| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MaxEventDbRecords       | <p>Sets the maximum number of events allowed in the in-memory or active database. You can observe these events in the client NBAPI. The MWTM archives deleted events.</p> <p>By default, the active database can hold a maximum of 10,000 events. If the database exceeds 10,000 events, the MWTM archives the oldest events until the database is reduced to 10,000 events.</p> <p>To change the size of the active database, enter the new size, in number of events, in this field. The valid range is 0 events (that is, no limit) to an unlimited number of events. The default setting is 10,000 events.</p> <p><b>Note</b> As you increase the size of the event database, you negatively impact the performance of the MWTM server and clients.</p>                                                                                                        |
| MaxAlarmDbRecords       | <p>Sets the maximum number of alarms allowed in the in-memory or active database. You can observe these alarms in the client NBAPI. The MWTM archives deleted alarms.</p> <p>By default, the active database can hold a maximum of 10,000 alarms. If the database exceeds 10,000 alarms, the MWTM archives the oldest alarms until the database is reduced to 10,000 alarms.</p> <p>To change the size of the active database, enter the new size, in number of alarms, in this field. The valid range is 0 alarms (that is, no limit) to an unlimited number of alarms. The default setting is 10,000 alarms.</p> <p><b>Note</b> As you increase the size of the alarm database, you negatively impact the performance of the MWTM server and clients.</p>                                                                                                        |
| MaxEventTimeToLive      | <p>Sets the maximum length of time, in days, the MWTM should retain events in the in-memory or active database. You can observe these events in the client NBAPI. The MWTM archives deleted events.</p> <p>By default, the active database retains events a maximum of 7 days. The MWTM archives events that are older than 7 days.</p> <p>To change the maximum age for events, enter the new age, in days, in this field. The valid range is 0 days (events are purged at each maintenance interval) to an unlimited number of days. The default setting is 7 days.</p>                                                                                                                                                                                                                                                                                          |
| CompressEventDbInterval | <p>Sets the length of time, in minutes, between maintenance checks of the in-memory or active database. The MWTM archives these events and alarms when this task runs. Also, the oldest archived events and alarms may be deleted from the database.</p> <p>By default, the MWTM performs maintenance on the active database every 15 minutes, archiving all events and alarms in excess of 10,000, all events older than 7 days, and all alarms older than 14 days.</p> <p>To change the maintenance interval, enter the new interval, in minutes, in this field. The valid range is 0 minutes (perform continual maintenance; not advised) to an unlimited number of minutes. The default setting is 60 minutes.</p> <p><b>Note</b> The smaller the maintenance interval, the greater the negative impact on the performance of the MWTM server and clients.</p> |

| Field                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AutomationTimeout        | <p>Sets the maximum length of time, in seconds, the MWTM should allow an event automation script to run.</p> <p>By default, the MWTM event database allows an event automation script to run for 300 seconds (5 minutes) before canceling the script and moving on.</p> <p>To change the event automation timeout interval, enter the new interval, in seconds, in this field. The valid range is 0 seconds (no automation) to an unlimited number of seconds. The default setting is 300 seconds.</p> <p><b>Note</b> The MWTM runs each automation script sequentially, not in parallel. Therefore, the longer the automation timeout interval, the greater the chance that a failed script can delay subsequent scripts.</p> |
| ProcessUndiscovered      | <p>Determines whether the MWTM should process events from undiscovered nodes:</p> <ul style="list-style-type: none"> <li>• <b>False</b>—Do not process events from undiscovered nodes. This setting is the default.</li> <li>• <b>True</b>—Begin processing events from undiscovered nodes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Send Updates             | <p>Determines whether the MWTM should send traps northbound:</p> <ul style="list-style-type: none"> <li>• <b>False</b>—Do not send traps northbound when an event is updated or deleted. Only send traps when an event is new. This setting is the default.</li> <li>• <b>True</b>—(Default setting) Send traps northbound when an event is updated, deleted, or new.</li> </ul>                                                                                                                                                                                                                                                                                                                                               |
| ProcessUnrecognizedTraps | <p>Determines whether the MWTM should create events for unrecognized traps:</p> <ul style="list-style-type: none"> <li>• <b>False</b>—Do not create events for unrecognized traps.</li> <li>• <b>True</b>—(Default setting) Create events for unrecognized traps.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TrapGenThrottle          | <p>A delay (in milliseconds) between each trap sent to a northbound host. This value is helpful if the MWTM is sending traps faster than the northbound host can receive them. The default is 10 milliseconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| HeartbeatTrapInterval    | <p>A delay (in seconds) between each heartbeat trap sent to a northbound host. If this value is zero or less than one, no heartbeat trap is sent. The default is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ArchiveAge               | <p>The maximum age, in days, of all archived events and alarms in the database. The default is 31 days.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MaxAlarmAge              | <p>The maximum age, in days, of all active alarms in the database. The default is 14 days.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| SendAlarms              | <p>Determines whether the MWTM should send alarms to a northbound system:</p> <ul style="list-style-type: none"> <li>• <b>False</b>—Does not send alarms to the northbound system.</li> <li>• <b>True</b>—(Default setting) Sends alarms to the northbound system.</li> </ul>                                                                                                                                                                                                                                                             |
| UseAlternateTrapOids    | When set to true, allows user-specified trap OIDs (SNMPv1 trap enterprise/specific type or SNMPv2 snmpTrapOID)                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ClearAlarmsOnUpdate     | When set to true, automatically clears outstanding alarms when a new event in the alarm sequence occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DeleteAlarmsOnUpdate    | When set to true, automatically deletes outstanding alarms when a new event in the alarm sequence occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SendAlarmSetsAndClears  | When set to true, sends a northbound notification only when an alarm is raised and when it is cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ArchiveActiveAlarms     | <p>Determines whether the MWTM should archive alarms.</p> <ul style="list-style-type: none"> <li>• <b>True</b>—(Default setting) Allows alarm archiving in accordance with both MaxAlarmAge and MaxAlarmDbRecords.</li> <li>• <b>False. Ignore MaxAlarmAge</b>—Does not archive alarms until they are manually or automatically cleared through alarm correlation.</li> <li>• <b>False. Ignore MaxAlarmAge and MaxAlarmDbRecords</b>— Never automatically archive an active alarm.</li> </ul>                                             |

| Field                       | Description                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FilterIgnoredNEs            | Determines whether the MWTM should propagate alarms to a northbound system: <ul style="list-style-type: none"> <li><b>False</b>—(Default setting) Propagates alarms to the northbound system.</li> <li><b>True</b>—Does not propagate alarms to the northbound system.</li> </ul>                               |
| ThrottleAlarmCountThreshold | Threshold count for Alarms. If the trap count exceeds the threshold, the traps need to be forwarded to NorthBound.                                                                                                                                                                                              |
| ThrottleAlarmTimeThreshold  | Threshold time for Alarms. If <i>X</i> traps are received within configured time, traps need to be forwarded to NorthBound, where <i>X</i> is ThrottleAlarmCountThreshold.                                                                                                                                      |
| NodeDisplayName             | The name from the Node object to be assigned to the NodeDisplayName variable for inclusion in event messages.<br><br>The values are: <ul style="list-style-type: none"> <li>CustomName—Custom name of the device.</li> <li>NodeName—Node name of the device.</li> <li>SysName—SysName of the device.</li> </ul> |

## Specifying SNMP Servers for Trap Forwarding

You use the MWTM to specify a list of SNMP servers, or hosts, to which the MWTM should forward events in the form of traps.

For more information about enabling MWTM trap forwarding, see [Forwarding Events as Traps to Other Hosts](#), page 9-35.

To specify the list of hosts, click the turner  beside Event Configuration, then click **SNMP Servers**. The SNMP Servers Configuration window appears in the content area in the right pane.

| Field or Button | Description                                                                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host            | Name of the host NMS that should receive traps from the MWTM. The host must be IP-routable, and the name must be a valid IP address or DNS name.                                                                                                                            |
| Port            | Host port number to which the MWTM should forward traps.                                                                                                                                                                                                                    |
| Community       | SNMP community string that the MWTM should include in forwarded traps.                                                                                                                                                                                                      |
| Version         | Trap version to forward. Valid values are 1 and 2c.                                                                                                                                                                                                                         |
| Trap Type       | Type of trap that the MWTM should forward to this host. Valid trap types are: <ul style="list-style-type: none"> <li>CISCO-SYSLOG: The CISCO-SYSLOG-MIB clogMessageGenerated trap.</li> <li>CISCO-EPM: CISCO-EPM-NOTIFICATION-MIB ciscoEpmNotificationRev1 trap.</li> </ul> |
| Add             | Adds a new hostname to the bottom of the list. Type over the default values with the new values.                                                                                                                                                                            |
| Delete          | Deletes the chosen hostname from the list.                                                                                                                                                                                                                                  |

| Field or Button            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send a trap for all events | <p>Checks the <b>Send Traps</b> check box for all MWTM events. Click this button if you want the MWTM to forward all events to the list of hosts.</p> <p>If you click this radio button, and then you uncheck even a single <b>Send Traps</b> check box for any event, the MWTM unchecks this button.</p> <p>This radio button is mutually exclusive with the <b>Send a trap for no events</b> button.</p>                                      |
| Send a trap for no events  | <p>Unchecks the <b>Send Traps</b> check box for all MWTM events. Click this button if you do not want the MWTM to forward any events to the list of hosts. This is the default setting.</p> <p>If you click this radio button, and then you check even a single <b>Send Traps</b> check box for any event, the MWTM unchecks this button.</p> <p>This radio button is mutually exclusive with the <b>Send a trap for all events</b> button.</p> |

## Changing Event Categories

To change categories for the MWTM event database, click the turner  beside Event Configuration, then click **Categories**. The Categories Configuration window appears in the content area in the right pane.

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category Name   | <p>Lists the names of the currently defined MWTM event categories.</p> <p>By default, the MWTM provides these event categories:</p> <ul style="list-style-type: none"> <li>• <b>Status</b>—Status change message generated.</li> <li>• <b>Trap</b>—SNMP trap message generated.</li> <li>• <b>Create</b>—Creation event, such as the creation of a seed file.</li> <li>• <b>Delete</b>—Deletion event, such as the deletion of an object or file.</li> <li>• <b>Discover</b>—Discovery event, such as Discovery beginning.</li> <li>• <b>Edit</b>—Edit event. A user has edited an event, linkset, or node.</li> <li>• <b>Ignore</b>—Ignore event. A user has Ignored a link or linkset.</li> <li>• <b>Login</b>—Login event. A user has logged in to the MWTM.</li> <li>• <b>LoginDisable</b>—LoginDisable event. The MWTM has disabled a user's User-Based Access authentication as a result of too many failed attempts to log in to the MWTM.</li> <li>• <b>LoginFail</b>—LoginFail event. An attempt by a user to log in to the MWTM has failed.</li> <li>• <b>Logout</b>—Logout event. A user has logged out of the MWTM.</li> <li>• <b>OverWrite</b>—OverWrite event. An existing file, such as a seed file or route file, has been overwritten.</li> <li>• <b>Poll</b>—Poll event, such as an SNMP poll.</li> <li>• <b>Purge</b>—Purge event. A user has requested Discovery with Delete Existing Data selected, and the MWTM has deleted the existing the MWTM database.</li> </ul> <p>To change the name of an existing event category, highlight the category name and type over it with the new name. For example, you could replace every occurrence of LoginFail with BadLogin.</p> |

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Add             | Adds a new category name to the bottom of the list. Type over the default category name with the new name.                                                                                                                                                                                                                                                                                                                          |
| Delete          | Deletes the chosen category name from the list.<br><br>If events in the MWTM database use the deleted category name, the Entry Substitution dialog box appears. Use this dialog box to select a new category name in place of the deleted category name. Select an existing category name from the drop-down list box, or enter a new category name. If you enter a new category name, the MWTM adds it to the Category Name field. |

## Configuring Trap, Status Alarm, or User Action Events

The MWTM can detect these event types:

- **Traps**—Events that are triggered by SNMP traps or notifications
- **Status Alarms**—Events that are triggered by status changes
- **User Actions**—Events that are triggered by user actions

You can choose to view all traps, all status alarms, and all user actions, or you can view these based on network type (RAN-O, ITP, and so on.)

To configure the event parameters for any of these event types:

- 
- Step 1** Choose **Tools > Event Editor** from the MWTM main menu in the client interface.
- Step 2** Click the turner  beside Event Configuration.
- Step 3** Click the turner  beside the event type that you want to configure:
- All Traps
  - All Status Alarms
  - All User Actions
  - Common (lists all traps, status alarms, and user actions common to all networks)
  - IPRAN
  - ITP
  - CSG1
  - CSG2
  - GGSN
  - BWG
  - HA
  - PDSN
  - PDNGW
  - SGW
  - PCRF

The MWTM lists the currently defined traps, status alarms, or user actions in the navigation tree under the event type.

- Step 4** Click the turner  beside the specific trap, status alarm, or user action for which you want to configure an event.
- The MWTM lists the currently defined events in the navigation tree under the chosen event type.
- Step 5** To add an event to an event type, right-click the event name and select **Add** from the right-click menu.
- The MWTM adds the chosen event to the list of configured events and creates a default entry for the event in the left pane.
- Step 6** Click the default entry in the left pane.
- The Event Configuration pane appears in the right pane.
- Step 7** Configure the event by adjusting the parameters.
- Step 8** To delete an event, right-click the event in the left pane and click **Delete**.

The Event Configuration pane contains:

| Field or Button        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                   | Fixed, internal name of the event, such as cItpRouteStateChange. You cannot change this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Event Keys and Setting | <div>  <b>Caution</b> This feature is for advanced users (Cisco developers and third-party integrators).         </div> <p>Names of the event keys, such as RouteDestinationState, and their settings, such as False.</p> <p>You cannot change the names of the event keys, but you can change their settings. To change an event key setting, select a new setting from the drop-down list box. For example, you can change the setting for RouteDestinationState from Accessible to Unknown.</p>                               |
| Category               | <p>Category of the event (for example, from Trap to Status).</p> <p>To change the category, select a new category from the drop-down list box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Severity               | <p>Severity of the event (for example, from Warning to Minor).</p> <p>To change the severity, select a new severity from the drop-down list box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Event Name             | <p>User-specified name for the event, that the MWTM uses for trap forwarding, also used in the MWTM client.</p> <p>If you want the MWTM to forward this event in the form of a trap to another host, you can specify a new, more meaningful name for the event. The new name can be from 1 to 30 characters, and can contain any letters (upper- or lowercase), any numbers, and any special characters. If you do not specify a new name, the MWTM uses the default name, MWTM.</p> <p>For more information about trap forwarding, see <a href="#">Forwarding Events as Traps to Other Hosts, page 9-35</a>.</p> |
| Message                | <p>Message text associated with the event.</p> <p>To change the message text, type over the message text. You can also right-click in the field and choose <b>Launch Text Editor</b>, where you can update, clear, or discard your text changes.</p> <p>You can also insert variable text in the message. To do so, right-click in the message text area. A popup menu of the valid substitutions for this event appears. To insert a variable in the text area, select from the popup menu.</p>                                                                                                                  |

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Help File       | <p>Help file associated with the event.</p> <p>By default, the MWTM provides extensive type-specific help for events. However, you can use the MWTM to provide your own enterprise-specific instructions to operators in the help file.</p> <p>To change the help file, create a new HTML help file or change the default MWTM help file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>The default directory, <i>/opt</i>, then the default help files are in the <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>A different directory, then the default help directory and files are located in that directory.</li> </ul> <p>If you use an MWTM help file as a basis for your help file, rename it when you save it; do not use the existing MWTM name. If you do, the next time you install the MWTM, the MWTM overwrites the file and you lose your changes.</p> <p>When you have created your new help files, store them in the <i>/opt/CSCOs/gm/apache/share/htdocs/customHelp</i> directory. This directory and its contents are preserved when you upgrade to a new MWTM release. If you do not store your new help files in the <i>/customHelp</i> directory, the files are lost the next time you upgrade to a new MWTM release.</p> <p>When you have created your new help files and stored them in the <i>/customHelp</i> directory, enter the new help file path and filename in the Help File field.</p> <p>After you deploy the new event settings and restart the MWTM server, whenever you display help for the trap, the MWTM shows your new, custom help file.</p> |
| Open            | <p>Opens the help file associated with the event.</p> <p>To see the help file, click <b>Open</b>. The MWTM shows context-sensitive help for the chosen event in a separate web browser.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Action: Run     | <p>Automation command or script for the event that a UNIX process runs.</p> <p>You use the MWTM to automate events. That is, you can configure the MWTM to call a UNIX script to drive automatic paging or e-mail, for example, whenever the MWTM logs an event for which you have defined an automation script.</p> <p>To configure automation for an event, enter a Run line with this format:</p> <p><i>UNIXCommand EventParameters</i></p> <p>where:</p> <ul style="list-style-type: none"> <li><i>UnixCommand</i> specifies either a binary command name or a shell script.</li> <li><i>EventParameters</i> are information from the event that the MWTM sends to <i>UnixCommand</i> as parameters. The set of <i>EventParameters</i> is the same as the set of Message element parameters, and they are specified the same way.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Disable         | Check box to disable this event without removing the event configuration from the <i>/opt/CSCOs/gm/etc</i> file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Personalities   | <p>Clicking Edit opens the Personalities Editor, where you can select from the following networks by checking the box:</p> <ul style="list-style-type: none"> <li>• IPRAN</li> <li>• ITP</li> <li>• CSG1</li> <li>• CSG2</li> <li>• GGSN</li> <li>• BWG</li> <li>• HA</li> <li>• PDNGW</li> <li>• SGW</li> <li>• PCRF</li> </ul> <p>Check the networks you want to include, then click <b>Update</b>, or click <b>Discard</b> to exit the window without saving your changes.</p>                                                                                                                                                                               |
| Detect Flapping | <p><b>Note</b> This field is only active if you have defined a key.</p> <p>If you check the Detect Flapping check box, the following fields appear:</p> <ul style="list-style-type: none"> <li>• Flapping Threshold—Number of correlated events raised if the value matches or exceeds what is set for the Flapping Time Span in seconds value.</li> <li>• Flapping Time Span in seconds—At most, you can get one flapping event per flapping time span period.</li> <li>• Flapping Event Name—Name of flapping event.</li> <li>• Flapping Severity—Severity of flapping event.</li> <li>• Flapping Message—Detailed message for the flapping event.</li> </ul> |
| Errors          | Error messages associated with the event. Correct all errors before deploying the new event configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Forwarding Events as Traps to Other Hosts

You use the MWTM to forward MWTM events to other hosts, in the form of SNMP traps. This operation enables the MWTM to integrate with high-level event- and alarm-monitoring systems such as the Cisco Info Center (CIC). These systems can provide a single high-level view of all alarm monitoring in your network, making it easier to detect and resolve problems.

To forward MWTM events to other hosts:

- Step 1** Specify the list of SNMP servers, or hosts, to which you want the MWTM to forward traps (see [Specifying SNMP Servers for Trap Forwarding, page 9-29](#)).

- Step 2** Specify the events you want to forward, using one of these procedures. To forward:
- All MWTM events, click the **Send a trap for all events** radio button in the SNMP Servers Configuration window of the MWTM Event Editor. For more information, see [Specifying SNMP Servers for Trap Forwarding, page 9-29](#).
  - Only chosen events, edit the events in the MWTM Event Editor and check the **Send Trap** check box. For more information, see the description of the Send Trap field in [Configuring Trap, Status Alarm, or User Action Events, page 9-31](#).
- Step 3** (Optional) Specify new, more meaningful names for the events that you want to forward. If you do not specify a new message name for an event, the MWTM uses the default message name, MWTM. For more information, see the description of the Message Name field in [Configuring Trap, Status Alarm, or User Action Events, page 9-31](#).
- Step 4** Save your new event settings, deploy them to the MWTM server, and restart the MWTM server.
- Step 5** MWTM allows you to specify source address for trap forwarding. You can specify the source address in SOURCE\_SERVER field present in the Server Properties (*/opt/CSCOs/gm/properties/Server.properties*) file.

**Note** For more details, see the [OSS Integration Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

## Setting Sounds for Events at an MWTM Client

You use the MWTM client interface to create and change event sound filters for the MWTM client. Event sound filters determine the sounds that the MWTM client plays when specific events are logged. The MWTM client plays the sounds even if the Event History window is not currently visible.

On Solaris and Linux systems, the root user can access the sound feature from a local or remote device. However, users other than the root user must use a local device and client, not a remote MWTM client accessed by using the xhost + UNIX command.

This section includes:

- [Listing Event Sound Filters, page 9-36](#)
- [Creating New Event Sound Filters, page 9-37](#)
- [Adding Sound Files to the MWTM, page 9-39](#)
- [Changing an Existing Event Sound Filter, page 9-40](#)
- [Deleting Event Sound Filters, page 9-40](#)
- [Playing and Muting Event Sounds, page 9-40](#)

From the MWTM web interface, you can modify the sound to be played when the client loses its connection to the MWTM server as explained in [Events and Alarms, page 11-20](#).

## Listing Event Sound Filters

You use the MWTM client interface to change the list of event sound filters that the MWTM client applies to events, or prevent the MWTM client from playing sounds for events.

To work with the list of event sound filters, choose **Tools > Event Sounds** from the MWTM main menu. The Event Sound Filters List dialog box appears.

The Event Sound Filters List dialog box lists all event sound filters that have been defined.

| Field or Button                | Description                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sound filters applied in order | Indicates the order in which sound filters are to be applied, from top to bottom. If an event matches two or more filters in the list, the top-most filter determines the sound that the MWTM client plays.<br>This field is blank until you have created at least one new sound filter for events.                                                                      |
| Move Up                        | Moves the chosen event sound filter up in the Sound filters applied in order list.                                                                                                                                                                                                                                                                                       |
| Move Down                      | Moves the chosen event sound filter down in the Sound filters applied in order list.                                                                                                                                                                                                                                                                                     |
| New                            | Opens the Event Sound Filters dialog box, which you use to create a new event sound filter.                                                                                                                                                                                                                                                                              |
| Edit                           | Opens the Event Sound Filters dialog box, which you use to change an existing event sound filter in the Sound filters applied in order list.                                                                                                                                                                                                                             |
| Delete                         | Deletes the chosen event sound filter from the Sound filters applied in order list.                                                                                                                                                                                                                                                                                      |
| Mute Sounds                    | Check box indicating whether the MWTM client should play event sounds. To: <ul style="list-style-type: none"> <li>Play event sounds, check the check box. This is the default setting.</li> <li>Not play event sounds, uncheck the check box.</li> </ul>                                                                                                                 |
| Client Disconnect Sound        | Drop-down menu of sound files to choose from. When the connection to the MWTM server is lost, an error popup appears and the selected sound plays in a loop for as long as the MWTM client window remains open.<br><b>Note</b> After a server connection loss, you must set this sound again; otherwise, no sound will play the next time the server connection is lost. |
| Set Sound                      | Button to set the sound you chose for loss of server connection.                                                                                                                                                                                                                                                                                                         |
| OK                             | Applies any changes you made to the event sound filters list and closes the Event Sound Filters List dialog box. When you are satisfied with the changes you made to the event sound filters list, click <b>OK</b> .                                                                                                                                                     |
| Apply                          | Applies any changes you made to the event sound filters list without closing the Event Sound Filters List dialog box.                                                                                                                                                                                                                                                    |
| Cancel                         | Closes the Event Sound Filters List dialog box without applying any changes to the event sound filters list.                                                                                                                                                                                                                                                             |
| Help                           | Shows online help for the current window.                                                                                                                                                                                                                                                                                                                                |

## Creating New Event Sound Filters

You use the MWTM client interface to create a new event sound filter. Open the Event Sound Filters List dialog box, as described in [Listing Event Sound Filters, page 9-36](#), then click **New**. The Event Sound Filters dialog box appears.

The Event Sound Filters dialog box contains:

| Button or Field             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Adding Sound Files to the MWTM

You can add sound files to an MWTM client. The MWTM clients can play these sound file formats:

- AIFC
- AIFF
- AU
- SND
- WAV

**Note**

WAV files encoded using MPEG Layer-3 are not supported.

The MWTM client sound files are stored in the MWTM client's */sounds* directory. If you installed the MWTM client:

- For Solaris/Linux in the default directory, */opt*, then the sound file directory is */opt/CSCOsgmClient/sounds*.
- For Windows in the default directory, */Program Files*, then the sound file directory is *C:\Program Files\MWTMClient\sounds*.
- In a different directory, then the sound file directory is located in that directory.

**Note**

Sound files used by the MWTM web client must also be copied to the MWTM server sound directory at */opt/CSCOsgm/sounds*.

If for some reason the MWTM cannot play a specified sound file, the MWTM plays a default beep. For example, the MWTM cannot play a sound file if one of these conditions exists:

- The file has been moved or deleted from the */sounds* directory.
- The */sounds* directory has been deleted or cannot be found.
- Some other application is using all of the sound resources.
- No sound card is present.

- [Creating New Event Sound Filters, page 9-37](#)
- [Managing Alarms and Events, page 9-1](#)

## Changing an Existing Event Sound Filter

You use the MWTM client interface to change an existing event sound filter. Open the Event Sound Filters List dialog box, as described in [Listing Event Sound Filters, page 9-36](#), select the filter in the **Sound filters applied in order** list, then click **Edit**. The MWTM shows the Event Sound Filters dialog box, populated with the chosen filter's settings.

Change the settings as needed, then click **OK**. The MWTM applies your changes and closes the Event Sound Filters dialog box.

## Deleting Event Sound Filters

You use the MWTM client interface to delete an existing event sound filter. Open the Event Sound Filters List dialog box, as described in [Listing Event Sound Filters, page 9-36](#), select the filter in the **Sound filters applied in order** list, then click **Delete**. The MWTM deletes the chosen filter.

## Playing and Muting Event Sounds

You use the MWTM client interface to specify whether you want the MWTM client to play event sounds. To do so, open the Event Sound Filters List dialog box, as described in [Listing Event Sound Filters, page 9-36](#). To:

- Play event sounds, uncheck the **Mute Sounds** check box. This is the default setting.
- Not play event sounds, check the **Mute Sounds** check box.

# Event Processing

This section contains these topics:

- [Event Queue Congestion, page 9-41](#)
- [Database Archiving, page 9-42](#)

## Event Queue Congestion

Event processing in the MWTM may occasionally experience congestion (for example, during discovery of very large networks). If the number of events exceeds the threshold of the event queue, the event congestion icon  appears in the lower left of the MWTM client and web windows. If the icon appears, the presentation of event information in the MWTM GUI will lag behind the actual state of network objects until the congestion clears. The event congestion icon will disappear from MWTM client and web windows when the congestion clears. No user action is necessary.

The event queue threshold is stored in the `EVENT_QUEUE_THRESHOLD_LIMIT` property in the `/opt/CSCOs/gm/properties/Server.properties` file. The default setting is 1000 events.

## Trap Rate Limits

If one or more nodes in the managed network begin to malfunction, these nodes can generate numerous trap notifications that trigger:

- An excessive number of events
- Excessive SNMP polling
- Increased database access

This condition is called a trap storm. In a large network, a trap storm can adversely affect the performance of the MWTM server. To minimize the effect of trap storms, the MWTM provides a server property to limit the trap rate of network nodes.

If a node in the network exceeds the trap rate threshold, the MWTM stops processing traps from that node. The MWTM raises an alarm (`TrapStatusAlarm`) to indicate that the node is generating excessive traps and that the MWTM has disabled trap processing for the node.

When you have corrected the problem with the faulty node and the trap rate is measured at a rate less than the `TRAP_RATE_LIMIT_COUNT` minus the `TRAP_RATE_ABATE_OFFSET`, the trap rate limit alarm will automatically clear and trap processing will automatically resume.

Though optional, you can clear the trap status alarm and re-enable trap processing for the node as described below:

- 
- |               |                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | In the navigation tree of the MWTM client, select the node.                                         |
| <b>Step 2</b> | Click the <b>Alarms</b> tab.                                                                        |
| <b>Step 3</b> | In the content pane, right-click the trap status alarm and choose <b>Clear</b> from the menu.       |
| <b>Step 4</b> | In the navigation tree, right-click the node and choose <b>Allow Trap Processing</b> from the menu. |
-

The `/opt/CSCOsrgm/properties/Server.properties` file provides these properties to limit the trap rate of managed nodes:

| Server Property             | Description                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRAP_RATE_ABATE_OFFSET      | This is an offset value from the trap rate limit count. The abate threshold limit is calculated by subtracting this value from the TRAP_RATE_LIMIT_COUNT.<br><br>The default value is 200 indicating if a node generates $2000 - 200 = 1800$ or more traps it is still considered to be faulty and MWTM stops further trap processing for these nodes. |
| TRAP_RATE_LIMIT_COUNT       | The threshold limit for a node. The default setting is 2,000. If a node generates 2,000 traps (or more) in the trap rate limit interval, the MWTM: <ul style="list-style-type: none"> <li>• Raises a trap status alarm for the node</li> <li>• Disables trap processing for the node</li> </ul>                                                        |
| TRAP_RATE_LIMIT_INTERVAL    | The time interval for trap limitation. The default setting is 30 minutes. The MWTM scans its managed nodes every 30 minutes to determine if any nodes are exceeding the trap rate limit count.                                                                                                                                                         |
| TRAP_RATE_MINOR_LIMIT_COUNT | The threshold limit for the trap rate minor alarm. By default, if a node generates 1,000 or more traps, MWTM raises a minor alarm.                                                                                                                                                                                                                     |

## Database Archiving

Database archiving describes the process by which the MWTM archives alarms and events in its database. The archival process for alarms and events follows this basic sequence:

1. An alarm or event occurs.
2. The alarm or event remains active for a configurable time period.
3. The MWTM archives the alarm or event in its database.
4. The alarm or event remains in archive for a configurable time period.
5. The MWTM deletes the alarm or event from the MWTM database.

The following sections go into greater detail about the archival process, including the differences between event and alarm archiving:

- [Event Archival Process, page 9-42](#)
- [Alarm Archival Process, page 9-43](#)

## Event Archival Process

When you click Event History in the navigation tree of the MWTM client or MWTM web interface, the right pane displays a tabular list of recent events. The events that appear in this table remain active for seven days (this is the default setting). After seven days, the MWTM removes active events from the Event History table and archives them in the MWTM database. To view the archived events, go to the MWTM web interface, click Event History in the navigation tree, then click the Archived link in the tool bar.

If a user manually deletes an event from the Event History table, the MWTM removes the event from the table and archives it in the MWTM database.

Also, if the number of active events exceeds 10,000 (this is the default setting), the MWTM archives the oldest events regardless of how long they have been active. This mechanism ensures optimal performance of the MWTM server and its clients.

The MWTM archives events in the MWTM database for 31 days (this is the default setting). After 31 days, the MWTM deletes the archived events from the MWTM database.

To change the default settings for archiving events, change the appropriate event limit. See [Changing Event Limits](#), page 9-25.

Figure 9-2 illustrates the archival process for events and lists the event limits associated with the event archival process.

**Figure 9-2 Event Archival Process**

## Alarm Archival Process

The archival process for alarms is very similar to the process for events. When you click Active Alarms in the navigation tree of the MWTM client or MWTM web interface, the right pane displays a tabular list of active alarms. The alarms that appear in this table remain active for 14 days (the default setting).

After 14 days, the MWTM removes alarms from the Active Alarms table and archives them in the MWTM database. To view the archived alarms, go to the MWTM web interface, click Active Alarms in the navigation tree, then click the Archived link in the tool bar.

If the alarm automatically clears or if you manually delete the alarm from the Active Alarms table, the MWTM removes the alarm from the table and archives it in the MWTM database.

Likewise, if the alarm automatically clears or you manually clear an alarm from the Active Alarms table, the MWTM retains the alarm in the table for 1440 minutes, which is 24 hours (the default setting). After 24 hours, the MWTM removes the cleared alarm from the table and archives it in the MWTM database.

[Figure 9-3](#) illustrates the archival process for alarms and lists the event limits associated with the alarm archival process.

**Figure 9-3 Alarm Archival Process**

Also, if the number of active alarms exceeds 10,000 (this is the default setting), the MWTM archives the oldest alarms regardless of how long they have been active. This mechanism ensures optimal performance of the MWTM server and its clients.

The MWTM archives alarms in the MWTM database for 31 days (this is the default setting). After 31 days, the MWTM deletes the archived alarms from the MWTM database.

To change the default settings for archiving alarms, change the appropriate event limit. See [Changing Event Limits](#), page 9-25.

## File-based Archiving

The MWTM exports events and alarms from its database archives once a day and consolidates them into a CSV-based file. File-based archiving allows administrators to access archived events and alarms in a file format. For example, an administrator may want to process the contents of a file archive by using third-party scripting tools.

To view file-based archives, choose **File Archive > Events** from the MWTM web interface. The MWTM displays file archives in the right pane. These examples illustrate the file-naming convention:

```
Status+Trap.WedJun04.log.csv.zip
Status+Trap.TueJun03.log.csv.zip
Status+Trap.MonJun02.log.csv.zip
```

The MWTM stores file archives in this directory:

```
/opt/CSCOsgm/logs/netstatus
```

If you want to change the default directory, use the `mwtm msglogdir` command.

The MWTM retains file archives for 31 days. (This default setting is the same value that is used for database archiving.) After 31 days, the MWTM deletes the files. If you want to change the default setting, use the `mwtm msglogage` command.

Another approach would be to configure the aging parameters of the file and database archives with different values. For example, you could use the default setting of 31 days to retain database archives but configure the file archive retention to 90 days (assuming your server has sufficient disk space). This file-based approach for long-term archiving is more efficient than retaining archives in the database beyond the 31-day default setting.

If required, you could retrieve file archives before the MWTM deletes them by using a backup system or a network file system that performs automatic file backups.

# CHAPTER 10

## Viewing Network Topology

### Note

The web interface does not support viewing the network topology. You can view the network topology in the MWTM client interface only.

In addition to tabular (text) views of your network, the Cisco Mobile Wireless Transport Manager (MWTM) client provides a topological (graphical) view of the objects in your ITP or RAN-O network, including:

- Nodes
- RAN-O service modules
- Interfaces
- ITP signaling points
- ITP application servers
- ITP application server process associations
- ITP linksets
- Adjacent legacy nodes

### Note

The MWTM does not manage legacy nodes (such as BSC, BTS, RNC, or Node B objects), but displays them in the topology map to help you visualize the interconnections between network objects.

Any associated alarms also appear in the topology window. You can use the MWTM to customize the topological view (for details, see [Chapter 6, “Managing Views”](#)).

To view the topology of your network, use one of these procedures:

- Choose **View > Topology** from the MWTM main menu.
- Right-click an object, then choose **View > Center in Topo** in the right-click menu.

The topology window appears.

The topology window shows tabular information about MWTM objects in the left pane and the graphical topology map in the right pane. Alarms associated with the chosen object appear in the bottom pane.

The topology window contains:

- [Topology Menu, page 10-2](#)
- [Topology Toolbar Buttons, page 10-3](#)

- [Topology Panes, page 10-5](#)
- [Topology Map, page 10-8](#)
- [Topology Alarm Pane, page 10-14](#)

The MWTM provides these functions related to the topology map:

- [Creating a Custom Layout, page 10-14](#)
- [Finding an Object, page 10-14](#)
- [Centering the Topology Map on an Object, page 10-15](#)
- [Displaying Detailed Information About a Topology Map Element, page 10-16](#)
- [Printing the Topology Map, page 10-16](#)
- [Saving the Topology Map as a JPEG File, page 10-16](#)
- [Selecting a Directory for the JPEG File, page 10-17](#)
- [Activating a Magnetic Grid on the Topology Map, page 10-18](#)
- [Specifying a Color for the Magnetic Grid, page 10-19](#)
- [Specifying a Background Color for the Topology Map, page 10-20](#)
- [Aligning Objects on the Topology Map, page 10-22](#)
- [Hiding and Displaying Non-ITP Nodes and Linksets, page 10-23](#)
- [Locking and Unlocking the Position of an Icon, page 10-23](#)
- [Improving Topology Performance, page 10-23](#)
- [Saving the Topology Map, page 10-24](#)
- [Restoring the Topology Map, page 10-25](#)

#### Related Topics

- [Diagnosing a Typical Network Problem, page D-5](#)
- [Changing MWTM Server Poller Settings, page 4-2](#)
- [Chapter 6, “Managing Views”](#)

## Topology Menu

The topology window is identical to the MWTM main menu. For detailed descriptions of the options it provides, see [Using the MWTM Main Menu, page 3-18](#).

#### Note

The menu option Go does not display in the Topology window, instead you can view Topology Tools menu command. The Topology Tools menu contains the options as in the table under [Topology Right-Click Menu: Map, page 10-13](#).

# Topology Toolbar Buttons

The topology window contains these toolbar buttons:

| Button                                                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Close view tab                | Closes the currently visible view in the topology window. This option is dimmed if the currently visible view is the highest-level parent view.                                                                                                                                                                                                                                                        |
|  Open parent view              | Opens the parent view of the currently visible view in the topology window. This option is dimmed if the currently visible view is the highest-level parent view.                                                                                                                                                                                                                                      |
|  Lay out nodes in a circle     | Shows the map in a circular layout.                                                                                                                                                                                                                                                                                                                                                                    |
|  Lay out nodes in a spring     | Shows the map in a spring layout. That is, the MWTM draws nodes with the most lines closer to the center of the map, and draws nodes with fewer lines farther away. This is the default setting the first time the map appears.<br><br><b>Note</b> You can change how far apart to space the nodes when the MWTM draws the spring layout (see <a href="#">Changing Topology Settings, page 5-13</a> ). |
|  Zoom in by a factor of 200% | Makes the map twice as large.                                                                                                                                                                                                                                                                                                                                                                          |
|  Zoom out by a factor of 50% | Makes the map half as large.                                                                                                                                                                                                                                                                                                                                                                           |
|  Zoom by percentage          | Zooms the map by a chosen percentage. You can choose a percentage from the drop-down list box; or, enter a percentage and click <b>Enter</b> . Valid values are integers in the range 5 through 400.                                                                                                                                                                                                   |
|  Zoom in on an area          | Zooms in on the selected area of the map. Click the button, then click in the topology map and drag a rectangle around the area on which you want to zoom. The MWTM expands the selected area to fill the topology map.                                                                                                                                                                                |
|  Zoom to fit window          | Adjusts the size of the map to fit in the window. This is the default setting the first time the map appears.                                                                                                                                                                                                                                                                                          |
|  Find objects                | Opens the Find Objects dialog box, which you use to find and highlight an object in the topology window.                                                                                                                                                                                                                                                                                               |

| Button                                                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Set magnetic grid properties               | <p>Opens the Magnetic Grid Settings dialog box, which you use to activate and deactivate the magnetic topology grid, and modifies how it appears. With the grid activated, when you move objects on the topology map they automatically align with the grid.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|  Align objects on map                       | <p>Opens the Align Objects dialog box, which you use to align two or more objects on the topology map.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Hiding/Showing non-ITP nodes (ITP only)<br> | <p>Hides or shows all non-ITP signaling points and linksets on the topology map. (Hidden signaling points and linksets still appear in the left pane.)</p> <p>The process determines whether the node's parent (visible on the topology maps) has an ITP MIB or not. If not, it is classified as a non-ITP node and it will be hidden or visible when the button is toggled.</p> <p>The MWTM automatically saves this setting (with non-ITP nodes and linksets either hidden or visible) with your preferences.</p>                                                                                                                                                                                                                               |
| Node Dragging Optimizer<br>                | <p>Turns the Node Dragging Optimizer on or off:</p> <ul style="list-style-type: none"> <li>When the Node Dragging Optimizer is <b>On</b>, the MWTM hides linkset lines as you drag an object around the topology map. The MWTM draws the linkset lines when you drop the object in its final position. This is the default setting.</li> <li>When the Node Dragging Optimizer is <b>Off</b>, the MWTM continually redraws linkset lines as you drag an object around the topology map.</li> </ul> <p>The MWTM automatically saves this setting (with the Node Dragging Optimizer on or off) with your preferences.</p>                                                                                                                            |
| Hiding/Showing Dangling Connections<br>   | <p>Hides or shows connections to objects that are not visible in the current view, which are called dangling connections. When the Hiding Dangling Connections is set to:</p> <ul style="list-style-type: none"> <li><b>Hide</b>, the MWTM hides dangling connections. This is the default setting.</li> <li><b>Show</b>, the MWTM shows dangling connections, drawing the objects in shades of gray to distinguish them from actual objects in the current view.</li> </ul> <p>The MWTM does not save this setting (with the Hiding Dangling Connections set to <b>Show</b> or <b>Hide</b>) when you save the view.</p> <p>To include a dangling connections in the current view, select the connection, then select <b>Include In View</b>.</p> |

| Button                                                                                                                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show/Hide alarm pane                                                                                                      | Shows or hides the alarm pane at bottom.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|  Lock position<br>or<br> Unlock position | <p>Locks or unlocks the position of an icon on the topology map. Locking the position of an icon can be useful if you want to keep the icon in its position, and you want to ensure you do not move it inadvertently. Locked icons do not appear in the circular or spring layouts. To lock the position of an icon, select:</p> <ul style="list-style-type: none"> <li>An unlocked icon, then select <b>Lock position</b>.</li> <li>A locked icon, then select <b>Unlock position</b>. This is the default setting.</li> </ul> <p>The MWTM automatically saves this setting (with icon positions locked or unlocked) with your view.</p> |

## Topology Panes

In the topology window, you can access:

- [View Objects and Connections Panes, page 10-5](#)
- [Topology Map, page 10-8](#)

## View Objects and Connections Panes

The View Objects pane in the left pane of the topology window shows information about the MWTM objects that are currently visible in the topology map. The Connections pane shows information about the connections associated with the object that you chose in the View Objects table, or the object currently chosen in the topology map.

**Tip**

If you cannot see the View Objects or Connections tables, click on the arrow bar  to expand.

- To redraw the topology map centered on a specific object, double-click the object in this table.
- You cannot select more than one object at a time in this table.
- To see the tooltip for each column in the table, place the cursor over a column heading.
- If a cell is too small to show all of its data, place the cursor over the cell to see the full data in a tooltip.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM sorts this table by Severity.

To:

- Display hidden columns, right-click in the table heading and check the check boxes for the columns you want to display.
- Hide columns, right-click in the table heading and uncheck the check boxes for the columns you want to hide.

For more information about resizing, sorting, displaying, or hiding columns, see [Navigating Table Columns, page 5-23](#).

The View Objects or Connections table contains:

| Column              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID         | <p>Internal ID of the object. The internal ID is a unique ID for every object, that MWTM assigns for its own internal use. It can also be useful when the TAC is debugging problems.</p> <p>This column is hidden by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Type (View Objects) | <p>Object types can be ITP only, RAN-O only, or General to all types of networks.</p> <p>General object types include:</p> <ul style="list-style-type: none"> <li>• <b>Node</b>—Any interconnecting node that is not an ITP node.</li> <li>• <b>View</b>—Custom view (if one exists).</li> </ul> <p>ITP only object types include:</p> <ul style="list-style-type: none"> <li>• <b>ASP</b>—An application server process.</li> <li>• <b>SP</b>—A signaling point.</li> </ul> <p>RAN-O only object types include:</p> <ul style="list-style-type: none"> <li>• <b>CSR</b>—Cell Site Router (CSR) node.</li> <li>• <b>RAN SVC Node</b>—A RAN service card in an Optical Networking System (ONS) node.</li> </ul>                                                                                          |

| Events             | <p>Indicates whether the object has a recent event. (Even if the server purges all of the events associated with the object, the MWTM continues to display the event icon  in this field.)</p> <p>During discovery, the MWTM might flag most objects with an event icon . If the event icons are too distracting, choose <b>Edit &gt; Clear All Events</b> from the MWTM main menu to remove them.</p> <p>This column is hidden by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Last Status Change | <p>Date and time that the status of the object last changed.</p> <p>This column is hidden by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Severity           | <p>Severity of the alarm. Possible severities are:</p> <ul style="list-style-type: none"> <li> Critical</li> <li> Major</li> <li> Minor</li> <li> Warning</li> <li> Informational</li> <li> Indeterminate</li> <li> Unmanaged</li> <li> Normal</li> </ul> <p>You can customize this field (see <a href="#">Right-Click Menu for a Specific Alarm or Event, page 9-10</a>).</p> |
| Status             | <p>Current status of the object. Possible values are:</p> <ul style="list-style-type: none"> <li>•  Active</li> <li>•  Unknown</li> <li>•  Unmanaged</li> <li>•  Warning</li> </ul> <p>For detailed definitions of each status, see the “<a href="#">Status Definitions</a>” section on page E-1.</p> <p>This column is hidden by default.</p>                                                                                                                                                                                                                                                                                                                                                             |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status Reason | <p>Reason for the current status of the object.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed MWTM in:</p> <ul style="list-style-type: none"> <li>The default directory, <i>/opt</i>, then the file resides at <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>A different directory, then the help directory and file reside in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full status reason in a tooltip.</p> <p>The MWTM lists status reasons in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> <p>This column is hidden by default.</p> |
| Ignored       | <p>Indicates whether the object should be included when aggregating and displaying MWTM status information:</p> <ul style="list-style-type: none"> <li>Uncheck the check box to include the object. This is the default setting.</li> <li>Check the check box to exclude the object.</li> </ul> <p>Users with authentication level Power User (level 2) and higher can edit this field.</p> <p>This column is hidden by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Topology Map

The topology map in the right pane of the topology window shows the objects and views in your network in an easy-to-read graphical format.

### Views

If you have defined custom views, you can view them in the topology map. The MWTM shows a tab for each visible view. Each tab shows a colored ball that indicates the current status of that view:

-  Active
-  Warning

#### Note

For detailed definitions of each status, see [Appendix E, “Status Definitions.”](#)

### Excluded and Unmanaged Objects

The MWTM removes from the topology map any objects and their associated objects (including adjacent legacy nodes) that you exclude from the current view and [Creating a New View, page 6-7](#)).

If you unmanage an object from the topology map right-click menu (see [Topology Right-Click Menu: Object, page 10-13](#)) the MWTM marks the object status as Unmanaged and removes any adjacent legacy nodes from the topology map.

### Tooltips

To see a tooltip, place the cursor over an object. For details on turning off tooltips, see [Changing Topology Settings, page 5-13](#).

### Viewing Associated Objects

To view objects associated with a chosen object, in the:

- Tabs in the View Objects pane, click an object. Any associated objects (such as signaling points with associated linksets) appear in the Connections pane.
- Content area, click a single line, a heavy line , a diamond , circle , arrowhead , or double-triangle  to:
  - Highlight the closest associated node in the View Objects pane in a tab. For example, if a line connects node **sgm-2600a** and node **sgm-2600b**, and you click the line closer to node **sgm-2600a**, then the MWTM highlights that node in the View Objects pane.
  - Display all objects (if any) associated with that node in the Connections pane in a tab.
  - Highlight the clicked object (if it is configured) in the Connections pane in a tab.

### Viewing Details for an Object

To display the Details tab for any object in the map, double-click it. If multiple options are possible, the Selection dialog box appears. Highlight the object, then click **Select**.

### Navigating and Scrolling

To:

- Scroll around in the topology map using keyboard options, click anywhere in the map, then click the arrow, **Page Up**, and **Page Down** keys.
- Redraw the topology map centered on a specific object, double-click the object in the View Objects pane in a tab.
- Activate or change the magnetic topology grid, which can help you align objects when you move them, use the Magnetic Grid Settings dialog box (see [Activating a Magnetic Grid on the Topology Map, page 10-18](#)).
- Align two or more objects on the topology map, use the Align Objects dialog box (see [Aligning Objects on the Topology Map, page 10-22](#)).

### Saving the Topology Map

To save the topology map as a JPEG file, use the Save as JPEG dialog box (see [Saving the Topology Map as a JPEG File, page 10-16](#)).

### Hiding or Showing Dangling Connections

To hide objects that connect to objects that are not in the current view (called dangling connections), click the **Hiding/Showing Dangling Connections** button to set it to **Hide**. To show dangling connections, click the **Hiding/Showing Dangling Connections** button to set it to **Show**. The MWTM

draws the objects in shades of gray to distinguish them from actual objects in the current view. The MWTM does not save this setting (with the Hiding Dangling Connections set to **Show** or **Hide**). To include a dangling object in the current view, right-click the object and select **Include In View**.

### Locking and Unlocking Icon Positions

To lock the position of an icon on the topology map, select an unlocked icon, then select **Lock position**.

Locking the position of an icon can be useful if you want to keep the icon in its position, and you want to ensure that you do not move it inadvertently. The MWTM does not include locked icons in the circular or spring layouts.

To unlock the position of an icon on the topology map, click a locked icon, then select **Unlock position**.

### Object Types in the Topology Map

The topology map might contain graphical elements for any of these objects, which the MWTM automatically assigns:

#### Note

Icon colors vary. The color of a graphical element indicates its current severity. If more than one object is configured on the connection, the color associated with the object that is in the most compromised state represents the severity color of the connection.

| Object Type                                                                                                  | Notes                                              |
|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
|  ASP                       | N/A                                                |
|  BSC                      | Base Station Controller                            |
|  BTS                      | Base Transceiver Station                           |
|  Cisco 2600 series router | Cisco 2650, Cisco 2650XM, Cisco 2651, Cisco 2651XM |
|  Cisco 2811 series router | N/A                                                |
|  Cisco 7202 series router | N/A                                                |
|  Cisco 7204 series router | Cisco 7204, Cisco 7204VXR                          |
|  Cisco 7206 series router | Cisco 7206, Cisco 7206VXR                          |
|  Cisco 7301 series router | N/A                                                |
|  Cisco 7304 series router | N/A                                                |

| Object Type                                                                                                    | Notes                                                                                                          |
|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
|  Cisco 7505 series router     | N/A                                                                                                            |
|  Cisco 7507 series router     | Cisco 7507, Cisco 7507mx, Cisco 7507z                                                                          |
|  Cisco 7513 series router     | Cisco 7513, Cisco 7513mx, Cisco 7513z                                                                          |
|  Cisco 7600 series router     | Cisco 7603, Cisco 7603s, Cisco 7604, Cisco 7606, Cisco 7606s, Cisco 7609, Cisco 7609s, Cisco 7613              |
|  Cisco MWR 1900 series router | N/A                                                                                                            |
|  Cloud                        | A collection of objects, called a submap. A submap can also contain other submaps.                             |
|  IP device                    | Other than those listed previously (if assigned by a user; see <a href="#">Editing Properties, page 7-37</a> ) |
|  PGW                          | Cisco Public Switched Telephone Network (PSTN) Gateway (PGW) 2200 Softswitch                                   |
|  Signaling point             | An SCP, SSP, or STP, or an ITP instance (if the ITP is configured for multi-instance)                          |

- A line indicates a single logical connection configured between two nodes. A line that:
  - Ends in a diamond  indicates that the connection has at least one configured interface or linkset associated with the node.
  - Ends in a circle  indicates that the connection is a virtual linkset, associated with a signaling point.
  - Does not end in a diamond  or circle  indicates that the interface or linkset is not configured on the node or cannot be shown because the MWTM is not managing the node.
  - Ends in an arrowhead  indicates that the connection is an application server process association.
  - Ends in a double-triangle  indicates a connection to a view that has multiple interfaces.
- A heavy line  indicates that two or more interfaces or linksets exist between two nodes, or between views and other objects.

In addition, users can assign graphical elements for these objects (see [Editing Properties, page 7-37](#)):

| Object Type                                                                                  | Description                                              |
|----------------------------------------------------------------------------------------------|----------------------------------------------------------|
|  Building | Icon representing a collection of objects in a building. |
|  City     | Icon representing a collection of objects in a city.     |

| Object Type                                                                                          | Description                                                                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Database           | Icon representing a database object.                                                                                                                                                                                                                                   |
|  MatedPair          | Mated pair of signaling points.                                                                                                                                                                                                                                        |
|  MSC                | Mobile switching center.                                                                                                                                                                                                                                               |
|  Node-B             | Radio transmission (or reception) unit for communication between radio cells in a UMTS network (Node-B resides at the cell site).<br><b>Note</b> The MWTM does not manage the Node B but displays the object in the topology window to help you visualize the network. |
|  RAN SVC Node       | RAN service module card.                                                                                                                                                                                                                                               |
|  RNC                | Radio Network Controller used in a UMTS network to aggregate multiple Node-B units.<br><b>Note</b> The MWTM does not manage the RNC but displays the object in the topology window to help you visualize the network.                                                  |
|  SCP                | Service control point.                                                                                                                                                                                                                                                 |
|  SSP              | Service switching point.                                                                                                                                                                                                                                               |
|  STP              | Signal transfer point.                                                                                                                                                                                                                                                 |
|  Tower            | Icon representing a PC tower.                                                                                                                                                                                                                                          |
|  TrafficGenerator | Icon representing a device or emulator used to generate traffic, usually in a test environment.                                                                                                                                                                        |
|  Unknown          | Node that does not respond to SNMP requests for supported MIBs.                                                                                                                                                                                                        |
|  Workstation      | Icon representing a workstation.                                                                                                                                                                                                                                       |
|  Workstation2     | Icon representing a different workstation.                                                                                                                                                                                                                             |

The topology map also provides right-click menus for elements. For more information, see these sections:

- [Topology Right-Click Menu: Map, page 10-13](#)
- [Topology Right-Click Menu: Object, page 10-13](#)

## Topology Right-Click Menu: Map

The topology window provides a subset of the MWTM main menu as a right-click menu. To see this menu for a map, right-click in a blank area of the topology map. The topology map right-click menu displays:

| Command                                   | Description                                                                                                                                                                                                                     |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zoom > Zoom In<br>(Ctrl=)                 | Makes the map twice as large.                                                                                                                                                                                                   |
| Zoom > Zoom Out<br>(Ctrl-- or Ctrl-Minus) | Makes the map half as large.                                                                                                                                                                                                    |
| Zoom > Zoom Area                          | Zooms in on the selected area of the map.                                                                                                                                                                                       |
| Zoom > Zoom Fit                           | Adjusts the size of the map to fit in the window. This is the default setting the first time the map appears.                                                                                                                   |
| Layout > Circular                         | Shows the map in a circular layout.                                                                                                                                                                                             |
| Layout > Spring                           | Shows the map in a spring layout. That is, the MWTM draws nodes with the most links closer to the center of the map, and draws nodes with fewer links farther away. This is the default setting the first time the map appears. |
| Find (Ctrl-F)                             | Opens the Find Objects dialog box, which you use to find and highlight an object in the topology window.                                                                                                                        |
| Restore Positions                         | Restores the view to the last saved view.                                                                                                                                                                                       |
| Save As JPEG<br>(Ctrl-J)                  | Opens the Save as JPEG dialog box, enabling you to save the topology map to a JPEG file.                                                                                                                                        |
| Magnetic Grid                             | Opens the Magnetic Grid Settings dialog box.                                                                                                                                                                                    |
| Change Background Color                   | Opens the Select Background Color dialog box, which you use to select a color for the background of the topology map.                                                                                                           |
| Align                                     | Opens the Align Objects dialog box, which you use to align two or more objects on the topology map.                                                                                                                             |
| Open Parent View                          | Opens the parent view of the currently visible view in the topology window. This option is dimmed if the currently visible view is the highest level parent view.                                                               |
| Close View                                | Closes the currently visible view in the topology window. This option is dimmed if the currently visible view is the highest level parent view.                                                                                 |

## Topology Right-Click Menu: Object

The topology window displays a subset of the MWTM main menu as a right-click menu. To see this menu for any object in the topology window, right-click on an object in the topology map in the right pane. Options may vary depending on the chosen object type.

For a list of right-click menu options, see [Viewing the Right-Click Menu for an Object, page 8-2](#).

## Topology Alarm Pane

The Alarm pane at the bottom of the topology window shows any current alarms on the chosen object. For details about the buttons and fields in the Alarm pane, see [Chapter 9, “Managing Alarms and Events.”](#)

## Creating a Custom Layout

You can use the MWTM to create a custom layout for the topology map by manually moving objects on the map and by grouping them or isolating them to meet your needs. To move:

- A single object, click and drag the object to its new position.
- More than one object at the same time, press the Shift key and at the same time, select the objects and drag them. Objects keep their positions relative to one another.

When you are satisfied with the new topology map layout, choose **File > Save View** from the MWTM main menu. The MWTM saves the changes you have made to the network view, including any changes you have made to the topology map layout.

## Finding an Object

Some topology maps are so large and complex that it can be difficult to find a specific object.

If the object appears in the tabs in the left pane, select the object, and the MWTM highlights it in the topology map.

If the object does *not* appear in the tabs in the left pane, click the **Find objects** button  in the topology window; or, choose **Edit > Find** from the MWTM main menu. The Find Object dialog box appears.

You can search by using the:

- Name
- Point code (for ITP signaling points)
- IP address (for RAN-O nodes)

The Find Object dialog box contains:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Search string   | Character string for which the MWTM should search.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| OK              | Launches the search. If: <ul style="list-style-type: none"><li>• No matching object is found, the MWTM shows an appropriate message.</li><li>• Exactly one object is found that matches the <b>Search string</b>, the MWTM highlights the object in the Tables pane of the topology window, and zooms in on the chosen object in the topology map.</li><li>• More than one object is found that matches the <b>Search string</b>, the Choose dialog box appears, in which you can select from a list of the found objects (see <a href="#">Using the Selection Dialog, page 10-15</a>).</li></ul> |
| Cancel          | Closes the Find Objects dialog box without launching the search.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Using the Selection Dialog

If more than one object matches the Search string in the Find Objects dialog box, the Selection dialog box appears.

The Selection dialog box contains:

| Field or Button    | Description                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------|
| Select one in list | Type, Name, or Status of the found objects. Select the object you want to find.                                              |
| Select             | Highlights the chosen object in the left pane of the topology window, and zooms in on the chosen object in the topology map. |
| Cancel             | Closes the Selection dialog box without selecting an object.                                                                 |

## Centering the Topology Map on an Object

To redraw the topology map centered on a specific object, double-click the object in one of the tabs.

# Displaying Detailed Information About a Topology Map Element

To display detailed information about an element in the map, double-click it in the map, then respond to the prompts. Double click:

- An object to view the Details tab in the MWTM main menu for that object.
- A single line, or a diamond , circle , or arrowhead  at the end of a single line, to display the MWTM main window details for that linkset or application server process association.
- A double-triangle  at the end of a heavy line  to display the Selection dialog box. (A heavy line indicates that two or more interfaces or linksets exist between two objects, or between views and other objects.) Then, select one of the interfaces or linksets to display the Selection dialog box for that interface or linkset.

## Printing the Topology Map

To print the topology map, see [Printing Windows, page 5-24](#).

## Saving the Topology Map as a JPEG File

You can use the MWTM to save the topology map to a JPEG file. You can save the entire topology map, or just the current window.

To save the topology map to a JPEG file, choose **Topology Tools > Save as JPEG** from the topology window.

