

# APPENDIX C

## Property Settings

To navigate to the properties, known as Dynamic Component Properties Library (DCPL), in the Graphical User Interface (GUI) navigate to the tab **Administration > Control Center > Hosts**. Then select a check box for a specific host and click the **Config** button. These updates are effective only for this session.

None of these properties can be set on a per user basis, including logging.

### Note

More details about this are explained in the [“Config” section on page 9-23](#).

When you click on the folder or subfolder, it expands to more subfolders or eventually to the property itself. Then you receive an explanation, default values, and in some cases range and rules. This table can help you understand all the properties available at a glance. The properties are listed alphabetically. When a / ends an entry, this means it can be expanded further. Also, if you are searching for a property and do not know the name, you can use some key words and do a Find on the pdf version.

**Table C-1**      **DCPL Properties**

| Property                         | Default Value | Range/Rules                                         | Explanation                                                                                                                                                                                   |
|----------------------------------|---------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AutoDiscovery Properties:</b> |               |                                                     | Controls the operation of Autodiscovery.                                                                                                                                                      |
| /DiscoveryTemplateFolder         | /Discovery    | string                                              | Template folder under which the templates to be discovered for MPLS VPN Discovery will reside.                                                                                                |
| /TopologyHandler                 | Default       | string                                              | This property points to the topology handler for the discovery run.                                                                                                                           |
| /createVpnAndCustomerFromVRFName | true          | The valid values are <b>true</b> and <b>false</b> . | This property controls whether the VPN and Customer objects can be created from the VRF names. This is valid only in certain scenarios when Service Providers have maintained such a mapping. |
| /performTemplateDiscovery        | false         | The valid values are <b>true</b> and <b>false</b> . | With this flag, the user can control the template discovery. For performance reasons, if the template discovery is not desired this should be set to false.                                   |
| <b>Cleanup Properties:</b>       |               |                                                     | Cleans up various system resources such as log files and temporary files.                                                                                                                     |
| /Cleanup/TaskLogs/               |               |                                                     | This component cleans up old TaskLogs.                                                                                                                                                        |

**Table C-1 DCPL Properties (continued)**

|                            |        |                                                 |                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|--------|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxAgeInHours              | 168    | integer                                         | Maximum age of the TaskLogs in hours. TaskLogs older than this age will be deleted during the next cleanup cycle. Set to 0 to disable this feature.                                                                                                                                                                                                         |
| sleepIntervalInHours       | 24     | integer,<br>1-1000 hours                        | Time in hours for taskLog cleanup service to sleep between clean up cycles.                                                                                                                                                                                                                                                                                 |
| <b>/Cleanup/Tasks/</b>     |        |                                                 |                                                                                                                                                                                                                                                                                                                                                             |
| maxAgeInHours              | 0      | integer                                         | Maximum age of the Tasks in hours. Tasks that have not been modified in over maxAge hours and that have no Active schedules will be deleted during the next cleanup cycle. Set to 0 to disable this feature.                                                                                                                                                |
| sleepIntervalInHours       | 24     | integer,<br>1-1000 hours                        | Time in hours for task cleanup service to wait between clean up cycles. Changing this value initiates an immediate cleanup cycle.                                                                                                                                                                                                                           |
| <b>/Cleanup/TempFiles/</b> |        |                                                 |                                                                                                                                                                                                                                                                                                                                                             |
| maxAgeInHours              | 168    | integer                                         | Maximum age of the temporary files in hours. Temporary files older than this age will be deleted during the next cleanup cycle. Set to 0 to disable this feature.                                                                                                                                                                                           |
| sleepIntervalInHours       | 24     | integer,<br>1-1000 hours                        | Time in hours for tempFile cleanup service to sleep between clean up cycles.                                                                                                                                                                                                                                                                                |
| <b>/Cleanup/logLevel</b>   |        |                                                 |                                                                                                                                                                                                                                                                                                                                                             |
|                            | CONFIG | selection                                       | This log Level is used only if there is no log Level defined for a component. The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value). |
| <b>CNS Properties:</b>     |        |                                                 |                                                                                                                                                                                                                                                                                                                                                             |
| defaultVersion             | 1.4    | 1.3, 1.3.1,<br>1.3.2, 1.4, 1.5,<br>2.0, and 3.0 | Default version of CNS to be selected while creating a device. The supported versions are: 1.3, 1.3.1, 1.3.2, 1.4, 1.5, 2.0, and 3.0.                                                                                                                                                                                                                       |

**Table C-1 DCPL Properties (continued)**

|                                   |       |                                                     |                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|-------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deprecatedReboot                  | 0     | The valid values are <b>0</b> and <b>1</b> .        | This is the flag to be used for reloading IOS 12.3 devices using cisco.mgmt.cns.config.reboot CNS event. Value 0 means IOS 12.3 devices may not be rebooted using cisco.mgmt.cns.config.reboot CNS event. So, IOS versions other than 12.3 can be rebooted. Value 1 means only IOS 12.3 devices are rebooted using cisco.mgmt.cns.config.reboot CNS event. |
| <b>DCS Properties:</b>            |       |                                                     | Device Configuration Service. This component corresponds to a library that is used by ISC to communicate with network devices using protocols such as telnet, ssh, tftp, and so forth.                                                                                                                                                                     |

