

## Cisco CNS IE2100 Appliances

---

Cisco IP Solution Center (ISC) supports the Cisco CNS IE2100 Device Access Protocol for communication with any Cisco IOS device, such as uploading a configuration file from a device, downloading a configlet to a device, or executing a command on a device and obtaining a result. ISC also supports CNS Plug-and-Play.

To use the Cisco CNS IE2100 functionality on ISC, you must first set up the Cisco CNS IE2100 appliance and the ISC workstation as explained in an appendix in [Cisco IP Solution Center Installation Guide, 4.0](#).

This appendix includes the following sections. Implement these sections in sequence:

### Note

---

The “[Using Plug-and-Play](#)” section on page A-6 is optional.

---

1. [Creating a Cisco CNS IE2100 Appliance, page A-1](#)
2. [Creating a Cisco IOS Device Using the Cisco CNS Device Access Protocol, page A-3](#)
3. [Using Plug-and-Play, page A-6](#)

## Creating a Cisco CNS IE2100 Appliance

ISC supports multiple Cisco CNS IE2100 appliances. To create a Cisco CNS IE2100 appliance, follow these steps:

### Note

---

For more information, see the [Devices](#) section of [Chapter 3, “Service Inventory > Inventory and Connection Manager”](#).

---

- 
- Step 1**    Navigate **Service Inventory > Inventory and Connection Manager > Devices**.
- Step 2**    A window appears as shown in [Figure A-1, “Devices Window.”](#)

Figure A-1 Devices Window

**Step 3** Click the **Create** button.

**Step 4** From the **Create** menu, click **IE2100**.

A window appears as shown in Figure A-2, “Create IE2100 Device Window”.

Figure A-2 Create IE2100 Device Window

The screenshot shows the 'Create IE2100 Device Window' form. It has a 'General' tab with the following fields: Device Host Name (required), Device Domain Name, Description, and IP Address. Below the fields are 'Save' and 'Cancel' buttons. A note at the bottom states: 'Note: \* - Required Field'.

**Step 5** Enter the **Device Host Name** and if applicable, the **IE2100 Device Domain Name**. If the Cisco CNS IE2100 appliance is not registered with DNS, then you must enter the **IP Address** of the Cisco CNS IE2100 appliance. Click **Save**.

Figure A-1 reappears with the IE2100 listed as a device.

# Creating a Cisco IOS Device Using the Cisco CNS Device Access Protocol

Each Cisco CNS IE2100 appliance can serve multiple Cisco IOS devices. A Cisco IOS device can only be served by one Cisco CNS IE2100 appliance. To create a Cisco IOS device using the Cisco CNS Device Access Protocol, follow these steps:

**Note**

For more information, see the [Devices](#) section of [Chapter 3, “Service Inventory > Inventory and Connection Manager”](#).

**Step 1** Navigate **Service Inventory > Inventory and Connection Manager > Devices**.

**Step 2** A window appears as shown in [Figure A-1, “Devices Window.”](#)

**Step 3** Click the **Create** button.

**Step 4** From the **Create** menu, click **Cisco IOS Device**.

A window appears as shown in [Figure A-3, “Create Cisco IOS Device Window.”](#)

**Step 5** In the **General** section, enter the **Device Host Name** and **Device Domain Name**.

For **CNS Device Access Protocol**, you do not need to define the parameters in the **Login User** and **Login Password** sections.

For the **Device and Configuration Access Information** section, you must select **CNS** for the **Terminal Session Protocol**. Defining Cisco IOS Device Properties

**Step 6** Click the **Edit** button for **Additional Properties** at the bottom of the window. A window as shown in [Figure A-4](#), “Cisco IOS Device Additional Properties,” appears.

**Figure A-4 Cisco IOS Device Additional Properties**

| Cisco IOS Device Properties                                             |                                             |
|-------------------------------------------------------------------------|---------------------------------------------|
| <b>Device:</b>                                                          |                                             |
| <b>SNMP v3</b>                                                          |                                             |
| SNMP Security Level:                                                    | Default (No Authentication/No Encryption) ▾ |
| Authentication User Name:                                               | <input type="text"/>                        |
| Authentication Password:                                                | <input type="text"/>                        |
| Verify Authentication Password:                                         | <input type="text"/>                        |
| Authentication Algorithm:                                               | None ▾                                      |
| Encryption Password:                                                    | <input type="text"/>                        |
| Verify Encryption Password:                                             | <input type="text"/>                        |
| Encryption Algorithm:                                                   | None ▾                                      |

| Terminal Server:                                                        | None ▾                                      |
| Port:                                                                   | <input type="text" value="0"/>              |
| Fully Managed:                                                          | <input type="checkbox"/>                    |
| Device State:                                                           | ACTIVE ▾                                    |
| CNS Identification:                                                     | <input type="text"/>                        |
| Device Event Identification:                                            | CNS_ID ▾                                    |
| Most recent CNS event:                                                  | None ▾                                      |
| IE2100:                                                                 | None ▾                                      |
| CNS Software Version:                                                   | 1.3.2 ▾                                     |
| CNS Device Transport:                                                   | HTTP ▾                                      |
| <b>Device Platform Information</b>                                      |                                             |
| Platform:                                                               | <input type="text"/>                        |
| Software Version:                                                       | <input type="text"/>                        |
| Image Name:                                                             | <input type="text"/>                        |
| Serial Number:                                                          | <input type="text"/>                        |
| Device Owner's Email Address:                                           | <input type="text"/>                        |
| <input type="button" value="OK"/> <input type="button" value="Cancel"/> |                                             |

111006

**Step 7** The following steps pertain to the **Terminal Server** and **CNS Options** section.

**Step 8** Select the **Fully Managed** check box if you want the device to become a fully managed device. For fully managed devices, ISC sends e-mail notifications upon receipt of device configuration changes originated outside ISC and schedules enforcement audit tasks upon detection of possible intrusion.