The Save as JPEG dialog box appears. The Save as JPEG dialog box contains:

| Field or Button | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| All             | Saves the entire topology map as a JPEG file. This check box is checked by default.                                                                                                                       |
| Current Window  | Saves just the portion of the topology map visible in the current window as a JPEG file. This check box is unchecked by default, which saves the entire map; not just the current window.                 |
| Quality         | Specifies the quality of the JPEG file, from 0 (lowest quality) to 1.0 (highest quality). The default setting is 0.7, which is sufficient for most JPEG files.                                            |
| Max. Size       | Specifies the size of the JPEG file, in pixels. Choose a value from the drop-down list box. The valid range is 400-2400 pixels. The default value is 400 pixels, which is sufficient for most JPEG files. |

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | <p>Enter a name for the JPEG file, or accept the default filename, <i>out.jpg</i>.</p> <p>The default directory for the JPEG file is the directory in which you installed the MWTM client:</p> <ul style="list-style-type: none"> <li>In Solaris/Linux, the default installation directory for the MWTM client is <i>/opt/CSCOsgmClient</i>.</li> <li>In Windows, the default installation directory for the MWTM client is <i>C:\Program Files\SGMClient\</i>.</li> <li>If you installed the MWTM client in a different directory, then the installation directory resides in that directory.</li> </ul> <p>If you do not want to save the JPEG file to the default directory, click <b>Browse</b> to select a different directory.</p> |
| Browse          | Opens the Save dialog box for a topology map, which you use to specify or select a name when you save the JPEG file. If you do not want to save the JPEG file to the default directory, click <b>Browse</b> to select a different directory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Save            | Saves the JPEG file and closes the Save as JPEG dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Cancel          | Closes the Save as JPEG dialog box without saving the JPEG file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Selecting a Directory for the JPEG File

You can use the MWTM to specify or select a name or directory when you save a topology map to a JPEG file. You can save the entire topology map, or just the current window.

To specify a name or directory for the JPEG file, click **Browse** in the Save as JPEG dialog box.

The Save dialog box appears for a topology map. The Save dialog box for a topology map contains:

| Field or Button                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Save In                                                                                          | Selects the directory in which you want to save the topology map JPEG file. You can accept the default directory, or select a new directory from the drop-down list box.                                                                                                                                                                                                                                                                                             |
| File Name                                                                                        | Enter a name for the JPEG file, or select a file from those listed in the <b>Save In</b> field.                                                                                                                                                                                                                                                                                                                                                                      |
| Files of Type                                                                                    | <p>Specifies the type of file to save, and shows all files of that type in the chosen directory. Choose a file type from the drop-down list box:</p> <ul style="list-style-type: none"> <li><b>All files</b>—Shows all files in the chosen directory, and saves the topology map file as a JPEG file.</li> <li><b>jpg files</b>—Shows only JPEG files in the chosen directory, and saves the topology map file as a JPEG file. This is the default value.</li> </ul> |
|  Up One Level | Shows the subfolders and files that are in the folder that is up one level from the currently visible folder.                                                                                                                                                                                                                                                                                                                                                        |
|  Desktop      | Shows the subfolders and files that are on your workstation desktop.                                                                                                                                                                                                                                                                                                                                                                                                 |

| Field or Button                                                                                     | Description                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Create New Folder | Creates a new subfolder in the currently visible folder.                                                                                                                                                                                                                                   |
|  List              | Shows only icons for subfolders and files.                                                                                                                                                                                                                                                 |
|  Details           | Shows detailed information for subfolders and files, including their size, type, date they were last modified, and so on.                                                                                                                                                                  |
| Save                                                                                                | Saves the file and closes the Save dialog box for a topology map.<br><br>When you are satisfied with the settings, click <b>Save</b> . The MWTM closes the Save dialog box for a topology map and populates the Name field in the Save as JPEG dialog box with the new name and directory. |
| Cancel                                                                                              | Closes the Save dialog box for a topology map without saving the file.                                                                                                                                                                                                                     |

## Activating a Magnetic Grid on the Topology Map

You can use the MWTM to activate the magnetic topology grid and change how it appears. With the grid activated, when you move objects on the topology map they align with the grid.

### Note

Magnetic grid settings are *not* saved when you save the view.

To activate or change the magnetic topology grid, choose **Topology Tools > Magnetic Grid** from the topology window. The Magnetic Grid Settings dialog box appears. The Magnetic Grid Settings dialog box contains:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Grid Activated  | Specifies whether the magnetic topology grid is activated. To: <ul style="list-style-type: none"> <li>Activate the grid, check this check box.</li> <li>Deactivate the grid, uncheck this check box. This is the default setting.</li> </ul>                                                                                       |
| Display Grid    | Specifies whether the grid should be visible on the topology map. To: <ul style="list-style-type: none"> <li>Display the grid, check this check box. This is the default setting.</li> <li>Hide the grid, uncheck this check box.</li> </ul> If <b>Grid Activated</b> is not checked, this check box is dimmed.                    |
| Grid Spacing    | Specifies the spacing between lines on the grid, in pixels.<br><br>To specify the spacing between lines on the grid, in pixels, check the <b>Grid Activated</b> check box, then select a <b>Grid Spacing</b> level. The valid range is 0-150 pixels. The default setting is 50 pixels, which is sufficient for most topology maps. |

| Field or Button | Description                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Grid Color      | Opens the Select Grid Color dialog box.<br>To specify a color for the grid, check the <b>Grid Activated</b> check box, then click <b>Change Color</b> in the Grid Color field. The MWTM opens the Select Grid Color dialog box. |
| OK              | Sets the new grid settings and closes the Magnetic Grid Settings dialog box.<br>When you are satisfied with the magnetic grid settings, click <b>OK</b> .                                                                       |
| Cancel          | Closes the Magnetic Grid Settings dialog box without changing any settings.                                                                                                                                                     |

## Specifying a Color for the Magnetic Grid

You can use the MWTM to customize the color of the magnetic topology grid.

### Note

The grid color is *not* saved when you save the view.

To specify a color for the grid, check the Grid Activated check box in the Magnetic Grid Settings dialog box, then click **Select** in the Grid Color field.

The Select Grid Color dialog box opens. The Select Grid Color dialog box contains:

- [Swatches Pane \(Recommended\), page 10-19](#)
- [HSB Pane, page 10-19](#)
- [RGB Pane, page 10-20](#)
- [Select Grid Color Field and Buttons, page 10-20](#)

### Related Topic:

[Activating a Magnetic Grid on the Topology Map, page 10-18.](#)

## Swatches Pane (Recommended)

You can use the Swatches pane of the Select Grid Color dialog box to select a grid color from a set of color swatches. This is the recommended method for selecting a grid color.

To display the Swatches pane, click the Swatches tab in the Select Grid Color dialog box.

To select a grid color, select a swatch. The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

## HSB Pane

You can use the HSB pane of the Select Grid Color dialog box to select a grid color based on color hue, saturation, and brightness (HSB).

To display the HSB pane, click the HSB tab in the Select Grid Color dialog box.

To select a grid color, use one of these procedures:

- Select a color range on the vertical color bar, then select a specific color by moving the cursor around on the color square.
- Enter specific values in the hue (H), saturation (S), and brightness (B) fields.

The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

## RGB Pane

You can use the RGB pane of the Select Grid Color dialog box to select a grid color based on the red, green, and blue (RGB) content of the color.

To display the RGB pane, click the RGB tab in the Select Grid Color dialog box.

To select a grid color, select values for the Red, Green, and Blue fields. The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

## Select Grid Color Field and Buttons

The Select Grid Color dialog box contains:

| Field   | Description                                                                                                                                                                                                        |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preview | Shows a preview of the currently chosen grid color.<br>Whichever method you choose to select a grid color, the chosen color appears in the Preview field. When you are satisfied with the color, click <b>OK</b> . |
| OK      | Sets the grid color as shown in the Preview field, and closes the Select Grid Color dialog box.                                                                                                                    |
| Cancel  | Closes the Select Grid Color dialog box without selecting a grid color.                                                                                                                                            |
| Reset   | Resets the grid color to its initial setting.                                                                                                                                                                      |

## Specifying a Background Color for the Topology Map

You can use the MWTM to customize the background color of the topology map.

### Note

The background color is *not* saved when you save the view.

To specify a background color for the topology map, right-click in a blank area of the topology map, then select **Change Background Color** from the right-click menu.

The Select Background Color dialog box contains:

- [Swatches Pane \(Recommended\), page 10-21](#)
- [HSB Pane, page 10-21](#)
- [RGB Pane, page 10-21](#)
- [Select Background Color Field and Buttons, page 10-21](#)

## Swatches Pane (Recommended)

You can use the Swatches pane of the Select Background Color dialog box to select a background color from a set of color swatches. This is the recommended method for selecting a background color.

To display the Swatches pane, click the Swatches tab in the Select Background Color dialog box.

To select a background color, select a swatch. The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

## HSB Pane

You can use the HSB pane of the Select Background Color dialog box to select a background color based on color hue, saturation, and brightness (HSB).

To display the HSB pane, click the HSB tab in the Select Background Color dialog box.

To select a grid color, use one of these procedures:

- Select a color range on the vertical color bar, then select a specific color by moving the cursor around on the color square.
- Enter specific values in the hue (H), saturation (S), and brightness (B) fields.

The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

## RGB Pane

You can use the RGB pane of the Select Background Color dialog box to select a background color based on the red, green, and blue (RGB) content of the color.

To display the RGB pane, click the RGB tab in the Select Background Color dialog box.

To select a background color, select values for the Red, Green, and Blue fields. The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

## Select Background Color Field and Buttons

The Select Background Color dialog box contains:

| Field   | Description                                                                                                                                                                                                                        |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preview | Shows a preview of the currently chosen background color.<br><br>Whichever method you choose to select a background color, the chosen color appears in the Preview field. When you are satisfied with the color, click <b>OK</b> . |
| OK      | Sets the background color as shown in the Preview field, and closes the Select Background Color dialog box.                                                                                                                        |
| Cancel  | Closes the Select Background Color dialog box without selecting a background color.                                                                                                                                                |
| Reset   | Resets the background color to its initial setting.                                                                                                                                                                                |

# Aligning Objects on the Topology Map

**Note**

To unalign objects, drag and drop the object to move it on the topology map.

You can use the MWTM to align two or more objects on the topology map. You can align the objects based on their left, right, top, or bottom edges, or you can center them in the map. The MWTM saves the alignment when you save the view.

To align objects, choose the objects that you want to align, then choose **Topology Tools > Align** from the topology window. The Align dialog box appears. The Align dialog box contains:

| Field                      | Description                                                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vertically: None           | Does not align the chosen objects vertically.                                                                                                                          |
| Vertically: Left           | Aligns the chosen objects vertically, aligned with the left edge of the left chosen object.                                                                            |
| Vertically: Center         | Aligns the chosen objects vertically, with centers aligned.                                                                                                            |
| Vertically: Right          | Aligns the chosen objects vertically, aligned with the right edge of the right chosen object.                                                                          |
| Vertically: Side by side   | Aligns the chosen objects vertically, aligned side-by-side, with no horizontal space between the objects. (There might still be vertical space between the objects.)   |
| Horizontally: None         | Does not align the chosen objects horizontally.                                                                                                                        |
| Horizontally: Top          | Aligns the chosen objects horizontally, aligned with the top edge of the top chosen object.                                                                            |
| Horizontally: Center       | Aligns the chosen objects horizontally, with centers aligned.                                                                                                          |
| Horizontally: Bottom       | Aligns the chosen objects horizontally, aligned with the bottom edge of the bottom chosen object.                                                                      |
| Horizontally: Side by side | Aligns the chosen objects horizontally, aligned side-by-side, with no vertical space between the objects. (There might still be horizontal space between the objects.) |
| Apply                      | Aligns the chosen objects and keeps the Align dialog box open, enabling you to continue aligning objects.                                                              |
| OK                         | Aligns the chosen objects and closes the Align dialog box.                                                                                                             |
| Cancel                     | Closes the Align dialog box. Changes you applied are saved; other changes are not saved.                                                                               |
| Help                       | Opens the Help window for this object.                                                                                                                                 |

# Hiding and Displaying Non-ITP Nodes and Linksets

**Note**

This function applies only to ITP objects. If you have not discovered ITP objects in your network, the Hiding/Showing Non-ITP Nodes button does not appear.

To hide all non-ITP nodes and linksets on the topology map (the default setting), click the **Hiding/Showing Non-ITP Devices** button. (The hidden signaling points and linksets are still visible in the left pane.)

To display all hidden nodes and linksets on the topology map, click the **Hiding/Showing Non-ITP Devices** button again.

The MWTM automatically saves this setting (with non-ITP nodes and linksets either hidden or visible) with your preferences.

## Locking and Unlocking the Position of an Icon

You can use the MWTM to lock the position of an icon on the topology map. Locking the position of an icon can be useful if you want to keep the icon in its position, and you want to ensure that you do not move it inadvertently. The MWTM does not include locked icons in the circular or spring layouts.

- To lock the position of an icon on the topology map, right-click an unlocked icon, then select **Lock Position**.
- To unlock the position of an icon on the topology map, right-click a locked icon, then select **Unlock Position**. This is the default setting.

The MWTM saves this setting (with icon positions locked or unlocked) when you save the view.

## Improving Topology Performance

In certain cases, you can enhance topology performance by:

- [Turning Off Antialiasing, page 10-23](#)
- [Connecting Locally for Large Networks—Solaris Clients Only, page 10-24](#)
- [Hiding and Redrawing Connections When Redrawing, page 10-24](#)
- [Hiding and Showing Connections When Redrawing, page 10-24](#)

## Turning Off Antialiasing

Antialiasing, which is on by default, improves the appearance of the icons and connections in the topology map. However, antialiasing can cause an unexpected delay in the MWTM client on a remote workstation (that is, a Solaris/Linux workstation using xhost, or a Windows workstation by using an X-Window system emulator such as eXceed or Reflection X).

You can use the MWTM to turn off antialiasing to improve the performance of the MWTM client on a remote workstation. To do so, check the **X Performance Enhancer (AntiAliasing Off)** check box in the Topology settings in the Preferences window (see [Changing Topology Settings, page 5-13](#)).

To turn antialiasing back on, uncheck the check box.

**Tip**

Keep in mind that for small networks, performance is always better if you access the MWTM by installing the MWTM client on the remote workstation.

## Connecting Locally for Large Networks—Solaris Clients Only

If you are using a remote Solaris client and you have a large network, use a local Solaris client with a graphics card and an attached monitor, rather than remote access, to improve topology performance.

**Note**

This issue might also cause an unexpected delay in the unsupported Linux client.

## Hiding and Redrawing Connections When Redrawing

To aid performance, you can use the MWTM to hide connection lines as you drag an object around the topology map, then re-draw the connection lines when you drop the object in its final position. To do so, click the **Node Dragging Optimizer** button to turn it on. This is the default setting.

To have the MWTM continually redraw connection lines as you drag an object around the topology map, click the **Node Dragging Optimizer** button to turn it off.

The MWTM automatically saves this setting (with the Node Dragging Optimizer on or off) with your preferences.

## Hiding and Showing Connections When Redrawing

To aid performance, you can use the MWTM to hide connections linked to objects that are not in the current view, called dangling connections. To do so, click the **Hiding/Showing Dangling Connections** button to set it to Hide. This is the default setting.

To show dangling connections, click the **Hiding/Showing Dangling Connections** button to set it to Show. The MWTM draws the connections in shades of gray to distinguish them from actual objects in the current view.

The MWTM does *not* save this setting (with the Hiding Dangling Connections set to Show or Hide) when you save the view.

To include a dangling connection in the current view, right-click the connection and select **Include In View**.

## Saving the Topology Map

When you are ready to close the topology window, choose **File > Save View** from the MWTM main menu. The MWTM prompts you to save any changes you made to the network view, including any changes you have made to the topology map layout, and closes the window (see [Closing the View Editor Window](#), page 6-13).

## Restoring the Topology Map

You can use the MWTM to restore the topology map to the way it looked in the last saved view. To do so, choose **Topology Tools > Restore Positions** from the topology window. The MWTM restores the view.

# CHAPTER 11

## Accessing Data from the Web Interface

---

This chapter provides information about accessing Cisco Mobile Wireless Transport Manager (MWTM) data from the MWTM web interface by using a web browser.

This chapter contains:

- [Supported Browsers, page 11-1](#)
- [Accessing the MWTM Web Interface, page 11-2](#)
- [Overview of the MWTM Web Interface, page 11-3](#)
- [Displaying the Home Page, page 11-11](#)
- [Downloading the MWTM Client from the Web, page 11-12](#)
- [Displaying Alarms and Events, page 11-14](#)
- [Displaying Summary Lists, page 11-14](#)
- [Displaying Status and Summary Reports, page 11-15](#)
- [Viewing Report Status, page 11-15](#)
- [Viewing Historical Statistics Report Settings, page 11-18](#)
- [Tools, page 11-19](#)
- [Understanding Groups, page 11-23](#)
- [Viewing Statistics, page 11-28](#)

## Supported Browsers

The MWTM web interface is supported on the following browsers:

- Microsoft Internet Explorer version 6.0 and 7.0 on Microsoft Windows operating system
- Mozilla Firefox 2.0 on Solaris 9 and Red Hat Linux Enterprise AS 4.0 operating system
- Mozilla Firefox 3.5+ on Solaris 10 and Red Hat Linux Enterprise 5.3 and Microsoft Windows operating systems.

### Note

The first time you attempt to connect to the MWTM server using Firefox 3.0, you must add an exception to allow the connection. See [Importing an SSL Certificate to an MWTM Client, page 2-25](#) for more information.

## Checking Your Browser

To check your browser and screen settings, from the MWTM web interface Home page, select **Browser Checker**.

### Note

Opening the MWTM in an unsupported browser generates a warning. Also, if JavaScript is not enabled, the MWTM web interface cannot function.

The Browser Checker window contains:

| Pane or Field              | Description                                                                                                                                                                                                                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Browser Information</b> |                                                                                                                                                                                                                                                                                                  |
| Browser                    | The name and version of the browser you are using.                                                                                                                                                                                                                                               |
| Browser User Agent         | Text string sent to identify the user agent to the server. Typically includes information such as the application name, version, host operating system, and language.                                                                                                                            |
| Platform                   | The platform type. For example, Win32.                                                                                                                                                                                                                                                           |
| Cookies Enabled            | Whether you have cookies enabled on the browser (Yes or No).                                                                                                                                                                                                                                     |
| Javascript Enabled         | Whether Javascript is enabled (Yes or No).                                                                                                                                                                                                                                                       |
| AJAX Component             | The Asynchronous JavaScript and XML (AJAX) component sends asynchronous HTTP update requests. The MWTM web application is only accessible to web browsers that have an AJAX component enabled. Typical values include XMLHttpRequest (for Mozilla-based browsers) and MSXML2.XmlHttp (for IE 6). |
| <b>Screen Information</b>  |                                                                                                                                                                                                                                                                                                  |
| Size                       | Resolution of the display; for example, 1600 x 1200.                                                                                                                                                                                                                                             |
| Color Depth                | Depth of the color display; for example, 16.                                                                                                                                                                                                                                                     |

## Accessing the MWTM Web Interface

The home page of the MWTM web interface is the first window to appear when you launch the MWTM web interface.

To access the MWTM web interface, use one of these methods:

- Open a browser and enter **`http://mwtm_server:1774`** in the Address field. (1774 is the default port).

### Note

Accessing the MWTM web interface through a URL other than **`http://mwtm-server:1774`** is not supported.

- From the MWTM client interface, choose **View > MWTM Web Links > Home**.

The MWTM Home page window opens in the browser window. For details about the Home page, see [Displaying the Home Page, page 11-11](#).

# Overview of the MWTM Web Interface

The MWTM web interface shows basic information about the events and objects that the MWTM manages. The MWTM web interface shows:

| Pane            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title Bar       | Shows: <ul style="list-style-type: none"><li>• Mobile Wireless Transport Manager, version, and server name</li><li>• Managed networks (can be any combination of IP-RAN, ITP, CSG1, CSG2, GGSN, BWG, HA, PDNGW, SGW, PCRF, and PDSN)</li><li>• Logout (appears only if you enable user access; see <a href="#">Configuring User Access, page 2-1</a>)</li><li>• Help—Click this link to access context-sensitive online help</li><li>• Preferences—Click this link to access preferences that you can change from the web interface (see <a href="#">Changing Web Preference Settings, page 5-18</a>)</li></ul> |
| Location bar    | Shows where you currently are in the MWTM navigation tree.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Navigation Tree | In the left pane, shows a tree of information organized by categories (see <a href="#">MWTM Web Interface Navigation Tree, page 11-3</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Content Area    | In the right pane, shows detailed information about the object chosen in the navigation tree (see <a href="#">MWTM Web Interface Content Area, page 11-5</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## MWTM Web Interface Navigation Tree

You can easily navigate the features of the MWTM web interface by using the navigation tree in the left pane. By default, the navigation tree is sorted by alarm severity, with objects having the most severe alarms appearing at the top of the tree.

**Note**

To learn more about alarm severity, see [Chapter 9, “Managing Alarms and Events.”](#)

To view detailed information about a selection in the navigation tree, click the item in the tree. The content area in the right pane shows details about the chosen item. A plus (+) or minus (-) just to the left of the item indicates whether the item has subtending items under its domain.

The MWTM automatically updates the navigation tree when changes occur to discovered nodes or to the network. When any changes occur in the MWTM client navigation tree, the MWTM web interface reflects these changes in its navigation tree. For example, if you delete a node in the MWTM client, the MWTM web interface removes that node from its navigation tree.

**Note**

For information about the navigation tree in the MWTM client interface, see [MWTM Client Navigation Tree, page 3-16](#).

The MWTM web interface navigation tree contains:

| GUI Element                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Tools        | Provides tools for launching CiscoWorks, CiscoView, and Device Center. Also provides a search tool for Home Agent (HA) and Gateway GPRS Support Node (GGSN) subscribers (see <a href="#">Tools, page 11-19</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Groups       | Displays user-defined groups (see <a href="#">Understanding Groups, page 11-23</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DEFAULT View | Shows a current list of nodes in the DEFAULT view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## MWTM Web Interface Content Area

The content area of the MWTM client interface is fully described in [MWTM Client Content Area, page 3-17](#). That description also applies to the web interface. Additional navigational features that appear only in the web interface include:

- [Customizing Date Ranges, page 11-5](#)
- [Using the Toolbar, page 11-6](#)

### Customizing Date Ranges

Some windows require that you select date ranges for generating historical graphs (see [Displaying RAN-O Statistics, page 11-28](#)) and forwarding traps. Standard date ranges (for example, Last 24 Hours or Last 7 Days) are available from a drop-down menu. However, if you want to customize the date range:

**Step 1** Click the **Customize Date and Time Range** tool  in the toolbar of the content area. A dialog box appears.

**Step 2** Enter a:

- Begin Date and End Date; or, select those dates by clicking the Calendar tool .
- Begin Hour and End Hour from the drop-down menus, if they are available.

**Note** The dialog box shows an error if the End Date is equal to or less than the Begin Date. Correct the error before proceeding.

**Step 3** Click **OK** to accept the date and time changes; or, **Cancel** to cancel this operation. The MWTM web interface generates a report for the specified time period.

## Using the Toolbar

Depending upon the object you select in the navigation tree, the web interface toolbar provides these tools and options:

| Tool or Function                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Updated                                                                              | Date and time the MWTM last updated the information on the page.                                                                                                                                                                                                                                                                                                                    |
| Page                                                                                      | Shows where you are (page X of X total pages) and lists the total number of entries.                                                                                                                                                                                                                                                                                                |
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                              |
| Status Refresh Interval                                                                   | <p>Allows you change the default refresh interval of 180 seconds. Enter a value between 180 and 900 seconds.</p> <p><b>Note</b> Changes you make are temporary to the current page. Navigating away from the page sets the status refresh interval back to the default setting. To change the default setting, see <a href="#">Changing Web Preference Settings, page 5-18</a>.</p> |
| Page Size                                                                                 | <p>Drop-down list of different page sizes (the number of table rows in the display). Click the drop-down arrow to select a different value. The value that you select becomes the default page size for all pages in the web interface.</p> <p>The title bar displays the current page and total number of table entries.</p>                                                       |

| Tool or Function                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

This link appears when you select Event History or Active Alarms in the navigation tree. It also appears when you click the Alarms tab or Recent Events tab for a specific object.</p> <p> <b>Caution</b> In the <i>Server.properties</i> file, you can limit the number of rows in the archived events table with the <code>MAX_ARCHIVED_EVENT_DB_ROWS</code> property. The default value is 200,000. Increasing this value can have severe impact on server performance and can cause the server to run out of memory.</p> |
|  Customize Date and Time Range   | Opens the Customize Date and Time Range dialog box (see <a href="#">Customizing Date Ranges, page 11-5</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|  Graph Series Editor             | <p>Opens the Graph Series Editor dialog box, which provides a check box for each available data series. Check the check box to display a series, and uncheck the check box to hide a series.</p> <p>If you click <b>OK</b> without selecting a series, it is the same as clicking Cancel.</p> <p>By default, the MWTM displays no more than 12 series by default. To change this default setting, see <a href="#">Display Series Dialog Box, page 8-109</a>.</p>                                                                                                                                                                                                 |
|  Run                             | Runs the report type for the chosen duration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|  Export the report as a CSV file | Exports the data in the table to comma-separated value file (CSV file). You can save this file to disk or open it with an application that you choose (for example, Microsoft Excel).                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Data Range                                                                                                        | Label that shows the chosen time range for the historical statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Type                                                                                                              | Drop-down list of report types.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Duration                                                                                                          | Drop-down list of default time ranges. Select one of these options, then click the <b>Run</b> tool. To specify a nondefault time range, click the <b>Customize Date and Time Range</b> too.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Toolbar for alarms and events | The web interface provides the same toolbar for alarms and events as the client interface. For full descriptions of these tools, see <a href="#">Toolbar Buttons, page 9-8</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Actions                       | <p>Drop-down menu appears when you hover over the Actions button. The Actions button is displayed for all the object based Summary Lists (i.e. except Alarms, Software Versions, IP Addresses, and Point Code), Management interfaces and Physical folders of the nodes under the navigation tree, and under the Details tab of all the objects.</p> <p><b>Note</b> Users with authentication level 1 cannot see the Actions button. Also, the Manage and Ignore options have separate permissions for Manage/Unmanage and Ignore/Unignore. The menu item is not shown if both the permissions are invalid.</p> <p><b>Note</b> The Action Menu appears in the Shorthauls tab for Backhauls and in the Nodes tab for APNs.</p> <p>For all the objects/summary lists except APN the drop-down menu contains:</p> <ul style="list-style-type: none"> <li>• Normal Poll Node—Polls the chosen nodes.</li> <li>• Clean Poll Node—Polls all chosen nodes and removes any Unknown objects after the completion of the poll.</li> <li>• Provision—Allows you to provision the objects.</li> <li>• Ignore/Unignore—Ignores or stops ignoring the chosen object at the next polling cycle.</li> <li>• Manage/Unmanage—Labels the chosen node Managed or Unmanaged. The option Manage or Unmanage is displayed based on the selected item.</li> <li>• Allow Trap Processing/Disallow Trap Processing—Enables or disables the MWTM to process traps from the chosen node. The option Allow Trap Processing or Disallow Trap Processing is displayed based on the selected item.</li> <li>• Delete—Deletes the chosen object.</li> </ul> <p>For Management interfaces and Physical folders of the nodes, the drop-down menu contains:</p> <ul style="list-style-type: none"> <li>• Ignore/Unignore—Ignores or stops ignoring the chosen object at the next polling cycle.</li> </ul> <p>For APNs the drop-down menu contains the following options:</p> <ul style="list-style-type: none"> <li>• Search for APN Subscriber—Used to search for a specific subscriber across one or more designated GGSN, PDNGW, and SGW subscribers. See <a href="#">Searching for APN Subscribers, page 11-23</a> for more information.</li> <li>• Ignore/Unignore—Ignores or stops ignoring the chosen object at the next polling cycle.</li> <li>• Delete—Deletes the chosen object.</li> </ul> <p><b>Note</b> For the nodes that are not manageable, the Actions menu contains only Ignore and Delete options.</p> <p>The Details tab of the groups created contains the Actions drop-down menu which contains the following options:</p> <ul style="list-style-type: none"> <li>• Batch Provision—Used to perform Batch Provisioning. See <a href="#">Batch Provisioning, page 11-26</a>.</li> </ul> <p><b>Note</b> The Actions button does not appear for the groups if they do not have a batch file of the corresponding node type.</p> |

# Displaying the Home Page

The MWTM web interface Home page provides access to MWTM client software, Cisco documentation, and information about the MWTM.

To access the Home page of the MWTM web interface, click **Home** under the navigation tree in the left pane.

The content area in the right pane shows these GUI elements:

| Pane              | GUI Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                   | Frequently Asked Questions         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                   | MWTM Server Help Command           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

1. To access the latest versions, go to the parent index for Cisco MWTM user documents:  
[http://www.cisco.com/en/US/products/ps6472/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps6472/tsd_products_support_series_home.html)

## Downloading the MWTM Client from the Web

You can access the MWTM client installation software for Linux (unsupported), Solaris, and Windows from the MWTM web interface Home page. This access is useful if you do not have the CD-ROM, or if you prefer to download the software by using your web browser. Once you have downloaded the MWTM client installation software to your workstation, you must install the software on your local system.

For more information about installing the MWTM client software by using a web server, see the following chapters in the *Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3*:

- “Installing the MWTM on Solaris”
- “Installing the MWTM on Windows”
- “Installing the MWTM on Linux”

### Related Topics

- [Downloading the Solaris Client, page 11-12](#)
- [Downloading the Windows Client, page 11-12](#)
- [Downloading the Linux Client \(Unsupported\), page 11-12](#)

## Downloading the Solaris Client

To access the MWTM Client for Solaris page, select **Download Solaris Client**.

The web interface shows the supported Solaris versions and instructions for downloading the Solaris client. See the *Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3* for a detailed procedure.

To start the client after installation, add the `/opt/CSCOsgmClient/bin` subdirectory to your path, then enter the **mwtm client** command from the command line.

## Downloading the Windows Client

To access the MWTM Client for Windows page, select **Download Windows Client**.

The web interface shows supported Windows versions and instructions for downloading the Windows setup program. After downloading the setup program onto your desktop or other Windows directory, double-click the **setup.exe** icon to start the setup program and launch the installation wizard. See the *Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3* for detailed procedures.

To start the client after installation, launch it from the Windows Start menu or double-click the **MWTM Client** icon on your desktop.

## Downloading the Linux Client (Unsupported)

To access the MWTM Client for Linux page, select **Download Linux Client**.

### Note

The MWTM does not support the MWTM client for Linux. Use the MWTM Linux client under advisement.

The web interface shows the supported Linux versions and instructions for downloading the Linux client. See the *Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3* for a detailed procedure.

To start the client after installation, add the `/opt/CSCOsgmClient/bin` subdirectory to your path, then enter the **mwtm client** command from the command line.

## Accessing Software Updates and Additional Information

You can access this information about the MWTM from the MWTM web interface Home page. To:

- View information about the MWTM or any other Cisco product available on Cisco.com, select **Cisco Home Page**.
- Read Cisco literature associated with the MWTM, including product data sheets, Q and As, and helpful presentations, select **MWTM Home Page**.
- Access software updates for the MWTM from Cisco.com for FTP, select **Engineering Software Updates (FTP)**. The Cisco Systems Engineering FTP server page appears.
- Access software updates for the MWTM from Cisco.com, select **MWTM Software Download Page**. The Software Download page for the MWTM appears.
- Access the most recent versions of customer documentation for the MWTM, select **Latest MWTM Documentation**. The Cisco Mobile Wireless Transport Manager documentation page on Cisco.com appears. From this page, you can view the latest versions of MWTM release notes, installation guides, and end-user guides.

### Note

If you cannot access Cisco.com from your location, you can always view the customer documentation that was delivered with the MWTM software. See the *Viewing the MWTM Technical Documentation*, page 11-13.

## Viewing the MWTM Technical Documentation

From the MWTM web interface Home page, you can view this MWTM technical documentation. To view the:

- Entire Cisco Mobile Wireless Transport Manager Help System, select **Help Home Page**.
- Entire *User Guide for the Cisco Mobile Wireless Transport Manager 6.1.3* as a PDF file on the web, using the Adobe Acrobat Reader, select **User Guide (PDF)**.
- Entire *Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3* as a PDF file on the web, using the Adobe Acrobat Reader, select **Install Guide (PDF)**.
- Entire *Release Notes for the Cisco Mobile Wireless Transport Manager 6.1.3* as a PDF file on the web, using the Adobe Acrobat Reader, select **Release Notes (PDF)**.
- Frequently Asked Questions (FAQs) about the MWTM, select **Frequently Asked Questions**.
- Syntax for every MWTM command, select **MWTM Server Help Command**.

### Caution

These PDF versions of technical documents might not be the latest versions. For the latest versions, go to: [http://www.cisco.com/en/US/products/ps6472/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps6472/tsd_products_support_series_home.html).

## Displaying Alarms and Events

To display alarms in the web interface, click **Active Alarms** in the navigation tree, or select an object in the navigation tree and click the Alarms tab.

To display events in the web interface, click Event History in the navigation tree, or select an object in the navigation tree and click the Recent Events tab.

Viewing alarms and events in the web interface is essentially the same as viewing them in the MWTM client. Only minor differences exist:

- A paging feature for paging through large tables.
- A refresh interval that you can change.
- An Archived link for viewing archived alarms.
- Alarm selection by check box and a Clear Selection link.
- Severity drop-down list and a Change Severity button.

For detailed descriptions of these tools, see the [“Using the Toolbar” section on page 11-6](#).

For descriptions of the columns, see the [“Right-click Menus” section on page 9-10](#).

## Displaying Summary Lists

Displaying Summary Lists in the web interface is essentially the same as displaying them in the MWTM client. Only minor differences exist. Clicking on an object under the Summary Lists in the web interface causes the content area to show information about the object.

For details on:

- Navigating table columns, see [Navigating Table Columns, page 5-23](#).
- The toolbar, see [Using the Toolbar, page 11-6](#).

For complete information about Summary Lists, see the [Displaying Object Windows, page 6-2](#).

## Displaying Software Versions

The Software Versions table lists the software versions for each node the MWTM manages.

To access the Software Versions page:

- From the Web interface navigation tree, choose **Summary Lists > Software Versions**.
- From the MWTM main window, choose **View > MWTM Web Links > Software Versions**.

For details on:

- Navigating the columns of the Software Versions table, see [Navigating Table Columns, page 5-23](#).
- The toolbar, see [Using the Toolbar, page 11-6](#).

The Software Versions table contains:

| Column               | Description                        |
|----------------------|------------------------------------|
| Name                 | Name of the node.                  |
| Node Type            | Type of node.                      |
| Software Version     | Software version used by the node. |
| Software Description | Full software version information. |

## Displaying Status and Summary Reports

You can view a table, graph, or CSV file that shows the overall state of the available MWTM reports, the time the server took to gather data from the network and store it in the database, and enable or disable reports from the report page. You can also run hourly and daily performance summary reports.

- 
- Step 1** In the MWTM Web interface, in the navigation tree, click **Reports**. The Report Status window appears as described in [Viewing Report Status, page 11-15](#).
- Step 2** From the Type pulldown menu, select one of the following types of reports:
- Report Status—See [Viewing Report Status, page 11-15](#).
  - Performance Summary Hourly—See [Performance Summary Hourly Report, page 11-16](#).
  - Performance Summary Daily—See [Performance Summary Daily Report, page 11-17](#).
- Step 3** Select a duration and output type. See the “Using the Toolbar” section on [page 11-6](#) for more information about these fields.
- 

## Viewing Report Status

The Reports page in the MWTM web interface allows you to view a table, graph, or CSV file that shows the overall state of the available MWTM reports. You can also enable or disable reports from the report page.

**Note**

Only reports that run on a regularly scheduled interval are displayed in the Hourly and Daily data. Reports that run continuously are not displayed.

**Note**

Only reports that run on a regular scheduled interval display information in the following columns: Last Start Time, Last End Time, and Duration. Reports that run continuously display *N/A* for these columns. A report that has not yet run has *Unknown* in the above columns.

To access the main Reports page:

**Step 1** Do one of the following:

- In a web browser, launch the MWTM web interface (see [Accessing the MWTM Web Interface, page 11-2](#)). In the navigation tree, click **Reports**.
- From the MWTM client, in the MWTM main window, choose **View > MWTM Web Links > Reports**.

The Reports page in the content area shows the Report Type and the status (enabled or disabled). If you have generated a report, a green status ball and the word “Enabled” appear in the Status column. If you have not generated a report, a red status ball and the word “Disabled” appears.

**Note** Clicking a Report Type takes you directly to the report data page.

The Status column indicates whether you have enabled or disabled data gathering for the specified report type.

**Step 2** To enable a report in the MWTM Web interface, click “Disabled” in the Status column. The Status changes “Enabled” and a green status ball appears.

## Performance Summary Hourly Report

The Performance Summary Hourly Report shows the time it takes to gather the data from the network and store it in the database. This report shows data for reports that are invoked via an hourly cronjob only and not reports that run continuously.

**Step 1** In the MWTM Web interface, in the navigation tree, click **Reports**. The Report Status window appears as described in [Viewing Report Status, page 11-15](#).

**Step 2** From the Type pulldown menu, select **Performance Summary Hourly**.

| GUI Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Toolbar</i>        | Provides functions to select a report type, duration, output type. | <i>Table</i>          | <p>If you select the Output Type <b>Table</b>, the table contains:</p> <ul style="list-style-type: none"> <li>• Report Type—Type of report.</li> <li>• Start Time (<i>timezone</i>)—Time the report started.</li> <li>• End Time (<i>timezone</i>)—Time the report ended.</li> <li>• Duration (secs)—Time it took to run the report.</li> <li>• Object Count—Number of objects on which the report was run.</li> </ul> <p><b>Note</b> If the Output Type is Table or CSV, the same data is presented but the column headings are labeled by data type.</p> |
| Expand to Full Screen | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Duration (Secs)       | <p>If Output Type is Graph, Y-axis label that shows duration in second.</p> <p><b>Note</b> If no data exists between any two data points, the graph displays a color-coded vertical bar to show the period for which no data is available.</p>                                                                                                                                                                                                                                                                                                             |
| Time                  | If Output Type is Graph, X-axis label that shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>Legend</i>         | If Output Type is Graph, color-coded legend that shows labels for output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Performance Summary Daily Report

The Performance Summary Daily Report shows the time it takes to gather the data from the network and store it in the database. This report shows data for reports that are invoked via a daily cronjob only and not reports that run continuously.

- 
- Step 1** In the MWTM Web interface, in the navigation tree, click **Reports**. The Report Status window appears as described in [Viewing Report Status, page 11-15](#).
- Step 2** From the Type pulldown menu, select **Performance Summary Daily**.

| GUI Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Duration (Secs)       | <p>If Output Type is Graph, Y-axis label that shows duration in second.</p> <p><b>Note</b> If no data exists between any two data points, the graph displays a color-coded vertical bar to show the period for which no data is available.</p>                                                                                                                                                                                                                                                                                        |
| Time                  | If Output Type is Graph, X-axis label that shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>Legend</i>         | If Output Type is Graph, color-coded legend that shows labels for output.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Bits/Sec or Bytes/Sec | <p>If Output Type is Graph, Y-axis label that shows traffic rate in bits per second. The Y axis automatically scales to the interface speed.</p> <p><b>Note</b> If no data exists between any two data points, the graph displays a color-coded vertical bar to show the period for which no data is available.</p>                                                                                                                                                                                                                   |

## Viewing Historical Statistics Report Settings

- Step 1** In the MWTM Web interface, in the navigation tree, click **Reports**. The Report Status window appears as described in [Viewing Report Status, page 11-15](#).
- Step 2** Click the **Settings** tab. The Historical Stats Report Settings information is displayed.
- You can click on Disabled or Enabled to change the state of any of the reports.
- You can click on any field, except for the Reports Directory field, to modify its value.

| Field               |                                            | Description                                                                                                                                                                              |
|---------------------|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General Settings    | Reports Directory                          | Specifies the directory in which the MWTM reports are stored. You must use the CLI to change the directory in which the reports are stored; you cannot click on this field to modify it. |
|                     | Time Mode                                  | Specifies the time mode, either 12-hour or 24-hour, for the reports.                                                                                                                     |
|                     | Master Report Flag                         | If this option is enabled, the individual report settings are used. If this option is disabled, all reports are turned off.                                                              |
|                     | Perform Disk Space Checking                | Specifies whether disk space checking is enabled or disabled.                                                                                                                            |
|                     | Export Reports                             | Specifies whether to automatically generate reports in CSV format.                                                                                                                       |
|                     | 15 Min Stats Aging (Days)                  | Specifies the database aging value for 15-minute statistics. When records exceed the specified value, they are aged out of the database.                                                 |
|                     | Hourly Stats Aging (Days)                  | Specifies the database aging value for hourly statistics. When records exceed the specified value, they are aged out of the database.                                                    |
|                     | Daily Stats Aging (Days)                   | Specifies the database aging value for daily statistics. When records exceed the specified value, they are aged out of the database.                                                     |
|                     | Monthly Stats Aging (Days)                 | Specifies the database aging value for monthly statistics. When records exceed the specified value, they are aged out of the database.                                                   |
|                     | Custom Stats Aging (Days)                  | Specifies the database aging value for custom statistics. When records exceed the specified value, they are aged out of the database.                                                    |
| ITP Report Settings | Show links with no capacity set (nullcaps) | Specifies whether to show links/linksets that do not have planned send and receive capacities.                                                                                           |
|                     | Show SCTP IP Links                         | Specifies whether to show SCTP IP links.                                                                                                                                                 |
|                     | High In-Service Ratio Threshold            | Displays the high value for the In-Service ratio threshold.                                                                                                                              |
|                     | High Utilization Ratio Threshold           | Displays the high value for the utilization ratio threshold.                                                                                                                             |

## Tools

To access launch and search tools, click **Tools** in the navigation tree of the MWTM web interface. The following options are available:

- [Launch Tools, page 11-20](#)
- [Events and Alarms, page 11-20](#)
- [Search Tools, page 11-22](#)

## Launch Tools

If you have integrated with a CiscoWorks server, one or more of the following applications appears in the Launch pane as active links:

- CiscoView
- CiscoWorks LMS Portal
- Device Center

The name of the server appears in parentheses following the application names. To launch an application, click the application name. See [Integrating the MWTM with Other Products, page 5-36](#).

## Events and Alarms

The Events and Alarms pane contains the following links:

- Client disconnect sound
- Alarm Synchronization

The Events and Alarms tool allows you to select a sound to be played when the client loses its connection to the MWTM server. By default, no sound is played when the client loses its connection to the server. You must select a sound to be played.

- 
- Step 1** Click **Tools** in the navigation tree of the MWTM web interface. From the **Client disconnect sound** pulldown menu, select a sound. The sound you selected is saved.
- Step 2** After selecting a client disconnect sound, click **Play** to sample the sound.
- 

**Note**

Make sure you are not logged into the MWTM client at the same time that you are changing the client disconnect sound in the MWTM web interface. Any sound changes you make using the MWTM client override changes you make using the web interface.

You can use the MWTM client interface to create and change event sound filters for the MWTM client as explained in [Setting Sounds for Events at an MWTM Client, page 9-36](#).

## Alarm Synchronization

Click the Alarm Synchronization link to open the Alarm Synchronization page. This page contains the following toolbar buttons and the panes:

- [Toolbar Buttons, page 11-21](#)
- [Trap Target Information, page 11-21](#)
- [Match Alarms by Date Range, page 11-21](#)
- [Match Alarms by Alarm Id Range, page 11-22](#)

## Toolbar Buttons

The page contains the following toolbar buttons:

| Field or Button                                                                                  | Description                                                       |
|--------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| Back                                                                                             | Use this button to return to the previous page.                   |
|  Forward Alarms | Click this icon to forward the alarms within the specified range. |

## Trap Target Information

The Trap Target Information pane contains the following fields:

| Field or Button                | Description                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Target Host Name or IP Address | Enter the destination host name or IP address in this text field.                                                                                                                                                                                                                                                                                           |
| Target Port                    | Host port number to which the MWTM should forward traps.                                                                                                                                                                                                                                                                                                    |
| SNMP Community String          | SNMP community string that the MWTM should include in forwarded traps.                                                                                                                                                                                                                                                                                      |
| SNMP Version                   | Trap version to forward. Valid values are 1 and 2c.                                                                                                                                                                                                                                                                                                         |
| Trap Type                      | Type of trap that the MWTM should forward to this host. Valid trap types are: <ul style="list-style-type: none"> <li>CISCO-SYSLOG: The CISCO-SYSLOG-MIB clogMessageGenerated trap.</li> <li>CISCO-EPM: CISCO-EPM-NOTIFICATION-MIB ciscoEpmNotificationRev1 trap.</li> <li>CISCO-EPM-2: CISCO-EPM-NOTIFICATION-MIB ciscoEpmNotificationRev2 trap.</li> </ul> |

## Match Alarms by Date Range

The Match Alarms by Date Range pane contains the following fields:

| Field or Button                                                                                                   | Description                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
|  Customize Date and Time Range | Opens the Customize Date and Time Range dialog box (see <a href="#">Customizing Date Ranges, page 11-5</a> ). |
| Clear                                                                                                             | Click this icon to clear the alarm dates and enable match by ID section.                                      |
| Start Alarm Change Time                                                                                           | The start alarm change time to forward the traps.                                                             |
| End Alarm Change Time                                                                                             | The end alarm change time to forward the traps.                                                               |

## Match Alarms by Alarm Id Range

The Match Alarms by Date Range pane contains the following fields:

| Field or Button | Description                                                              |
|-----------------|--------------------------------------------------------------------------|
| Clear           | Click this icon to clear the alarm IDs and enable match by date section. |
| Start Alarm Id  | The start alarm ID to forward the traps.                                 |
| End Alarm Id    | The end alarm ID to forward the traps.                                   |

## Search Tools

### Note

You must have the Cisco Home Agent (HA) network enabled to use this tool (for details on enabling HA, see [mwtm manage, page B-44](#)).

The Search pane provides a tool that you use to search for a specific subscriber across one or more designated Cisco Home Agent (HA) routers or to search for GGSN, PDNGW, and SGW subscribers. These tools are useful for troubleshooting problems that subscribers might report.

In the Search pane, click one of the following options:

- **Search for Home Agent Subscriber** (See [Searching for Home Agent Subscribers, page 11-22](#))
- **Search for APN Subscriber** (See [Searching for APN Subscribers, page 11-23](#))

## Searching for Home Agent Subscribers

- Step 1** Click **Tools** in the navigation tree of the MWTM web interface, then select **Search for Home Agent Subscriber**.
- Step 2** Click the Identifier Type radio button:
  - **Network Access Identifier**—Use this option if you know the subscriber's network access identifier (NAI); for example, jdoe@xyz.com.
  - **IP Address**—Use this option if you know the subscriber's IP address
- Step 3** Depending on your selection in [Step 2](#), enter the subscriber's NAI or IP address in the Mobile Node Identifier field.
- Step 4** In the Select Groups to Search pane, click on the group(s) for which you want to search for Home Agents. This field is only available if you have previously created an HA config, HA report, or General group. (See [Creating Groups, page 11-23](#)).
- Step 5** In the Select Home Agents to Search pane, check the check boxes of the Home Agents that you want to search. (The default setting is all Home Agents.) Click **Select All** to check all boxes and search all Home Agents. Click **Deselect All** to clear all check boxes.
- Step 6** To conduct the search, click the **Search** button.  
The Search Results popup window appears.
- Step 7** If the search successfully locates the subscriber, and you want to troubleshoot the problem, click the **Troubleshoot Subscriber** button in the Search Results popup.  
The MWTM automatically navigates to the Troubleshooting tab of the HA device.

- Step 8** For more information about troubleshooting devices by using the Troubleshooting tab, see [Viewing Troubleshooting, page 8-40](#).
- 

## Searching for APN Subscribers

- Step 1** Click **Tools** in the navigation tree of the MWTM web interface, then click **Search for APN Subscriber**.
- Step 2** In the MSISDN field, enter the MSISDN for which you want to search.
- Step 3** In the Select Groups to Search pane, click on the group(s) for which you want to search for GGSN, PDNGW, or SGW subscribers. This field is only available if you have previously created a GGSN config, GGSN report, PDNGW config, PDNGW report, SGW config, SGW report, or General group. (See [Creating Groups, page 11-23](#)).
- Step 4** In the Select Nodes to Search field, select all the Nodes on which you want to search for the MSISDN you entered. Click **Select All** to check all boxes and search all the nodes. Click **Deselect All** to clear all check boxes.
- Step 5** To conduct the search, click the **Search** button.  
The Search Results popup window appears.
- Step 6** If the search is successful, you can select from the matching nodes to troubleshoot the subscriber by clicking the **Troubleshoot Subscriber** button in the Search Results popup.
- 

## Understanding Groups

MWTM allows you to create *groups* of nodes that can simplify operations. You can create groups using the MWTM web interface and then perform operations against all nodes of a group instead of performing the operation against each node individually. You can also perform searches on groups. For example, you can search for a home agent subscriber on nodes within a specific group.

For provisioning groups, the *master node* is the first node in the group. The master node is used to determine provisioning commands.

## Creating Groups

### Note

This option is available to users with authentication level Power User (level 2) and higher.

---

You can create the following types of groups:

- Step 1** From the web interface, click **Groups**.
- Step 2** Click the Create icon. The New Group form appears.
- Step 3** Complete the New Group fields:

| Field | Description                                                                                                                                                                                                                                                                                                                                            |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name  | Enter a name for the group                                                                                                                                                                                                                                                                                                                             |
| Type  | From the pulldown menu, select the group type:<br>CSG configuration<br>CSG report<br>GGSN configuration<br>GGSN report<br>General—Any node can be in the general group.<br>HA configuration<br>HA report<br>IPRAN configuration<br>RAN-O configuration<br>PDNGW configuration<br>PDNGW report<br>SGW configuration<br>SGW report<br>mSEF configuration |

**Note** If a group contains non-existent nodes or if you add a node of the wrong type to a group, the group will be invalid.

- Step 4** Click **OK**.
- The Edit window appears displaying information about the group you just created. See [Viewing Group Summary Information, page 11-25](#) for more information.

## Editing Groups

After you have created a group, you can add nodes to and remove nodes from the group. You can also order the nodes within the group.

**Note**

This option is available to users with authentication level Power User (level 2) and higher. If you do not have the required privileges you will not see the Edit tab.

- Step 1** From the web interface, click **Groups > group name**.
- Step 2** Click the **Edit** tab. The Group Settings pane displays the group name and group type.
- Step 3** In the Group Members pane, specify to display available members by **Nodes** or by **Groups**. You might want to view members by Group if you want to copy all members of one group to another group. The available members or groups are displayed.

**Note**

Only valid nodes for a group are displayed in the Available members/groups list. A group is invalid if it contains non-existent nodes or if the group contains nodes of the wrong type.

- Step 4** Click on a member or group to add to the specified group, then click **Add**. The member or group is added to the Selected Members list.
- Step 5** To remove a member, click on the member in the Selected Members list, then click **Remove**.
- Step 6** To order the nodes in a group, use the **Raise** and **Lower** buttons.

For provisioning groups, the *master node* is the first node in the group. The master node is used to determine provisioning commands.

## Viewing Group Summary Information

From the web interface navigation tree, click **Groups** to display the Group Summary List.

| Field         | Description                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name          | Name of the group.                                                                                                                                                                          |
| Group Type    | Type of group.                                                                                                                                                                              |
| Size          | Number of nodes in the group.                                                                                                                                                               |
| Notes         | Displays any notes attached to the group.                                                                                                                                                   |
| Valid         | <b>Yes</b> indicates the group is valid. <b>No</b> indicates the group is not valid. A group is invalid if it contains non-existent nodes or if the group contains nodes of the wrong type. |
| Last Verified | Time and date group was last verified.                                                                                                                                                      |

# Displaying Group Details

- Step 1** From the web interface, click **Groups** > *group name*. You can click on any of the following tabs for more information about the specified group:
- Details—See [Viewing Group Details](#), page 11-26.
- Notes—See [Viewing Notes](#), page 6-43.
- Events—Displays events associated with the nodes in the group only. See [Displaying Alarms and Events](#), page 11-14.
- Alarms—Displays alarms associated with the nodes in the group only. See [Displaying Alarms and Events](#), page 11-14.
- Edit—See [Editing Groups](#), page 11-25.

## Viewing Group Details

- Step 1** From the web interface, click **Groups** > *group name*.
- Step 2** Click **Details**. Detailed information about the specified group is displayed. See [Nodes Table](#), page 6-5 for descriptions of the fields.
- The Group Member Verification Status field specifies that status of each group member as it exists in the group. If the group is not valid, this field indicates which node is causing the group to not be valid.

## Batch Provisioning

The MWTM provides a popup text field where you can type any CLI commands and then have those stored in a file on the server. These commands can then be used in batch operations to push out config changes to the nodes where there is no direct support in the wizard GUI interface.

The MWTM uses the existing "Groups" feature to create group objects. Once you have a group to provision (see [Using the Provisioning Wizard](#), page 8-49), select the group from left panel and then choose **Actions** > **Batch Provision** from the toolbar. The page gets loaded with the Batch Provision page.

### Note

The Batch Provision option is available only for the users with authentication level 3 and above. Also, the Batch Provision is not available for a group of the type "Report".

The Batch Provision page contains:

| Field or Button                                                                               | Description                                                                                   |
|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| Back                                                                                          | Use this button to go back to the previous page.                                              |
|  Load File | Opens the <a href="#">MWTM: File Dialog</a> window, which allows you to load the batch files. |

| Field or Button                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Save File | Saves the changes you have made to the chosen batch file. The saved batch files are added in the path <code>/opt/CSCOsrm/etc/batch</code> with the naming convention <code>"\$Name.99.9(99).Generic.batch"</code> .                                                                                                                                                                                                                                                                                                                                                        |
|  Save As   | Click this to save the updated batch file with a new name, or to overwrite an existing batch file. Opens the <a href="#">MWTM: File Dialog</a> window with the addition of a text field "Filename" where you can specify the new name for the batch file. If an existing file name is given in the "File Name" text field, a confirmation dialog box is displayed asking whether to overwrite the existing file. The saved batch files are added in the path <code>/opt/CSCOsrm/etc/batch</code> with the naming convention <code>"\$Name.99.9(99).Generic.batch"</code> . |
| Write Mem                                                                                   | Click this check box to save the script to the running configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Provision                                                                                   | Allows you to perform batch provisioning for the nodes in the selected group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Batch File                                                                                  | Text area to display or edit the contents of the batch file.<br><br>This text area is empty and the title displays "Batch File: No File" when there is no batch file loaded. Once the batch files are loaded (using the Load File option), the text area displays the contents of the loaded batch file and the title of the text area changes to Batch File: <i>filename</i> , where <i>filename</i> is the name of the batch file.<br><br>You can also enter the device level commands in this text area to provision the nodes in the selected group.                   |

## MWTM: File Dialog

The MWTM: File Dialog window contains:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Batch File List | The Batch File List pane contains the following columns: <ul style="list-style-type: none"> <li>Type—Icon indicating the item in the table is a file.</li> <li>Name—Name of the batch file.</li> <li>Node Type—Type of node. See <a href="#">Nodes Table, page 6-5</a>, for a list of the available node types.</li> <li>Last Modified—Date and time the batch file or folder was last modified.</li> <li>Size (bytes)—Size of the batch file or folder, in bytes.</li> </ul> |
| OK              | Loads the chosen batch file and closes the dialog box. To load a batch file, select the file in the list and click <b>OK</b> . The batch file is loaded properly in the "Batch File:" text area panel of the "Batch Provision" page.                                                                                                                                                                                                                                          |
| Delete          | Deletes the chosen file from the batch file list. The MWTM displays a confirmation message before deleting the file.                                                                                                                                                                                                                                                                                                                                                          |
| Cancel          | Closes the dialog box without loading a batch file or saving any changes to the batch file list.                                                                                                                                                                                                                                                                                                                                                                              |
| Help            | Displays online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Viewing Statistics

You can use statistics for capacity planning and trend analysis. For example, you can generate graphs, tables, or CSV files:

- For a specified time range to display historical statistics for customer busy-hours.
- To show the maximum send and receive traffic over a specified time period.
- To show data on a 15-minute, daily, or hourly basis.

MWTM provides two types of statistics:

- **Real-time statistics**—The MWTM provides real-time (not historical) performance statistics and error information occurring in real time. The MWTM client also displays graphs for real-time statistics. You use real-time statistics for troubleshooting active problem areas in your network. See [Displaying RAN-O Statistics, page 11-28](#) and [Displaying Error Statistics, page 11-31](#)
- **Historical reports (statistics)**. These reports are available on the MWTM web interface only.

These statistics vary by the time frame over which they are collected and stored and for some domains, the statistics gathered vary. For example, real-time SCTP Association Statistic Details describes link-level SCTP statistics collected every 15 seconds. The SCTP historical reports describe device-level SCTP statistics for all of the SCTP links on a specific device over 15 minute, hourly, and daily intervals.

## Displaying RAN-O Statistics

You can view real-time performance data for a shorthaul or backhaul interface in the MWTM:

- Web interface by selecting a shorthaul or backhaul interface in the navigation tree and clicking the Shorthaul Performance or Performance tab in the right pane.
- Client interface by right-clicking a shorthaul or backhaul interface in the navigation tree and clicking Performance History. The MWTM client interface provides access to RAN-O real-time performance statistics that you can use to troubleshoot problems that occur in real time. The zoom and navigation features quickly enable isolating and focusing on a problem area.

### Note

If the CISCO-IP-RAN-BACKHAUL-MIB on the node is not compliant with the MWTM, the MWTM issues the message:

MIB not compliant for reports

Install a version of IOS software on the node that is compatible with the MWTM. For a list of compatible IOS software, from the MWTM:

- Web interface, choose **Administrative > IPRAN OS README**.
- Client interface, choose **View > MWTM Web Links > Administrative**; then click **IPRAN OS README**.

The Performance tab shows one or more graphs depending on the type of report chosen. These graphs depict send and receive rates of optimized IP traffic over a specified time range. The graphs display the traffic in bits per second. Each data series shows maximum, minimum, and average rates of optimized traffic.

The Performance tab for a backhaul interface shows total rates for GSM and UMTS traffic, including total error rates.

This section provides information about:

- [Displaying Shorthaul Performance Statistics, page 11-29](#)
- [Displaying Backhaul Performance Statistics, page 11-29](#)

## Displaying Shorthaul Performance Statistics

The Shorthaul Performance tab for a shorthaul interface shows the maximum, minimum, and average rates for send and receive traffic.

The Shorthaul Performance tab for a shorthaul interface contains:

| GUI Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Toolbar</i>        | Provides functions to select a report type, duration, output type. See <a href="#">Using the Toolbar, page 11-6</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Type                  | A comprehensive summary of minimum, average, and maximum capacity statistics for send and receive traffic on a RAN shorthaul. You can choose from 15-minute, hourly, or daily capacity summary reports, or choose a custom range.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>Table</i>          | <p>If you select the Output Type Table, the table contains:</p> <ul style="list-style-type: none"> <li>• Data Type—Type of data, send or receive</li> <li>• Average—Average of the data across the chosen time range</li> <li>• Minimum—Minimum value across the chosen time range</li> <li>• Minimum Timestamp EDT—Time the minimum value occurred</li> <li>• Maximum—Maximum value across the chosen time range</li> <li>• Maximum Timestamp EDT—Time the maximum value occurred</li> </ul> <p><b>Note</b> If the Output Type is Table or CSV, the same data is presented but the column headings are labeled by data type (for example, Send Average and Receive Average).</p> |
| Expand to Full Screen | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Bits/Sec or Bytes/Sec | <p>If Output Type is Graph, Y-axis label that shows traffic rate in bits per second. The Y axis automatically scales to the interface speed.</p> <p><b>Note</b> If no data exists between any two data points, the graph displays a color-coded vertical bar to show the period for which no data is available.</p>                                                                                                                                                                                                                                                                                                                                                               |
| Time                  | If Output Type is Graph, X-axis label that shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>Legend</i>         | If Output Type is Graph, color-coded legend that shows labels for traffic rates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Displaying Backhaul Performance Statistics

The Performance tab for a backhaul interface shows minimum, average, and maximum traffic rates for send and receive traffic. You can also determine the percentage of backhaul utilization that various traffic types occupy. Error rates appear, too.