Retry delay interval is fixed at 30 seconds.                                                                                                                                                                                                                                                                                                                                                              |
| /DCS/allowCommandDownloadOnError     | false          | The valid values are <b>true</b> and <b>false</b> . | Continue command download on error.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| /DCS/cnsEventTimeout                 | 120            | integer, 0-120 seconds                              | CNS event wait time in seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| /DCS/configUploadTimeout             | 300            | integer, 60-900                                     | Maximum time in seconds to wait for a device configuration to be uploaded.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| /DCS/customPasswordPrompt            | Password:      |                                                     | Device custom password prompt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| /DCS/customUsernamePrompt            | Username:      |                                                     | Device custom username prompt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| /DCS/getCommitCLIConfigAfterDownload | true           | The valid values are <b>true</b> and <b>false</b> . | Retrieve the committed CLI configuration after an XML configuration download. If the default of <b>true</b> is set, whenever a Service Request is deployed on an IOS XR device, a transaction is created. This transaction gets the configlet deployed in the CLI mode and stores it in the repository. This creation of a new transaction adds to the time of Service Request deployment. If this property is set to <b>false</b> , no transaction to retrieve the CLI configlet is created. |
| /DCS/logLevel                        | CONFIG         | selection                                           | The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value).                                                                                                                                                                                                                 |
| /DCS/maxDeviceConnectCompleteTime    | 60             | integer, 15-600 seconds                             | Maximum time in seconds to wait for a terminal session connection to a device.                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table C-1 DCPL Properties (continued)**

|                                 |        |                                                     |                                                                                                                                                                                                                                                                                         |
|---------------------------------|--------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /DCS/maxDeviceConnectRetryCount | 3      | integer, 0-5                                        | Maximum number of times to retry connecting to a device when the maxDeviceConnectCompleteTime expires. 0= no retries.                                                                                                                                                                   |
| /DCS/maxOperationTimeout        | 30     | integer, 5-300 minutes                              | Maximum time in minutes to wait for a device operation to complete.                                                                                                                                                                                                                     |
| /DCS/maxPromptTimeout           | 60     | integer, 15-300 seconds                             | Maximum time in seconds to wait for a prompt during a terminal session with a device.                                                                                                                                                                                                   |
| /DCS/maxSocketReadTimeout       | 30     | integer, 10-300 seconds                             | Maximum time in seconds to wait for data on a socket connection read operation.                                                                                                                                                                                                         |
| <b>/DCS/misc</b>                |        |                                                     | Miscellaneous settings.                                                                                                                                                                                                                                                                 |
| ConfigForMergeXML               |        | string, file name                                   | Configuration file to be used for the merging of two XMLs.                                                                                                                                                                                                                              |
| allowPromptCharsInBanner        | false  | The valid values are <b>true</b> and <b>false</b> . | Controls if prompt characters, such as # and >, are allowed in banners. If <b>true</b> , a minimum of 2 seconds (default of loginSocketReadTimeout) is added to each login. Note that selecting this option requires “aaa authentication attempts login n” to be set to a minimum of 2. |
| loginSocketReadTimeout          | 2      | integer, 1-45                                       | Number of seconds to WAIT for a login authentication username or password prompt. Applicable if DCS\misc\allowPromptCharsInBanner is <b>true</b> . Increasing this value slows down device logins and counts against DCS\maxDeviceConnectCompleteTime who’s default is 60 seconds.      |
| readBufferSize                  | 32     | integer, 4-96                                       | Size in KBytes of the buffers used while reading device input streams with telnet and SSH. Increasing size might improve performance. Decrease size if there are memory issues.                                                                                                         |
| <b>DeploymentFlow Property:</b> |        |                                                     | Deployment flow Component: Used to create a flow of different types of steps such as mpls.                                                                                                                                                                                              |
| /DeploymentFlow/logLevel        | CONFIG | selection                                           | The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value).           |
| <b>Discovery Properties:</b>    |        |                                                     | ISC auto discovery framework.                                                                                                                                                                                                                                                           |

Table C-1 DCPL Properties (continued)

