display of debug messages, use the **no** form of this command.

**debug cable subscriber-monitoring**

**no debug cable subscriber-monitoring**

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values

**Command Modes** Privileged EXEC (#)

| Command History | Release     | Modification                                                    |
|-----------------|-------------|-----------------------------------------------------------------|
|                 | 12.2(15)BC1 | This command was introduced.                                    |
|                 | 12.3(9a)BC  | This command was integrated into Cisco IOS Release 12.3(9a)BC.  |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. |
|                 |             | Support for the Cisco uBR7225VXR router was added.              |

**Usage Guidelines** Because this command can produce a large volume of debug information, use this command only when you have also enabled debugging for a particular interface or MAC address, using the **debug cable interface** and **debug cable mac-address** commands, respectively.

**Examples** The following example shows how to enable debugging output using the **debug cable subscriber-monitoring** command:

```
Router# debug cable subscriber-monitoring

subscriber monitoring debugging is on

cmts_enf_map_sm_to_qos: enforced=9, penalty_life_time=10080
cmts_enf_map_sm_to_qos: Found rule #=9, rule_name=name, dir=US
cmts_enf_map_sm_to_registered_qos1: us smp=0x00, ds smp=0x1F
```

| Related Commands | Command                       | Description                                                                                                                               |
|------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>cable qos enforce-rule</b> | Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode. |
|                  | <b>debug cable interface</b>  | Enables debugging output for a specific cable interface.                                                                                  |

| Command                                | Description                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>debug cable<br/>mac-address</b>     | Enables debugging output for the cable modems that match the specified hardware MAC address or range of addresses. |
| <b>show cable qos<br/>enforce-rule</b> | Displays the QoS enforce-rules that are currently defined.                                                         |

# debug cable telco-return

To display debug messages for telco-return events, use the **debug cable telco-return** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable telco-return**

**no debug cable telco-return**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release   | Modification                 |
|-----------------|-----------|------------------------------|
|                 | 12.0(4)XI | This command was introduced. |

**Usage Guidelines** This command is supported only in images that support telco-return operation (-t-).

**Examples** The following is sample output from the **debug cable telco-return** and **debug cable telco-return msg** commands:

```
Router# debug cable telco-return
Router# debug cable telco-return msg
01:17:31:Sending TCD message:

# debug cable tlvs

To display the Type/Length/Value encodings (TLVs) parsed by the DOCSIS 1.1 TLV parser/encoder, use the **debug cable tlvs** command in privileged EXEC mode. The **no** form of this command disables debugging output.

**debug cable tlvs**

**no debug cable tlvs**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                                                                                           |
|-----------------|-------------|--------------------------------------------------------------------------------------------------------|
|                 | 12.1(4)CX   | This command was introduced.                                                                           |
|                 | 12.2(4)BC1  | This command was supported on the Cisco uBR7100 series and Cisco uBR10012 universal broadband routers. |
|                 | 12.2(33)SCC | This command was integrated into Cisco IOS Release 12.2(33)SCC.                                        |

**Usage Guidelines** This command displays the TLVs for service flow encodings, classifier encodings, and PHS rules. Do not use this command when you have a large number of active CMs on your network because it could generate a huge amount of output to the console port.

**Examples** The following example shows typical output for the **debug cable tlvs** command:

```
Router# debug cable tlvs
CMTS TLV encodings debugging is on

|-----------------|-------------|------------------------------------------------------------------|
|                 | 11.3 NA     | This command was introduced.                                     |
|                 | 12.2(11)BC2 | Support for this command was added to the Release 12.2 BC train. |

|                         |                                                                                                                                                                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command displays information about the operation of the ToD server that is onboard the Cisco CMTS. Before this command will display any output, you must also use the <b>debug cable interface</b> command to enable debugging operations on each interface that has CMs you wish to monitor. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                    |
|-----------------|------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows typical output for the <b>debug cable tod</b> command: |
|-----------------|------------------------------------------------------------------------------------|

```
Router# debug cable interface c3/0
Router# debug cable tod
TOD server debugging is on
Router#
```

```
000104: Jun 8 05:48:08.783: tod: Received request from 10.1.1.27 (0001.9659.4411) on
Cable3/0
000105: Jun 8 05:48:15.015: tod: Received request from 10.1.1.32 (0030.96f9.65d9) on
Cable3/0
000106: Jun 8 05:48:16.363: tod: Received request from 10.3.3.10 (0001.9659.43fd) on
Cable3/0
000107: Jun 8 05:48:17.335: tod: Received request from 10.2.2.43 (0002.fdfa.0a35) on
Cable3/0
```

For telco-return CMs, the ToD server verifies that the IP address for the CM making the ToD request is on the correct cable interface, so as to prevent IP spoofing. If the IP address and interface do not match, the following message is printed:

```
000104: Jun 8 05:48:08.783: tod: Cant match output i/f for telco return
```

|                  |                                |                                                                |
|------------------|--------------------------------|----------------------------------------------------------------|
| Related Commands | <b>debug cable interface</b>   | Enables debugging on a specific cable interface.               |
|                  | <b>debug cable mac-address</b> | Enables debugging for MAC-layer information for a specific CM. |

# debug cable transmit

To display debug messages for messages that the CMTS transmits on the cable interface, use the **debug cable transmit** command in privileged EXEC mode. To stop displaying debug messages, use the **no** form of this command.

- debug cable transmit**
- no debug cable transmit**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release              | Modification                 |
|-----------------|----------------------|------------------------------|
|                 | 12.0(7)XR            | This command was introduced. |
|                 | 12.1(1)T, 12.1(2)EC1 | This command was disabled.   |
|                 | 12.1(11b)EC          | This command was removed.    |

**Examples** The following command enables debugging of messages that the CMTS transmits on the cable interface:

```
Router# debug cable transmit
CMTS debug transmit debugging is on
Router#
```

The **debug cable transmit** command was disabled in Cisco IOS Release 12.1 T, 12.1 EC, and later releases, although it still appears in the CLI until Cisco IOS Release 12.1(11b)EC. To monitor the packets transmitted by the CMs, use the **debug ip packet** command instead.

Because the **debug ip packet** command produces a large volume of messages, you must use it together with an access list to restrict the messages to a particular CM or CPE device to avoid affecting system performance. For example, the following commands would set up an access list that monitors all traffic being sent between the hosts with the two specified IP addresses:

```
router# configure terminal
router(config)# access-list 150 permit ip host ip-address-1 host ip-address-2
router(config)# access-list 150 permit ip host ip-address-2 host ip-address-1
router(config)# exit
router# debug ip packet 150 detail
```

| Related Commands | Command                    | Description                                                             |
|------------------|----------------------------|-------------------------------------------------------------------------|
|                  | <b>debug cable receive</b> | Enables debugging for received packets.                                 |
|                  | <b>debug ip packet</b>     | Enables debugging of IP packets received and transmitted by the router. |

# debug cable ubg

To enable debugging information for upstream bonding groups, use the **debug cable ubg** command in privileged EXEC mode. To turn off debugging, use the **no** form of this command.

**debug cable ubg**

**no debug cable ubg**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

| Command History | Release     | Modification                                                  |
|-----------------|-------------|---------------------------------------------------------------|
|                 | 12.2(33)SCC | This command was introduced in Cisco IOS Release 12.2(33)SCC. |

**Examples** The following is a sample output of the **debug cable ubg** command:

```
Router#debug cable ubg
```

```
CMTS UBG assignment info debugging is on
```

```

# debug cable ucc

To debug upstream channel change (UCC) messages generated when CMs request or are assigned a new channel, use the **debug cable ucc** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable ucc**

**no debug cable ucc**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 11.3NA  | This command was introduced. |

**Usage Guidelines** This command activates debugging of any upstream channel change (UCC) messages generated when CMs request or are assigned a new channel. When this command is activated, any messages related to upstream channel changes are displayed on the Cisco CMTS console.

**Examples** The following is typical output from the **debug cable ucc** command:

```
Router# debug cable ucc
Router#
SID 2 has been registered
Mac Address of CM for UCC
 00:0E:1D:D8:52:16
UCC Message Sent to CM
Changing SID 2 from upstream channel 1 to upstream channel 2
```

| Related Commands | Command         | Description                         |
|------------------|-----------------|-------------------------------------|
|                  | debug cable ucd | Enables debugging for UCD messages. |

# debug cable ucd

To debug upstream channel descriptor (UCD) messages, use the **debug cable ucd** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

- debug cable ucd**
- no debug cable ucd**

| Syntax Description | This command has no arguments or keywords.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |              |        |                              |

| 11.3NA             | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |              |        |                              |
| Usage Guidelines   | This command activates debugging of any upstream channel descriptor (UCD) messages. UCD messages contain information about upstream channel characteristics and are sent to the CMs on the HFC network. Cable modems that are configured to use enhanced upstream channels use these UCD messages to identify and select an enhanced upstream channel to use. When this command is activated, any messages related to upstream channel descriptors are displayed on the Cisco CMTS console.                                                                                                                                                                                                                                                                                                                                                                                                                              |         |              |        |                              |

# debug cable upconverter

To enable hardware debugging of an internal upconverter, use the **debug cable upconverter** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cable upconverter**

**no debug cable upconverter**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release    | Modification                                                                                          |
|-----------------|------------|-------------------------------------------------------------------------------------------------------|
|                 | 12.1(5)EC  | This command was introduced for the Cisco uBR7100 series routers.                                     |
|                 | 12.2(11)CY | Support was added for the Cisco uBR10-MC5X20S cable interface line card on the Cisco uBR10012 router. |

**Usage Guidelines** This command activates hardware debugging of the internal upconverter that is onboard the Cisco uBR7100 series or the Cisco uBR10-MC5X20S cable interface line card on the Cisco uBR10012 router.

**Examples** The following command shows how to enable the **debug cable upconverter** output:

```
Router# debug cable upconverter
Upconverter programming debugging is on
Router# config t
Router(config)# int c1/0
Router(config-if)# no cable downstream rf-shutdown
Ack failed from upconverter
Card does not have upconverter?
Error in upconverter!
Router(config-if)#
```

|                 | 12.1(4)CX  | This command was introduced for the Cisco uBR10012 router.                                                                                      |
|                 | 12.2(4)BC1 | Support for this command was added to the Release 12.2 BC train for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers. |
|                 | 12.2(11)CY | Support was added for the Cisco uBR10-MC5X20S cable interface line card on the Cisco uBR10012 router.                                           |

**Examples**                  The following command shows how to enable debugging output for upstream admission control:

```
Router# debug cable us-adm-ctrl
CMTS upstream admission control debugging is on

Router# show debug
CMTS:
 CMTS upstream admission control debugging is on
Router#
```

The following are the debug messages that are displayed when the CMTS does not have an admission policy, scheduling instance, or service class for a registering CM:

```
Null service class
Null admission policy
Null scheduler instance
```

The CMTS displays the following debug message when a CM requests a scheduling type that is either not defined, not recognized, or not supported:

```
Undefined scheduling Type
```

|------------------|-----------------------------------------|--------------------------------------------------------------------------------------|
|                  | <b>cable upstream admission-control</b> | Determines the percentage of overbooking allowed on the upstream channel.            |
|                  | <b>debug cable mac-scheduler</b>        | Displays information for the MAC layer's scheduler and admission control activities. |

# debug cable wbcmts

To enable debugging information for the wideband CMTS, use the **debug cable wbcmts** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug cable wbcmts [association | bpi | cli | guardian | statistics | wbka | wcd]

no debug cable wbcmts [association | bpi | cli | guardian | statistics | wbka | wcd]
```

Syntax Description

|             |                                                                                                                                      |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| association | (Optional) Enables debug messages for RF to fiber-node associations.                                                                 |
| bpi         | (Optional) Enables debug messages for Baseline Privacy Interface (BPI).                                                              |
| cli         | (Optional) Enables debug messages for wideband-related Cisco IOS CLI activity.                                                       |
| guardian    | (Optional) Enables debug messages for DOCSIS 3.0 Downstream Channel Bonding operations performed by the modular-host line card.      |
| ha          | (Optional) Enables debug messages for wideband high availability (HA).                                                               |
| statistics  | (Optional) Enables debug messages for wideband-related statistics.                                                                   |
| wbka        | (Optional) Enables debug messages for wideband keepalive (WBKA) operations.                                                          |
| wcd         | (Optional) Enables debug messages with wideband channel information as conveyed in the Bonded Downstream Channel Descriptor (BD CD). |

Command Default

No wideband-related debug messages are enabled.

Command Modes

Privileged EXEC (#)

Command History

| Release     | Modification                                                    |
|-------------|-----------------------------------------------------------------|
| 12.3(21)BC  | This command was introduced for the Cisco uBR10012 router.      |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. |

Usage Guidelines

The **debug cable wbcmts** command is intended for use by Cisco technical support personnel.

Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support personnel. Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

If you specify **debug cable wbcmts** with no argument, generic wideband debugging messages are enabled.

Before issuing the **debug cable wbcmts wcd** command to display BDCD information, you must issue the **debug cable interface** command to enable debugging on the cable interface line card configured for DOCSIS 3.0 protocol operations. For example:

```
Router# debug cable interface Cable slot/subslot/port
Router# debug cable wbcmts wcd
```

In the preceding example, *slot/subslot/port* specifies a port on a cable interface line card that has been configured for DOCSIS 3.0 protocol operations with the **modular-host subslot** command. The line card cable interface for which you enable debug messages with **debug cable interface** is the first cable interface that is up. For example, if the line card configured for DOCSIS 3.0 protocol operations is located in slot 7/0, specify interface 7/0/1 if 7/0/0 is down and 7/0/1 is up.

For information on configuring a cable interface line card for DOCSIS 3.0 protocol operations, see the **modular-host subslot** command.

## Examples

The following example shows how to enable debug messages for RF to fiber-node associations, and shows sample output:

```
Router# debug cable wbcmts association

WBCMTS Association debugging is on
...
Router(config-fiber-node)# downstream modular-cable 3/0/0 rf-channel 0-1
Router(config-fiber-node)# end
...
Router#
*Nov 7 17:16:08.835: Remove Wideband-Cable3/0/0:0 nb_info 8/1 index 0,chanID 203 bundle 1,
Index 203
*Nov 7 17:16:08.835: Remove Cable8/1/0 wb_info 8/1 wb_index 0, chanID 72, Index 72
*Nov 7 17:16:08.835: %SYS-5-CONFIG_I: Configured from console by console

Router#
```

The following example shows how to enable debug messages for wideband CMTS statistics, and shows sample output.

```
Router# debug cable wbcmts statistics

WBCMTS statistics debugging is on

Router#
Router# show interface cable 8/1/0 service-flow 19 counters
Sfid Packets Bytes PacketDrop Bits/Sec Packet/Sec
19 0 0 0 0 0
Router#
*Nov 7 17:28:09.815: LC SFID=19, SFID=19, Blaze_Index=23 Reading stats for SFID 1 @ index

# debug cable-modem bpkm

To display information about Baseline Privacy Interface (BPI) key management, use the **debug cable-modem bpkm** command in privileged EXEC mode. To disable BPI debugging, use the **no** form of this command.

**Cisco uBR904, uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter**

**debug cable-modem bpkm {errors | events | packets}**

**no debug cable-modem bpkm {errors | events | packets}**

## Syntax Description:

|                |                                                  |
|----------------|--------------------------------------------------|
| <b>errors</b>  | Debugs CM privacy errors.                        |
| <b>events</b>  | Debugs events related to cable baseline privacy. |
| <b>packets</b> | Debugs baseline privacy packets.                 |

## Command Modes

Privileged EXEC

## Command History

| Release           | Modification                                                          |
|-------------------|-----------------------------------------------------------------------|
| 11.3(4)NA         | This command was introduced for the Cisco uBR904 cable access router. |
| 12.0(4)XI1        | Support was added for the Cisco uBR924 cable access router.           |
| 12.0(5), 12.0(5)T | This command was removed from normal access.                          |

## Usage Guidelines

Baseline privacy key management exchanges take place only when both the router and the CMTS are running code images that support baseline privacy, and the privacy class of service is enabled via the configuration file that is downloaded to the cable access router. Baseline privacy code images for the router contain k1, k8, or k9 in the code image name.

In Cisco IOS Release 12.0(5) and later releases, this command is available only under the direction of TAC or field service, and should be used only while debugging CM operation. Displaying debugging messages consumes system resources, and turning on too many messages could negatively affect system performance.

## Examples

The following example shows typical debug output when the CMTS does not have privacy enabled:

Router# **debug cable-modem bpkm errors**

```
cm_bpkm_fsm(): machine: KEK, event/state: EVENT_4_TIMEOUT/STATE_B_AUTH_WAIT, new state: STATE_B_AUTH_WAIT
```

```
cm_bpkm_fsm(): machine: KEK, event/state: EVENT_4_TIMEOUT/STATE_B_AUTH_WAIT, new state: STATE_B_AUTH_WAIT
```

```
%LINEPROTO-5-UPDOWN: Line protocol on Interface cable-modem0, changed state to down
cm_bpkm_fsm(): machine: KEK, event/state: EVENT_1_PROVISIONED/STATE_A_START, new state: STATE_B_AUTH_WAIT
```

```
%LINEPROTO-5-UPDOWN: Line protocol on Interface cable-modem0, changed state to up
Router#
```

| <b>debug cable-modem bridge</b>     | Displays bridge filter processing information.                               |
| <b>debug cable-modem error</b>      | Displays debugging messages for the cable interface driver.                  |
| <b>debug cable-modem interrupts</b> | Displays information about CM interrupts.                                    |
| <b>debug cable-modem mac log</b>    | Displays comprehensive debugging messages for the cable interface MAC layer. |
| <b>debug cable-modem map</b>        | Displays the timing of MAP and sync messages.                                |

# debug cable-modem bridge

To display bridge filter processing information, use the **debug cable-modem bridge** command in Privileged EXEC mode. To disable bridge filter debugging, use the **no** form of this command.

**Cisco uBR904, uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter**

**debug cable-modem bridge**

**no debug cable-modem bridge**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release           | Modification                                                          |
|-----------------|-------------------|-----------------------------------------------------------------------|
|                 | 11.3(4)NA         | This command was introduced for the Cisco uBR904 cable access router. |
|                 | 12.0(4)XI1        | Support was added for the Cisco uBR924 cable access router.           |
|                 | 12.0(5), 12.0(5)T | This command was removed from normal access.                          |

**Usage Guidelines** When the interface is down, all bridge table entries learned on the Ethernet interface are set to discard because traffic is not bridged until the cable interface has completed initialization. After the interface (the line protocol) is completely up, bridge table entries learned on the Ethernet interface program the cable's MAC data filters. The cable MAC hardware filters out any received packets whose addresses are not in the filters. In this way, the cable interface only receives packets addressed to its own MAC address or an address it has learned on the Ethernet interface.

In Cisco IOS Release 12.0(5) and later releases, this command is available only under the direction of TAC or field service, and should be used only while debugging CM operation. Displaying debugging messages consumes system resources, and turning on too many messages could negatively affect system performance.

**Examples** The following shows typical output for the **debug cable-modem bridge** command:

```
Router# debug cable-modem bridge
Router#
%LINEPROTO-5-UPDOWN: Line protocol on Interface cable-modem0, changed state to downshut
cm_tbridge_add_entry(): MAC not initialized, discarding entry: 00e0.fe7a.186fno shut
cm_tbridge_add_entry(): MAC not initialized, discarding entry: 00e0.fe7a.186f
%LINEPROTO-5-UPDOWN: Line protocol on Interface cable-modem0, changed state to up
cm_tbridge_add_entry(): Adding entry 00e0.fe7a.186f to filter 2
```

| 12.2(2)XA  | Support was added for the Cisco uBR925 cable access router.           |

## Usage Guidelines

The **debug cable-modem mac log** command is one of the most useful debugging tools because MAC-layer log messages are written to a circular log file even when debugging is not turned on. These messages include timestamps, events, and information pertinent to these events. Enter the **debug cable-modem mac log** command to view MAC log messages. If you want to view this information without entering debug mode, use the **show controllers cable-modem number mac log** command. The same information is displayed by both commands.

### Tip

The **debug cable-modem mac log** command displays details about the MAC-layer processes. In particular, this command displays the details of the CM's registration and initialization process.

If the router interface fails to come up or resets periodically, the MAC log will show what happened. For example, if an address is not obtained from the DHCP server, an error is logged, initialization starts over, and the CM scans for a downstream frequency. The **debug cable-modem mac log** command displays the log from oldest entry to newest entry.

After initial ranging is successful (dhcp\_state has been reached), further RNG-REQ/RNG-RSP messages and watchdog timer entries are suppressed from output unless the **verbose** keyword is used. Note that CMAC\_LOG\_WATCHDOG\_TIMER entries while in the maintenance\_state are normal when using the **verbose** keyword.

**Note**

This command should be used only while debugging CM operation. Displaying debugging messages consumes system resources, and turning on too many messages could negatively affect system performance.

**Examples**

This example shows typical output from the **debug cable-modem mac log** command. The fields of the output are the time since bootup, the log message, and in some cases a parameter that gives more detail about the log entry.