The Performance tab for a backhaul interface contains:

| GUI Elements     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <i>Toolbar</i>   | Provides functions to select a report type, duration, output type, and the Graph Series Editor. See the <a href="#">“Using the Toolbar” section on page 11-6</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Type             | <p>Report Type. If you choose a Capacity Summary report, the report shows a comprehensive summary of minimum, average, and maximum capacity statistics for total traffic (GSM-Abis and UMTS-Iub), total GSM-Abis traffic, and total UMTS-Iub traffic. You can choose from 15-minute, hourly, or daily capacity summary reports. Error rates appear, too.</p> <p>If Output Type is Graph, statistics appear in these graphs:</p> <ul style="list-style-type: none"> <li>• Top—Capacity statistics for send traffic rates, including percentage of backhaul utilization (right side of graph).</li> <li>• Middle—Capacity statistics for receive traffic rates, including percentage of backhaul utilization (right side of graph).</li> <li>• Bottom—Error counts for send and receive traffic.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Type (continued) | <p>If you choose a Minimum, Average, or Maximum Capacity report, the tables and graphs show capacity statistics for the backhaul interface. You can choose from 15-minute, hourly, or daily capacity reports.</p> <p>If Output Type is Graph, send and receive rate statistics appear in separate panes. Each pane shows two fully expandable graphs:</p> <ul style="list-style-type: none"> <li>• Top—Shows total (GSM-Abis and UMTS-Iub), total GSM-Abis, and total UMTS-Iub traffic rates, including percentage of backhaul utilization (right side of graph).</li> <li>• Bottom—Shows traffic rates for each shorthaul interface that belongs to the backhaul.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>Table</i>     | <p><b>Note</b> Different tables appear depending on the report Type and Output Type selections.</p> <p>If the Output Type is Graph, a table appears with these columns:</p> <ul style="list-style-type: none"> <li>• Data Type—Type of data, send or received</li> <li>• Average—Average of the data across the chosen time range</li> <li>• Minimum—Minimum value across the chosen time range</li> <li>• Minimum Timestamp EDT—Time the minimum value occurred</li> <li>• Maximum—Maximum value across the chosen time range</li> <li>• Maximum Timestamp EDT—Time the maximum value occurred</li> </ul> <p><b>Note</b> If the Output Type is Table or CSV, similar data is presented but the column headings may vary. Also, if the value is N/A, that means no data is available.</p> <p>Another table has these columns:</p> <ul style="list-style-type: none"> <li>• Data Type—Category of error for which statistics are gathered. Types include optimization, missed packets, and miscellaneous errors.</li> <li>• Total Counts—Total error count for each type of error.</li> <li>• Avg. Error Rate (Per Sec)—The calculated average error rate per second for each error type over the duration of the data range that you chose.</li> </ul> <p><b>Note</b> You can sort the contents of the columns in ascending or descending order by clicking the column heading.</p> |

| GUI Elements          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expand to Full Screen | If Output Type is Graph, text link that shows a graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Bits/Sec or Bytes/Sec | <p>If Output Type is Graph, primary Y-axis label (left side of graph) that shows traffic rate in bits per second. The Y axis automatically scales to the User Bandwidth.</p> <p>If no data exists between any two data points, the graph displays a color-coded vertical bar to show the period for which no data is available.</p>                                                                                                                                                                                                                                                                                                                                                                                        |
| % Utilization         | <p>If Output Type is Graph, secondary Y-axis label (right side of graph) that shows the backhaul utilization as a percentage of the User Bandwidth. The graph background has horizontal bars that are color-coded to indicate these thresholds:</p> <ul style="list-style-type: none"> <li>Overloaded—Top portion of graph.</li> <li>Warning—Middle portion of graph.</li> <li>Acceptable—Bottom portion of graph.</li> </ul> <p>For definitions of these thresholds, see the “<a href="#">Threshold Information (RAN-O Only)</a>” section on page 8-38.</p> <p><b>Note</b> If the % Utilization exceeds 100%, see <a href="#">Why does my backhaul graph show greater than 100% for transmit traffic?</a>, page C-25.</p> |
| Time                  | X-axis label that shows a user-specified, historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Legend                | Color-coded legend that shows labels for traffic and error rates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Displaying Error Statistics

You can view error data for a shorthaul or backhaul interface in the MWTM:

- Web interface by selecting an interface in the navigation tree and clicking the Shorthaul Errors or Errors tab in the content area.
- Client by right-clicking an interface in the navigation tree and clicking **Error History**.

### Note

If the CISCO-IP-RAN-BACKHAUL-MIB on the node is not compliant with the MWTM, the MWTM issues the message:

```
MIB not compliant for reports
```

Install a version of IOS software on the node that is compatible with the MWTM. For a list of compatible IOS software, from the MWTM:

- Web interface, choose **Administrative > IP-RAN OS README**.
- Client interface, choose **View > MWTM Web Links > Administrative**; then click **IP-RAN OS README**.

You view error data for a shorthaul or backhaul interface by selecting the interface in the navigation tree and clicking the Errors tab in the content area. The Errors tab shows total error counts and average error rates in table and graph format.

This section provides information about:

- [Displaying Shorthaul Error Statistics, page 11-32](#)
- [Displaying Backhaul Error Statistics, page 11-33](#)

## Displaying Shorthaul Error Statistics

The Shorthaul Errors tab for a shorthaul interface shows a single table and a graph that shows the error rates and counts for different types of GSM-Abis and UMTS-Iub errors.

The Shorthaul Errors tab for a shorthaul interface contains:

| GUI Elements          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Toolbar</i>        | Provides functions to select report type, duration, and output type. See the <a href="#">“Using the Toolbar” section on page 11-6</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Type                  | <p>Report Type. If you choose an Error Summary report, the table and graph display a comprehensive summary of total error counts and average error rates for protocol, missed-packet, and miscellaneous errors for the chosen shorthaul. You can choose from 15-minute, hourly, or daily error summary reports. Statistics appear in table and graph format.</p> <p>If you choose an error report that is not a summary report, the table and graph displays protocol, missed packet, or miscellaneous errors for the shorthaul interface. You can choose from 15-minute, hourly, or daily error reports. Statistics appear in table and graph format.</p> <p>For definitions of these error types, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Protocol Failures, page 8-112</a></li> <li>• <a href="#">Miscellaneous, page 8-113</a></li> <li>• <a href="#">Missed Packets, page 8-114</a></li> </ul>                                                                                                                                                                                                                                                                                                                             |
| <i>Table</i>          | <p><b>Note</b> Different tables and column headings appear depending on the report Type and Output Type selections.</p> <p>If Output Type is Graph, a table appears with these columns:</p> <ul style="list-style-type: none"> <li>• Data Type—Category of error for which statistics are gathered. Types include protocol, missed packets, and miscellaneous errors.</li> <li>• Total Counts—Total error count for each type of error.</li> <li>• Avg. Error Rate (Per Sec)—The calculated average error rate per second for each error type over the duration of the data range that you chose.</li> </ul> <p><b>Note</b> If the value is N/A, that means no data is available.</p> <p>Depending on the report Type selection, if the Output Type is Table or CSV, a table appears with multiple columns showing various error types and their counts. For definitions of these error types, see the:</p> <ul style="list-style-type: none"> <li>• <a href="#">Protocol Failures, page 8-112</a></li> <li>• <a href="#">Miscellaneous, page 8-113</a></li> <li>• <a href="#">Missed Packets, page 8-114</a></li> </ul> <p><b>Note</b> You can sort the contents of the columns in ascending or descending order by clicking the column heading.</p> |
| Expand to Full Screen | If Output Type is Graph, this text link displays a graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Error Counts          | <p>If Output Type is Graph, Y-axis label on left side of graph that shows traffic rate in bits per second.</p> <p><b>Note</b> If no data exists between any two data points, the graph displays a color-coded vertical bar to show the period for which no data is available.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| GUI Elements | Description                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------|
| Time         | If Output Type is Graph, X-axis label that shows a user-specified, historical time scale and the server time zone. |
| Legend       | If Output Type is Graph, color-coded legend that shows labels for traffic and error rates.                         |

## Displaying Backhaul Error Statistics

The Errors tab for a RAN backhaul interface shows a single table and a graph that shows the error rates and counts for different interfaces belonging to the backhaul.

The Errors tab for a backhaul interface contains:

| GUI Elements          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Toolbar               | Provides functions to select a report type, duration, output type, and the Graph Series Editor. See the <a href="#">“Using the Toolbar” section on page 11-6</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Table                 | <p><b>Note</b> Different tables and column headings appear depending on the report Type and Output Type selections.</p> <p>If Output Type is Graph, a table appears with these columns:</p> <ul style="list-style-type: none"> <li>• Data Type—Category of error for which statistics are gathered. Types include optimization, missed packets, and miscellaneous errors.</li> <li>• Total Counts—Total error count for each type of error.</li> <li>• Avg. Error Rate (Per Sec)—The calculated average error rate per second for each error type over the duration of the data range that you chose.</li> </ul> <p><b>Note</b> If the value is N/A, that means no data is available.</p> <p>If Output Type is Table, a table appears with columns for total error counts for various error types (for example, total GSM-Abis errors).</p> <p><b>Note</b> You can sort the contents of the columns in ascending or descending order by clicking the column heading.</p> |
| Expand to Full Screen | If Output Type is Graph, text link that shows a graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Error Counts          | If Output Type is Graph, Y-axis label on left side of graph that shows traffic rate in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Time                  | If Output Type is Graph, X-axis label that shows a user-specified, historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Legend                | If Output Type is Graph, color-coded legend that shows labels for traffic and error rates (for example, Total Errors UMTS-Iub).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Generating RAN Data Export Files

You can easily generate historical reports for RAN backhauls and shorthauls in the web interface. You can then export this data to a report with comma-separated values (CSV file). You can save this file to disk or open it with an application that you choose (for example, Microsoft Excel).

To export RAN data:

- 
- Step 1** Select a RAN backhaul or shorthaul in the navigation tree of the web interface.
- Step 2** Click the Performance or Errors tab in the right pane.
- Step 3** Generate a report.
- Step 4** Click the Export the report as a CSV file icon  .
- 

## Displaying CSG2 Real-Time Statistics

The MWTM enables you to display real-time statistics for CSG2 nodes in the MWTM web interface. To display real-time statistics, select the node in the navigation tree and click the Statistics tab. The following options appear under the Type drop-down menu:

- [Global Statistics, page 11-34](#)
- [CSG2 Protocol, page 11-40](#)
- [Gx Global Statistics, page 11-41](#)
- [Gx Policy Preload, page 11-43](#)
- [Gx Policy Preload Ext, page 11-44](#)
- [Gx PCRF Method List Message, page 11-46](#)
- [Gx PCRF Method List Message Error, page 11-47](#)

## Global Statistics

### Note

---

For toolbar details, see [Using the Toolbar, page 11-6](#).

---

To view the Global Statistics table, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [Global Statistics, page 11-35](#)
- [Load Statistics, page 11-35](#)
- [BMA Statistics, page 11-38](#)
- [Quota Server Statistics, page 11-39](#)
- [User Database Statistics, page 11-40](#)

## Global Statistics

The Global Statistics pane contains:

| Field                                                                                                             | Description                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| User Current                                                                                                      | The total number of users with one or more active sessions on the system.                                                                        |
| Session Current                                                                                                   | The total number of sessions on the system. A session corresponds to a transmission control protocol (TCP) or user datagram protocol (UDP) flow. |
| User High Water                                                                                                   | The highest number of active users reported by the User Current field since its last reset.                                                      |
| Session High Water                                                                                                | The highest number of active sessions reported by the Session Current field since its last reset.                                                |
| User License                                                                                                      |                                                                                                                                                  |
| <i>The following statistics are available only on CSG2, Release 2, for devices running IOS 12.4(15) or later.</i> |                                                                                                                                                  |
| GTP BMA Rejected                                                                                                  | Number of messages received from all the Billing Mediation Agents (BMAs) with reject cause code.                                                 |
| GTP BMA Dropped                                                                                                   | Total Number of messages dropped destined for any of the BMAs                                                                                    |
| GTP BMA Retransmit                                                                                                | Number of messages retransmitted to all BMAs.                                                                                                    |
| GTP QuotaMgr Rejected                                                                                             | Number of messages received from all the Quota Managers with reject cause code.                                                                  |
| GTP QuotaMgr Dropped                                                                                              | Total Number of messages dropped destined for any of the Quota Managers.                                                                         |
| GTP QuotaMgr Retransmit                                                                                           | Number of messages retransmitted to all the Quota Managers.                                                                                      |

## Load Statistics

Load statistics are available only on CSG2, Release 2, for devices running IOS 12.4(15) or later.

The Load Statistics pane contains:

|                 |        | Description                                                                                                                                                                                                                                             |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Statistics Type | Column | Defines the type of statistics for each row: <ul style="list-style-type: none"> <li>• Radius Start Requests</li> <li>• Session Create Requests</li> <li>• BMA Messages</li> <li>• Messages to Quota Server</li> <li>• User Database Requests</li> </ul> |

|                          |                           | Description                                                                                     |
|--------------------------|---------------------------|-------------------------------------------------------------------------------------------------|
| Radius Start Requests    | Allowed                   | Number of outgoing Radius Start requests allowed.                                               |
|                          | Allowed Rate              | Number of outgoing Radius Start requests allowed per second.                                    |
|                          | Allowed Rate High Water   | The highest number of outgoing Radius Start requests allowed per second.                        |
|                          | IPC Queue Depth Tolerance | Maximum queue depth for Radius Start requests in the (Inter Processor Communication) IPC queue. |
|                          | Denied                    | Number of outgoing Radius Start requests denied.                                                |
|                          | Denial Rate               | Number of outgoing Radius Start requests denied per second.                                     |
|                          | Denial Rate High Water    | The highest number of outgoing Radius Start requests denied per second.                         |
| Session Create Requests  | Allowed                   | Number of outgoing Session Create Requests allowed.                                             |
|                          | Allowed Rate              | Number of outgoing Session Create Requests allowed per second.                                  |
|                          | Allowed Rate High Water   | The highest number of outgoing Session Create Requests allowed per second.                      |
|                          | IPC Queue Depth Tolerance | Maximum queue depth for Session Create Requests in the IPC queue.                               |
|                          | Denied                    | Number of outgoing Session Create Requests denied.                                              |
|                          | Denial Rate               | Number of outgoing Session Create Requests denied per second.                                   |
|                          | Denial Rate High Water    | The highest number of outgoing Session Create Requests denied per second.                       |
| BMA Messages             | Allowed                   | Number of outgoing BMA messages allowed.                                                        |
|                          | Allowed Rate              | Number of outgoing BMA messages allowed per second.                                             |
|                          | Allowed Rate High Water   | The highest number of outgoing BMA messages allowed per second.                                 |
|                          | IPC Queue Depth Tolerance | Maximum queue depth for BMA messages in the IPC queue.                                          |
|                          | Denied                    | Number of outgoing BMA messages denied.                                                         |
|                          | Denial Rate               | Number of outgoing BMA messages denied per second.                                              |
|                          | Denial Rate High Water    | The highest number of outgoing BMA messages denied per second.                                  |
| Messages to Quota Server | Allowed                   | Number of outgoing messages to Quota Manager allowed.                                           |
|                          | Allowed Rate              | Number of outgoing messages to Quota Manager allowed per second.                                |
|                          | Allowed Rate High Water   | The highest number of outgoing messages to Quota Manager allowed per second.                    |
|                          | IPC Queue Depth Tolerance | Maximum queue depth for messages to Quota Manager in the IPC queue.                             |
|                          | Denied                    | Number of outgoing messages to Quota Manager denied.                                            |
|                          | Denial Rate               | Number of outgoing messages to Quota Manager denied per second.                                 |
|                          | Denial Rate High Water    | The highest number of outgoing messages to Quota Manager denied per second.                     |

|                        |                           | Description                                                               |
|------------------------|---------------------------|---------------------------------------------------------------------------|
| User Database Requests | Allowed                   | Number of outgoing User Database requests allowed.                        |
|                        | Allowed Rate              | Number of outgoing User Database requests allowed per second.             |
|                        | Allowed Rate High Water   | The highest number of outgoing User Database requests allowed per second. |
|                        | IPC Queue Depth Tolerance | Maximum queue depth for User Database requests in the IPC queue.          |
|                        | Denied                    | Number of outgoing User Database requests denied.                         |
|                        | Denial Rate               | Number of outgoing User Database requests denied per second.              |
|                        | Denial Rate High Water    | The highest number of outgoing User Database requests denied per second.  |

## BMA Statistics

The Billing Mediation Agent (BMA) Statistics pane contains:

| Column                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server                 | Name of the BMA server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Port                   | The UDP port of the BMA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| VRF Name               | Name of the virtual routing and forwarding (VRF) over which communication with BMA occurs. If no VRF is specified, the global routing table is used.                                                                                                                                                                                                                                                                                                                                                                                                         |
| State                  | The state of the BMA. Possible states include: <ul style="list-style-type: none"> <li>Standby—The server is prepared to become active.</li> <li>Failed—The server has failed to respond to requests.</li> <li>Active—The server has been activated to receive requests.</li> <li>Echowait—An echo request to this billing mediation agent is waiting for a response.</li> <li>Nawait—A node-alive request to this billing mediation agent is waiting for a response.</li> <li>Suspended—The server has received a stop request from the operator.</li> </ul> |
| Lost Records           | Total number of lost records since system initialization or the last time the counter wrapped.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Total Sent             | Total number of records sent to the billing mediation agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Failed Acks            | Number of acknowledgments received from the billing mediation agent for which there are no outstanding requests.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Outstanding            | Current number of messages waiting to be acknowledged. An arrow icon indicates the trend (up or down) since the last poll.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Outstanding High Water | The highest number of messages waiting for acknowledgements as reported by the Outstanding field since its last reset.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Bad Records            | Number of bad records received. These are records in which an error was detected while attempting to decode the contents.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Retransmits            | Number of messages retransmitted to the billing mediation agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Sent Rate              | Rate at which records are sent to the billing mediation agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

*The following statistics are available only on CSG2, Release 2, for devices running IOS 12.4(15) or later.*

| Column        | Description                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------|
| Rate Interval | The duration of time interval in Packet Rate and Ack Rate.                                                          |
| Packet Rate   | Number of packets sent to the BMA per second calculated over the interval indicated by Rate Interval.               |
| Ack Rate      | Number of acknowledgments received from the BMA per second calculated over the interval indicated by Rate Interval. |

## Quota Server Statistics

The Quota Server Statistics pane contains:

| Column                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server                 | Name of the quota server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Port                   | The UDP port of the quota server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| VRF Name               | Name of the Virtual Routing and Forwarding (VRF) over which communication with the quota server occurs. If no VRF is specified, the global routing table is used.                                                                                                                                                                                                                                                                                                                                                                                                              |
| State                  | The state of the quota manager. Possible states include: <ul style="list-style-type: none"> <li>Standby—The quota manager is prepared to become active.</li> <li>Failed—The quota manager has failed to respond to requests.</li> <li>Active—The quota manager has been activated to receive requests.</li> <li>Echowait—An echo request to this quota manager is waiting for a response.</li> <li>Nawait—A node-alive request to this quota manager is waiting for a response.</li> <li>Suspended—The quota manager has received a stop request from the operator.</li> </ul> |
| Lost Records           | Total number of lost records since system initialization or the last time the counter wrapped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Total Sent             | Total number of records sent to the quota server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Failed Acks            | Number of acknowledgments received from the quota server for which there are no outstanding requests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Outstanding            | Current number of messages waiting to be acknowledged. An arrow icon indicates the trend (up or down) since the last poll.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Outstanding High Water | The highest number of messages waiting for acknowledgements as reported by the Outstanding field since its last reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Bad Records            | Number of bad records received. These are records in which an error was detected while attempting to decode the contents.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Retransmits            | Number of messages retransmitted to the quota manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Sent Rate              | Rate at which records are sent to the quota server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

*The following statistics are available only on CSG2, Release 2, for devices running IOS 12.4(15) or later.*

|               |                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| Rate Interval | The duration of time interval in Packet Rate and Ack Rate.                                                                    |
| Packet Rate   | Number of packets sent to the Quota Manager per second calculated over the interval indicated by Rate Interval.               |
| Ack Rate      | Number of acknowledgments received from the Quota Manager per second calculated over the interval indicated by Rate Interval. |

## User Database Statistics

The user database is a service that translates a client IP address into a user identifier. The User Database Statistics pane contains:

| Column                         | Description                                                                                                                                                                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server                         | Name of the user database server.                                                                                                                                                                                                                  |
| Port                           | The listening UDP port of the server.                                                                                                                                                                                                              |
| VRF Name                       | Name of the VRF over which communication with user data server occurs. If no VRF is specified, the global routing table is used.                                                                                                                   |
| State                          | State of the user database. Possible values include:<br>Reset—State before the database is determined to be active.<br>Active—The database is available and processing requests.<br>Failed—The database has failed and is not processing requests. |
| Requests                       | Number of user database requests.                                                                                                                                                                                                                  |
| User Identifiers Returned      | Number of user identifiers returned.                                                                                                                                                                                                               |
| Requests Resent                | Number of user database requests resent.                                                                                                                                                                                                           |
| Request Timeouts               | Number of user database requests that have timed out.                                                                                                                                                                                              |
| Request Errors                 | Number of errors returned on user database requests.                                                                                                                                                                                               |
| Requests Rate                  | Rate of user database requests.                                                                                                                                                                                                                    |
| User Identifiers Returned Rate | Rate at which user identifiers are returned.                                                                                                                                                                                                       |

## CSG2 Protocol

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the CSG2 Protocol statistics, choose this option from the Type drop-down menu. The GUI displays:

| Column                  | Description                                                                                                                                                                                                                                                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inspection Method       | Type of inspection method used to identify the protocol.                                                                                                                                                                                                                    |
| Protocol                | Protocol name used in the configuration of the entity which provides the content services.                                                                                                                                                                                  |
| Transactions            | <ul style="list-style-type: none"> <li>Count—Total number of transactions occurred in the network.</li> <li>Rate—Number of transactions occurred in the network per second.</li> <li>Peak—The highest number of transactions occurred in the network per second.</li> </ul> |
| Subscriber Send Packets | <ul style="list-style-type: none"> <li>Count—Total number of outgoing subscriber packets.</li> <li>Rate—Number of outgoing subscriber packets per second.</li> <li>Peak—The highest number of outgoing subscriber packets per second.</li> </ul>                            |

| Column               | Description                                                                                                                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subscriber Send Bits | <ul style="list-style-type: none"> <li>Count—Total number of outgoing subscriber bits.</li> <li>Rate—Number of outgoing subscriber bits per second.</li> <li>Peak—The highest number of outgoing subscriber bits per second.</li> </ul> |
| Network Send Packets | <ul style="list-style-type: none"> <li>Count—Total number of outgoing network packets.</li> <li>Rate—Number of outgoing network packets per second.</li> <li>Peak—The highest number of outgoing network packets per second.</li> </ul> |
| Network Send Bits    | <ul style="list-style-type: none"> <li>Count—Total number of outgoing network bits.</li> <li>Rate—Number of outgoing network bits per second.</li> <li>Peak—The highest number of outgoing network bits per second.</li> </ul>          |

## Gx Global Statistics

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Gx Global statistics, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [Global Message Statistics, page 11-41](#)
- [Global Message Error Statistics, page 11-42](#)

## Global Message Statistics

The Global Message Statistics pane contains:

| Column                                            | Description                                     |
|---------------------------------------------------|-------------------------------------------------|
| Active Sessions                                   | Total number of active sessions.                |
| Credit Control Request Initial Messages Sent      | Total number of CCR-Initial messages sent.      |
| Credit Control Request Initial Messages Sent Rate | Rate at which CCR-Initial messages are sent.    |
| Credit Control Request Update Messages Sent       | Total number of CCR-Update messages sent.       |
| Credit Control Request Update Messages Sent Rate  | Rate at which the CCR-Update messages are sent. |
| Credit Control Request Final Messages Sent        | Total number of CCR-Final messages sent.        |

| Column                                          | Description                                    |
|-------------------------------------------------|------------------------------------------------|
| Credit Control Request Final Messages Sent Rate | Rate at which the CCR-Final messages are sent. |
| Credit Control Answer Messages Received         | Total number of CCA messages received.         |
| Credit Control Answer Messages Received Rate    | Rate at which the CCA messages are received.   |
| Reauthorization Request Messages Received       | Total number of RAR messages received.         |
| Reauthorization Request Messages Received Rate  | Rate at which the RAR messages are sent.       |
| Reauthorization Answer Messages Sent            | Total number of RAA messages sent.             |
| Reauthorization Answer Messages Sent Rate       | Rate at which the RAA messages are sent.       |

## Global Message Error Statistics

The Global Message Error Statistics pane contains:

| Column                           | Description                                     |
|----------------------------------|-------------------------------------------------|
| Credit Control Response Failures | Number of failures to send CCR.                 |
| Invalid Message Type Errors      | Total number of invalid message type errors.    |
| Duplicate Request Errors         | Total number of duplicate request type errors.  |
| Credit Control Answer Errors     | Total number of errors occurred in CCA.         |
| Reauthorization Answer Failures  | Number of failures to send RAA.                 |
| Reauthorization Response Errors  | Total number of errors occurred in RAR.         |
| Invalid Request Type Errors      | Number of errors due to invalid request type.   |
| Invalid Request Number Errors    | Number of errors due to invalid request number. |

| Column                        | Description                                                                                                                                |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Invalid Request Status Errors | Number of errors due to invalid request status.                                                                                            |
| Invalid Session ID Errors     | Number of times the session id received does not exist or when the session id associated with request is not the same as the one received. |

## Gx Policy Preload

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Gx Policy Preload statistics, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [Policy Preload Statistics, page 11-43](#)
- [Policy Preload Error Statistics, page 11-43](#)

## Policy Preload Statistics

The Policy Preload Statistics pane contains:

| Column                             | Description                                   |
|------------------------------------|-----------------------------------------------|
| PCEF Initiated Preloading          | Number of PCEF initiated preloading.          |
| PCRF Initiated Preloading          | Number of PCRF initiated preloading.          |
| Policy Preload Requests            | Number of Policy Preload requests.            |
| Policy Preload Responses           | Number of Policy Preload responses.           |
| Global Policy Push Count           | Number of Global Policy Push.                 |
| Global Policy Push Acknowledgement | Number of Global Policy Push Acknowledgement. |

## Policy Preload Error Statistics

The Policy Preload Error Statistics pane contains:

| Column                        | Description                                                             |
|-------------------------------|-------------------------------------------------------------------------|
| Preload Data Inconsistent     | Number of times the preload data is inconsistent.                       |
| Attribute Value Pairs Missing | Number of times the mandatory AVPs (Attribute Value Pairs) are missing. |

| Column                          | Description                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Wrong Order Failures            | Number of failures due to wrong order.                                                                                                     |
| Enforcement Failures            | Number of failures to enforce.                                                                                                             |
| Static configuration Conflicts  | Number of conflicts with static config.                                                                                                    |
| Credit Control Request Failures | Number of times failed to CCR (Credit Control Request).                                                                                    |
| Invalid Message Type Errors     | Number of invalid message type errors.                                                                                                     |
| Credit Control Answer Errors    | Total number of errors occurred in CCA (Credit Control Answer).                                                                            |
| Reauthorization Answer Failures | Number of times failed to send RAA (Re-Authorization Answer).                                                                              |
| Reauthorization Response Errors | Total number of errors occurred in RAR (Re-Authorization Request).                                                                         |
| Invalid Request Type Errors     | Number of invalid req-type errors.                                                                                                         |
| Invalid Request Number Errors   | Number of invalid req-num errors.                                                                                                          |
| Invalid Request Status Errors   | Number of invalid req-status errors.                                                                                                       |
| Invalid Session ID Errors       | Number of times the session id received does not exist or when the session id associated with request is not the same as the one received. |
| Preload Timeout Errors          | Number of times the preload timeout occurs.                                                                                                |

## Gx Policy Preload Ext

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Gx Policy Preload Ext statistics, choose this option from the Type drop-down menu. The GUI displays:

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete Failed   | <ul style="list-style-type: none"> <li>• Service Contents—Number of times deletion of service contents has failed during preload.</li> <li>• Accounting Policy Maps—Number of times deletion of accounting policy-maps has failed during preload.</li> <li>• Billing Services—Number of times deletion of billing services has failed during preload.</li> <li>• Content Policies—Number of times deletion of content policies has failed during preload.</li> <li>• Billing Plans—Number of times deletion of billing plans has failed during preload.</li> </ul>      |
| Deleted         | <ul style="list-style-type: none"> <li>• Service Contents—Number of service contents deleted during preload.</li> <li>• Accounting Policy Maps—Number of accounting policy-maps deleted during preload.</li> <li>• Billing Services—Number of billing services deleted during preload.</li> <li>• Content Policies—Number of content policies deleted during preload.</li> <li>• Billing Plans—Number of billing plans deleted during preload.</li> </ul>                                                                                                               |

| Credit Control Answer Messages Received      | <ul style="list-style-type: none"> <li>Count—Total number of CCA messages received.</li> <li>Rate—Rate at which the CCA messages are received.</li> </ul>       |

| Column                                    | Description                                                                                                                                           |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reauthorization Request Messages Received | <ul style="list-style-type: none"> <li>Count—Total number of RAR messages received.</li> <li>Rate—Rate at which the RAR messages are sent.</li> </ul> |
| Reauthorization Answer Messages Sent      | <ul style="list-style-type: none"> <li>Count—Total number of RAA messages sent.</li> <li>Rate—Rate at which the RAA messages are sent.</li> </ul>     |

## Gx PCRF Method List Message Error

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Gx PCRF Method List Message Error statistics, choose this option from the Type drop-down menu.

The GUI displays:

| Column                           | Description                                                                                                                                |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Method List Name                 | Method list name.                                                                                                                          |
| PCRF Reboots                     | Number of times PCRF reboots.                                                                                                              |
| Invalid Message Type Errors      | Total number of invalid message type errors.                                                                                               |
| Duplicate Request Errors         | Total number of duplicate request type errors.                                                                                             |
| Credit Control Response Failures | Number of failures to send CCR.                                                                                                            |
| Credit Control Answer Errors     | Total number of errors occurred in CCA.                                                                                                    |
| Reauthorization Answer Failures  | Number of failures to send RAA.                                                                                                            |
| Reauthorization Response Errors  | Total number of errors occurred in RAR.                                                                                                    |
| Invalid Request Type Errors      | Number of errors due to invalid request type.                                                                                              |
| Invalid Request Number Errors    | Number of errors due to invalid request number.                                                                                            |
| Invalid Request Status Errors    | Number of errors due to invalid request status.                                                                                            |
| Invalid Session ID Errors        | Number of times the session id received does not exist or when the session id associated with request is not the same as the one received. |

# Displaying BWG Real-Time Statistics

The MWTM enables you to display real-time statistics for Broadband Wireless Gateway (BWG) nodes in the MWTM web interface. To display BWG real-time statistics, select a BWG node in the navigation tree and click the Statistics tab. The following subtabs appear:

- [Global, page 11-48](#)
- [Paths, page 11-56](#)
- [User Groups, page 11-57](#)

## Global

The Global subtab shows global statistics for BWG nodes and contains:

- [Status, page 11-48](#)
- [Creation and Deletion Statistics, page 11-49](#)
- [Miscellaneous Statistics, page 11-50](#)
- [Signaling Packet Statistics, page 11-51](#)
- [DHCP Packet Statistics, page 11-51](#)
- [Handoff Statistics, page 11-52](#)
- [Data Packet Statistics, page 11-53](#)
- [Dropped Packet Statistics, page 11-54](#)
- [Profile Statistics, page 11-55](#)
- [Rejected Statistics, page 11-56](#)

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Status

The Status pane shows:

| Field                     | Description                                                  |
|---------------------------|--------------------------------------------------------------|
| Version                   | Software version of the BWG.                                 |
| Description               | Description of the physical instance of the BWG.             |
| Operational Status        | Current operational state of the BWG.                        |
| Session Redundancy Status | Indicates whether session redundancy is enabled or disabled. |

## Creation and Deletion Statistics

The Creation and Deletion Statistics pane shows:

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Base Stations | <ul style="list-style-type: none"> <li>• Maximum—Maximum number of base stations that can be concurrently supported by this BWG.</li> <li>• Current—Current number of signaling paths to all base stations. One signaling path is created between the BWG and each base station, so the current number of signaling paths is equal to the number of base stations currently connected to the BWG.</li> <li>• Created Count—Total number of signaling paths created on this BWG which include active and past signaling paths.</li> <li>• Created Rate—Rate at which signaling paths are created.</li> <li>• Deleted Count—Total number of signaling paths deleted on this BWG.</li> <li>• Deleted Rate—Rate at which signaling paths are deleted.</li> </ul> |
| Data Paths    | <ul style="list-style-type: none"> <li>• Maximum—N/A</li> <li>• Current—Current number of data paths to all base stations.</li> <li>• Created Count—Total number of data paths created on this BWG which include active and past data paths.</li> <li>• Created Rate—Rate at which data paths are created.</li> <li>• Deleted Count—Total number of data paths deleted on this BWG.</li> <li>• Deleted Rate—Rate at which data paths are deleted.</li> </ul>                                                                                                                                                                                                                                                                                                 |

## Miscellaneous Statistics

The Miscellaneous Statistics pane shows:

| Field                           | Description                                                                                                                                                                 |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Framed Routes                   | Indicates the current number of unique framed routes downloaded from AAA and inserted into the IP routing table on a gateway.                                               |
| Framed Router Subscribers       | Indicates the number of subscribers using framed routes.                                                                                                                    |
| Auto-Provisioned Sessions       | Indicates the number of auto-provisioned sessions on gateway.                                                                                                               |
| Redirected Sessions             | Indicates the number of sessions with all uplink IP packets redirected by the gateway.                                                                                      |
| Networks Behind Mobile Stations | Indicates the number of networks behind mobile stations.                                                                                                                    |
| Aged Out Hosts                  | <ul style="list-style-type: none"> <li>• Count—Indicates the number of idle static hosts aged out.</li> <li>• Rate—Rate at which idle static hosts are aged out.</li> </ul> |

## Signaling Packet Statistics

The Signaling Packet Statistics pane shows:

| Field                      | Description                                                                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pending                    | <ul style="list-style-type: none"> <li>Count—Total number of signaling packets currently pending on this BWG</li> </ul>                                                                                                                     |
| Processed                  | <ul style="list-style-type: none"> <li>Count—Total number of signaling packets processed by this BWG.</li> <li>Rate—Rate at which signaling packets are processed.</li> </ul>                                                               |
| Requeued                   | <ul style="list-style-type: none"> <li>Count—Total number of signaling packets that were requeued on this BWG.</li> <li>Rate—Rate at which signaling packets are requeued.</li> </ul>                                                       |
| Congestion Drops           | <ul style="list-style-type: none"> <li>Count—Number of signaling packets dropped when too many signaling packets are queued. The current queue limit is 1000 packets.</li> <li>Rate—Rate at which signaling packets are dropped.</li> </ul> |
| Service Disabled Drops     | <ul style="list-style-type: none"> <li>Count—Number of signaling packets dropped due to disabled service.</li> <li>Rate—Rate at which signaling packets are dropped.</li> </ul>                                                             |
| Service Not Ready Drops    | <ul style="list-style-type: none"> <li>Count—Number of signaling packets dropped while in non-active state for redundant configuration.</li> <li>Rate—Rate at which signaling packets are dropped.</li> </ul>                               |
| Encapsulation Errors Drops | <ul style="list-style-type: none"> <li>Count—Number of signaling packets dropped due to encapsulation errors.</li> <li>Rate—Rate at which signaling packets are dropped.</li> </ul>                                                         |
| Disposed Drops             | <ul style="list-style-type: none"> <li>Count—Number of signaling packets disposed by the BWG.</li> <li>Rate—Rate at which signaling packets are disposed.</li> </ul>                                                                        |

## DHCP Packet Statistics

The DHCP Packet Statistics pane shows:

| Field    | Description                                                                                                                                                                   |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Discover | <ul style="list-style-type: none"> <li>Count—Number of DHCP discover packets.</li> <li>Rate—Rate at which DHCP packets are discovered.</li> </ul>                             |

| Rejected Session Flows           | <ul style="list-style-type: none"> <li>Count—Number of flows that were rejected due to exceeding the maximum number of flows allowed per session.</li> <li>Rate—Rate at which flows were rejected due to exceeding the maximum number of flows allowed per session.</li> </ul>                                      |
| Session Deleted by the Gateway   | <ul style="list-style-type: none"> <li>Count—Number of sessions deleted by the BWG.</li> <li>Rate—Rate at which sessions were deleted by the BWG.</li> </ul>                                                                                                                                                        |
| Rejected Hosts Open Requests     | <ul style="list-style-type: none"> <li>Count—Number of <i>hosts open</i> requests rejected.</li> <li>Rate—Rate at which <i>hosts open</i> requests are rejected.</li> </ul>                                                                                                                                         |

## Paths

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

The Paths subtab shows information and statistics about each base station and contains:

| Column            | Description                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote IP Address | Path IP address at the base station side.                                                                                                               |
| Local IP Address  | Path IP address at the BWG side.                                                                                                                        |
| Type              | Path type, can be signaling or data.                                                                                                                    |
| Sessions          | Number of sessions over the path.                                                                                                                       |
| Flows             | Number of flows over the path.                                                                                                                          |
| Sent IP Packets   | <ul style="list-style-type: none"> <li>Count—Total number of IP packets sent over the path.</li> <li>Rate—Rate at which IP packets are sent.</li> </ul> |

| Column                    | Description                                                                                                                                                                 |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sent IP Bits              | <ul style="list-style-type: none"> <li>Count—Total number of IP bits sent over the path.</li> <li>Rate—Rate at which IP bits are sent.</li> </ul>                           |
| Received IP Packets       | <ul style="list-style-type: none"> <li>Count—Total number of IP packets received over the path.</li> <li>Rate—Rate at which IP packets are received.</li> </ul>             |
| Received IP Bits          | <ul style="list-style-type: none"> <li>Count—Total number of IP bits received over the path.</li> <li>Rate—Rate at which IP bits are received.</li> </ul>                   |
| Sent Ethernet Packets     | <ul style="list-style-type: none"> <li>Count—Total number of Ethernet packets sent over the path.</li> <li>Rate—Rate at which Ethernet packets are sent.</li> </ul>         |
| Sent Ethernet Bits        | <ul style="list-style-type: none"> <li>Count—Total number of Ethernet bits sent over the path.</li> <li>Rate—Rate at which Ethernet bits are sent.</li> </ul>               |
| Received Ethernet Packets | <ul style="list-style-type: none"> <li>Count—Total number of Ethernet packets received over the path.</li> <li>Rate—Rate at which Ethernet packets are received.</li> </ul> |
| Received Ethernet Bits    | <ul style="list-style-type: none"> <li>Count—Total number of Ethernet bits received over the path.</li> <li>Rate—Rate at which Ethernet bits are received.</li> </ul>       |

## User Groups

The User Groups subtab shows information and statistics for user groups and contains:

- [Sessions and Flow Statistics, page 11-57](#)
- [Traffic Statistics, page 11-58](#)

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Sessions and Flow Statistics

The Sessions and Flow Statistics pane shows:

| Column                | Description                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                  | Domain name identifying a user group.                                                                                                                      |
| Service Mode          | User group service mode.                                                                                                                                   |
| Current Session Count | Total number of active sessions per user group.                                                                                                            |
| Current Flows Count   | Total number of active flows per user group.                                                                                                               |
| Sessions Created      | <ul style="list-style-type: none"> <li>Count—Total number of sessions created per user group.</li> <li>Rate—Rate at which sessions are created.</li> </ul> |
| Sessions Deleted      | <ul style="list-style-type: none"> <li>Count—Total number of sessions deleted per user group.</li> <li>Rate—Rate at which sessions are deleted.</li> </ul> |

| Column           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flows Created    | <ul style="list-style-type: none"> <li>Count—Total number of flows created per user group.</li> <li>Rate—Rate at which flows are created.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| Flows Deleted    | <ul style="list-style-type: none"> <li>Count—Total number of flows deleted per user group.</li> <li>Rate—Rate at which flows are deleted.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| Group Overwrites | <ul style="list-style-type: none"> <li>Count—Number of times this user group has been overwritten by the user group received from the AAA server. Users can belong to a particular user group at the time of initial entry and the AAA server can recategorize the user under a different user group after successful authentication.</li> <li>Rate—Rate at which this user group has been overwritten by the user group received from the AAA server.</li> </ul> |

## Traffic Statistics

The Traffic Statistics pane shows:

| Column                    | Description                                                                                                                                                                 |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                      | Domain name identifying a user group.                                                                                                                                       |
| Service Mode              | User group service mode.                                                                                                                                                    |

| Invalid Source Bits       | <ul style="list-style-type: none"> <li>Count—Number of bits dropped due to invalid source address errors.</li> <li>Rate—Rate at which bits are dropped.</li> </ul>          |

# Displaying HA Real-Time Statistics

The MWTM enables you to display real-time statistics for Home Agent (HA) nodes in the MWTM web interface. To display HA real-time statistics, select a HA node in the navigation tree and click the Statistics tab. These subtabs appear:

- [Global, page 11-59](#)
- [IP Local Pool Config, page 11-61](#)
- [IP Local Pool Stats, page 11-61](#)

## Global

The Global subtab shows global statistics for HA nodes and contains:

- [Registrations Processed by AAA, page 11-59](#)
- [Registration Requests, page 11-60](#)
- [Standby Synchronization, page 11-60](#)

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Registrations Processed by AAA

The Registrations Processed by AAA pane shows:

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Processed in one minute | The maximum number of registration requests processed in a minute by the HA. It includes only those registration requests which were authenticated by the AAA server.                                                                                                                                                                                                                             |
| Average time to process (msecs) | The average time taken by the home agent to process a registration request. Calculations are based on only those registration requests that were authenticated by the AAA server.                                                                                                                                                                                                                 |
| Authenticated via AAA Server    | <ul style="list-style-type: none"> <li>• Count—The total number of registration requests processed by the home agent, including only those registration requests that were authenticated by the AAA server.</li> <li>• Rate—The total rate of registration requests processed by the home agent, including only those registration requests that were authenticated by the AAA server.</li> </ul> |

## Registration Requests

The Registration Requests pane shows:

| Field            | Description                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current Bindings | <ul style="list-style-type: none"> <li>Count—The current number of entries in the home agent's mobility binding list. The home agent updates this number in response to registration events from mobile nodes.</li> <li>Rate—The count can increment or decrease, resulting in a positive or negative rate.</li> </ul> |
| Initial Received | <ul style="list-style-type: none"> <li>Count—Total number of initial registration requests received by the HA.</li> <li>Rate—Rate at which initial registration requests are received by the HA.</li> </ul>                                                                                                            |
| Initial Denied   | <ul style="list-style-type: none"> <li>Count—Total number of initial registration requests denied by the HA.</li> <li>Rate—Rate at which initial registration requests are denied by the HA.</li> </ul>                                                                                                                |
| All Received     | <ul style="list-style-type: none"> <li>Count—Total number of all registration requests received by the HA.</li> <li>Rate—Rate at which all registration requests are received by the HA.</li> </ul>                                                                                                                    |
| All Denied       | <ul style="list-style-type: none"> <li>Count—Total number of all registration requests denied by the HA.</li> <li>Rate—Rate at which all registration requests are denied by the HA.</li> </ul>                                                                                                                        |

## Standby Synchronization

The Standby Synchronization pane shows:

| Field                          | Description                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Binding Updates Sent           | <ul style="list-style-type: none"> <li>Count—Total number of binding updates sent by the home agent to a standby home agent.</li> <li>Rate—Total rate of binding updates sent by the home agent to a standby home agent.</li> </ul>                                                                                           |
| Binding Updates Unacknowledged | <ul style="list-style-type: none"> <li>Count—Total number of binding updates sent by the home agent for which no acknowledgement is received from the standby home agent.</li> <li>Rate—Total rate of binding updates sent by the home agent for which no acknowledgement is received from the standby home agent.</li> </ul> |

## IP Local Pool Config

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

The IP Local Pool Config subtab shows IP addresses for HA nodes and contains:

| Column            | Description                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | Name that uniquely identifies an IP local pool. This name must be unique among all the local IP pools even when they belong to different pool groups.                                           |
| Addresses: Low    | This object specifies the first IP address of the range of IP addresses contained by this pool entry. This address must be less than or equal to the High address.                              |
| Addresses: High   | This object specifies the last IP address of the range of IP addresses mapped by this pool entry. If only a single address is being mapped, the value of this object is equal to the Low value. |
| Addresses: Free   | Number of IP addresses available for use in the range of IP addresses.                                                                                                                          |
| Addresses: In Use | Number of IP addresses being used in the range of IP addresses.                                                                                                                                 |
| Priority          | This object specifies the priority of the IP local pool. IP local pools will be used in assigning IP addresses in the order of priority.                                                        |

## IP Local Pool Stats

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

The IP Local Pool Stats subtab shows IP addresses and IP addresses in use for HA nodes and contains:

| Column                           | Description                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                             | Name that uniquely identifies an IP local pool. This name must be unique among all the local IP pools even when they belong to different pool groups.                            |
| Addresses: Free                  | Number of IP addresses available for use in this IP local pool.                                                                                                                  |
| Addresses: In Use                | Number of IP addresses being used in this IP local pool.                                                                                                                         |
| Addresses: Maximum In Use        | Contains the high water mark of used addresses in an IP local pool since pool creation, since the system was restarted, or since this object was reset, whichever occurred last. |
| Addresses In Use: Low Threshold  | When the number of used addresses in an IP local pool falls below this threshold value, a notification is generated.                                                             |
| Addresses In Use: High Threshold | When the number of used addresses in an IP local pool is equal or exceeds this threshold value, a notification is generated.                                                     |

| Column                                      | Description                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Addresses In Use: Low Threshold Percentage  | When the percentage of used addresses in an IP local pool falls below this threshold value, a notification is generated.         |
| Addresses In Use: High Threshold Percentage | When the percentage of used addresses in an IP local pool is equal or exceeds this threshold value, a notification is generated. |

## Displaying GGSN Real-Time Statistics

The MWTM enables you to display real-time statistics only in the MWTM web interface for Gateway GPRS Support Nodes (GGSNs) that reside on the Service and Application Module for IP (SAMI). To display GGSN real-time statistics, select a SAMI-based GGSN node in the navigation tree and click the Statistics tab. These subtabs appear:

- [Global, page 11-62](#)
- [SGSN Throughput, page 11-67](#)
- [APN, page 11-68](#)
- [IP Local Pool Config, page 11-72](#)
- [IP Local Pool Stats, page 11-73](#)

### Global

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

The Global subtab shows global statistics for GGSN nodes and contains:

- [GTP Statistics, page 11-63](#)
- [Charging Statistics, page 11-63](#)
- [GTP Throughput Statistics Ext, page 11-63](#)
- [PDP Context Statistics, page 11-64](#)
- [AAA Authentication Statistics, page 11-66](#)
- [AAA Accounting Statistics, page 11-66](#)
- [IP and UDP Statistics, page 11-67](#)

## GTP Statistics

The GTP Statistics pane displays statistics about the GPRS Tunneling Protocol (GTP) and contains:

| Field                             | Description                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP Signaling Messages            | GTP signaling messages sent between the Serving GPRS Support Node (SGSN) and GGSN.                                                                                     |
| G-PDU Messages                    | GTP Packet Data Unit (G-PDU) messages sent or received on an SGSN path.                                                                                                |
| G-PDU Octets                      | G-PDU bits sent or received in a GTP PDU message on an SGSN path.                                                                                                      |
| Unexpected GTP Signaling Messages | Number of unexpected GTP signaling messages sent or received.                                                                                                          |
| GTP Messages with Parser Errors   | Number of GTP messages received with wrong value.                                                                                                                      |
| Sent                              | <ul style="list-style-type: none"> <li>Count—Number of messages or bits in the transmit direction.</li> <li>Rate—The transmit rate of the messages or bits.</li> </ul> |
| Received                          | <ul style="list-style-type: none"> <li>Count—Number of messages or bits in the receive direction.</li> <li>Rate—The receive rate of the messages or bits.</li> </ul>   |

## Charging Statistics

The Charging Statistics pane displays count and rate statistics for GGSN charging messages and contains:

| Field                  | Description                                                                                                                                                          |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| G-CDR Messages Pending | <ul style="list-style-type: none"> <li>Count—GGSN Call Detail Records (CDRs) that are pending.</li> <li>Rate—Rate (per second) of pending G-CDR messages.</li> </ul> |
| G-CDR Messages Sent    | <ul style="list-style-type: none"> <li>Count—Total number of G-CDRs sent.</li> <li>Rate—Rate (per second) of sent G-CDR messages.</li> </ul>                         |

## GTP Throughput Statistics Ext

The GTP Throughput Statistics Ext pane displays count and rate statistics about GTP throughput and contains:

| Field                           | Description                                                               |
|---------------------------------|---------------------------------------------------------------------------|
| GTP Packets                     | GTP packets between the GGSN and SGSN.                                    |
| GTP Bytes                       | GTP bytes between the GGSN and SGSN.                                      |
| Sampling Interval in Minutes: 3 | Global GTP throughput statistics on the GGSN for a duration of 3 minutes. |
| Sampling Interval in Minutes: 5 | Global GTP throughput statistics on the GGSN for a duration of 5 minutes. |

| Field              | Description                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data age (minutes) | The difference in minutes between the time when the data was collected and retrieved. This is the time that has elapsed after the previous collection or update of the data. |
| Upstream           | Rate (per second) of upstream GTP traffic during the last sampling period.                                                                                                   |
| Downstream         | Rate (per second) of downstream GTP traffic during the last sampling period.                                                                                                 |

## PDP Context Statistics

The PDP Context Statistics pane shows count and rate values for these statistics:

| Field                                             | Description                                                                                                                                                                                                                                                                         |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The IP and UDP Statistics pane shows:

| Field               | Description                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP In Header Errors | Input datagrams discarded because of errors in their IP headers, including bad checksums, version number mismatches, other format errors, time-to-live exceeded, and errors discovered in processing their IP options. |
| IP Out Discards     | Outbound packets that were discarded although no errors were detected. One reason for discarding a packet would be to free buffer space.                                                                               |
| IP Out No Routes    | IP datagrams discarded because no route could be found to transmit them. This statistic includes any datagrams that a host cannot route because all its default gateways are down.                                     |
| IP Reassembly Fails | Failures detected by the IP reassembly algorithm.                                                                                                                                                                      |
| IP Routing Discards | Routing entries that were discarded even though they are valid. One reason for discarding a routing entry would be to free buffer space for other routing entries.                                                     |
| UDP In Datagrams    | UDP datagrams delivered to UDP users.                                                                                                                                                                                  |

## SGSN Throughput

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

The SGSN Throughput subtab shows:

| Field                           | Description                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SGSN Name                       | Name of the SGSN.                                                                                                                                                            |
| Sampling Interval in Minutes: 3 | Throughput statistics on the SGSN for a duration of 3 minutes.                                                                                                               |
| Sampling Interval in Minutes: 5 | Throughput statistics on the SGSN for a duration of 5 minutes.                                                                                                               |
| Upstream Packets                | Rate (per second) of upstream packets sent on this SGSN during the last sampling period.                                                                                     |
| Upstream Bytes                  | Rate (per second) of upstream bytes sent on this SGSN during the last sampling period.                                                                                       |
| Downstream Packets              | Rate (per second) of downstream packets sent on this SGSN during the last sampling period.                                                                                   |
| Downstream Bytes                | Rate (per second) of downstream bytes sent on this SGSN during the last sampling period.                                                                                     |
| Data age (minutes)              | The difference in minutes between the time when the data was collected and retrieved. This is the time that has elapsed after the previous collection or update of the data. |

## APN

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

The APN subtab contains:

- [APN Instance Throughput, page 11-68](#)
- [APN Instance Throughput Ext, page 11-69](#)
- [APN Instance PDP, page 11-69](#)
- [APN Instance PDP Ext, page 11-70](#)
- [APN Instance Miscellaneous, page 11-71](#)

## APN Instance Throughput

To view the APN Instance Throughput Statistics table, choose this option from the Type drop-down menu. The GUI displays the count and rate values for these statistics:

| Field         | Description                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Name      | The name of the Access Point Name (APN).                                                                                                                                                                                                 |
| APN Index     | A unique numerical identifier for the APN.                                                                                                                                                                                               |
| Upstream Bits | <ul style="list-style-type: none"> <li>• Count—Number of upstream bits sent on this APN during the last sampling period.</li> <li>• Rate—Rate (per second) of upstream bits sent on this APN during the last sampling period.</li> </ul> |

| Field              | Description                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Downstream Bits    | <ul style="list-style-type: none"> <li>Count—Number of downstream bits sent on this APN during the last sampling period.</li> <li>Rate—Rate (per second) of downstream bits sent on this APN during the last sampling period.</li> </ul>       |
| Upstream Packets   | <ul style="list-style-type: none"> <li>Count—Number of upstream packets sent on this APN during the last sampling period.</li> <li>Rate—Rate (per second) of upstream packets sent on this APN during the last sampling period.</li> </ul>     |
| Downstream Packets | <ul style="list-style-type: none"> <li>Count—Number of downstream packets sent on this APN during the last sampling period.</li> <li>Rate—Rate (per second) of downstream packets sent on this APN during the last sampling period.</li> </ul> |

## APN Instance Throughput Ext

To view the APN Instance Throughput Ext Statistics table, choose this option from the Type drop-down menu. The GUI displays the count and rate values for these statistics:

| Field                           | Description                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Name                        | The name of the Access Point Name (APN).                                                                                                                                     |
| APN Index                       | A unique numerical identifier for the APN.                                                                                                                                   |
| Sampling Interval in Minutes: 3 | Throughput statistics on the APN for a duration of 3 minutes.                                                                                                                |
| Sampling Interval in Minutes: 5 | Throughput statistics on the APN for a duration of 5 minutes.                                                                                                                |
| Upstream Packets                | Rate (per second) of upstream packets sent on this APN during the last sampling period.                                                                                      |
| Upstream Bits                   | Rate (per second) of upstream bytes sent on this APN during the last sampling period.                                                                                        |
| Downstream Packets              | Rate (per second) of downstream packets sent on this APN during the last sampling period.                                                                                    |
| Downstream Bytes                | Rate (per second) of downstream bytes sent on this APN during the last sampling period.                                                                                      |
| Data Age (minutes)              | The difference in minutes between the time when the data was collected and retrieved. This is the time that has elapsed after the previous collection or update of the data. |

## APN Instance PDP

To view the APN Instance PDP Statistics table, choose this option from the Type drop-down menu. The GUI displays the count and rate values for these statistics:

| Field              | Description                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------|
| APN Name           | The name of the Access Point Name (APN).                                                                          |
| APN Index          | A unique numerical identifier for the APN.                                                                        |
| Active PDP/Bearers | <ul style="list-style-type: none"> <li>Count—Current number of active PDP/Bearer contexts on this APN.</li> </ul> |

| Field                                                        | Description                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PDP/Bearer Activations by MS Success                         | <ul style="list-style-type: none"> <li>Count—Total number of successfully completed PDP/Bearer context activation procedures by the MS on this APN.</li> <li>Rate—Rate (per second) of successfully completed PDP/Bearer context activation procedures by the MS on this APN.</li> <li>Ratio—Number of successful activations for every 100 activation attempts.</li> </ul>         |
| PDP/Bearer Activations by MS Failure                         | <ul style="list-style-type: none"> <li>Count—Total number of failed PDP/Bearer context activation procedures by the MS on this APN.</li> <li>Rate—Rate (per second) of failed PDP/Bearer context activation procedures by the MS on this APN.</li> </ul>                                                                                                                            |
| PDP/Bearer Deactivations by Network Success                  | <ul style="list-style-type: none"> <li>Count—Total number of successfully completed PDP/Bearer context deactivation procedures by the GGSN on this APN.</li> <li>Rate—Rate (per second) of successfully completed PDP/Bearer context deactivation procedures by the GGSN on this APN.</li> </ul>                                                                                    |
| PDP/Bearer Deactivations by Network Failure                  | <ul style="list-style-type: none"> <li>Count—Total number of failed PDP/Bearer context deactivation procedures by the GGSN on this APN.</li> <li>Rate—Rate (per second) of failed PDP/Bearer context deactivation procedures by the GGSN on this APN.</li> </ul>                                                                                                                    |
| PDP/Bearer Deactivations by Network PDP/Bearer Retainability | <ul style="list-style-type: none"> <li>Ratio—For every 100 PDP/Bearer contexts, the number of activations whose deactivation was not completed by the GGSN.</li> </ul>                                                                                                                                                                                                              |
| PDP/Bearer Deactivations By MS Success                       | <ul style="list-style-type: none"> <li>Count—Total number of successfully completed PDP/Bearer context deactivation procedures by the MS on this APN.</li> <li>Rate—Rate (per second) of successfully completed PDP/Bearer context deactivation procedures by the MS on this APN.</li> <li>Ratio—Number of successful deactivations for every 100 deactivation attempts.</li> </ul> |
| PDP/Bearer Deactivations By MS Failure                       | <ul style="list-style-type: none"> <li>Count—Total number of failed PDP/Bearer context deactivation procedures by the MS on this APN.</li> <li>Rate—Rate (per second) of failed PDP/Bearer context deactivation procedures by the MS on this APN.</li> </ul>                                                                                                                        |

## APN Instance PDP Ext

To view the APN Instance PDP Statistics table, choose this option from the Type drop-down menu. The GUI displays the count and rate values for these statistics:

| Field     | Description                                |
|-----------|--------------------------------------------|
| APN Name  | The name of the Access Point Name (APN).   |
| APN Index | A unique numerical identifier for the APN. |

| Field                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic PDP/Bearer Activations By MS Success      | <ul style="list-style-type: none"> <li>Count—Total number of successfully completed dynamic PDP/Bearer context activation procedures initiated by MS on this APN.</li> <li>Rate—Rate (per second) of successfully completed dynamic PDP/Bearer context activation procedures initiated by MS on this APN.</li> <li>Ratio—Number of successful dynamic activations for every 100 dynamic activation attempts.</li> </ul> |

## APN Instance Miscellaneous

To view the APN Miscellaneous Statistics table, choose this option from the Type drop-down menu. The GUI displays count and rate values for these statistics:

| Field     | Description                                |
|-----------|--------------------------------------------|
| APN Name  | The name of the Access Point Name (APN).   |
| APN Index | A unique numerical identifier for the APN. |