**Note**

Be sure to set the DCPL parameters for e-mail and Fully Managed, as explained in the “[Config](#)” section on page 8-27. Navigate **Administration > Control Center**. Select a Host and then click **Config**. Then in the TOC in the left column, be sure to enter appropriate information in the following four fields: **SYSTEM > email > from**; **SYSTEM > email > smtpHost**; **SYSTEM > fullyManaged > enforcementAuditScript**; and **SYSTEM > fullyManaged > externalEventsEmailRecipients**.

**Note**

Verify that the **cns config notify** command is configured for the IOS device.

**Step 9** Specify the **Device State**, as follows:

- Select **ACTIVE** (the default) if the router is physically present on the network.
- Select **INACTIVE** if the router is not yet physically present on the network.

**Step 10** Specify the **Device Event Identification**, as follows:

- Select **HOST\_NAME** if the **Device Host Name** as defined in [Step 5](#) is to be used as the **CNS Identification** for this device.
- Select **CNS\_ID** if the device CNS Identification string is other than the **Device Host Name**.
- If you have selected **CNS\_ID** as the **Device Event Identification**, you must enter the **CNS Identification** parameter in the field labeled **CNS Identification**. This must be a unique argument. It is used to create the device in the corresponding Cisco CNS IE2100 repository and to listen to events pertaining to this device.

**Note**

Verify that the **cns id string {CNS\_ID} event** command is configured for the IOS device.

**Step 11** Select the Cisco CNS **IE2100** appliance that serves this Cisco IOS device. Select one entry from the drop-down menu of IE2100 devices already defined in the repository.

**Step 12** Use the drop-down menu for **CNS Software Version** to choose the version of Cisco CNS Configuration Engine that manages the IOS device (1.3, 1.3.1, 1.3.2, or 1.4).

**Step 13** Use the drop-down menu for **CNS Device Transport** to choose HTTP or HTTPS as the transport mechanism used by ISC to create, delete, or edit devices in the IE2100 repository. If HTTPS is used, the Cisco CNS Configuration Engine must be running in secure mode.

**Step 14** Click **OK**. [Figure A-1](#) reappears with the Cisco IOS device listed.

## Using Plug-and-Play

ISC supports the Plug-and-Play device configuration through a Cisco CNS IE2100 appliance. ISC supports devices not physically present on the network.

The procedures for using Plug-and-Play when the Cisco IOS device is not physically present on the network vary depending on whether there is an initial configuration file for the device.

Follow these steps if the Cisco IOS device *does not* have an initial configuration file:

- 
- Step 1** Create a Cisco IOS Device as described in the “[Creating a Cisco IOS Device Using the Cisco CNS Device Access Protocol](#)” section.
- Step 2** Define the Cisco IOS device properties as shown in [Figure A-4](#).  
Be sure to specify the **Device State** as **INACTIVE** because the device is not physically present on the network.
- Step 3** Click **Save**.  
A Cisco IOS Device entry is created in the ISC repository and in the corresponding Cisco CNS IE2100 appliance repository.
- 

Follow this step if the Cisco IOS device *does* have an initial configuration file:

- 
- Step 1** Import the initial configuration file into ISC using the Inventory Manager functionality, explained in [Chapter 4, “Service Inventory > Inventory and Connection Manager > Inventory Manager”](#) in this manual.  
Be sure to specify the **Device State** as **INACTIVE** because the device is not physically present on the network.  
The Inventory Manager create a Cisco IOS Device entry in the ISC repository. Also, it creates an entry in the corresponding Cisco CNS IE2100 repository, and associates the specified initial configuration file with this new device in the Cisco CNS IE2100 repository.
- 

You can provision the newly created inactive Cisco IOS Device for different services. Because the device is not physically present on the network, ISC saves the configlets associated with these services in its repository and tries to download them to the device only after the device has come up. Until the device is physically present on the network, the service request goes into the **WAIT\_DEPLOY** state. The service requests are explained in the user guides for each of the services.

After the device comes up and connects to its corresponding Cisco CNS IE2100 appliance, the device retrieves and applies its initial configuration if there is one waiting for it in the Cisco CNS IE2100 repository.

ISC detects that the device has come onto the network and performs the following actions:

- Changes the Cisco IOS Device state from **INACTIVE** to **ACTIVE**.  
ISC performs a collect config of the IOS device and stores it in the ISC repository.
- Verifies whether any ISC service has been waiting for this device to come up and tries to download the corresponding configlets to the device to complete the service request.