```
uBR924# debug cable-modem mac log
Cable Modem mac log debugging is on
```

```

0 events dropped due to lack of a chunk

#### Note

The line “0 events dropped due to lack of a chunk” at the end of the display indicates that no log entries were discarded due to a temporary lack of memory. This means the log is accurate and reliable.

The following example shows typical output of the **debug cable-modem mac log verbose** command. The **verbose** keyword displays periodic events such as ranging.

```

Router# debug cable mac log verbose
Cable Modem mac log debugging is on (verbose)
Router#
574623.810 CMAC_LOG_RNG_REQ_TRANSMITTED
574623.812 CMAC_LOG_RNG_RSP_MSG_RCVD
574627.942 CMAC_LOG_WATCHDOG_TIMER
574633.880 CMAC_LOG_RNG_REQ_TRANSMITTED
574633.884 CMAC_LOG_RNG_RSP_MSG_RCVD
574643.950 CMAC_LOG_RNG_REQ_TRANSMITTED
574643.954 CMAC_LOG_RNG_RSP_MSG_RCVD
574654.022 CMAC_LOG_RNG_REQ_TRANSMITTED
574654.024 CMAC_LOG_RNG_RSP_MSG_RCVD
574657.978 CMAC_LOG_WATCHDOG_TIMER
574664.094 CMAC_LOG_RNG_REQ_TRANSMITTED
574664.096 CMAC_LOG_RNG_RSP_MSG_RCVD
574674.164 CMAC_LOG_RNG_REQ_TRANSMITTED
574674.166 CMAC_LOG_RNG_RSP_MSG_RCVD

```

The following example shows how to disable verbose debugging:

```

Router# no debug cable mac log verbose
Cable Modem mac log debugging is off
Router#

```

**debug cable-modem mac messages** *message-type*

**no debug cable-modem mac messages** *message-type*

| Syntax Description | <i>message-type</i> | Selects the specific type of MAC-layer message type to display:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Command History | Release    | Modification                                                                                                  |
|-----------------|------------|---------------------------------------------------------------------------------------------------------------|
|                 | 11.3(4)NA  | This command was introduced for the Cisco uBR904 cable access router.                                         |
|                 | 12.0(4)XI1 | Support was added for the Cisco uBR924 cable access router.                                                   |
|                 | 12.1(3)XL  | Support was added for the Cisco uBR905 cable access router.                                                   |
|                 | 12.1(5)XU1 | Support was added for the Cisco CVA122 Cable Voice Adapter.                                                   |
|                 | 12.2(2)XA  | Support was added for the Cisco uBR925 cable access router.                                                   |
|                 | 12.2(15)CZ | The <b>dcc-ack</b> , <b>dcc-req</b> , and <b>dcc-rsp</b> options were added to support DOCSIS 1.1 operations. |
|                 | 12.3(2)T   | The <b>up-dis</b> option was supported.                                                                       |

**Usage Guidelines** The output from this command is very verbose, displaying the details of the DOCSIS MAC-layer messages, and is usually not needed for normal interface debugging. The command is most useful when attempting to attach a router to a CMTS that is not DOCSIS-qualified.

**Caution**

This command should be used only while debugging CM operation. Displaying debugging messages consumes system resources, and turning on too many messages could negatively affect system performance.

**Examples** The following example shows typical output from the **debug cable-modem mac messages** command. A separate command must be given for each message type to be displayed.

Much of the information, such as REG-REQ messages, is displayed in hexadecimal dump format, using the Type/Length/Value (TLV) format required by the DOCSIS specification.

**Note**

For complete descriptions of the MAC-layer management messages, see the DOCSIS Radio Frequency Interface Specification (SP-RF1v1.1-I07-010829 or later), available from CableLabs at <http://www.cablemodem.com/>

# debug cable-modem mac messages dynsrv

To display debug messages for the dynamic service MAC-layer messages that are generated when voice calls are made using the dynamic SID feature, use the **debug cable-modem mac messages dynsrv** command in privileged EXEC mode. To turn off debugging for the dynamic service MAC-layer messages, use the **no** form of this command.

**Cisco uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter**

**debug cable-modem mac messages dynsrv**

**no debug cable-modem mac messages dynsrv**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release                | Modification                                                          |
|-----------------|------------------------|-----------------------------------------------------------------------|
|                 | 12.0(7)XR and 12.1(1)T | This command was introduced for the Cisco uBR924 cable access router. |
|                 | 12.1(3)XL              | Support was added for the Cisco uBR905 cable access router.           |
|                 | 12.1(5)XU1             | Support was added for the Cisco CVA122 Cable Voice Adapter.           |
|                 | 12.2(2)XA              | Support was added for the Cisco uBR925 cable access router.           |

**Usage Guidelines** This command begins the display of debug messages that show the dynamic service MAC messages that are generated when a voice call is made using the dynamic SID feature. Dynamic SIDs use the following DOCSIS MAC-layer messages to create a new SID when a voice call is made and to delete it when the call is over:

- DSA-REQ—Dynamic Service Addition Request, sent to establish a new service flow.
- DSA-RSP—Dynamic Service Addition Response, sent in reply to DSA-REQ to confirm or deny the new service flow.
- DSA-ACK—Dynamic Service Addition Acknowledge, sent in reply to DSA-RSP to acknowledge the creation of the service flow.
- DSD-REQ—Dynamic Service Deletion Request, sent to delete an existing service flow when it is no longer needed (for example, when a voice call has terminated).
- DSD-RSP—Dynamic Service Deletion Response, sent in response to DSD-REQ to delete an existing service flow.

**Note**

Dynamic Services are described in the DOCSIS 1.1 specification (SP-RF1v1.1-I03-991105 or later revision), available from CableLabs at <http://www.cablemodem.com/>

**Examples**

The following example shows how to enable the display of debug messages related to dynamic service operations:

```
Router# debug cable-modem mac messages dynsrv
Router#
```

The following example shows how to turn off the display of debug messages related to dynamic service operations:

```
Router# no debug cable-modem mac messages dynsrv
Router#
```

The following example shows the types of debug messages that are displayed when a voice call is made. This example shows that dynamic SID 52 is created for this particular call.

```

## Related Commands

| Command                                 | Description                                                                                                                          |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>debug cable-modem mac log</b>        | Displays debug messages for other types of MAC-layer messages, including MAP messages, upstream request messages, and sync messages. |
| <b>show controllers cable-modem qos</b> | Displays detailed information about the QoS configuration for the router.                                                            |

# debug cable-modem map

To display the timing of MAP messages to sync messages, and the timing between MAP messages, use the **debug cable-modem map** command in privileged EXEC mode. To turn off debugging of MAP messages, use the **no** form of this command.

Cisco uBR904, uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter

- debug cable-modem map
- no debug cable-modem map

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release           | Modification                                                          |
|-----------------|-------------------|-----------------------------------------------------------------------|
|                 | 11.3(4)NA         | This command was introduced for the Cisco uBR904 cable access router. |
|                 | 12.0(4)XI1        | Support was added for the Cisco uBR924 cable access router.           |
|                 | 12.0(5), 12.0(5)T | This command was removed from normal access.                          |

**Usage Guidelines** In Cisco IOS Release 12.0(5) and later releases, this command is available only under the direction of TAC or field service, and should be used only while debugging CM operation. Displaying debugging messages consumes system resources, and turning on too many messages could negatively affect system performance.

**Examples** The following shows typical output from the **debug cable map** command:

```
Router# debug cable-modem map
Cable Modem MAP debugging is on
Router#
*Mar 7 20:12:08: 595322.942: Min MAP to sync=72
*Mar 7 20:12:08: 595322.944: Max map to map time is 40
*Mar 7 20:12:08: 595322.982: Min MAP to sync=63
*Mar 7 20:12:08: 595323.110: Max map to map time is 41
*Mar 7 20:12:08: 595323.262: Min MAP to sync=59
*Mar 7 20:12:08: 595323.440: Max map to map time is 46
*Mar 7 20:12:09: 595323.872: Min MAP to sync=58
```

# debug cable-modem up-dis

To display information about DOCSIS 1.1 Upstream Transmitter Disable (UP-DIS) messages received by the cable modem, use the **debug cable-modem up-dis** command in Privileged EXEC mode. To disable debugging output for UP-DIS messages, use the **no** form of this command.

**debug cable-modem up-dis**

**no debug cable-modem up-dis**

|                    |                                            |                              |
|--------------------|--------------------------------------------|------------------------------|
| Syntax Description | This command has no arguments or keywords. |                              |
| Command Default    | No default behavior or values.             |                              |
| Command Modes      | Privileged EXEC                            |                              |
| Command History    | Release                                    | Modification                 |
|                    | 12.3(2)T                                   | This command was introduced. |

**Usage Guidelines**

This command shows debugging messages about the Upstream Transmitter Disable (UP-DIS) messages that the CMTS sends to a CM. The CMTS can send an UP-DIS message to a cable modem to suspend its operation on the cable network. The UP-DIS message can instruct the cable modem to suspend its operations for a limited period of time or permanently.

After sending the UP-DIS message, the CMTS allows the cable modem back on the network only if the cable modem is power-cycled, or if the CMTS sends another UP-DIS message re-enabling the cable modem’s upstream transmitter. If a cable modem is already in the suspended state, it must ignore any further UP-DIS messages except a UP-DIS message re-enabling its operations.

  
**Note**

See the DOCSIS 1.1 specification (revision SP-RFIV1.1-I09-020830 and above) for information on the content and format of the UP-DIS messages.

**Examples**

The following examples show typical output for the **debug cable up-dis** command, which displays the MAC frame header and UP-DIS Timeout Interval value (in milliseconds):

```
Router# debug cable up-dis
up-dis message debugging is on

Router#

UP-DIS MESSAGE");

# debug checkpoint

To enable debugging of the Checkpointing Facility (CF) subsystem on the Cisco uBR10012 router, use the **debug checkpoint** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

```
debug checkpoint [all | errors | messages | temporary | timers]

no debug checkpoint [all | errors | messages | temporary | timers]
```

Syntax Description

|           |                                                                                           |
|-----------|-------------------------------------------------------------------------------------------|
| all       | (Optional) Enables all checkpoint debugging types.                                        |
| errors    | (Optional) Enables debugging of any checkpoint errors that occur.                         |
| messages  | (Optional) Enables debugging for the messages that are sent during checkpoint operations. |
| temporary | (Optional) Enables basic checkpoint debugging (default).                                  |
| timers    | (Optional) Enables debugging of the checkpoint timers.                                    |

Command Modes

Privileged EXEC

Command History

| Release     | Modification                                                                   |
|-------------|--------------------------------------------------------------------------------|
| 12.2(11)BC3 | This command was introduced for the Cisco uBR10012 universal broadband router. |

Usage Guidelines

The **debug checkpoint** command enables debugging of the Checkpoint Facility (CF) subsystem, which passes messages from the Active processor to the Standby processor. It also handles sequencing and throttling, as needed, during redundancy operations.

Examples

The following example shows how to enable debugging messages for the CF subsystem:

```
Router# debug checkpoint

Router#
```

|-------------------------|-----------------------------------------------------------------------------------|
| debug cable interface   | Enables debugging on a specific cable interface.                                  |
| debug cable mac-address | Enables debugging for a specific CM, as identified by its hardware (MAC) address. |

# debug cmts ipc-cable base

To debug the base layer cable inter-processor communication (IPC) software, use the **debug cmts ipc-cable base** command from the Privileged EXEC mode. To disable the debug flag, use the **no** form of the command.

```
debug cmts ipc-cable base {client {all | id cid} |
 entity client-id cid entity-id eid |
 service |
 session client-id cid entity-id eid slot slot subslot subslot}

no debug cmts ipc-cable base {client {all | id cid} |
 entity client-id cid entity-id eid |
 service |
 session client-id cid entity-id eid slot slot subslot subslot}
```

| Syntax Description            |  |                                                                                            |
|-------------------------------|--|--------------------------------------------------------------------------------------------|
| <b>client</b>                 |  | Displays all the clients or the specified client-related IPC information                   |
| <b>entity</b>                 |  | Displays the IPC information of the entity.                                                |
| <b>service</b>                |  | Displays the IPC information related to service.                                           |
| <b>session</b>                |  | Displays the IPC information related to this session.                                      |
| <b>all</b>                    |  | Displays the IPC information for all clients.                                              |
| <b>client-id</b> <i>cid</i>   |  | Specifies the client ID of the cable IPC layer. The valid client ID range is from 0 to 8.  |
| <b>entity-id</b> <i>eid</i>   |  | Specifies the entity ID of the cable IPC layer. The valid entity ID range is from 0 and 2. |
| <b>slot</b> <i>slot</i>       |  | Specifies the cable interface slot. The valid range is from 5 to 8.                        |
| <b>subslot</b> <i>subslot</i> |  | Specifies the cable interface subslot. The valid values are 0 and 1.                       |

**Command Default** Debug is disabled.

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCF | This command was introduced. |

**Usage Guidelines**

Each debug log has a debug-enable flag that is set by the **debug cmts ipc-cable** command. Each cable IPC debug log has a severity level. The **logging cmts ipc-cable** command allows you to selectively enable cable IPC debug logs based on the log severities. A debug log is recorded only if its severity is equal to or higher than the configured log-level, and if its debug enable flag is set.

**Examples**

The following example shows the IPC base layers service debugging message:

```
Router(config)# logging cmts ipc-cable log-level debugging
Router# debug cmt ipc-cable base service
Router# hw-module subslot 8/0 reset
```

```
Proceed with reset? [confirm]
*Feb 11 05:24:44.101: CLNT DOCSIS C8/0 is down for apps

|------------------------|---------------------------------------------------------------------------|
| logging cmts ipc-cable | Enables debug logging for the cable IPC software.                         |
| show cmts ipc-cable    | Displays information about the cable IPC layer on the Cisco CMTS routers. |

# debug cmts ipc-cable client

To debug the client cable inter-processor communication (IPC) software, use the **debug cmts ipc-cable client** command from the Privileged EXEC mode. To disable the debug flag, use the **no** form of the command.