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCP Requests Success  | <ul style="list-style-type: none"> <li>Count—Total number of successful DHCP address request sent by the GGSN or PDNGW on this APN.</li> <li>Rate—Rate at which the successful DHCP address requests are sent by the GGSN or PDNGW on this APN.</li> <li>Ratio—Number of successful DHCP requests for every 100 DHCP requests.</li> </ul>                        |
| DHCP Requests Failure  | <ul style="list-style-type: none"> <li>Count—Total number of unsuccessful DHCP address request sent by the GGSN or PDNGW on this APN.</li> <li>Rate—Rate at which the unsuccessful DHCP address requests are sent by the GGSN or PDNGW on this APN.</li> </ul>                                                                                                   |
| DHCP Releases          | <ul style="list-style-type: none"> <li>Count—Total number of DHCP address release request sent by the GGSN or PDNGW on this APN.</li> <li>Rate—Rate at which the DHCP address release request is sent by the GGSN or PDNGW on this APN.</li> </ul>                                                                                                               |
| COA Message Success    | <ul style="list-style-type: none"> <li>Count—Number of successfully acknowledged COA messages by the GGSN or PDNGW with a COA ACK.</li> <li>Rate—Rate of successfully acknowledged COA messages by the GGSN or PDNGW with a COA ACK.</li> <li>Ratio—Number of successfully acknowledged COA messages for every 100 COA messages received on this APN.</li> </ul> |
| COA Message Failure    | <ul style="list-style-type: none"> <li>Count—Number of unsuccessfully acknowledged COA messages by the GGSN or PDNGW with a COA ACK.</li> <li>Rate—Rate of unsuccessfully acknowledged COA messages by the GGSN or PDNGW with a COA ACK.</li> </ul>                                                                                                              |
| Direct Tunnels Enabled | <ul style="list-style-type: none"> <li>Count—Direct tunnels enabled for the PDP contexts on this APN.</li> <li>Rate—Rate at which the direct tunnels are enabled for the PDP contexts on this APN.</li> </ul>                                                                                                                                                    |

## IP Local Pool Config

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

The IP Local Pool Config subtab shows IP addresses for GGSN, PDNGW, or SGW nodes and contains:

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name      | Name of the IP local pool.                                                                                                                                                                                                                                                                                                                                                                                           |
| Addresses | <ul style="list-style-type: none"> <li>• Low—The first IP address of the range of IP addresses contained by this pool entry.</li> <li>• High—The last IP address of the range of IP addresses mapped by this pool entry.</li> <li>• Free—Number of IP addresses available for use within the range of IP addresses.</li> <li>• In Use—Number of IP addresses being used within the range of IP addresses.</li> </ul> |

## IP Local Pool Stats

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

The IP Local Pool Stats subtab shows IP addresses and IP addresses in use for GGSN, PDNGW, or SGW nodes and contains:

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name      | Name of the IP local pool.                                                                                                                                                                                                                                                                                                                                                                           |
| Addresses | <ul style="list-style-type: none"> <li>• Free—Number of IP addresses available for use in this IP local pool.</li> <li>• In Use—Number of IP addresses being used in this IP local pool.</li> <li>• Maximum in Use—The maximum number of used addresses in an IP local pool since pool creation, since the system was restarted, or since this object was reset, whichever occurred last.</li> </ul> |

## Displaying PDSN Real-Time Statistics

The MWTM enables you to display real-time statistics for Packet Data Serving Node (PDSN) nodes in the MWTM web interface. To display PDSN real-time statistics, select a PDSN node in the navigation tree and click the Statistics tab. The following option appears under Type drop-down menu:

- [System Statistics, page 11-73](#)

## System Statistics

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the System Statistics, choose this option from Type drop-down menu. The GUI displays the following categories:

- [Session Statistics, page 11-74](#)
- [Flow Statistics, page 11-75](#)
- [Session Bandwidth Statistics, page 11-76](#)
- [PCF Statistics, page 11-76](#)
- [Traffic Statistics, page 11-77](#)

## Session Statistics

The Session Statistics pane contains:

| Field                           | Description                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Allowed Sessions        | <ul style="list-style-type: none"> <li>Count—Maximum number of sessions allowed by the system.</li> </ul>                            |
| Session Failure Ratio           | <ul style="list-style-type: none"> <li>Count—Ratio of session failures.</li> </ul>                                                   |
| Session Utilization             | <ul style="list-style-type: none"> <li>Count—Total session utilization.</li> </ul>                                                   |
| Total Active Sessions           | <ul style="list-style-type: none"> <li>Count—Total number of sessions in active state.</li> </ul>                                    |
| Total Dormant Sessions          | <ul style="list-style-type: none"> <li>Count—Total number of sessions in dormant state.</li> </ul>                                   |
| Total HDLC over GRE Sessions    | <ul style="list-style-type: none"> <li>Count—Total number of HDLCoGRE sessions currently established with the system.</li> </ul>     |
| Total PPP over GRE Sessions     | <ul style="list-style-type: none"> <li>Count—Total number of PPPoGRE sessions currently established with the system.</li> </ul>      |
| Total Session Failures          | <ul style="list-style-type: none"> <li>Count—Number of A10/A11 session failures occurring since PDSN agent restarted.</li> </ul>     |
| Total Sessions                  | <ul style="list-style-type: none"> <li>Count—Total number of sessions currently established with the system.</li> </ul>              |
| Total Sessions Established      | <ul style="list-style-type: none"> <li>Count—Total number of sessions established since system was last restarted.</li> </ul>        |
| Total Sessions Established Rate | <ul style="list-style-type: none"> <li>Count—Rate at which the sessions were established since system was last restarted.</li> </ul> |
| Total Sessions Release          | <ul style="list-style-type: none"> <li>Count—Total number of sessions released since system was last restarted.</li> </ul>           |
| Total Sessions Released Rate    | <ul style="list-style-type: none"> <li>Count—Rate at which the sessions were released since system was last restarted.</li> </ul>    |

## Flow Statistics

The Flow Statistics pane contains:

| Field                                   | Description                                                                                                                                                                                                                                                     |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flow Failure Ratio                      | <ul style="list-style-type: none"> <li>Count—Ratio of flow failures.</li> </ul>                                                                                                                                                                                 |
| Total Mobile IP Flow Failures           | <ul style="list-style-type: none"> <li>Count—Total number of mobile IP flow setup request failed since system reboot.</li> <li>Rate—Rate of mobile IP flow setup request failed since system reboot.</li> </ul>                                                 |
| Total Mobile IP Flows                   | <ul style="list-style-type: none"> <li>Count—Total number of flows currently using MoIP services.</li> </ul>                                                                                                                                                    |
| Total Mobile IP Flows Established       | <ul style="list-style-type: none"> <li>Count—Total number of mobile IP flow that has been established successfully since system reboot.</li> <li>Rate—Rate of mobile IP flow that has been established successfully since system reboot.</li> </ul>             |
| Total MSID Flows                        | <ul style="list-style-type: none"> <li>Count—Total number of flows currently using MSID service.</li> </ul>                                                                                                                                                     |
| Total Proxy Mobile IP Flow Failures     | <ul style="list-style-type: none"> <li>Count—Total number of proxy mobile IP flow setup request failed since system reboot.</li> <li>Rate—Rate of proxy mobile IP flow setup request failed since system reboot.</li> </ul>                                     |
| Total Proxy Mobile IP Flows             | <ul style="list-style-type: none"> <li>Count—Total number of flows currently using proxy MoIP service.</li> </ul>                                                                                                                                               |
| Total Proxy Mobile IP Flows Established | <ul style="list-style-type: none"> <li>Count—Total number of proxy mobile IP flow that has been established successfully since system reboot.</li> <li>Rate—Rate of proxy mobile IP flow that has been established successfully since system reboot.</li> </ul> |

| Total Simple IP Flows                   | <ul style="list-style-type: none"> <li>Count—Total number of flows currently using simple IP service.</li> </ul>                                                                                                                                                |
| Total Simple IP Flows Established       | <ul style="list-style-type: none"> <li>Count—Total number of Simple IP flow that has been established successfully since system reboot.</li> <li>Rate—Rate of Simple IP flow that has been established successfully since system reboot.</li> </ul>             |
| Total Unknown Type Flow Failures        | <ul style="list-style-type: none"> <li>Count—Total number of unknown type flow setup request failed since last system reboot.</li> <li>Rate—Rate of unknown type flow setup request failed since last system reboot.</li> </ul>                                 |
| Total VPDN Flow Failures                | <ul style="list-style-type: none"> <li>Count—Total number of VPDN flow setup request failed since last system reboot.</li> <li>Rate—Rate of VPDN flow setup request failed since last system reboot.</li> </ul>                                                 |

| Field                        | Description                                                                                                                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total VPDN Flows             | <ul style="list-style-type: none"> <li>Count—The total number of flows currently using VPDN service.</li> </ul>                                                                                                                           |
| Total VPDN Flows Established | <ul style="list-style-type: none"> <li>Count—Total number of VPDN flow that has been established successfully since system reboot.</li> <li>Rate—Rate of VPDN flow that has been established successfully since system reboot.</li> </ul> |

## Session Bandwidth Statistics

The Session Bandwidth Statistics pane contains:

| Field                      | Description                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Bandwidth Utilization      | <ul style="list-style-type: none"> <li>Count—Total bandwidth that has been utilized.</li> </ul>                                              |
| Total Allocated Bandwidth  | <ul style="list-style-type: none"> <li>Count—Total bandwidth allocated for sessions currently established on the PDSN.</li> </ul>            |
| Total Available Bandwidth  | <ul style="list-style-type: none"> <li>Count—Bandwidth available on the PDSN system for creation of new sessions.</li> </ul>                 |
| Total Configured Bandwidth | <ul style="list-style-type: none"> <li>Count—total bandwidth value configured via the CLI that would be supported by PDSN system.</li> </ul> |

## PCF Statistics

The PCF Statistics pane contains:

| Field                | Description                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------|
| Maximum Allowed PCFs | <ul style="list-style-type: none"> <li>Count—Maximum number of PCF allowed by the system.</li> </ul>               |
| PCF Utilization      | <ul style="list-style-type: none"> <li>Count—Total PCF utilization.</li> </ul>                                     |
| Total PCFs           | <ul style="list-style-type: none"> <li>Count—Total number of PCF currently interacting with the system.</li> </ul> |

## Traffic Statistics

The Traffic Statistics pane contains:

| Field                                | Description                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proxy Mobile IP Packets Received     | <ul style="list-style-type: none"> <li>Count—Total number of proxy mobile IP data packets received from mobile stations by PDSN since system was last restarted.</li> <li>Rate—Rate at which the proxy mobile IP data packets are received from mobile stations by PDSN since system was last restarted.</li> </ul>                             |
| Short Data Burst Packets Sent        | <ul style="list-style-type: none"> <li>Count—Total number of SDB marked data packets sent to PCF from PDSN since system was last restarted.</li> <li>Rate—Rate at which the SDB marked data packets are sent to PCF from PDSN since system was last restarted.</li> </ul>                                                                       |

# Displaying SGW Real-Time Statistics

The MWTM enables you to display real-time statistics for SGW nodes in the MWTM web interface. To display real-time statistics, select the node in the navigation tree and click the Statistics tab. These options appear under the Type drop down list:

- [AAA, page 11-79](#)
- [APN Instance Throughput, page 11-81](#)
- [APN Instance Throughput Ext, page 11-81](#)
- [APN Instance Bearer, page 11-82](#)
- [EPC Buffering, page 11-83](#)
- [EPC Overload Protection, page 11-84](#)
- [GTP Statistics, page 11-86](#)
- [GTPv2 Statistics, page 11-88](#)
- [GTPv2 Path Bearer Statistics, page 11-89](#)
- [GTPv2 Path Session Statistics, page 11-90](#)
- [GTP Path Error Statistics, page 11-91](#)
- [IP Local Pool Configuration, page 11-92](#)
- [IP Local Pool Statistics, page 11-92](#)

## AAA

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the AAA statistics table, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [AAA Authentication Statistics, page 11-79](#)
- [AAA Accounting Statistics, page 11-80](#)

## AAA Authentication Statistics

AAA Authentication Statistics pane shows:

| Column                 | Description                                                                                                                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Name            | Name of the server.                                                                                                                                                                                                                                                           |
| Server State           | Whether the server is up (operational) or down (not operational).                                                                                                                                                                                                             |
| Transactions Completed | <ul style="list-style-type: none"> <li>• Count—Number of authentication transactions with the server which succeeded since it is made active.</li> <li>• Rate—Rate at which the authentication transactions with the server are succeeded since it is made active.</li> </ul> |

| Column               | Description                                                                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transaction Failures | <ul style="list-style-type: none"> <li>Count—Number of authentication transactions with this server which failed since it is made active.</li> <li>Rate—Rate at which the authentication transactions with the server are failed since it is made active.</li> </ul>                   |
| Requests             | <ul style="list-style-type: none"> <li>Count—Number of authentication requests sent to this server since it is made active.</li> <li>Rate—Rate at which the authentication requests are sent to the server since it is made active.</li> </ul>                                         |
| Request Timeouts     | <ul style="list-style-type: none"> <li>Count—Number of authentication requests which are timed out since it is made active.</li> <li>Rate—Rate at which the authentication requests are timed out since it is made active.</li> </ul>                                                  |
| Error Responses      | <ul style="list-style-type: none"> <li>Count—Number of server ERROR authentication responses received from this server since it is made active.</li> <li>Rate—Rate at which the server ERROR authentication responses are received from the server since it is made active.</li> </ul> |
| Incorrect Responses  | <ul style="list-style-type: none"> <li>Count—Number of authentication responses which could not be processed since it is made active.</li> <li>Rate—Rate of authentication responses which could not be processed since it is made active.</li> </ul>                                  |

## AAA Accounting Statistics

AAA Accounting Statistics pane shows:

| Column                 | Description                                                                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Name            | Name of the server.                                                                                                                                                                                                                                                                  |
| Server State           | Whether the server is up (operational) or down (not operational).                                                                                                                                                                                                                    |
| Transactions Completed | <ul style="list-style-type: none"> <li>Count—Number of accounting transactions with the server which succeeded since system reinitialization.</li> <li>Rate—Rate at which the accounting transactions with the server are succeeded since it is made active.</li> </ul>              |
| Transaction Failures   | <ul style="list-style-type: none"> <li>Count—Number of accounting transactions with this server which failed since system reinitialization.</li> <li>Rate—Rate at which the accounting transactions with the server are failed since it is made active.</li> </ul>                   |
| Requests               | <ul style="list-style-type: none"> <li>Count—Number of accounting requests sent to this server since system reinitialization.</li> <li>Rate—Rate at which the accounting requests are sent to the server since it is made active.</li> </ul>                                         |
| Request Timeouts       | <ul style="list-style-type: none"> <li>Count—Number of accounting requests which have timed out since system reinitialization.</li> <li>Rate—Rate at which the accounting requests are timed out since it is made active.</li> </ul>                                                 |
| Error Responses        | <ul style="list-style-type: none"> <li>Count—Number of server ERROR accounting responses received from this server since system reinitialization.</li> <li>Rate—Rate at which the server ERROR accounting responses are received from the server since it is made active.</li> </ul> |

## APN Instance Throughput

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the APN Instance Throughput Statistics table, choose this option from the Type drop-down menu. The GUI displays the count and rate values for these statistics:

| Column             | Description                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Name           | The name of the Access Point Name (APN).                                                                                                                                                                                                    |
| APN Index          | A unique numerical identifier for the APN.                                                                                                                                                                                                  |
| Upstream Bits      | <ul style="list-style-type: none"><li>Count—Number of upstream bits sent on this APN during the last sampling period.</li><li>Rate—Rate (per second) of upstream bits sent on this APN during the last sampling period.</li></ul>           |
| Downstream Bits    | <ul style="list-style-type: none"><li>Count—Number of downstream bits sent on this APN during the last sampling period.</li><li>Rate—Rate (per second) of downstream bits sent on this APN during the last sampling period.</li></ul>       |
| Upstream Packets   | <ul style="list-style-type: none"><li>Count—Number of upstream packets sent on this APN during the last sampling period.</li><li>Rate—Rate (per second) of upstream packets sent on this APN during the last sampling period.</li></ul>     |
| Downstream Packets | <ul style="list-style-type: none"><li>Count—Number of downstream packets sent on this APN during the last sampling period.</li><li>Rate—Rate (per second) of downstream packets sent on this APN during the last sampling period.</li></ul> |

## APN Instance Throughput Ext

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the APN Instance Throughput Ext Statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                           | Description                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------|
| APN Name                        | The name of the Access Point Name (APN).                                                  |
| APN Index                       | A unique numerical identifier for the APN.                                                |
| Sampling Interval in Minutes: 3 | Throughput statistics on the APN for a duration of 3 minutes.                             |
| Sampling Interval in Minutes: 5 | Throughput statistics on the APN for a duration of 5 minutes.                             |
| Upstream Packets                | Rate (per second) of upstream packets sent on this APN during the last sampling period.   |
| Upstream Bits                   | Rate (per second) of upstream bits sent on this APN during the last sampling period.      |
| Downstream Packets              | Rate (per second) of downstream packets sent on this APN during the last sampling period. |

| Field              | Description                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Downstream Bits    | Rate (per second) of downstream bits sent on this APN during the last sampling period.                                                                                       |
| Data Age (minutes) | The difference in minutes between the time when the data was collected and retrieved. This is the time that has elapsed after the previous collection or update of the data. |

## APN Instance Bearer

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the APN Instance Bearer statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                        | Description                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Name                     | The name of the Access Point Name (APN).                                                                                                                                                                                                                                                                                                        |
| APN Index                    | A unique numerical identifier for the APN.                                                                                                                                                                                                                                                                                                      |
| Active Bearers               | <ul style="list-style-type: none"> <li>Count—Total number of bearers on this APN.</li> </ul>                                                                                                                                                                                                                                                    |

## EPC Buffering

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the EPC Buffering Statistics table, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [Buffering Configuration, page 11-83](#)
- [Buffering Status, page 11-83](#)
- [Buffering Statistics, page 11-84](#)

## Buffering Configuration

The Buffering Configuration pane shows:

| Field                      | Description                                                                  |
|----------------------------|------------------------------------------------------------------------------|
| Buffering Agent Status     | The state of buffering agent.                                                |
| Maximum Buffer Size        | The maximum buffer size allocated for the buffering agent per bearer.        |
| Buffer Duration            | The duration for which the buffering agent stores data before discarding it. |
| Maximum Packets Per Buffer | The maximum number of packets allowed per buffer.                            |

## Buffering Status

The Buffering Status pane shows:

| Field                   | Description                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------|
| Total In Use Buffers    | <ul style="list-style-type: none"> <li>Count—Total number of buffers currently in use.</li> </ul>                  |
| Total Buffered Packets  | <ul style="list-style-type: none"> <li>Count—Total number of packets buffered at present in the buffer.</li> </ul> |
| Total Buffered Bits     | <ul style="list-style-type: none"> <li>Count—Total number of bits buffered at present in the buffer.</li> </ul>    |
| Total Buffers Available | <ul style="list-style-type: none"> <li>Count—Current available buffer size.</li> </ul>                             |

## Buffering Statistics

The Buffering Statistics pane shows:

| Field                              | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Buffers Created                    | <ul style="list-style-type: none"> <li>Count—Total number of buffers created.</li> <li>Rate—Rate at which the buffers are created.</li> </ul>                                                                                                                                                                                                 |
| Buffers Deleted                    | <ul style="list-style-type: none"> <li>Count—Total number of buffers deleted.</li> <li>Rate—Rate at which the buffers are deleted.</li> </ul>                                                                                                                                                                                                 |
| Buffer Rejected Low Memory         | <ul style="list-style-type: none"> <li>Count—Total number of times the buffer allocation is rejected due to low memory availability in the gateway.</li> <li>Rate—Rate at which the buffer allocation is rejected due to low memory availability in the gateway.</li> </ul>                                                                   |
| Buffers Timed Out                  | <ul style="list-style-type: none"> <li>Count—Total number of buffers that got timed out.</li> <li>Rate—Rate at which the buffers got timed out.</li> </ul>                                                                                                                                                                                    |
| Buffer Packets Enqueued            | <ul style="list-style-type: none"> <li>Count—Total number of packets enqueued to the buffering agent.</li> <li>Rate—Rate at which the packets are enqueued to the buffering agent.</li> </ul>                                                                                                                                                 |
| Buffer Rejected Memory Unavailable | <ul style="list-style-type: none"> <li>Count—Total number of times the buffer allocation is rejected by gateway due to requested memory is greater than the total available buffers.</li> <li>Rate—Rate at which the buffer allocation is rejected by gateway due to requested memory is greater than the total available buffers.</li> </ul> |
| Buffer Packets Dequeued            | <ul style="list-style-type: none"> <li>Count—Total number of packets dequeued from the buffering agent.</li> <li>Rate—Rate at which the packets are dequeued from the buffering agent.</li> </ul>                                                                                                                                             |
| Buffer Bits Enqueued               | <ul style="list-style-type: none"> <li>Count—Total bits of data enqueued to the buffering agent.</li> <li>Rate—Rate at which the bits of data are enqueued to the buffering agent.</li> </ul>                                                                                                                                                 |
| Buffer Bits Dequeued               | <ul style="list-style-type: none"> <li>Count—Total bits of data dequeued from the buffering agent.</li> <li>Rate—Rate at which the bits of data are dequeued from the buffering agent.</li> </ul>                                                                                                                                             |

## EPC Overload Protection

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the EPC Overload Protection Statistics table, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [Status Information, page 11-85](#)
- [Congestion Threshold Information, page 11-85](#)
- [Statistics Information, page 11-85](#)
- [Congestion Times, page 11-85](#)

## Status Information

The Status Information pane shows:

| Field                 | Description                                                                  |
|-----------------------|------------------------------------------------------------------------------|
| Congestion Status     | The congestion gateway status.                                               |
| Congestion DFP Weight | The dfp value, which is used to measure the congestion level in the gateway. |

## Congestion Threshold Information

The Congestion Threshold Information pane shows:

| Field                       | Description                        |
|-----------------------------|------------------------------------|
| Congestion Low Threshold %  | The low threshold for congestion.  |
| Congestion High Threshold % | The high threshold for congestion. |

## Statistics Information

The Statistics Information pane shows:

| Field                         | Description                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Requests Dropped         | <ul style="list-style-type: none"> <li>Count—Total number of incoming calls dropped at the gateway.</li> <li>Rate—Rate at which the incoming calls are dropped at the gateway.</li> </ul>       |
| Times High Congestion Reached | <ul style="list-style-type: none"> <li>Count—The number of times high congestion occurred on the gateway.</li> <li>Rate—Rate at which the high congestion occurred on the gateway.</li> </ul>   |
| Times Low Congestion Reached  | <ul style="list-style-type: none"> <li>Count—The number of times low congestion occurred on the gateway.</li> <li>Rate—Rate at which the low congestion are occurred on the gateway.</li> </ul> |

## Congestion Times

The Congestion Times pane shows:

| Field           | Description                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Congestion Low  | <ul style="list-style-type: none"> <li>Last Occurrence—Timestamp at which the low congestion last occurred on the gateway.</li> <li>Last Duration—Duration of last low congestion.</li> </ul>   |
| Congestion High | <ul style="list-style-type: none"> <li>Last Occurrence—Timestamp at which the high congestion last occurred on the gateway.</li> <li>Last Duration—Duration of last high congestion.</li> </ul> |

## GTP Statistics

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the GTP Statistics table, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [GTP Active Statistics, page 11-86](#)
- [Charging Statistics, page 11-86](#)
- [GTP Bearer Statistics, page 11-87](#)
- [GTP Throughput Statistics, page 11-87](#)
- [GTP Throughput Statistics Ext, page 11-88](#)
- [GTP Error Statistics, page 11-88](#)

### GTP Active Statistics

The GTP Statistics pane shows:

| Column  | Description                                                                      |
|---------|----------------------------------------------------------------------------------|
| Bearers | <ul style="list-style-type: none"><li>• Count—Total number of bearers.</li></ul> |
| Users   | <ul style="list-style-type: none"><li>• Count—Total number of users.</li></ul>   |

### Charging Statistics

The Charging Statistics pane shows:

| Column                 | Description                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| G-CDR Messages Pending | <ul style="list-style-type: none"><li>• Count—Number of G-CDRs pending.</li><li>• Rate—Rate (per second) of G-CDRs pending.</li></ul> |
| G-CDR Messages Sent    | <ul style="list-style-type: none"><li>• Count—Number of G-CDRs sent.</li><li>• Rate—Rate at which the g-CDRs are sent.</li></ul>      |

## GTP Bearer Statistics

The GTP PDP/Bearer Statistics pane shows:

| Column                          | Description                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bearer Activation Failure Ratio | <ul style="list-style-type: none"> <li>Count—Ratio of bearer activation request to bearer activation failures.</li> <li>Rate—Rate (per second) of ratio of bearer activation request to bearer activation failures.</li> </ul> |
| Bearers Created                 | <ul style="list-style-type: none"> <li>Count—Number of bearers created since the system is up.</li> <li>Rate—Rate at which the bearers are created since the system is up.</li> </ul>                                          |
| Bearers Rejected                | <ul style="list-style-type: none"> <li>Count—Number of bearers rejected since the system is up.</li> <li>Rate—Rate at which the bearers are rejected since the system is up.</li> </ul>                                        |
| Bearers Deleted                 | <ul style="list-style-type: none"> <li>Count—Number of bearers deleted since the system is up</li> <li>Rate—Rate at which the bearers are deleted since the system is up.</li> </ul>                                           |

## GTP Throughput Statistics

The GTP Throughput Statistics pane displays count and rate statistics about GTP throughput and shows:

| Column                           | Description                                                                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP signaling Messages Sent      | <ul style="list-style-type: none"> <li>Count—Number of signalling messages sent on a SGSN path.</li> <li>Rate—Rate at which the signalling messages are sent on a SGSN path.</li> </ul>                 |
| GTP Signalling Messages Received | <ul style="list-style-type: none"> <li>Count—Number of signalling messages received on a SGSN path.</li> <li>Rate—Rate at which the signalling messages are received on a SGSN path.</li> </ul>         |
| G-PDU Messages Sent              | <ul style="list-style-type: none"> <li>Count—Number of PDU messages sent on a SGSN path.</li> <li>Rate—Rate at which the PDU messages are sent on a SGSN path.</li> </ul>                               |
| G-PDU Messages Received          | <ul style="list-style-type: none"> <li>Count—Number of PDU messages received on a SGSN path.</li> <li>Rate—Rate at which the PDU messages are received on a SGSN path.</li> </ul>                       |
| G-PDU Bits Sent                  | <ul style="list-style-type: none"> <li>Count—Number of PDU bits sent in PDU message on a SGSN path.</li> <li>Rate—Rate at which the PDU bits are sent in PDU message on a SGSN path.</li> </ul>         |
| G-PDU Bits Received              | <ul style="list-style-type: none"> <li>Count—Number of PDU bits received in PDU message on a SGSN path.</li> <li>Rate—Rate at which the PDU bits are received in PDU message on a SGSN path.</li> </ul> |

## GTP Throughput Statistics Ext

The GTP Throughput Statistics Ext pane shows:

| Field                           | Description                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP Packets                     | GTP packets between the SGW and SGSN.                                                                                                                                        |
| GTP Bytes                       | GTP bytes between the SGW and SGSN.                                                                                                                                          |
| Sampling Interval in Minutes: 3 | Global GTP throughput statistics on the SGW for a duration of 3 minutes.                                                                                                     |
| Sampling Interval in Minutes: 5 | Global GTP throughput statistics on the SGW for a duration of 5 minutes.                                                                                                     |
| Upstream                        | Rate (per second) of upstream GTP traffic during the last sampling period.                                                                                                   |
| Downstream                      | Rate (per second) of downstream GTP traffic during the last sampling period.                                                                                                 |
| Data age (minutes)              | The difference in minutes between the time when the data was collected and retrieved. This is the time that has elapsed after the previous collection or update of the data. |

## GTP Error Statistics

The GTP Error Statistics pane shows:

| Column                             | Description                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP Messages with Parser Errors    | <ul style="list-style-type: none"> <li>Count—Number of GTP messages received with wrong value.</li> <li>Rate—Rate (per second) of GTP messages received with wrong value.</li> </ul>            |
| Dropped Signalling Messages        | <ul style="list-style-type: none"> <li>Count—Number of signalling packets dropped by SGW.</li> <li>Rate—Rate at which the signalling packets are dropped by SGW.</li> </ul>                     |
| Unexpected GTP Signalling Messages | <ul style="list-style-type: none"> <li>Count—Number of unexpected GTP signalling messages received.</li> <li>Rate—Rate at which the unexpected GTP signalling messages are received.</li> </ul> |

## GTPv2 Statistics

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the GTPv2 Statistics table, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [GTPv2 Bearer Statistics, page 11-89](#)
- [GTPv2 Session Statistics, page 11-89](#)

## GTPv2 Bearer Statistics

The GTPv2 Bearer Statistics pane shows:

| Field                   | Description                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete Bearer Responses | Total number of delete bearer response messages.                                                                                                                                                                      |
| Update Bearer Requests  | Total number of update bearer request messages.                                                                                                                                                                       |
| Modify Bearer Requests  | Total number of modify bearer request messages.                                                                                                                                                                       |
| Create Bearer Requests  | Total number of create bearer request messages.                                                                                                                                                                       |
| Sent                    | <ul style="list-style-type: none"> <li>Count—Total number of bearer response or bearer request messages sent.</li> <li>Rate—Rate at which the bearer response or bearer request messages are sent.</li> </ul>         |
| Received                | <ul style="list-style-type: none"> <li>Count—Total number of bearer response or bearer request messages received.</li> <li>Rate—Rate at which the bearer response or bearer request messages are received.</li> </ul> |
| Rejected                | <ul style="list-style-type: none"> <li>Count—Total number of bearer response or bearer request messages rejected.</li> <li>Rate—Rate at which the bearer response or bearer request messages are rejected.</li> </ul> |

## GTPv2 Session Statistics

The GTPv2 Session Statistics pane shows:

| Field                    | Description                                                                                                                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete Session Responses | Total number of delete session response messages.                                                                                                                                                                         |
| Create Session Responses | Total number of create session response messages.                                                                                                                                                                         |
| Delete Session Requests  | Total number of delete session request messages.                                                                                                                                                                          |
| Create Session Requests  | Total number of create session request messages.                                                                                                                                                                          |
| Sent                     | <ul style="list-style-type: none"> <li>Count—Total number of session response or session request messages sent.</li> <li>Rate—Rate at which the session response or session request messages are sent.</li> </ul>         |
| Received                 | <ul style="list-style-type: none"> <li>Count—Total number of session response or session request messages received.</li> <li>Rate—Rate at which the session response or session request messages are received.</li> </ul> |
| Rejected                 | <ul style="list-style-type: none"> <li>Count—Total number of session response or session request messages rejected.</li> <li>Rate—Rate at which the session response or session request messages are rejected.</li> </ul> |

## GTPv2 Path Bearer Statistics

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the GTPv2 Path Bearer Statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                     | Description                                                                                                                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## GTP Path Error Statistics

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the GTP Path Error Statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP Path                    | GTP path.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Signalling Messages Dropped | <p><b>Unexpected</b></p> <ul style="list-style-type: none"> <li>Count—Number of unexpected GTP signaling messages sent or received.</li> <li>Rate—Rate at which the unexpected GTP signaling messages are sent or received.</li> </ul> <p><b>Dropped</b></p> <ul style="list-style-type: none"> <li>Count—Number of signaling messages that are dropped.</li> <li>Rate—Rate at which the signaling messages are dropped.</li> </ul> |

## IP Local Pool Configuration

The GUI displays the same fields as that of IP Local Pool Configuration statistics for GGSN node. See [IP Local Pool Config, page 11-72](#).

## IP Local Pool Statistics

The GUI displays the same fields as that of IP Local Pool statistics for GGSN node. See [IP Local Pool Stats, page 11-73](#).

# Displaying PDNGW Real time statistics

The MWTM enables you to display real-time statistics for PDNGW nodes in the MWTM web interface. To display real-time statistics, select the node in the navigation tree and click the Statistics tab. These options appear under the Type drop down list:

- [AAA, page 11-93](#)
- [APN Instance Throughput, page 11-93](#)
- [APN Instance Throughput Ext, page 11-93](#)
- [APN Instance PDP/Bearer, page 11-93](#)
- [APN Instance PDP/Bearer Ext, page 11-94](#)
- [APN Instance Miscellaneous, page 11-95](#)
- [EPC Buffering, page 11-95](#)
- [EPC Overload Protection, page 11-95](#)
- [GTP Statistics, page 11-95](#)
- [GTPv2 Statistics, page 11-99](#)
- [GTPv2 Path Bearer Statistics, page 11-99](#)
- [GTPv2 Path Session Statistics, page 11-100](#)
- [GTP Path Error Statistics, page 11-100](#)

- [IP Local Pool Configuration, page 11-100](#)
- [IP Local Pool Statistics, page 11-101](#)

## AAA

The GUI displays the same fields as that of AAA Statistics for SGW node. See [AAA, page 11-79](#).

## APN Instance Throughput

The GUI displays the same fields as that of APN Instance Throughput Statistics for SGW node. See [APN Instance Throughput, page 11-81](#).

## APN Instance Throughput Ext

The GUI displays the same fields as that of APN Instance Throughput Ext Statistics for SGW node. See [APN Instance Throughput Ext, page 11-81](#).

## APN Instance PDP/Bearer

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the APN Instance PDP/Bearer Statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                                       | Description                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Name                                    | The name of the Access Point Name (APN).                                                                                                                                                                                                                                                                                                                                    |
| APN Index                                   | A unique numerical identifier for the APN.                                                                                                                                                                                                                                                                                                                                  |
| Active PDP/Bearers                          | <ul style="list-style-type: none"> <li>Count—Number of active PDP contexts or Bearers on this APN.</li> </ul>                                                                                                                                                                                                                                                               |

## APN Instance PDP/Bearer Ext

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the APN Instance PDP/Bearer Ext Statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Name                                     | The name of the Access Point Name (APN).                                                                                                                                                                                                                                                                                                                                                                    |
| APN Index                                    | A unique numerical identifier for the APN.                                                                                                                                                                                                                                                                                                                                                                  |
| Dynamic PDP/Bearer Activations By MS Success | <ul style="list-style-type: none"> <li>Count—Total number of successfully completed dynamic PDP context/Bearer activation procedures by the MS on this APN.</li> <li>Rate—Rate (per second) of successfully completed dynamic PDP context/Bearer activation procedures by the MS on this APN.</li> <li>Ratio—Number of successful dynamic activations for every 100 dynamic activation attempts.</li> </ul> |
| Dynamic PDP/Bearer Activations By MS Failure | <ul style="list-style-type: none"> <li>Count—Total number of failed dynamic PDP context/Bearer activation procedures by the MS on this APN.</li> <li>Rate—Rate (per second) of failed dynamic PDP context/Bearer activation procedures by the MS on this APN.</li> </ul>                                                                                                                                    |
| PDP/Bearer Activations By Network Success    | <ul style="list-style-type: none"> <li>Count—Total number of successfully completed network initiated PDP context/Bearer activation procedures.</li> <li>Rate—Rate (per second) successfully completed network initiated PDP context/Bearer activation procedures.</li> <li>Ratio—number of successful network initiated activations for every 100 activation attempts.</li> </ul>                          |

| Field                                     | Description                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PDP/Bearer Activations By Network Failure | <ul style="list-style-type: none"> <li>Count—Total number of failed network initiated PDP context/Bearer activation procedures.</li> <li>Rate—Rate (per second) failed network initiated PDP context/Bearer activation procedures.</li> </ul>                                                                                                                            |
| PDP/Bearer Updates By Network Success     | <ul style="list-style-type: none"> <li>Count—Total number of successful update responses received on this APN.</li> <li>Rate—Rate (per second) of successful update responses received on this APN.</li> <li>Ratio—Number of successful update responses received for every 100 activation attempts.</li> </ul>                                                          |
| PDP/Bearer Updates By Network Failure     | <ul style="list-style-type: none"> <li>Count—Total number of unsuccessful update responses received on this APN.</li> <li>Rate—Rate (per second) of unsuccessful update responses received on this APN.</li> </ul>                                                                                                                                                       |
| Dedicated Bearer Activations Success      | <ul style="list-style-type: none"> <li>Count—Total number of successful dedicated bearer activation procedures received on this APN.</li> <li>Rate—Rate (per second) of successful dedicated bearer activation procedures received on this APN.</li> <li>Ratio—Number of successful dedicated bearer activation procedures for every 100 activation attempts.</li> </ul> |
| Dedicated Bearer Activations Failure      | <ul style="list-style-type: none"> <li>Count—Total number of unsuccessful dedicated bearer activation procedures received on this APN.</li> <li>Rate—Rate (per second) of unsuccessful dedicated bearer activation procedures received on this APN.</li> </ul>                                                                                                           |

## APN Instance Miscellaneous

The GUI displays the same fields as that of APN instance Miscellaneous Statistics for GGSN node. See [APN Instance Miscellaneous, page 11-71](#).

## EPC Buffering

The GUI displays the same fields as that of EPC Buffering Statistics for SGW node. See [EPC Buffering, page 11-83](#).

## EPC Overload Protection

The GUI displays the same fields as that of EPC Overload protection Statistics for SGW node. See [EPC Overload Protection, page 11-84](#).

## GTP Statistics

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the GTP Statistics table, choose this option from the Type drop-down menu. The GUI displays the following categories:

- [GTP Active Statistics, page 11-96](#)

- [Charging Statistics, page 11-96](#)
- [GTP PDP/Bearer Statistics, page 11-96](#)
- [GTP Throughput Statistics, page 11-97](#)
- [GTP Throughput Statistics Ext, page 11-88](#)
- [GTP Error Statistics, page 11-98](#)

## GTP Active Statistics

The GTP Active Statistics pane shows:

| Column                          | Description                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------|
| GTP v0 PDP Contexts             | PDP contexts (GTP version 0) that are active.                                                                       |
| GTP v1 PDP Contexts             | PDP contexts (GTP version 1) that are active.                                                                       |
| GTP v2 EPS Bearers              | EPS bearers (GTP version 2) that are active.                                                                        |
| PPP Regen PDPs                  | Device-specific interfaces created for association with PDP contexts regenerated to a Point-to-Point (PPP) session. |
| PPP PDPs                        | Total number of point to point PDP contexts.                                                                        |
| PDP Contexts with Direct Tunnel | Direct tunnels enabled for the PDP contexts in the PDNGW.                                                           |

## Charging Statistics

The Charging Statistics pane shows:

| Column                 | Description                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| G-CDR Messages Pending | <ul style="list-style-type: none"> <li>• Count—Number of Call Detail Records (CDRs) pending.</li> <li>• Rate—Rate (per second) of CDRs pending.</li> </ul> |
| G-CDR Messages Sent    | <ul style="list-style-type: none"> <li>• Count—Number of G-CDRs sent.</li> <li>• Rate—Rate at which the G-CDRs are sent.</li> </ul>                        |

## GTP PDP/Bearer Statistics

The GTP Bearer Statistics pane shows:

| Column                                      | Description                                                                                                                                                                                                                            |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PDP/Bearer Context Activation Failure Ratio | <ul style="list-style-type: none"> <li>Count—Ratio of PDP/bearer activation request to bearer activation failures.</li> <li>Rate—Rate (per second) of ratio of PDP/bearer activation request to bearer activation failures.</li> </ul> |
| PDP/Bearer Contexts Created                 | <ul style="list-style-type: none"> <li>Count—Number of PDP/bearers created since the system is up.</li> <li>Rate—Rate at which the PDP/bearers are created since the system is up.</li> </ul>                                          |
| PDP/Bearer Context Activations Rejected     | <ul style="list-style-type: none"> <li>Count—Number of PDP/bearer activation requests rejected since the system is up.</li> <li>Rate—Rate at which the PDP/bearer activation requests are rejected since the system is up.</li> </ul>  |
| PDP/Bearer Contexts Deleted                 | <ul style="list-style-type: none"> <li>Count—Number of PDP/bearers deleted since the system is up</li> <li>Rate—Rate at which the PDP/bearers are deleted since the system is up.</li> </ul>                                           |

## GTP Throughput Statistics

The GTP Throughput Statistics pane displays count and rate statistics about GTP throughput and shows:

| Column                           | Description                                                                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP Signalling Messages Sent     | <ul style="list-style-type: none"> <li>Count—Number of signalling messages sent on a SGSN path.</li> <li>Rate—Rate at which the signalling messages are sent on a SGSN path.</li> </ul>                 |
| GTP Signalling Messages Received | <ul style="list-style-type: none"> <li>Count—Number of signalling messages received on a SGSN path.</li> <li>Rate—Rate at which the signalling messages are received on a SGSN path.</li> </ul>         |
| G-PDU Messages Sent              | <ul style="list-style-type: none"> <li>Count—Number of PDU messages sent on a SGSN path.</li> <li>Rate—Rate at which the PDU messages are sent on a SGSN path.</li> </ul>                               |
| G-PDU Messages Received          | <ul style="list-style-type: none"> <li>Count—Number of PDU messages received on a SGSN path.</li> <li>Rate—Rate at which the PDU messages are received on a SGSN path.</li> </ul>                       |
| G-PDU Bits Sent                  | <ul style="list-style-type: none"> <li>Count—Number of PDU bits sent in PDU message on a SGSN path.</li> <li>Rate—Rate at which the PDU bits are sent in PDU message on a SGSN path.</li> </ul>         |
| G-PDU Bits Received              | <ul style="list-style-type: none"> <li>Count—Number of PDU bits received in PDU message on a SGSN path.</li> <li>Rate—Rate at which the PDU bits are received in PDU message on a SGSN path.</li> </ul> |

## GTP Throughput Statistics Ext

The GTP Throughput Statistics Ext pane shows:

| Field                           | Description                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP Packets                     | GTP packets between the PDNGW and SGSN.                                                                                                                                      |
| GTP Bytes                       | GTP bytes between the PDNGW and SGSN.                                                                                                                                        |
| Sampling Interval in Minutes: 3 | Global GTP throughput statistics on the PDNGW for a duration of 3 minutes.                                                                                                   |
| Sampling Interval in Minutes: 5 | Global GTP throughput statistics on the PDNGW for a duration of 5 minutes.                                                                                                   |
| Upstream                        | Rate (per second) of upstream GTP traffic during the last sampling period.                                                                                                   |
| Downstream                      | Rate (per second) of downstream GTP traffic during the last sampling period.                                                                                                 |
| Data age (minutes)              | The difference in minutes between the time when the data was collected and retrieved. This is the time that has elapsed after the previous collection or update of the data. |

## GTP Error Statistics

The GTP Error Statistics pane shows:

| Column                                                                                     | Description                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PDP Context Activations Rejected due to Insufficient Resources                             | <ul style="list-style-type: none"> <li>Count—Number of PDP context requests rejected due to insufficient resources.</li> <li>Rate—Rate at which the PDP context requests are rejected due to insufficient resources.</li> </ul>                                           |
| PDP Context Requests Rejected due to Insufficient Resources Rejection for PPP Regeneration | <ul style="list-style-type: none"> <li>Count—Number of PDP context requests rejected due to insufficient resources for PPP regeneration.</li> <li>Rate—Rate at which the PDP context requests are rejected due to insufficient resources for PPP regeneration.</li> </ul> |
| PDP Context Requests Dropped due to the PPP Regeneration Threshold Limit                   | <ul style="list-style-type: none"> <li>Count—Number of PDP context requests dropped due to the PPP regeneration threshold limit.</li> <li>Rate—Rate at which the PDP context requests are dropped due to the PPP regeneration threshold limit.</li> </ul>                 |
| PDP Context Messages with Packet Filter Semantic Errors                                    | <ul style="list-style-type: none"> <li>Count—Total number of received PDP context messages that had packet filters with semantic errors.</li> <li>Rate—Rate at which the PDP context messages that had packet filters with semantic errors are received.</li> </ul>       |
| PDP Context Messages with Packet Filter Syntax Errors                                      | <ul style="list-style-type: none"> <li>Count—Total number of received PDP context messages that had packet filters with syntax errors.</li> <li>Rate—Rate at which the PDP context messages that had packet filters with syntax errors are received.</li> </ul>           |

## GTPv2 Statistics

The GUI displays the same fields as that of GTPv2 Statistics for SGW node. See [GTPv2 Statistics, page 11-88](#).

## GTPv2 Path Bearer Statistics

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the GTPv2 Path Bearer Statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                    | Description                                                                                                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP Path                 | GTP path.                                                                                                                                                                                     |
| Create Requests Received | <ul style="list-style-type: none"> <li>Count—Total number of create bearer request messages received.</li> <li>Rate—Rate at which the create bearer request messages are received.</li> </ul> |
| Create Requests Rejected | <ul style="list-style-type: none"> <li>Count—Total number of create bearer request messages rejected.</li> <li>Rate—Rate at which the create bearer request messages are rejected.</li> </ul> |
| Modify Requests Received | <ul style="list-style-type: none"> <li>Count—Total number of modify bearer request messages received.</li> <li>Rate—Rate at which the modify bearer request messages are received.</li> </ul> |
| Modify Requests Rejected | <ul style="list-style-type: none"> <li>Count—Total number of modify bearer request messages rejected.</li> <li>Rate—Rate at which the modify bearer request messages are rejected.</li> </ul> |

| Field                    | Description                                                                                                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Update Requests Received | <ul style="list-style-type: none"> <li>Count—Total number of update bearer request messages received.</li> <li>Rate—Rate at which the update bearer request messages are received.</li> </ul> |
| Update Requests Rejected | <ul style="list-style-type: none"> <li>Count—Total number of update bearer request messages rejected.</li> <li>Rate—Rate at which the update bearer request messages are rejected.</li> </ul> |
| Delete Responses Sent    | <ul style="list-style-type: none"> <li>Count—Total number of delete bearer response messages sent.</li> <li>Rate—Rate at which the delete bearer response messages are sent.</li> </ul>       |

## GTPv2 Path Session Statistics

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the GTPv2 Path Session Statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                    | Description                                                                                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTP Path                 | GTP path.                                                                                                                                                                                       |
| Create Requests Received | <ul style="list-style-type: none"> <li>Count—Total number of create session request messages received.</li> <li>Rate—Rate at which the create session request messages are received.</li> </ul> |
| Create Requests Rejected | <ul style="list-style-type: none"> <li>Count—Total number of create session request messages rejected.</li> <li>Rate—Rate at which the create session request messages are rejected.</li> </ul> |
| Delete Requests Received | <ul style="list-style-type: none"> <li>Count—Total number of delete session request messages received.</li> <li>Rate—Rate at which the delete session request messages are received.</li> </ul> |
| Delete Requests Rejected | <ul style="list-style-type: none"> <li>Count—Total number of delete session request messages rejected.</li> <li>Rate—Rate at which the delete session request messages are rejected.</li> </ul> |
| Create Responses Sent    | <ul style="list-style-type: none"> <li>Count—Total number of create session response messages sent.</li> <li>Rate—Rate at which the create session response messages are sent.</li> </ul>       |
| Delete Responses Sent    | <ul style="list-style-type: none"> <li>Count—Total number of delete session response messages sent.</li> <li>Rate—Rate at which the delete session response messages are sent.</li> </ul>       |

## GTP Path Error Statistics

The GUI displays the same fields as that of GTP Path Error Statistics for SGW node. See [GTP Path Error Statistics, page 11-91](#).

## IP Local Pool Configuration

The GUI displays the same fields as that of IP Local Pool Configuration statistics for GGSN node. See [IP Local Pool Config, page 11-72](#).

## IP Local Pool Statistics

The GUI displays the same fields as that of IP Local Pool statistics for GGSN node. See [IP Local Pool Stats, page 11-73](#).

## Displaying QoS Statistics

You can view QOS real-time statistics for IP-RAN aggregation and cell-site routers that have both pseudo wires and RAN Optimized backhauls. To view QOS real-time statistics for one of these nodes, select the node in the navigation tree, then click the QoS tab.

The following options appear under View drop-down menu:

- [Config, page 11-101](#)
- [Class Map, page 11-101](#)
- [Queuing, page 11-102](#)
- [Match Statement, page 11-102](#)
- [Packet Marking, page 11-103](#)
- [Traffic Shaping, page 11-104](#)
- [Policing, page 11-104](#)

## Config

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Config details, choose Config option from the View drop-down menu. The GUI displays a bullet list/tree of the QOS configuration.

## Class Map

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Class Map Statistics table, choose Class Map option from the View drop-down menu. The GUI displays:

| Column                   | Description                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Class Map                | User-defined traffic class that contains one or many match statements used to classify packets into different categories. |
| Service Policy Direction | The direction of traffic for which the service policy is applied.                                                         |
| Pre-Policy Packets       | The number of inbound packets prior to executing any QoS policies.                                                        |

| Column                      | Description                                                                                                            |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------|
| Pre-Policy Bits             | The number of inbound octets prior to executing any QoS policies.                                                      |
| Pre-Policy Bits Rate        | The rate of the traffic prior to executing any QoS policies.                                                           |
| Post-Policy Bits            | The number of outbound octets after executing QoS policies.                                                            |
| Post-Policy Bits Rate       | The rate of the traffic after executing QoS policies                                                                   |
| Dropped Packets             | The number of dropped packets per class as the result of all features that can produce drops.                          |
| Dropped Bits                | The number of dropped bits per class as the result of all features that can produce drops.                             |
| Drop Bits Rate              | The rate of the drops per class as the result of all features that can produce drops.                                  |
| SRAM Buffer Dropped Packets | The number of drop packet count which occurred due to a lack of SRAM buffers during output processing on an interface. |

## Queuing

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Queuing Statistics table, choose Queuing option from the View drop-down menu. The GUI displays:

| Column                   | Description                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Class Map                | User-defined traffic class that contains one or many match statements used to classify packets into different categories. |
| Service Policy Direction | The direction of traffic for which the service policy is applied.                                                         |
| Queue Depth              | The current depth of the queue.                                                                                           |
| Max Queue Depth          | The maximum depth of the queue.                                                                                           |
| Queue Discarded Bits     | The count of octets, associated with this class, that were dropped by queueing.                                           |
| Queue Discarded Packets  | The number of packets, associated with this class, that were dropped by queueing.                                         |

## Match Statement

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Match Statement Statistics table, choose Match Statement option from the View drop-down menu. The GUI displays:

| Column                   | Description                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Class Map                | User-defined traffic class that contains one or many match statements used to classify packets into different categories. |
| Service Policy Direction | The direction of traffic for which the service policy is applied.                                                         |
| Match Statement          | The specific match criteria to identify packets for classification purposes.                                              |
| Pre-Policy Packets       | The number of inbound packets prior to executing any QoS policies.                                                        |
| Pre-Policy Bits          | The number of inbound octets prior to executing any QoS policies.                                                         |
| Pre-Policy Bits Rate     | The rate of the traffic prior to executing any QoS policies.                                                              |

## Packet Marking

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Packet Marking Statistics table, choose Packet Marking option from the View drop-down menu. The GUI displays:

| Column                               | Description                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Class Map                            | User-defined traffic class that contains one or many match statements used to classify packets into different categories. |
| Service Policy Direction             | The direction of traffic for which the service policy is applied.                                                         |
| DSCP Packets                         | The number of packets whose DSCP field is marked by Set feature.                                                          |
| Precedence Packets                   | The number of packets whose Precedence field is marked by Set feature.                                                    |
| QOS Group Packets                    | The number of packets whose Qos Group field is marked by Set feature.                                                     |
| Frame Relay DE Packets               | The number of packets whose Frame Relay DE Bit is marked by Set feature.                                                  |
| ATM CLP Packets                      | The number of packets whose ATM CLP Bit is marked by Set feature.                                                         |
| Layer 2 COS Packets                  | The number of packets whose Layer 2 Cos field is marked by Set feature.                                                   |
| MPLS Experimental Imposition Packets | The number of packets whose MPLS Experimental Imposition field is marked by Set feature.                                  |
| Discard Class Packets                | The number of packets whose Discard Class field is marked by Set feature.                                                 |
| MPLS Experimental Top Most Packets   | The number of packets whose MPLS Experimental Top Most field is marked by Set feature.                                    |

| Column                    | Description                                                                       |
|---------------------------|-----------------------------------------------------------------------------------|
| SRP Priority Packets      | The number of packets whose SRP Priority field is marked by Set feature.          |
| DSCP Tunnel Packets       | The number of packets whose DSCP Tunnel field is marked by Set feature.           |
| Precedence Tunnel Packets | The number of packets whose Precedence Tunnel field is marked by Set feature.     |
| Frame Relay FECN          | The number of packets whose Frame Relay FECN BECN field is marked by Set feature. |

## Traffic Shaping

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Traffic Shaping Statistics table, choose this option from the View drop-down menu. The GUI displays:

| Column                   | Description                                                                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Class Map                | User-defined traffic class that contains one or many match statements used to classify packets into different categories.                                                                         |
| Service Policy Direction | The direction of traffic for which the service policy is applied.                                                                                                                                 |
| Active                   | The current traffic-shaping state. When traffic-shaping is enabled and the traffic rate exceeds the shape rate, traffic-shaping is considered to be active. Otherwise, it is considered inactive. |
| Queue Size               | The current traffic-shaping queue depth in packets.                                                                                                                                               |
| Delayed Bits             | The number of octets that have been delayed.                                                                                                                                                      |
| Delayed Packets          | The number of packets that have been delayed.                                                                                                                                                     |
| Dropped Bits             | The number of octets that have been dropped during shaping.                                                                                                                                       |
| Dropped Packets          | The number of packets that have been dropped during shaping.                                                                                                                                      |

## Policing

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Policing Statistics table, choose Policing option from the View drop-down menu. The GUI displays:

| Column                   | Description                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Class Map                | User-defined traffic class that contains one or many match statements used to classify packets into different categories. |
| Service Policy Direction | The direction of traffic for which the service policy is applied.                                                         |
| Conformed Packets        | The number of packets treated as conforming by the policing feature                                                       |
| Conformed Bits           | The number of octets treated as conforming by the policing feature                                                        |
| Conformed Bits Rate      | The rate of conforming traffic.                                                                                           |
| Exceeded Packets         | The number of packets treated as non-conforming by the policing feature.                                                  |
| Exceeded Bits            | The number of octets treated as non-conforming by the policing feature.                                                   |
| Exceeded Bits Rate       | The rate of non-conforming traffic.                                                                                       |
| Violated Packets         | The number of packets treated as violated by the policing feature.                                                        |
| Violated Bits            | The number of octets treated as violated by the policing feature.                                                         |
| Violated Bits Rate       | The rate of the violating traffic.                                                                                        |

## Displaying PWE3 Real-Time Statistics

The MWTM enables you to display PWE3 real-time statistics in the MWTM web interface. Because the MWTM client also displays these statistics and the GUIs for the web and client interfaces are so similar, the PWE3 real-time statistics are described in [Viewing PWE3 Statistics, page 8-115](#).

## Displaying TDM Real-Time Statistics

The MWTM enables you to display TDM real-time statistics in the MWTM web interface. Because the MWTM client also displays these statistics and the GUIs for the web and client interfaces are so similar, the TDM real-time statistics are described in [Viewing TDM Statistics, page 8-101](#).

## Displaying SLB Real time statistics

The MWTM enables you to display SLB real-time statistics in the MWTM web interface, for the mSEF devices that support 7600 supervisor card. To display SLB real-time statistics, select the mSEF node that supports 7600 supervisor card in the navigation tree and click the Statistics tab. These options appear under the Type drop-down menu:

- [Virtual Server, page 11-106](#)
- [Real Server, page 11-106](#)
- [Server Farms, page 11-107](#)
- [Global Statistics, page 11-108](#)

- [DFP Agents, page 11-109](#)
- [DFP Real Servers, page 11-109](#)

## Virtual Server

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Virtual Server statistics table, choose Virtual Server option from the Type drop-down menu. The GUI displays:

| Column              | Description                                                                                                                                                                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Virtual Server Name | Name of the virtual server.                                                                                                                                                                                                                                                       |
| Protocol            | Protocol for the virtual server.                                                                                                                                                                                                                                                  |
| IP Address          | IP address of the virtual server.                                                                                                                                                                                                                                                 |
| Port                | Port of the virtual server.                                                                                                                                                                                                                                                       |
| State               | State of the virtual server.                                                                                                                                                                                                                                                      |
| Current Connections | Number of currently assigned connections being handled by this virtual server.                                                                                                                                                                                                    |
| Total Connections   | <ul style="list-style-type: none"> <li>• Count—Number of assigned connections handled by the virtual server since the server was configured.</li> <li>• Rate—Rate at which the assigned connections are handled by the virtual server since the server was configured.</li> </ul> |
| Server Farm         | Name of the virtual server farm bound to the virtual server.                                                                                                                                                                                                                      |

## Real Server

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Real server configuration and statistics table, choose Real Server option from the Type drop-down menu. The GUI displays:

| Column              | Description                                                       |
|---------------------|-------------------------------------------------------------------|
| IP Address          | IP Address of the real server.                                    |
| Farm Name           | Name of the server farm of the real server.                       |
| State               | Current state of real server.                                     |
| Current Connections | Number of assigned connections being handled by this real server. |

| Column                          | Description                                                                                                                                                                                                                                                               |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total Connections               | <ul style="list-style-type: none"> <li>Count—Number of assigned connections handled by this real server since this server was configured.</li> <li>Rate—Rate at which the assigned connections are handled by the real server since the server was configured.</li> </ul> |
| Consecutive Connection Failures | Number of connection failures to this real server without a successful connection.                                                                                                                                                                                        |
| Total Connection Failures       | <ul style="list-style-type: none"> <li>Count—Total number of times this real server has failed since the creation of this row.</li> <li>Rate—Rate at which the real server has failed since the creation of this row.</li> </ul>                                          |
| Administrative Weight           | User-configured weight of the real server for the load balancing algorithms.                                                                                                                                                                                              |
| Operational Weight              | Actual operating weight of the real server used by the load-balancing algorithms.                                                                                                                                                                                         |

## Server Farms

### Note

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Server farm configuration and statistics table, choose Server Farm option from the Type drop-down menu. The GUI displays:

| Column                 | Description                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------|
| Farm Name              | Name of the server farm.                                                                          |
| Predictor              | Load balancing algorithm in use by the server farm for its real servers for the local SLB entity. |
| NAT Setting            | Type of NAT employed by the local SLB entity for servers in this server farm.                     |
| Number of Real Servers | Number of real servers in the server farm.                                                        |
| Bind ID                | Identifies one or more server farms to which the real server belongs.                             |

## Global Statistics

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the Global Statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Field                        | Description                                                                                                                                                                                                                                                                       |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Assisted Switching Packets   | <ul style="list-style-type: none"> <li>Count—Number of packets handled by SLB which are switched via the highest-performance switching path.</li> <li>Rate—Rate at which the packets are handled by SLB which are switched via the highest-performance switching path.</li> </ul> |
| Zombies                      | <ul style="list-style-type: none"> <li>Count—Number of TCP and UDP connections currently in the zombie state waiting for timers to expire.</li> <li>Rate—Rate at which the TCP and UDP connections currently in the zombie state waiting for timers are expired.</li> </ul>       |
| Connections Reassigned       | <ul style="list-style-type: none"> <li>Count—Number of TCP and UDP connections reassigned from one real server to another.</li> <li>Rate—Rate at which the TCP and UDP connections are reassigned from one real server to another.</li> </ul>                                     |
| Connections Destroyed        | <ul style="list-style-type: none"> <li>Count—Number of TCP and UDP connections destroyed by SLB, either by TCPIP teardown or timeout.</li> <li>Rate—Rate at which the TCP and UDP connections are destroyed by SLB.</li> </ul>                                                    |
| Connections Created          | <ul style="list-style-type: none"> <li>Count—Number of TCP and UDP connections created since SLB was configured.</li> <li>Rate—Rate at which the TCP and UDP connections are created since SLB is configured.</li> </ul>                                                          |
| Unassisted Switching Packets | <ul style="list-style-type: none"> <li>Count—Number of packets forwarded by the Software Load Balancing manager's software.</li> <li>Rate—Rate at which the packets are forwarded by the Software Load Balancing manager's software.</li> </ul>                                   |
| Connections Established      | <ul style="list-style-type: none"> <li>Count—Number of connections established through SLB.</li> <li>Rate—Rate at which the connections are established through SLB.</li> </ul>                                                                                                   |

## DFP Agents

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the DFP Agents statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Column         | Description                                                                           |
|----------------|---------------------------------------------------------------------------------------|
| IP Address     | IP address of the DFP agent.                                                          |
| Port           | Port number of DFP agent.                                                             |
| State          | State of DFP agent.                                                                   |
| Time Out       | Time interval during which the agent must send at least one message to the manager.   |
| Retry Count    | Number of times the manager will attempt to re-establish a connection with the agent. |
| Agent Interval | Time interval before SLB retries connecting to a DFP agent.                           |

## DFP Real Servers

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

To view the DFP Real Servers statistics table, choose this option from the Type drop-down menu. The GUI displays:

| Column      | Description                                                           |
|-------------|-----------------------------------------------------------------------|
| IP Address  | IP address of the DFP agent.                                          |
| Protocol    | Protocol of the real server.                                          |
| Port        | Port number of real server.                                           |
| Bind ID     | Identifies one or more server farms to which the real server belongs. |
| Real Weight | Weight of the real server reported from a DFP agent.                  |

# CHAPTER 12

## Viewing Administrative Information from the Web Interface

---

To access the Administrative page of the MWTM web interface, click **Administrative** in the navigation tree in the left pane. The right pane displays the following tabs:

- General
- SNMP
- Credentials
- Discovery
- User Management

This chapter contains:

- [Viewing General Tab Details, page 12-2](#)
- [Viewing SNMP Tab Details, page 12-22](#)
- [Viewing Credentials Tab Details, page 12-24](#)
- [Viewing Discovery Tab Details, page 12-27](#)
- [Viewing User Management Tab Details, page 12-32](#)

### Note

If MWTM User-Based Access is enabled, only users with authentication level 3 (Network Operator) and higher can see all options. Users of all other levels see only the System Information and System Status panes (except License Information and Chassis Inventory (7600/SAMI) Report).