| /Discovery/DeviceDiscovery |        |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|--------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| continueOnError            | false  | The valid values are <b>true</b> and <b>false</b> . | A Boolean flag indicating whether device discovery should try to continue on an error. When the value is <b>true</b> , device discovery ignores the device and attempts to create other devices discovered. In this case, the device discovery is marked as SUCCESS, but indicates there were errors. The default behavior is device discovery is marked FAILED at the first error encountered. This property applies only to errors encountered during the device creation phase of device discovery like duplicate or missing hostnames in case of CDP and file based discovery options and invalid device configurations or insufficient read permissions for configurations files and so on, for the configuration file based discovery option. Any errors encountered during CDP discovery itself or while parsing XML files still result in the device discovery step being marked as FAILED.<br>WARNING: If this property is set to <b>true</b> , discovery continues if there are any device creation errors, ignoring the device that caused the error, but only partial NPCs and services are discovered. |
| logLevel                   | CONFIG | selection                                           | The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                  |        |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|--------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mgmtIpAddressLoopkupPattern      |        | string                                              | A comma separated list of interface name patterns to look for to determine the management IP address of the device discovered using the import configuration option. The configuration is parsed for the interface information, and the first available IP address of the interface from the given list is used as the management IP address of the device. For example, if the IP address of the loopback 0 interface should be used as the management IP address, the value of the property should be set to "loopback0". If the first available loopback should be used, set the value of the property to "loopback". A comma separated list can be specified as "Loopback0,Ethernet0". In this case, the first available IP address among the list of interfaces specified in that order is used as the management IP address. |
| <b>/Discovery/DataCollection</b> |        |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| continueOnError                  | false  | The valid values are <b>true</b> and <b>false</b> . | A Boolean flag indicating whether data collection should try to continue on an error. When the value is <b>true</b> , the data collection step does not collect discovery data for the failed device, but attempts to collect configuration for other devices discovered. In this case, the configuration collection step is marked as SUCCESS, but indicates there were errors. The default behavior is discovery data collection step is marked FAILED at the first error encountered. WARNING: If this property is set to <b>true</b> , discovery continues if there are any collection or parsing errors, ignoring the device that caused the error, but only partial NPCs and services are discovered.                                                                                                                        |
| logLevel                         | CONFIG | selection                                           | The log Level is the level at which logging is done for this component. |                                       |        |                 |                                                                                                                                                                                                                                                                                    |
|---------------------------------------|--------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/DistributionFramework/Worker/</b> |        |                 | Worker.                                                                                                                                                                                                                                                                            |
| Groups                                |        | string          | The groups this worker belongs to. This property is deprecated because groups are stored in the database rather than being provided by the worker.                                                                                                                                 |
| ThreadPoolSize                        | 100    | integer, 25-250 | The maximum number of threads. Set it to 0 to allow the pool to use as many thread as necessary.                                                                                                                                                                                   |
| logLevel                              | CONFIG | selection       | The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value).      |
| <b>GSAM Property:</b>                 |        |                 | Generic Service Access Model to get an XML dump from the repository for the provisioning driver.                                                                                                                                                                                   |
| /GSAM/logLevel                        | CONFIG | selection       | The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value).      |
| <b>GTL Properties:</b>                |        |                 | Generic Transport Layer. This library provides an API to different jobs (such as provisioning, collection etc.) to access Device Configuration Service (DCS). The jobs do not interface with DCS directly (to access the devices), but work with the API provided by GTL.          |
| <b>/GTL/CSL/</b>                      |        |                 | Configuration Services Layer                                                                                                                                                                                                                                                       |
| ios/                                  |        |                 | IOS related properties.                                                                                                                                                                                                                                                            |
| cmdsRequiringDelay                    |        | string          | List of the IOS commands that execute asynchronously and require time to be processed before they are reflected in the running configuration. Matching rules: case insensitive, . matches any char except newline, * means zero or more, + means one or more, ? means zero or one. |

Table C-1 DCPL Properties (continued)

|                                    |       |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------|-------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| delayAfterDownloadingCmd           |       | command name: integer, 0-1800 seconds               | List of the IOS commands that require a delay after they are downloaded using a terminal session protocol, such as Telnet. The character ; delimits the list elements. The IOS command in each list element must be followed by the character : followed by a maximum integer of 1800, which indicates the number of seconds to delay, thus indicating 0-1800 seconds (0-30 minutes). The command matching rules: case insensitive, . matches any char except newline, * means zero or more, + means one or more, ? means zero or one. The default is a blank field. |
| delayBeforeDownloadingCmd          |       |                                                     | List of the IOS commands that require a delay before they are downloaded using a terminal session protocol, such as Telnet. The character ; delimits the list elements. The IOS command in each list element must be followed by the character : followed by a maximum integer of 1800, which indicates the number of seconds to delay, thus indicating 0-1800 seconds (0-30 minutes). The command matching rules: case insensitive, . matches any char except newline, * means zero or more, + means one or more, ? means zero or one.                              |
| delayBeforeUpload                  |       | integer, 0-30 seconds                               | The delay in seconds to wait after downloading a configlet that contains asynchronous commands before uploading the new configuration.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| delayBeforeWriteMem                | 0     | integer, 0-300 seconds                              | The delay in seconds to wait after downloading a configlet before performing a write memory command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| /GTL/PAM/                          |       |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| /GTL/device-terminal-session-protocol | 1        | integer, 1-2                                        | Protocol to use for device terminal sessions. 1= TELNET 2= SSH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| /GTL/echo-mode                        | false    | The valid values are <b>true</b> and <b>false</b> . | Flag indicating whether to run GTL in <b>ECHO</b> mode or <b>DCS</b> mode.<br><br>Setting ISC to run in echo mode allows ISC to perform Service provisioning tasks without downloading the resulting commands to the physical hardware. The resulting Service Provisioning is stored only in the Repository and no attempt is made to connect to the target devices. When echo mode is enabled (set to <b>true</b> ), no attempt to audit the Service Request is performed. From a production environment, you are able to perform service provisioning on devices that are either temporarily offline or not yet commissioned. Once these devices become active, you can Force Deploy the already provisioned Service Requests and ISC downloads the configurations. |