```
debug cmts ipc-cable client {all |
 client client-id cid
 entity client-id cid entity-id eid |
 session client-id cid entity-id eid slot slot subslot subslot |
 message client-id cid entity-id eid message-type mtype |
 packing client-id cid entity-id eid packing-type ptype}

no debug cmts ipc-cable client {all |
 client client-id cid
 entity client-id cid entity-id eid |
 session client-id cid entity-id eid slot slot subslot subslot |
 message client-id cid entity-id eid message-type mtype |
 packing client-id cid entity-id eid packing-type ptype}
```

| Syntax Description                 |  |                                                                                                      |
|------------------------------------|--|------------------------------------------------------------------------------------------------------|
| <b>all</b>                         |  | Displays all information about IPC for all the clients including base layer IPC information.         |
| <b>client</b>                      |  | Displays the specified client-related IPC information including base layer IPC information.          |
| <b>entity</b>                      |  | Displays the IPC information of the entity, including base layer IPC information.                    |
| <b>session</b>                     |  | Displays the IPC information related to the specified session, including base layer IPC information. |
| <b>message</b>                     |  | Displays the IPC information related to the particular message type.                                 |
| <b>packing</b>                     |  | Displays the IPC information related to this type of packing message.                                |
| <b>client-id</b> <i>cid</i>        |  | Specifies the client ID of the cable IPC layer. The valid client ID range is from 0 to 8.            |
| <b>entity-id</b> <i>eid</i>        |  | Specifies the entity ID of the cable IPC layer. The valid entity ID range is from 0 and 2.           |
| <b>slot</b> <i>slot</i>            |  | Specifies the cable interface slot. The valid range is from 5 to 8.                                  |
| <b>subslot</b> <i>subslot</i>      |  | Specifies the cable interface subslot. The valid values are 0 and 1.                                 |
| <b>message type</b> <i>mtype</i>   |  | Specifies the message-type. The valid value is decided by the client and entity.                     |
| <b>packaging type</b> <i>ptype</i> |  | Specifies the packing-type. The valid values are 0 and 1.                                            |

**Command Default** Debug is disabled.

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(33)SCF | This command was introduced. |

**Usage Guidelines** Each debug log has a debug-enable flag that is set by the **debug cmts ipc-cable** command. Each cable IPC debug log has a severity level. The **logging cmts ipc-cable** command allows you to selectively enable cable IPC debug logs based on the log severities. A debug log is recorded only if its severity is equal to or higher than the configured log-level, and if its debug enable flag is set.

**Examples** The following example shows the client PLFM entity of the route processor-cable line card (RP-CLC) session in the logging message:

```
Router# debug cmts ipc-cable client session client-id 4 entity-id 0 slot 5 subslot 0
Router# show cable modem

## debug cr10k-rp

To enable debugging of the subsystems on the active Performance Routing Engine (PRE1) module on the Cisco uBR10012 router, use the **debug cr10k-rp pkt** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug cr10k-rp** [**cli** | **drv** | **ha-all** | **ha-error** | **ha-msg** | **ha-recovery** | **ha-timing** | **ipc** | **oir** | **pkt** [**conditional** [**peek** *byte*] ] | **sid** | **spec**]

**no debug cr10k-rp** [**cli** | **drv** | **ha-all** | **ha-error** | **ha-msg** | **ha-recovery** | **ha-timing** | **ipc** | **oir** | **pkt** [**conditional** [**peek** *byte*] ] | **sid** | **spec**]

| Syntax Description      |                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cli</b>              | (Optional) Displays debugging messages for the command-line interface (CLI) commands run on the processor.                                                                                                               |
| <b>drv</b>              | (Optional) Displays debugging messages for the processor's driver software.                                                                                                                                              |
| <b>ha-all</b>           | (Optional) Displays debugging messages related to High Availability (HA) redundancy events.                                                                                                                              |
| <b>ha-error</b>         | (Optional) Displays debugging messages about errors related to the recovery of cable modems during HA switchovers.                                                                                                       |
| <b>ha-msg</b>           | (Optional) Displays debugging messages for HA bulk synchronization operations.                                                                                                                                           |
| <b>ha-recovery</b>      | (Optional) Displays debugging messages related to the recovery operations for cable modems after HA switchovers. In particular, these messages concern the recovery of high-priority cable modems that have voice calls. |
| <b>ha-timing</b>        | (Optional) Displays debugging messages related to HA timing events.                                                                                                                                                      |
| <b>ipc</b>              | (Optional) Displays debugging messages for the processor's interprocess communications (IPC) system.                                                                                                                     |
| <b>oir</b>              | (Optional) Displays debugging messages for online insertion and removal (OIR) operations.                                                                                                                                |
| <b>pkt</b>              | (Optional) Displays debugging messages for the packets that the PRE1 module processes.                                                                                                                                   |
| <b>conditional</b>      | (Optional) Enables conditional debugging for the packets processed by the PRE1 module.                                                                                                                                   |
| <b>peek</b> <i>byte</i> | (Optional) Specifies that debugging should show the value for a specific byte in each packet processed by the PRE. The valid range for <i>byte</i> is 1 to 120.                                                          |
| <b>sid</b>              | (Optional) Displays debugging messages for the service IDs (SIDs) processed by the PRE1 module.                                                                                                                          |
| <b>spec</b>             | (Optional) Displays debugging messages for spectrum management operations.                                                                                                                                               |

**Command Modes** Privileged EXEC

**Command History**

| Release     | Modification                                                                                                                              |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(4)BC1  | This command was introduced for the Cisco uBR10012 universal broadband router.                                                            |
| 12.2(11)BC2 | The <b>conditional</b> and <b>peek</b> options were added for the <b>pkt</b> keyword.                                                     |
| 12.2(11)BC3 | The <b>ha-all</b> , <b>ha-msg</b> , and <b>ha-timing</b> options were added to support High-Availability N+1 (1:n) redundancy operations. |

**Usage Guidelines**

The **debug cr10k-rp pkt** command enables debugging of the different subsystems that are active on the PRE1 modules in the Cisco uBR10012 router. You can perform general debugging by giving the command without any options, or you can limit the debugging output to a specific subsystem by specifying one of the optional keywords.

In Cisco IOS Release 12.2(11)BC2 and later releases, you can use the **conditional** option, together with the **debug cable mac-address** and **debug cable interface** commands, to display information about selected packets. The command will display only those packets that match the specified cable interface or MAC address options.

Together with the **conditional** option, you can also optionally specify the **peek** keyword to create specifically match only those packets that contain a matching MAC address at the specified location in the datagram. This can be useful for examining certain types of packets, such as DHCP or ARP packets.

**Examples**

The following example shows typical output for CLI debugging messages:

```
Router# debug cr10k-rp cli
```

```
CR10K RP debug CLI debugging is on
```

```
Failed setting clock for slot 2, subunit 1
SNMP Info download failed for slot 2, subunit 1
Config change command for unknown interface!!!
```

The following example shows typical output for IPC debugging messages:

```
Router# debug cr10k-rp ipc
```

```
CR10K RP debug IPC debugging is on
```

```
plugin_card__c10k_sch_card_event: hwidb=Cable8/1/0 if_num=0 event=6
```

```
00:03:14: clc_if_stats_event: If stats from Ca8/1/0
```

```
00:03:14: Merge: on Ca8/1/0
```

```
00:03:14: Outputs Tot_Outs TotTxBytes
```

```
00:03:14: RP 0 40 7103
```

```
00:03:14: SIC 0 0 0
```

```
00:03:14: LC 0 40 7103
```

```
plugin_card__c10k_sch_card_event: hwidb=Cable8/1/1 if_num=1 event=6
```

```
00:03:14: clc_if_stats_event: If stats from Ca8/1/1
```

```
00:03:14: Merge: on Ca8/1/1plugin_card__c10k_sch_card_event: hwidb=Cable6/0/0 if_num=0
event=6
```

```
00:03:15: clc_if_stats_event: If stats from Ca6/0/0
```

```
00:03:15:
```

```
Merge: on Ca6/0/0
```

```
00:03:15: Outputs Tot_Outs TotTxBytes
```

```
00:03:15: RP 0 0 0
00:03:15: SIC 0 0 0
00:03:15: LC 0 0 0
```

The following example shows typical output for IPC debugging messages when you are shutting down and reenabling a cable interface:

```
Router# debug cr10k-rp ipc
```

```
CR10K RP debug IPC debugging is on
```

```
Router# configure terminal
```

```
Router(config)# interface c6/0/0
```

```
Router(config-if)# shutdown
```

```
schrp_cli_cmd: slot=6 subunit=100 slotunit=8 cmdtype=101F
c10k_card_send_nbcmd_eventrsp: nbcmd_id=0x611CE998 hwidb=6B3DF60
plugin_card__c10k_sch_card_event: hwidb=0x6B3DF60 interface_num=0 event=4096
sch_handle_sch_event: erso_type=0x1001

sch_handle_sch_rp_cfg_ersp(): hwidb=0x6B3DF60 msg_size=0x0 0x950 ersp_size=0x0 0x950
type=0x1001
c10k_card_send_nbcmd_eventrsp: nbcmd_id=0x611CE998 hwidb=6B3DF60
plugin_card__c10k_sch_card_event: hwidb=0x6B3DF60 interface_num=0 event=4096
sch_handle_sch_event: erso_type=0x1001
sch_handle_sch_rp_cfg_ersp(): hwidb=0x6B3DF60 msg_size=0x0 0x20 ersp_size=0x0 0x20
type=0x1001
plugin_card__c10k_sch_card_event: hwidb=0x6B3DF60 interface_num=0 event=4
c10k_sch_link_state_event: hwidb=0x6B3DF60 unit=0 seq=35 reason=2 event_state=1
```

The following example shows a typical display for the **debug cr10k-rp pkt conditional** command, which displays packets for SID 2 on cable interface 6/1/0:

```
Router# debug cable interface c6/1/0 sid 2
```

```
Router# debug cr10k-rp pkt conditional
```

```
Router# show debug
```

```
CR10K PACKET:
```

```
 Dump cr10k packets to/from RP conditionally
```

The following example shows how to enable conditional debugging of packets, displaying only those packets that contain the desired mac address at byte 92 in the datagram:

```
Router# debug cr10k-rp pkt conditional peek 92
```

```
Router# debug cable interface c6/1/0 mac-address 00C0.abcd.ef00
```

```
Router# show debug
```

```
CR10K PACKET:
```

```
 Dump cr10k packets to/from RP conditionally
```

```
 Additionally, peeking inside transmitted pkts at offset 92
```

Both types of packet debugging generate output similar to the following example:

```
Jun 19 13:07:32.316: RPTX: Using Downstream Service Flow ID : 16939, SID : 2 V5
```

```

Jun 19 13:07:32.316: RPTX to Cobalt: 0x801B634, size=111
006F0000 00057010 422B2488 00020000 10000006 10000010 950701DB 00016440
D1420800 4500004B 2B260000 FF11187A A4789781 A478978F CD7E00A1 0037D2CA

```

Table 0-274 explains the information contained in the display for each packet:

**Table 0-274** *debug cr10k-rp pkt Field Descriptions*

| Field                                  | Description                                                                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RPIX: Using Downstream Service Flow ID | Displays the service flow ID (SFID) for this packet.                                                                                                        |
| SID                                    | Displays the service ID (SID) for this packet.                                                                                                              |
| RPTX or RPRX                           | Displays whether this packet is transmitted (RPTX) or received (RPRX) by the processor.                                                                     |
| Size                                   | Displays the size of the packet's datagram in decimal.                                                                                                      |
| Packet Dump                            | Displays the first 96 bytes of the packet's datagram in hexadecimal. The command then displays an ellipses (. . .) if the datagram is larger than 96 bytes. |

The following example shows typical output for SID debugging messages:

```

Router# debug cr10k-rp sid

CR10K RP debug SID debugging is on

(Cable 6/1/0:2): CM Offline - MAC 00C0.1234.5678, SID 113
(Cable 6/1/0:2): -Shutdown CM- SID 231
(Cable 6/1/0:2): CM Shutdown - MAC 00C0.2210.a01c, SID 231
(Cable 6/1/0:2): CM Remove - MAC 00C0.2210.a01c, SID 231
Call SID replace with old IP addr 10.10.13.18 new IP addr 10.10.13.121
(Cable 5/1/1:1) - New CM 00C0.1122.bcab, SID 396
(Cable 5/1/0:1) - New CM 00C0.8723.11F0, SID 397
(Cable 5/1/0:1) - CM Init FAILED - MAC 00C0.8723.11F0, SID 397

```

The following example shows typical output for spectrum management debugging messages for a particular interface:

```

Router# debug cable interface c6/1/0 sid 2
Router# debug cr10k-rp pkt spec

CR10K RP debug Spectrum debugging is on

(Cable 5/0/0:4) Release frequency (11600000, 3200000) from group 12
(Cable 5/0/0:4) Frequency request (10000000 - 13200000) from group 12 approved
(Cable 7/0/0:1) Frequency request (12000000 - 13600000) from group 2 approved
(Cable 7/0/0:1) Release frequency (12800000, 1600000) from group 2
(Cable 7/0/0:1) Frequency request (12000000 - 15200000) from group 2 approved
(Cable 7/0/0:2) Frequency request (20000000 - 21600000) from group 22 approved
(Cable 7/0/0:2) Release frequency (20800000, 1600000) from group 22

```

```
(Cable 7/0/0:2) Frequency request (20000000 - 23200000) from group 22 approved

(Cable 7/0/0:3) Release frequency (20800000, 1600000) from group 22
(Cable 7/0/0:4) Release frequency (20800000, 1600000) from group 22
(Cable 7/0/0:4) Frequency request (20000000 - 20400000) from group 22 approved
(Cable 7/0/0:5) Frequency request (20000000 - 21600000) from group 22 approved
(Cable 7/0/0:5) Release frequency (20800000, 1600000) from group 22
(Cable 7/0/0:5) Frequency request (20000000 - 20200000) from group 22 approved
(Cable 7/0/0:6) Frequency request (20000000 - 21600000) from group 22 approved
Release frequency request sent to slot 7 subslot 0
(Cable 7/0/0:6) Frequency request (21400000 - 21800000) from group %d rejected because of
overlapping band
```

The following lists the typical messages that are displayed by the **ha-all** option.

```
PRE Redundancy: failed to get RF buf to send msg to peer
PRE Redundancy: failed to send RF buf to peer
PRE REDUNDANCY: bulk sync in progress
PRE REDUNDANCY: Got RF message when not in Active state.
RP DS SRV FLOW packet sanity check... ok.
Failed to find DS SF with sfid 321
Deleting an old inter_rp_ds_srv_flow
Adding a new inter_rp_ds_srv_flow
Updating an inter_rp_ds_srv_flow
Processing inter_rp_ds_srv_flow
cr10k_rp_ha_parse_sync: Received Packet of 122 len
cr10k_rp_ha_parse_sync:Received
Synching cm instance
CR10K HA: Standby recv chkpt msg
PRE REDUNDANCY: NO Resources
PRE REDUNDANCY: RF_PROG_STANDBY_BULK received
PRE REDUNDANCY:This is standby from boot
PRE REDUNDANCY: RF_PROG_ACTIVE_FAST received
```

The following example shows the typical messages for the **ha-timing** option. These messages show the total time it takes to synchronize all of the cable modems on a cable interface after a switchover, as well as the total time it takes for all cable modems to recover and come online. These messages also show the total time it took the HCCP and DOCSIS protocol subsystems to synchronize after a switchover.

```
Router# debug cable interface c6/1/0
Router# debug cr10k-rp ha-timing

CR10K RP debug High Availability timing

PRE_HA: c6/1/0 Total modems 234 bulk sync'ed in 531 msec
 (delay: 20 msec; CM's per loop:10)
PRE_HA: c6/1/0 Total modems (234) recovered in 1124 msec
PRE_HA: Completed hccp bulksync in 335 msec
PRE_HA: Completed docsis bulksync in 751 msec
```

The following example shows the typical messages for the **ha-msg** option. These messages show the total time it takes to synchronize all of the cable modems on a cable interface after a switchover, as well as the total time it takes for all cable modems to recover and come online. These messages also show the total time it took the HCCP and DOCSIS protocol subsystems to synchronize after a switchover.

```
Router# debug cable interface c6/1/0
Router# debug cr10k-rp ha-msg

CR10K RP debug High Availability msg

PRE_HA_BUGMSG
PRE REDUNDANCY: Bulk sync completed
PRE REDUNDANCY: Recv bulk sync complete - sending ack
```

```
PRE_REDUNDANCY: Send bulk sync ack failed
PRE_RF: Waiting for bulk sync ack
PRE_REDUNDANCY: Bulk sync completed
PRE_REDUNDANCY: Recv bulk sync complete - sending ack
PRE_REDUNDANCY: Send bulk sync ack failed
PRE_RF: Waiting for bulk sync ack
```

The following example shows the typical messages for the **ha-recovery** option. The following messages show the typical recovery process, in which cable modems with active voice calls are recovered first. After these cable modems are online, the remaining, data-only cable modems are recovered.

```
PRE_RECOVERY: <Cable I/F> Received message to recover voice
PRE_RECOVERY: Suspending recovery until higher priority modems are recovered
PRE_RECOVERY: All interfaces recovered. Killing the voice process
PRE_RECOVERY: No events in voice queue. Allow data modems to recover
PRE_RECOVERY: <Cable I/F> Resume data recovery after suspend (modems recovered <# of CMs>)
PRE_RECOVERY:<Cable I/F> Received message to recover data
PRE_RECOVERY: All interfaces recovered. Killing the data process
```

The following are possible messages that can be displayed because of potential error conditions:

```
PRE_RECOVERY:<Cable I/F> No modems to be recovered
PRE_HA:<Cable I/F> Unable to start the voice recovery process
PRE_HA: <Cable I/F> Unable to start the data recovery process
```

|--------------------------------|-----------------------------------------------------------------------------------|
| <b>debug cable interface</b>   | Enables debugging on a specific cable interface.                                  |
| <b>debug cable mac-address</b> | Enables debugging for a specific CM, as identified by its hardware (MAC) address. |

# debug cr10k-rp dbs-queue

To display debug information for dynamic bandwidth sharing (DBS) on the Cisco uBR10012 universal broadband router, use the **debug cr10k-rp dbs-queue** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug cr10k-rp dbs-queue**

**no debug cr10k-rp dbs-queue**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

| Command History | Release     | Modification                                                    |
|-----------------|-------------|-----------------------------------------------------------------|
|                 | 12.3(23)BC1 | This command was introduced.                                    |
|                 | 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB. |

**Usage Guidelines** The **debug cr10k-rp dbs-queue** command is used only with the Cisco uBR10012 universal broadband router.

**Note**

Routine use of the debug cr10k-rp dbs-queue command is not recommended. If you require further information, contact Cisco technical assistance at <http://www.cisco.com/techsupport>.

**Examples** The following example shows that the debug option has been turned on using the **debug cr10k-rp dbs-queue** command :

```
Router# debug cr10k-rp dbs-queue
CR10K RP debug dynamic BG link queue setup debugging is on
```

| Related Commands | Command                          | Description                                                                                                 |
|------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------|
|                  | <b>cable dynamic-bw-sharing</b>  | Enables dynamic bandwidth sharing on a specific modular cable or wideband cable interface.                  |
|                  | <b>show pxf cable controller</b> | Displays information about the RF channel Versatile Traffic Management System (VTMS) links and link queues. |
|                  | <b>show pxf cpu queue</b>        | Displays parallel express forwarding (PXF) queueing and link queue statistics.                              |

# debug docsis ssid

To display debugging information about the parsing and verification of the DOCSIS code verification certificates (CVCs) that are part of a software image downloaded with the Secure Software Download (SSD) procedure, use the **debug docsis ssid** command in privileged EXEC mode. To disable the debugging output, use the **no** form of this command.

Cisco uBR905 and Cisco uBR925 cable access routers, and Cisco CVA122 Cable Voice Adapter

**debug docsis ssid**  
  
**no debug docsis ssid**

**Syntax Description**    This command has no arguments or keywords.

**Command Modes**    Privileged EXEC

| Command History | Release    | Modification                                                                                                                      |
|-----------------|------------|-----------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(15)CZ | This command was introduced for the Cisco uBR905 and Cisco uBR925 cable access routers, and the Cisco CVA122 Cable Voice Adapter. |

**Usage Guidelines**    This command displays whether the Secure Software Download procedure could validate the manufacturer’s CVC and optional cosigner’s CVC (if present) that are part of the downloaded software image.