## Viewing General Tab Details

The MWTM web interface **General** tab provides access to MWTM system information, including messages, logs, status, and properties. To view the General tab information, click **Administrative** in the navigation tree and then click **General** tab in the right pane. This tab displays the information indicated in the following table.

| Pane               | GUI Elements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Reference                                                                     |

The General tab displays the following:

- [Viewing MWTM System Information](#), page 12-5
- [Viewing System Messages](#), page 12-6
- [Viewing System Status Information](#), page 12-12
- [Viewing System Logs](#), page 12-13

- [Viewing Properties, page 12-17](#)

## Viewing MWTM System Information

Depending upon which type(s) of network you are managing, you can view the following MWTM system information from the MWTM web interface by clicking **Administrative** in the navigation tree in the left pane and then clicking **General** tab in the right pane:

- **README**—Shows the contents of the `/opt/CSCOs/gm/install/README.txt` file. This file provides a brief overview of the system requirements and the tasks that are necessary to install this software release.

To access the MWTM README page, choose **README** from the **Administrative** page.

- **CHANGES**—Lists the major new features for the release.
- *(ITP only)* **ITP OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-ITP` file. This file contains a list of the supported OS software images for:
  - ITP nodes
  - GTT encoding scheme
  - MLR address table configuration
  - GTT accounting statistics reports
  - Route table and GTT table deployment
  - MSU rates
  - ITP provisioning

To access the MWTM ITP OS README page, choose **ITP OS README** from the **Administrative** page.

- *(IPRAN only)* **IPRAN OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-IPRAN` file. This file contains a list of the supported OS software images for:
  - MWR nodes
  - ONS nodes
  - RAN SVC cards

To access the MWTM IPRAN OS README page, choose **IPRAN OS README** from the **Administrative** page.

- *(mSEF, CSG1 only)* **CSG1 OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-CSG` file. This file contains a list of the supported OS software images for CSG1.

To access the MWTM CSG1 OS README page, choose **CSG1 OS README** from the **Administrative** page.

- *(mSEF, CSG2 only)* **CSG2 OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-CSG2` file. This file contains a list of the supported OS software images for CSG2.

To access the MWTM CSG2 OS README page, choose **CSG2 OS README** from the **Administrative** page.

- (*mSEF, GGSN only*) **GGSN OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-GGSN` file. This file contains a list of the supported OS software images for GGSN.  
To access the MWTM GGSN OS README page, choose **GGSN OS README** from the **Administrative** page.
- (*mSEF, HA only*) **HA OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-HA` file. This file contains a list of the supported OS software images for HA.  
To access the MWTM HA OS README page, choose **HA OS README** from the **Administrative** page.
- (*mSEF, PDSN only*) **PDSN OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-PDSN` file. This file contains a list of the supported OS software images for PDSN.
- (*mSEF, PDSN only*) **PDNGW OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-PDNGW` file. This file contains a list of the supported OS software images for PDNGW.
- (*mSEF, SGW only*) **SGW OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-SGW` file. This file contains a list of the supported OS software images for SGW.
- (*mSEF, PCRF only*) **PCRF OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-PCRF` file. This file contains a list of the supported OS software images for PCRF.
- **Export Reports README**—Shows the contents of the `/opt/CSCOs/gm/install/README-ExportReports.txt` file. This file contains a list of the formats for the export files.
- (*mSEF, BWG only*) **BWG OS README**—Shows the contents of the `/opt/CSCOs/gm/install/MWTM-OS-Info-BWG` file. This file contains a list of the supported OS software images for BWG.  
To access the MWTM BWG OS README page, choose **BWG OS README** from the **Administrative** page.
- **MWTM Supported SNMP MIBs**—Shows a list of the MIBs (categorized by product type) on the server to which you are connected, and which is currently running the MWTM.

Each MIB appears in a list as a clickable link. You can open or download the contents of the MIB by clicking the MIB name. See [Appendix F, “MIB Reference,”](#) for a complete list and high-level description of each supported MIB.

To access the MIBs page, choose **MIBs** from the **Administrative** page of the MWTM web interface.

## Viewing System Messages

You can view the following MWTM system messages from the MWTM web interface by clicking **Administrative** in the navigation tree in the left pane and then clicking **General** tab in the right pane:

### Note

These messages are related to the MWTM system itself, not to your network.

- [Viewing Info Messages, page 12-7](#)
- [Viewing Error Messages, page 12-7](#)

- [Viewing MWTM User Action Messages, page 12-8](#)
- [Viewing All Archived MWTM Messages, page 12-10](#)
- [Viewing Console Log Archived Messages, page 12-11](#)

## Viewing Info Messages

You can view info messages by clicking **Administrative > General > Info Messages**, or **Info** from the web page menu bar, if visible.

The System Messages: Last *number* Info Messages page shows informational messages in the MWTM system log. These messages can be useful when diagnosing and correcting MWTM operational problems.

The Last Info Messages table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Period<br>(in heading)    | Collection period of the table, such as <i>Since Server Restart</i> .                                                                                                                                                                                                                                                                                                                                                                                                        |
| Timestamp<br>(in heading) | Date and time the MWTM last updated the information on the page.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Row                       | Unique number identifying each entry in the table. You cannot edit this field.                                                                                                                                                                                                                                                                                                                                                                                               |
| Time                      | Date and time the message was logged.<br>To sort the messages by time, click the Time heading.                                                                                                                                                                                                                                                                                                                                                                               |
| Source                    | Source for the message, with the format <i>process.host.id</i> , where: <ul style="list-style-type: none"> <li>• <i>process</i> is the process that logged the message.</li> <li>• <i>host</i> is the hostname of the process that logged the message.</li> <li>• <i>id</i> is an MWTM ID that uniquely identifies the process that logged the message; or in the event that two or more clients are running on the same node, connected to the same MWTM server.</li> </ul> |
| Task                      | Task, or thread, that logged the message.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Message                   | Text of the message.<br>To sort the messages alphabetically by message text, click the Message heading.                                                                                                                                                                                                                                                                                                                                                                      |

## Viewing Error Messages

The System Messages: Last *number* Error Messages page shows error messages stored in the MWTM system log. These messages can be useful when diagnosing and correcting MWTM operational problems.

To access this page, click:

- **Administrative > General > Error Messages.**
- **Error** from the web page menu bar, if visible.

The Last Error Messages table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Period<br>(in heading)    | Collection period of the table, such as <i>Since Server Restart</i> .                                                                                                                                                                                                                                                                                                                                                                                                  |
| Timestamp<br>(in heading) | Date and time the MWTM last updated the information on the page.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Row                       | Unique number identifying each entry in the table. You cannot edit this field.                                                                                                                                                                                                                                                                                                                                                                                         |
| Time                      | Date and time the message was logged.<br>To sort the messages by time, click the Time heading.                                                                                                                                                                                                                                                                                                                                                                         |
| Source                    | Source for the message, with the format <i>process.host.id</i> , where: <ul style="list-style-type: none"> <li><i>process</i> is the process that logged the message.</li> <li><i>host</i> is the hostname of the process that logged the message.</li> <li><i>id</i> is an MWTM ID that uniquely identifies the process that logged the message; or in the event that two or more clients are running on the same node, connected to the same MWTM server.</li> </ul> |

| Message                   | Text of the message.<br>To sort the messages alphabetically by message text, click the Message heading.                                                                                                                                                                                                                                                                                                                                                                |

## Viewing MWTM User Action Messages

The System Messages: Last *number* Action Messages page shows user action messages stored in the MWTM system log. These messages can be useful when diagnosing and correcting MWTM operational problems, and when monitoring audit trails of user actions.

To access this page, use one of these procedures. Click:

- Administrative > General > User Actions.**
- Action** from the web page menu bar, if visible.

The MWTM shows the System Messages: Last *number* Action Messages page. The System Messages: Last *number* Action Messages page has these sections:

- [Last Action Messages Menu, page 12-8](#)
- [Last Action Messages Table, page 12-9](#)

### Last Action Messages Menu

By default, the MWTM shows action messages of all classes on the System Messages: Last *number* Action Messages page. However, the MWTM provides menu options that enable you to display only messages of a specific class on the page.

The Last Action Messages menu contains:

| Column         | Description                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Create         | Opens the System Messages: Last <i>number</i> Action: specified web page:                                                                                                                                                                                                                  |
| Delete         | <ul style="list-style-type: none"> <li>• <b>Create</b>—Opens the Create Messages web page, showing only Create action messages.</li> </ul>                                                                                                                                                 |
| Discover       | <ul style="list-style-type: none"> <li>• <b>Delete</b>—Opens the Delete Messages web page, showing only Delete action messages.</li> </ul>                                                                                                                                                 |

### Last Action Messages Table

The Last Action Messages table contains:

| Column                    | Description                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------|
| Period<br>(in heading)    | Collection period of the table, such as <i>Since Server Restart</i> .                                     |
| Timestamp<br>(in heading) | Date and time the information on the page was last updated by the MWTM.                                   |
| Row                       | Unique number identifying each entry in the table. You cannot edit this field.                            |
| Time                      | <p>Date and time the message was logged.</p> <p>To sort the messages by time, click the Time heading.</p> |

| Column  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Class   | <p>Class of the message. Possible classes are:</p> <ul style="list-style-type: none"> <li>• <b>Create</b>—Creation event, such as the creation of a seed file.</li> <li>• <b>Delete</b>—Deletion event, such as the deletion of an object or file.</li> <li>• <b>Discover</b>—Discovery event, such as Discovery beginning.</li> <li>• <b>Edit</b>—Edit event. A user has edited an object.</li> <li>• <b>Ignore</b>—Ignore event. A user has flagged a link or linkset as Ignored.</li> <li>• <b>Login</b>—Login event. A user has logged in to the MWTM.</li> <li>• <b>LoginDisable</b>—LoginDisable event. The MWTM has disabled a user's User-Based Access authentication as a result of too many failed attempts to log in to the MWTM.</li> <li>• <b>LoginFail</b>—LoginFail event. An attempt by a user to log in to the MWTM has failed.</li> <li>• <b>Logout</b>—Logout event. A user has logged out of the MWTM.</li> <li>• <b>OverWrite</b>—OverWrite event. An existing file, such as a seed file or route file, has been overwritten.</li> <li>• <b>Poll</b>—Poll event, such as an SNMP poll.</li> <li>• <b>Purge</b>—Purge event. A user has requested Discovery with Delete Existing Data chosen, and the MWTM has deleted the existing MWTM database.</li> </ul> <p>To sort the messages by class, click the Class heading.</p> |
| Message | <p>Text of the message.</p> <p>To sort the messages alphabetically by message text, click the Message heading.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Viewing All Archived MWTM Messages

The System Message Archives: All Messages page shows all archived messages in the MWTM system logs, including:

- error
- informational
- trace
- debug
- dump
- messages
- SNMP

To access the System Message Archives: All Messages page, use one of these options. Click:

- **Administrative > General > Message Archives.**
- **Archives** from the web page menu bar, if visible.

On the System Message Archives: All Messages page, messages are archived by timestamp. Each archived file contains all MWTM system messages for a single session for the server to which you are connected, and which is currently running the MWTM server. (If you restart the server, the MWTM creates a new file.)

To view archived messages, click a timestamp. The System Messages Archive: Last *number* All Messages page appears, which shows all messages that were in the system log at the specified timestamp.

**Note**

You might observe an entry labeled *messageLog-old* among a list of files that have timestamps in the filenames. A daily cron job creates the files with the timestamps. The cron job, which runs at midnight, searches through the *messageLog.txt* and *messageLog-old.txt* files for all entries from the past day. The *messageLog-old.txt* file exists only if the size of *messageLog.txt* exceeds the limit set by the [mwtm logsize](#) command. The MWTM lists the contents of *messageLog-old.txt* because it could contain important data from the day the message log file rolled over.

The Last All Messages table contains this information (without column headers):

| Description | Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Index       | Message number that the MWTM assigns to the message.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Time        | Date and time the message was logged.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Type        | Type of message. Possible types are: <ul style="list-style-type: none"> <li>• Action</li> <li>• Debug</li> <li>• Dump</li> <li>• Error</li> <li>• Info</li> <li>• SNMP</li> <li>• Trace</li> </ul>                                                                                                                                                                                                                                                                            |
| Source      | Source for the message, with the format <i>process.host.id</i> , where: <ul style="list-style-type: none"> <li>• <i>process</i> is the process that logged the message.</li> <li>• <i>host</i> is the hostname of the process that logged the message.</li> <li>• <i>id</i> is an MWTM ID that uniquely identifies the process that logged the message; or, in the event that two or more clients are running on the same node, connected to the same MWTM server.</li> </ul> |
| Task        | Task, or thread, that logged the message.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Message     | Text of the message.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Viewing Console Log Archived Messages

The System Console Archives: All Messages page shows all archived system console messages.

To access the System Console Archives: All Messages page, choose **Administrative > General > Console Log Archives**.

On the System Console Archives: All Messages page, messages are archived by timestamp. Each archived file contains all MWTM system console messages for a single session for the server to which you are connected, and which is currently running the MWTM server. (If you restart the server, the MWTM creates a new file).

To view these archived messages, click a timestamp. The Console Archive: Last *number* All Messages page appears, which shows all the console messages that were in the system log at the specified timestamp.

## Viewing System Status Information

You can view the MWTM system status information from the MWTM web interface by clicking **Administrative** in the navigation tree in the left pane and then clicking **General** tab in the right pane:

- [Viewing System Status, page 12-12](#)
- [Viewing System Versions, page 12-12](#)
- [Viewing System Check, page 12-12](#)
- [Viewing Connected Clients, page 12-12](#)
- [Viewing License Information, page 12-12](#)
- [Viewing Chassis Inventory \(7600/SAMI\) Report, page 12-13](#)

### Viewing System Status

To access system status information, choose **Administrative > General > System Status** (the MWTM might take a few seconds to display this page). This page shows the status of all MWTM servers, local clients, and processes.

### Viewing System Versions

To access version information, choose **Administrative > General > System Versions** (the MWTM might take a few seconds to display this page). This page shows version information for all MWTM servers, clients, and processes.

### Viewing System Check

To access system information, choose **Administrative > General > System Check**. MWTM displays the output from the following command:

```
/opt/CSCOsgm/logs/sgmCheckSystemLog.txt
```

### Viewing Connected Clients

To access connected client information, choose **Administrative > General > Connected Clients**. This page lists all MWTM clients that are currently connected to the MWTM server. It also lists all Solaris and Linux users that are logged in to the MWTM server.

### Viewing License Information

To access license information and to verify license compliance, choose **Administrative > General > License Information**.

MWTM displays the output from the following command:

```
/opt/CSCOsgm/bin/mwtm licenseinfo
```

When you select **Administrative > License Information**, MWTM displays the number of devices and cards that are managed by the MWTM software. For example, for an mSEF network, MWTM displays the number of 7600, 7300, and 7200 devices in addition to the number of SAMI cards. For ITP networks, MWTM displays the number of 7600, including the number of different types of cards on the 7600 device, 7300, 7200, and 2800 devices.

## Viewing Chassis Inventory (7600/SAMI) Report

To access chassis inventory (7600/SAMI) report information, choose **Administrative > General > Chassis Inventory (7600/SAMI) Report**.

MWTM displays the output from the following command:

```
/opt/CSCOSgm/bin/mwtm chassisinventory
```

## Viewing System Logs

You can view the MWTM system logs information from the MWTM web interface by clicking **Administrative** in the navigation tree in the left pane and then clicking **General** tab in the right pane:

- [Viewing the Install Log, page 12-13](#)
- [Viewing the Console Log, page 12-13](#)
- [Viewing the Backup Log, page 12-14](#)
- [Viewing the Command Log, page 12-14](#)
- [Viewing the Troubleshoot Log, page 12-14](#)
- [Viewing the Event Automation Log, page 12-15](#)
- [Viewing the Security Log, page 12-15](#)
- [Viewing the Install Log, page 12-16](#)
- [Viewing the Web Access Logs, page 12-16](#)
- [Viewing the Web Error Logs, page 12-16](#)
- [Viewing the Report Log, page 12-17](#)
- [Viewing the ITP Report Timers, page 12-17](#)

### Viewing the Install Log

The Install Log shows the contents of the MWTM installation log file for the server to which you are connected, and which is currently running the MWTM.

To access the Install Log, choose **Administrative > General > Install Log**. You can also view the Console Log with the `mwtm installlog` command.

### Viewing the Console Log

The Console Log shows the contents of the MWTM system console log file for the server to which you are connected, and which is currently running the MWTM. The console log file contains unexpected error and warning messages from the MWTM server, such as those that might occur if the MWTM server cannot start. It also provides a history of start-up messages for server processes and the time each message appeared.

To access the Console Log, choose **Administrative > General > Console Log**. You can also view the Console Log with the `mwtm console` command.

## Viewing the Backup Log

The Backup Log shows the contents of the MWTM backup log file for the server to which you are connected, and which is currently running the MWTM.

The default path and filename for the backup log file is */opt/CSCOsgm/logs/mwtmBackupLog.txt*. If you installed the MWTM in a directory other than */opt*, then the backup log file is in that directory.

To access the Backup Log, choose **Administrative > General > Backup Log**. You can also view the Backup Log with the **mwtm backuplog** command.

## Viewing the Command Log

The Command Log shows the contents of the MWTM system command log file for the server to which you are connected, and which is currently running the MWTM server. The system command log lists all **mwtm** commands that have been entered for the MWTM server, the time each command was entered, and the user who entered the command.

To access the Command Log, choose **Administrative > General > Command Log**. You can also view the Command Log with the **mwtm cmdlog** command.

The MWTM Command Log page appears. The Command Log table contains:

| Column    | Description                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------|
| Timestamp | Date and time the command was logged.<br>To sort the messages by time, click the Timestamp heading.     |
| User Name | User who entered the command.<br>To sort the commands by user, click the User heading.                  |
| Command   | Text of the command.<br>To sort the messages alphabetically by command text, click the Command heading. |

## Viewing the Troubleshoot Log

The Troubleshoot Log shows the contents of the MWTM troubleshoot log file for the server to which you are connected, and which is currently running the MWTM server.

### Note

By default, the Troubleshoot logging is disabled. To enable this log, execute **mwtm tshootlog action** command.

The default path and filename for the troubleshoot log file is */opt/CSCOsgm/logs/sgmTroubleshootLog.txt*. If you installed the MWTM in a directory other than */opt*, then the troubleshoot log file is in that directory.

To access the Troubleshoot Log page, choose **Administrative > General > Troubleshoot Log**. You can also view the Troubleshoot Log page using the **mwtm tshootlog** command.

The Troubleshoot Log table contains these columns:

| Column                         | Description                            |
|--------------------------------|----------------------------------------|
| Timestamp                      | Time of command execution.             |
| Client IP Address or User Name | User who executed the command.         |
| Node                           | Node on which the command is executed. |
| Feature                        | Personality of the device.             |
| Category                       | Category of the command.               |
| Command Name                   | Name of the command.                   |
| Command                        | The actual command from execution.     |

## Viewing the Event Automation Log

The Event Automation Log shows the contents of the system event automation log file for the server to which you are connected, and which is currently running the MWTM server. The system event automation log lists all messages that event automation scripts generate.

The default path and filename for the system event automation log file is */opt/CSCOs/gm/logs/eventAutomationLog.txt*. If you installed the MWTM in a directory other than */opt*, then the system event automation log file is in that directory.

To access the Event Automation Log, choose **Administrative > General > Event Automation Log**. You can also view the Event Automation Log with the ***mwtm eventautolog*** command.

### Related Topic

[Changing the Way the MWTM Processes Events, page 9-23.](#)

## Viewing the Security Log

The Security Log shows the contents of the MWTM system security log file for the server to which you are connected, and which is currently running the MWTM server. The system security log lists:

- All security events that have occurred for the MWTM server
- The time each event occurred
- The user and command that triggered the event
- The text of any associated message

The default path and filename for the system security log file is */opt/CSCOs/gm/logs/sgmSecurityLog.txt*. If you installed the MWTM in a directory other than */opt*, then the system security log file is in that directory.

To access the Security Log, choose **Administrative > General > Security Log**. You can also view the Security Log with the ***mwtm seclog*** command.

The Last Security Entries table contains these columns:

| Column    | Description                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| Timestamp | Date and time the security event occurred.<br>To sort the entries by time, click the Time heading.                                       |
| User      | User who triggered the security event.<br>To sort the entries by user, click the <b>User</b> heading.                                    |
| Message   | Text of the security event message.<br>To sort the entries alphabetically by message text, click the Message heading.                    |
| Command   | Text of the command that triggered the security event.<br>To sort the entries alphabetically by command text, click the Command heading. |

## Viewing the Install Log

The Install Log shows the contents of the MWTM system installation log. The installation log contains messages and other information recorded during installation, which can be useful when troubleshooting problems. The Install Log also records the installer's selections (for example, whether the installer chose to configure the MWTM to receive SNMP traps).

The default path and filename for the install log file is `/opt/CSCOsgm/install/cisco_sgmsvr_install.log`. If you installed the MWTM in a directory other than `/opt`, then the install log file is in that directory.

To access the Install Log, choose **Administrative > General > Install Log**. You can also view the Install Log with the `mwtm installlog` command.

## Viewing the Web Access Logs

The Web Access Logs page shows a list of web access log files for the server to which you are connected, and which is currently running the MWTM server. The web access log lists all system web access messages that have been logged for the MWTM server, providing an audit trail of all access to the MWTM server through the MWTM web interface.

The default path and filename for the web access log file is `/opt/CSCOsgm/apache/logs/access_log`. If you installed the MWTM in a directory other than `/opt`, then the web access log file is in that directory.

To access the Web Access Logs page, choose **Administrative > General > Web Access Logs**. You can also view the Web Access Logs page using the `mwtm webaccesslog` command.

## Viewing the Web Error Logs

The Web Error Logs page shows a list of web error log files for the server to which you are connected, and which is currently running the MWTM server. The web server error log lists all system web error messages that have been logged for the MWTM web server. You can use the web error log to troubleshoot the source of problems that users may have encountered while navigating the MWTM web interface.

The default path and filename for the web error log file is `/opt/CSCOsgm/apache/logs/error_log`. If you installed the MWTM in a directory other than `/opt`, then the web error log file is in that directory.

To access the Web Error Logs page, choose **Administrative > General > Web Error Logs**. You can also view the Web Error Logs page using the `mwtm weberrorlog` command.

## Viewing the Report Log

The Report Log shows the message log for ITP reports for the server to which you are connected, and which is currently running the MWTM server. You can view this log to determine the beginning and finish times for report generation. The log also records errors that occurred during report generation (for example, server connection errors).

The default path and filename for the report log file is `/opt/CSCOSgm/logs/sgmReportLog.txt`. If you installed the MWTM in a directory other than `/opt`, then the report log file is in that directory.

To access the Report Log, choose **Administrative > General > Report Log**. You can also view the Report Log with the `mwtm replot` command.

## Viewing the ITP Report Timers

To access the ITP Report Timers, choose **Administrative > General > ITP Report Timers**. This link is displayed only if the ITP personality is enabled.

The ITP Report Timers displays the output of the following command:

```
/opt/CSCOSgm/bin/mwtm statrep timer
```

The output displays the timer file for MWTM ITP network statistics reports. The timer file is useful for identifying how much time the MWTM spends gathering report data and generating reports.

## Viewing Properties

Property files for the MWTM are in the `/opt/CSCOSgm/properties` directory. You can view the MWTM properties from the MWTM web interface by clicking **Administrative** in the navigation tree in the left pane and then clicking **General** tab in the right pane:

- [Viewing System Properties, page 12-17](#)
- [Viewing Server Properties, page 12-19](#)
- [Viewing Web Configuration Properties, page 12-19](#)
- [Viewing Reports Properties, page 12-21](#)
- [Viewing Trap Forwarding Properties, page 12-22](#)

## Viewing System Properties

To access the System Properties file, choose **Administrative > General > System** in the Properties pane. The MWTM shows the contents of the `/opt/CSCOSgm/properties/System.properties` file.

The System Properties file contains MWTM server and client properties that control various MWTM configuration parameters.

You can change some of the system properties using MWTM commands:

| To change this system property | Use this MWTM command                          |
|--------------------------------|------------------------------------------------|
| ATBLDIR                        | <a href="#">mwtm atbldir, page B-100</a>       |
| AUTO_SYNC_CONFIG               | <a href="#">mwtm autosynconfig, page B-101</a> |

| To change this system property | Use this MWTM command                            |
|--------------------------------|--------------------------------------------------|
| BACKUP_RMIPOrt                 | <a href="#">mwtm secondaryserver</a> , page B-60 |
| BACKUP_SERVER                  |                                                  |
| BACKUP_WEBPORT                 |                                                  |
| BACKUPDAYS                     | <a href="#">mwtm backupdays</a> , page B-10      |
| BADLOGIN_TRIES_ALARM           | <a href="#">mwtm badloginalarm</a> , page B-12   |

| VCS_REPOSITORY_DIR             | <a href="#">mwtm archivedir, page B-99</a>  |
| WEB_PORT                       | <a href="#">mwtm webport, page B-94</a>     |
| WEB_BROWSER                    | <a href="#">mwtm browserpath, page B-13</a> |

For these system properties, you can view related documentation:

| System Property  | Related Documentation                                                  |
|------------------|------------------------------------------------------------------------|
| CLIENT_PORT      | <a href="#">Configuring Port Numbers and Parameters, page H-5</a>      |
| DATASERVER_PORT  |                                                                        |
| LOGINSERVER_PORT |                                                                        |
| RMIREGISTRY_PORT |                                                                        |
| MAX_CHART_SERIES | <a href="#">Displaying Backhaul Performance Statistics, page 11-29</a> |

## Viewing Server Properties

To access the Server Properties file, choose **Administrative > General > Server** in the Properties pane. The MWTM shows the contents of the `/opt/CSCOsgm/properties/Server.properties` file.

The Server Properties file contains various properties that control the MWTM server.

You can use MWTM commands to change these server properties:

| To change this server property | Use this MWTM command                         |
|--------------------------------|-----------------------------------------------|
| DEMAND_POLLER_TIMELIMIT        | <a href="#">mwtm pollertimeout, page B-51</a> |
| SNMP_MAX_ROWS                  | <a href="#">mwtm snmpwalk, page B-71</a>      |
| UNKNOWN_AGING_TIMEOUT          | <a href="#">mwtm unknownage, page B-89</a>    |

To change poller parameters in the Server Properties file, see the “[Changing MWTM Server Poller Settings](#)” section on page 4-2.

## Viewing Web Configuration Properties

To access the Web Configuration Properties file, choose **Administrative > General > WebConfig** in the Properties pane. The MWTM shows the contents of the `/opt/CSCOsgm/properties/WebConfig.properties` file.

The Web Configuration Properties file contains properties that control the configuration of the MWTM web interface. For example:

```
MAX_ASCII_ROWS = 6000
```

```

MAX_HTML_ROWS = 100

The selectable page sizes start at MIN_SELECTABLE_PAGE_SIZE and doubles until
the MAX_SELECTABLE_PAGE_SIZE value is reached
(e.g. 25, 50, 100, 200, 400, 800)
MIN_SELECTABLE_PAGE_SIZE = 25
MAX_SELECTABLE_PAGE_SIZE = 800
LOG_UPDATE_INTERVAL = 300
WEB_UTIL = percent
WEB_NAMES = display
MAX_EV_HIST = 15000

```

You can use the MWTM to change the web configuration properties:

| Web Configuration Property | Changing Default Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOG_UPDATE_INTERVAL        | To control how often, in seconds, the MWTM updates certain web output, use the <b><a href="#">mwtm weblogupdate</a></b> command. The valid range is 1 second to an unlimited number of seconds. The default value is 300 seconds (5 minutes).                                                                                                                                                                                                                                                               |
| MAX_ASCII_ROWS             | To set the maximum number of rows for MWTM ASCII web output, such as displays of detailed debugging information, use the <b><a href="#">mwtm maxascirows</a></b> command. The valid range is 1 row to an unlimited number of rows. The default value is 6,000 rows.                                                                                                                                                                                                                                         |
| MAX_EV_HIST                | To set the maximum number of rows for MWTM to search in the event history logs, use the <b><a href="#">mwtm maxevhist</a></b> command. The event history logs are the current and archived MWTM network status logs for status change and SNMP trap messages. The MWTM sends the results of the search to the web browser, where the results are further limited by the setting of the mwtm maxhtmlrows command. The valid range is 1 row to an unlimited number of rows. The default value is 15,000 rows. |
| MAX_HTML_ROWS              | To set the maximum number of rows for MWTM HTML web output, such as displays of statistics reports, status change messages, or SNMP trap messages, use the <b><a href="#">mwtm maxhtmlrows</a></b> command. This lets you select a page size (if you have not explicitly chosen a page size). Once you select a page size from any page, the MWTM remembers your preference until you delete your browser cookies. The default value is 100 rows.                                                           |
| MIN_SELECTABLE_PAGE_SIZE   | This setting determines the minimum page size for the user to select from the Page Size drop-down menu. The page size values start with the MIN_SELECTABLE_PAGE_SIZE and double until they reach the MAX_SELECTABLE_PAGE_SIZE.                                                                                                                                                                                                                                                                              |
| MAX_SELECTABLE_PAGE_SIZE   | This setting determines the maximum page size for the user to select from the Page Size drop-down menu. The page size values start with the MIN_SELECTABLE_PAGE_SIZE and double until they reach the MAX_SELECTABLE_PAGE_SIZE.                                                                                                                                                                                                                                                                              |

| Web Configuration Property | Changing Default Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WEB_NAMES                  | <p>To specify whether the MWTM should show real DNS names or display names in web pages, enter the <b>mwtm webnames</b> command. To show:</p> <ul style="list-style-type: none"> <li>The real DNS names of nodes, as discovered by the MWTM, enter <b>mwtm webnames real</b>.</li> <li>Display names, enter <b>mwtm webnames display</b>. Display names are new names that you specify for nodes. This is the default setting. For more information about display names, see the “Editing Properties” section on page 7-37.</li> </ul>                                                                                                           |
| WEB_UTIL                   | <p>To specify whether the MWTM should display send and receive as percentages or in Erlangs in web pages, enter the <b>mwtm who</b> command. To show:</p> <ul style="list-style-type: none"> <li>as a percentage, enter <b>mwtm webutil percent</b>. This is the default setting.</li> <li>Display in Erlangs (E), enter <b>mwtm webutil erlangs</b>.</li> </ul> <p>See <a href="#">Displaying RAN-O Statistics, page 11-28</a> and <a href="#">Displaying Error Statistics, page 11-31</a> for more information.</p> <p>See <a href="#">Chapter 13, “Managing Reports”</a> for more information on send and receive for linksets and links.</p> |

Each of the web configuration commands requires you to be logged in as the root user, as described in the “[Becoming the Root User \(Server Only\)](#)” section on page 3-2, or as a superuser, as described in the “[Specifying a Super User \(Server Only\)](#)” section on page 2-19.

## Viewing Reports Properties

To access the Reports Properties file, choose **Administrative > General > Reports** in the Properties pane. The MWTM shows the contents of the */opt/CSCOsgm/properties/Reports.properties* file.

The Reports Properties file contains properties that control various aspects of the reports that are available in the MWTM web interface.

You can use MWTM commands to change these reports properties:

| To change this server property | Use this MWTM command                      |
|--------------------------------|--------------------------------------------|
| ACC_REPORTS                    | <a href="#">mwtm accstats, page B-97</a>   |

## Viewing Trap Forwarding Properties

To access the Trap Forwarding Properties file, choose **Administrative > General > TrapForwarding** in the Properties. The MWTM shows the contents of the */opt/CSCOsgm/properties/TrapForwarder.properties* file.

The Trap Forwarder Properties file contains a list of the destination addresses for the trap forwarder. Enter each destination address on its own line and use this format:

**SERVER***xx=destination\_IP\_address[:port\_number]*

The *port\_number* parameter is optional.

## Viewing SNMP Tab Details

The MWTM web interface **SNMP** tab provides access to SNMP (Simple Network Management Protocol) Editor to edit the SNMP settings. To view the **SNMP** tab information, click **Administrative** in the navigation tree and then click **SNMP** tab in the right pane. The **SNMP** tab contains:

- [SNMP Editor Buttons, page 12-23](#)
- [SNMP Editor Table, page 12-23](#)

## SNMP Editor Buttons

The SNMP tab contains the following buttons:

| Button                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Add a new SNMP entry                | <p>Adds the new SNMP settings to the MWTM database. It opens <a href="#">Add SNMP Entry</a> window.</p> <p>To add a new node or range of nodes, enter the SNMP information in the appropriate fields of the Add SNMP Entry window and click <b>OK</b>. The new SNMP settings are added to the MWTM database and are displayed in the SNMP Editor table in the right pane.</p> <p>Click <b>Cancel</b> to close the Add SNMP Entry window.</p> <p>Click <b>Help</b> to display the online help for the window.</p> |
|  Save All SNMP entries               | Saves all the SNMP entries added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|  Reload SNMP entries from the server | Reloads all the SNMP entries from the server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Add SNMP Entry

The Add SNMP Entry window contains the following fields:

| Field or Button              | Description                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------|
| IP Address Range or Hostname | IP address or DNS name of a node or range of nodes. An asterisk (*) indicates a wildcard value.                   |
| Read Community               | SNMP community name used by the node for read access to the information maintained by the SNMP agent on the node. |
| Timeout (secs)               | Time, in seconds, the MWTM waits for a response from the node.                                                    |
| Retries                      | Number of times the MWTM attempts to connect to the node.                                                         |
| Poll Interval (mins)         | Time, in minutes, between polls for the node.                                                                     |
| OK                           | Applies the new SNMP settings to the MWTM database.                                                               |
| Cancel                       | Closes the Add SNMP Entry window without applying any changes.                                                    |
| Help                         | Shows online help for the current window.                                                                         |

## SNMP Editor Table

The SNMP Editor table contains:

| Column                       | Description                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------|
| IP Address Range or Hostname | IP address or DNS name of a node or range of nodes. An asterisk (*) indicates a wildcard value.                   |
| Read Community               | SNMP community name used by the node for read access to the information maintained by the SNMP agent on the node. |

| Column               | Description                                                    |
|----------------------|----------------------------------------------------------------|
| Timeout (secs)       | Time, in seconds, the MWTM waits for a response from the node. |
| Retries              | Number of times the MWTM attempts to connect to the node.      |
| Poll Interval (mins) | Time, in minutes, between polls for the node.                  |
| Action               | Delete—Deletes the entries in the corresponding row.           |

## Viewing Credentials Tab Details

The MWTM web interface **Credentials** tab provides access to Device Credentials Editor to edit the credential details for the nodes. To view the **Credentials** tab information, click **Administrative** in the navigation tree and then click **Credentials** tab in the right pane. The **Credentials** tab contains:

- [Device Credentials Editor Buttons, page 12-24](#)
- [Global Settings Table, page 12-25](#)
- [Node Settings Table, page 12-25](#)

## Device Credentials Editor Buttons

The Credentials tab contains the following buttons:

| Button                                                                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Add a new credential for a node    | <p>Adds new credentials to a specified node. It opens <a href="#">Add a Credential</a> window.</p> <p>To add a new credential, enter the credential information in the appropriate fields of the Add a Credential window and click <b>OK</b>. The new credentials are added to the MWTM database and are displayed in the Global Settings table in the right pane.</p> <p>Click <b>Cancel</b> to close the Add a Credential window.</p> <p>Click <b>Help</b> to display the online help for the window.</p> |
|  Save All Credentials               | Saves all the new credentials added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|  Reload credentials from the server | Reloads all the credentials from the server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Add a Credential

The Add a Credential window contains the following fields:

| Field or Button  | Description            |
|------------------|------------------------|
| Node             | Name of the node.      |
| User Name        | Login username.        |
| Password         | Login password.        |
| Enable User Name | Login enable username. |

| Field or Button | Description                                                                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Password | Login enable password.                                                                                                                                                                        |
| Protocol        | Choose the protocol to use when connecting to the node, either SSH or Telnet.<br><b>Note</b> The key size on the node must be configured to a minimum of 768 bits and a maximum of 2048 bits. |
| OK              | Adds the new credential information to the MWTM database.                                                                                                                                     |
| Cancel          | Closes the current window without saving the changes.                                                                                                                                         |
| Help            | Displays the online help for the window.                                                                                                                                                      |

## Global Settings Table

The Global Settings table contains:

| Column              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Type           | Type of node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| User Name           | Login username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Password            | Login password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable User Name    | Login enable username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Enable Password     | Login enable password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Connection Protocol | Choose the protocol to use when connecting to the node, either SSH or Telnet.<br><b>Note</b> The key size on the node must be configured to a minimum of 768 bits and a maximum of 2048 bits.                                                                                                                                                                                                                                                                                                                             |
| Action              | This column contains the following buttons: <ul style="list-style-type: none"> <li>Test the Credentials—You can test the credentials you have configured on the corresponding node or the default credentials against a selected node type. This opens <a href="#">Test Credentials for Node Type</a> window. An error message is displayed, if there are no nodes in data model to test.</li> <li>Clear the Row—Clears the entries in the corresponding row. The entries are cleared from the user interface.</li> </ul> |

## Node Settings Table

The Node Settings table contains:

| Column           | Description            |
|------------------|------------------------|
| Node             | Type of node.          |
| User Name        | Login username.        |
| Password         | Login password.        |
| Enable User Name | Login enable username. |
| Enable Password  | Login enable password. |

|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Protocol | Choose the protocol to use when connecting to the node, either SSH or Telnet.<br><br><b>Note</b> The key size on the node must be configured to a minimum of 768 bits and a maximum of 2048 bits.                                                                                                                                        |
| Action              | <ul style="list-style-type: none"> <li>Test the Credentials—You can test the credentials you have configured on the corresponding node. This opens <a href="#">Test Credentials for Node</a> window.</li> <li>Clear the Row—Clears the entries in the corresponding row. The entries are cleared in the user interface alone.</li> </ul> |

## Test Credentials for *Node Type*

The Test Credentials for *Node Type* window contains:

- Select a Node Pane

The Select a Node pane contains a drop-down menu which lists all the nodes of the corresponding *Node Type*.

- Logging Information Pane

The Logging Information pane displays the logging information about the node that you selected from the Select a Node drop-down menu. The information for the selected node is displayed after clicking **OK** button in the window.

- Test Credentials for *Node Type* Buttons

The Test Credentials for *Node Type* contains the following buttons:

| Button | Description                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------|
| OK     | Tests the credentials you have configured on the corresponding node or the default credentials against a selected node type. |
| Close  | Closes the current window.                                                                                                   |
| Help   | Displays the online help for the window.                                                                                     |

## Test Credentials for *Node*

The Test Credentials for *Node* window contains:

- Logging Information Pane

The Logging Information pane displays the logging information about the node. a timeout error is displayed if the credential information is not present for the corresponding node.

- Test Credentials for *Node* Buttons

The Test Credentials for *Node* contains the following buttons:

| Button | Description                              |
|--------|------------------------------------------|
| Close  | Closes the current window.               |
| Help   | Displays the online help for the window. |

# Viewing Discovery Tab Details

The MWTM web interface **Discovery** tab allows you to discover the network. To view the **Discovery** tab information, click **Administrative** in the navigation tree and then click **Discovery** tab in the right pane. The **Discovery** tab contains:

- [Discover Network Buttons, page 12-27](#)
- [Discovery Seeds Pane, page 12-30](#)
- [Discovery Settings Pane, page 12-31](#)

See [Discovering Your Network, page 3-4](#) for more information on Discovery feature.

## Discover Network Buttons

The Discover Network pane contains the following buttons:

| Button                                                                                       | Description                                                                                    |
|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
|  Load Seeds | Opens <a href="#">Load File Dialog</a> window, enabling you to load a seed file into the MWTM. |
|  Save Seeds | Saves the changes you have made to the chosen seed file.                                       |

| Button                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Save As | Opens the <a href="#">Save File Dialog</a> , using which you can save the updated seed file with a new name, or overwrite an existing seed file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Discover Network                                                                          | <p>Begins discovering the network.</p> <p>Click <b>Discover Network</b> to begin Discovery.</p> <p>If you have not defined at least one seed node in the Seed Settings tab, the MWTM prompts you to do so.</p> <p>When Discovery begins:</p> <ul style="list-style-type: none"> <li>• The <b>Discover Network</b> button changes to <b>Stop Discovery</b>.</li> <li>• The <code>Discovery In Progress</code> message appears in the title bar of all MWTM client windows.</li> </ul> <p>Discovery progresses in bursts. You might see a number of updates, followed by a pause, followed by more updates. The information that MWTM windows displays is not fully updated until Discovery is complete.</p> <p>By default, Discovery times out after 600 seconds (10 minutes). To change the Discovery timeout, change the value of the <code>DISCOVERY_TIMELIMIT</code> entry in the <i>Server.properties</i> file:</p> <ul style="list-style-type: none"> <li>• If you installed the MWTM in the default directory, <i>/opt</i>, then the location of the <i>Server.properties</i> file is <i>/opt/CSCOsgm/properties/Server.properties</i>.</li> <li>• If you installed the MWTM in a different directory, then the <i>Server.properties</i> file resides in that directory.</li> </ul> <p>Because the MWTM is an asynchronous system, with the MWTM server contacting clients one at a time, and because clients might run at different speeds, the information that MWTM clients display during Discovery might not always be synchronized.</p> <p>All other MWTM windows (Node, topology, and so on) are also populated with the newly discovered network data.</p> |

## Load File Dialog

The Load File Dialog window contains:

| Field or Button                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Seed File List                      | <p>The Seed File List pane contains:</p> <ul style="list-style-type: none"> <li>• Go up one Folder—Click this icon to go up one folder in the directory structure.</li> <li>• Type—Icon indicating whether the item in the table is a file or a folder.</li> <li>• Name—Name of the seed file or folder.</li> <li>• Last Modified—Date and time the seed file or folder was last modified.</li> <li>• Size (bytes)—Size of the seed file or folder, in bytes.</li> </ul> |
| Make this my preferred start option | <p>Specifies whether the chosen seed file should be loaded automatically whenever this MWTM client is started or the Discovery dialog box is opened.</p> <p>By default, this check box is unchecked for all seed files. That is, no seed file is loaded automatically when the MWTM client is started or the Discovery dialog box is opened.</p>                                                                                                                         |

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OK              | <p>Loads the chosen seed file, saves any changes you made to the list of files, and closes the dialog box.</p> <p>To load a seed file, double-click it in the list, select it in the list and click <b>OK</b>, or enter the name of the file and click <b>OK</b>.</p> <p>The MWTM saves any changes you made to the list of files, closes the Load File Dialog: Seed File List dialog box, loads the seed file, and returns to the Discovery dialog box. The MWTM lists all of the seed nodes in the seed file in the Seed Nodes pane, and displays details of the SNMP settings for the seed nodes in the Seed Details pane.</p> |
| Delete          | Deletes the chosen file from the seed file list. The MWTM issues an informational message containing the name and location of the deleted file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Cancel          | Closes the dialog box without loading a seed file or saving any changes to the seed file list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Help            | Displays online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

See [Loading a Seed File, page 3-8](#) for more information about loading the seed files.

## Save File Dialog

The Save File Dialog window contains:

| Field or Button                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Seed File List                      | <p>The Seed File List pane contains:</p> <ul style="list-style-type: none"> <li>Go up one Folder—Click this icon to go up one folder in the directory structure.</li> <li>New Folder—Click this icon to create a new folder in the current directory. This action opens the Input dialog box. Enter a folder name and click <b>OK</b>. The new folder appears in the Save File dialog box. Double-click the folder to open it. You can save files in this folder or create another folder at this level.</li> <li>Type—Icon indicating whether the item in the table is a file or a folder.</li> <li>Name—Name of the seed file or folder.</li> <li>Last Modified—Date and time the seed file or folder was last modified.</li> <li>Size (bytes)—Size of the seed file or folder, in bytes.</li> </ul> |
| Filename                            | <p>Name by which you want to save the seed file.</p> <p>If you create a new seed filename, you can use any letters, numbers, or characters in the name that are allowed by your operating system. However, if you include any spaces in the new name, the MWTM converts those spaces to hyphens. For example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Make this my preferred start option | <p>Specifies whether the chosen seed file should be loaded automatically whenever this MWTM client is started or the Discovery dialog box is opened.</p> <p>By default, this check box is unchecked for all seed files. That is, no seed file is loaded automatically when the MWTM client is started or the Discovery dialog box is opened.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| OK              | <p>Saves the seed file and any changes you made to the seed file list and closes the dialog box.</p> <p>To save the seed file with a new name, you can either save the file with:</p> <ul style="list-style-type: none"> <li>• A completely new name. Enter the new name and click <b>OK</b>.</li> <li>• An existing name, overwriting an old seed file. Select the name in the list and click <b>OK</b>.</li> </ul> <p>The MWTM:</p> <ul style="list-style-type: none"> <li>• Saves the seed file with the new name</li> <li>• Saves any changes you made to the list of files</li> <li>• Closes the Save File Dialog: Seed File List dialog</li> <li>• Returns to the Discovery dialog box</li> </ul> |
| Delete          | Deletes the chosen file from the seed file list. The MWTM issues an informational message containing the name and location of the deleted file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Cancel          | Closes the dialog box without saving the seed file or saving any changes to the seed file list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Help            | Displays online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

See [Saving a Seed File, page 3-8](#) for more information on saving the seed files.

## Discovery Seeds Pane

The Discovery Seeds pane contains:

- [Seed Nodes File: No File panel, page 12-30](#)
- [Seed Details panel, page 12-31](#)

### Seed Nodes File: No File panel

The Seed Nodes File: No File panel contains:

| Field or Button                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address, Address Range, Subnet, CIDR, or DNS Hostname | <p>Address or name of the chosen seed node.</p> <p>To create a new seed file, enter the name or address of a seed node in this field. Examples of acceptable input include:</p> <ul style="list-style-type: none"> <li>• IP Address: 1.2.3.4 (see the guidelines for IP addresses in <a href="#">SNMP Configuration Table, page 4-16</a>).</li> <li>• Address Range: 1.2.3.2-15</li> <li>• Subnet, CIDR: 1.2.3.0/24, 1.2.3.0/255.255.255.0</li> <li>• DNS Hostname: mwtm.cisco.com</li> </ul> |

| Field or Button | Description                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------|
| Add             | Adds a new seed node to the MWTM.                                                               |
| Delete          | Deletes the chosen seed node. A confirmation dialog is displayed before deleting the seed node. |

## Seed Details panel

The Seed Details panel contains:

| Field                        | Description                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------|
| IP Address Range or Hostname | IP address or DNS name of a node or range of nodes. An asterisk (*) indicates a wildcard value.                   |
| Read Community               | SNMP community name used by the node for read access to the information maintained by the SNMP agent on the node. |
| Timeout (secs)               | Time, in seconds, the MWTM waits for a response from the node.                                                    |
| Retries                      | Number of times the MWTM attempts to connect to the node.                                                         |
| Poll Interval (mins)         | Time, in minutes, between polls for the node.                                                                     |

## Discovery Settings Pane

The Discovery Settings pane contains:

| Field          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entire Network | <p>Check box used to specify the extent of the network discovery:</p> <ul style="list-style-type: none"> <li>To discover the entire network, check this check box. This is called <i>recursive discovery</i>, and it is the default setting.</li> </ul> <p>With this check box checked, the MWTM discovers all seed nodes and attempts to manage them; then attempts to discover and manage all nodes that are adjacent to those seed nodes (unless the nodes are connected by serial links only); then attempts to discover and manage all nodes that are adjacent to <i>those</i> nodes; and so on, until the Max Hops limit is reached.</p> <ul style="list-style-type: none"> <li>To rediscover only seed nodes, uncheck this check box. This is called <i>nonrecursive discovery</i>.</li> </ul> <p>With this check box unchecked, the MWTM discovers all seed nodes and attempts to manage them, then labels all nodes that are adjacent to those seed nodes as Unmanaged.</p> <p><b>Note</b> When the user unchecks this option, the Max Hops field gets grayed-out.</p> |

| Field                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Hops             | The maximum number of hops from the seed node to search for other nodes to discover. Default is 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Delete Existing Data | <p>Check box used to keep or delete the existing MWTM database when discovering the network:</p> <ul style="list-style-type: none"> <li>To keep all existing network data in the MWTM database before rediscovering the network, uncheck this check box. This is the default setting.</li> <li>To delete all existing network data from the MWTM database before rediscovering the network, check this check box. Choose this option if you know that network elements have been deleted from your network since the last Discovery.</li> </ul> <p>If you discover the network with Delete Existing Data chosen, the MWTM stops any real-time polls that are running and issues appropriate messages.</p> |

## Viewing User Management Tab Details

The MWTM allows user management through the web interface. User access must be enabled for this feature. A level 5 user must be created during installation or post-installation using the MWTM CLI as root. A web user with user management permissions with MWTM access level five, can add or delete users and modify user passwords and roles/access levels.

To access the **User Management**, click **Administrative** in the navigation tree and then click **User Management** tab in the right pane. This tab displays all users in the system along with the time of their most recent login, their access level, and their account status.

The User Management tab contains:

- [User Management Buttons, page 12-33](#)
- [User Management Table, page 12-34](#)

## User Management Buttons

The User Management tab contains the following buttons:

| Button                                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Create a new user account       | <p>When the local authentication is enabled, it opens the <a href="#">Add New User</a> window. Password is the input when local authentication is enabled.</p> <p>When the solaris or linux authentication is enabled, it opens the <a href="#">Add New User</a> window. But it does not prompt for passwords since it reuses the OS-based passwords.</p> <p>To add a new user, enter the user information in the appropriate fields of the Add New User window and click <b>OK</b>. The new user is added to the MWTM database and the new information is displayed in the User Management table.</p> <p>Click <b>Cancel</b> to close the window.</p> <p>Click <b>Help</b> to display the online help for the window.</p> |
|  Delete an existing user account | <p>Deletes an existing user. The user interface asks for confirmation and deletes the user.</p> <p>To delete multiple users, click the checkbox in the user row and then click the 'Delete an existing user account' button in the toolbar.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>Users</i> users selected                                                                                       | Number of currently selected users.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Clear Selection                                                                                                   | Deselects the selected list of users.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Add New User

The Add New User window contains the following options when the local authentication is enabled:

| Field or Button                        | Description                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                   | The user name.                                                                                                                                                                                                                                                                                        |
| Level                                  | <p>Authentication level for the user. The valid values are:</p> <ul style="list-style-type: none"> <li>• Basic User</li> <li>• Power User</li> <li>• Network Operator</li> <li>• Network Administrator</li> <li>• System Administrator</li> <li>• Custom Level 1</li> <li>• Custom Level 2</li> </ul> |
| Password                               | User's password.                                                                                                                                                                                                                                                                                      |
| Confirm Password                       | Retype the password to confirm the new password.                                                                                                                                                                                                                                                      |
| Force user to reset password at login? | Whether to force the user to change the password at the next log in. The default is not to force the user to change the password.                                                                                                                                                                     |
| OK                                     | Saves the new user information.                                                                                                                                                                                                                                                                       |
| Cancel                                 | Closes the window without saving the changes.                                                                                                                                                                                                                                                         |
| Help                                   | Shows online help for the window.                                                                                                                                                                                                                                                                     |

## Add New User

The Add New User window contains the following options when solaris or linux authentication is enabled:

| Field or Button                | Description                                                                                                                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                           | The user name.                                                                                                                                                                                                                                                                                 |
| Level                          | Authentication level for the user. The valid values are: <ul style="list-style-type: none"> <li>• Basic User</li> <li>• Power User</li> <li>• Network Operator</li> <li>• Network Administrator</li> <li>• System Administrator</li> <li>• Custom Level 1</li> <li>• Custom Level 2</li> </ul> |
| Add users not known to system? | Whether to add the users who are not known to the system. The default is not to add the unknown users to the system.                                                                                                                                                                           |
| OK                             | Saves the new user information.                                                                                                                                                                                                                                                                |
| Cancel                         | Closes the window without saving the changes.                                                                                                                                                                                                                                                  |
| Help                           | Shows online help for the window.                                                                                                                                                                                                                                                              |

## User Management Table

The User Management table contains:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action          | Allows you to change the user's password.<br><br>Click the Change a user's password icon under the 'Action' column, To open <a href="#">Update user window</a> . Enter the new passwords in the appropriate fields of the window and click <b>OK</b> .<br><br>Click <b>Cancel</b> to close the window without saving the changes.<br><br>Click <b>Help</b> to display the online help for the window. |
| User            | The MWTM user for whom a User-Based Access account has been set up.                                                                                                                                                                                                                                                                                                                                   |
| Last Login      | Date and time the user last logged in to the MWTM.                                                                                                                                                                                                                                                                                                                                                    |

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Level    | <p>Authentication level and number for the user. Valid levels and numbers are:</p> <ul style="list-style-type: none"> <li>• Basic User, 1</li> <li>• Power User, 2</li> <li>• Network Operator, 3</li> <li>• Network Administrator, 4</li> <li>• System Administrator, 5</li> <li>• Custom Level 1, 11</li> <li>• Custom Level 2, 12</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Account Status  | <p>Current status of the user's account. Valid status settings are:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—The account has been enabled and is functioning normally.</li> <li>• <b>Disabled</b>—The account has been disabled for one of these reasons: <ul style="list-style-type: none"> <li>– A System Administrator disabled the account. See the <a href="#">“mwtm disablepass” section on page B-26</a> and the <a href="#">“mwtm disableuser” section on page B-27</a> for more information.</li> <li>– The MWTM disabled the account as a result of too many failed attempts to log in using the account. See the <a href="#">“mwtm badlogindisable” section on page B-12</a> for more information.</li> <li>– The MWTM disabled the account because it was inactive for too many days. See the <a href="#">“mwtm inactiveuserdays” section on page B-35</a> for more information.</li> </ul> </li> <li>• Expired Password</li> <li>• Temporary Password</li> </ul> |

## Update *user* window

The Update *user* window contains:

| Field or Button                        | Description                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Password                               | User's password.                                                                                                                  |
| Confirm Password                       | Retype the password to confirm the new password.                                                                                  |
| Force user to reset password at login? | Whether to force the user to change the password at the next log in. The default is not to force the user to change the password. |
| OK                                     | Saves the new user information.                                                                                                   |
| Cancel                                 | Closes the window without saving the changes.                                                                                     |
| Help                                   | Displays online help for the window.                                                                                              |

# CHAPTER 13

## Managing Reports

---

At scheduled intervals, you can configure the Cisco Mobile Wireless Transport Manager (MWTM) to gather critical information from network objects that it detects. The MWTM uses that information to calculate statistics (accounting statistics, performance statistics, and so on) and generates reports based on those statistics.

You can view reports in several ways:

- From the MWTM web navigation tree, in **Reports** or **File Archive**, click the type of report you want to view in the web navigation tree; for example, if you want to view current link reports, select **Reports > ITP Statistics > Link**. All link reports appear. See [Displaying Status and Summary Reports, page 11-15](#) for more information about accessing reports from the web interface.
- For a single object of a specified type do one of the following. From the MWTM:
  - Web navigation tree, in **DEFAULT View**, click a node select an object in a node. In the content area in the right pane, click the **Reports** tab. Reports appear for the active object only.
  - Client, right-click an object and click **Latest Reports**. The Reports tab in the MWTM web interface opens for the active object only.

This chapter contains:

- [Using the Reports Page, page 13-1](#)
- [Enabling Automatic Reports Using the CLI, page 13-2](#)
- [Viewing Reports, page 13-3](#)
- [Viewing Graph Series Editor Details, page 13-251](#)
- [Locating Stored Reports, page 13-253](#)
- [Customizing ITP Reports, page 13-254](#)
- [Generating Custom ITP Statistics Reports Using the CLI, page 13-254](#)

## Using the Reports Page

To access the main Reports page:

---

**Step 1** Do one of the following:

- In a web browser, launch the MWTM web interface (see [Accessing the MWTM Web Interface, page 11-2](#)). In the navigation tree, click **Reports**.

- From the MWTM client, in the MWTM main window, choose **View > MWTM Web Links > Reports**.

The Reports page in the content area shows the Report Type and the status (enabled or disabled). If you have generated a report, a green status ball and the word “Enabled” appear in the Status column. If you have not generated a report, a red status ball and the word “Disabled” appears.

**Note** Clicking a Report Type takes you directly to the report data page.

The Status column indicates whether you have enabled or disabled data gathering for the specified report type.

- Step 2** To enable a report in the MWTM Web interface, click “Disabled” in the Status column. The Status changes “Enabled” and a green status ball appears.

## Enabling Automatic Reports Using the CLI

Using CLI commands, there are two types of reports that you can generate:

- Continuous reports that run at specified intervals. You enable automatic generation of these reports with the **mwtm statreps** commands (see [Generating Custom ITP Statistics Reports Using the CLI, page 13-254](#)). After you enable generation of a continuous report, it will run at the specified intervals until you disable it with the appropriate CLI command.
- Custom ITP reports that you create one-time on demand. You generate these reports with the **mwtm abcstats** commands where *abc* is the type of command (see [Generating Custom ITP Statistics Reports Using the CLI, page 13-254](#)). They run at custom intervals or on demand at the specified times. Custom reports are *custom* because you can specify that they run at custom time intervals. The content of custom ITP reports is the same as the regularly scheduled reports. This option is only available for ITP reports listed in [Table 13-1](#).

Enabling continuous reports using the CLI is the same as enabling and disabling reports from the Reports page.