|---------------------------------|--------------------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logFileNumber                   | 2                              | integer, 1-10                   | Maximum number of log files for a process. Each of these files can be of size <b>logFileSize</b> . When the maximum number for log files is reached for a process, the log files are rotated by deleting the oldest log file for that process.                                                                                                                    |
| logFileSize                     | 2000000                        | integer, 1000000-10000000 bytes | Size in bytes of a single log file for a process. Each process will have a number of log files (see <b>logFileNumber</b> property), where each of these files can grow to this size.                                                                                                                                                                              |
| logFormatter                    | java.util.logging.XMLFormatter | string                          | Class name for the default formatter of log records.                                                                                                                                                                                                                                                                                                              |
| logLevel                        | CONFIG                         | selection                       | NOTE: This log Level is used only if there is no log Level defined for a component. The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value). |

**Table C-1** DCPL Properties (continued)

|                                     |       |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------|-------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AuditJITUpload                      | true  | The valid values are <b>true</b> and <b>false</b> . | If the value of this property is set to <b>false</b> , the provisioning server does NOT upload a copy of the configuration file from the routers when it processes the Service Request for auditing purpose. Instead, it uses copies of the configuration files that were collected and stored in the Repository earlier. If the value of this property is set to <b>true</b> , the provisioning server uploads a copy of the configuration file from the routers when it processes the Service Request for auditing purpose. The default value of this property is <b>true</b> . |
| CleanStagedConfigletWhenForceDeploy | false | The valid values are <b>true</b> and <b>false</b> . | If this value is <b>true</b> , when a service request is force deployed, the staged configlet is removed before provisioning. If this value is the default of <b>false</b> , the staged configlet is considered as part of the base configuration during provisioning.                                                                                                                                                                                                                                                                                                            |
| DownloadTemplateToUnmanagedDevice   | false | The valid values are <b>true</b> and <b>false</b> . | If this value is <b>true</b> , for an unmanaged device, ISC attempts to download just the template. The configlet generated by the provision is not part of the download. By default, this value is <b>false</b> and then there is no attempt to download to an unmanaged device.                                                                                                                                                                                                                                                                                                 |

|-------------------------------|-------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ForceTemplateDeploy           | false | The valid values are <b>true</b> and <b>false</b> . | <p>Templates are downloaded in the first/initial service request (SR) deployment.</p> <p>During <b>edit/modification of SRs</b>, in case templates are attached to the SR, the following is true:</p> <p>a) Templates are updated if this property is set to <b>true</b>, in case the physical interface or VLAN ID (or other ISC repository variables) is modified or changed.</p> <p>b) Templates attached to a service policy are not downloaded to new LINKS added to an existing SR if this property is set to <b>true</b> or <b>false</b>.</p> <p>Templates are not updated if this property is set to <b>false</b>, if the physical interface or VLAN ID (or other ISC repository variables) is modified.</p> <p>If the templates do not include any ISC repository variables, the recommendation is to set this property to <b>false</b>. If the templates include any ISC repository variables, the recommendation is to set this property to <b>true</b>.</p> |
| MaxNumberOfDevicesPerDownload | 100   | integer                                             | ISC will try to bundle as much devices as possible during a download attempt. This value set the max number of devices allowed during such an attempt. If the number of devices exceeds this limit, multiple download attempts will take place. You should decrease this limit if the download involves many devices with huge configlets in order to conserve memory usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ProvisionJITUpload            | true  | The valid values are <b>true</b> and <b>false</b> . | <p>If the value of this property is set to <b>false</b>, the provisioning server does NOT upload a copy of the configuration file from the routers when it processes the Service Request for provisioning purpose. Instead, it uses copies of the configuration files that were collected and stored in the Repository earlier. If the value of this property is set to <b>true</b>, the provisioning server uploads a copy of the configuration file from the routers when it processes the Service Request for provisioning purpose.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |

| allowDuplicateIpAddressForPPPoATM | false                                              | The valid values are <b>true</b> and <b>false</b> . | Provision PPPoATM by allowing duplicate IP addresses for MPLS Service Requests. Ignore duplicate IP address on Loopback and Multilink interfaces.                                                                                                                             |