**Examples**    The following example shows typical output for a successful Secure Software Download procedure for a software image that has been signed by both the manufacturer and by a cosigner:

```
Router# debug docsis ssid

secure software download debugging is on
Router#
SSD: decrypt process suspended and continued
SSD: decrypt process suspended and continued
Code Verification Successful (Manufacturer CVC/CVS)
Verifying Co-Signer CVC/CVS
SSD: decrypt process suspended and continued
SSD: decrypt process suspended and continued
Co-signer CVC has been validated
Code Verification Successful (Co-Signer CVC/CVS)

Router#

If the manufacturer’s signature on the software image file cannot be validated using the manufacturer’s CVC on the router, the following messages are displayed:

MFG code signature does not validate
MFG CVC validation has failed
```

If the MSO cosigner's signature on the software image file cannot be validated using the cosigner's CVC on the router, the following messages are displayed:

```
Co-signer code signature does not validate
Co-signer CVC validation has failed
```

If the software image was signed either before or after the allowable time range specified as part of the manufacturer's CVC, one of the following messages is displayed:

```
signingTime is before saved codeAccessStart
signingTime is before CVC validNotBefore
signingTime is after CVC validNotAfter
CVC validity start is less than save cvcAccessStart
```

**Related Commands**

|------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>docsis cvc mfg</b>  | Configures the access start times and organization name for the manufacturer's code verification certificate (CVC).        |
| <b>docsis cvc mso</b>  | Configures the access start times and organization name for the optional MSO cosigned code verification certificate (CVC). |
| <b>docsis cvc test</b> | Tests the root CA public key and CM private key that are installed on the router.                                          |

# debug ehsa

To enable debug information about enhanced high system availability (EHSA) activity, use the **debug ehsa** command in privileged EXEC mode. To disable debugging output for the EHSA module, use the **no** form of this command.

**debug ehsa {alarms | all | configsync | fsm | keepalive | peer-monitor | services | timesync}**

**no debug ehsa**

## Syntax

|                     |                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>alarms</b>       | Enables debugging of EHSA alarms.                                                                                          |
| <b>all</b>          | Enables all EHSA debugging types.                                                                                          |
| <b>configsync</b>   | Enables debugging of EHSA configuration synchronization.                                                                   |
| <b>fsm</b>          | Enables debugging of EHSA redundancy finite state machine (FSM).                                                           |
| <b>keepalive</b>    | Enables debugging of EHSA keepalive messages sent between the active Performance Routing Engine (PRE) and the standby PRE. |
| <b>peer-monitor</b> | Enables EHSA debugging messages for the standby PRE monitoring of the active PRE.                                          |
| <b>services</b>     | Enables debugging of EHSA services for the services requested during redundancy processing.                                |
| <b>timesync</b>     | Enables debugging of EHSA time synchronization procedures.                                                                 |

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC (#)

## Command History

| Release     | Modification                                              |
|-------------|-----------------------------------------------------------|
| 12.2(33)SCA | This command was introduced on the Cisco uBR10012 router. |

## Usage Guidelines

The **debug ehsa** command must be enabled on the active PRE and on the standby PRE to ensure that debug output after a switchover is displayed.

## Examples

The following example shows all debugging output during a switchover using the **all** keyword:

```
Router# debug ehsa all

Redundancy All debugging is on
router#
...

router# show log | inc EHSA
*Apr 6 04:43:53.007: EHSA: Process KEEPALIVE(30) bootstrap message.

|-------------------------|------------------------------------------------------------|
| <b>redundancy</b>       | Forces the standby RP to assume the role of the active RP. |
| <b>force-switchover</b> |                                                            |

# debug hccp authentication

To display authentication debug messages for Hot Standby Connection-to-Connection (HCCP) groups, use the **debug hccp authentication** command in privileged EXEC mode. To disable HCCP authentication debug message output, use the **no** form of this command.

**debug hccp authentication**

**no debug hccp authentication**

## Syntax Description

This command has no arguments or keywords.

## Command Default

Debug is disabled and authentication messages for HCCP groups are not displayed.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                   | Modification                                                                    |
|---------------------------|---------------------------------------------------------------------------------|
| 12.1(3a)EC                | This command was introduced.                                                    |
| 12.2(4)XF1,<br>12.2(4)BC1 | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router.   |
| 12.2(11)BC1               | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router. |
| 12.3(21)BC                | This command is obsolete on the Cisco uBR7246VXR router.                        |

## Usage Guidelines

You must use the **debug hccp events** command before the **debug hccp authentication** command will generate any debug message output.

## Examples

The following example shows the additional N+1 redundancy authentication debug message output produced when the **debug hccp authentication** command has been activated:

```
Router# debug hccp events
Router# debug hccp authentication
```

```
Sep 7 09:51:50.151:HCCP 1 0->1:HELLO Learn tran 31708
Sep 7 09:51:50.151:auth md5 keyid 1 digest B77F65ED 1B38ED5C 87A7037B C006DAFB
```

| <b>debug hccp plane</b>    | Displays debug messages for HCCP-related messages sent between the router's control plane and data backplane. |
| <b>debug hccp sync</b>     | Displays debug messages for HCCP synchronization messages.                                                    |
| <b>debug hccp timing</b>   | Displays debug messages for the timing of HCCP events.                                                        |

# debug hccp channel-switch

To display debug messages related to a radio frequency (RF) or channel switch that is being used for Hot Standby Connection-to-Connection Protocol (HCCP) N+1 (1:n) redundancy, use the **debug hccp channel-switch** command in privileged EXEC mode. To disable the debug message output, use the **no** form of this command.

**debug hccp channel-switch**

**no debug hccp channel-switch**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Debug is disabled and channel switch messages are not displayed.

**Command Modes** Privileged EXEC (#)

| Command History | Release                   | Modification                                                                            |
|-----------------|---------------------------|-----------------------------------------------------------------------------------------|
|                 | 12.2(4)XF1,<br>12.2(4)BC1 | This command was introduced for the N+1 (1:n) RF Switch with the Cisco uBR10012 router. |
|                 | 12.2(11)BC1               | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router.         |
|                 | 12.3(21)BC                | This command is obsolete on the Cisco uBR7246VXR router.                                |

**Usage Guidelines** The **debug hccp channel-switch** command displays debugging messages related to the SNMP messages and other communication between the CMTS and an RF-switch or channel-switch during N+1 (1:n) HCCP operations.

**Note**

You must use the **debug hccp events** command to activate HCCP event debugging before the **debug hccp channel-switch** command will generate any debug output.

**Examples** The following example shows typical output for the **debug hccp channel-switch** command:

```
Router# debug hccp events
Router# debug hccp channel-switch

HCCP channel action debugging is on

|                  | <b>debug hccp timing</b>         | Displays debug messages for the timing of HCCP events.                                                        |

# debug hccp docsis-recovery

To display debug messages about the recovery of cable modems (CMs) during Hot Standby Connection-to-Connection Protocol (HCCP) N+1 (1:n) redundancy operations, use the **debug hccp docsis-recovery** command in privileged EXEC mode. To disable the debug message output, use the **no** form of this command.

**debug hccp docsis-recovery**

**no debug hccp docsis-recovery**

**Syntax Description** This command has no arguments or keywords.

**Command History** Debug is disabled and DOCSIS recovery messages are not displayed.

**Command Modes** Privileged EXEC (#)

| Command History | Release    | Modification                                             |
|-----------------|------------|----------------------------------------------------------|
|                 | 12.2(15)BC | This command was introduced.                             |
|                 | 12.3(21)BC | This command is obsolete on the Cisco uBR7246VXR router. |

**Usage Guidelines** The **debug hccp docsis-recovery** command displays debugging messages about the recovery of CMs during N+1 (1:n) HCCP operations.

**Note**

You must use the **debug hccp events** command to activate HCCP event debugging before the **debug hccp docsis-recovery** command will generate any debug output.

**Examples** The following example shows typical output for the **debug hccp docsis-recovery** command:

```
Router# debug hccp events
Router# debug hccp docsis-recovery

HCCP DOCSIS Recovery ACTION/EVENT messages debugging is on

HCCP 1 1 Working: Built 4 prio 3 CMs [tot 23]

|--------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>debug hccp plane</b>  | Displays debug messages for HCCP-related messages sent between the router's control plane and data backplane. |
| <b>debug hccp sync</b>   | Displays debug messages for HCCP synchronization messages.                                                    |
| <b>debug hccp timing</b> | Displays debug messages for the timing of HCCP events.                                                        |

# debug hccp fast-failure-detection

To display debug messages for fast failure detection (FFD) operations during Hot Standby Connection-to-Connection (HCCP) N+1 (1:n) redundancy, use the **debug hccp fast-failure-detection** command in privileged EXEC mode. To disable the debug message output, use the **no** form of this command.

**debug hccp fast-failure-detection**

**no debug hccp fast-failure-detection**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Debug is disabled and FFD messages are not displayed.

**Command Modes** Privileged EXEC (#)

| Command History | Release    | Modification                                             |
|-----------------|------------|----------------------------------------------------------|
|                 | 12.2(15)BC | This command was introduced.                             |
|                 | 12.3(21)BC | This command is obsolete on the Cisco uBR7246VXR router. |

**Usage Guidelines** The **debug hccp fast-failure-detection** command displays debugging messages about the operation of sync pulse messages for FFD support during N+1 (1:n) HCCP operations. A Working interface sends these sync pulse messages upon a failure to proactively inform the Protect interface that a switchover is occurring.

**Note**

You must use the **debug hccp events** command to activate HCCP event debugging before the **debug hccp fast-failure-detection** command will generate any debug output.

**Examples** The following example shows typical FFD debugging messages that are displayed by the **debug hccp fast-failure-detection** command:

```
Router# debug hccp events
Router# debug hccp fast-failure-detection
```

```
HCCP Fast Failure Detection ACTION/EVENT messages debugging is on
```

```
HCCP: FFD cutover packet address updated: src = 10.10.10.3, dst = 10.10.10.4
HCCP: FFD cutover packet allocated!
```

# debug hccp inter-db

To display debug messages for the inter-database events during Hot Standby Connection-to-Connection Protocol (HCCP) operations, use the **debug hccp inter-db** command in privileged EXEC mode. To disable HCCP group debug message output, use the **no** form of this command.

**debug hccp inter-db {error | events}**

**no debug hccp inter-db {error | events}**

## Syntax Description

|               |                                                                                         |
|---------------|-----------------------------------------------------------------------------------------|
| <b>error</b>  | Display debugging messages related to database errors that occur.                       |
| <b>events</b> | Display debugging messages related to all events that occur during database operations. |

## Command Default

Debug is disabled and inter-database messages are not displayed.

## Command History

Privileged Exec (#)

## Command History

| Release                   | Modification                                                                    |
|---------------------------|---------------------------------------------------------------------------------|
| 12.1(3a)EC                | This command was introduced.                                                    |
| 12.2(4)XF1,<br>12.2(4)BC1 | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router.   |
| 12.2(11)BC1               | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router. |
| 12.3(21)BC                | This command is obsolete on the Cisco uBR7246VXR router.                        |

## Usage Guidelines

You must use the **debug hccp events** command before the **debug hccp inter-db** command will generate any debug message output.

## Examples

The following example shows typical debug output for the **debug hccp inter-db error** command:

```
Router# debug hccp events
```

```
Router# debug hccp inter-db error
```

```
HCCP inter database ERROR messages debugging is on
```

```

|----------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>debug hccp authentication</b> | Displays authentication debug messages for HCCP groups.                                                       |
| <b>debug hccp channel-switch</b> | Displays debug messages related to an RF or channel switch that is being used for HCCP N+1 (1:n) redundancy.  |
| <b>debug hccp events</b>         | Displays debug messages for all HCCP group interaction.                                                       |
| <b>debug hccp plane</b>          | Displays debug messages for HCCP-related messages sent between the router's control plane and data backplane. |
| <b>debug hccp sync</b>           | Displays debug messages for HCCP synchronization messages.                                                    |
| <b>debug hccp timing</b>         | Displays debug messages for the timing of HCCP events.                                                        |

# debug hccp plane

To display debug messages for Hot Standby Connection-to-Connection Protocol (HCCP)-related messages sent between the router's control plane and data backplane, use the **debug hccp plane** command in privileged EXEC mode. To disable HCCP group debug message output, use the **no** form of this command.

```
debug hccp plane {message | packet | syncpulse}
```

```
no debug hccp plane {message | packet | syncpulse}
```

## Syntax Description

|                  |                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>message</b>   | Display debugging messages for the inter-plane messages that occur.                                                                             |
| <b>packet</b>    | Display a partial dump of packets that are sent between the control plane and data backplane.                                                   |
| <b>syncpulse</b> | Display debugging messages related to the “heartbeat” packets that are sent between the control plane and data backplane to synchronize events. |

## Command Default

Debug is disabled and HCCP control plane messages are not displayed.

## Command History

Privileged Exec (#)

## Command History

| Release                   | Modification                                                                                                                |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 12.2(4)BC1                | This command was introduced for the Cisco uBR10012 router.                                                                  |
| 12.2(4)XF1,<br>12.2(4)BC1 | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router.                                               |
| 12.2(11)BC1               | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router. The <b>syncpulse</b> option also was added. |
| 12.3(21)BC                | This command is obsolete on the Cisco uBR7246VXR router.                                                                    |

## Usage Guidelines

The processor card and line cards on the Cisco uBR10012 router chassis communicate with each other using the control plane (which is on the processor card) and the data backplane (the backplane into which the line cards are installed). The **debug hccp plane** command displays debugging messages related to the messages and packets that are transmitted between the control plane and data backplane.

### Note

You must use the **debug hccp events** command to activate HCCP event debugging before the **debug hccp plane** command will generate any debug output.

## Examples

The following example shows typical output that is produced by the **debug hccp plane message** command:

```
Router# debug hccp events
```

**debug hccp plane**

```
Router# debug hccp plane message
```

HCCP inter-plane message debugging is on

```
Mar 7 08:47:26.513: HCCP 1 Working 4: Control plane sending message BECOME_ACTIVE_STRUCT
Mar 7 08:47:26.513: HCCP 1 Working Cable7/1/0: Control plane sending message FORWARDING

Mar 7 08:47:26.513: HCCP 1 Protect 1: Data plane sending message STATICDONE
Mar 7 08:47:26.513: HCCP 2 Protect 1: Data plane received message START_SYNC
Mar 7 08:47:26.513: HCCP 2 Protect 1: Data plane received message DO_STATICSYNC
Mar 7 08:47:26.513: HCCP 2 Protect 1: Data plane sending message STATICDONE
Mar 7 08:47:26.513: HCCP 2 Working 1: Control plane sending message BECOME_ACTIVE_STRUCT
Mar 7 08:47:26.513: HCCP 2 Working Cable5/0/1: Control plane sending message FORWARDING
Mar 7 08:47:26.513: HCCP 2 Protect 1: Control plane sending message STOP_SYNC
Mar 7 08:47:26.513: HCCP 2 Protect 1: Control plane sending message BECOME_STANDBY_STRUCT
Mar 7 08:47:26.513: HCCP 2 Protect Cable5/1/1: Control plane sending message BLOCKING
Mar 7 08:47:26.513: HCCP 2 Protect Cable5/1/1: Control plane sending message READY_NOT
Mar 7 08:47:26.513: HCCP 2 Protect 1: Control plane sending message DEACTIVATE_MEMBER
```

The following example shows a typical example of the message that is produced by the **debug hccp plane packet** command:

```
Router# debug hccp events
Router# debug hccp plane packet
```

HCCP inter-plane packet debugging is on

```
Aug 2 00:37:24.203: HCCP 1 70 Protect: Data plane receives DOCSIS sync packet
```

The following example shows a typical example of the message that is produced by the **debug hccp plane syncpulse** command:

```
Router# debug hccp events
Router# debug hccp plane syncpulse
```

HCCP inter-plane sync-pulse packet debugging is on

```
Aug 2 00:37:24.203: HCCP 1 70 Protect: Data plane receives DOCSIS sync packet
Aug 2 00:37:24.203: CMTS HCCP docsis_ver 1, sw_ver 1
```

**Tip**

Use both the **message** and **syncpulse** keyword options to debug heartbeat synchronization problems.

# debug hccp sync

To display debugging messages for Hot Standby Connection-to-Connection Protocol (HCCP) SYNC activity, use the **debug hccp sync** command in privileged EXEC mode. To disable the debug message output, use the **no** form of the command.

## debug hccp sync

**debug hccp sync cable** [**bpi** | **classifier** | **clear-cm** | **cm** | **qos-profile** | **cpe-management** | **host** | **offered-band** | **phs** | **qosparam** | **ranged-list** | **service-flow** | **sid** | **tlvs** | **ucd**]

## no debug hccp sync

**no debug hccp sync cable** [**bpi** | **classifier** | **clear-cm** | **cm** | **qos-profile** | **cpe-management** | **host** | **offered-band** | **phs** | **qosparam** | **ranged-list** | **service-flow** | **sid** | **tlvs** | **ucd**]

| Syntax Description    |            |                                                                                                                                                        |
|-----------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable</b>          | (Optional) | Displays debugging for SYNC messages on the cable interface.                                                                                           |
| <b>bpi</b>            | (Optional) | Displays debugging for SYNC messages about BPI configuration and operation.                                                                            |
| <b>classifier</b>     | (Optional) | Displays debugging for SYNC messages about classifier coordination.                                                                                    |
| <b>clear-cm</b>       | (Optional) | Displays debugging for CLEAR-CM messages that are sent between interfaces to sync the CM databases when the <b>clear cable modem</b> command is given. |
| <b>cm</b>             | (Optional) | Displays debugging for CM-related SYNC messages.                                                                                                       |
| <b>qos-profile</b>    | (Optional) | Displays debugging for SYNC messages related to quality of service (QoS) profile messages generated by the CM.                                         |
| <b>cpe-management</b> | (Optional) | Displays debugging for SYNC messages that concern CPE-related parameters, such as MAX CPE, MAX CPE IP, and max learnable addresses.                    |
| <b>host</b>           | (Optional) | Displays debugging for host-related SYNC messages.                                                                                                     |
| <b>offered-band</b>   | (Optional) | Displays debugging messages for CMTS-generated offered band messages.                                                                                  |
| <b>phs</b>            | (Optional) | Displays debugging for SYNC messages about PHS values.                                                                                                 |
| <b>qosparam</b>       | (Optional) | Displays debugging for SYNC messages about QoS and service templates.                                                                                  |
| <b>ranged-list</b>    | (Optional) | Displays debugging for SYNC messages about ranged list messages.                                                                                       |
| <b>service-flow</b>   | (Optional) | Displays debugging for SYNC messages about service flows.                                                                                              |
| <b>sid</b>            | (Optional) | Displays debugging for SYNC messages that concern service IDs (SIDs).                                                                                  |
| <b>tlvs</b>           | (Optional) | Displays any type, length, or value errors in SYNC messages.                                                                                           |
| <b>ucd</b>            | (Optional) | Displays debugging for SYNC messages that concern DOCSIS upstream channel descriptor (UCD) messages.                                                   |

**Command Default** Debug is disabled and messages for HCCP sync activity are not displayed.

## Command History

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(3a)EC                | This command was introduced.                                                                                                                                                                                                     |
| 12.2(4)XF1,<br>12.2(4)BC1 | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router. Also, the <b>cable</b> message-specific options were added to allow the debugging of a particular set of messages without overloading the console. |
| 12.2(8)BC1                | The <b>offered-band</b> option was added to add in debugging problems with blind-hopping.                                                                                                                                        |
| 12.2(11)BC1               | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router.                                                                                                                                                  |
| 12.2(15)BC2               | The <b>cpe-management</b> option was added.                                                                                                                                                                                      |
| 12.3BC                    | The <b>clear-cm</b> and <b>cm-qos-profile</b> options were added.                                                                                                                                                                |

## Usage Guidelines

You must activate the **debug hccp events** command before the **debug hccp sync** command will generate any debug message output.

