

Scripts

These UNIS shell scripts automate the input of XML requests to, and process the resulting output from, the Northbound Interface (NBI) Application Programmers Interface (API) of the Cisco IP Solution Center (ISC) network management application.

This appendix contains information about the following scripts:

- [changeMaxRoutes](#)
- [changepasswd](#)
- [collectConfig](#)
- [deletece](#)
- [deletesr](#)
- [deployallsr](#)
- [deploysr](#)
- [downinterface](#)
- [getpe](#)
- [modifyce](#)
- [purgesrs](#)
- [removesr](#)
- [showsr](#)
- [srdump](#)
- [taskdump](#)
- [upinterface](#)
- [VrfPing](#)

README File

The README file contains an example of a working script file and describes the required environment variables and parameters, and the location for optional files.

Scripts Main directory

This section describes the scripts in the main directory. See the [“Script Subdirectories” section on page C-15](#) for more information about these optional files required by the UNIX shell scripts in the main scripts directory.

Note

These scripts work with either the Sybase and Oracle database.

env

The **env** file contains all of the environment or UNIX shell variable definitions required by all of the UNIX shell scripts in the main scripts directory. All existing UNIX shell scripts in this directory reference the **env** file. Any new scripts created must also include a reference to this file.

changeMaxRoutes

This script changes the maximum allowed VPN routes for the service request links that belong to the specified VPN and Customer. It also downloads the **maxRoutes** value to the PE devices that belong to the service request links.

Command Syntax

```
changeMaxRoutes [-v vpnName] [-c customerName] -m maxroutes
```

Table C-1 *changeMaxRoutes Command Options*

Option	Description
-v vpnName	VPN name. Optional parameter.
-c customerName	Customer name. Optional parameter.
-m maxroutes	The maximum number of VPN routes allowed in the device configuration. Required parameter.

STDOUT

```
State Success
OutputString
ilpe3.cisco.com|V1:test_vpn|change
ilpe3.cisco.com|V1:test_vpn|change
ilpe2.cisco.com|V2:test_vpn-s|change
ilpe2.cisco.com|V3:newvpn|nochange: Reason- since could not set maxroutes in repository
```

Where State is either *Success* or *Failure*. The OutputString is:

```
<pename>|<vrf name>|<change or nochange: Reason- >
```

LOG

The log information is stored in <ISC log Location>/http.0.* in xml format.

The information stored depends on the log level. Log levels range from SEVERE to FINEST, and are set using Administration -> Control Center->Hosts->Configuration->Logging->Default->Loglevel.

changepasswd

This script causes the ISC application to change the password on a specified device.

Command Syntax

changepasswd -f <inputfilename> [-log <logfile>] | changepasswd -help

STDOUT

0 for success, 1 for failure

File Name

None

Log Name

The default log name is \$ISC_HOME/tmp/changepasswd.log.\$\$, where \$\$ is the process ID. An alternate log file name can be specified in the input parameters.

Log Output Example

```
-----
opening the repository
input: 3550_6-1|NbiRegion|test|test1|test2
rpmname: 3550_6-1
regionname: NbiRegion
newusername: test
newpassword: test1
newenpassword: test2
After constructTibrvMsg Password ID:: 43835
RPM 3550_6-1 Success
*****
input:
```

collectConfig

Use this script to collect the device configuration for a specified device (**rpmName**). The device configuration is stored in the directory \$ISC_HOME/tmp in a file named after the device. You can list multiple device names (multiple **rpmName** parameters).

Command Syntax

collectConfig -r rpmName

STDOUT

0 for success, 1 for failure.

File Name

\$ISC_HOME/tmp/device, where *device* is the name of the device (for example, 3550_6-1).

File Output Example

```

3550_6-1#term len 0
3550_6-1#show run
Building configuration...

Current configuration : 10676 bytes
!
version 12.1
no service pad
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname 3550_6-1
!
enable secret 5 $1$xHqv$.pVjEARl1vXrJ7tKlS0qa1
!
errdisable recovery cause l2ptguard
errdisable recovery interval 5000
ip subnet-zero
!
...

```

Log Name

\$ISC_HOME/tmp/collectConfig.log

Log Output Example

```

Mon Aug  2 14:13:36 PDT 2004:  collectConfig started
-----
collectConfig request created for device: 3550_6-1
-----

saving config for device 3550_6-1 in the directory /opt/vpnsc/iscadmin/tmp

```

deletece

Deletes all CE devices in the repository that have no service requests associated with them.