To enable continuous reports using the CLI:

- Step 1** Log in as the root user, as described in [Starting the MWTM Client, page 3-3](#), or as a superuser, as described in [Specifying a Super User \(Server Only\), page 2-19](#).

- Step 2** Enter:

```
cd /opt/CSCOs/gm/bin
```

- Step 3** Enter the following CLI command to enable all report types:

```
./mwtm statreps all
```

You can enable and disable specific reports using specific CLI commands. For example, to generate continuous GTT statistics, enter:

```
./mwtm statreps gtt
```

To see a list of all report-related CLI commands, enter the following command:

```
./mwtm rephelp
```

To determine which CLI command generates which report, see [Generating Custom ITP Statistics Reports Using the CLI, page 13-254](#).

- Step 4** (Optional) View the generated report in the MWTM web interface by clicking **Reports** in the navigation pane as described in [Viewing Reports, page 13-3](#).

**Note**

After you issue the CLI to generate a continuous report, the report is not immediately available for viewing. It takes approximately two times the report interval before the report is available.

## Viewing Reports

After you generate reports, you can view them using the MWTM web interface. You can view historical reports for all objects of a specific type (for example, all link reports for all links) or, you can view reports for a specific object (for example, all link reports for a specific link).

**Note**

For the reports having output type as Graph, the Graph Series Editor window is displayed when you click the Custom series icon. See [Viewing Graph Series Editor Details, page 13-251](#).

**Note**

For the reports having output type as Graph, the Sort Parameter option is available to select the criteria for including a top set of series and for ordering of the corresponding graphs displayed.

You can access reports in the MWTM web interface through these categories:

| Category                    | Report Type    | Related Content                                   |

To view a Web report:

- Step 1** For all objects of a specified type:
- From the MWTM web navigation tree, in **Reports** or **File Archive**, click the type of report you want to view in the web navigation tree; for example, if you want to view current link reports, select **Reports > ITP Statistics > Link**. All link reports appear.

For a single object of a specified type do one of the following. From the MWTM:

- Web navigation tree, in **DEFAULT View**, click a node to select an object in a node. In the content area in the right pane, click the **Reports** tab. Reports appear for the active object only.
- Client, right-click an object and click **Latest Reports**. The Reports tab in the MWTM web interface opens for the active object only.

- Step 2** Choose the **Type** and **Duration** from the drop-down lists; for example, if you wanted to view hourly link reports for the last 12 hours, choose **Link Hourly** from the Type list and **Last 12 Hours** from the Duration list.

- Step 3** (Optional) For most Statistics and Accounting reports, to customize the date or time range (or both) click the Customize icon. 

- Step 4** Click the green arrow to run the report. If you change the Type or Duration, an information message appears:

Click the green arrow to show the selected report.

- Step 5** To disable this error message, click **Hide Message**. To display the message again, click the **Information** icon. 

- Step 6** (Optional) For Statistics and Accounting reports, to export the report as a .csv file, click the **Export** icon. 

**Note** For information about all File Archive export reports in *csv.zip* format, refer to the MWTM readme file by clicking **Administrative** on the navigation pane, then under System Information, click **Export Reports README**. The readme contains documentation on every field in each export report, description of the report fields, and in most cases, the SNMP MIB variables used to generate the field values.

**Note**

To navigate to the Details tab for an object, click the underlined object in the report; for example, to go to the Details tab for a node, click the underlined node in the reports table.

**Tip**

For details on web toolbars and icons, see [Using the Toolbar, page 11-6](#).

## Viewing Common Statistics Reports

Common Statistics Reports are located within **Reports > Common Statistics** in the MWTM web interface. You can also find archived reports in the `/opt/CSCOs/gm/reports` directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All archived reports are saved as export files in .csv format.

You can view any of the following Common statistics reports:

- [AAA Reports, page 13-7](#)
- [CPU Reports, page 13-10](#)
- [Interface Reports, page 13-14](#)
- [Memory Reports, page 13-20](#)

### AAA Reports

The MWTM web interface provides node-level and network wide AAA reports for monitoring communications and status of AAA Server operation. To generate a network wide AAA reports:

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > AAA**.
  - Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
  - Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
  - Step 4** Choose an output format (Table or CSV) from the Output drop-down menu for contents of each output type.
  - Step 5** To generate the report, click the Run icon (green arrow .
  - Step 6** In the tool bar of the right pane, choose a report type from the Type drop-down menu:
    - [AAA Accounting Statistics Daily Report, page 13-7](#)
    - [AAA Authentication Statistics Daily Report, page 13-9](#)
- 

### AAA Accounting Statistics Daily Report

MWTM displays the AAA accounting statistics daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > AAA**.

**Note**

---

The 15-minute and hourly AAA accounting statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the AAA reports to navigate to a specific node to view hourly and 15 minute reports for that node.

---

- Step 2** Choose AAA Accounting Statistics Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node for the object                                                                                                                                                                                                                                           |
| Server Name                   | Name of the Server.                                                                                                                                                                                                                                                       |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                  |
| Requests                      | The number of accounting requests sent to the server during the system reinitialization.                                                                                                                                                                                  |
| Request Timeouts              | The number of accounting requests timed out during the system reinitialization.                                                                                                                                                                                           |
| Transaction Completed         | <ul style="list-style-type: none"> <li>Count—Total number of accounting transactions with the server which succeeded during the system reinitialization.</li> <li>Rate—Rate at which the accounting transactions succeeded during the system reinitialization.</li> </ul> |
| Transaction Failures          | The number of accounting transactions with this server which failed during the system reinitialization.                                                                                                                                                                   |
| Error Responses               | The number of server ERROR accounting responses received from the server during the system reinitialization.                                                                                                                                                              |
| Incorrect Responses           | The number of accounting responses which could not be processed during the system reinitialization.                                                                                                                                                                       |

### AAA Authentication Statistics Daily Report

MWTM displays the AAA authentication statistics daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > AAA**.

**Note**

The 15-minute and hourly AAA authentication statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the AAA reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose AAA Authentication Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node for the object                                                                                                                                                                                                                                                   |
| Server Name                   | Name of the Server.                                                                                                                                                                                                                                                               |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                          |
| Requests                      | The number of authentication requests sent to the server during the system reinitialization.                                                                                                                                                                                      |
| Request Timeouts              | The number of authentication requests which have timed out since the server is in active state.                                                                                                                                                                                   |
| Transaction Completed         | <ul style="list-style-type: none"> <li>Count—Total number of authentication transactions with the server which succeeded during the system reinitialization.</li> <li>Rate—Rate at which the authentication transactions succeeded during the system reinitialization.</li> </ul> |
| Transaction Failures          | The number of authentication transactions occurred when the server which failed since the server is in active state.                                                                                                                                                              |
| Error Responses               | The number of server ERROR authentication responses received from the server since the server is in active state.                                                                                                                                                                 |
| Incorrect Responses           | The number of authentication responses which could not be processed since the server is in active state.                                                                                                                                                                          |

## CPU Reports

The MWTM web interface provides node-level CPU reports. The information is available in graphical, tabular, and CSV formats. There are two types of utilization reports:

- Peak utilization—Displays the maximum (or peak) values obtained during the specified period (for example, 15 minutes, hourly, daily).
- Average utilization—Displays the average values obtained during the specified period (for example, 15 minutes, hourly, daily).

**Note** The 15-minute and hourly CPU reports are available from the node level only; they are not available from the top level or the network level.

In addition to generating network-wide CPU reports as explained in the following steps, you can also generate node-level CPU reports as explained in [Generating Node-Level CPU/Memory Reports, page 13-191](#).

To generate a network-wide CPU reports:

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > CPU**.

- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** To generate the report, click the Run icon (green arrow .
- Step 6** In the tool bar of the right pane, choose a report type from the Type drop-down menu:
- [CPU Peak Utilization Daily Reports, page 13-11](#)
  - [CPU Average Utilization Daily Reports, page 13-13](#)

## CPU Peak Utilization Daily Reports

The CPU Peak Utilization Daily reports display the CPUs with the highest maximum CPU utilization over the specified time period.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > CPU**. You can access node-level CPU/Memory reports by clicking on a node name, then clicking the **Performance** tab.
- Step 2** From the Type menu, select one of the following CPU utilization reports:
- CPU Peak Utilization Daily
  - CPU Average Utilization Daily

**Note** The 15-minute and hourly CPU reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CPU reports to navigate to a specific node to view hourly and 15 minute reports for that node.

A summary table displays the information described in the following table:

| Field                               | Description                                              |
|-------------------------------------|----------------------------------------------------------|
| Node                                | Name of the node.                                        |
| Slot/CPU                            | Slot number (if known) and CPU number.                   |
| CPU Description                     | Type of CPU.                                             |
| Average Utilization                 | Average utilization across the chosen time range.        |
| Maximum Utilization                 | Maximum utilization during the specified time range.     |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp when the maximum utilization occurred.         |
| Warning Threshold                   | Threshold setting beyond which a warning is issued.      |
| Overload Threshold                  | Threshold setting beyond which is considered overloaded. |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| GUI Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Graph</i>           | If you select <b>Graph</b> from the Output menu, the graph displays the 12 CPUs with the highest maximum CPU utilization over the specified time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>Table or CSV</i>    | <p>If you select <b>Table</b> from the Output menu, the table contains all CPUs monitored by MWTM. By default, the CPUs are sorted by maximum CPU utilization. The table includes:</p> <ul style="list-style-type: none"> <li>• Node—Name of the node.</li> <li>• Slot/CPU—Slot number (if known) and CPU number.</li> <li>• CPU Description—Type of CPU.</li> <li>• Timestamp (<i>timezone</i>)—Timestamp at which the maximum utilization rate occurred.</li> <li>• Average Utilization—Average of the data across the chosen time range.</li> <li>• Maximum Utilization—Maximum utilization during the specified time range.</li> <li>• Minimum Utilization—Minimum utilization during the specified time range.</li> <li>• Warning Threshold—Threshold setting beyond which a warning is issued.</li> <li>• Overload Threshold—Threshold setting beyond which is considered overloaded.</li> </ul> <p><b>Note</b> If you select <b>CSV</b> from the Output menu, the same data is presented in the excel format.</p> |
| Expand to Full Screen  | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Hide Summary Table     | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Percentage Utilization | If Output Type is Graph, the Y-axis label shows percentage of CPU utilization over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Time                   | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>Legend</i>          | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## CPU Average Utilization Daily Reports

The CPU Average Utilization Daily reports display the average CPU values gathered during the specified period.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > CPU**. You can access node-level CPU/Memory reports by clicking on a node name, then clicking the **Performance** tab.

**Step 2** In the tool bar of the right pane, from the Type menu, select **CPU Average Utilization Daily**.

A summary table displays the following information:

| Field                               | Description                                                                |
|-------------------------------------|----------------------------------------------------------------------------|
| Node                                | Name of the node.                                                          |
| Slot/CPU                            | Name of the CPU.                                                           |
| CPU Description                     | Description of the CPU.                                                    |
| Average Utilization                 | Average utilization across the chosen time range.                          |
| Maximum Utilization                 | Highest utilization of the average values during the specified time range. |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp for when the maximum utilization value occurred.                 |
| Warning Threshold                   | Threshold setting beyond which a warning is issued.                        |
| Overload Threshold                  | Threshold setting beyond which is considered overloaded.                   |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| GUI Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Graph</i>           | If you select <b>Graph</b> from the Output menu, the graph displays the average daily CPU utilization over the specified time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>Table or CSV</i>    | <p>If you select <b>Table</b> from the Output menu, the table contains all CPUs monitored by MWTM. By default, the CPUs are sorted by maximum CPU utilization. The table includes:</p> <ul style="list-style-type: none"> <li>• Node—Name of the node.</li> <li>• Slot/CPU—Slot number (if known) and CPU number.</li> <li>• CPU Description—Type of CPU.</li> <li>• Timestamp (<i>timezone</i>)—Timestamp at which the maximum utilization rate occurred.</li> <li>• Average Utilization—Average of the data across the chosen time range.</li> <li>• Maximum Utilization—Maximum utilization during the specified time range.</li> <li>• Minimum Utilization—Minimum utilization during the specified time range.</li> <li>• Warning Threshold—Threshold setting beyond which a warning is issued.</li> <li>• Overload Threshold—Threshold setting beyond which is considered overloaded.</li> </ul> <p><b>Note</b> If you select <b>CSV</b> from the Output menu, the same data is presented in the excel format.</p> |
| Expand to Full Screen  | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Hide Summary Table     | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Percentage Utilization | If Output Type is Graph, the Y-axis label shows percentage of CPU utilization over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Time                   | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>Legend</i>          | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Interface Reports

The MWTM web interface provides node-level and network wide interface reports. To generate a network wide interface reports:

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > Interface**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.
- Step 6** To generate the report, click the Run icon (green arrow .
- Step 7** In the tool bar of the right pane, choose a report type from the Type drop-down menu:
- [Interface Utilization Daily Reports, page 13-15](#)
  - [Interface Total Packets Daily Reports, page 13-17](#)
  - [Interface Errors/Discards Daily Report, page 13-19](#)

**Note**

If MWTM detects an utilization percentage that it considers to be impossible, the GUI displays ‘Out of Range’ in the corresponding table cells.

## Interface Utilization Daily Reports

MWTM displays the Interface Utilization Daily report during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > Interface**.

**Note**

The 15-minute and hourly Interface Utilization reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the Interface Utilization reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose Interface Utilization Daily from Type drop-down menu.
- The Send Utilization and Receive Utilization tables contain summary information as described below:

| Field     | Description            |
|-----------|------------------------|
| Node      | Name of the node.      |
| Interface | Name of the interface. |

| Field   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send    | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp that shows time when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp that shows time when the maximum value occurred.</li> </ul>          |
| Receive | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp that shows time when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp that shows time when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                 | Output     | Field                         | Description                                                                                                                                                                                   |
|-----------------------------|------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Utilization Daily | Table, CSV | Node                          | Name of the node for the link.                                                                                                                                                                |
|                             |            | Interface                     | Name of the interface.                                                                                                                                                                        |
|                             |            | Timestamp ( <i>timezone</i> ) | Timestamp that shows time bits-per second value occurred.                                                                                                                                     |
|                             |            | Average Utilization%          | <ul style="list-style-type: none"> <li>• Send—Average of the data sent across the chosen time range.</li> <li>• Receive—Average of the data received across the chosen time range.</li> </ul> |
|                             | Graph      | Expand to Full Screen         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                   |
|                             |            | Hide Summary Table            | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                            |
|                             |            | Utilization %                 | If Output Type is Graph, the Y-axis label shows Utilization in percentage.                                                                                                                    |
|                             |            | Time                          | Name of the node for the link.                                                                                                                                                                |
|                             |            | <i>Legend</i>                 | Device allows the user to interact with the operating system.                                                                                                                                 |

## Interface Total Packets Daily Reports

MWTM displays the Interface Total Packets Daily report during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > Interface**.

### Note

The 15-minute and hourly Interface Total Packets reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the Interface Total Packets reports to navigate to a specific node to view hourly and 15 minute reports for that node.

### Step 2

Choose Interface Total Packets Daily from Type drop-down menu.

The Total Send Packets and Total Receive Packets tables contain summary information as described below:

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node      | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Interface | Name of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Send      | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp that shows time when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp that shows time when the maximum value occurred.</li> </ul>          |
| Receive   | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp that shows time when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp that shows time when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                            | Output        | GUI Element | Field                             | Description                                                                                                        |
|----------------------------------------|---------------|-------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Interface<br>Total<br>Packets<br>Daily | Table,<br>CSV |             | Node                              | Name of the node for the link.                                                                                     |
|                                        |               |             | Interface                         | Device allows the user to interact with the operating system.                                                      |
|                                        |               |             | Time stamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                           |
|                                        |               | Send        | Total<br>Packets                  | The total number of packets sent by the Interface.                                                                 |
|                                        |               |             | Unicast<br>Packets %              | The number packets sent from a single source to a specified destination by the interface.                          |
|                                        |               |             | Multicast<br>Packets %            | The number of packets sent from the single source to multiple destinations by the interface.                       |
|                                        |               |             | Broadcast<br>Packets %            | The number of packets sent from multiple source to multiple destinations.                                          |
|                                        |               | Receive     | Total<br>Packets                  | The total number of packets received by the Interface.                                                             |
|                                        |               |             | Unicast<br>Packets %              | The number packets received by the interface.                                                                      |
|                                        |               |             | Multicast<br>Packets %            | The number of packets received by the interface.                                                                   |
|                                        |               |             | Broadcast<br>Packets %            | The number of packets received by the interface.                                                                   |
|                                        | Graph         |             | Expand to<br>Full Screen          | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.        |
|                                        |               |             | Hide<br>Summary<br>Table          | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|                                        |               |             | Total<br>Packets                  | If Output Type is Graph, the Y-axis label shows Utilization in percentage.                                         |
|                                        |               |             | Time                              | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                                        |               |             | <i>Legend</i>                     | If Output Type is Graph, a color-coded legend shows labels for utilization.                                        |

## Interface Errors/Discards Daily Report

MWTM displays the Interface failed during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > Interface**.

### Note

The 15-minute and hourly Interface Errors/Discards reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the Interface Errors/Discards reports to navigate to a specific node to view hourly and 15 minute reports for that node

### Step 2

Choose Interface Errors/Discards from Type drop-down menu.

The Send Errors+Discards and Receive Errors+Discards tables contain summary information as described below:

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node      | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Interface | Name of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Send      | <ul style="list-style-type: none"> <li>Average—Average Send for the statistic for the specified time.</li> <li>Minimum—Minimum Send for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp that shows time when the minimum value occurred.</li> <li>Maximum—Maximum Send for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp that shows time when the maximum value occurred.</li> </ul>          |
| Receive   | <ul style="list-style-type: none"> <li>Average—Average Receive for the statistic for the specified time.</li> <li>Minimum—Minimum Receive for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp that shows time when the minimum value occurred.</li> <li>Maximum—Maximum Receive for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp that shows time when the maximum value occurred.</li> </ul> |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                            | Output     | GUI Element | Field                          | Description                                                                                                        |
|----------------------------------------|------------|-------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Interface Errors/<br>Discards<br>Daily | Table, CSV |             | Node                           | Name of the node for the link.                                                                                     |
|                                        |            |             | Interface                      | Device allows the user to interact with the operating system.                                                      |
|                                        |            |             | Time stamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                           |
|                                        |            | Send        | Packets                        | Total number of outbound packets                                                                                   |
|                                        |            |             | Errors                         | Number of outbound packets that contained errors.                                                                  |
|                                        |            |             | Error %                        | Percentage of outbound packets that contained errors.                                                              |
|                                        |            |             | Discards                       | Number of outbound packets that were discarded                                                                     |
|                                        |            |             | Discard %                      | Percentage of outbound packets that were discarded.                                                                |
|                                        |            | Receive     | Packets                        | Total number of inbound packets                                                                                    |
|                                        |            |             | Errors                         | Number of inbound packets that contained errors.                                                                   |
|                                        |            |             | Error %                        | Percentage of inbound packets that contained errors.                                                               |
|                                        |            |             | Discards                       | Number of inbound packets that were discarded                                                                      |
|                                        |            |             | Discard %                      | Percentage of inbound packets that were discarded.                                                                 |
|                                        | Graph      |             | Expand to Full Screen          | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.        |
|                                        |            |             | Hide Summary Table             | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|                                        |            |             | Errors+ Discards               | If Output Type is Graph, the Y-axis label shows Utilization in percentage.                                         |
|                                        |            |             | Time                           | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                                        |            |             | <i>Legend</i>                  | If Output Type is Graph, a color-coded legend shows labels for utilization.                                        |

## Memory Reports

The MWTM web interface provides node-level Memory reports. The information is available in graphical, tabular, and CSV formats. There are two types of utilization reports:

- **Peak utilization**—Displays the maximum (or peak) values obtained during the specified period (for example, 15 minutes, hourly, daily).

- Average utilization—Displays the average values obtained during the specified period (for example, 15 minutes, hourly, daily).

**Note** The 15-minute and hourly Memory reports are available from the node level only; they are not available from the top level or the network level.

In addition to generating network-wide Memory reports as explained in the following steps, you can also generate node-level CPU reports as explained in [Generating Node-Level CPU/Memory Reports, page 13-191](#).

To generate a network-wide Memory reports:

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > Memory**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** To generate the report, click the Run icon (green arrow .
- Step 6** In the tool bar of the right pane, choose a report type from the Type drop-down menu:
  - [Memory Peak Utilization Daily Reports, page 13-21](#)
  - [Memory Average Utilization Daily Reports, page 13-24](#)

## Memory Peak Utilization Daily Reports

The Memory Peak Utilization Daily reports display the CPUs with the highest memory utilization over the specified time period.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > Memory**. You can access node-level CPU/Memory reports by clicking on a node name, then clicking the **Performance** tab.
- Step 2** From the Type menu, select one of the following Memory utilization reports:
  - Memory Peak Utilization 15 minutes
  - Memory Peak Utilization Hourly
  - Memory Peak Utilization Daily

**Note** The 15-minute and hourly Memory reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the Memory reports to navigate to a specific node to view hourly and 15 minute reports for that node.

A summary table displays the following information:

| Field                               | Description                                                 |
|-------------------------------------|-------------------------------------------------------------|
| Node                                | Name of the node.                                           |
| Slot/CPU                            | Name of the CPU.                                            |
| CPU Description                     | Description of the CPU.                                     |
| Memory Description                  | Type of memory.                                             |
| Average Utilization                 | Average memory utilization during the specified time range. |
| Maximum Utilization                 | Maximum memory utilization during the specified time range  |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp for when the maximum utilization value occurred.  |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| GUI Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Graph</i>           | If you select <b>Graph</b> from the Output menu, the graph displays the CPUs with the highest memory utilization over the specified time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>Table or CSV</i>    | <p>If you select <b>Table</b> from the Output menu, the table contains all CPUs monitored by MWTM. By default, the CPUs are sorted by maximum CPU utilization. The table includes:</p> <ul style="list-style-type: none"> <li>• Node—Name of the node.</li> <li>• Slot/CPU—Slot number (if known) and CPU number.</li> <li>• CPU Description—Type of CPU.</li> <li>• Timestamp (<i>timezone</i>)—Timestamp at which the maximum utilization rate occurred.</li> <li>• Memory Description—Type of memory, which can be processor, I/O, Fast, etc.</li> <li>• Average Utilization—Average of the data across the chosen time range.</li> <li>• Maximum Utilization—Maximum utilization during the specified time range.</li> <li>• Minimum Utilization—Minimum utilization during the specified time range.</li> <li>• Total—Average Used plus Average Free memory during the specified time frame.</li> <li>• Average Used—Average memory used during the specified time range.</li> <li>• Average Free—Average memory available during the specified time range.</li> </ul> <p><b>Note</b> If you select <b>CSV</b> from the Output menu, the same data is presented in the excel format.</p> |
| Percentage Utilization | If Output Type is Graph, the Y-axis label shows percentage of memory utilization over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Expand to Full Screen  | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Hide Summary Table     | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Time                   | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>Legend</i>          | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Memory Average Utilization Daily Reports

The Memory Average Utilization Daily reports display the average memory values gathered during the specified period.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Common Statistics > Memory**. You can access node-level CPU/Memory reports by clicking on a node name, then clicking the **Performance** tab.

**Step 2** From the Type menu, select one of the following Memory utilization reports:

- Memory Average Utilization 15 minutes
- Memory Average Utilization Hourly
- Memory Average Utilization Daily

**Note** The 15-minute and hourly Memory reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the Memory reports to navigate to a specific node to view hourly and 15 minute reports for that node.

A summary table displays the following information:

| Field                               | Description                                                                       |
|-------------------------------------|-----------------------------------------------------------------------------------|
| Node                                | Name of the node.                                                                 |
| Slot/CPU                            | Name of the CPU.                                                                  |
| CPU Description                     | Description of the CPU.                                                           |
| Memory Description                  | Type of memory.                                                                   |
| Average Utilization                 | Average memory utilization during the specified time range.                       |
| Maximum Utilization                 | Highest memory utilization of the average values during the specified time range. |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp for when the maximum utilization value occurred.                        |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| GUI Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <i>Graph</i>           | If you select <b>Graph</b> from the Output menu, the graph displays the average memory utilization over the specified time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>Table or CSV</i>    | <p>If you select <b>Table</b> from the Output menu, the table contains all CPUs monitored by MWTM. By default, the CPUs are sorted by maximum CPU utilization. The table includes:</p> <ul style="list-style-type: none"> <li>• Node—Name of the node.</li> <li>• Slot/CPU—Slot number (if known) and CPU number.</li> <li>• CPU Description—Type of CPU.</li> <li>• Timestamp (<i>timezone</i>)—Timestamp at which the maximum utilization rate occurred.</li> <li>• Memory Description—Type of memory, which can be processor, I/O, Fast, etc.</li> <li>• Average Utilization—Average of the data across the chosen time range.</li> <li>• Maximum Utilization—Maximum utilization during the specified time range.</li> <li>• Minimum Utilization—Minimum utilization during the specified time range.</li> <li>• Total—Average Used plus Average Free memory during the specified time frame.</li> <li>• Average Used—Average memory used during the specified time range.</li> <li>• Average Free—Average memory available during the specified time range.</li> </ul> <p><b>Note</b> If you select <b>CSV</b> from the Output menu, the same data is presented in the excel format.</p> |
| Expand to Full Screen  | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Hide Summary Table     | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Percentage Utilization | If Output Type is Graph, the Y-axis label shows percentage of memory utilization over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Time                   | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>Legend</i>          | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Viewing ITP Statistics Reports

ITP Statistics Reports are located within **Reports > ITP Statistics** in the MWTM web interface. You can also find ITP statistics reports in the `/opt/CSCOSgm/reports` directory on the MWTM server or an alternate location as configured by the MWTM system administrator. All reports are saved as export files in .csv format.

You can view any of the following ITP statistics reports:

- [AS Reports, page 13-26](#)
- [ASP Reports, page 13-34](#)

## AS Reports

The MWTM web interface provides node-level Application Server (AS) reports. The information is available in graphical, tabular, and CSV formats. To generate a network-wide AS report:

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > AS**.
  - Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
  - Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
  - Step 4** Choose an output format (Graph, Table or CSV) from the Output drop-down menu for contents of each output type.
  - Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.
  - Step 6** To generate the report, click the Run icon (green arrow .

In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [AS Statistics Hourly Reports, page 13-26](#)
  - [AS Statistics Daily Reports, page 13-30](#)
  - [AS Peaks Statistics Daily Reports, page 13-32](#)
- 

### AS Statistics Hourly Reports

MWTM displays the AS Statistics Hourly report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > AS**.
- Step 2** Choose AS Statistics Hourly from the Type drop-down menu.

The Send Packets and Receive Packets tables contain summary information as described below:

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node               | Name of the node for the application server.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Signaling Point    | Name of the signaling point for the application server.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Application Server | Name of the application server.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Send               | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive            | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                 | Output     | Field                         | Description                                                                                                        |
|-----------------------------|------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| AS Statistics Hourly Report | Table, CSV | Node                          | Name of the node.                                                                                                  |
|                             |            | Signaling Point               | Name of the signaling point for the application server.                                                            |
|                             |            | AS                            | Name of the application server.                                                                                    |
|                             |            | Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                           |
|                             |            | Packets From MTP3             | Total number of packets that the application server received, sent from the MTP3 layer.                            |
|                             |            | Packets To ASPs               | Total number of packets that the application server sent to the application server processes.                      |
|                             | Graph      | Expand to Full Screen         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|                             |            | Hide Summary Table            | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|                             |            | Packets                       | If Output Type is Graph, the Y-axis label shows hourly statistics over time.                                       |
|                             |            | Time                          | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                             |            | <i>Legend</i>                 | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.        |

## AS Statistics Daily Reports

MWTM displays the AS Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > AS**.

**Step 2** Choose AS Statistics Daily from the Type drop-down menu.

The Send Packets and Receive Packets tables contain summary information as described below:

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node               | Name of the node for the application server.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Signaling Point    | Name of the signaling point for the application server.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Application Server | Name of the application server.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Send               | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive            | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                | Output     | Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## AS Peaks Statistics Daily Reports

MWTM displays the AS Peaks Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > AS**.

**Step 2** Choose AS Peaks Statistics Daily from the Type drop-down menu.

The Send Peak Packets and Receive Peak Packets tables contain summary information as described below:

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node               | Name of the node for the application server.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Signaling Point    | Name of the signaling point for the application server.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Application Server | Name of the application server.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Send               | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive            | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                      | Output     | Field                         | Description                                                                                                                                                                                                                                                               |

|                                  |            | Peaks                         | If Output Type is Graph, the Y-axis label shows peaks daily statistics over time.                                                                                                                                                                                         |
|                                  |            | Time                          | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                         |
|                                  |            | <i>Legend</i>                 | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing                                                                                                                                                                |

## ASP Reports

The MWTM web interface provides node-level Application Server Process (ASP) reports. The information is available in graphical, tabular, and CSV formats. To generate a network-wide ASP report:

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > ASP**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.
- Step 6** To generate the report, click the Run icon (green arrow .
- 

In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [ASP Statistics Hourly Reports, page 13-34](#)
  - [ASP Statistics Daily Reports, page 13-37](#)
  - [ASP Peaks Statistics Daily Reports, page 13-39](#)
  - [ASP MTP3 Statistics Daily Reports, page 13-43](#)
  - [ASP MTP3 Peaks Statistics Daily Reports, page 13-45](#)
- 

### ASP Statistics Hourly Reports

MWTM displays the ASP Statistics Hourly report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

---

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > ASP**.
- Step 2** Choose ASP Statistics Hourly from the Type drop-down menu.

The Send Packets and Receive Packets tables contain summary information as described below:

| Field              | Description                                             |
|--------------------|---------------------------------------------------------|
| Node               | Name of the node for the application server process.    |
| Signaling Point    | Name of the signaling point for the application server. |
| Application Server | Name of the application server.                         |
| ASP                | Name of the application server process.                 |

| Field   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send    | <ul style="list-style-type: none"><li>• Average—Average Send for the statistic for the specified time.</li><li>• Minimum—Minimum Send for the statistic for the specified time.</li><li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li><li>• Maximum—Maximum Send for the statistic for the specified time.</li><li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li></ul>          |
| Receive | <ul style="list-style-type: none"><li>• Average—Average Receive for the statistic for the specified time.</li><li>• Minimum—Minimum Receive for the statistic for the specified time.</li><li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li><li>• Maximum—Maximum Receive for the statistic for the specified time.</li><li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li></ul> |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type              | Output        | Field                            | Description                                                                                                                      |
|--------------------------|---------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| ASP Statistics<br>Hourly | Table,<br>CSV | Node                             | Name of the node.                                                                                                                |
|                          |               | Signaling Point                  | Name of the signaling point for the application server.                                                                          |
|                          |               | AS                               | Name of the application server.                                                                                                  |
|                          |               | ASP                              | Name of the application server process.                                                                                          |
|                          |               | Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                         |
|                          |               | Packets From ASP                 | Total number of packets that the application server process send for the specified date and hour.                                |
|                          |               | Packets To ASP                   | Total number of packets sent to the application server process for the specified date and hour.                                  |
|                          |               | Packets From MTP3                | Total number of packets that the application server process received from the MTP3 layer for the specified date and hour.        |
|                          |               | Packets To MTP3                  | Total number of packets the application server process sent to the MTP3 layer for the specified date and hour.                   |
|                          |               | Send Errors                      | Total number of errors that occurred when sending packets to the application server process for the specified date and hour.     |
|                          |               | Receive Errors                   | Total number of errors that occurred when receiving packets from the application server process for the specified date and hour. |
|                          | Graph         | Expand to Full Screen            | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing                       |
|                          |               | Hide Summary Table               | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.               |
|                          |               | Packets                          | If Output Type is Graph, the Y-axis label shows hourly statistics over time.                                                     |
|                          |               | Time                             | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                |
|                          |               | <i>Legend</i>                    | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing                       |

## ASP Statistics Daily Reports

MWTM displays the ASP Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > ASP**.

**Step 2** Choose ASP Statistics Daily from the Type drop-down menu.

The Send Packets and Receive Packets tables contain summary information as described below:

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node               | Name of the node for the application server process.                                                                                                                                                                                                                                                                                                                                                                                            |
| Signaling Point    | Name of the signaling point for the application server.                                                                                                                                                                                                                                                                                                                                                                                         |
| Application Server | Name of the application server.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ASP                | Name of the application server process.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Send               | <ul style="list-style-type: none"> <li>Average—Average Send for the statistic for the specified time.</li> <li>Minimum—Minimum Send for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum Send for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive            | <ul style="list-style-type: none"> <li>Average—Average Receive for the statistic for the specified time.</li> <li>Minimum—Minimum Receive for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum Receive for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type          | Output     | Field                         | Description                                                                                                                                                                                                |
|----------------------|------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASP Statistics Daily | Table, CSV | Node                          | Name of the node.                                                                                                                                                                                          |

|                      |            | Peak From Hour                | Hour in which the Peak From ASP for the application server process occurred for the specified date.<br><br>Click the hour to see the ASP Hourly Report for the chosen application server process and hour. |
|                      |            | Packets To ASP                | Total number of packets that the application server sent to the application server processes for the specified date.                                                                                       |
|                      |            | Peak To ASP                   | Highest hourly Packets To ASP for the application server process for the specified date.                                                                                                                   |
|                      |            | Peak To Hour                  | Hour in which the Peak To ASP for the application server process occurred for the specified date.                                                                                                          |
|                      |            | Send Errors                   | Total number of errors that occurred when sending packets to the application server processes for the specified date.                                                                                      |
|                      |            | Peak Send Errors              | Highest hourly Send Errors for the application server process for the specified date.                                                                                                                      |
|                      |            | Peak Send Hour                | Hour in which the Peak Send Errors for the application server process occurred for the specified date.                                                                                                     |
|                      |            | Receive Errors                | Total number of errors that occurred when receiving packets from the application server processes for the specified date.                                                                                  |
|                      |            | Peak Receive Errors           | Highest hourly receive errors for the application server process for the specified date.                                                                                                                   |
|                      |            | Peak Receive Hour             | Hour in which the peak receive errors for the application server process occurred for the specified date.                                                                                                  |

| Report Type | Output | Field                 | Description                                                                                                        |
|-------------|--------|-----------------------|--------------------------------------------------------------------------------------------------------------------|
|             | Graph  | Expand to Full Screen | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|             |        | Hide Summary Table    | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|             |        | Packets               | If Output Type is Graph, the Y-axis label shows hourly statistics over time.                                       |
|             |        | Time                  | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|             |        | <i>Legend</i>         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |

### ASP Peaks Statistics Daily Reports

MWTM displays the ASP Peaks Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > ASP**.

**Step 2** Choose ASP Peaks Statistics Daily from the Type drop-down menu.

The Send Peak Packets and Receive Peak Packets tables contain summary information as described below:

| Field              | Description                                             |
|--------------------|---------------------------------------------------------|
| Node               | Name of the node for the application server process.    |
| Signaling Point    | Name of the signaling point for the application server. |
| Application Server | Name of the application server.                         |
| ASP                | Name of the application server process.                 |

| Field   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send    | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                   | Output        | Field                             | Description                                                                                                        |
|-------------------------------|---------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------|
| ASP Peaks Statistics<br>Daily | Table,<br>CSV | Node                              | Name of the node.                                                                                                  |
|                               |               | SP Name                           | Name of the signaling point for the application server.                                                            |
|                               |               | AS                                | Name of the application server.                                                                                    |
|                               |               | ASP                               | Name of the application server process.                                                                            |
|                               |               | Timestamp<br>( <i>timestamp</i> ) | Timestamp of the report.                                                                                           |
|                               |               | Peak From<br>ASP                  | Highest hourly Packets From ASP for the application server process for the chosen day.                             |
|                               |               | Peak From<br>Hour                 | Hour in which the Peak From ASP for the application server process occurred for the chosen day.                    |
|                               |               | Peak To ASP                       | Highest hourly Packets To ASP for the application server process for the chosen day.                               |

|                               |               | Peak Send<br>Errors               | Highest hourly Send Errors for the application server process for the last 30 days.                                |
|                               |               | Peak Send<br>Hour                 | Hour in which the Peak Send Errors for the application server process occurred for the chosen day.                 |
|                               |               | Peak Receive<br>Errors            | Highest hourly Receive Errors for the application server process or the last 30 days.                              |
|                               |               | Peak Receive<br>Hour              | Hour in which the Peak Receive Errors for the application server process occurred for the chosen day.              |
|                               | Graph         | Expand to<br>Full Screen          | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|                               |               | Hide<br>Summary<br>Table          | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|                               |               | Peaks                             | If Output Type is Graph, the Y-axis label shows daily statistics over time.                                        |
|                               |               | Time                              | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                               |               | <i>Legend</i>                     | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |

## ASP MTP3 Statistics Daily Reports

MWTM displays the ASP MTP3 Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > ASP**.

**Step 2** Choose ASP MTP3 Statistics Daily from the Type drop-down menu.

The Send Packets and Receive Packets tables contain summary information as described below:

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node               | Name of the node for the application server process.                                                                                                                                                                                                                                                                                                                                                                                            |
| Signaling Point    | Name of the signaling point for the application server.                                                                                                                                                                                                                                                                                                                                                                                         |
| Application Server | Name of the application server.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ASP                | Name of the application server process.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Send               | <ul style="list-style-type: none"> <li>Average—Average Send for the statistic for the specified time.</li> <li>Minimum—Minimum Send for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum Send for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive            | <ul style="list-style-type: none"> <li>Average—Average Receive for the statistic for the specified time.</li> <li>Minimum—Minimum Receive for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum Receive for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                  | Output        | Field                            | Description                                                                                                                                                                                                      |
|------------------------------|---------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASP MTP3 Statistics<br>Daily | Table,<br>CSV | Node                             | Name of the node.                                                                                                                                                                                                |

|                              |               | Peak Receive Hour                | Hour in which the Peak Receive Errors for the application server process occurred for the specified date.<br><br>Click the hour to see the ASP Hourly Report for the chosen application server process and hour. |

| Report Type | Output | Field                 | Description                                                                                                        |
|-------------|--------|-----------------------|--------------------------------------------------------------------------------------------------------------------|
|             | Graph  | Expand to Full Screen | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|             |        | Hide Summary Table    | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|             |        | Packets               | If Output Type is Graph, the Y-axis label shows hourly statistics over time.                                       |
|             |        | Time                  | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|             |        | <i>Legend</i>         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |

### ASP MTP3 Peaks Statistics Daily Reports

MWTM displays the ASP MTP3 Peaks Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > ASP**.

**Step 2** Choose ASP MTP3 Peaks Statistics Daily from the Type drop-down menu.

The Send Peak Packets and Receive Peak Packets tables contain summary information as described below:

| Field              | Description                                             |
|--------------------|---------------------------------------------------------|
| Node               | Name of the node for the application server process.    |
| Signaling Point    | Name of the signaling point for the application server. |
| Application Server | Name of the application server.                         |
| ASP                | Name of the application server process.                 |

| Field   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send    | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                     | Output     | Field                         | Description                                                                                                        |
|---------------------------------|------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| ASP MTP3 Peaks Statistics Daily | Table, CSV | Node                          | Name of the node.                                                                                                  |

|                                 |            | Time                          | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                                 |            | <i>Legend</i>                 | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |

## GTT Rates Reports

You can view peak GTT rates or average GTT rates. The information is available in graphical, tabular, and CSV formats. There are two types of GTT rates reports:

- **Peak utilization**—Displays the maximum (or peak) GTT rates obtained during the specified period (for example, 15 minutes, hourly, daily).
- **Average utilization**—Displays the average values obtained during the specified period (for example, 15 minutes, hourly, daily).

### Note

The 15-minute and hourly reports for GTT Rates are available from the node level only; they are not available from the top level or the network level.

To generate a network-wide GTT reports:

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > GTT Rates**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu for contents of each output type.

### Note

The Graph output displays up to twelve GTT Rates data streams based on traffic and/or number of errors. To view all GTT Rates data streams, choose Graph, Table, or CSV.

- Step 5** To generate the report, click the Run icon (green arrow ).  
In the tool bar of the right pane, choose a report type from the Type drop-down menu:
  - [GTT Rate Peak Daily Reports, page 13-50](#)
  - [GTT Rate Average Daily Reports, page 13-51](#)

## GTT Rate Peak Daily Reports

GTT Rate Peak Daily Report displays the maximum (or peak) GTT rates obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > GTT Rates**.

**Step 2** Choose GTT Rate Peak Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                     |
|----------------------------------|-------------------------------------------------|
| Node                             | Name of the node.                               |
| Slot/CPU                         | Slot number (if known) and CPU number.          |
| CPU Description                  | Type of CPU.                                    |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                        |
| Average GTT Rate                 | Average GTT rate for the specified duration.    |
| Maximum GTT Rate                 | Maximum GTT rate during the specified duration. |
| Minimum GTT Rate                 | Minimum GTT rate during the specified duration. |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                | Output | Field                          | Description                                                                                                                                                                                                                                               |
|----------------------------|--------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTT Rate Peak Daily Report | Table  | Node                           | Name of the node for the object. You can click on a node name to see node-specific reports.                                                                                                                                                               |
|                            |        | Slot/CPU                       | Slot number (if known) and CPU number.                                                                                                                                                                                                                    |
|                            |        | CPU Description                | Type of CPU.                                                                                                                                                                                                                                              |
|                            |        | Average GTT Rate               | Average GTT rate for the specified duration.                                                                                                                                                                                                              |
|                            |        | Maximum GTT Rate               | Maximum GTT rate during the specified duration.                                                                                                                                                                                                           |
|                            |        | Maximum Date (timezone)        | Timestamp when the maximum GTT rate occurred.                                                                                                                                                                                                             |
|                            | Graph  | Expand to Full Screen          | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                               |
|                            |        | Hide Summary Table             | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                        |
|                            |        | Global Title Translations /Sec | If Output Type is Graph, Y-axis label that shows the Global Title Translations per second.<br><b>Note</b> If no data exists between any two data points, the graph displays a color-coded vertical bar to show the period for which no data is available. |
|                            |        | Time                           | If Output Type is Graph, X-axis label that shows a historical time scale and the server time zone.                                                                                                                                                        |
|                            |        | Legend                         | If Output Type is Graph, color-coded legend that shows labels for output.                                                                                                                                                                                 |

### GTT Rate Average Daily Reports

GTT Rate Average Daily Report displays the average values obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > GTT Rates**.

- Step 2** Choose GTT Rate Average Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                               | Description                                      |
|-------------------------------------|--------------------------------------------------|
| Node                                | Name of the node.                                |
| Slot/CPU                            | Slot number (if known) and CPU number.           |
| CPU Description                     | Type of CPU.                                     |
| Average GTT Rate                    | Average GTT rate for the specified duration.     |
| Maximum GTT Rate                    | Maximum GTT rate during the specified duration.  |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp when the maximum utilization occurred. |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                            | Output | Field                          | Description                                                                                                                                                                                                                                                   |
|----------------------------------------|--------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTT Rate<br>Average<br>Daily<br>Report | Table  | Node                           | Name of the node for the object. You can click on a node name to see node-specific reports.                                                                                                                                                                   |
|                                        |        | Slot/CPU                       | Slot number (if known) and CPU number.                                                                                                                                                                                                                        |
|                                        |        | CPU Description                | Type of CPU.                                                                                                                                                                                                                                                  |
|                                        |        | Average GTT Rate               | Average GTT rate for the specified duration.                                                                                                                                                                                                                  |
|                                        |        | Maximum GTT Rate               | Maximum GTT rate during the specified duration.                                                                                                                                                                                                               |
|                                        |        | Maximum Date (timezone)        | Timestamp when the maximum GTT rate occurred.                                                                                                                                                                                                                 |
|                                        | Graph  | Expand to Full Screen          | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                   |
|                                        |        | Hide Summary Table             | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                            |
|                                        |        | Global Title Translations /Sec | If Output Type is Graph, Y-axis label that shows the Global Title Translations per second.<br><br><b>Note</b> If no data exists between any two data points, the graph displays a color-coded vertical bar to show the period for which no data is available. |
|                                        |        | Time                           | If Output Type is Graph, X-axis label that shows a historical time scale and the server time zone.                                                                                                                                                            |
|                                        |        | Legend                         | If Output Type is Graph, color-coded legend that shows labels for output.                                                                                                                                                                                     |

## Link Reports

You can view summary reports of hourly and daily statistics for links, and export the reports.

This section covers:

- [Link Statistics Hourly Reports, page 13-53](#)
- [Link Statistics Daily Reports, page 13-56](#)
- [Link Peaks Statistics Daily Reports, page 13-60](#)

### Link Statistics Hourly Reports

You can view hourly summaries of statistics for all links or a specific link that the MWTM detected on the specified date and hour. The Link Hourly Report page shows summary reports of hourly link statistics by date and hour. You can also graph the results.

The Link Hourly Report table is sorted based on the information in the Send Average Utilization column; however, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > Link**.
- Step 2** In the tool bar of the right pane, from the Type drop-down menu, select Link Hourly Statistics. (See [Table 13-1](#) for a list of report types and their contents).
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu (see [Table 13-1](#) for contents of each output type).
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.

The Send Utilization and Receive Utilization tables contain summary information as described below:

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node            | Name of the node for the link.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Signaling Point | Name of the signaling point for the link.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Linkset         | Linkset for the object.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SLC             | ID of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Send            | <ul style="list-style-type: none"> <li>Average—Average Send for the statistic for the specified time.</li> <li>Minimum—Minimum Send for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum Send for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive         | <ul style="list-style-type: none"> <li>Average—Average Receive for the statistic for the specified time.</li> <li>Minimum—Minimum Receive for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum Receive for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 6** Depending on what you select from the Output pulldown menu, the following information is displayed:

| Field or Column               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Graph</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Expand to Full Screen         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Hide Summary Table            | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Utilization %                 | If Output Type is Graph, the Y-axis label shows hourly statistics over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Time                          | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>Legend</i>                 | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Table, CSV</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Node                          | Name of the node for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SP Name                       | Name of the signaling point for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Linkset Name                  | Linkset for the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SLC                           | ID of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Type                          | Type of link. Possible link types are: <ul style="list-style-type: none"> <li>• <b>HSL</b>—Uses the SS7-over-ATM (Asynchronous Transfer Mode) high-speed protocol.</li> <li>• <b>SCTP</b>—Uses the Stream Control Transmission Protocol (SCTP) IP transport protocol.</li> <li>• <b>Serial</b>—Uses the serial SS7 signaling protocol.</li> <li>• <b>Virtual</b>—A virtual link that connects signaling point instances that run on the same node. The MWTM does not poll virtual links; nor does it display real-time data or accounting statistics for virtual links.</li> </ul> |
| Hourly In-Service (%)         | Percentage of time the link was in service on the specified date and hour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Long Term In-Service (%)      | Average percentage of time the link was in service since MWTM polling began for the link, or since the MWTM last reset the averages as a result of bad data.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Congestion %                  | Percentage of time the link was congested on the specified date and hour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Send            | <ul style="list-style-type: none"> <li>• <b>Average Utilization %</b>—Average Send for the link, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for the specified date and hour.<br/><br/>If you do not set the planned send capacity for the SCTP link, then <b>NoCap</b> appears in the field.</li> <li>• <b>Long Term Average Utilization %</b>—Long-term average Send for the link, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command), since MWTM polling began for the link, or since the MWTM last reset the averages as a result of bad data.<br/><br/>If you do not set the planned send capacity for the SCTP link, then <b>NoCap</b> appears in the field.</li> <li>• <b>MSUs</b>—Total number of MTP3 message signal units (MSUs) sent on the specified date and hour.</li> </ul>           |
| Receive         | <ul style="list-style-type: none"> <li>• <b>Average Utilization %</b>—Average Receive for the link, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for the specified date and hour.<br/><br/>If you do not set the planned send capacity for the SCTP link, then <b>NoCap</b> appears in the field.</li> <li>• <b>Long Term Average Utilization %</b>—Long-term average Receive for the link, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command), since MWTM polling began for the link, or since the MWTM last reset the averages as a result of bad data.<br/><br/>If you do not set the planned send capacity for the SCTP link, then <b>NoCap</b> appears in the field.</li> <li>• <b>MSUs</b>—Total number of MTP3 message signal units (MSUs) received on the specified date and hour.</li> </ul> |

## Link Statistics Daily Reports

You can view daily summaries of statistics for all links or for a specific link that the MWTM detected on the specified date and hour. The Link Daily Report page shows summary reports of daily link statistics by date and hour.

The Link Daily Report table is sorted based on the information in the Avg Send or Avg Send Erlangs column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then **MathError** appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > Link**.

- Step 2** In the tool bar of the right pane, from the Type drop-down menu, select Link Daily Statistics. (See [Table 13-1](#) for a list of report types and their contents).
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu (see [Table 13-1](#) for contents of each output type).
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.

The Send Utilization and Receive Utilization tables contain summary information as described below:

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node            | Name of the node for the link.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Signaling Point | Name of the signaling point for the link.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Linkset         | Linkset for the object.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SLC             | ID of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Send            | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive         | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 6** Depending on what you select from the Output pulldown menu, the following information is displayed:

| Field or Column               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Graph</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Expand to Full Screen         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Hide Summary Table            | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Utilization Percentage        | If Output Type is Graph, the Y-axis label shows daily link statistics over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Time                          | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>Legend</i>                 | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Table, CSV</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Node                          | Name of the node for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SP Name                       | Name of the signaling point for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Linkset Name                  | Linkset for the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SLC                           | ID of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Type                          | Type of link. Possible link types are: <ul style="list-style-type: none"> <li>• <b>HSL</b>—Uses the SS7-over-ATM (Asynchronous Transfer Mode) high-speed protocol.</li> <li>• <b>SCTP</b>—Uses the Stream Control Transmission Protocol (SCTP) IP transport protocol.</li> <li>• <b>Serial</b>—Uses the serial SS7 signaling protocol.</li> <li>• <b>Virtual</b>—A virtual link that connects signaling point instances that run on the same node. The MWTM does not poll virtual links; nor does it display real-time data or accounting statistics for virtual links.</li> </ul> |
| Daily In-Service %            | Percentage of time the link was in service on the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Long Term In-Service %        | Average percentage of time the link was in service since MWTM polling began for the link, or since the MWTM last reset the averages as a result of bad data.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Daily Low In-Service %        | Lowest hourly in-service percentage for the link for the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Low Service Hour              | Hour in which the lowest in-service percentage occurred for the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Avg Congestion %              | Average percentage of time the link was congested on the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Link Peaks Statistics Daily Reports

You can view a daily link statistics peaks report using the Link Peaks Daily Report page. The peaks report shows peak values for each day and the hour in which each peak value occurred.

The Link Peaks Daily table is sorted based on the information in the Peak Send or Peak Send Erlangs column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > Link**.
- Step 2** In the tool bar of the right pane, from the Type drop-down menu, select Link Peaks Daily Statistics. (See [Table 13-1](#) for a list of report types and their contents).
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu (see [Table 13-1](#) for contents of each output type).
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.

The Send Utilization and Receive Utilization tables contain summary information as described below:

| Field or Column | Description                               |
|-----------------|-------------------------------------------|
| Node            | Name of the node for the link.            |
| Signaling Point | Name of the signaling point for the link. |
| Linkset         | Linkset for the object.                   |
| SLC             | ID of the link.                           |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send            | <ul style="list-style-type: none"><li>• Average—Average Send for the statistic for the specified time.</li><li>• Minimum—Minimum Send for the statistic for the specified time.</li><li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li><li>• Maximum—Maximum Send for the statistic for the specified time.</li><li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li></ul>          |
| Receive         | <ul style="list-style-type: none"><li>• Average—Average Receive for the statistic for the specified time.</li><li>• Minimum—Minimum Receive for the statistic for the specified time.</li><li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li><li>• Maximum—Maximum Receive for the statistic for the specified time.</li><li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li></ul> |

**Step 6** Depending on what you select from the Output pulldown menu, the following information is displayed:

| Field or Column                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Graph</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Expand to Full Screen            | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Hide Summary Table               | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Utilization %                    | If Output Type is Graph, the Y-axis label shows daily link statistics over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Time                             | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>Legend</i>                    | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Table, CSV</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Node                             | Name of the node for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SP Name                          | Name of the signaling point for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Linkset Name                     | Linkset for the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SLC                              | ID of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Type                             | Type of link. Possible link types are: <ul style="list-style-type: none"> <li>• <b>HSL</b>—Uses the SS7-over-ATM (Asynchronous Transfer Mode) high-speed protocol.</li> <li>• <b>SCTP</b>—Uses the Stream Control Transmission Protocol (SCTP) IP transport protocol.</li> <li>• <b>Serial</b>—Uses the serial SS7 signaling protocol.</li> <li>• <b>Virtual</b>—A virtual link that connects signaling point instances that run on the same node. The MWTM does not poll virtual links; nor does it display real-time data or accounting statistics for virtual links.</li> </ul> |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Link Multi-Day Report

The Link Multi-Day Report page shows send and receive percentages for all links for the last three or five days.

The Link Multi-Day table is sorted based on the information in the Avg Send column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns](#), page 5-23).

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > Link Multi-Day**.

**Step 2** In the tool bar of the right pane, from the Type pulldown menu, select Link Statistics Multi-Day. (See [Table 13-1](#) for a list of report types and their contents).

**Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .

The information described in the following table is displayed for the duration you selected.

**Note**

If there are less than five days of data available, the Link Multi-Day Report displays N/A for the days for which there is no data.

| Field or Column              | Description                                                                                                                                                                                                                                                                   |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                         | Name of the node for the link.                                                                                                                                                                                                                                                |
| Network Name                 | Name of the network for the link.                                                                                                                                                                                                                                             |
| Signaling Point              | Name of the signaling point for the link.                                                                                                                                                                                                                                     |
| Link                         | Name of the link.                                                                                                                                                                                                                                                             |
| Avg. Send Utilization (%)    | Send for the link, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for each of the last five days.<br><br>If you do not set the planned send capacity for the SCTP link, then <code>NoCap</code> appears in the field.       |
| Avg. Receive Utilization (%) | Receive for the link, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for each of the last five days.<br><br>If you do not set the planned receive capacity for the SCTP link, then <code>NoCap</code> appears in the field. |

## Linkset Reports

You can view summary reports of hourly and daily statistics for linksets, and export the reports.

This section covers:

- [Linkset Statistics Hourly Reports, page 13-65](#)
- [Linkset Statistics Daily Reports, page 13-69](#)
- [Linkset Peaks Statistics Daily Reports, page 13-72](#)

## Linkset Statistics Hourly Reports

You can view hourly summaries of statistics for all linksets or for a specific linkset that the MWTM detected on the specified date and hour. The Linkset Hourly Report page shows summary reports for all archived MWTM hourly linkset statistics by date and hour.

The Linkset Hourly Report table is sorted based on the information in the Send Utilization column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns](#), page 5-23).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > Linkset**.
- Step 2** In the tool bar of the right pane, from the Type drop-down menu, select Linkset Hourly Statistics. (See [Table 13-1](#) for a list of report types and their contents).
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu (see [Table 13-1](#) for contents of each output type).
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.

The Send Utilization and Receive Utilization tables contain summary information as described below:

| Field or Column | Description                                  |
|-----------------|----------------------------------------------|
| Node            | Name of the node for the linkset.            |
| Signaling Point | Name of the signaling point for the linkset. |
| Linkset         | Linkset for the object.                      |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send            | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive         | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 6** Depending on what you select from the Output pulldown menu, the following information is displayed:

| Field or Column                   | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Graph</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Expand to Full Screen             | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                            |
| Hide Summary Table                | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                     |
| Utilization Percentage            | If Output Type is Graph, the Y-axis label shows hourly linkset utilization over time.                                                                                                                                                                                                                                                                                                                                  |
| Time                              | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                      |
| <i>Legend</i>                     | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                            |
| <b>Table, CSV</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Node                              | Name of the node for the linkset.                                                                                                                                                                                                                                                                                                                                                                                      |
| SP Name                           | Name of the signaling point for the linkset.                                                                                                                                                                                                                                                                                                                                                                           |
| Linkset Name                      | Linkset for the object.                                                                                                                                                                                                                                                                                                                                                                                                |
| Timestamp ( <i>timezone</i> )     | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                                                               |
| Hourly In-Service (%)             | Percentage of time the linkset was in service on the specified date.                                                                                                                                                                                                                                                                                                                                                   |
| Long Term In-Service (%)          | Average percentage of time the linkset was in service since MWTM polling began for the link, or since the MWTM last reset the averages as a result of bad data.                                                                                                                                                                                                                                                        |
| Send Utilization (%)              | <p>Average Send for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for the specified date and hour.</p> <p>If you do not set the planned send capacity for one or more of the SCTP links associated with the linkset, then NoCap appears in the field.</p>                                                                                              |
| Long Term Send Utilization (%)    | <p>Long-term average Send for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command), since MWTM polling began for the linkset, or since the MWTM last reset the averages as a result of bad data.</p> <p>If you do not set the planned send capacity for one or more of the SCTP links associated with the linkset, then NoCap appears in the field.</p>       |
| Receive Utilization (%)           | <p>Average Receive for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for the specified date and hour.</p> <p>If you do not set the planned receive capacity for one or more of the SCTP links associated with the linkset, then NoCap appears in the field.</p>                                                                                        |
| Long Term Receive Utilization (%) | <p>Long-term average Receive for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command), since MWTM polling began for the linkset, or since the MWTM last reset the averages as a result of bad data.</p> <p>If you do not set the planned receive capacity for one or more of the SCTP links associated with the linkset, then NoCap appears in the field.</p> |

## Linkset Statistics Daily Reports

You can view daily summaries of statistics for all linksets or for a specific linkset that the MWTM detected on the specified date and hour. The Linkset Daily Report page shows summary reports of all archived MWTM daily linkset statistics by date and hour.

The Linkset Daily Report table is sorted based on the information in the Send Average column. You can sort the table based on the information in one of the other columns (see [Navigating Table Columns](#), page 5-23).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > Linkset**.
- Step 2** In the tool bar of the right pane, from the Type drop-down menu, select Linkset Daily Statistics. (See [Table 13-1](#) for a list of report types and their contents).
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu (see [Table 13-1](#) for contents of each output type).
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.