## Examples

The following example shows typical output for the **debug hccp sync** command:

```
Router# debug hccp events
Router# debug hccp sync
```

```
Sep 7 09:57:25.215:HCCP 1 0<-1:SYNC Teach tran 88 type DOCSIS10, tran_sync 82
Sep 7 09:57:25.215:HCCP 1 0->1:SYNC_ACK Learn tran 88
Sep 7 09:57:25.219:DOCSIS10_QOS:qos 1
```

The following example shows typical debugging messages for the **debug hccp sync cable offered-band** command:

```
Router# debug hccp events
Router# debug hccp sync cable offered-band
```

```
CMTS OFFERED BAND sync messages debugging is on

HCCP 1 1 Protect: load config (ds) - 123 msec
HCCP 1 1 Protect: load config (chnl set freq) - 35 msec

```

| Related Commands | Command                          | Description                                                                                                   |
|------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------|
|                  | <b>debug hccp authentication</b> | Displays authentication debug messages for HCCP groups.                                                       |
|                  | <b>debug hccp channel-switch</b> | Displays debug messages related to an RF or channel switch that is being used for HCCP N+1 (1:n) redundancy.  |
|                  | <b>debug hccp events</b>         | Displays debug messages for all HCCP group interaction.                                                       |
|                  | <b>debug hccp inter-db</b>       | Displays debug messages for the inter-database events during HCCP operations.                                 |
|                  | <b>debug hccp plane</b>          | Displays debug messages for HCCP-related messages sent between the router's control plane and data backplane. |
|                  | <b>debug hccp sync</b>           | Displays debug messages for HCCP synchronization messages.                                                    |

# debug hw-module all upgrade

To enable debug messages for field-programmable devices (FPDs), use the **debug hw-module all upgrade** command in privileged EXEC configuration mode. To disable debug messages, use the **no** form of the command.

```
debug hw-module all upgrade [error | event]

no debug hw-module all upgrade [error | event]
```

|                    |              |                                                                 |
|--------------------|--------------|-----------------------------------------------------------------|
| Syntax Description | <b>all</b>   | Enable debug messaging for all supported modules in the system. |
|                    | <b>error</b> | (Optional) Enables display of FPD upgrade error messages.       |
|                    | <b>event</b> | (Optional) Enables display of FPD upgrade event messages.       |

Defaults    No default behavior or values

| Command History | Release     | Modification                                                                                                                                                                   |
|-----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(18)SXE | This command was introduced.                                                                                                                                                   |
|                 | 12.2(33)SRA | This command was integrated into Cisco IOS Release 12.2(33)SRA.                                                                                                                |
|                 | 12.2(33)SCB | This command was integrated into Cisco IOS Release 12.2(33)SCB. The FPD image upgrade is supported only for the SPAs inserted in the Cisco SIP-600 on a Cisco uBR10012 router. |

Usage Guidelines    The **debug hw-module all upgrade** command is intended for use by Cisco Systems technical support personnel.

If you attempt to use this command without a SPA installed, or with an incompatible SPA installed, the keyword options are not provided.

**Caution**

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco Systems technical support personnel. Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

For more information about FPD upgrades on SPA interface processors (SIPs) and shared port adapters (SPAs), refer to the *Cisco 7600 Series Router SIP, SSC, and SPA Software Configuration Guide*.

---

**Examples**

The following example enables FPD upgrade debug messages for all supported card types on the Cisco 7600 series router:

```
Router# debug hw-module all upgrade
```

# debug hw-module bay

To enable debugging information for a SPA, use the **debug hw-module bay** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

## Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

```
debug hw-module bay slot/subslot/bay {commands | errors | events | interrupts | oir | periodic}

no debug hw-module bay slot/subslot/bay {commands | errors | events | interrupts | oir |
periodic}
```

## Cisco IOS Release 12.2(33)SCB

```
debug hw-module bay slot/bay/port {commands | errors | events | interrupts | oir | periodic}

no debug hw-module bay slot/bay/port {commands | errors | events | interrupts | oir | periodic}
```

| Syntax            | Description                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------|
| <i>slot</i>       | The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for a SIP.         |
| <i>subslot</i>    | The subslot where the Wideband SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified. |
| <i>bay</i>        | The bay in the SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).             |
| <i>port</i>       | Specifies the interface number on the SPA.                                                               |
| <b>commands</b>   | Enables debug messages for control plane configuration and commands on a SPA.                            |
| <b>errors</b>     | Enables debug messages for error handling and race conditions on a SPA.                                  |
| <b>events</b>     | Enables debug messages for control plane event notifications on a SPA.                                   |
| <b>interrupts</b> | Enables debug messages for interrupt handling on a SPA.                                                  |
| <b>oir</b>        | Enables debug messages for online insertion and removal (OIR) processing on a SPA.                       |
| <b>periodic</b>   | Enables debug messages for periodic processing on a SPA.                                                 |

**Command Default** No Wideband SPA debug messages are enabled.

**Command Modes** Privileged EXEC (#)

**Command History**

| Release     | Modification                                                                                                               |
|-------------|----------------------------------------------------------------------------------------------------------------------------|
| 12.3(21)BC  | This command was introduced for the Cisco uBR10012 router.                                                                 |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                            |
| 12.2(33)SCB | This command was modified to change the addressing format for a SPA from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> . |

**Usage Guidelines**

The **debug hw-module bay** command is intended for use by Cisco technical support personnel.

**Caution**

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support personnel. Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

If you attempt to use a **debug hw-module bay** command without a SPA installed, the keyword options are not provided.

**Examples**

The following example shows how to enable debug messages for error handling and race conditions:

```
Router# debug hw-module bay 1/0/0 errors
```

|                 | 12.2(8)BC2     | This command was introduced for the Cisco uBR7200 series universal broadband router.                                                                                                                                                                                                                                                                                                                                                                                      |
|                 | 12.2(15)BC1    | Support was added for the Cisco uBR10012 universal broadband router.<br><br>Also, the <b>detail</b> option was removed, and this command now requires that you enable PacketCable debugging for one or more IP addresses, using the <b>debug packetcable subscriber</b> command, before displaying any output.<br><br>In addition, <b>packetcable gate coordination</b> support was removed for all platforms because that debugging option was removed from the release. |

|                  |                                                                                                                                                                                                                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | This command enables the display of all PacketCable debugging messages, and is equivalent to giving the other <b>debug packetcable gate</b> commands individually. Use this command to get complete debugging about a particular event, such as the creation or termination of a call. |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

In Cisco IOS Release 12.2(15)BC1 and later releases, you must first use the **debug packetcable subscriber** command to enable PacketCable debugging for one or more IP addresses before the **debug packetcable all** command displays any output.

## Note

To display detailed debugging output in Cisco IOS Release 12.2(15)BC1 and later releases, use the **verbose** option when you enable PacketCable debugging output using the **debug packetcable subscriber** command.

## Caution

This command can generate a significant amount of debugging information, and the volume of this information could impact system performance on active PacketCable networks. Do not use this command except in lab or test networks, or where the need to troubleshoot problems makes the impact on system performance acceptable.

**Examples**

The following example shows typical output for the **debug packetcable all** command for the events starting with a call is placed up until the gates go into the committed state:

```
Router# debug packetcable all
PacketCable Client:
 Pktcbl gate control msgs debugging is on
 Pktcbl gate coord msgs debugging is on
 Pktcbl commit msgs debugging is on
 Pktcbl event msgs debugging is on
 Pktcbl rsvp-to-docsis msgs debugging is on
 Pktcbl gate database changes debugging is on

|------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>debug cops</b>             | Displays debugging messages related to the COPS protocol.                                                                                                                 |
|                  | <b>debug packetcable cops</b> | Enables debugging of Common Open Policy Service (COPS) messages and errors that are related to PacketCable operations on the Cisco CMTS router.                           |
|                  | <b>debug packetcable gate</b> | Displays general debugging messages related to specific PacketCable gate events and messages.                                                                             |
|                  | <b>debug packetcable hccp</b> | Enables debugging messages for events that are related to Hot Standby Connection-to-Connection Protocol (HCCP) N+1 redundancy synchronization for PacketCable operations. |

 **debug packetcable all**

| Command                             | Description                                                                                                        |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>debug packetcable ipc</b>        | Enables interprocess communications (IPC) messages related to PacketCable operations on the Cisco uBR10012 router. |
| <b>debug packetcable subscriber</b> | Enables PacketCable debugging for a specific subscriber IP address.                                                |

# debug packetcable cops

To enable debugging of Common Open Policy Service (COPS) messages and errors that are related to PacketCable operations on the Cisco CMTS router, use the **debug packetcable cops** command in privileged EXEC mode. To turn off this debugging, use the **no** form of this command.

**debug packetcable cops**

**no debug packetcable cops**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                                                                                         |
|-----------------|-------------|------------------------------------------------------------------------------------------------------|
|                 | 12.2(15)BC1 | This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers. |

**Usage Guidelines** This command enables debugging for the COPS messages and errors that are related to PacketCable operations. It produces output that is similar to the **debug cops** command, except that the output for this command is limited to the use of the COPS protocol to support PacketCable connections.

**Examples** The following example shows typical debugging output for the **debug packetcable cops** command:

```
Router# debug packetcable cops
Pktcbl COPS msgs debugging is on

Router#

|                  | <b>debug packetcable all</b>        | Displays general debugging messages for all PacketCable events.                                                                                                           |
|                  | <b>debug packetcable gate</b>       | Displays general debugging messages related to specific PacketCable gate events and messages.                                                                             |
|                  | <b>debug packetcable hccp</b>       | Enables debugging messages for events that are related to Hot Standby Connection-to-Connection Protocol (HCCP) N+1 redundancy synchronization for PacketCable operations. |
|                  | <b>debug packetcable ipc</b>        | Enables interprocess communications (IPC) messages related to PacketCable operations on the Cisco uBR10012 router.                                                        |
|                  | <b>debug packetcable subscriber</b> | Enables PacketCable debugging for a specific subscriber IP address.                                                                                                       |

# debug packetcable gate

To display general debugging messages for specific PacketCable gate events and messages, use the **debug packetcable gate** command in privileged EXEC mode. To turn off Packetcable debugging, use the **no** form of this command.

```
debug packetcable gate { commit | control | coordination | database | docsis-mapping |
events [process] } [detail]
```

```
no debug packetcable gate { commit | control | coordination | database | docsis-mapping |
events [process] } [detail]
```

| Syntax Description    |             |                                                                                                                                                   |
|-----------------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>commit</b>         |             | Displays debugging messages for the commit events on each gate.                                                                                   |
| <b>control</b>        |             | Displays debugging messages for gate control events (allocation, set, and delete).                                                                |
| <b>coordination</b>   |             | Displays debugging messages for gate coordination events (gate close and open) (not supported in Release 12.2(15)BC1 and later releases).         |
| <b>database</b>       |             | Displays debugging messages for all updates to the gate database, including gate creation and deletion, state transitions, and structure updates. |
| <b>docsis-mapping</b> |             | Displays debugging messages for the mapping between PacketCable and Data-over-Cable System Interface Specification (DOCSIS) parameters.           |
| <b>events</b>         |             | Displays debugging messages for the event messages that are sent during a voice call.                                                             |
| <b>process</b>        |             | (Optional) Displays non-subscriber-related process event messages (available only when using the <b>events</b> option).                           |
| <b>detail</b>         |             | Displays additional debug messages for specific events, such as the contents of a PacketCable headers and messages.                               |
|                       | <b>Note</b> | Release 12.2(15)BC1 removed this option and replaced it with the <b>verbose</b> option of the <b>debug packetcable subscriber</b> command.        |

| Command Modes | Privileged EXEC |

|---------------|-----------------|

| Command History | Release     | Modification                                                                                                                                                                                                                                                                                                                                            |
|-----------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(8)BC2  | This command was introduced for the Cisco uBR7200 series universal broadband router.                                                                                                                                                                                                                                                                    |
|                 | 12.2(15)BC1 | The <b>coordination</b> and <b>detail</b> options were removed, and the <b>process</b> option was added. Support was also added for the Cisco uBR10012 router. In addition, most options no longer display any output until PacketCable debugging has been enabled for one or more IP addresses, using the <b>debug packetcable subscriber</b> command. |
|                 | 12.2(15)BC2 | The <b>hccp</b> option was added.                                                                                                                                                                                                                                                                                                                       |

**Usage Guidelines**

Use this command to enable debugging for the individual PacketCable functional systems on the Cisco CMTS. As a general rule, selectively use these commands to debug or troubleshoot problems instead of turning on all debugging with the **debug packetcable all** command.

In Cisco IOS Release 12.2(15)BC1 and later, you must also enable debugging for one or more IP addresses, using the **debug packetcable subscriber** command, before the **debug packetcable gate** command displays any output. The **debug packetcable gate events process** command is an exception to this, however, because it does not display subscriber-related information.

**Note**

The **debug packetcable all** command is equivalent to repeatedly giving the **debug packetcable gate** command with each of its possible options.

**Tip**

To display detailed debugging output in Cisco IOS Release 12.2(15)BC1 and later releases, use the **verbose** option when you enable PacketCable debugging output using the **debug packetcable subscriber** command.

**Examples**

This section shows typical examples for each type of debugging message.

**Commit Event Debugging**

The following example shows typical debugging messages for the commit events on a gate. Omit the **verbose** option if you do not want to display the header and message contents.

```
Router# debug packetcable subscriber 192.168.78.21 verbose
```

```
Router# debug packetcable commit
```

```
Pktcbl commit msgs (detail) debugging is on
```

### Gate Coordination Event Debugging

The following example shows typical debugging messages for gate coordination events. Omit the **verbose** option if you do not want to display the header and message contents.

#### Note

The **coordination** option was removed in Cisco IOS Release 12.2(15)BC1.

```
Router# debug packetcable subscriber 192.168.78.21 verbose
Router# debug packetcable coordination
Pktcbl gate coord msgs (detail) debugging is on

| <b>debug packetcable cops</b>       | Enables debugging of Common Open Policy Service (COPS) messages and errors that are related to PacketCable operations on the Cisco CMTS router.                           |
| <b>debug packetcable hccp</b>       | Enables debugging messages for events that are related to Hot Standby Connection-to-Connection Protocol (HCCP) N+1 redundancy synchronization for PacketCable operations. |
| <b>debug packetcable ipc</b>        | Enables interprocess communications (IPC) messages related to PacketCable operations on the Cisco uBR10012 router.                                                        |
| <b>debug packetcable subscriber</b> | Enables PacketCable debugging for a specific subscriber IP address.                                                                                                       |

# debug packetcable hccp

To display debugging messages for events that are related to Hot Standby Connection-to-Connection Protocol (HCCP) N+1 redundancy synchronization for PacketCable operations, use the **debug packetcable hccp** command in privileged EXEC mode. To turn off the debugging, use the **no** form of this command.

**debug packetcable hccp**

**no debug packetcable hccp**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                                                                                         |
|-----------------|-------------|------------------------------------------------------------------------------------------------------|
|                 | 12.2(15)BC2 | This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers. |

**Usage Guidelines** Use this command to enable debugging for events that are related to HCCP redundancy operations that are related to PacketCable operations on the Cisco CMTS. These debugging messages show errors that occurred when the Cisco CMTS was synchronizing the PacketCable databases and state information between the Working and Protect interfaces.

**Examples** The following example shows a typical debugging message for the **debug packetcable hccp** command.

```
Router# debug packetcable hccp
```

```
Pktcbl HCCP msgs debugging is on
```

```
Pktcbl(gdb): gdb pointer is null for if_index = 13, gid = 3
```

**Tip**

The above debug message indicates that the Cisco CMTS was synchronizing the PacketCable gate database on the Protect interface at the same time a PacketCable gate was in the process of being created. Because the gate had not yet been fully initialized, the synchronization of the gate database had incomplete information about the gate. This is typically a temporary condition that is resolved at the next synchronization of the interfaces.

|------------------|------------------------------|-----------------------------------------------------------------|
|                  | <b>debug cops</b>            | Displays debugging messages related to the COPS protocol.       |
|                  | <b>debug hccp sync</b>       | Displays debug messages for HCCP synchronization messages.      |
|                  | <b>debug packetcable all</b> | Displays general debugging messages for all PacketCable events. |

| Command                       | Description                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>debug packetcable cops</b> | Enables debugging of Common Open Policy Service (COPS) messages and errors that are related to PacketCable operations on the Cisco CMTS router. |
| <b>debug packetcable gate</b> | Displays general debugging messages related to specific PacketCable gate events and messages.                                                   |
| <b>debug packetcable ipc</b>  | Enables interprocess communications (IPC) messages related to PacketCable operations on the Cisco uBR10012 router.                              |

# debug packetcable ipc

To enable interprocess communications (IPC) messages related to PacketCable operations on the Cisco uBR10012 router, use the **debug packetcable ipc** command in privileged EXEC mode. To turn off Packetcable IPC debugging, use the **no** form of this command.

**debug packetcable ipc**

**no debug packetcable ipc**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                                                                   |
|-----------------|-------------|--------------------------------------------------------------------------------|
|                 | 12.2(15)BC1 | This command was introduced for the Cisco uBR10012 universal broadband router. |

**Usage Guidelines** This command enables debugging for the IPC messages that are sent between the PRE1 module and cable interface line cards on the Cisco uBR10012 router during PacketCable operations. This command is not supported on the Cisco uBR7200 series router because this router does not use IPC messaging for PacketCable operations.

**Tip**

On the Cisco uBR10012 router, the **debug packetcable ipc** command displays some of the debugging messages that are displayed on other Cisco CMTS platforms by the **control** option for the **debug packetcable gate** command.

**Note**

The **debug packetcable ipc** command does not display any output until you have also enabled PacketCable debugging for one or more IP addresses using the **debug packetcable subscriber** command.

**Examples** The following example shows typical debugging output for the **debug packetcable ipc** command:

```
Router# debug packetcable subscriber 10.10.10.131
Router# debug packetcable ipc
Debug pktcbl IPC messages debugging is on
Router#
```

```
Jul 26 08:51:34 UTC: Pktcbl(ipc): Delete gate [5123] notification sent from Cable 6/1/1 to RP

|                  | <b>debug cops</b>                   | Displays debugging messages related to the COPS protocol.                                                                                                                 |
|                  | <b>debug packetcable all</b>        | Displays general debugging messages for all PacketCable events.                                                                                                           |
|                  | <b>debug packetcable cops</b>       | Enables debugging of Common Open Policy Service (COPS) messages and errors that are related to PacketCable operations on the Cisco CMTS router.                           |
|                  | <b>debug packetcable gate</b>       | Displays general debugging messages related to specific PacketCable gate events and messages.                                                                             |
|                  | <b>debug packetcable hccp</b>       | Enables debugging messages for events that are related to Hot Standby Connection-to-Connection Protocol (HCCP) N+1 redundancy synchronization for PacketCable operations. |
|                  | <b>debug packetcable subscriber</b> | Enables PacketCable debugging for a specific subscriber IP address.                                                                                                       |

# debug packetcable subscriber

To enable PacketCable debugging for a specific subscriber IP address or subnet, use the **debug packetcable subscriber** command in privileged EXEC mode. To turn off Packetcable debugging for a particular IP address or subnet, use the **no** form of this command.