Command Syntax

deletece [-p pvc_id]

Optionally, you can specify a single CE device using the **pvc_id** value with the **-p** script option flag.

STDOUT

```

Deleting unused CEs
c1234
The number of CEs deleted: 1
The number of Sites deleted: 0
To view the log file, please see /tmp/deletecefile

```

File Name

None

Log Name

\$ISC_HOME/tmp/deletecefile

Log Output Example

```
Deleting unused CEs
Start TIME = Mon Aug  2 15:24:36 PDT 2004
c1234
The number of CEs deleted: 1
The number of Sites deleted: 0
End TIME = Mon Aug  2 15:25:07 PDT 2004
```

deletesr

This script performs these actions:

- Decommissions the list of service requests from the ISC database. The service request is specified using the **SRJobId**.
- Produces an audit report for all specified service requests, returning the associated **JobId** and state for each one.
- Purges service requests in the *Closed* state.

The audit report can be disabled using the **-noaudit** option flag.

Command Syntax

deletesr SRJobId [SRJobId, ...]

STDOUT

```
113      CLOSED - purging
Purge complete
```

deployallsr

This script performs these actions:

- Finds all the MPLS service requests that are in the *Requested* state.
- Deploys the above listed MPLS service requests to the ISC-managed network.

Command Syntax

deployallsr [-outdir dir_name] [-log log_file_name]

STDOUT

None

File Name

None

Log Name

\$ISC_HOME/tmp/deployallsr.log.1897_08_03_04_09_06_29

Where 1897 is the process ID, and the remaining numbers are the date and time. An alternate log file name can be specified in the input parameters.

Log Output Example

```
SRs to be deployed...
146
Task deployment state: Completed
DateTime, SRJobID, State
2004-08-03 10:07:03, 146, CLOSED
```

deploysr

This script performs these actions:

- Deploys all service requests listed in the input parameters, *regardless* of the state.
- Produces an audit report for all specified service requests, returning the associated **JobId** and state for each one.

Command Syntax

deploysr SRJobId [SRJobId, ...]

The audit report can be disabled using the **-noaudit** option flag.

STDOUT

None, unless there is an error. The following is an example of an error output:

```
The SR with ID: 1 does not exist in the Database!
```

File Name

None

Log Name

None

downinterface

Use this script to turn off or shut down a given network interface (**interfaceName**) on a given device (**rpmName**). This script logs into the listed RPM device and inserts the **shutdown** IOS command on the specified interface.

Command Syntax

downinterface -rpm rpmName [-user userName] -pw userPassword -enableuser enableUserName -enablepw enablePassword -interface interfaceName [-log Log filename]

Table C-2 *downinterface Command Options*

Command Option	Description
-rpm	Host name (or IP address) of the RPM (PE device). Required parameter.
-user	Login username. This parameter is only required if both the username and password are required for login.
-pw	Login password. Required parameter.
-enableuser	Enable username. This parameter is only required if both the username and password are required to enter enable mode.
-enablepw	Enable password. Required parameter.
-interface	The complete interface name (for example, Switch1.1). Required parameter.
-log	Log filename. Optional parameter. If not specified, the file downinterface.log is created in the \$ECSP_HOME/tmp directory.

STDOUT

Non-zero exit code if there is an error.

getpe

This script provides a report for all PE device names and associated IP addresses contained in the ISC database. The display is sent to the computer screen by default, or you can specify an output file, using the **-f filename** script option flag.

Command Syntax

```
getpe <-f filename> | getpe -help
```

STDOUT

Creating getpe.txt in current directory

File Name

Default is getpe.txt (found in the directory where the script was executed). An alternate file name can be specified in the input parameters.

File Output Example

```
atlnga95r11-0038 | null
stlsmo95r10-0063 | null
stlsmo95r11-0064 | null
washdc95r10-0068 | null

dllstx95r10-0033|null
dllstx95r11-0034|null
chcgil95r10-0039|135.184.14.155
```

Log Name

None

modifyce

This script modifies the CE device names in the ISC database. The **inputfilename** parameter is used to specify the CE device names to be changed.