The Send Utilization and Receive Utilization tables contain summary information as described below:

| Field or Column | Description                                  |
|-----------------|----------------------------------------------|
| Node            | Name of the node for the linkset.            |
| Signaling Point | Name of the signaling point for the linkset. |
| Linkset         | Linkset for the object.                      |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send            | <ul style="list-style-type: none"> <li>• Average—Average Send for the statistic for the specified time.</li> <li>• Minimum—Minimum Send for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Send for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive         | <ul style="list-style-type: none"> <li>• Average—Average Receive for the statistic for the specified time.</li> <li>• Minimum—Minimum Receive for the statistic for the specified time.</li> <li>• Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>• Maximum—Maximum Receive for the statistic for the specified time.</li> <li>• Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 6** Depending on what you select from the Output pulldown menu, the following information is displayed:

| Field or Column                  | Description                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Graph</b>                     |                                                                                                                                                                    |
| Expand to Full Screen            | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                        |
| Hide Summary Table               | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                 |
| Utilization Percentage           | If Output Type is Graph, the Y-axis label shows daily linkset statistics over time.                                                                                |
| Time                             | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                  |
| <i>Legend</i>                    | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                        |
| <b>Table, CSV</b>                |                                                                                                                                                                    |
| Date                             | Date of the report.                                                                                                                                                |
| Node                             | Name of the node for the linkset.                                                                                                                                  |
| SP Name                          | Name of the signaling point for the linkset.                                                                                                                       |
| Linkset Name                     | Linkset for the object.                                                                                                                                            |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                           |
| Daily In-Service<br>(%)          | Percentage of time the linkset was in service on the specified date.                                                                                               |
| Long Term<br>In-Service (%)      | Average percentage of time the linkset was in service since MWTM polling began for the linkset, or since the MWTM last reset the averages as a result of bad data. |
| Daily Low<br>In-Service (%)      | Lowest hourly in-service percentage for the linkset for the specified date.                                                                                        |
| Low Service Hour                 | Hour in which the lowest in-service percentage occurred for the specified date.                                                                                    |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send            | <ul style="list-style-type: none"> <li>• <b>Average Utilization (%)</b>—Average Send for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for the specified date and hour.<br/><br/>If you do not set the planned receive capacity for one or more of the SCTP links associated with the linkset, then <b>NoCap</b> appears in the field.</li> <li>• <b>Peak Utilization (%)</b>—Highest Send for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for the specified date and hour.</li> <li>• <b>Peak Hour</b>—Hour in which the Peak Send for the linkset occurred for the specified date.<br/><br/>Click the hour to see the Link Hourly Report for all links associated with the chosen linkset for the chosen hour.</li> <li>• <b>Long Term Average Utilization (%)</b>—Long-term average Send for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command), since MWTM polling began for the linkset, or since the MWTM last reset the averages as a result of bad data.<br/><br/>If you do not set the planned send capacity for one or more of the SCTP links associated with the linkset, then <b>NoCap</b> appears in the field.</li> </ul>             |

### Linkset Peaks Statistics Daily Reports

You can view a linkset daily statistics peaks report using the Linkset Peaks Daily Report page. The peaks report shows peak values for each day and the hour in which each peak value occurred.

The Linkset Peaks Daily Report table is sorted based on the information in the Peak Send or Peak Send Erlangs column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > Linkset**.
- Step 2** In the tool bar of the right pane, from the Type drop-down menu, select Linkset Peaks Daily Statistics. (See [Table 13-1](#) for a list of report types and their contents).
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu (see [Table 13-1](#) for contents of each output type).
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.

The Send Utilization and Receive Utilization tables contain summary information as described below:

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node            | Name of the node for the linkset.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Signaling Point | Name of the signaling point for the linkset.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Linkset         | Linkset for the object.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Send            | <ul style="list-style-type: none"> <li>Average—Average Send for the statistic for the specified time.</li> <li>Minimum—Minimum Send for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum Send for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>          |
| Receive         | <ul style="list-style-type: none"> <li>Average—Average Receive for the statistic for the specified time.</li> <li>Minimum—Minimum Receive for the statistic for the specified time.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum Receive for the statistic for the specified time.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 6** Depending on what you select from the Output pulldown menu, the following information is displayed:

| Field or Column               | Description                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Graph</b>                  |                                                                                                                    |
| Expand to Full Screen         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.        |
| Hide Summary Table            | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
| Utilization Percentage        | If Output Type is Graph, the Y-axis label shows daily linkset statistics over time.                                |
| Time                          | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
| <i>Legend</i>                 | If Output Type is Graph, a color-coded legend shows labels for utilization.                                        |
| <b>Table, CSV</b>             |                                                                                                                    |
| Node                          | Name of the node for the linkset.                                                                                  |
| SP Name                       | Name of the signaling point for the linkset.                                                                       |
| Linkset Name                  | Linkset for the object.                                                                                            |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                           |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send            | <ul style="list-style-type: none"> <li>• <b>Peak Utilization %</b>—Highest Send or Receive for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for the specified date and hour.</li> <li>• <b>Peak Hour</b>—Hour in which the Peak Send or Peak Receive for the linkset occurred for the specified date.<br/>Click the hour to see the Link Hourly Report for all links associated with the chosen linkset for the chosen hour.</li> <li>• <b>Long Term Average Utilization %</b>—Long-term average Send or Receive for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command), since MWTM polling began for the linkset, or since the MWTM last reset the averages as a result of bad data.<br/><br/>If you do not set the planned send capacity for one or more of the SCTP links associated with the linkset, then <b>NoCap</b> appears in the field.</li> </ul> |
| Receive         | <ul style="list-style-type: none"> <li>• <b>Peak Utilization %</b>—Highest Receive for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command) for the specified date and hour.</li> <li>• <b>Peak Hour</b>—Hour in which the Peak Receive for the linkset occurred for the specified date.<br/>Click the hour to see the Link Hourly Report for all links associated with the chosen linkset for the chosen hour.</li> <li>• <b>Long Term Average Utilization %</b>—Long-term average Receive for the linkset, expressed as a percentage or number of Erlangs (E) (as set with the <b>mwtm webutil</b> command), since MWTM polling began for the linkset, or since the MWTM last reset the averages as a result of bad data.<br/><br/>If you do not set the planned send capacity for one or more of the SCTP links associated with the linkset, then <b>NoCap</b> appears in the field.</li> </ul>                              |

## MLR Reports

Multi-Layer SMS Routing, or MLR, is a routing scheme that enables intelligent routing of Short Message Service (SMS) mobile originated (MO) messages based on the application or service from which they originated or to which they are destined. The MLR feature can make SMS message routing decisions based on information found in the TCAP, MAP, and MAP-user layers; MAP operation codes MAP-MT-FORWARD-SM and SEND-ROUTING-INFO-FOR-SM; and ANSI TCAP and IS-41 MAP operations.

You can view a summary report of daily statistics for MLR. You can also export the reports.

## Daily MLR Reports

You can view a summary report of MLR processed, aborts, continues, result invokes, rule matches, subtriggers, and triggers statistics for the MWTM on a specified date. The MLR *type* Daily Report page shows reports of all archived MWTM daily MLR processed, aborts, continues, result invokes, rule matches, subtriggers, and triggers by date.

These archived daily MLR reports are available:

- [MLR Aborts Statistics Daily Reports, page 13-76](#)
- [MLR Continues Statistics Daily Reports, page 13-77](#)
- [MLR Processed Statistics Daily Reports, page 13-77](#)
- [MLR ResultInvokes Statistics Daily Reports, page 13-78](#)
- [MLR RuleMatches Statistics Daily Reports, page 13-79](#)
- [MLR SubTriggers Statistics Daily Reports, page 13-79](#)
- [MLR Triggers Statistics Daily Reports, page 13-80](#)

## MLR Aborts Statistics Daily Reports

The MLR Aborts Statistics Custom Report table is sorted based on the information in the Total Aborted column. However, you can sort the table based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column             | Description                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------------------|
| Date                        | Date of the report.                                                                             |
| Node                        | Name of the node for the signaling point.                                                       |
| Network Name                | Name of the network for the signaling point.                                                    |
| Signaling Point             | Name of the signaling point.                                                                    |
| Total Aborted               | Total number of MSUs aborted by MLR on the specified date.                                      |
| No Resources                | Number of MSUs aborted by MLR because of a shortage of resources on the specified date.         |
| Results Blocked             | Number of MSUs aborted by MLR with a result of <b>block</b> on the specified date.              |
| GTI Mismatches              | Number of MSUs aborted by MLR because of mis-matched GTIs on the specified date.                |
| Address Conversion Failures | Number of MSUs aborted by MLR because of a failed GTA address conversion on the specified date. |
| Destination Unavailables    | Number of MSUs aborted by MLR because the destination was unavailable on the specified date.    |
| No Server Aborted           | Number of MSUs aborted by MLR because no server was available on the specified date.            |

## MLR Continues Statistics Daily Reports

The MLR Continues Statistics Custom Report table is sorted based on the information in the Total Continued column. However, you can sort the table based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column          | Description                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Date                     | Date of the report.                                                                                                         |
| Node                     | Name of the node for the signaling point.                                                                                   |
| Network Name             | Name of the network for the signaling point.                                                                                |
| Signaling Point          | Name of the signaling point.                                                                                                |
| Total Continued          | Total number of MSUs returned to SCCP by MLR with a result of <b>continue</b> on the specified date.                        |
| Unsupported Message Type | Number of MSUs returned to SCCP by MLR because of unsupported message types on the specified date.                          |
| Unsupported Seg SCCP     | Number of MSUs returned to SCCP by MLR because of unsupported SCCP segments on the specified date.                          |
| Unsupported Messages     | Number of MSUs returned to SCCP by MLR because of parse failures resulting from unsupported messages on the specified date. |
| Parse Errors             | Number of MSUs returned to SCCP by MLR because of parse errors on the specified date.                                       |
| No Results               | Number of MSUs returned to SCCP by MLR with no results on the specified date.                                               |
| Result Continueds        | Number of MSUs returned to SCCP by MLR with a result of <b>continue</b> on the specified date.                              |
| No Server Continueds     | Number of MSUs returned to SCCP by MLR because no server was available on the specified date.                               |
| Result GTTs              | Number of MSUs returned to SCCP by MLR with a result of <b>GTT</b> on the specified date.                                   |
| Failed Triggers          | Number of MSUs returned to SCCP by MLR because of no trigger match on the specified date.                                   |

## MLR Processed Statistics Daily Reports

The MLR Processed Statistics Custom Report table is sorted based on the information in the Routed column. However, you can sort the table based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column      | Description                                                                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date                 | Date of the report.                                                                                                                                                     |
| Node                 | Name of the node for the signaling point.                                                                                                                               |
| Network Name         | Name of the network for the signaling point.                                                                                                                            |
| Signaling Point      | Name of the signaling point.                                                                                                                                            |
| Routed               | Total number of packets routed by MLR on the specified date.                                                                                                            |
| Total Continued      | Total number of MSUs passed back to SCCP processing by MLR on the specified date.                                                                                       |
| Total Aborted        | Total number of MSUs not processed by MLR because of invalid data or a blocked MSU.                                                                                     |
| MAP SMS-MOs          | Number of MSUs of type GSM-MAP SMS-MO processed by MLR on the specified date.                                                                                           |
| MAP SMS-MTs          | Number of MSUs of type GSM-MAP SMS-MT processed by MLR on the specified date.                                                                                           |
| MAP SRI-SMs          | Number of MSUs of type GSM-MAP SRI-SM processed by MLR on the specified date.                                                                                           |
| MAP AlertScs         | Number of MSUs of type GSM-MAP AlertSc processed by MLR on the specified date.                                                                                          |
| ANSI-41 SMD-PPs      | Number of MSUs of type ANSI-41 SMD-PP processed by MLR on the specified date.                                                                                           |
| ANSI-41 SMS-Requests | Number of MSUs of type ANSI-41 SMSRequest processed by MLR on the specified date.                                                                                       |
| ANSI-41 SMS-Notifys  | Number of MSUs of type ANSI-41 SMSNotify processed by MLR on the specified date.                                                                                        |
| Links                | Contains links to related MLR reports (Aborts, Continues, Triggers, SubTriggers, RuleMatches, and ResultInvokes). The target report is filtered by the signaling point. |

### MLR ResultInvokes Statistics Daily Reports

The MLR ResultInvokes Statistics Custom Report table is sorted based on the information in the Invokes column. However, you can sort the table based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column | Description                                  |
|-----------------|----------------------------------------------|
| Date            | Date of the report.                          |
| Node            | Name of the node for the signaling point.    |
| Network Name    | Name of the network for the signaling point. |

| Field or Column | Description                                              |
|-----------------|----------------------------------------------------------|
| Signaling Point | Name of the signaling point.                             |
| ResultSet       | Name of the result set of which this result is a member. |
| Result Number   | Number of this result in the result set.                 |
| Invokes         | Total number of times this result was invoked.           |

### MLR RuleMatches Statistics Daily Reports

The MLR RuleMatches Statistics Custom Report table is sorted based on the information in the Matches column. However, you can sort the table based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column | Description                                          |
|-----------------|------------------------------------------------------|
| Date            | Date of the report.                                  |
| Node            | Name of the node for the signaling point.            |
| Network Name    | Name of the network for the signaling point.         |
| Signaling Point | Name of the signaling point.                         |
| RuleSet         | Name of the rule set of which this rule is a member. |
| Rule Number     | Number of this rule in the rule set.                 |
| Matches         | Total number of times this rule was matched.         |

### MLR SubTriggers Statistics Daily Reports

The MLR SubTriggers Statistics Custom Report table is sorted based on the information in the Matches column. However, you can sort the table based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column   | Description                                  |
|-------------------|----------------------------------------------|
| Date              | Date of the report.                          |
| Node              | Name of the node for the signaling point.    |
| Network Name      | Name of the network for the signaling point. |
| Signaling Point   | Name of the signaling point.                 |
| Trigger Index     | Index number associated with the trigger.    |
| Sub Trigger Index | Index number associated with the subtrigger. |

| Field or Column | Description                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action          | Action taken by the subtrigger. Clicking on the ruleset name highlights the signaling point in the navigation tree and opens the MLR Trigger Config tab for the chosen ruleset. |
| Parameters      | Parameters that control the behavior of the subtrigger.                                                                                                                         |
| Matches         | Number of subtrigger matches with result <b>Action Performed</b> .                                                                                                              |

## MLR Triggers Statistics Daily Reports

The MLR Triggers Statistics Custom Report table is sorted based on the information in the Matches column. However, you can sort the table based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column     | Description                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date                | Date of the report.                                                                                                                                                          |
| Node                | Name of the node for the signaling point.                                                                                                                                    |
| Network Name        | Name of the network for the signaling point.                                                                                                                                 |
| Signaling Point     | Name of the signaling point.                                                                                                                                                 |
| Trigger Index       | Index number associated with the trigger.                                                                                                                                    |
| Action              | Action taken by the trigger. Clicking on the ruleset name highlights the signaling point in the navigation tree and opens the MLR Trigger Config tab for the chosen ruleset. |
| Parameters          | Parameters that control the behavior of the trigger.                                                                                                                         |
| Preliminary Matches | Preliminary count of trigger matches.                                                                                                                                        |
| Matches             | Number of trigger matches with result <b>Action Performed</b> .                                                                                                              |
| Links               | Contains links to related MLR SubTrigger reports. The target report is filtered by the signaling point.                                                                      |

## MSU Rates Reports

You can view 15 minute, hourly, and daily MSU rates reports. You can also export the reports in CSV format.

This section covers:

- [MSU Load Statistics Reports, page 13-81](#)
- [MSU Peaks Statistics Reports, page 13-81](#)

## MSU Load Statistics Reports

You can view a 15 minute, hourly, or daily report of MSU load rates for all nodes that the MWTM detected in that time. The MSU Load Report provides the distribution of send and receive MSU packets, pertaining to overload thresholds for every CPU.

The MSU Load Report tables are sorted based on the information in the Date column. However, you can sort the tables based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column      | Description                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date                 | Date of the report.                                                                                                                                                             |
| Node                 | Name of the node.                                                                                                                                                               |
| Processor Slot/Bay   | Number of the processor and the number of the bay containing the processor. This number is set to zero when the platform does not support processors in multiple slots or bays. |
| Overloaded Threshold | Over this rate of traffic, MSU traffic handling may be impacted.                                                                                                                |
| Duration % Send      | Duration of time the send MSU rate is in the specified percentage.                                                                                                              |
| Duration % Receive   | Duration in time the receive MSU rate is in the specified percentage.                                                                                                           |

## MSU Peaks Statistics Reports

You can view a 15 minute, hourly, or daily report of MSU peak rates for all nodes that the MWTM detected in that time. The MSU Peaks Report page provides information that helps you analyze the maximum send and receive rates for each processor in MSU units per second.

The MSU Peaks Report tables are sorted based on the information in the Send column. However, you can sort the tables based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column                | Description                                                                                                                                                                                                                                  |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date                           | Date of the report.                                                                                                                                                                                                                          |
| Node                           | Name of the node.                                                                                                                                                                                                                            |
| Processor Slot/Bay             | Number of the processor and the number of the bay containing the processor. This number is set to zero when the platform does not support processors in multiple slots or bays.                                                              |
| Max Rate (MSU/sec) Send        | This value records the highest rate of MSUs per second sent by the processor since the measurement was cleared.                                                                                                                              |
| Max Rate (MSU/sec) Receive     | This value records the highest rate of MSU per second received by the processor since the measurement was cleared.                                                                                                                           |
| Threshold (MSU/sec) Acceptable | Specifies a level of traffic below which traffic is considered to be acceptable. Once the traffic rate exceeds the Warning threshold, it is not Acceptable until traffic falls below this threshold.                                         |
| Threshold (MSU/sec) Warning    | Specifies a level of traffic that should be avoided, but is below a level that impacts MSU routing. Once the traffic rate exceeds the Overloaded threshold, it is not considered non-impacting until the traffic falls below this threshold. |

| Field or Column                                    | Description                                                                                       |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Threshold (MSU/sec) Overloaded                     | Specifies a level of traffic indicating a rate that might impact MSU routing.                     |
| Duration in Acceptable Threshold (Seconds) Send    | Rate of traffic (in seconds) sent by this processor considered as acceptable.                     |
| Duration in Acceptable Threshold (Seconds) Receive | Rate of traffic (in seconds) received by this processor considered as acceptable.                 |
| Duration in Overloaded Threshold (Seconds) Send    | Rate of traffic (in seconds) sent by this processor at a level that might impact MSU routing.     |
| Duration in Overloaded Threshold (Seconds) Receive | Rate of traffic (in seconds) received by this processor at a level that might impact MSU routing. |

## SCTP Reports

The MWTM web interface provides node-level SCTP reports for performance and error statistics. The information is available in graphical, tabular, and CSV formats.

### Note

SCTP Reports are supported on ITP platforms only.

To generate a network-wide SCTP report:

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > SCTP**. You can also click on a node name, then select the Reports tab.

**Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [SCTP Performance Daily Reports, page 13-82](#)
- [SCTP Errors Daily Reports, page 13-84](#)

### Note

The 15-minute and hourly reports for SCTP are available from the node level only; they are not available from the top level or the network level.

## SCTP Performance Daily Reports

MWTM displays the SCTP performance rates obtained during the specified period.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > ITP Statistics > SCTP**.

### Note

The 15-minute and hourly reports for SCTP are available from the node level only; they are not available from the top level or the network level. Click on a node name in the SCTP reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose SCTP Performance Daily from Type drop-down menu.

The Sent Packets and Receive Packets tables contain summary information as described below:

| Field or Column |                                     | Description                                                  |
|-----------------|-------------------------------------|--------------------------------------------------------------|
| Node            |                                     | You can click on a node name to go to node-specific reports. |
| Send            | Average Packets                     | Average SCTP packets sent.                                   |
|                 | Maximum Packets                     | Maximum SCTP packets sent.                                   |
|                 | Maximum Date<br>( <i>timezone</i> ) | Time when the maximum SCTP packets sent value occurred.      |
| Receive         | Average Packets                     | Average SCTP packets received.                               |
|                 | Maximum Packets                     | Maximum SCTP packets received.                               |
|                 | Maximum Date<br>( <i>timezone</i> ) | Time when the maximum SCTP packets received value occurred.  |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| GUI Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Graph</i>          | If you select <b>Graph</b> from the Output menu, the graph displays the SCTP send and receive packets rates over the specified time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>Table</i>          | <p>If you select <b>Table</b> from the Output menu, the table contains:</p> <ul style="list-style-type: none"> <li>• Node—Name of the node.</li> <li>• Timestamp (<i>timezone</i>)—Timestamp of the report.</li> <li>• Send <ul style="list-style-type: none"> <li>– SCTP Packets—Number of SCTP packets sent to peers.</li> <li>– Control Chunks—Number of SCTP control chunks sent to peers (no transmissions included).</li> <li>– Ordered Chunks—Number of SCTP ordered data chunks sent to peers (no transmissions included).</li> <li>– Unordered Chunks—Number of SCTP unordered chunks (which are data chunks in which the U bit is set to one) sent to peers (no transmissions included).</li> </ul> </li> <li>• Receive <ul style="list-style-type: none"> <li>– SCTP Packets—Number of SCTP packets received from peers.</li> <li>– Control Chunks—Number of SCTP control chunks received from peers (no transmissions included).</li> <li>– Ordered Chunks—Number of SCTP ordered data chunks received from peers (no transmissions included).</li> <li>– Unordered Chunks—Number of SCTP unordered chunks (which are data chunks in which the U bit is set to one) received from peers (no transmissions included).</li> </ul> </li> </ul> |
| Expand to Full Screen | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Hide Summary Table    | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Packets               | If Output Type is Graph, the Y-axis label shows percentage of utilization over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Time                  | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>Legend</i>         | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## SCTP Errors Daily Reports

MWTM displays the SCTP error rates obtained during the specified period.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Statistics > SCTP**.

**Note**

The 15-minute and hourly reports for SCTP are available from the node level only; they are not available from the top level or the network level. Click on a node name in the SCTP reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose SCTP Errors Daily from Type drop-down menu.

The summary table displays the following information:

| Field or Column                      | Description                                                                                                                                                                                                         |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                                 | Name of the node.                                                                                                                                                                                                   |
| Timestamp ( <i>timezone</i> )        | Timestamp of the report.                                                                                                                                                                                            |
| Unassociated Packets                 | Number of SCTP packets received by the host which are correctly formed but for which the receiver is not able to identify the association to which the packet belongs.                                              |
| Checksum Errors                      | Number of SCTP packets received from peers with an invalid checksum.                                                                                                                                                |
| Fragmented User Messages             | Number of user messages that have to be fragmented because of the MTU.                                                                                                                                              |
| Reassembled User Messages            | Number of user messages reassembled.                                                                                                                                                                                |
| Retransmitted Chunks                 | Number of SCTP chunks retransmitted due to the T3 timers expiring before the packet is acknowledged.                                                                                                                |
| Retransmitted Chunks (Fast Recovery) | Number of SCTP chunks retransmitted using the fast-recovery retransmission mechanism specified in SCTP.                                                                                                             |
| Destination Address Failures         | Number of times a destination IP address was marked unavailable since the start of the association. The IP destination address will be marked unavailable when the specified number of retransmissions have failed. |

## Viewing Mobile Statistics Reports

Mobile Statistics Reports are located within **Reports > Mobile Statistics** in the MWTM web interface. You can also find Mobile statistics reports in the `/opt/CSCOs/gm/reports` directory on the MWTM server or an alternate location as configured by the MWTM system administrator. All reports are saved as export files in .csv format.

You can view any of the following Mobile statistics reports:

- [CSG Reports, page 13-86](#)
- [GGSN Reports, page 13-108](#)
- [PDNGW Reports, page 13-125](#)
- [PDSN Reports, page 13-137](#)
- [SGW Reports, page 13-150](#)

## CSG Reports

The MWTM web interface provides node-level Content services reports. Content Service is a capability to examine IP/TCP/UDP headers, payload and enable billing based on the content being provided.

To generate a network-wide Content services report:

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.
  - Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
  - Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
  - Step 4** Choose an output format (Table or CSV) from the Output drop-down menu for contents of each output type.
  - Step 5** To generate the report, click the Run icon (green arrow .

In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [CSG BMA Statistics Daily Reports, page 13-87](#)
- [CSG Global Peaks Rates Daily Reports, page 13-88](#)
- [CSG Protocol Rates Daily Reports, page 13-89](#)
- [CSG Load Session Rates Daily Reports, page 13-91](#)
- [CSG Load Radius Rates Daily Reports, page 13-92](#)
- [CSG Load BMA Rates Daily Reports, page 13-93](#)
- [CSG Load User DB Rates Daily Reports, page 13-94](#)
- [CSG Load Gx Event Rates Daily Reports, page 13-95](#)
- [CSG Quota Manager Statistics Daily Reports, page 13-96](#)
- [CSG Gx Global Message Statistics Daily Reports, page 13-97](#)
- [CSG Gx Global Message Errors Daily Reports, page 13-98](#)
- [CSG Gx PCRF Method List Message Statistics Daily Reports, page 13-99](#)
- [CSG Gx PCRF Method List Message Errors Daily Reports, page 13-100](#)
- [CSG Gx Policy Preload Statistics Daily Reports, page 13-101](#)
- [CSG Gx Policy Preload Errors Daily Reports, page 13-102](#)
- [CSG Gx Policy Preload Accounting Policy Statistics Daily Reports, page 13-103](#)
- [CSG Gx Policy Preload Billing Plan Statistics Daily Reports, page 13-104](#)

- [CSG Gx Policy Preload Billing Services Statistics Daily Reports, page 13-105](#)
- [CSG Gx Policy Preload Content Policy Statistics Daily Reports, page 13-106](#)
- [CSG Gx Policy Preload Service Content Statistics Daily Reports, page 13-107](#)

## CSG BMA Statistics Daily Reports

MWTM displays the CSG BMA Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

### Note

The 15-minute and hourly CSG BMA Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG BMA Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

### Step 2

Choose CSG BMA Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                         |
| Server                        | Name of the Server.                                                                                                       |
| Port                          | Name of the Port.                                                                                                         |
| VRF Name                      | Name of the VRF.                                                                                                          |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                  |
| Sent                          | Number of records sent to the billing mediation agent.                                                                    |
| Sent Per Second               | Number of records sent per second to the billing mediation agent.                                                         |
| Retransmits                   | Number of messages retransmitted to the billing mediation agent.                                                          |
| Failed Acks                   | Number of acknowledgments received from the billing mediation agent for which there are no outstanding requests.          |
| Lost Records                  | Number of lost records since system initialization or the last time the counter wrapped.                                  |
| Bad Records                   | Number of bad records received. These are records in which an error was detected while attempting to decode the contents. |

## CSG Global Peaks Rates Daily Reports

MWTM displays the CSG Global Peaks Rates Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

### Note

The 15-minute and hourly CSG Global Peaks Rates reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Global Peaks Rates reports to navigate to a specific node to view hourly and 15 minute reports for that node.

### Step 2

Choose CSG Global Peaks Rates Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field    | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node     | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                              |
| Users    | <ul style="list-style-type: none"> <li>Average—Average CSG rate for the specified duration.</li> <li>Minimum—Minimum CSG rate during the specified duration.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum CSG rate during the specified duration.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |
| Sessions | <ul style="list-style-type: none"> <li>Average—Average CSG rate for the specified duration.</li> <li>Minimum—Minimum CSG rate during the specified duration.</li> <li>Minimum Date (<i>timezone</i>)—Timestamp when the minimum value occurred.</li> <li>Maximum—Maximum CSG rate during the specified duration.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                 | Output     | Field                         | Description                                                                                                        |
|-----------------------------|------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| CSG Global Peak Rates Daily | Table, CSV | Node                          | Name of the node.                                                                                                  |
|                             |            | Timestamp ( <i>timezone</i> ) | Time value occurred.                                                                                               |
|                             |            | Average Users                 | The average number of users using the network.                                                                     |
|                             |            | Peak Users                    | The maximum number of users using the network.                                                                     |
|                             |            | Average Sessions              | The average number of sessions in the network.                                                                     |
|                             |            | Peak Sessions                 | The maximum number of sessions in the network.                                                                     |
|                             | Graph      | Expand to Full Screen         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|                             |            | Hide Summary Table            | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|                             |            | Peak Users/ Peak Sessions     | If Output Type is Graph, the Y-axis label shows Daily statistics over time.                                        |
|                             |            | Time                          | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                             |            | Utilization                   | If Output Type is Graph, a color-coded legend shows labels for utilization.                                        |
|                             |            | <i>Legend</i>                 | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |

## CSG Protocol Rates Daily Reports

MWTM displays the CSG Protocol Rates Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

### Note

The 15-minute and hourly CSG Protocol Rates reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Protocol Rates reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose CSG Protocol Rates Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                                                                                           |
| Protocol                      | Name of the protocol.                                                                                                                                                                                                                                                       |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                                                    |
| Inspection Method             | The type of inspection method applied in the network.                                                                                                                                                                                                                       |
| Transactions                  | <ul style="list-style-type: none"> <li>Count—Total number of transactions occurred in the network.</li> <li>Rate—Number of transactions occurred in the network per second.</li> <li>Peak—The highest number of transactions occurred in the network per second.</li> </ul> |
| Subscriber Send Packets       | <ul style="list-style-type: none"> <li>Count—Total number of outgoing subscriber packets.</li> <li>Rate—Number of outgoing subscriber packets per second.</li> <li>Peak—The highest number of outgoing subscriber packets per second.</li> </ul>                            |
| Subscriber Send Bits          | <ul style="list-style-type: none"> <li>Count—Total number of outgoing subscriber bits.</li> <li>Rate—Number of outgoing subscriber bits per second.</li> <li>Peak—The highest number of outgoing subscriber bits per second.</li> </ul>                                     |

### CSG Load BMA Rates Daily Reports

MWTM displays the CSG Load BMA Rates Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

#### Note

The 15-minute and hourly CSG Load BMA Rates reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Load BMA Rates reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose CSG Load BMA Rates Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                     |
|-------------------------------|-----------------------------------------------------------------|
| Node                          | Name of the node.                                               |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                        |
| IPC Queue Depth Tolerance     | Maximum queue depth for Radius Start requests in the IPC queue. |
| Allowed                       | Number of outgoing Radius Start requests allowed.               |
| Allowed Rate                  | Number of outgoing Radius Start requests allowed per second.    |
| Allowed Peak                  | Number of outgoing Radius Start maximum requests allowed.       |
| Denied                        | Number of outgoing Radius Start requests denied.                |
| Denied Rate                   | Number of outgoing Radius Start requests denied per second.     |
| Denied Peak                   | Number of outgoing Radius Start maximum requests denied.        |

### CSG Load User DB Rates Daily Reports

MWTM displays the CSG Load User DB Rates Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

#### Note

The 15-minute and hourly CSG Load User DB Rates reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Load User DB Rates reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose CSG Load User DB Rates Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                     |
|-------------------------------|-----------------------------------------------------------------|
| Node                          | Name of the node.                                               |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                        |
| IPC Queue Depth Tolerance     | Maximum queue depth for Radius Start requests in the IPC queue. |
| Allowed                       | Number of outgoing Radius Start requests allowed.               |
| Allowed Rate                  | Number of outgoing Radius Start requests allowed per second.    |
| Allowed Peak                  | Number of outgoing Radius Start maximum requests allowed.       |
| Denied                        | Number of outgoing Radius Start requests denied.                |
| Denied Rate                   | Number of outgoing Radius Start requests denied per second.     |
| Denied Peak                   | Number of outgoing Radius Start maximum requests denied.        |

### CSG Load Gx Event Rates Daily Reports

MWTM displays the CSG Load Gx Event Rates Daily report, obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

#### Note

The 15-minute and hourly CSG Load Gx Event Rates reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Load Gx Event Rates reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose CSG Load Gx Event Rates Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                                                                            |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                     |
| IPC Queue Depth Tolerance     | Maximum queue depth for Radius Start requests in the IPC queue.                                                                                                                                                                                              |
| Allowed                       | <ul style="list-style-type: none"> <li>Count—Number of outgoing Radius Start requests allowed.</li> <li>Rate—Number of outgoing Radius Start requests allowed per second.</li> <li>Peak—Number of outgoing Radius Start maximum requests allowed.</li> </ul> |
| Denied                        | <ul style="list-style-type: none"> <li>Count—Number of outgoing Radius Start requests denied.</li> <li>Rate—Number of outgoing Radius Start requests denied per second.</li> <li>Peak—Number of outgoing Radius Start maximum requests denied.</li> </ul>    |

### CSG Quota Manager Statistics Daily Reports

MWTM displays the CSG Quota Manager Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

#### Note

The 15-minute and hourly CSG Quota Manager Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Quota Manager Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose CSG Quota Manager Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                         |
| Server                        | Name of the Server.                                                                                                       |
| Port                          | Name of the Port.                                                                                                         |
| VRF Name                      | Name of the VRF.                                                                                                          |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                  |
| Sent                          | Number of records sent to the billing mediation agent.                                                                    |
| Sent Per Second               | Number of records sent per second to the billing mediation agent.                                                         |
| Retransmits                   | Number of messages retransmitted to the billing mediation agent.                                                          |
| Failed Acks                   | Number of acknowledgments received from the billing mediation agent for which there are no outstanding requests.          |
| Lost Records                  | Number of lost records since system initialization or the last time the counter wrapped.                                  |
| Bad Records                   | Number of bad records received. These are records in which an error was detected while attempting to decode the contents. |

### CSG Gx Global Message Statistics Daily Reports

## CSG Gx Global Message Errors Daily Reports

MWTM displays the CSG Gx Global Message Errors Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

### Note

The 15-minute and hourly CSG Gx Global Message Errors reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Gx Global Message Errors reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose CSG Gx Global Message Errors Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                           | Description                                                                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                            | Name of the node.                                                                                                                                                                                                                                         |

| Invalid Session ID Errors       | Number of times the session id received does not exist.                                                                                                                                                                                                   |

### CSG Gx PCRF Method List Message Statistics Daily Reports

MWTM displays the CSG Gx PCRF Method List Message Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

**Note**

The 15-minute and hourly CSG Gx PCRF Method List Message Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Gx PCRF Method List Message Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose CSG Gx PCRF Method List Message Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Invalid Session ID Errors     | Number of times the session id received does not exist.                                                                                                                                                                                                   |

## CSG Gx Policy Preload Statistics Daily Reports

MWTM displays the CSG Gx Policy Preload Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

**Note**

The 15-minute and hourly CSG Gx Policy Preload Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the Gx Policy Preload Daily Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose CSG Gx Policy Preload Statistics Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                              | Description                                              |
|------------------------------------|----------------------------------------------------------|
| Node                               | Name of the node.                                        |
| Timestamp ( <i>timezone</i> )      | Timestamp shows the time bits-per second value occurred. |
| PCEF Initiated Preloading          | Number of PCEF initiated preloading                      |
| PCRF Initiated Preloading          | Number of PCRF initiated preloading                      |
| Policy Preload Requests            | Number of Policy Preload requests.                       |
| Policy Preload Responses           | Number of Policy Preload responses.                      |
| Global Policy Push Count           | Number of Global Policy Push.                            |
| Global Policy Push Acknowledgement | Number of Global Policy Push Acknowledgements.           |

### CSG Gx Policy Preload Errors Daily Reports

MWTM displays the CSG Gx Policy Preload Errors Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

**Note**

The 15-minute and hourly CSG Gx Policy Preload Errors Daily Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Gx Policy Preload Errors Daily reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose CSG Gx Policy Preload Errors Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                          | Description                                                                                                                                                                                                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                           | Name of the node.                                                                                                                                                                                                                                         |
| Timestamp ( <i>timezone</i> )  | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                                  |
| Preload Data Inconsistent      | Number of times the preload data is inconsistent.                                                                                                                                                                                                         |
| Attribute Value Pairs Missing  | Number of times the mandatory AVPs are missing                                                                                                                                                                                                            |
| Wrong Order Failures           | Number of failures due to wrong order.                                                                                                                                                                                                                    |
| Enforcement Failures           | Number of failures to enforce.                                                                                                                                                                                                                            |
| Static Configuration Conflicts | Number of conflicts with static config.                                                                                                                                                                                                                   |
| Invalid Message Type Errors    | Number of invalid message type errors.                                                                                                                                                                                                                    |
| Credit Control                 | <ul style="list-style-type: none"> <li>Request Failures—Number of times failed to send CCR.</li> <li>Answer Errors—Number of errors occurred in CCA.</li> </ul>                                                                                           |
| Reauthorization                | <ul style="list-style-type: none"> <li>Answer Failures—Number of times failed to send RAA.</li> <li>Response Errors—Number of errors occurred in RAR.</li> </ul>                                                                                          |
| Invalid Request                | <ul style="list-style-type: none"> <li>Type Errors—Number of errors due to invalid request type.</li> <li>Number Errors—Number of errors due to invalid request number.</li> <li>Status Errors—Number of errors due to invalid request status.</li> </ul> |
| Invalid Session ID Errors      | Number of times the session id received does not exist.                                                                                                                                                                                                   |
| Preload Timeout Errors         | Number of times the preload timeout occurs.                                                                                                                                                                                                               |

### CSG Gx Policy Preload Accounting Policy Statistics Daily Reports

MWTM displays the CSG Gx Policy Preload Accounting Policy Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

#### Note

The 15-minute and hourly CSG Gx Policy Preload Accounting Policy Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Gx Policy Preload Accounting Policy Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose CSG Gx Policy Preload Errors Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Accounting Policy             | <ul style="list-style-type: none"> <li>Inserted—Number of accounting policy-maps inserted during preload.</li> <li>Deleted—Number of accounting policy-maps deleted during preload.</li> <li>Rolled Back—Number of times rollback is successful on insertion/deletion of accounting policy-maps during preload.</li> <li>Insert Failed —Number of times insertion of accounting policy-maps has failed.</li> <li>Delete Failed—Number of times deletion of accounting policy-maps has failed.</li> <li>Roll Back Failed—Number of times rollback has failed on insertion/deletion of accounting policy-maps during preload.</li> </ul> |

### CSG Gx Policy Preload Billing Plan Statistics Daily Reports

MWTM displays the CSG Gx Policy Preload Billing Plan Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

**Note**

The 15-minute and hourly CSG Gx Policy Preload Billing Plan Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Gx Policy Preload Billing Plan Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose CSG Gx Policy Preload Billing Plan Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

### CSG Gx Policy Preload Billing Services Statistics Daily Reports

MWTM displays the CSG Gx Policy Preload Billing Services Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > CSG**.

#### Note

The 15-minute and hourly CSG Gx Policy Preload Billing Services Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the CSG Gx Policy Preload Billing Services Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose CSG Gx Policy Preload Billing Services Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Node                          | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Service Contents              | <ul style="list-style-type: none"> <li>Inserted—Number of service-contents inserted during preload.</li> <li>Deleted—Number of service-contents deleted during preload.</li> <li>Rolled Back—Number of times rollback is successful on insertion/deletion of service-contents during preload.</li> <li>Insert Failed —Number of times insertion of service-contents has failed.</li> <li>Delete Failed—Number of times deletion of service-contents has failed.</li> <li>Roll Back Failed—Number of times rollback has failed on insertion/deletion of service-contents during preload.</li> </ul> |

## GGSN Reports

The MWTM web interface provides node-level GGSN reports. To generate a network-wide GGSN report:

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** If available, choose a sort parameter from the Sort Parameter drop-down menu.
- Step 6** To generate the report, click the Run icon (green arrow .

In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [APN Aggregate Miscellaneous Statistics Daily Reports, page 13-109](#)
- [APN Aggregate PDP/Bearer Statistics Daily Reports, page 13-110](#)
- [APN Aggregate PDP/Bearer Extended Statistics Daily Reports, page 13-113](#)
- [APN Aggregate Throughput Statistics Daily Reports, page 13-115](#)
- [APN Instance Miscellaneous Statistics Daily Reports, page 13-119](#)
- [APN Instance PDP/Bearer Statistics Daily Reports, page 13-119](#)
- [APN Instance PDP/Bearer Extended Statistics Daily Reports, page 13-119](#)
- [APN Instance Throughput Statistics Daily Reports, page 13-119](#)

- [GTP Active Statistics Daily Reports, page 13-119](#)
- [GTP Error Statistics Daily Reports, page 13-121](#)
- [GTP PDP Statistics Daily Reports, page 13-122](#)
- [GTP Throughput Statistics Daily Reports, page 13-123](#)

**Note** The 15-minute and hourly reports for GGSN are available from the node level only; they are not available from the top level or the network level.

## APN Aggregate Miscellaneous Statistics Daily Reports

MWTM displays the APN Aggregate Miscellaneous Statistics Daily report obtained during the specified period.

**Note** The same column names are displayed for **APN Instance Miscellaneous Statistics Daily Reports** with the addition of the column Node. Also, the same column names are displayed for APN Aggregate Miscellaneous Statistics Daily Reports of GGSN and PDNGW reports.

**Note** If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN or PDNGW**

**Note** The 15-minute and hourly reports for APN Aggregate Miscellaneous Statistics and APN Instance Miscellaneous Statistics are available from the node level only; they are not available from the top level or the network level. Click on a node name in the APN Aggregate Miscellaneous Statistics or in the APN Instance Miscellaneous Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose APN Aggregate Miscellaneous Statistics Daily (or APN Instance Miscellaneous Statistics Daily) from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Name                      | The name of the Access Point Name (APN).                                                                                                                                                                                                      |
| APN Index                     | A unique numerical identifier for the APN.                                                                                                                                                                                                    |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                      |
| DHCP Requests Success         | <ul style="list-style-type: none"> <li>Count—Number of DHCP request packets.</li> <li>Rate—Rate at which DHCP packets are requested.</li> <li>Ratio—Ratio of DHCP successful request packets.</li> </ul>                                      |
| DHCP Requests Failure         | <ul style="list-style-type: none"> <li>Count—Number of DHCP failure packets.</li> <li>Rate—Rate at which DHCP packets are declined.</li> </ul>                                                                                                |
| DHCP Releases                 | <ul style="list-style-type: none"> <li>Count—Number of DHCP released packets.</li> <li>Rate—Rate at which DHCP packets released.</li> </ul>                                                                                                   |
| COA Message Success           | <ul style="list-style-type: none"> <li>Count—Number of COA messages received at GGSN or PDNGW.</li> <li>Rate—Rate at which COA messages received at GGSN or PDNGW.</li> <li>Ratio—Ratio of COA messages received at GGSN or PDNGW.</li> </ul> |
| COA Message Failure           | <ul style="list-style-type: none"> <li>Count—Number of Error indication messages received on the GGSN or PDNGW.</li> <li>Rate—Rate at which Error indication messages received on the GGSN or PDNGW.</li> </ul>                               |
| Direct Tunnels Enabled        | <ul style="list-style-type: none"> <li>Count—Direct tunnels enabled for the PDP contexts in the GGSN or PDNGW.</li> <li>Rate—Rate at which the direct tunnels are enabled for the PDP contexts in the GGSN or PDNGW.</li> </ul>               |

### APN Aggregate PDP/Bearer Statistics Daily Reports

MWTM displays the APN Aggregate PDP/Bearer Statistics Daily report obtained during the specified period.

#### Note

The same column names are displayed for **APN Instance PDP/Bearer Statistics Daily Reports** with the addition of the column **Node**. Also, the same column names are displayed for APN Aggregate PDP/Bearer Statistics Daily Reports of GGSN and PDNGW reports.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN or PDNGW**.

**Note**

The 15-minute and hourly reports for APN Aggregate PDP/Bearer Statistics and APN Instance PDP/Bearer Statistics are available from the node level only; they are not available from the top level or the network level. Click on a node name in the APN Aggregate PDP/Bearer Statistics reports or in the APN Instance PDP/Bearer Statistics to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose APN Aggregate PDP/Bearer Statistics Daily (or APN Instance PDP/Bearer Statistics Daily) from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                                       | Description                                                                                        |
|---------------------------------------------|----------------------------------------------------------------------------------------------------|
| APN                                         | The name of the Access Point Name (APN).                                                           |
| APN Index                                   | A unique numerical identifier for the APN.                                                         |
| Average Active PDP/Bearer Contexts          | Average Number of PDP/Bearer contexts that are currently established on the GGSN or PDNGW devices. |
| Maximum Active PDP/Bearer Contexts          | Maximum Number of PDP/Bearer contexts that are currently established on the GGSN or PDNGW devices. |
| Maximum Date ( <i>timezone</i> )            | Time the maximum value occurred.                                                                   |
| Average PDP/Bearer Activation Success Ratio | Average ratio of PDP/Bearer context request messages received by the GGSN or PDNGW devices.        |
| Maximum PDP/Bearer Activation Success Ratio | Maximum ratio of PDP/Bearer context request messages received by the GGSN or PDNGW devices.        |
| Maximum Date ( <i>timezone</i> )            | Time the maximum value occurred.                                                                   |
| Average PDP/Bearer Retainability Ratio      | Average ratio of PDP/Bearer context messages retained by the GGSN or PDNGW devices.                |
| Maximum PDP/Bearer Retainability Ratio      | Maximum ratio of PDP/Bearer context messages retained by the GGSN or PDNGW devices.                |
| Maximum Date ( <i>timezone</i> )            | Time the maximum value occurred.                                                                   |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                                                                                | Output     | Field                                       | Description                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------|------------|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Aggregate PDP/Bearer Statistics Daily<br>(or APN Instance PDP/Bearer Statistics Daily) | Table, CSV | APN Name                                    | The name of the Access Point Name (APN).                                                                                                                                                                                                                                                                                                                                    |
|                                                                                            |            | APN Index                                   | A unique numerical identifier for the APN.                                                                                                                                                                                                                                                                                                                                  |
|                                                                                            |            | Timestamp<br>( <i>timezone</i> )            | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                    |
|                                                                                            |            | Active PDP/Bearers                          | <ul style="list-style-type: none"> <li>Count—Number of active PDP contexts or Bearers on this APN.</li> </ul>                                                                                                                                                                                                                                                               |

|             |        | <i>Legend</i>                                                                                        | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                         |

### APN Aggregate PDP/Bearer Extended Statistics Daily Reports

MWTM displays the APN Aggregate PDP/Bearer Extended Statistics Daily report obtained during the specified period.

#### Note

The same column names are displayed for **APN Instance PDP/Bearer Extended Statistics Daily Reports** with the addition of the column Node. Also, the same column names are displayed for APN Aggregate PDP/Bearer Extended Statistics Daily Reports of GGSN and PDNGW reports.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1**

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN or PDNGW**.

**Note**

The 15-minute and hourly reports for APN Aggregate PDP/Bearer Extended Statistics and APN Instance PDP/Bearer Extended Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the APN Aggregate PDP/Bearer Extended Statistics reports or in the APN Instance PDP/Bearer Extended Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2**

Choose APN Aggregate PDP/Bearer Extended Statistics Daily (or APN Instance PDP/Bearer Extended Statistics Daily) from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Name                                     | The name of the Access Point Name (APN).                                                                                                                                                                                                                                                                                                                                                                                |
| APN Index                                    | A unique numerical identifier for the APN.                                                                                                                                                                                                                                                                                                                                                                              |
| Timestamp ( <i>timezone</i> )                | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                                                                |

| Dedicated Bearer Activations Failure      | <ul style="list-style-type: none"> <li>Count—Total number of unsuccessful dedicated bearer activation procedures received on this APN.</li> <li>Rate—Rate (per second) of unsuccessful dedicated bearer activation procedures received on this APN.</li> </ul>                                                                                                                                                                  |

### APN Aggregate Throughput Statistics Daily Reports

MWTM displays the APN Aggregate Throughput Statistics Daily report obtained during the specified period.

#### Note

The same column names are displayed for **APN Instance Throughput Statistics Daily Reports** with the addition of the column Node. Also, the same column names are displayed for APN Aggregate Throughput Statistics Daily Reports of GGSN, PDNGW, and SGW reports.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN, PDNGW, or SGW**.

**Note** The 15-minute and hourly reports for APN Aggregate Throughput Statistics and APN Instance Throughput Statistics are available from the node level only; they are not available from the top level or the network level. Click on a node name in the APN Aggregate Throughput Statistics reports or in the APN Instance Throughput Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

---

- Step 2** Choose APN Aggregate Throughput Statistics Daily (APN Instance Throughput Statistics Daily) from the Type drop-down menu.

A summary table displays the information described in the following table:

| GUI Element     | Field                               | Description                                                                |
|-----------------|-------------------------------------|----------------------------------------------------------------------------|
|                 | APN                                 | The name of the Access Point Name (APN).                                   |
|                 | APN Index                           | A unique numerical identifier for the APN.                                 |
| Upstream Bits   | Average Rate                        | Average Rate during the specified duration.                                |
|                 | Maximum Rate                        | Maximum Rate during the specified duration.                                |
|                 | Maximum Date<br>( <i>timezone</i> ) | Timestamp that shows time when the maximum bits-per-second value occurred. |
| Downstream Bits | Average Rate                        | Average Rate during the specified duration.                                |
|                 | Maximum Rate                        | Maximum Rate during the specified duration.                                |
|                 | Maximum Date<br>( <i>timezone</i> ) | Timestamp that shows time when the maximum bits-per-second value occurred. |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                                                                                | Output     | Field                                               | Description                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------|------------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APN Aggregate Throughput Statistics Daily<br>(or APN Instance Throughput Statistics Daily) | Table, CSV | APN Name                                            | The name of the Access Point Name (APN).                                                                                                                                                                                                       |
|                                                                                            |            | APN Index                                           | The Unique identifier for the Access Point Name.                                                                                                                                                                                               |
|                                                                                            |            | Timestamp ( <i>timezone</i> )                       | Timestamp of the report.                                                                                                                                                                                                                       |
|                                                                                            |            | Upstream Bits                                       | <ul style="list-style-type: none"> <li>Count—Number of upstream bytes sent on this APN during the last sampling period.</li> <li>Rate—Rate (per second) of upstream bytes sent on this APN during the last sampling period.</li> </ul>         |
|                                                                                            |            | Downstream Bits                                     | <ul style="list-style-type: none"> <li>Count—Number of downstream bytes sent on this APN during the last sampling period.</li> <li>Rate—Rate (per second) of downstream bytes sent on this APN during the last sampling period.</li> </ul>     |
|                                                                                            |            | Upstream Packets                                    | <ul style="list-style-type: none"> <li>Count—Number of upstream packets sent on this APN during the last sampling period.</li> <li>Rate—Rate (per second) of upstream packets sent on this APN during the last sampling period.</li> </ul>     |
|                                                                                            |            | Downstream Packets                                  | <ul style="list-style-type: none"> <li>Count—Number of downstream packets sent on this APN during the last sampling period.</li> <li>Rate—Rate (per second) of downstream packets sent on this APN during the last sampling period.</li> </ul> |
|                                                                                            | Graph      | Expand to Full Screen                               | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                    |
|                                                                                            |            | Hide Summary Table                                  | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                             |
|                                                                                            |            | Upstream Throughput Rate\Downstream Throughput Rate | If Output Type is Graph, the Y-axis label shows Daily statistics over time.                                                                                                                                                                    |
|                                                                                            |            | Time                                                | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                              |
|                                                                                            |            | <i>Legend</i>                                       | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                    |

### APN Instance Miscellaneous Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate Miscellaneous Statistics Daily report with the addition of the column Node. See [APN Aggregate Miscellaneous Statistics Daily Reports, page 13-109](#).

### APN Instance PDP/Bearer Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate PDP/Bearer Statistics Daily report with the addition of the column Node. See [APN Aggregate PDP/Bearer Statistics Daily Reports, page 13-110](#).

### APN Instance PDP/Bearer Extended Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate PDP/Bearer Extended Statistics Daily report with the addition of the column Node. See [APN Aggregate PDP/Bearer Extended Statistics Daily Reports, page 13-113](#).

### APN Instance Throughput Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate Throughput Statistics Daily report with the addition of the column Node. See [APN Aggregate Throughput Statistics Daily Reports, page 13-115](#).

### GTP Active Statistics Daily Reports

MWTM displays the GTP Active Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN**.

#### Note

The 15-minute and hourly GTP Active Statistics (GGSN) reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Active Statistics (GGSN) reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose GTP Active Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                   | Description                                 |
|-------------------------|---------------------------------------------|
| Node                    | Name of the node.                           |
| Average Active Sessions | Average sessions which are in active state. |
| Maximum Active Sessions | Maximum sessions which are in active state. |

| Field                               | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| Maximum Date<br>( <i>timezone</i> ) | Timestamp when the maximum value occurred.            |
| Average GTP v0<br>PDP Contexts      | Average PDP contexts (GTP version 0) that are active. |
| Maximum GTP<br>v0 PDP Contexts      | Maximum PDP contexts (GTP version 0) that are active. |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp when the maximum value occurred.            |
| Average GTP v1<br>PDP Contexts      | Average PDP contexts (GTP version 1) that are active. |
| Maximum GTP<br>v1 PDP Contexts      | Maximum PDP contexts (GTP version 1) that are active. |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp when the maximum value occurred.            |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                 | Output     | Field                                                           | Description                                                                                                         |
|-----------------------------|------------|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| GTP Active Statistics Daily | Table, CSV | Node                                                            | Name of the node.                                                                                                   |
|                             |            | Timestamp ( <i>timezone</i> )                                   | Timestamp of the report.                                                                                            |
|                             |            | Active Sessions                                                 | Total number of sessions currently established with the system.                                                     |
|                             |            | Direct Tunnel PDP Contexts                                      | Direct tunnels enabled for the PDP contexts in the GGSN.                                                            |
|                             |            | GTP v0 PDP Contexts                                             | PDP contexts (GTP version 0) that are active.                                                                       |
|                             |            | GTP v1 PDP Contexts                                             | PDP contexts (GTP version 1) that are active.                                                                       |
|                             |            | PPP Regen PDPs                                                  | Device-specific interfaces created for association with PDP contexts regenerated to a Point-to-Point (PPP) session. |
|                             |            | PPP PDPs                                                        | Total number of point to point PDP contexts.                                                                        |
|                             | Graph      | Expand to Full Screen                                           | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing          |

### GTP Error Statistics Daily Reports

MWTM displays the GTP Error Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN**.

**Note** The 15-minute and hourly GTP Error Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Error Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose GTP Error Statistics Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## GTP PDP Statistics Daily Reports

**Note** The same column names are displayed for **GTP PDP/Bearer Statistics Daily Reports** of PDNGW Reports and **GTP Bearer Statistics Daily Reports** of SGW Reports.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN, PDNGW, or SGW**.

**Note**

The 15-minute and hourly GTP PDP Statistics (GGSN), GTP PDP/Bearer Statistics (PDNGW), and GTP Bearer Statistics (SGW) reports are available from the node level only; they are not available from the top level or the network level. Choose GTP PDP Statistics Daily from the Type drop-down menu.

- Step 2** Choose GTP PDP Statistics Daily (GTP PDP/Bearer Statistics Daily or GTP Bearer Statistics Daily) from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                                                                 |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                          |
| Activation Failure Ratio         | Failure ratio.                                                                                                                                                    |
| Created                          | <ul style="list-style-type: none"> <li>Count—Number of PDP/Bearer contexts created.</li> <li>Rate—Rate at which the PDP/Bearer contexts are created.</li> </ul>   |
| Rejected                         | <ul style="list-style-type: none"> <li>Count—Number of PDP/Bearer contexts rejected.</li> <li>Rate—Rate at which the PDP/Bearer contexts are rejected.</li> </ul> |
| Deleted                          | <ul style="list-style-type: none"> <li>Count—Number of PDP/Bearer contexts deleted.</li> <li>Rate—Rate at which the PDP/Bearer contexts are deleted.</li> </ul>   |

## GTP Throughput Statistics Daily Reports

MWTM displays the GTP Throughput Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Note**

The same column names are displayed for GTP Throughput Statistics Daily Reports of GGSN, PDNGW, and SGW reports.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > GGSN, PDNGW, or SGW**.

**Note** The 15-minute and hourly GTP Throughput Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Throughput Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose GTP Throughput Statistics Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## PDNGW Reports

The MWTM web interface provides node-level PDNGW reports for bearer performance statistics. To generate a network wide PDNGW report:

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** If available, choose a sort parameter from the Sort Parameter drop-down menu.
- Step 6** To generate the report, click the Run icon (green arrow .

In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [APN Aggregate Miscellaneous Statistics Daily Reports, page 13-126](#)
- [APN Aggregate PDP/Bearer Statistics Daily Reports, page 13-126](#)
- [APN Aggregate PDP/Bearer Extended Statistics Daily Reports, page 13-126](#)
- [APN Aggregate Throughput Statistics Daily Reports, page 13-126](#)
- [APN Instance Miscellaneous Statistics Daily Reports, page 13-126](#)
- [APN Instance PDP/Bearer Statistics Daily Reports, page 13-126](#)
- [APN Instance PDP/Bearer Extended Statistics Daily Reports, page 13-126](#)
- [APN Instance Throughput Statistics Daily Reports, page 13-126](#)
- [EPC Gateway Protection Statistics Daily Reports, page 13-126](#)
- [EPC Gateway Buffering Statistics Daily Reports, page 13-127](#)
- [GTP Active Statistics Daily Reports, page 13-129](#)
- [GTP Error Statistics Daily Reports, page 13-129](#)
- [GTP Path Errors Daily Reports, page 13-130](#)
- [GTP PDP/Bearer Statistics Daily Reports, page 13-131](#)
- [GTP Throughput Statistics Daily Reports, page 13-131](#)
- [GTPv2 Bearer Statistics Daily Reports, page 13-131](#)
- [GTPv2 Session Statistics Daily Reports, page 13-134](#)
- [GTPv2 Path Bearer Statistics Daily Reports, page 13-135](#)
- [GTPv2 Path Session Statistics Daily Reports, page 13-136](#)

**Note** The 15-minute and hourly reports for PDNGW are available from the node level only; they are not available from the top level or the network level.

### APN Aggregate Miscellaneous Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate Miscellaneous Statistics Daily report of GGSN Reports. See [APN Aggregate Miscellaneous Statistics Daily Reports, page 13-109](#).

### APN Aggregate PDP/Bearer Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate PDP/Bearer Statistics Daily report of GGSN Reports. See [APN Aggregate PDP/Bearer Statistics Daily Reports, page 13-110](#).

### APN Aggregate PDP/Bearer Extended Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate PDP/Bearer Extended Statistics Daily report of GGSN Reports. See [APN Aggregate PDP/Bearer Extended Statistics Daily Reports, page 13-113](#).

### APN Aggregate Throughput Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate Throughput Statistics Daily report of GGSN Reports. See [APN Aggregate Throughput Statistics Daily Reports, page 13-115](#).

### APN Instance Miscellaneous Statistics Daily Reports

The GUI displays the same fields as that of APN Instance Miscellaneous Statistics Daily report of GGSN Reports. See [APN Instance Miscellaneous Statistics Daily Reports, page 13-119](#).

### APN Instance PDP/Bearer Statistics Daily Reports

The GUI displays the same fields as that of APN Instance PDP/Bearer Statistics Daily report of GGSN Reports. See [APN Instance PDP/Bearer Statistics Daily Reports, page 13-119](#).

### APN Instance PDP/Bearer Extended Statistics Daily Reports

The GUI displays the same fields as that of APN Instance PDP/Bearer Extended Statistics Daily report of GGSN Reports. See [APN Instance PDP/Bearer Extended Statistics Daily Reports, page 13-119](#).

### APN Instance Throughput Statistics Daily Reports

The GUI displays the same fields as that of APN Instance Throughput Statistics Daily report of GGSN Reports. See [APN Instance Throughput Statistics Daily Reports, page 13-119](#).

### EPC Gateway Protection Statistics Daily Reports

MWTM displays the EPC Gateway Protection Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Note**

The same column names are displayed for EPC Gateway Protection Statistics Daily Reports of PDNGW and SGW reports.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW or SGW**.

**Note** The 15-minute and hourly EPC Gateway Protection Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the EPC Gateway Protection Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose EPC Gateway Protection Statistics Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                               |
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                        |
| Call Requests Dropped         | <ul style="list-style-type: none"> <li>Count—Total number of incoming calls dropped at the gateway.</li> <li>Rate—Rate at which the incoming calls are dropped at the gateway.</li> </ul>       |
| Times Low Congestion Reached  | <ul style="list-style-type: none"> <li>Count—The number of times low congestion occurred on the gateway.</li> <li>Rate—Rate at which the low congestion are occurred on the gateway.</li> </ul> |
| Times High Congestion Reached | <ul style="list-style-type: none"> <li>Count—The number of times high congestion occurred on the gateway.</li> <li>Rate—Rate at which the high congestion occurred on the gateway.</li> </ul>   |

### EPC Gateway Buffering Statistics Daily Reports

MWTM displays the EPC Gateway Buffering Statistics Daily report obtained during the specified period.

**Note** If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Note** The same column names are displayed for EPC Gateway Buffering Statistics Daily Reports of PDNGW and SGW reports.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW or SGW**.