**debug packetcable subscriber** *ip-address* [*mask*] [**verbose**]

**no debug packetcable subscriber** *ip-address* [*mask*] [**verbose**]

## Syntax Description

|                   |                                                                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i> | IP address for which PacketCable debugging should be enabled.                                                                                                                                                            |
| <i>mask</i>       | Subnet mask to use for this IP address. The router uses this mask to determine the scope of the IP addresses to be debugged. The default is 255.255.255.255 to indicate the IP address is a specific, single IP address. |
| <b>verbose</b>    | Displays detailed information as part of the debug messages, such as the contents of a PacketCable headers and messages.                                                                                                 |
| <b>Note</b>       | The <b>verbose</b> option replaces the <b>detail</b> option that appeared in previous versions of the other <b>debug packetcable</b> command.                                                                            |

## Command Modes

Privileged EXEC

## Command History

| Release     | Modification                                                                         |
|-------------|--------------------------------------------------------------------------------------|
| 12.2(15)BC1 | This command was introduced for the Cisco uBR7200 series universal broadband router. |

## Usage Guidelines

This command enables debugging for one or more specific PacketCable subscribers. This command by itself does not generate any debugging output, but enables debugging output for the other **debug packetcable** commands.

In Cisco IOS Release 12.2(15)BC1 and later releases, you must use the debug packet subscriber command to enable debugging for at least one IP address before the following **debug packetcable** commands will generate output:

- **debug packetcable gate commit**
- **debug packetcable gate control**
- **debug packetcable gate database**
- **debug packetcable gate docsis-mapping**
- **debug packetcable gate events**
- **debug packetcable ipc**

### Note

You do not need to use the debug packetcable subscribe command before using the **debug packetcable cops** and **debug packetcable gate events process** commands because these display information that is not subscriber-specific.

Examples

The following example shows how to enable PacketCable gate control debugging for one specific PacketCable subscriber at the IP address of 10.10.10.131:

```
Router# debug packetcable subscriber 10.10.10.131
Router# debug packetcable gate control
Router#
```

The following example shows how to enable PacketCable events debugging for all PacketCable subscribers within the 6.6.1.0 subnet:

```
Router# debug packetcable subscriber 6.6.1.0 255.255.255.0
Router# debug packetcable gate events
Router#
```

Related Commands

|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| debug cops             | Displays debugging messages related to the COPS protocol.                                                                                                                 |
| debug packetcable all  | Displays general debugging messages for all PacketCable events.                                                                                                           |
| debug packetcable cops | Enables debugging of Common Open Policy Service (COPS) messages and errors that are related to PacketCable operations on the Cisco CMTS router.                           |
| debug packetcable gate | Displays general debugging messages related to specific PacketCable gate events and messages.                                                                             |
| debug packetcable hccp | Enables debugging messages for events that are related to Hot Standby Connection-to-Connection Protocol (HCCP) N+1 redundancy synchronization for PacketCable operations. |
| debug packetcable ipc  | Enables interprocess communications (IPC) messages related to PacketCable operations on the Cisco uBR10012 router.                                                        |

# debug pxf

To enable debugging of the Parallel eXpress Forwarding (PXF) subsystems on the active Performance Routing Engine (PRE1) module on the Cisco uBR10012 router, use the **debug pxf** command in privileged EXEC mode. To disable debugging output, use the **no** form of the command.

**debug pxf {dma | microcode | stats | subblocks}**

**no debug pxf {dma | microcode | stats | subblocks}**

## Syntax Description

|                  |                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dma</b>       | Displays debugging information for direct memory access (DMA) buffers, error counters, and registers on the PXF processor.                                                                                                                   |
| <b>microcode</b> | Disables the automatic reloading of the microcode on the PXF processors upon a crash or fault condition. (If a fault or crash occurs, you must manually load the microcode on the PXF processors using the <b>microcode reload</b> command.) |
| <b>stats</b>     | Displays debugging information for the statistics collector events on the PXF processor.                                                                                                                                                     |
| <b>subblocks</b> | Displays debugging information for changes in the subblocks onboard the PXF processor.                                                                                                                                                       |

## Command Modes

Privileged EXEC

## Command History

| Release    | Modification                                                                   |
|------------|--------------------------------------------------------------------------------|
| 12.2(4)BC1 | This command was introduced for the Cisco uBR10012 universal broadband router. |

## Usage Guidelines

The **debug pxf** command enables debugging of the different subsystems that are active on the PXF processors that are on the PRE1 modules in the Cisco uBR10012 router.

Also, by default the PRE1 modules automatically reload the microcode on the PXF processors in case of a crash or fault. The **debug pxf microcode** command disables this automatic reloading of the microcode, to allow further debugging. When you have finished debugging the PXF processor, you then must manually reload the microcode on the PXF processor using the **microcode reload** command.

## Examples

### debug pxf dma

The following example shows how to enable debugging of the DMA engine on the PXF processor, as well as typically debugging messages that appear for the packets sent and received by the **ping** command:

```
Router# debug pxf dma
```

```
PXF DMA ASIC debugging is on
```

```
Router# ping 11.1.1.1
```

```

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 11.1.1.1, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 8/8/8 ms

**debug pxf microcode**

The following example shows how to disable the automatic reloading of the microcode on the PXF processors if a fault or crash occurs:

```

Router# debug pxf microcode

PXF microcode debugging is on

Router#

```

If a fault or crash then occurs on the PXF processors, the following messages are displayed on the console to indicate that the automatic reload of the microcode has been disabled and that the microcode must be manually reloaded using the **microcode reload** command.

```

Mar 1 16:29:58.796: %SLICE_TOASTER-4-PXF_CRASHINFO: Writing Slice (PXF) debug information
to slot0:pxf_crashinfo_20020301-212958.
Mar 1 16:30:00.252: NOTE: 'debug pxf microcode' is set. Use 'micro reload pxf' to restart
the PXF

```

**debug pxf stats**

The following example shows how to enable debugging of the statistics collector on the PXF processors, along with some typical debugging messages:

```

Router# debug pxf stats

PXF hardware statistics debugging is on

Router#

00:05:28: read vpn session 1 stat from toaster
00:05:28: read vpn session 2 stat from toaster
00:05:29: Statcoll: read simple stats failed
00:05:29: Statcoll read simple_octet...: NULL params (hwsb=0xFF, tt_info=0xC0)

```

**debug pxf subblocks**

The following example shows how to enable debugging of the subblocks on the PXF processors:

```

Router# debug pxf subblocks

PXF Subblocks debugging is on

Router#

```

|------------------|------------------------------------|--------------------------------------------------------------------------------------------------------------|
|                  | <b>clear pxf</b>                   | Clears the DMA and error checking and correcting (ECC) error counters on the PXF processor.                  |
|                  | <b>show hardware pxf cable</b>     | Displays information about the multicast echo and packet intercept features for one or all cable interfaces. |
|                  | <b>show hardware pxf cpu</b>       | Displays the display different statistics about the operation of the CPU processor during PXF processing.    |
|                  | <b>show hardware pxf microcode</b> | Displays identifying information for the microcode being used on the processor.                              |
|                  | <b>show hardware pxf xcm</b>       | Displays the current state of ECC for the External Column Memory (XCM) on the PXF processor.                 |

# debug pxf atom

To divert upstream and downstream Layer 2 Virtual Private Network (L2VPN) packets from the hardware switching path to the software switching path on the CMTS routers, use the **debug pxf atom** command in privileged EXEC mode. To cancel this operation, use the **no** form of this command.

```
debug pxf atom {ac | mpls | punt {upstream cable slot/subslot/port sid-value | downstream
label-number}}

no debug pxf atom {ac | mpls | punt {upstream cable slot/subslot/port sid-value | downstream
label-number}}
```

## Syntax Description

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ac</b>                      | Specifies the attachment circuit.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>mpls</b>                    | Specifies the MPLS forwarding information (MFI).                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>punt</b>                    | Diverts packet from the hardware switching path to the software switching path.                                                                                                                                                                                                                                                                                                                                                           |
| <b>upstream</b>                | Specifies the upstream packets.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>cable slot/subslot/port</b> | Specifies the cable interface for the L2VPN-compliant cable modem, where: <ul style="list-style-type: none"> <li><i>slot</i>—Chassis slot number of the cable interface line card. Valid values are from 5 to 8.</li> <li><i>subslot</i>—Secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li><i>port</i>—Port number. Valid values are from 0 to 4 (depending on the cable interface).</li> </ul> |
| <i>sid-value</i>               | Service ID (SID) of the cable modem.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>downstream label-number</b> | Specifies the local Multiprotocol Label Switching (MPLS) label of the pseudowire on the CMTS for downstream packets.                                                                                                                                                                                                                                                                                                                      |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

|-------------|---------------------------------------------------------------|
| 12.2(33)SCC | This command was introduced in Cisco IOS Release 12.2(33)SCC. |

## Usage Guidelines

This debug command enables the Parallel eXpress Forwarding (PXF) function to divert the upstream L2VPN packets from the hardware switching path to the software switching path, if the upstream packets match with the specified cable interface and SID. This debug command also enables the PXF function to divert the downstream L2VPN packets from the hardware switching path to the software switching path, if the downstream packets match with the specified local MPLS pseudowire label.

The **debug pxf atom** command must be used in conjunction with the **debug cable mac-address** and **debug cable l2-vpn** commands.

| Related Commands | Command                        | Description                                                                                                                                      |
|------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>debug cable mac-address</b> | Enables debugging output for a specific cable modem.                                                                                             |
|                  | <b>debug cable l2-vpn</b>      | Enables debugging output for the Layer 2 mapping of cable modems to a permanent virtual connection (PVC) or a virtual local area network (VLAN). |

# debug redundancy

To enable debugging of the Route Processor Redundancy (RPR) feature and its background procedures, use the **debug redundancy** command in Privileged EXEC mode.

**debug redundancy** {alarms | all | configsync | fsm | keepalive | peer-monitor | services | timesync}

## Syntax Description

|                     |                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------|
| <b>alarms</b>       | Enables debugging messages for alarms sent because of redundancy procedures.                                  |
| <b>all</b>          | Enables all redundancy debugging messages.                                                                    |
| <b>configsync</b>   | Enables debugging messages for the synchronization of the configuration files.                                |
| <b>fsm</b>          | Enables debugging for changes in the redundancy finite state machine (FSM).                                   |
| <b>keepalive</b>    | Enables debugging messages for the keepalive messages sent between Performance Routing Engine (PRE1) modules. |
| <b>peer-monitor</b> | Enables debugging messages for the standby PRE1 module's monitoring of the active PRE1 module.                |
| <b>rf-fsm</b>       | Enables debugging for changes in the redundancy finite state machine (FSM).                                   |
| <b>services</b>     | Enables debugging for the services requested during redundancy processing.                                    |
| <b>timesync</b>     | Enables debugging messages for time synchronization procedures.                                               |

## Command Modes

Privileged EXEC

## Command History

| Release     | Modification                                               |
|-------------|------------------------------------------------------------|
| 12.2(4)XF1  | This command was introduced for the Cisco uBR10012 router. |
| 12.2(11)BC3 | The <b>fsm</b> option was renamed to <b>rf-fsm</b> .       |

## Examples

The following example shows all redundancy debugging messages being enabled:

```
Router# debug redundancy all
```

```
Redundancy All debugging is on
```

```
Router#
```

The following example shows typical messages that the **debug redundancy alarms** command displays:

```
Router# debug redundancy alarms
```

```
Redundancy Alarms debugging is on
```

```
Router#
```

```
01:28:48: %REDUNDANCY-5-PEER_MONITOR_EVENT: Primary detected a secondary crash
(raw-event=KEEPALIVE_FAILURE(7))
slave_down: generating Secondary-Down alarm
Asserting alarm : SEC_FAILURE

01:28:48: %REDUNDANCY-5-PEER_MONITOR_EVENT: Primary detected a secondary crash
(raw-event=PEER_REDUNDANCY_STATE_CHANGE(5))
```

The following example shows the typical state changes that the **debug redundancy fsm** command displays when the standby PRE1 module is reset:

```
Router# debug redundancy fsm

Redundancy FSM debugging is on
Router#

01:15:30: %REDUNDANCY-5-PEER_MONITOR_EVENT: Primary detected a secondary crash
(raw-event=KEEPALIVE_FAILURE(7))
Flushing IPC entries in FSM queue

01:15:30: ehfa_fsm: state change, events: major=2 minor=1
REDUNDANCY_PEERSECONDARY_INITED(9) => REDUNDANCY_PEERSECONDARY_NONOPERATIONAL(6)

01:15:31: %REDUNDANCY-5-PEER_MONITOR_EVENT: Primary detected a secondary crash
(raw-event=PEER_REDUNDANCY_STATE_CHANGE(5))

01:15:31: %REDUNDANCY-5-PEER_MONITOR_EVENT: Primary detected a secondary crash
(raw-event=KEEPALIVE_FAILURE(7))
Flushing IPC entries in FSM queue

01:15:31: ehfa_fsm: state change, events: major=2 minor=1
REDUNDANCY_PEERSECONDARY_INITED(9) => REDUNDANCY_PEERSECONDARY_NONOPERATIONAL(6)

01:15:31: %REDUNDANCY-5-PEER_MONITOR_EVENT: Primary detected a secondary crash
(raw-event=PEER_REDUNDANCY_STATE_CHANGE(5))
```

The following example shows the messages that are displayed by the **debug redundancy keepalive** command:

```
Router# debug red keepalive

Redundancy Keepalive debugging is on
Router#

Sent keepalive
Received keepalive
Sent keepalive
Received keepalive
Sent keepalive
Received keepalive
Sent keepalive
```

| <b>redundancy<br/>force-failover<br/>main-cpu</b> | Forces a switchover so that the standby PRE1 module becomes the active PRE1 module. |

# debug usb

To display the packets that are transmitted and received over the USB interface, use the **debug usb** command in privileged EXEC mode. To turn off debugging for the USB interface, use the **no** form of this command.

**Cisco uBR925 cable access router, Cisco CVA122 Cable Voice Adapter**

**debug usb {rx | tx}**

**no debug usb {rx | tx}**

## Syntax Description

|           |                                                    |
|-----------|----------------------------------------------------|
| <b>rx</b> | Displays packets received on the USB interface.    |
| <b>tx</b> | Displays packets transmitted on the USB interface. |

## Command Modes

Privileged EXEC

## Command History

| Release   | Modification                                                          |
|-----------|-----------------------------------------------------------------------|
| 12.1(5)XU | This command was introduced for the Cisco CVA122 Cable Voice Adapter. |
| 12.2(2)XA | Support was added for the Cisco uBR925 cable access router.           |

## Usage Guidelines

This command displays a hexadecimal dump of each packet transmitted or received on the USB interface and should be used only while debugging CM operation. Displaying debugging messages, especially for each packet transmitted or received, consumes system resources. Turning on too many messages could negatively affect system performance.

## Examples

The following shows typical output from the **debug usb** command.

```
Router# debug usb rx
USB Rx debugging is on
Router# debug usb tx
USB Tx debugging is on
Nov 22 11:01:36.909: 0x040: 72 6C 19 E7 0C 12

## Appendix B: CMTS Router ROM Monitor Commands

---

**Revised: August 12, 2013, OL-15510-17**

This appendix describes the ROM monitor (ROMMON) that is used by the Cisco CMTS routers. The Cisco CMTS runs the ROM monitor when it is initially powered on or reset, and the ROM monitor determines what other software, such as a Cisco IOS boot helper image or software image, should be loaded next.

Because the ROM monitor is in the permanent memory on the processor card, it is always available and can help in troubleshooting possible hardware or software problems. It contains a small set of commands that allow access to the router's internal memory and other memory devices.

This appendix contains the following major sections:

- [Entering the ROM Monitor, page 2549](#)
- [Command Conventions, page 2552](#)
- [ROM Monitor Commands, page 2552](#)

**Caution**

The ROM monitor should be used only by trained service technicians or under the direction of a Cisco TAC engineer. Many of the commands available in the ROM monitor put the router in a diagnostic mode or in a non-functional state. Do not enter any commands in the ROM monitor unless you thoroughly understand their function and how to reverse their effects so that you can restore the router to normal operations.

---

## Entering the ROM Monitor

When the router initially powers on or reboots, the ROM monitor initializes the processor hardware and boots the main Cisco IOS software. You can enter ROM monitor mode during the bootup sequence or while the Cisco IOS software is running by using either the BREAK signal or by using the configuration register. See the following sections for more information on each method.

## Using the BREAK Signal

When the Cisco CMTS router is booting up, you can interrupt the start-up sequence and enter the ROM monitor by sending the BREAK signal. If the Cisco IOS software image is already running, you can also break into the ROM monitor by sending the BREAK signal. (Consult the documentation for your terminal software for information on how to send the BREAK signal).

For example, the following shows the BREAK signal being sent to interrupt a router that is running Cisco IOS software so as to enter ROM monitor mode.

**Tip** In this example, a CTRL-] is used to enter Telnet command mode, where the **send brk** command is used to send the BREAK signal. Other terminal programs might use different commands.

```

Cause Reg = 0xffffffff, Status Reg = 0x3400ff03
```

```
rommon 1 >
```

### Caution

When you enter ROM monitor mode, the Cisco IOS software no longer is executing, and all of the router's normal functions end. Do not enter ROM monitor mode on a Cisco CMTS that is being used for production purposes because this immediately halts all network and subscriber traffic through that Cisco CMTS until you restart the Cisco IOS software.

### Tip

To resume execution after interrupting the boot process or Cisco IOS software, use the **cont** command at the ROM monitor prompt. To boot another software image, use the **boot** command at the ROM monitor prompt.

## Using the Configuration Register

When the router initially boots, it passes control to the ROM monitor software, which uses the value of the configuration register to determine the next step in the bootup process. You can change the value of the configuration register by using the **confreg** command in ROM monitor mode or by using the **config-reg** command in global configuration mode.