For example, the following input file:

```
1234 5678
```

```
4321 8765
```

makes these modifications:

- The site named C1234 is changed to C5678
- The device named c1234 is changed to c5678
- The site named C4321 is changed to C8765
- The device named c4321 is changed to c8765

Command Syntax

```
modifyce <-input filename> [-log <logFileName>]
```

To send the output to a log file, use the **-log** script option and specify a **logFileName**.

STDOUT

0 for success, 1 for failure.

File Name

None

Log Name

Default log name is \$ISC_HOME/tmp/modifyce.log.\$\$

Where \$\$ is the UNIX process id assigned to this script when it is run. An alternate log file name can be specified in the input parameters.

Log Output Example

```
*****
*
*
```

```

Tue Aug 3 09:19:19 PDT 2004
*****Detailed log messages for each of CE and it's Site name modification****
***
Success: Site with the name C1234 changed to C4321 and it's CE name changed from
c1234 to c4321
*****All the given CE names and it's Site name changed successfully!*****

*****

```

purgesrs

This script performs these actions:

- Finds all service requests in the ISC database that are in the *Closed* state.
- Purges or removes each of these service requests from the ISC database.

If you specify a file and filename that contains a list of service request job IDs (**SRJobId**), only the service requests listed in the file are purged, and only if they are in the *Closed* state.

To purge service requests regardless of the state use the **-force** script option flag.

Command Syntax

```
purgesrs [-file <filename>] [-log <logFileName>] [-force]
```

If no arguments are given, all service requests in the *Closed* state are purged.

Table C-3 *purgesrs* Command Options

Option	Description
-file <filename>	The file containing the list of service requests to be purged.
-log <logFileName>	The log output file name.
-force	All service requests in <filename> are force purged

STDOUT

None

File Name

None

Log Name

Specified on the command line.

Log Output Example

```
SR with Id 140403 was purged
```

removesr

Use this script to change a specified service request to the *Decommissioned* state. The service request remains in the ISC database but is not deployed. Use the job ID (**SRJobId**) to specify the service request to decommission.

Command Syntax

```
removesr SRJobId
```

STDOUT

```
New SR created 140403
```

File Name

```
None
```

Log name

```
None
```

showsr

This script performs these actions:

- Find all the MPLS service requests in the ISC database which are not in the *Deployed*, *Functional*, or *Closed* state.
- Find the VPNs associated with each MPLS service request.
- Find the PE and CE devices associated with each MPLS service request
- Display this information in a table format.

When no arguments are specified, the output lists all service requests that are not in the *Deployed*, *Functional*, or *Closed* state.

Command Syntax

```
showsr [-a] [<last_N_sr>] [sr_state]
```

```
showsr [-p pvc_id]
```

```
showsr [-v vpn_name]
```

Table C-4 *showsr Command Options*

Option	Description
-a	Prints all service requests regardless of the state.
last_N_sr	Truncates the number of service requests reported, regardless of the state.

Table C-4 *showsr Command Options*

Option	Description
sr_state	Reports only service requests in a specified state. Valid [sr_state] values are: REQUESTED, PENDING, FAILED_DEPLOY, INVALID, DEPLOYED, BROKEN, FUNCTIONAL, LOST, CLOSED, FAILED_AUDIT and WAIT_DEPLOY.
<last_N_sr> [sr_state]	Prints the last (N) of service requests in a specified state. If last_N_sr = 0, all service requests in state [sr_state] are printed.
-p pvc_id	Reports only service requests with a specific device ID.
-v vpn_name	Reports only service requests with a specific VPN name.

STDOUT

Job_ID SR_STATE PE_ROUTER CE_ROUTER VPN_ID CREATION_DATE_TIME

srdump

This script performs one of these actions:

- Returns information about all service requests in the ISC database which contain the network device specified by the **pvc_id** parameter.
- Returns information about the service request designated by the **sr_id**. The **-sr** script option is required when requesting **sr_id**.