**Table C-1** DCPL Properties (continued)

|                                         |               |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------|---------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allowOverwriteManualAssigned Address    | false         | The valid values are <b>true</b> and <b>false</b> . | Allow manually-assigned IP address in Service Request overwrite the pre-existing interface IP address. <b>False</b> means if an MPLS service request tries to provision a manually-assigned IP address to an interface that already has a different IP address on it, ISC detects that and reports the error. <b>True</b> means ISC allows the new IP address to overwrite the existing IP address.       |
| allowShared VLAN Modification           | false         | The valid values are <b>true</b> and <b>false</b> . | For residential services, if the flag is on, <b>true</b> , shared VLAN attributes are available for modify in edit mode. If the flag is off, <b>false</b> , attributes are in read only mode.                                                                                                                                                                                                             |
| auditIpAddressViaUnnumbered             | false         | The valid values are <b>true</b> and <b>false</b> . | When the value is the default of <b>false</b> , the auditor only looks for the IP address of a provisioned interface. When the value is <b>true</b> , the auditor tries to match the IP address of the unnumbered interface, if one exists.                                                                                                                                                               |
| auditMaxrouteThreshold                  | true          | The valid values are <b>true</b> and <b>false</b> . | This property controls whether an audit will be run on the Max Route Threshold for a Service Request. This is needed to maintain backward compatibility.                                                                                                                                                                                                                                                  |
| auditPartialCommands                    | false         | The valid values are <b>true</b> and <b>false</b> . | This property is set for the autodiscovered systems containing a superset of the commands that ISC supports.                                                                                                                                                                                                                                                                                              |
| dataFileSchema                          | l3vpnData.xsd | string                                              | Specifies the schema for the data XML file for MPLS/BGP layer3 VPNs.                                                                                                                                                                                                                                                                                                                                      |
| excludeNoKeepaliveConfigOnPort Channel  | false         | The valid values are <b>true</b> and <b>false</b> . | Exclude the no keepalive command on the port channel trunk port.                                                                                                                                                                                                                                                                                                                                          |
| forceRemoveNonBroadcastStatic RouteOnPE | false         | The valid values are <b>true</b> and <b>false</b> . | The default value is <b>false</b> .<br>When the value is set to <b>true</b> , ISC removes the non-broadcast type static route command that has a pre-existing long syntax, even if the command was not provisioned by ISC. The non-broadcast type static route command is removed from a PE router prior to provisioning. Long syntax contains both an outgoing interface name and a next hop IP address. |
| ignoreLoopbackWhileRemovingVRF          | false         | The valid values are <b>true</b> and <b>false</b> . | Remove a VRF, even when some Loopback interfaces are still pointing to it.                                                                                                                                                                                                                                                                                                                                |

Table C-1 DCPL Properties (continued)

|                                          |        |                                                     |                                                                                                                                                                                                                                                                                                     |
|------------------------------------------|--------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ignoreMajorInterfaceCheck                | false  | The valid values are <b>true</b> and <b>false</b> . | This property controls the check for a proper major interface name in an unmanaged CE. If set to <b>true</b> , ISC bypasses the check for a proper major interface name. Note: This will work only for Unmanaged CE devices                                                                         |
| ignoreStatusMessagesForUnmanaged CEs     | false  | The valid values are <b>true</b> and <b>false</b> . | If set to <b>true</b> , this property prevents the generation of status messages for unmanaged CEs                                                                                                                                                                                                  |
| logLevel                                 | CONFIG | selection                                           | The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value).                       |
| ospfProcessLimit                         | 2      | integer                                             | If the number of OSPF processes reaches or exceeds this limit, a warning will be produced.                                                                                                                                                                                                          |
| parseConfigAfterProvisioning             | false  | The valid values are <b>true</b> and <b>false</b> . | This property controls the parsing of the configuration file after the provisioning is completed in order to make sure that device inventory is in sync with network.                                                                                                                               |
| passAuditForNonBroadcastStatic RouteOnPE | false  | The valid values are <b>true</b> and <b>false</b> . | When this property is set to <b>true</b> , the ISC auditor does not generate an error message if the static route was found with a different format (such as, a PE interface name instead of a CE IP address).                                                                                      |
| passIpAddressAuditWhenNoAddress Detected | false  | The valid values are <b>true</b> and <b>false</b> . | Pass the IP address command auditing if uploaded router config does not contain an IP address. This is to prevent the audit failure from appended template blob overwriting the provisioned IP address command.                                                                                     |
| reapplyIpAddress                         | false  | The valid values are <b>true</b> and <b>false</b> . | Re-apply the same IP address to the interface when decommission a service request. This option is only applicable to manually-assigned IP addresses. It does not work for automatically-assigned IP addresses. When this property is in effect, the interface negate command will not be generated. |
| removeSubInterface                       | true   | The valid values are <b>true</b> and <b>false</b> . | Removing the ISC generated subinterface commands in decommission service requests.                                                                                                                                                                                                                  |