### Using the Configuration Register in Global Configuration Mode

To set the configuration register when the router is running the Cisco IOS software, use the **config-reg** command in global configuration mode. Then use the **reload** command to reboot the router.

For example, the following commands set the configuration register to 0x00 so that the router boots into ROM monitor mode. The **reload** command then reboots the router.

```
Router# configure terminal
Router(config)# config-reg 0x0
Router(config)# exit
Router# reload

(router reboots)

Copyright (c) 2002 by cisco Systems, Inc.
UBR7200 platform with 524288 Kbytes of main memory

rommon 1 >
```

Tip

To set the configuration register for normal operations, use the **config-reg 0x2102** command. For a complete description of the configuration register, see the description of the **confreg** command.

### Using the Configuration Register in ROM Monitor Mode

To set the configuration register when the router is in ROM monitor mode, use the **confreg** command in ROM monitor mode. For example, the following commands set the configuration register to 0x2102, so that the router boots the Cisco IOS software. The **reset** command then reboots the router.

```
rommon 21 > confreg 0x2102

You must reset or power cycle for new config to take effect

rommon 22 > reset

(Software image boots...)

Router>
```

**Tip**

To set the configuration register for normal operations, use the **confreg 0x0** command. For a complete description of the configuration register, see the description of the **confreg** command.

## Command Conventions

Use the following conventions when giving commands at the ROM monitor prompt:

- Brackets [ ] denote an optional field.
- A word in *italics* is a variable for which you must supply a valid value.
- The default ROM monitor prompt is “rommon *x* >”, where *x* is the number of the command, as used in the command history table. The ROM monitor prompt is determined by the PS1 environment variable (see the **set** command).
- Give the **help** or **?** command to display a help screen listing all of the commands that are available in ROM monitor mode. For usage information about a specific command, give the command followed by **-?** (for example, **alias -?**).
- All address and size arguments to the memory-related commands are hexadecimal values (using a “0x” prefix).
- To specify more than one command on a command line, separate the commands with the semicolon (;) delimiter.

**Note**

You cannot include the **repeat** command as part of a command line that has multiple commands.

## ROM Monitor Commands

You can use the following commands at the ROM monitor prompt on a Cisco CMTS router:

- [alias, page 2554](#)
- [boot, page 2556](#)
- [break, page 2560](#)
- [confreg, page 2562](#)
- [cont, page 2565](#)
- [context, page 2567](#)
- [cpu\\_card\\_type, page 2569](#)
- [dev, page 2570](#)
- [dir, page 2572](#)
- [dis, page 2573](#)
- [frame, page 2575](#)
- [help, page 2577](#)
- [history, page 2579](#)

- [meminfo](#), page 2581
- [repeat](#), page 2582
- [reset](#), page 2584
- [set](#), page 2586
- [show\\_spd](#), page 2588
- [stack](#), page 2591
- [sync](#), page 2593

- [unalias](#), page 2597
- [unset](#), page 2599

# alias

To define an alias to be used at the ROM monitor prompt, use the **alias** command in ROM monitor mode.

**alias** [*name=value*]

## Syntax Description

|                   |                                                                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name=value</i> | (Optional) Specifies the name of the alias to be defined and its corresponding command string. If the <i>value</i> parameter includes spaces, you must include the string within double quotes. |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

If no arguments are given, displays the aliases that are currently defined.

## Command Modes

|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
| 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
| 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

## Usage Guidelines

Aliasing allows you to abbreviate commands or to set up a command so that it is automatically run with certain options. The ROM monitor's **alias** function is based on the syntax used in the Korn shell on Unix systems.

Normally, only the first word at the ROM monitor prompt is checked for an alias. However, when you define an alias that contains a space as its last character, the ROM monitor also checks the next word at the ROM monitor prompt for an alias.

### Note

If an alias contains any spaces, the entire command must be enclosed within quotes when you define it with the **alias** command. To create an alias for multiple commands, separate the commands with a semicolon (;) delimiter.

### Tip

Use the **unalias** command to delete an alias.

---

**Examples**

The following example shows how to display the currently defined aliases:

```
rommon 13 > alias
```

```
r=repeat
h=history
?=help
b=boot
ls=dir
i=reset
k=stack
```

```
rommon 14 >
```

The following example defines an alias named “cpuinfo” that executes three separate CPU-related commands:

```
rommon 31 > alias cpuinfo="cpu_card_type;meminfo;context"
rommon 32 >
```

The following example shows how to define an alias **dird** that lists the file contents of the Flash Disk in the disk0 slot:

```
rommon 18 > alias dird="dir disk0:"
rommon 19 > alias
```

```
r=repeat
h=history
?=help
b=boot
ls=dir
i=reset
k=stack
dird=dir disk0:
```

```
rommon 20 >
```

---

**Related Commands**

| Command        | Description                                                                             |
|----------------|-----------------------------------------------------------------------------------------|
| <b>sync</b>    | Writes the current values of aliases and monitor environment variables to Flash memory. |
| <b>unalias</b> | Deletes a currently-defined alias.                                                      |

# boot

To boot a router manually, use the **boot** command in ROM monitor mode.

```
boot [-xv]

boot [-xv] [device:][imagename]

boot [-xv] filename [tftp-ip-address]

boot [-xv] tftp://server/path/filename
```

## Syntax Description

|                                    |                                                                                                                                                                                                                                                                                       |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>x</b>                           | (Optional) Loads the specified image into the router’s memory but does not execute it.                                                                                                                                                                                                |
| <b>v</b>                           | (Optional) Enables verbose mode to display debugging information as the image is loaded and executed.                                                                                                                                                                                 |
| <i>device:</i>                     | (Optional) Specifies that the router should boot an image on the specified device. If not specified, the router boots from the default memory device.                                                                                                                                 |
| <i>imagename</i>                   | (Optional) Specifies the filename for the image to be booted and loaded. If not specified, the router boots the first file on the specified device.<br><br><b>Note</b> When specifying both a <i>device:</i> and <i>imagename</i> , do not put any spaces between the two arguments.  |
| <i>filename</i>                    | Specifies the path and filename for the image that the router should download from a Trivial File Transfer Protocol (TFTP) server.<br><br><b>Note</b> You must specify the full path for the desired file, as it exists on the TFTP server.                                           |
| <i>tftp-ip-address</i>             | (Optional) Specifies the IP address for the TFTP server from which the router should download and boot the specified <i>filename</i> . If not specified, the router sends a TFTP request to the IP broadcast address of 255.255.255.255 and uses the first TFTP server that responds. |
| <i>tftp://server/path/filename</i> | Specifies the complete TFTP URL for the filename to be downloaded and run. This URL should specify the fully-qualified <i>server</i> name (or IP address), full <i>path</i> on the TFTP server, and <i>filename</i> to be downloaded.                                                 |

## Defaults

If specified without any options, the **boot** command loads and executes the first file on the default memory device. If a *device* is specified without a *filename*, the **boot** command loads and executes the first file on that device. If a *filename* is specified without a TFTP server IP address, the boot command advertises for a TFTP server using the IP broadcast address of 255.255.255.255 and uses the first TFTP server that responds.

|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

### Usage Guidelines

The **boot** command allows a network administrator to boot the router from the ROM monitor (ROMMON) prompt. The router can enter ROMMON for the following reasons:

- The administrator interrupted the boot sequence or Cisco IOS software by pressing the BREAK signal.
- The router's configuration register is set to boot into ROMMON (0x00).
- The router entered ROMMON because of a software exception or error.

The **boot** command allows the administrator to continue the boot process or to load a new software image.

#### Note

To upgrade the router to a new Cisco IOS software image, you can use either the **boot** command in ROMMON mode or the **boot system** commands in global configuration mode.

### Boot Changes in Cisco IOS Release 12.2

Cisco IOS Release 12.2 changed the behavior of the ROM monitor (ROMMON) during the bootup sequence. Previously, users could issue the break signal during the bootup sequence to break into ROMMON, and then immediately boot a new Cisco IOS image using the **boot** command.

This behavior is no longer allowed when the router is using a boot image that is based on Cisco IOS Release 12.2, because interrupting the boot process could leave the hardware and software registers in an unknown state. Instead, use the following procedure when using a router with a Cisco IOS Release 12.2 boot image:

- Step 1** At the router's console prompt, send a BREAK signal to interrupt the boot process and enter ROMMON.
- Step 2** Set the configure register to boot into ROMMON by giving the **confreg 0x0** command.
- Step 3** Use the **reset** command to reset the NPE and to boot into ROMMON. This ensures a clean boot into ROMMON, with all registers set to a known state.
- Step 4** Set the configure register to boot an IOS image by giving the **confreg 0x2102** command.
- Step 5** Use the **boot** command to boot the desired Cisco IOS image.

### Examples

The following example shows how to boot the router using the first file in the default device:

```
rommon 1 > boot
```

```
Self decompressing the image :
```

```
#####
[OK]
```

```
(Software image boots...)
```

```
Router>
```

The following example shows how to specify that the router should download and boot the file named “newimage.bin” in the subdirectory named “ubrimages” on the TFTP server with the IP address of 10.10.10.31:

```
rommon 45> boot tftp://10.10.10.31/ubrimages/newimage.bin
```

```
Self decompressing the image :
```

```
#####
[OK]
```

```
(Software image boots...)
```

```
Router>
```

The following example shows how to use the alternate syntax to specify that the router should download and boot the file named newimage.bin on the TFTP server with the IP address of 10.10.10.31:

```
rommon 45> boot newimage.bin 10.10.10.31
```

```
Self decompressing the image :
```

```
#####
[OK]
```

```
(Software image boots...)
```

```
Router>
```

The following example shows the new ROMMON boot procedure that is required when using a Cisco IOS Release 12.2 (or later) boot image:

```
Router-NPE#
```

```
telnet> send brk
```

```
*** System received an abort due to Break Key ***
signal= 0x3, code= 0x0, context= 0x6208b290
PC = 0x606b5ab0, SP = 0x80007e00, RA = 0x606d2370
Cause Reg = 0xffffffff, Status Reg = 0x3400ff03
```

```
rommon 2 > boot flash:newiosimage.bin
```

```
Please reset before booting
```

```
rommon 3 > confreg 0x0
```

```
You must reset or power cycle for new config to take effect
```

```
rommon 4 > reset
```

```
System Bootstrap, Version 12.2(11)BC3a, RELEASE SOFTWARE (fc1)
Copyright (c) 2002 by cisco Systems, Inc.
UBR7200 platform with 524288 Kbytes of main memory
```

```
rommon 1 > boot flash:newiosimage.bin
```

```
Self decompressing the image :
```

```
#####
[OK]
```

```
(Software image boots...)
```

```

```

**Related Commands**

| Command         | Description                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| <b>break</b>    | Sets or clears the debugger breakpoint.                                                                           |
| <b>cont</b>     | Continues the execution of the Cisco IOS software image that has been interrupted by a BREAK or debugger command. |
| <b>reset</b>    | Reinitializes the ROM monitor and return it to a known state.                                                     |
| <b>sync</b>     | Writes the current values of aliases and monitor environment variables to Flash memory.                           |
| <b>sysreset</b> | Displays the return information from the system image that was last booted.                                       |

# break

To set or clear the debugger breakpoint, use the **break** command in ROM monitor mode.

**break** [-s *address* | -c]

|                           |                          |                                                                                                                                |
|---------------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>-s <i>address</i></b> | (Optional) Sets the breakpoint to the specified <i>address</i> in memory. The <i>address</i> must be specified in hexadecimal. |
|                           | <b>-c</b>                | (Optional) Clears the currently-defined breakpoint.                                                                            |

**Defaults** If no arguments are given, the command displays the currently-defined breakpoint.

**Command Modes** ROM monitor

| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                                                                                                                                                                            |
|------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | 11.3 NA        | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
|                        | 12.1(5)EC      | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
|                        | 12.2(4)BC1     | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
|                        | 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines** The ROM monitor supports one breakpoint. If set, the processor runs normally, but when its program counter reaches the breakpoint address, the system breaks into ROM monitor mode. You can examine memory locations or register contents, and then continue normal program execution by using the **cont** command.

**Examples** The following example shows how to set a breakpoint so that when the processor breaks into ROM monitor mode when its program counter reaches 0xbfc02708:

```
rommon 37 > break -s 0xbfc02708
```

```
breakpoint set to 0xbfc02708
```

```
rommon 38 >
```

The following example shows how to display the currently-defined breakpoint:

```
rommon 38 > break
```

```
breakpoint set to 0xbfc02708
```

```
rommon 39 >
```

The following example shows how to clear the currently-defined breakpoint:

```
rommon 39 > break -c

breakpoint is cleared

rommon 40 >
```

#### Related Commands

| Command     | Description                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------|
| <b>boot</b> | Boots the router manually.                                                                                           |
| <b>cont</b> | Continues the execution of the Cisco IOS software image that has been interrupted by a BREAK or debugger breakpoint. |

# confreg

To change the value of the router's configuration register, use the **confreg** command in ROM monitor mode.

**confreg** [*value*]

## Syntax Description

|              |                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>value</i> | (Optional) New value for the configuration register, expressed as a 16-bit hexadecimal value. The valid range for <i>value</i> is 0x0 to 0xFFFF. If <i>value</i> is not specified, the command interactively prompts you for the individual register settings. |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

0x2102 (boots the Cisco IOS software image and allows the use of the BREAK signal to enter ROMMON)

## Command Modes

ROM monitor (>)

## Command History

| 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                       |
| 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                |
| 12.2(4)BC1  | Support was added for the Cisco uBR10012 router.                                                                   |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                         |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. |

## Usage Guidelines

The configuration register determines the router's behavior when it boots. Typically, an administrator changes the configuration register so that it boots either into ROMMON mode or boots a Cisco IOS software image, but other options are also available.

If given without an argument, the **confreg** command interactively prompts you for the new values of the individual register settings, using English descriptions. You can either keep the current settings unchanged or change them as desired. The new value of the configuration register is written into the router's nonvolatile Flash memory (NVRAM) immediately, but does not take effect until you reset the router.

If you specify an argument with the **confreg** command, it must be a 16-bit hexadecimal value in the following format:

**Table 275 Configuration Register Bit Field Descriptions**

| Bit | Description                                                             |
|-----|-------------------------------------------------------------------------|
| 15  | If set, enables the router's diagnostic mode (for example, 0x8000).     |
| 14  | If set, uses the network number in IP broadcasts (for example, 0x4000). |

**Table 275** Configuration Register Bit Field Descriptions (continued)

| Bit   | Description                                                                                                                                                                                                                                                                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 13    | If set, allows the router to fall back into ROMMON mode if the boot procedure fails. If not set, the router attempts each valid <b>boot</b> command (as specified by bits 3–0) for a total of 5 times each, until one of the commands is successful (for example, 0x2000).                                                                                            |
| 12–11 | Defines the speed, in bps, for the console port:<br>00 = 0x0000 = 9600<br>01 = 0x0800 = 4800<br>10 = 0x1000 = 1200<br>11 = 0x1800 = 2400<br><b>Note</b> On the Cisco CMTS routers, the console port speed is fixed at 9600 bps and cannot be changed.                                                                                                                 |
| 10    | If set, uses an IP broadcast address that consists of all ones (for example, 0x0400).                                                                                                                                                                                                                                                                                 |
| 9     | If set, disables the secondary bootstrap (for example, 0x0200).                                                                                                                                                                                                                                                                                                       |
| 8     | If set, the router enables the BREAK key, allowing users to break into ROMMON during the boot process (for example, 0x0100).                                                                                                                                                                                                                                          |
| 7     | Unused on the Cisco CMTS routers.                                                                                                                                                                                                                                                                                                                                     |
| 6     | If set, the router ignores the configuration file in its Flash memory. This is typically done when the user has forgotten the router's enable password (for example, 0x0040).                                                                                                                                                                                         |
| 5–4   | Unused on the Cisco CMTS routers.                                                                                                                                                                                                                                                                                                                                     |
| 3–0   | Defines the router's boot behavior:<br>0x0000 = Boots to the ROMMON prompt<br>0x0001 = Boots the ROMMON boot helper software (first file in bootflash:)<br>0x0002 to 0x000F = Boots a Cisco IOS software image, based on the values of the router's boot variables. Each <b>boot system</b> command in the configuration file is tried until a valid image is booted. |

For example, for normal operations the configuration register is set to 0x2102, which sets bit 13 (allows the router to fall into ROMMON mode if the boot fails), bit 8 (allows the user to break into ROMMON), and bit 1 (boots a Cisco IOS software image). Bits 11 and 12 are cleared, which sets the console port to 9600 bps.

The following are the most commonly-used configuration register values:

- 0x0 = Boot into ROMMON.
- 0x2002 = Normal boot for standard operations, but the BREAK signal cannot be used to break into ROM monitor mode.
- 0x2102 = Normal boot for standard operations, enabling the BREAK signal.
- 0x2142 = Normal boot but the router ignores the configuration file in Flash memory.

**Tip**

The **confreg** command is identical in function to the **config-register** command that is available in global configuration mode.

Examples

The following example shows how to change the configuration register by using the English prompts. In this example, the only change is to have the router boot the Cisco IOS software image instead of entering ROMMON mode:

```
rommon 1 > confreg

Configuration Summary
enabled are:
break/abort has effect
console baud: 9600
boot: the ROM Monitor

do you wish to change the configuration? y/n [n]: y
enable "diagnostic mode"? y/n [n]:
enable "use net in IP bcast address"? y/n [n]:
enable "load rom after netboot fails"? y/n [n]:
enable "use all zero broadcast"? y/n [n]:
disable "break/abort has effect"? y/n [n]:
enable "ignore system config info"? y/n [n]:
change console baud rate? y/n [n]:
change the boot characteristics? y/n [n]: y
enter to boot:
0 = ROM Monitor
1 = the boot helper image
2-15 = boot system
[0]: 2

Configuration Summary
enabled are:
break/abort has effect
console baud: 9600
boot: image specified by the boot system commands
 or default to: cisco2-C10000

do you wish to change the configuration? y/n [n]: n

You must reset or power cycle for new config to take effect.

rommon 2 >
```

Note

After changing the configuration register in interactive mode, the system displays the new values and prompts you again as to whether you want to change them. If the values are correct, answer **no** and the system returns you to the ROMMON prompt. If you made any changes, the system reminds you that you must reset or power cycle the router before the new configuration register takes effect.

The following example shows how to set the configuration register to the typical value of 0x2102, so that it boots a Cisco IOS software image:

```
rommon 7 > confreg 0x2102

You must reset or power cycle for new config to take effect.

rommon 8 >
```

Related Commands

| Command     | Description                |
|-------------|----------------------------|
| <b>boot</b> | Boots the router manually. |

# cont

To continue the execution of the Cisco IOS software image that has been interrupted by a BREAK signal or debugger breakpoint, use the **cont** command in ROM monitor mode.