Command Syntax

srdump <pvc_id> [-disable] [-configlet]

srdump -sr <sr_id> [-configlet]

Table C-5 *srdump Command Options*

Option	Description
-sr	Indicates that the required argument refers to a service request ID. If -sr is not specified, a PVC device name must be defined.
<sr_id> <pvc_id>	The required identification number of the service request for this report. • service request ID <sr_id> • PVC device name <pvc_id>
-disable	Disables full reports. Only a brief report is displayed for each service request. Use this option to reduce the amount of data reported. This option is only available with the <pvc_id> argument.
-configlet	Prints the configlet for each service request

STDOUT

```

taskdump

This script provides information about service request tasks. Indicate the detail of the report by specifying either a:

- service request ID (**sr_id**)
- task name (**task_name**)

Command Syntax

```
taskdump -h | <sr_id> | <task_name> [-verbose]
```

Table C-6 taskdump Command Options

Option	Description
-h	Prints the help message
sr_id	Obtain information about tasks associated with service request.
task_name	Obtain information about a specified task.
-verbose	Obtain detailed task information.

STDOUT

```

File Name

None

Log Name

None

upinterface

Use this script to turn on (or turn up) given network interface (**interfaceName**) on a given device (**rpmName**). This script logs into the specified RPM device and inserts the **no shutdown** IOS command on the specified interface.

Command Syntax

```

upinterface -rpm rpmName [-user userName] -pw userPassword -enableuser
enableUserName -enablepw enablePassword -interface interfaceName [-log Log file
name]

```

Table C-7 *upinterface Command Options*

Command Option	Description
-rpm	Host name (or IP address) of the RPM (PE device). Required parameter.
-user	Login username. This parameter is only required if both the username and password are required for login.
-pw	Login password. Required parameter.
-enableuser	Enable username. This parameter is only required if both the username and password are required to enter enable mode.
-enablepw	Enable password. Required parameter.
-interface	The complete interface name (for example, Switch1.1). Required parameter.
-log	Log filename. Optional parameter. If not specified, the file upinterface.log is created in the \$ECSP_HOME/tmp directory.

STDOUT

Non-zero exit code if there is an error.

VrfPing

VrfPing checks the connectivity between the PE and CE by executing **traceroute vrf** and **ping atm** commands. If the traceroute vrf command succeeds, VrfPing returns with an exit status of 0. The ping atm command is executed only if the VCI value is specified with the **-vci** option and the traceroute command fails.

The exit states of VrfPing are:

- 0 - traceroute command successful.
- 1 - traceroute command failed. ping atm command successful (if vci was specified).
- 2 - traceroute command failed. ping atm command failed.

Command Syntax

```
VrfPing -pe pe_name -ce ce_name -vrf vrf_name [-vci vci_value] [-user user_name] -pw  
user_passwd [-enuser enable_username] -enpw enable_passwd [-log log_file_name]
```

Table C-8 VrfPing Options

Option	Description
-pe	Host name (or IP address) of the PE device (RPM). Required parameter.
-ce	VPN interface address of the CE device. Required parameter.
-vrf	VRF name. Required parameter.
-vci	VCI value of the ATM subinterface.
-user	Login username. Required only if both username and password are required for login.
-pw	Login password. Required parameter.
-enuser	Enable username for PE. Required only if both username and password are required for login.
-enpw	Enable password for the PE device.
-log	Log file name. This parameter is optional. If not specified, the file vrfping.log is created in the \$ECSP_HOME/tmp directory.

STDOUT

Non-zero exit code if there is an error.

Script Subdirectories

These subdirectories are located in the scripts main directory.

util

This directory contains UNIX shell scripts that are used by the UNIX shell scripts in the main scripts directory. They perform utility functions which might be used by any of the UNIX shell scripts in the main directory. Users that create or modify scripts in the main directory have reference to these utility script, but they cannot be used directly or modified.

xml

This directory contains input request XML template files. The main directory UNIX shell scripts read, copy, and modify the copied XML template file to generate inputs for the ISC NBI. The files in this directory are not modified throughout the process.

filters

This directory contains variables, used by the UNIX shell scripts in the main directory, to filter the responses generated by the ISC NBI before the response data is formatted for output to the user. As you create or modify UNIX shell scripts in the main directory, you might need to modify or add new filter files to this directory.

queries

This directory contains input request XML template files, similar to those in the `xml` subdirectory, but these files are in a different and more detailed format. The main directory UNIX shell scripts use the files in this directory in much the same way those in the `xml` directory are used. The resulting output from the NBI API are more detailed, and the scripts using the files of this directory can generate more detailed and formatted output to present to the user.