**Table C-1** *DCPL Properties (continued)*

|                                             |                  |                                                     |                                                                                                                                                                                                                                                                 |
|---------------------------------------------|------------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| routeMapDeletedAfterLastLink<br>Deletion    | true             | The valid values are <b>true</b> and <b>false</b> . | If this property is set to <b>true</b> , the route map configuration is automatically removed from the device after the last link is deleted. If <b>false</b> , the route map configuration is left as it is in the device.                                     |
| saveDebugData                               | true             | The valid values are <b>true</b> and <b>false</b> . | If this property is set to <b>true</b> , whenever an SR is provisioned, the uploaded config files and input XML data are saved to a temporary directory for debugging purposes.                                                                                 |
| sendAuditEvent                              | true             | The valid values are <b>true</b> and <b>false</b> . | Set true to enable sending audit event for this service.                                                                                                                                                                                                        |
| serviceFile                                 | l3vpnService.xml | string                                              | Specifies the XML file containing the service definition for MPLS/BGP layer3 VPNs. The schema for this file is specified by Provisioning.Engine.serviceSchema                                                                                                   |
| skipIpAddressValidationOn<br>UnmanagedCE    | false            | The valid values are <b>true</b> and <b>false</b> . | When the value is <b>false</b> , the IP addresses between a PE and an unmanaged CE are validated to ensure they are in the same subnetwork and valid host addresses. When the value is <b>true</b> , this validation is bypassed.                               |
| useNextHopAddressForStaticRoutes            | false            | The valid values are <b>true</b> and <b>false</b> . | For Static Routes, use local router outbound interface or IP address of the next hop to reach the destination network.                                                                                                                                          |
| useOnlyExtraCEloopbackForGrey<br>AccessList | false            | The valid values are <b>true</b> and <b>false</b> . | With Extra CE loopback, the user can select this option to add only the loopback address instead of the interface ip address and extra CE loopback.                                                                                                             |
| <b>shared/</b>                              |                  |                                                     | Properties shared by MPLS VPN, L2VPN and VPLS.                                                                                                                                                                                                                  |
| <b>FeatureQuery/</b>                        |                  |                                                     | ISC components that check if certain features are available for certain devices based on their software version and platform information.                                                                                                                       |
| enableValidation                            | true             | The valid values are <b>true</b> and <b>false</b> . | If enabled, FeatureQuery will check if the features are available based on the feature matrix and device OS version (IOS Version or PIX Version). If disable it will assume that all features are available on all platforms (should be used for testing only). |
| IosXrVersionFilesDir                        |                  | string                                              | Path to IOS XR version XML files.                                                                                                                                                                                                                               |
| actionTakenOnUNIVlanList                    | prune            | string                                              | Action taken when switch port <b>allowed vlan</b> cmd is absent for ERS service.                                                                                                                                                                                |

Table C-1 DCPL Properties (continued)

|                                      |                                                              |                                                     |                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|--------------------------------------------------------------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| leaveSystemMTUUnset                  | false                                                        | The valid values are <b>true</b> and <b>false</b> . | If this property is set as <b>true</b> :<br>U-PE system MTU is not set as default, or set as value given by user;<br>N-PE SVI MTU is set as 9216 for VPLS(EWS and ERS) and L2VPN(EWS).<br>If this property is set as <b>false</b> :<br>U-PE system MTU is set as minimum value 1522, or set as value given by user;<br>N-PE SVI MTU is not set as default, or set as value given by user. |
| overwriteInterfaceDescription        | true                                                         | The valid values are <b>true</b> and <b>false</b> . | By default, ISC generates a <b>description</b> subcommand for all the physical interfaces it provisioned. Set this property to false if this behavior is not desirable. This property does not apply to logical interfaces or other CLI objects that have a <b>description</b> subcommand (Example: crypto map entries, gre Interfaces, and so on).                                       |
| transferUNIDescToVlanName            | false                                                        | The valid values are <b>true</b> and <b>false</b> . | Controls provisioning of the VLAN name on the PE-POP. If set to <b>true</b> , the VLAN name is assigned from the description for the UNI. If set to the default of <b>false</b> , no VLAN name is assigned.                                                                                                                                                                               |
| useSRDescriptionToGenerateDebug Data | false                                                        | The valid values are <b>true</b> and <b>false</b> . | This property is used to generate more intuitive debug data for easy fixing of issues.                                                                                                                                                                                                                                                                                                    |
| <b>staging/</b>                      |                                                              |                                                     |                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>platform/</b>                     |                                                              |                                                     | Platform related classes.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>CATOS/</b>                        |                                                              |                                                     | Service blade parameters for CATOS.                                                                                                                                                                                                                                                                                                                                                       |

|-----------------------------|--------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /Scheduler/syncInterval     | 5      | integer, 0-10 minutes                               | When scheduler starts up for the first time, it reads all the scheduling information from the task repository. After that, it depends on the events generated by task repository for receiving changes to the scheduling information. It can also periodically synchronize with the task repository by re-reading it at regular intervals. This property specifies, in minutes, that interval. If the value for the interval is 0, scheduler will not synchronize with the task repository and only depends on the events. |
| <b>Services Properties:</b> |        |                                                     | Common services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| /Services/Common/           |        |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| allowForcePurge             | true   | The valid values are <b>true</b> and <b>false</b> . | With the default value of <b>true</b> , you can force purge a Service Request. If the value is <b>false</b> , you cannot force purge a Service Request.                                                                                                                                                                                                                                                                                                                                                                    |
| disableFallBack             | false  | The valid values are <b>true</b> and <b>false</b> . | This property is used to set a default value for the DisableFallBack property of PseudowireClass. This property is effective only for IOS XR L2VPN services.                                                                                                                                                                                                                                                                                                                                                               |