**cont** [*address*]

## Syntax Description

*address* (Optional) Specifies the address in memory at which the router should continue execution. If *address* is not specified, the command continues execution at the address currently stored in the program counter (PC) register.

### Caution

Do not use the *address* option unless instructed to do so by Cisco TAC engineers.

## Command Default

If given without any arguments, the command continues execution at the address currently stored in the processor's program counter (PC) register.

## Command Modes

ROM monitor (>)

## Command History

| Release     | Modification                                                                                                       |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                       |
| 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                |
| 12.2(4)BC1  | Support was added for the Cisco uBR10012 router.                                                                   |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                         |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. |

## Usage Guidelines

The **cont** command typically is used when a user has interrupted the operation of the Cisco IOS software by using the BREAK signal to enter ROM monitor mode, and then wants to continue with the original Cisco IOS software image. This command can also be used to continue program execution when the user uses the BREAK signal to interrupt the Cisco IOS software boot procedure, or has used the **break** command to set a debug breakpoint.

## Examples

In the following example, the **cont** command continues executing the Cisco IOS software image, after the user has interrupted the software by sending a BREAK signal:

```
Router#
```

```
telnet> send brk
```

```
*** System received an abort due to Break Key ***
signal= 0x3, code= 0x0, context= 0x6208b290
```

 cont

```
PC = 0x606b5ab0, SP = 0x80007e00, RA = 0x606d2370
Cause Reg = 0xffffffff, Status Reg = 0x3400ff03
```

```
rommon 5 > cont
```

```
Router#
```

|-----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
|                 | 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
|                 | 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
|                 | 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines** When the processor fault or exception occurs, the ROM monitor preserves the processor context at the time of the fault. The **context** command displays this processor context, which includes information about the kernel registers and the process mode of the booted image (if available).

**Examples** The following example shows how to display the CPU context at the time of the most recent fault or exception:

```
rommon 21 > context
```

```
Kernel Level Context:
```

| Reg   | MSW        | LSW       | Reg   | MSW        | LSW      |

|-----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
|                 | 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
|                 | 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
|                 | 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Examples** The following example shows how to list the files on the slot0: and bootflash: devices.

```
rommon 40 > dir slot0:
 File size Checksum File name
 65 bytes (0x41) 0xb49d basic.cm
 2229799 bytes (0x220627) 0x469e uBR7200-k.z

rommon 41 > dir bootflash:

 File size Checksum File name
1378560 bytes (0x150900) 0x6607c732 ubr7200-kboot-mz.122.11.BC3
 16220 bytes (0x3f5c) 0x47e9a02c bundle.cfg
 76 bytes (0x4c) 0x313b6bb0 config.cm
 189250 bytes (0x2e342) 0xe95da48e crashinfo_20030515-212829

rommon 42 >
```

# dis

To disassemble a segment of main memory, use the **dis** command in ROM monitor mode.

**dis** [*address*] [*num-of-bytes*]

|                           |                     |                                                                          |
|---------------------------|---------------------|--------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>address</i>      | (Optional) Address in main memory at which the disassembly should begin. |
|                           | <i>num-of-bytes</i> | (Optional) Number of bytes to disassemble.                               |

**Command Default** If no arguments are given, the command prompts for the *address* and *num-of-bytes* parameters.

**Command Modes** ROM monitor (>)

|                        | 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |
|                        |                |                                                                                                                                                                                                                                |

**Examples** The following example shows a typical disassembly:

```
rommon 23 > dis 0x60696358 0x20
```

```
0x60696358: 1040012b beq v0, zero, #0x60696808
0x6069635c: 00008821 addu s1, zero, zero
0x60696360: 8e0285d0 lw v0, -31280(s0)
0x60696364: 14400006 bne v0, zero, #0x60696380
0x60696368: 00002021 addu a0, zero, zero
0x6069636c: 0c1a2d93 jal 0x6068b64c
0x60696370: 00002021 addu a0, zero, zero
0x60696374: 8e0285d0 lw v0, -31280(s0)
```

```
rommon 24 >
```

The following example shows the command's interactive mode being used to perform the same disassembly:

```
rommon 25 > dis
```

```
Enter in hex the start address [0x0]: 0x60696358
```

```
Enter in hex the test size or length in bytes [0x0]: 0x20
```

dis

```
0x60696358: 1040012b beq v0, zero, #0x60696808
0x6069635c: 00008821 addu s1, zero, zero
0x60696360: 8e0285d0 lw v0, -31280(s0)
0x60696364: 14400006 bne v0, zero, #0x60696380
0x60696368: 00002021 addu a0, zero, zero
0x6069636c: 0c1a2d93 jal 0x6068b64c
0x60696370: 00002021 addu a0, zero, zero
0x60696374: 8e0285d0 lw v0, -31280(s0)

rommon 26 >
```

The `dis` command displays an exception if you attempt to disassemble a non-existent address or if you specify an argument that the system interprets as a non-existent address. For example, the following command shows the `dis disk0:` command being given. The system interprets the `disk0:` argument as a memory address of `0xd`, and because this address does not exist, displays the exception message:

```
rommon 3 > dis disk0:

Warning : address not word aligned, 0xd

*** TLB (Load/Fetch) Exception ***
Access address = 0xc
PC = 0xbfc11074, Cause Reg = 0x8, Status Reg = 0x3040d003

monitor: command "dis" aborted due to exception

rommon 4 >
```

Related Commands

| Command | Description                         |
|---------|-------------------------------------|
| frame   | Displays an individual stack frame. |
| stack   | Displays a stack trace.             |

# frame

To display an individual stack frame, use the **frame** command in ROM monitor mode.

**frame** [*number*]

|                           |               |                                                                                                  |
|---------------------------|---------------|--------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>number</i> | (Optional) Number of the stack frame to be displayed. The default is 0 (the most current frame). |
|---------------------------|---------------|--------------------------------------------------------------------------------------------------|

|                        |                         |
|------------------------|-------------------------|
| <b>Command Default</b> | Displays stack frame 0. |
|------------------------|-------------------------|

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | ROM monitor (>) |

|                 | 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
|                 | 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
|                 | 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
|                 | 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines** The **help** command displays a list of available ROM monitor commands, along with a brief description of each. To display additional details for a specific command, enter the command name followed by the **-?** option.

**Examples** The following example shows a typical display of the **help** screen:

```
rommon 12 > help
```

|               |                                       |
|---------------|---------------------------------------|
| alias         | set and display aliases command       |
| boot          | boot up an external process           |
| break         | set/show/clear the breakpoint         |
| confreg       | configuration register utility        |
| cont          | continue executing a downloaded image |
| context       | display the context of a loaded image |
| cpu_card_type | display CPU card type                 |
| dev           | list the device table                 |
| dir           | list files in file system             |
| dis           | disassemble instruction stream        |
| frame         | print out a selected stack frame      |
| help          | monitor builtin command help          |
| history       | monitor command history               |

```

meminfo main memory information
repeat repeat a monitor command
reset system reset
set show all monitor variables
show_spd show all SPD data
stack produce a stack trace
sync write monitor environment to NVRAM
sysret print out info from last system return
unalias unset an alias
unset unset a monitor variable

```

```
rommon 13 >
```

The following example shows how to display additional help for the **alias** command:

```

rommon 14 > alias -?

usage: alias [name=value]

rommon 15 >

```

| Related Commands | Command     | Description                |
|------------------|-------------|----------------------------|
|                  | <b>boot</b> | Boots the router manually. |

# history

To display the last 16 commands given at the ROM monitor prompt, use the **history** command in ROM monitor mode.

## history

### Syntax Description

This command has no arguments or keywords.

### Command Default

No default behavior or values.

### Command Modes

ROM monitor (>)

### Command History

| Release     | Modification                                                                                                                                                                                                                   |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
| 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
| 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

### Usage Guidelines

The ROM monitor keeps a record of the last commands given at the ROM monitor prompt (up to 16), similar to the way this is done with the Korn shell. Use the **history** command to display these commands, and the **repeat** command to repeat them one or more times.

#### Tip

When you use an **alias**, the **history** list includes the alias and not the actual commands that were executed.

#### Note

The **repeat** command is not added to the history list.

### Examples

The following example shows how to reset the ROM monitor and return it to a known state:

```
rommon 9 > history

1 boot sysfiles/ubr10k-k8p6-mz.12211BC3
2 dev
3 dir disk0:
4 confreg
```

**history**

```
5 confreg 0x00
6 cont
7 break -c
8 break
9 history
```

```
rommon 10 >
```

**Related Commands**

| Command       | Description                                            |
|---------------|--------------------------------------------------------|
| <b>alias</b>  | Defines an alias to be used at the ROM monitor prompt. |
| <b>boot</b>   | Boots the router manually.                             |
| <b>repeat</b> | Repeats a particular ROM monitor command.              |

# meminfo

To display information about the available range of main memory and Flash memory, use the **meminfo** command in ROM monitor mode.

## meminfo

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values.

**Command Modes** ROM monitor (>)

| Command History | Release     | Modification                                                                                                                                                                                                                   |
|-----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
|                 | 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
|                 | 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
|                 | 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines** The **meminfo** command displays the size of available main memory, its starting address, the size of available packet memory, and the size of nonvolatile Flash memory.

**Examples** The following example shows how to display information about the current memory usage:

```
rommon 9 > meminfo
```

```
Main memory size: 512 MB.
Available main memory starts at 0xa000e000, size 0x7ffc8 KB
NVRAM size: 0x80000
```

```
rommon 10 >
```

|------------------|-----------------|-----------------------------------------------------------------------------|
|                  | <b>boot</b>     | Boots the router manually.                                                  |
|                  | <b>sysreset</b> | Displays the return information from the system image that was last booted. |

# repeat

To repeat a particular ROM monitor command from the history list, use the **repeat** command in ROM monitor mode.

**repeat** [*number* [*count*] | *string* [*count*] ]

**Syntax Description**

|               |                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number</i> | (Optional) Specifies the number, as listed in the <b>history</b> command, of the command to be repeated.                                                                                                                            |
| <i>string</i> | (Optional) Specifies a string to be compared against the commands in the history list. The most recent command that matches the <i>string</i> is repeated. If the <i>string</i> includes spaces, it must be enclosed within quotes. |
| <i>count</i>  | (Optional) Specifies the number of times the command should be executed. The default is 1.                                                                                                                                          |

**Command Default**

If given without any arguments, repeats the previous command once.

**Command Modes**

ROM monitor (>)

**Command History**

| Release     | Modification                                                                                                                                                                                                                   |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
| 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
| 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines**

The **repeat** command repeats one of the commands in the history list (which can contain up to 16 commands). You can specify the command to be repeated by its history number (as shown by the **history** command) or by a string that will match the command.

If you do not give any arguments with the command, it repeats the last command in the history list once.

**Note**

The **repeat** command is not added to the history list, so you cannot repeat the **repeat** command. You also cannot include the **repeat** command on a command line that has multiple commands separated by a semicolon delimiter.

## Examples

The following example shows how to use the repeat command to execute one of the commands in the history list:

```
rommon 9 > history

1 boot sysfiles/ubr10k-k8p6-mz.12211BC3
2 dev
3 dir disk0:
4 confreg
5 confreg 0x00
6 cont
7 break -c
8 break
9 history

rommon 10 > repeat 9

1 boot sysfiles/ubr10k-k8p6-mz.12211BC3
2 dev
3 dir disk0:
4 confreg
5 confreg 0x00
6 cont
7 break -c
8 break
9 history
10 history

rommon 11 >
```

## Related Commands

|                 | 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
|                 | 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
|                 | 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
|                 | 12.3BC      | This command ws integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                      |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| Usage Guidelines | <p>The <b>reset</b> command returns the ROM monitor to its initial state, without requiring a complete system reboot by performing a warm reset. This is useful if you have been setting and unsetting registers and variables, and no longer know whether the system is in a stable state.</p> <p>If you specify the <b>-s</b> option, the system saves the current environment variables and aliases to nonvolatile memory before resetting the ROM monitor, so as to preserve their current values.</p> |  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|

|          |                                                                                                                                                                                                                                                                                                                                                                         |  |

|------------------|-----------------|-----------------------------------------------------------------------------|
|                  | <b>boot</b>     | Boots the router manually.                                                  |
|                  | <b>sysreset</b> | Displays the return information from the system image that was last booted. |

# set

To display the contents of the currently-defined environment variables, use the **set** command in ROM monitor mode.

**set**

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values.

**Command Modes** ROM monitor (>)

| Command History | Release     | Modification                                                                                                                                                                                                                   |
|-----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
|                 | 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
|                 | 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
|                 | 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines** The set command displays the environment variables that are currently defined in the ROM monitor. Variables are defined at the ROM monitor prompt in a manner similar to that of the Korn shell, by specifying *variable=value*.

**Tip** Use the **unset** command to delete a monitor variable.

**Examples** The following example shows how to display the values of the currently defined monitor variables:

```
rommon 13 > set

PS1=rommon ! >
RET_2_RTS=17:28:46 PST Tue Oct 12 1993
BSI=0
RET_2_RUTC=
?=1

rommon 14 >
```

The following example shows the PS1 variable (which defines the ROM monitor prompt) being changed, and the **set** command displaying the new value:

```
rommon 12 > PS1="Rommon-CMTS ! >"
Rommon-CMTS 13 > set

PS1=Rommon-CMTS ! >
RET_2_RTS=17:28:46 PST Tue Oct 12 1993
BSI=0
RET_2_RUTC=
?=1

Rommon-CMTS 14 >
```

|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines**    The **show\_spd** command displays the contents of the processor card’s SPD/EEPROM memory device. This information is typically useful only to Cisco TAC engineers.

**Note**    The **show\_spd** command displays a large volume of data. Enable the capture buffer on your terminal program so that you can preserve this data and review it later.

**Examples**    The following example shows how to display the SPD data (only a portion of the command’s display is shown):

```
rommon 15 > show_spd

DIMM 0 SPD specifications:
byte 0 - 0x80000000
byte 1 - 0x80000000
byte 2 - 0x40000000
...
byte 125 - 0xff000000
byte 126 - 0x64000000
```

```
byte 127 - 0xad000000

DIMM 1 SPD specifications:
byte 0 - 0xff000000
byte 1 - 0xff000000
byte 2 - 0xff000000
...
byte 125 - 0xff000000
byte 126 - 0xff000000
byte 127 - 0xff000000

DIMM 2 SPD specifications:
byte 0 - 0xff000000
byte 1 - 0xff000000
byte 2 - 0xff000000
...
byte 125 - 0xff000000
byte 126 - 0xff000000
byte 127 - 0xff000000

DIMM 3 SPD specifications:
byte 0 - 0xff000000
byte 1 - 0xff000000
byte 2 - 0xff000000
...
byte 125 - 0xff000000
byte 126 - 0xff000000
byte 127 - 0xff000000

|                 | 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

|                         |                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>stack</b> command displays a stack trace of the most recently booted software image. This trace includes the value of the program counter and the selected number of frames from the kernel stack and process stack (if available) from that software image. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Tip**

To display details for an individual frame stack, use the **frame** command.

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows how to display a stack trace with 6 frames: |
|-----------------|-------------------------------------------------------------------------|

```
rommon 5 > stack 6
```

```
Stack trace:
```

```
PC = 0x02004adc
```

```
Frame 00: FP = 0x02003938 RA = 0x02005f2a
```

```
Frame 01: FP = 0x02003948 RA = 0x02005df0
```

```
Frame 02: FP = 0x02003960 RA = 0x020050ee
```

```
Frame 03: FP = 0x02003994 RA = 0x02004034
```

```
Frame 04: FP = 0x02003b00 RA = 0x00012ca6
```

```
Frame 04: FP = 0x02003b34 RA = 0x020a703c
```

```
rommon 6 >
```

The following example shows how to display a stack trace with the default of 5 frames, when a process stack is available:

```
rommon 21 > stack
Kernel Level Stack Trace:

| <b>sysreset</b> | Displays the return information from the system image that was last booted. |

# sync

To write the current values of aliases and monitor environment variables to Flash memory, use the **sync** command in ROM monitor mode.

## sync

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values.

**Command Modes** ROM monitor (>)

| Command History | Release     | Modification                                                                                                                                                                                                                   |
|-----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
|                 | 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
|                 | 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
|                 | 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines** The **sync** command writes the current values of the monitor environment variables and aliases to Flash memory so that they are read on the next reset. If you do not do this, all variables and aliases are deleted upon reset and replaced with the default values.

**Examples** The following example shows how to synchronize the monitor variables and aliases:

```
rommon 39 > sync
```

```
rommon 40 >
```

|                 | 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

**Usage Guidelines** The **sysreset** command displays the information about the last system image that was booted and then terminated. This includes the reason for why the last image ended its execution, the values of the program counter and error address registers when the program ended execution, and a stack trace holding the last eight frames. Any exception information is also shown.

**Examples** The following example shows a typical display from the **sysreset** command:

```
rommon 22 > sysreset

| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

## Usage Guidelines

The **unalias** command deletes one or more aliases that you have previously defined for the ROM monitor using the **alias** command.

## Examples

The following example shows how to delete one alias:

```
rommon 13 > unalias dird
```

```
rommon 14 >
```

The following example shows three aliases being deleted:

```
rommon 20 > unalias alias1 alias2 alias3
```

```
rommon 21 >
```

The following example shows the error message that is displayed when you try to delete an alias that does not exist:

```
rommon 11 > unalias gobbledegook
```

```
unalias: "gobbledegook" does not exist
```

```
rommon 12>
```

|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.3 NA     | This command was introduced on Cisco uBR7200 series routers.                                                                                                                                                                   |
| 12.1(5)EC   | Support was added for Cisco uBR7100 series routers.                                                                                                                                                                            |
| 12.2(4)BC1  | Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image. |
| 12.3BC      | This command was integrated into Cisco IOS Release 12.3BC.                                                                                                                                                                     |
| 12.2(33)SCA | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                             |

## Usage Guidelines

The **unset** command clears the contents of one or more monitor variables that have been defined in the ROM monitor. Variables are defined at the ROM monitor prompt in a manner similar to that of the Korn shell, by specifying *variable=value*.

## Examples

The following example shows how to delete a variable named “temp-var”:

```
rommon 13 > unset temp-var
```

```
rommon 14 >
```

The following example shows how to delete two variables:

```
rommon 17 > unset temp-var my-var
```

```
rommon 18 >
```

## Related Commands

| Command     | Description                                                                             |
|-------------|-----------------------------------------------------------------------------------------|
| <b>set</b>  | Displays the currently-defined monitor environment variables.                           |
| <b>sync</b> | Writes the current values of aliases and monitor environment variables to Flash memory. |