**Table C-1 DCPL Properties (continued)**

|                                   |           |                                                     |                                                                                                                                                                                                                                                            |
|-----------------------------------|-----------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| disallowVlan1                     | true      | The valid values are <b>true</b> and <b>false</b> . | This prevents allocating VLAN ID 1 for services configured by ISC. This is applicable for both auto allocation of VLAN from VLAN resource pool and manual allocation. Set this property to <b>true</b> to block ISC from deploying services with VLAN ID 1 |
| interfaceDescRegEx                |           | string                                              | Interface Configuration Regular Expression.                                                                                                                                                                                                                |
| interfaceNameRegEx                |           | string                                              | Interface Name Regular Expression.                                                                                                                                                                                                                         |
| l2vpnGroupNameOptions             | ISC,VPNSC | string                                              | This property is used to set a comma separated list of a maximum of 10 L2VPN Group Names. This property is effective only for IOS XR L2VPN services.                                                                                                       |
| pseudoWireVlanMode                | false     | The valid values are <b>true</b> and <b>false</b> . | This property is effective only for IOS XR L2VPN services. The default is <b>false</b> . When set to <b>true</b> , this configures pseudowire transport mode to VLANs.                                                                                     |
| <b>SnmpService Properties:</b>    |           |                                                     | The Snmp Service package provides APIs to perform SNMP get() and set() operations.                                                                                                                                                                         |
| /SnmpService/misc                 |           |                                                     | Advanced settings.                                                                                                                                                                                                                                         |
| enableDebug                       | false     | The valid values are <b>true</b> and <b>false</b> . | Enables the AdventNet SNMP stack debug messages. Messages are written to the TaskLogs directory in files stdout and stderr. Warning: These log files grow quickly and are NOT managed by the ISC logger. Requires WatchDog restart.                        |
| rcvPktBuffSize                    | 96        | integer, 64-512                                     | Buffer size in K bytes, for SNMP stack receive buffer.                                                                                                                                                                                                     |
| /SnmpService/defaultSNMPVersion   | 1         | integer, 1-2                                        | The default SNMP version used to connect to Cisco router. Used if the SNMP version is not specified per router. Valid Values: SNMPv1/SNMPv2c - 1 SNMPv3 - 2.                                                                                               |
| /SnmpService/defaultSecurityLevel | 3         | integer, 1-3                                        | The default security level used to connect to Cisco router. Used if the security level is not specified per router. Values: authentication no encryption - 1 authentication encryption - 2 no authentication no encryption - 3.                            |

**Table C-1** DCPL Properties (continued)

|                              |        |                                                     |                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|--------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /SnmpService/logLevel        | CONFIG | selection                                           | The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value).                                                                                                |
| /SnmpService/maxTaskDuration | 5      | integer, 1-30                                       | Maximum duration in minutes for collecting device interface information. A longer duration is required for devices with large numbers of interfaces. This period must be longer than $2^{(retries+1)} * \text{timeout}$ .                                                                                                                                                    |
| /SnmpService/retries         | 3      | integer, 0-10                                       | The number of retries to be used by the SNMP protocol.                                                                                                                                                                                                                                                                                                                       |
| /SnmpService/timeout         | 5      | integer, 0-300 seconds                              | Timeout value to be used by the SNMP protocol. Unit: seconds                                                                                                                                                                                                                                                                                                                 |
| TE Properties:               |        |                                                     | Traffic Engineering Management (TEM) Properties                                                                                                                                                                                                                                                                                                                              |

| maxCacheSize                 | 60     | integer, >0                                         | Maximum cache size.                                                                                                                                                                                                                                                                                                                                                          |
| oneDeviceEachTimeThreshold   | 500    | integer, >0                                         | When the total number of tunnels to be provisioned exceeds this threshold number, provision one device at a time.                                                                                                                                                                                                                                                            |
| partialConfigAudit           | false  | The valid values are <b>true</b> and <b>false</b> . | When the value is the default of <b>false</b> , the config audit is not limited. When the value is set to <b>true</b> , only a partial config audit (audit of only the PENDING tunnels) occurs for primary and backup tunnel deployment.                                                                                                                                     |
| /TE/repository               |        |                                                     | TEM Repository-related Properties                                                                                                                                                                                                                                                                                                                                            |
| checkPermissionEnabled       | false  | The valid values are <b>true</b> and <b>false</b> . | This property enables or disables Role-Based Access Control (RBAC) checking during particular TEM operations, such as topology population, discovery, and service deployment. When the value is the default of <b>false</b> , RBAC permission checking is not enabled. When the values is set to <b>true</b> , RBAC permission checking is enabled and performance degrades. |
| TE Topology Properties:      |        |                                                     | TEM Topology-related Properties                                                                                                                                                                                                                                                                                                                                              |
| /TE Topology/TrafficData     |        |                                                     | Color Control for Traffic Data Displays                                                                                                                                                                                                                                                                                                                                      |

**Table C-1 DCPL Properties (continued)**

|                                    |                                   |                             |                                                                                                                                                                                                                                                                                      |
|------------------------------------|-----------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Green                              | 0-25                              | integer, 0-100 (percentage) | Topology representations for a link performance utilization range, specified as a percentage (default: 0-25), are displayed in the color green.                                                                                                                                      |
| Orange                             | 51-75                             | integer, 0-100 (percentage) | Topology representations for a link performance utilization range, specified as a percentage (default: 51-75), are displayed in the color orange.                                                                                                                                    |
| Red                                | 76-100                            | integer, 0-100 (percentage) | Topology representations for a link performance utilization range, specified as a percentage (default: 76-100), are displayed in the color red. Greater than 100% is also displayed in red.                                                                                          |
| Yellow                             | 26-50                             | integer, 0-100 (percentage) | Topology representations for a link performance utilization range, specified as a percentage (default: 26-50), are displayed in the color yellow.                                                                                                                                    |
| <b>TaskManager Properties:</b>     |                                   |                             | Task manager executes tasks that are scheduled by scheduler. Task execution consists of executing different actions that comprise the task. Task manager manages the dependencies between these actions.                                                                             |
| /TaskManager/CollectConfig         |                                   |                             | The Collect Config task uploads the running configuration.                                                                                                                                                                                                                           |
| logLevel                           | CONFIG                            | selection                   | The log Level indicates the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value). |

The logging levels are as defined in the java.util.logging package.                                                                                               |

Table C-1 DCPL Properties (continued)

|                                     |        |                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------|--------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>lockmanager Properties:</b>      |        |                                                     | Component that handles device locking. When different jobs (such as provisioning) try to update the config on the device, they obtain <b>software</b> locks so that two different jobs do not update the config at the same time. LockManager provides a way to obtain and later release such software locks.                                                                                                                         |
| /lockmanager/collectConfigLock      | false  | The valid values are <b>true</b> and <b>false</b> . | Determines if a software lock is to be applied to the devices in the CollectConfig task. If <b>true</b> , a software lock is applied to all devices prior to executing the CollectConfig operation, and is released upon completion of the CollectConfig operation. Note that a software lock is not applied to the optional device attributes and interfaces operations. This flag is read by the CollectConfig task upon execution. |
| /lockmanager/lockTimeoutInHours     | 8      | integer, 1-168 hours                                | Timeout in hours for a lock held by a lock holder. If the lock holder does not free a lock within this time the lockmanager will automatically release the device lock.                                                                                                                                                                                                                                                               |
| /lockmanager/logLevel               | SEVERE | selection                                           | The log Level is the level at which logging is done for this component. These levels are identical to the logging levels defined for JDK1.4 logging package. The levels in descending order are: SEVERE (highest value) WARNING INFO CONFIG FINE FINER FINEST (lowest value).                                                                                                                                                         |
| /lockmanager/queueServicingInterval | 100    | integer, 10-2000 milliseconds                       | How often in milliseconds to service pending lock requests. A lower value decreases the average time it takes to get a lock at the expense of CPU processing overhead.                                                                                                                                                                                                                                                                |

| /repository/Concurrency/      |                                        |                                                     | To setup properties for re-try loop to avoid deadlock                                                                                                                                                                                                                                                   |
| NOICE_FACTOR                  | 500                                    | integer                                             | Add random noise to each process that is being retried.                                                                                                                                                                                                                                                 |
| NO_OF_RETRIES                 | 3                                      | integer                                             | Number of retries before throwing deadlock exception.                                                                                                                                                                                                                                                   |
| TIME_BASE                     | 2                                      | integer                                             | The base number to calculate the wait time. For example, a value of 2 for this property and 3 retries means, the process will be retried every $2^0$ , $2^1$ , and $2^2$ seconds.                                                                                                                       |
| /repository/IPAddressPool/    |                                        |                                                     | IP Address Pool Constants.                                                                                                                                                                                                                                                                              |
| AGE_TIME                      | 1440                                   | integer                                             | The Aging interval for released IP Address, in minutes. The default is 24 hours (1440 minutes).                                                                                                                                                                                                         |
| RecoverIPAddrSleepInterval    | 60                                     | integer, 10 - 144000 minutes                        | The time in minutes for recovering Aged IP addresses recovery service to wait between recovery cycles. The default is 60 minutes. Changing this value initiates the recovery process.                                                                                                                   |
| releaseAndReuseAgedAddresses  | true                                   | The valid values are <b>true</b> and <b>false</b> . | The default value is <b>false</b> . When the value is set to <b>true</b> , the user wants a manual allocation of the address in the aged address to succeed. When the value is set to <b>true</b> , the address is released from the Aged Pool and moved to the Allocated pool when manually allocated. |

| maxAllowedMisses              | 3                   | integer                                 | The maximum number of consecutive misses that a watchdog should miss for the master to consider it inactive or unregistered.                                                                                                                                                                                                                                                                                                                                                                                        |
| maxAttemptsForMasterReconnect | 500                 | integer                                 | After the slave watchdog loses connection with the master, it will try this many times to try and establish the connection. If it cannot re-establish a connection with the master even after making these many attempts, it shuts itself down. Between attempts, it sleeps <b>watchdog.heartbeat.wds.masterReconnectAttemptDelay</b> time. The value for this property should be specified in milliseconds. A value of 0 indicates that the slave watchdog has no upper limit on the number of reconnect attempts. |