**Note** The 15-minute and hourly EPC Gateway Buffering Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the EPC Gateway Buffering Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose EPC Gateway Buffering Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                              | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                               | Name of the node.                                                                                                                                                                                                                                                                                                                             |
| Timestamp ( <i>timezone</i> )      | Timestamp of the report.                                                                                                                                                                                                                                                                                                                      |
| Total In Use Buffers               | Total number of buffers currently in use.                                                                                                                                                                                                                                                                                                     |
| Total Buffered Packets             | Total number of packets buffered at present in the buffer.                                                                                                                                                                                                                                                                                    |
| Total Buffered Bits                | Total number of bytes buffered at present in the buffer.                                                                                                                                                                                                                                                                                      |
| Total Buffers Available            | Current available buffer size.                                                                                                                                                                                                                                                                                                                |
| Buffers Created                    | <ul style="list-style-type: none"> <li>Count—Total number of buffers created.</li> <li>Rate—Rate at which the buffers are created.</li> </ul>                                                                                                                                                                                                 |
| Buffers Deleted                    | <ul style="list-style-type: none"> <li>Count—Total number of buffers deleted.</li> <li>Rate—Rate at which the buffers are deleted.</li> </ul>                                                                                                                                                                                                 |
| Buffers Timed Out                  | <ul style="list-style-type: none"> <li>Count—Total number of buffers that got timed out.</li> <li>Rate—Rate at which the buffers got timed out.</li> </ul>                                                                                                                                                                                    |
| Buffer Packets Enqueued            | <ul style="list-style-type: none"> <li>Count—Total number of packets enqueued to the buffering agent.</li> <li>Rate—Rate at which the packets are enqueued to the buffering agent.</li> </ul>                                                                                                                                                 |

| Buffer Bits Dequeued               | <ul style="list-style-type: none"> <li>Count—Total bytes of data dequeued from the buffering agent.</li> <li>Rate—Rate at which the bits of data are dequeued from the buffering agent.</li> </ul>                                                                                                                                            |
| Buffer Rejected Memory Unavailable | <ul style="list-style-type: none"> <li>Count—Total number of times the buffer allocation is rejected by gateway due to requested memory is greater than the total available buffers.</li> <li>Rate—Rate at which the buffer allocation is rejected by gateway due to requested memory is greater than the total available buffers.</li> </ul> |
| Buffer Rejected Low Memory         | <ul style="list-style-type: none"> <li>Count—Total number of times the buffer allocation is rejected due to low memory availability in the gateway.</li> <li>Rate—Rate at which the buffer allocation is rejected due to low memory availability in the gateway.</li> </ul>                                                                   |

## GTP Active Statistics Daily Reports

MWTM displays the GTP Active Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW**.

### Note

The 15-minute and hourly GTP Active Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Active Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

### Step 2

Choose GTP Active Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                   |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                            |
| Active Sessions                  | Total number of sessions currently established with the system.                                                     |
| Direct Tunnel<br>PDP Contexts    | Direct tunnels enabled for the PDP contexts in the GGSN.                                                            |
| GTP v0 PDP<br>Contexts           | PDP contexts (GTP version 0) that are active.                                                                       |
| GTP v1 PDP<br>Contexts           | PDP contexts (GTP version 1) that are active.                                                                       |
| GTP v2 EPS<br>Bearers            | EPS bearers (GTP version 2) that are active.                                                                        |
| PPP Regen PDPs                   | Device-specific interfaces created for association with PDP contexts regenerated to a Point-to-Point (PPP) session. |
| PPP PDPs                         | Total number of point to point PDP contexts.                                                                        |

## GTP Error Statistics Daily Reports

MWTM displays the GTP Error Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW**.

**Note** The 15-minute and hourly GTP Error Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Error Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose GTP Error Statistics Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PDP Context Activations          | <ul style="list-style-type: none"> <li>Insufficient Resources Rejection—Number of PDP context requests rejected due to insufficient resources.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                    |

| GTP Message Parsers Errors       | Number of GTP messages received with wrong value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## GTP Path Errors Daily Reports

MWTM displays the GTP Path Errors Daily report obtained during the specified period.

**Note** If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW**.

**Note** The 15-minute and hourly GTP Path Error (PDNGW) reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Path Error (PDNGW) reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose GTP Path Errors Daily from the Type drop-down menu.  
A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| GTP Path                         | Path of the GTP.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Signaling<br>Messages            | <p><b>Unexpected</b></p> <ul style="list-style-type: none"> <li>Count—Number of unexpected GTP signaling messages sent or received.</li> <li>Rate—Rate at which the unexpected GTP signaling messages are sent or received.</li> </ul> <p><b>Dropped</b></p> <ul style="list-style-type: none"> <li>Count—Number of signaling messages that are dropped.</li> <li>Rate—Rate at which the signaling messages are dropped.</li> </ul> |

### GTP PDP/Bearer Statistics Daily Reports

The GUI displays the same fields as that of GTP PDP Statistics Daily report of GGSN Reports. See [GTP PDP Statistics Daily Reports, page 13-122](#).

### GTP Throughput Statistics Daily Reports

The GUI displays the same fields as that of GTP Throughput Statistics Daily report of GGSN Reports. See [GTP Throughput Statistics Daily Reports, page 13-123](#).

### GTPv2 Bearer Statistics Daily Reports

MWTM displays the GTPv2 Bearer Statistics Daily report obtained during the specified period.

**Note** If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW**.

**Note** The 15-minute and hourly GTPv2 Bearer Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the SGW GTPv2 Bearer Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

---

- Step 2** Choose GTPv2 Bearer Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                           | Description                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                            | Name of the node.                                                                                                                                                                       |
| Timestamp ( <i>timezone</i> )   | Timestamp shows the time bits-per second value occurred.                                                                                                                                |
| Create Bearer Requests Received | <ul style="list-style-type: none"> <li>Count—Number of create bearer request messages received.</li> <li>Rate—Rate at which the create bearer request messages are received.</li> </ul> |
| Create Bearer Requests Rejected | <ul style="list-style-type: none"> <li>Count—Number of create bearer request messages rejected.</li> <li>Rate—Rate at which the create bearer request messages are rejected.</li> </ul> |
| Modify Bearer Requests Received | <ul style="list-style-type: none"> <li>Count—Number of modify bearer request messages received.</li> <li>Rate—Rate at which the modify bearer request messages are received.</li> </ul> |
| Modify Bearer Requests Rejected | <ul style="list-style-type: none"> <li>Count—Number of modify bearer request messages rejected.</li> <li>Rate—Rate at which the modify bearer request messages are rejected.</li> </ul> |
| Update Bearer Requests Received | <ul style="list-style-type: none"> <li>Count—Number of update bearer request messages received.</li> <li>Rate—Rate at which the update bearer request messages are received.</li> </ul> |
| Update Bearer Requests Rejected | <ul style="list-style-type: none"> <li>Count—Number of update bearer request messages rejected.</li> <li>Rate—Rate at which the update bearer request messages are rejected.</li> </ul> |
| Delete Bearer Responses Sent    | <ul style="list-style-type: none"> <li>Count—Number of delete bearer response messages sent.</li> <li>Rate—Rate at which the delete bearer response messages are sent.</li> </ul>       |

## GTPv2 Session Statistics Daily Reports

MWTM displays the GTPv2 Session Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1**

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW**

**Note**

The 15-minute and hourly GTPv2 Session Daily (PDNGW) reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTPv2 Session Daily (PDNGW) reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2**

Choose GTPv2 Session Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                               | Description                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                                | Name of the node.                                                                                                                                                                         |
| Timestamp<br>( <i>timezone</i> )    | Timestamp of the report.                                                                                                                                                                  |

| Delete Session<br>Responses Sent    | <ul style="list-style-type: none"> <li>Count—Number of delete session response messages sent.</li> <li>Rate—Rate at which the delete session response messages are sent.</li> </ul>       |

## GTPv2 Path Bearer Statistics Daily Reports

MWTM displays the GTPv2 Path Bearer Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW**.

### Note

The 15-minute and hourly GTPv2 Path Bearer Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTPv2 Path Bearer Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

### Step 2

Choose GTPv2 Path Bearer Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                              | Description                                                                                                                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                               | Name of the node.                                                                                                                                                                       |
| GTP Path                           | Path of GTP.                                                                                                                                                                            |
| Timestamp<br>( <i>timezone</i> )   | Timestamp shows the time bits-per second value occurred.                                                                                                                                |
| Create Bearer<br>Requests Received | <ul style="list-style-type: none"> <li>Count—Number of create bearer request messages received.</li> <li>Rate—Rate at which the create bearer request messages are received.</li> </ul> |
| Create Bearer<br>Requests Rejected | <ul style="list-style-type: none"> <li>Count—Number of create bearer request messages rejected.</li> <li>Rate—Rate at which the create bearer request messages are rejected.</li> </ul> |
| Modify Bearer<br>Requests Received | <ul style="list-style-type: none"> <li>Count—Number of modify bearer request messages received.</li> <li>Rate—Rate at which the modify bearer request messages are received.</li> </ul> |
| Modify Bearer<br>Requests Rejected | <ul style="list-style-type: none"> <li>Count—Number of modify bearer request messages rejected.</li> <li>Rate—Rate at which the modify bearer request messages are rejected.</li> </ul> |
| Update Bearer<br>Requests Received | <ul style="list-style-type: none"> <li>Count—Number of update bearer request messages received.</li> <li>Rate—Rate at which the update bearer request messages are received.</li> </ul> |
| Update Bearer<br>Requests Rejected | <ul style="list-style-type: none"> <li>Count—Number of update bearer request messages rejected.</li> <li>Rate—Rate at which the update bearer request messages are rejected.</li> </ul> |
| Delete Bearer<br>Responses Sent    | <ul style="list-style-type: none"> <li>Count—Number of delete bearer response messages sent.</li> <li>Rate—Rate at which the delete bearer response messages are sent.</li> </ul>       |

## GTPv2 Path Session Statistics Daily Reports

MWTM displays the GTPv2 Path Session Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1**

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDNGW**.

**Note**

The 15-minute and hourly GTPv2 Path Session Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTPv2 Path Session Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2**

Choose GTPv2 Path Session Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                               | Description                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                                | Name of the node.                                                                                                                                                                         |
| GTP Path                            | Path of GTP.                                                                                                                                                                              |
| Timestamp<br>( <i>timezone</i> )    | Timestamp shows the time bits-per second value occurred.                                                                                                                                  |
| Create Session<br>Requests Received | <ul style="list-style-type: none"> <li>Count—Number of create session request messages received.</li> <li>Rate—Rate at which the create session request messages are received.</li> </ul> |

## PDSN Reports

The MWTM web interface provides node-level PDSN reports. To generate a network-wide PDSN report:

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDSN**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** If available, choose a sort parameter from the Sort Parameter drop-down menu.
- Step 6** To generate the report, click the Run icon (green arrow .
- 

In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [PDSN Session Statistics Daily Reports, page 13-137](#)
  - [PDSN Session Bandwidth Statistics Daily Reports, page 13-140](#)
  - [PDSN Flow Statistics Daily Reports, page 13-142](#)
  - [PDSN Flow Extended Statistics Daily Reports, page 13-144](#)
  - [PDSN Packet Control Function Statistics Daily Reports, page 13-146](#)
  - [PDSN Traffic Statistics Daily Reports, page 13-147](#)
  - [PDSN Traffic Extended Statistics Daily Reports, page 13-149](#)
- 

### PDSN Session Statistics Daily Reports

MWTM displays the PDSN Session Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

---

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDSN**.

#### Note

The 15-minute and hourly PDSN Session reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PDSN Session reports to navigate to a specific node to view hourly and 15 minute reports for that node.

---

- Step 2** Choose PDSN Session Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                               | Description                                                     |
|-------------------------------------|-----------------------------------------------------------------|
| Node                                | Name of the node.                                               |
| Total Sessions                      | Total number of sessions currently established with the system. |
| Maximum Allowed Session             | Maximum number of sessions allowed by the system.               |
| Average Session Utilization         | Average session utilization during the specified duration.      |
| Maximum Session Utilization         | Maximum session utilization during the specified duration.      |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp when the maximum value occurred                       |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                   | Output     | Field                            | Description                                                                  |
|-------------------------------|------------|----------------------------------|------------------------------------------------------------------------------|
| PDSN Session Statistics Daily | Table, CSV | Node                             | Name of the node.                                                            |
|                               |            | Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                     |
|                               |            | Total Sessions                   | Total number of sessions currently established with the system.              |
|                               |            | Maximum Allowed Sessions         | Maximum number of sessions allowed by the system.                            |
|                               |            | Session Utilization              | Total session utilization.                                                   |
|                               |            | Total Active Sessions            | Total number of sessions in active state.                                    |
|                               |            | Total Dormant Sessions           | Total number of sessions in dormant state.                                   |
|                               |            | Total PPP over GRE Sessions      | Total number of PPPoGRE sessions currently established with the system.      |
|                               |            | Total HDLC over GRE Sessions     | Total number of HDLCoGRE sessions currently established with the system.     |
|                               |            | Total Sessions Established       | Total number of sessions established since system was last restarted.        |
|                               |            | Total Sessions Established Rate  | Rate at which the sessions were established since system was last restarted. |
|                               |            | Total Sessions Released          | Total number of sessions released since system was last restarted.           |
|                               |            | Total Sessions Released Rate     | Rate at which the sessions were released since system was last restarted.    |
|                               |            | Total Session Failures           | Number of A10/A11 session failures occurring since PDSN agent restarted.     |
|                               |            | Session Failure Ratio            | Ratio of session failures.                                                   |

| Report Type | Output | Field                                                               | Description                                                                                                        |
|-------------|--------|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
|             | Graph  | Expand to Full Screen                                               | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|             |        | Hide Summary Table                                                  | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|             |        | Maximum Allowed Sessions/<br>Total Sessions/<br>Session Utilization | If Output Type is Graph, the Y-axis label shows Daily statistics over time.                                        |
|             |        | Time                                                                | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|             |        | Utilization                                                         | If Output Type is Graph, a color-coded legend shows labels for utilization.                                        |
|             |        | <i>Legend</i>                                                       | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|             |        |                                                                     |                                                                                                                    |

## PDSN Session Bandwidth Statistics Daily Reports

MWTM displays the PDSN Session Bandwidth Statistics Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDSN**.

### Note

The 15-minute and hourly PDSN Session Bandwidth reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PDSN Session Bandwidth reports to navigate to a specific node to view hourly and 15 minute reports for that node.

### Step 2

Choose PDSN Session Bandwidth Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                                                          |
|----------------------------------|--------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                    |
| Total Allocated Bandwidth        | Total bandwidth allocated for sessions currently established on the PDSN.            |
| Total Configured Bandwidth       | Total bandwidth value configured via the CLI that would be supported by PDSN system. |
| Average Bandwidth Utilization    | Average bandwidth utilization during the specified duration.                         |
| Maximum Bandwidth Utilization    | Maximum bandwidth utilization during the specified duration.                         |
| Maximum Date ( <i>timezone</i> ) | Timestamp when the maximum value occurred                                            |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                             | Output     | Field                                                                        | Description                                                                                                        |
|-----------------------------------------|------------|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| PDSN Session Bandwidth Statistics Daily | Table, CSV | Node                                                                         | Name of the node.                                                                                                  |
|                                         |            | Timestamp ( <i>timezone</i> )                                                | Timestamp of the report.                                                                                           |
|                                         |            | Total Available Bandwidth                                                    | Bandwidth available on the PDSN system for creation of new sessions.                                               |
|                                         |            | Total Allocated Bandwidth                                                    | Total bandwidth allocated for sessions currently established on the PDSN.                                          |
|                                         |            | Total Configured Bandwidth                                                   | Total bandwidth value configured via the CLI that would be supported by PDSN system.                               |
|                                         |            | Bandwidth Utilization                                                        | Total bandwidth that has been utilized.                                                                            |
|                                         | Graph      | Expand to Full Screen                                                        | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|                                         |            | Hide Summary Table                                                           | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|                                         |            | Total Allocated Bandwidth/ Total Configured Bandwidth/ Bandwidth Utilization | If Output Type is Graph, the Y-axis label shows Daily statistics over time.                                        |
|                                         |            | Time                                                                         | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                                         |            | Utilization                                                                  | If Output Type is Graph, a color-coded legend shows labels for utilization.                                        |
|                                         |            | <i>Legend</i>                                                                | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |

## PDSN Flow Statistics Daily Reports

MWTM displays the PDSN Flow Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDSN**.

**Note**

The 15-minute and hourly PDSN Flow reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PDSN Flow reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose PDSN Flow Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                               | Description                                              |
|-------------------------------------|----------------------------------------------------------|
| Node                                | Name of the node.                                        |
| Total Simple IP Flows               | Total number of flows currently using simple IP service. |
| Total Mobile IP Flows               | Total number of flows currently using MoIP services.     |
| Maximum Date<br>( <i>timezone</i> ) | Timestamp when the maximum value occurred.               |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                        | Output     | Field                                           | Description                                                                                                        |
|------------------------------------|------------|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| PDSN Flow Statistics Daily Reports | Table, CSV | Node                                            | Name of the node.                                                                                                  |
|                                    |            | Timestamp ( <i>timezone</i> )                   | Timestamp of the report.                                                                                           |
|                                    |            | Total Simple IP Flows                           | Total number of flows currently using simple IP service.                                                           |
|                                    |            | Total Mobile IP Flows                           | Total number of flows currently using MoIP services.                                                               |
|                                    |            | Total Proxy Mobile IP Flows                     | Total number of flows currently using proxy MoIP service.                                                          |
|                                    |            | Total MSID Flows                                | Total number of flows currently using MSID service.                                                                |
|                                    |            | Total VPDN Flows                                | The total number of flows currently using VPDN service.                                                            |
|                                    | Graph      | Expand to Full Screen                           | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |
|                                    |            | Hide Summary Table                              | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|                                    |            | Total Simple IP Flows/<br>Total Mobile IP Flows | If Output Type is Graph, the Y-axis label shows Daily statistics over time.                                        |
|                                    |            | Time                                            | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                                    |            | <i>Legend</i>                                   | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |

### PDSN Flow Extended Statistics Daily Reports

MWTM displays the PDSN Flow Extended Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDSN**.

**Note**

The 15-minute and hourly PDSN Flow Extended Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PDSN Flow Extended Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose PDSN Flow Extended Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                                         | Description                                                                                                                                                                                                                                                    |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                                          | Name of the node.                                                                                                                                                                                                                                              |
| Timestamp<br>( <i>timezone</i> )              | Timestamp of the report.                                                                                                                                                                                                                                       |

| Total Unknown Type Flow Failures | <ul style="list-style-type: none"> <li>Count—Total number of unknown type flow setup request failed since last system reboot.</li> <li>Rate—Rate at which the unknown type flow setup request is failed since last system reboot.</li> </ul> |
| Flow Failure Ratio               | Ratio of flow failures.                                                                                                                                                                                                                      |

### PDSN Packet Control Function Statistics Daily Reports

MWTM displays the PDSN Packet Control Function Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDSN**.

#### Note

The 15-minute and hourly PDSN PCF Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PDSN PCF reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose PDSN Packet Control Function Statistics Daily from the Type drop-down menu. A summary table displays the information described in the following table:

| Field                            | Description                                                |
|----------------------------------|------------------------------------------------------------|
| Node                             | Name of the node.                                          |
| Total PCFs                       | Total number of PCF currently interacting with the system. |
| Maximum Allowed PCFs             | Maximum number of PCF allowed by the system.               |
| Average PCF Utilization          | Average PCF utilization during the specified duration.     |
| Maximum PCF Utilization          | Maximum PCF utilization during the specified duration.     |
| Maximum Date ( <i>timezone</i> ) | Timestamp for when the maximum value occurred.             |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                                           | Output     | Field                                             | Description                                                                                                        |
|-------------------------------------------------------|------------|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| PDSN Packet Control Function Statistics Daily Reports | Table, CSV | Node                                              | Name of the node.                                                                                                  |
|                                                       |            | Timestamp ( <i>timezone</i> )                     | Timestamp of the report.                                                                                           |
|                                                       |            | Total PCFs                                        | Total number of PCF currently interacting with the system.                                                         |
|                                                       |            | Maximum Allowed PCFs                              | Maximum number of PCF allowed by the system.                                                                       |
|                                                       |            | PCF Utilization                                   | PCF utilization.                                                                                                   |

|                                                       |            | Hide Summary Table                                | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph. |
|                                                       |            | Total PCFs/ PCF Utilization/ Maximum Allowed PCFs | If Output Type is Graph, the Y-axis label shows Daily statistics over time.                                        |
|                                                       |            | Time                                              | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                  |
|                                                       |            | <i>Legend</i>                                     | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing         |

### PDSN Traffic Statistics Daily Reports

MWTM displays the PDSN Traffic Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDSN**.

**Note**

The 15-minute and hourly PDSN Traffic Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PDSN Traffic Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose PDSN Traffic Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                                                                                                                                                                                                                                                       |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                |

### PDSN Traffic Extended Statistics Daily Reports

MWTM displays the PDSN Traffic Extended Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > PDSN**.

#### Note

The 15-minute and hourly PDSN Traffic Extended Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PDSN Traffic Extended Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose PDSN Traffic Extended Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                                      | Description                                                                                                                                                                                                                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                                       | Name of the node.                                                                                                                                                                                                                                                                                    |
| Timestamp<br>( <i>timezone</i> )           | Timestamp of the report.                                                                                                                                                                                                                                                                             |
| Short Data Burst<br>Packets Sent           | <ul style="list-style-type: none"> <li>Count—Total number of SDB marked data packets sent to PCF from PDSN since system was last restarted.</li> <li>Rate—Rate at which the SDB marked data packets are sent to PCF from PDSN since system was last restarted.</li> </ul>                            |
| Short Data Burst<br>Bits Sent              | <ul style="list-style-type: none"> <li>Count—Total number of SDB marked data octets sent to PCF from PDSN since system was last restarted.</li> <li>Rate—Rate at which the SDB marked data octets are sent to PCF from PDSN since system was last restarted.</li> </ul>                              |
| No GRE Key<br>Packet Discards              | <ul style="list-style-type: none"> <li>Count—Total number of packets discarded from PCF because of the missing GRE Keying since system was last restarted.</li> <li>Rate—Rate at which the packets are discarded from PCF because of the missing GRE Key since system was last restarted.</li> </ul> |
| No Session Packet<br>Discards              | <ul style="list-style-type: none"> <li>Count—Total number of packets discarded from PCF because of missing session since system was last restarted.</li> <li>Rate—Rate at which the packets are discarded from PCF because of missing session since system was last restarted.</li> </ul>            |
| Invalid GRE<br>Protocol Packet<br>Discards | <ul style="list-style-type: none"> <li>Count—Total number of packets discarded from PCF because of invalid GRE protocol since system was last restarted.</li> <li>Rate—Rate at which the packets are discarded from PCF because of invalid GRE protocol since system was last restarted.</li> </ul>  |
| Invalid Checksum<br>Packet Discards        | <ul style="list-style-type: none"> <li>Count—Total number of packets discarded from PCF because of invalid checksum since system was last restarted.</li> <li>Rate—Rate at which the packets are discarded from PCF because of invalid checksum since system was last restarted.</li> </ul>          |

## SGW Reports

The MWTM web interface provides node-level SGW reports for bearer performance statistics. To generate a network wide PDNGW report:

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > SGW**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .

- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** If available, choose a sort parameter from the Sort Parameter drop-down menu.
- Step 6** To generate the report, click the Run icon (green arrow ).

In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [APN Aggregate Bearer Statistics Daily Reports, page 13-151](#)
- [APN Aggregate Throughput Statistics Daily Reports, page 13-155](#)
- [APN Instance Bearer Statistics Daily Reports, page 13-156](#)
- [APN Instance Throughput Statistics Daily Reports, page 13-156](#)
- [EPC Gateway Protection Statistics Daily Reports, page 13-156](#)
- [EPC Gateway Buffering Statistics Daily Reports, page 13-156](#)
- [GTP Active Statistics Daily Reports, page 13-156](#)
- [GTP Error Statistics Daily Reports, page 13-157](#)
- [GTP Path Errors Daily Reports, page 13-158](#)
- [GTP Bearer Statistics Daily Reports, page 13-159](#)
- [GTP Throughput Statistics Daily Reports, page 13-159](#)
- [GTPv2 Bearer Statistics Daily Reports, page 13-159](#)
- [GTPv2 Session Statistics Daily Reports, page 13-160](#)
- [GTPv2 Path Bearer Statistics Daily Reports, page 13-162](#)
- [GTPv2 Path Session Statistics Daily Reports, page 13-164](#)

**Note** The 15-minute and hourly reports for SGW are available from the node level only; they are not available from the top level or the network level.

## APN Aggregate Bearer Statistics Daily Reports

MWTM displays the APN Aggregate Bearer Statistics Daily report obtained during the specified period.

**Note** The same column names are displayed for **APN Instance Bearer Statistics Daily Reports** with the addition of the column Node.

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > SGW**.

**Note** The 15-minute and hourly reports for APN Aggregate Bearer Statistics are available from the node level only; they are not available from the top level or the network level. Click on a node name in the APN Aggregate Bearer Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

- Step 2** Choose APN Aggregate Bearer Statistics Daily (or APN Instance Bearer Statistics Daily) from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                                   | Description                                                                          |
|-----------------------------------------|--------------------------------------------------------------------------------------|
| APN                                     | The name of the Access Point Name (APN).                                             |
| APN Index                               | A unique numerical identifier for the APN.                                           |
| Average Active Bearers                  | Average Number of bearer contexts that are currently established on the SGW devices. |
| Maximum Active Bearers                  | Maximum Number of bearer contexts that are currently established on the SGW devices. |
| Maximum Date ( <i>timezone</i> )        | Time the maximum value occurred.                                                     |
| Average Bearer Activation Success Ratio | Average ratio of bearer context request messages received by the SGW devices.        |
| Maximum Bearer Activation Success Ratio | Maximum ratio of bearer context request messages received by the SGW devices.        |
| Maximum Date ( <i>timezone</i> )        | Time the maximum value occurred.                                                     |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                                                                        | Output     | Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------------------------------|------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|             |        | Active Bearers/<br>Bearer Activation Success Ratio | If Output Type is Graph, the Y-axis label shows Daily statistics over time.                                                                                                                                                                                                                                                            |
|             |        | Time                                               | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                      |
|             |        | <i>Legend</i>                                      | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                            |

### APN Aggregate Throughput Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate Throughput Statistics Daily report of GGSN Reports. See [APN Aggregate Throughput Statistics Daily Reports, page 13-115](#).

### APN Instance Bearer Statistics Daily Reports

The GUI displays the same fields as that of APN Aggregate Bearer Statistics Daily report of SGW reports. See [APN Aggregate Bearer Statistics Daily Reports, page 13-151](#).

### APN Instance Throughput Statistics Daily Reports

The GUI displays the same fields as that of APN Instance Throughput Statistics Daily report of GGSN Reports. See [APN Instance Throughput Statistics Daily Reports, page 13-119](#).

### EPC Gateway Protection Statistics Daily Reports

The GUI displays the same fields as that of EPC Gateway Protection Statistics Daily report of PDNGW Reports. See [EPC Gateway Protection Statistics Daily Reports, page 13-126](#).

### EPC Gateway Buffering Statistics Daily Reports

The GUI displays the same fields as that of EPC Gateway Buffering Statistics Daily report of PDNGW Reports. See [EPC Gateway Buffering Statistics Daily Reports, page 13-127](#).

### GTP Active Statistics Daily Reports

MWTM displays the GTP Active Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > SGW**.

#### Note

The 15-minute and hourly GTP Active Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Active Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose GTP Active Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                                     |
|----------------------------------|-----------------------------------------------------------------|
| Node                             | Name of the node.                                               |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                        |
| Active Sessions                  | Total number of sessions currently established with the system. |
| Active Users                     | Number of active users.                                         |

## GTP Error Statistics Daily Reports

MWTM displays the GTP Error Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1**

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > SGW**.

**Note**

The 15-minute and hourly GTP Error Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Error Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2**

Choose GTP Error Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                                           |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                                                                                     |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                              |
| Signaling<br>Messages            | <ul style="list-style-type: none"> <li>Unexpected—Number of unexpected GTP signaling messages sent or received.</li> <li>Dropped—Number of dropped GTP signaling messages.</li> </ul> |

### GTP Path Errors Daily Reports

MWTM displays the GTP Path Errors Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > SGW**.

#### Note

The 15-minute and hourly GTP Path Errors reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTP Path Errors reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose GTP Path Errors Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                          |
| GTP Path                         | Path of the GTP.                                                                                                                                                                                                                                                                                                                                                                                                           |
| Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Signaling<br>Messages            | <p><b>Unexpected</b></p> <ul style="list-style-type: none"> <li>Count—Number of unexpected GTP signaling messages sent or received.</li> <li>Rate—Rate at which the unexpected GTP signaling messages are sent or received.</li> </ul> <p><b>Dropped</b></p> <ul style="list-style-type: none"> <li>Count—Number of signaling messages dropped.</li> <li>Rate—Rate at which the signaling messages are dropped.</li> </ul> |

### GTP Bearer Statistics Daily Reports

The GUI displays the same fields as that of GTP PDP Statistics Daily reports of GGSN Reports. See [GTP PDP Statistics Daily Reports, page 13-122](#).

### GTP Throughput Statistics Daily Reports

The GUI displays the same fields as that of GTP Throughput Statistics Daily reports of GGSN Reports. See [GTP Throughput Statistics Daily Reports, page 13-123](#).

### GTPv2 Bearer Statistics Daily Reports

MWTM displays the GTPv2 Bearer Statistics Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

#### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > SGW**.

#### Note

The 15-minute and hourly GTPv2 Bearer Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the SGW GTPv2 Bearer Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

#### Step 2

Choose GTPv2 Bearer Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                            | Description                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                             | Name of the node.                                                                                                                                                                         |
| Timestamp ( <i>timezone</i> )    | Timestamp shows the time bits-per second value occurred.                                                                                                                                  |
| Create Bearer Requests Sent      | <ul style="list-style-type: none"> <li>Count—Number of create bearer request messages sent.</li> <li>Rate—Rate at which the create bearer request messages are sent.</li> </ul>           |

## GTPv2 Path Session Statistics Daily Reports

MWTM displays the GTPv2 Path Session Statistics Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1**

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > Mobile Statistics > SGW**.

**Note**

The 15-minute and hourly GTPv2 Path Session Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the GTPv2 Path Session Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2**

Choose GTPv2 Path Session Statistics Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                             | Description                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                              | Name of the node.                                                                                                                                                                           |
| GTP Path                          | Path of GTP.                                                                                                                                                                                |
| Timestamp ( <i>timezone</i> )     | Timestamp shows the time bits-per second value occurred.                                                                                                                                    |

| Create Session Requests Rejected  | <ul style="list-style-type: none"> <li>Count—Number of create session request messages rejected.</li> <li>Rate—Rate at which the create session request messages are rejected.</li> </ul>   |
| Delete Session Requests Sent      | <ul style="list-style-type: none"> <li>Count—Number of delete session request messages sent.</li> <li>Rate—Rate at which the delete session request messages are sent.</li> </ul>           |
| Delete Session Requests Received  | <ul style="list-style-type: none"> <li>Count—Number of delete session request messages received.</li> <li>Rate—Rate at which the delete session request messages are received.</li> </ul>   |
| Delete Session Requests Rejected  | <ul style="list-style-type: none"> <li>Count—Number of delete session request messages rejected.</li> <li>Rate—Rate at which the delete session request messages are rejected.</li> </ul>   |
| Create Session Responses Sent     | <ul style="list-style-type: none"> <li>Count—Number of create session response messages sent.</li> <li>Rate—Rate at which the create session response messages are sent.</li> </ul>         |
| Create Session Responses Received | <ul style="list-style-type: none"> <li>Count—Number of create session response messages received.</li> <li>Rate—Rate at which the create session response messages are received.</li> </ul> |
| Create Session Responses Rejected | <ul style="list-style-type: none"> <li>Count—Number of create session response messages rejected.</li> <li>Rate—Rate at which the create session response messages are rejected.</li> </ul> |
| Delete Session Responses Sent     | <ul style="list-style-type: none"> <li>Count—Number of delete session response messages sent.</li> <li>Rate—Rate at which the delete session response messages are sent.</li> </ul>         |
| Delete Session Responses Received | <ul style="list-style-type: none"> <li>Count—Number of delete session response messages received.</li> <li>Rate—Rate at which the delete session response messages are received.</li> </ul> |
| Delete Session Responses Rejected | <ul style="list-style-type: none"> <li>Count—Number of delete session response messages rejected.</li> <li>Rate—Rate at which the delete session response messages are rejected.</li> </ul> |

## Viewing RAN Statistics Reports

RAN Statistics Reports are located within **Reports > RAN Reports** in the MWTM web interface. You can also find the RAN statistics reports in the `/opt/CSCOsgm/reports` directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All reports are saved as export files in .csv format.

You can view any of the following RAN statistics reports:

- [PWE3 Reports, page 13-166](#)
- [QOS Reports, page 13-172](#)
- [RAN-Optimized Reports, page 13-178](#)

## PWE3 Reports

The MWTM web interface provides network-wide and node level reports that summarize PWE3 over a specified time period. The information is available in graphical, tabular, and CSV formats. Administrators use these reports for analysis of network-wide performance and errors for RAN backhauls and shorthauls. For example, you can generate a report to show which backhaul links were the most heavily utilized in the last 24 hours.

To generate a network-wide PWE3 report:

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > PWE3**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu (see [Table 13-1](#) for a list of report types and their contents).
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu (see [Table 13-1](#) for contents of each output type).
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.
- 

**Note** The Graph output displays up to twelve RAN data streams based on traffic and/or number of errors. To view all RAN data streams, choose Table or CSV.

---

- Step 6** To generate the report, click the Run icon (green arrow .
- In the tool bar of the right pane, choose a report type from the Type drop-down menu:
- [PWE3 Peak Performance Daily Reports, page 13-166](#)
  - [PWE3 Average Performance Daily Reports, page 13-169](#)
- 

### PWE3 Peak Performance Daily Reports

MWTM displays the PWE3 Peak Performance Daily report obtained during the specified period.

**Note** If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

---

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > PWE3**.

**Note**

The 15-minute and hourly PWE3 Peak Performance reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PWE3 Peak Performance reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose PWE3 Peak Performance Daily from Type drop-down menu.

A summary table displays the information described in the following table:

| Field           | Description                                                                                                                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node            | Name of the node.                                                                                                                                                                                                         |
| Virtual Circuit | Name of the Virtual Circuit                                                                                                                                                                                               |
| Send Bits/Sec   | <ul style="list-style-type: none"> <li>Average—Average bits/second sent.</li> <li>Maximum—Maximum bits/second sent.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>         |
| Recv Bits/Sec   | <ul style="list-style-type: none"> <li>Average—Average bits/second received.</li> <li>Maximum—Maximum bits/second received.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

**Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                 | Output     | Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------|------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PWE3 Peak Performance Daily | Table, CSV | Node                          | Name of the node for the virtual circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                             |            | ID                            | Virtual circuit ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                             |            | Timestamp ( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                             |            | Peer Address                  | IP address of the peer node.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                             |            | Received                      | <ul style="list-style-type: none"> <li>• Packet Count—Number of packets received.</li> <li>• Packet Max Rate—Maximum packet rate for traffic received.</li> <li>• Packet Avg Rate—Average packet rate for traffic received.</li> <li>• Packet Min Rate—Minimum packet rate for traffic received.</li> <li>• Total—Total bits received.</li> <li>• Max Rate—Maximum bits received.</li> <li>• Avg Rate—Average bits received.</li> <li>• Min Rate—Minimum bits received.</li> </ul> |
|                             |            | Sent                          | <ul style="list-style-type: none"> <li>• Packet Count—Number of packets sent.</li> <li>• Packet Max Rate—Maximum packet rate for traffic sent.</li> <li>• Packet Avg Rate—Average packet rate for traffic sent.</li> <li>• Packet Min Rate—Minimum packet rate for traffic sent.</li> <li>• Total—Total bits sent.</li> <li>• Max Rate—Maximum bits sent.</li> <li>• Avg Rate—Average bits sent.</li> <li>• Min Rate—Minimum bits sent.</li> </ul>                                 |
|                             | Graph      | Expand to Full Screen         | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing                                                                                                                                                                                                                                                                                                                                                                         |
|                             |            | Hide Summary Table            | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                                                                                                                                                 |
|                             |            | Maximum Bits/Sec              | If Output Type is Graph, the Y-axis label shows Daily statistics over time.                                                                                                                                                                                                                                                                                                                                                                                                        |
|                             |            | Time                          | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                  |
|                             |            | Legend                        | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing                                                                                                                                                                                                                                                                                                                                                                         |

## PWE3 Average Performance Daily Reports

MWTM displays the PWE3 Average Performance Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > PWE3**.

### Note

The 15-minute and hourly PWE3 Average Performance reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the PWE3 Average Performance reports to navigate to a specific node to view hourly and 15 minute reports for that node.

### Step 2

Choose PWE3 Average Performance Daily from Type drop-down menu.

A summary table displays the information described in the following table:

| Field           | Description                                                                                                                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node            | Name of the node.                                                                                                                                                                                                         |
| Virtual Circuit | Name of the Virtual Circuit                                                                                                                                                                                               |
| Send Bits/Sec   | <ul style="list-style-type: none"> <li>Average—Average bits/second sent.</li> <li>Maximum—Maximum bits/second sent.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul>         |
| Recv Bits/Sec   | <ul style="list-style-type: none"> <li>Average—Average bits/second received.</li> <li>Maximum—Maximum bits/second received.</li> <li>Maximum Date (<i>timezone</i>)—Timestamp when the maximum value occurred.</li> </ul> |

- Step 3** Select the duration and output (see [Using the Toolbar, page 11-6](#)), and the following information is displayed:

| Report Type                    | Output     | Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------|------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PWE3 Average Performance Daily | Table, CSV | Node                             | Name of the node for the virtual circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                |            | Legend                           | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing                                                                                                                                                                                                                                                                                                                                                                         |

## QOS Reports

The MWTM web interface provides node-level QOS reports. To generate a network-wide QOS report:

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > QOS**
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu for a list of report types and their contents.
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Table or CSV) from the Output drop-down menu for contents of each output type.
- Step 5** To generate the report, click the Run icon (green arrow .

In the tool bar of the right pane, choose a report type from the Type drop-down menu:

- [QOS Class Map Daily Reports, page 13-172](#)
  - [QOS Match Statement Daily Reports, page 13-173](#)
  - [QOS Packet Marking Daily Reports, page 13-174](#)
  - [QOS Policing Daily Reports, page 13-175](#)
  - [QOS Queuing Daily Reports, page 13-176](#)
  - [QOS Traffic Shaping Daily Reports, page 13-177](#)
- 

### QOS Class Map Daily Reports

MWTM displays the QOS Class Map Daily report obtained during the specified period.

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

---

- 
- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > QOS**.

#### Note

The 15-minute and hourly QOS Class Map reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the QOS Class Map Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

---

- Step 2** Choose QOS Class Map Daily from the Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Class Map                     | User-defined traffic class that contains one or many match statements used to classify packets into different categories.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Service Policy Direction      | The direction of traffic for which the service policy is applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Pre-Policy                    | <ul style="list-style-type: none"> <li>• Packets—The number of inbound packets prior to executing any QoS policies.</li> <li>• Bits—The number of inbound octets prior to executing any QoS policies.</li> <li>• Bits Rate—The rate of the traffic prior to executing any QoS policies.</li> </ul>                                                                                                                                                                                                                                        |

| Dropped                       | <ul style="list-style-type: none"> <li>• Packets—The number of outbound packets after executing QoS policies.</li> <li>• SRAM Buffer Packets—The number of drop packet count which occurred due to a lack of SRAM buffers during output processing on an interface.</li> <li>• Bits—The number of drop octet count which occurred due to a lack of SRAM buffers during output processing on an interface.</li> <li>• Bits Rate—The rate of the traffic due to a lack of SRAM buffers during output processing on an interface.</li> </ul> |

## QoS Match Statement Daily Reports

MWTM displays the QoS Match Statement Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

### Step 1

In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > QoS**.

### Note

The 15-minute and hourly QoS Match Statement Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the QoS Match Statement Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose QOS Match Statement Daily from Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                                                                                                                  |
| Class Map                     | User-defined traffic class that contains one or many match statements used to classify packets into different categories.                                                                                                                                                                          |
| Service Policy Direction      | The direction of traffic for which the service policy is applied.                                                                                                                                                                                                                                  |
| Match Statement               | The specific match criteria to identify packets for classification purposes.                                                                                                                                                                                                                       |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                                                                           |
| Pre-Policy                    | <ul style="list-style-type: none"> <li>• Packets—The number of inbound packets prior to executing any QoS policies.</li> <li>• Bits—The number of inbound octets prior to executing any QoS policies.</li> <li>• Bits Rate—The rate of the traffic prior to executing any QoS policies.</li> </ul> |

## QOS Packet Marking Daily Reports

MWTM displays the QOS Packet Marking Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > QOS**.

### Note

The 15-minute and hourly QOS Packet Marking Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the QOS Packet Marking Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose QOS Packet Marking Daily from Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                                                                                             |
| Class Map                     | User-defined traffic class that contains one or many match statements used to classify packets into different categories.                                                                                                                                                     |
| Service Policy Direction      | The direction of traffic for which the service policy is applied.                                                                                                                                                                                                             |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                                                      |
| QOS Group Packets             | The number of packets whose QoS Group field is marked by Set feature.                                                                                                                                                                                                         |
| ATM CLP Packets               | The number of packets whose ATM CLP Bit is marked by Set feature.                                                                                                                                                                                                             |
| Layer 2 COS Packets           | The Layer 2 CoS value to use when mapping this DSCP to layer 2 CoS.                                                                                                                                                                                                           |
| Discard Class Packets         | The number of packets whose Discard Class field is marked by Set feature.                                                                                                                                                                                                     |
| SRP Priority Packets          | The number of packets whose SRP Priority field is marked by Set feature.                                                                                                                                                                                                      |
| Precedence                    | <ul style="list-style-type: none"> <li>Packets—The number of packets whose Precedence field is marked by Set feature.</li> <li>Tunnel Packets—The number of packets whose Precedence Tunnel field is marked by Set feature.</li> </ul>                                        |

## QOS Policing Daily Reports

MWTM displays the QOS Policing Daily report obtained during the specified period.

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > QOS**.

**Note**

The 15-minute and hourly QOS Policing Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the QOS Policing Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose QOS Policing Daily from Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                                                                                               |
| Class Map                     | User-defined traffic class that contains one or many match statements used to classify packets into different categories.                                                                                                                                                       |
| Service Policy Direction      | The direction of traffic for which the service policy is applied.                                                                                                                                                                                                               |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                                                        |
| Conformed                     | <ul style="list-style-type: none"> <li>Packets—The number of packets treated as conforming by the policing feature.</li> <li>Bits—The number of octets treated as conforming by the policing feature.</li> <li>Bits Rate—The rate of conforming traffic.</li> </ul>             |
| Exceeded                      | <ul style="list-style-type: none"> <li>Packets—The number of packets treated as non-conforming by the policing feature.</li> <li>Bits—The number of octets treated as non-conforming by the policing feature.</li> <li>Bits Rate—The rate of non-conforming traffic.</li> </ul> |
| Violated                      | <ul style="list-style-type: none"> <li>Packets—The number of packets treated as violated by the policing feature.</li> <li>Bits—The number of octets treated as violated by the policing feature.</li> <li>Bits Rate—The rate of the violating traffic.</li> </ul>              |

## QOS Queuing Daily Reports

MWTM displays the QOS Queuing Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > QOS**.

**Note**

The 15-minute and hourly QOS Queuing Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the QOS Queuing Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose QOS Queuing Daily from Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                                                                |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                                                          |
| Class Map                     | User-defined traffic class that contains one or many match statements used to classify packets into different categories.                                                                                                                  |
| Service Policy Direction      | The direction of traffic for which the service policy is applied.                                                                                                                                                                          |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                                                                   |
| Queue Depth                   | The current depth of the queue.                                                                                                                                                                                                            |
| Max Queue Depth               | The maximum depth of the queue.                                                                                                                                                                                                            |
| Queue Discarded               | <ul style="list-style-type: none"> <li>Bits—The number of octets, associated with this class, that were dropped by queueing.</li> <li>Packets—The number of packets, associated with this class, that were dropped by queueing.</li> </ul> |

## QOS Traffic Shaping Daily Reports

MWTM displays the QOS Traffic Shaping Daily report obtained during the specified period.

**Note**

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

**Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > QOS**.

**Note**

The 15-minute and hourly QOS Traffic Shaping Statistics reports are available from the node level only; they are not available from the top level or the network level. Click on a node name in the QOS Traffic Shaping Statistics reports to navigate to a specific node to view hourly and 15 minute reports for that node.

**Step 2** Choose QOS Traffic Shaping Daily from Type drop-down menu.

A summary table displays the information described in the following table:

| Field                         | Description                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                          | Name of the node.                                                                                                                                                                                 |
| Class Map                     | User-defined traffic class that contains one or many match statements used to classify packets into different categories.                                                                         |
| Service Policy Direction      | The direction of traffic for which the service policy is applied.                                                                                                                                 |
| Timestamp ( <i>timezone</i> ) | Timestamp shows the time bits-per second value occurred.                                                                                                                                          |
| Active                        | The current traffic-shaping state. When traffic-shaping is enabled and the traffic rate exceeds the shape rate, traffic-shaping is considered to be active. Otherwise, it is considered inactive. |
| Queue Size                    | The current traffic-shaping queue depth in packets.                                                                                                                                               |
| Delayed                       | <ul style="list-style-type: none"> <li>Bits—The number of octets that have been delayed.</li> <li>Packets—The number of packets that have been delayed.</li> </ul>                                |
| Dropped                       | <ul style="list-style-type: none"> <li>Bits—The number of octets that have been dropped during shaping.</li> <li>Packets—The number of packets that have been dropped during shaping.</li> </ul>  |

## RAN-Optimized Reports

The MWTM web interface provides network-wide reports that summarize IP-RAN over a specified time period. The information is available in graphical, tabular, and CSV formats. Administrators use these reports for analysis of network-wide performance and errors for RAN backhauls and shorthauls. For example, you can generate a report to show which backhaul links were the most heavily utilized in the last 24 hours.

To generate a network-wide RAN report:

- Step 1** In the left pane (navigation tree) of the MWTM web interface, choose **Reports > RAN Statistics > RAN-Optimized**.
- Step 2** In the tool bar of the right pane, choose a report type from the Type drop-down menu (see [Table 13-1](#) for a list of report types and their contents).
- Step 3** Choose a time range from the Duration drop-down menu or customize your own time range by clicking the Customize icon .
- Step 4** Choose an output format (Graph, Table, or CSV) from the Output drop-down menu (see [Table 13-1](#) for contents of each output type).
- Step 5** Choose a sort parameter from the Sort Parameter drop-down menu.

**Note** The Graph output displays up to twelve RAN data streams based on traffic and/or number of errors. To view all RAN data streams, choose Table or CSV.

- Step 6** To generate the report, click the Run icon (green arrow ).
- Step 7** To understand the report, click the report type listed in [Table 13-1](#) for a detailed description of the report fields.

| Report Type                                        | Output       | Contents                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Backhaul Performance Daily Report</a>  | Graph        | Minimum, maximum, and average performance data for all the RAN backhauls in the network: <ul style="list-style-type: none"> <li>• Send Summary—Table summary of backhaul send data.</li> <li>• Receive Summary—Table summary of backhaul receive data.</li> <li>• Send Backhaul Performance Daily—Graph of backhaul send data.</li> <li>• Receive Backhaul Performance Daily—Graph of backhaul receive data.</li> </ul> |
|                                                    | Table or CSV | Send and receive data, node, and backhaul in tabular format.                                                                                                                                                                                                                                                                                                                                                            |
| <a href="#">Backhaul Errors Daily Report</a>       | Graph        | For all the RAN backhauls in the network: <ul style="list-style-type: none"> <li>• Table—Average error rate, total errors, and total GSM-Abis and UMTS-Iub errors in tabular format.</li> <li>• Backhaul Errors Daily—Graph that shows total errors, GSM errors, and UMTS errors.</li> </ul>                                                                                                                            |

## Backhaul Performance Daily Report

| Output | GUI Element             | Description                                                                                                                                                                                                                                                                                                                                           |
|--------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Graph  | Node                    | Table column that lists nodes that contain RAN backhauls. To access details for a specific node, click a node in this column.                                                                                                                                                                                                                         |
|        | Backhaul                | Table column that lists the visible backhauls. To access details for a specific backhaul, click a backhaul in this column.<br><br><b>Note</b> The column shows a maximum of 12 backhauls by default. To change the number of visible backhauls, use the Graph Series Editor. See <a href="#">Using the Toolbar, page 11-6</a> , for more information. |
|        | Average Utilization %   | Table column that shows the average of the backhaul. A value greater than 100% indicates that the backhaul is oversubscribed.                                                                                                                                                                                                                         |
|        | Average                 | Table column that shows average bits per second for the backhaul.                                                                                                                                                                                                                                                                                     |
|        | Minimum Utilization %   | Table column that shows the minimum of the backhaul. A value greater than 100% indicates that the backhaul is oversubscribed.                                                                                                                                                                                                                         |
|        | Minimum                 | Table column that shows minimum number of bits per second for the backhaul.                                                                                                                                                                                                                                                                           |
|        | Minimum Date (timezone) | Table column that shows time when the minimum bits-per-second value occurred.                                                                                                                                                                                                                                                                         |
|        | Maximum Utilization %   | Table column that shows the maximum of the backhaul. A value greater than 100% indicates that the backhaul is oversubscribed.                                                                                                                                                                                                                         |
|        | Maximum                 | Table column that shows maximum number of bits per second for the backhaul.                                                                                                                                                                                                                                                                           |
|        | Maximum Date (timezone) | Table column that shows time when the maximum bits-per-second value occurred.                                                                                                                                                                                                                                                                         |
|        | Expand to Full Screen   | Click this link to open the graph in a full-screen window for better viewing.                                                                                                                                                                                                                                                                         |
|        | Hide Summary Table      | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                    |
|        | Minimum Bits/Sec        | Y-axis labels for graphs that show minimum, average, and maximum bits per second for the visible backhauls.<br><br><b>Note</b> The graph shows a maximum of 12 backhauls by default. To change the number of visible backhauls, use the Graph Series Editor. See <a href="#">Using the Toolbar, page 11-6</a> , for more information.                 |
|        | Average Bits/Sec        |                                                                                                                                                                                                                                                                                                                                                       |
|        | Maximum Bits/Sec        |                                                                                                                                                                                                                                                                                                                                                       |
|        | Legend                  | Appearing below each graph, a legend of color-coded labels for each backhaul that appears in the graph.                                                                                                                                                                                                                                               |

|        | Average                             | Table column that shows the average bits per second for the shorthaul.                                                                                                                                                                                                                                                                                    |
|        | Minimum                             | Table column that shows the minimum number of bits per second for the shorthaul.                                                                                                                                                                                                                                                                          |
|        | Minimum Date<br>( <i>timezone</i> ) | Table column that shows time when the minimum bits-per-second value occurred.                                                                                                                                                                                                                                                                             |
|        | Maximum                             | Table column that shows maximum number of bits per second for the shorthaul.                                                                                                                                                                                                                                                                              |
|        | Maximum Date<br>( <i>timezone</i> ) | Table column that shows time when the maximum bits-per-second value occurred.                                                                                                                                                                                                                                                                             |
|        | Expand to Full Screen               | Click this link to open the graph in a full-screen window for better viewing.                                                                                                                                                                                                                                                                             |
|        | Hide Summary Table                  | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                        |
|        | Minimum Bits/Sec                    | Y-axis labels for graphs that show minimum, average, and maximum bits per second for the visible shorthauls.                                                                                                                                                                                                                                              |
|        | Average Bits/Sec                    | <b>Note</b> The graph shows a maximum of 12 shorthauls by default. To change the number of visible shorthauls, use the Graph Series Editor. See <a href="#">Using the Toolbar, page 11-6</a> , for more information.                                                                                                                                      |
|        | Maximum Bits/Sec                    |                                                                                                                                                                                                                                                                                                                                                           |
|        | <i>Legend</i>                       | Positioned below each graph, a legend of color-coded labels for each shorthaul that appears in the graph.                                                                                                                                                                                                                                                 |

| Output        | GUI Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## GSM Errors Daily Reports

| Output | GUI Element               | Description                                                                                                                                                                                                                                                                                                                                                   |
|--------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Graph  | Node                      | Table column that lists nodes that contain GSM shorthauls. To access details for a specific node, click a node in this column.                                                                                                                                                                                                                                |
|        | Backhaul                  | Table column that lists backhauls that contain GSM shorthauls. To access details for a specific backhaul, click a backhaul in this column.                                                                                                                                                                                                                    |
|        | Shorthaul                 | Table column that lists the visible GSM shorthauls. To access details for a specific shorthaul, click a shorthaul in this column.<br><br><b>Note</b> The table shows a maximum of 12 shorthauls by default. To change the number of visible shorthauls, use the Graph Series Editor. See <a href="#">Using the Toolbar, page 11-6</a> , for more information. |
|        | Total Counts              | Table column that lists the total number of GSM errors for the visible shorthauls during the chosen duration.                                                                                                                                                                                                                                                 |
|        | Avg. Error Rate (Per Sec) | Table column that lists the average error rate each second for the visible shorthauls.                                                                                                                                                                                                                                                                        |
|        | Expand to Full Screen     | Click this link to open the graph in a full-screen window for better viewing.                                                                                                                                                                                                                                                                                 |
|        | Hide Summary Table        | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                            |
|        | Error Counts              | Y-axis label for graph that shows total GSM errors for the visible GSM shorthauls.<br><br><b>Note</b> The graph shows a maximum of 12 shorthauls by default. To change the number of visible shorthauls, use the Graph Series Editor. See <a href="#">Using the Toolbar, page 11-6</a> , for more information.                                                |
|        | <i>Legend</i>             | Positioned below the graph, a legend of color-coded labels for each shorthaul that appears in the graph.                                                                                                                                                                                                                                                      |

| Output        | GUI Element                      | Description                                                                                                                                                            |
|---------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Table,<br>CSV | Node                             | Table column that lists all the nodes that contain GSM shorthauls. If Output is Table, to access details for a specific node, click a node in this column.             |
|               | Backhaul                         | Table column that lists all the backhauls that contain GSM shorthauls. If Output is Table, to access details for a specific backhaul, click a backhaul in this column. |
|               | Shorthaul                        | Table column that lists all the GSM shorthauls in the network. If Output is Table, to access details for a specific shorthaul, click a shorthaul in this column.       |
|               | Timestamp<br>( <i>timezone</i> ) | Timestamp of the report.                                                                                                                                               |
|               | Total Errors                     | Table column that lists the total number of GSM errors for the visible shorthauls during the chosen duration.                                                          |
|               | Total Missed<br>Packets          | Total number of missed packets on the GSM shorthaul.                                                                                                                   |
|               | Total Protocol<br>Errors         | Total number of protocol errors on the GSM shorthaul.                                                                                                                  |
|               | Total<br>Miscellaneous<br>Errors | Total number of miscellaneous errors on the GSM shorthaul.                                                                                                             |

## UMTS Errors Daily Reports

| Output | GUI Element               | Description                                                                                                                                                                                                                                                                                                                                            |
|--------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Graph  | Node                      | Table column that lists nodes that contain UMTS shorthauls. To access details for a specific node, click a node in this column.                                                                                                                                                                                                                        |
|        | Backhaul                  | Table column that lists backhauls that contain UMTS shorthauls. To access details for a specific backhaul, click a backhaul in this column.                                                                                                                                                                                                            |
|        | Shorthaul                 | Table column that lists the visible UMTS shorthauls. To access details for a specific shorthaul, click a shorthaul in this column.<br><br><b>Note</b> The table shows only 12 shorthauls by default. To change the number of visible shorthauls, use the Graph Series Editor. See <a href="#">Using the Toolbar, page 11-6</a> , for more information. |
|        | Total Counts              | Table column that lists the total number of UMTS errors that occurred for the visible shorthauls during the chosen duration.                                                                                                                                                                                                                           |
|        | Avg. Error Rate (Per Sec) | Table column that lists the average error rate each second for the visible shorthauls during the chosen duration.                                                                                                                                                                                                                                      |
|        | Expand to Full Screen     | Click this link to open the graph in a full-screen window for better viewing.                                                                                                                                                                                                                                                                          |
|        | Hide Summary Table        | If Output Type is Graph, this text link hides the summary table at the top of the report and only shows the graph.                                                                                                                                                                                                                                     |
|        | Error Counts              | Y-axis label for the graph that shows the total number of UMTS errors for the visible UMTS shorthauls.<br><br><b>Note</b> The graph shows only 12 shorthauls by default. To change the number of visible shorthauls, use the Graph Series Editor. See <a href="#">Using the Toolbar, page 11-6</a> , for more information.                             |
|        | <i>Legend</i>             | Positioned below the graph, a legend of color-coded labels for each UMTS shorthaul that appears in the graph.                                                                                                                                                                                                                                          |

| Output        | GUI Element                      | Description                                                                                                                                                             |
|---------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Table,<br>CSV | Node                             | Table column that lists nodes that contain UMTS shorthauls. If Output is Table, to access details for a specific node, click a node in this column.                     |
|               | Backhaul                         | Table column that lists all the backhauls that contain UMTS shorthauls. If Output is Table, to access details for a specific backhaul, click a backhaul in this column. |
|               | Shorthaul                        | Table column that lists all the UMTS shorthauls in the network. If Output is Table, to access details for a specific shorthaul, click a shorthaul in this column.       |
|               | Timestamp<br>( <i>timezone</i> ) | Time that the error values occurred for the visible shorthauls.                                                                                                         |
|               | Total Errors                     | Table column that lists the total number of UMTS errors for the visible shorthauls during the chosen duration.                                                          |
|               | Total Protocol Errors            | Table column that lists the total number of protocol errors on the UMTS shorthaul.                                                                                      |
|               | Total Miscellaneous Errors       | Table column that lists the total number of miscellaneous errors on the UMTS shorthaul.                                                                                 |

## Generating Node-Level CPU/Memory Reports

In addition to generating network-wide CPU/Memory reports as explained in [CPU Reports, page 13-10](#), you can also generate node-level CPU/Memory reports as explained in the following steps.

- 
- Step 1** From the MWTM web interface, click on a node name.
- Step 2** Click the Performance tab.
- Step 3** From the View pulldown menu, select **Historical CPU Utilization** or **Historical Memory Utilization**.  
If the device you selected has multiple CPUs, in addition to the Summary tab, there are also separate Slot tabs. Each Slot tab contains CPU statistics for the CPUs in that slot.
- Step 4** From the Type menu, select which CPU or Memory report to view:
- CPU Peak Utilization 15 Minutes
  - CPU Average Utilization 15 Minutes
  - CPU Peak Utilization Hourly
  - CPU Average Utilization Hourly
  - CPU Peak Utilization Daily
  - CPU Average Utilization Daily
  - Memory Peak Utilization 15 Minutes
  - Memory Average Utilization 15 Minutes
  - Memory Peak Utilization Hourly

- Memory Average Utilization Hourly
- Memory Peak Utilization Daily
- Memory Average Utilization Daily

## Viewing ITP Accounting Reports

You can view any of the following statistics reports:

- [AS Accounting Reports, page 13-192](#)
- [GTT Accounting Reports, page 13-193](#)
- [MTP3 Accounting Reports, page 13-194](#)

### Note

All accounting reports are supported on ITP platforms only.

## AS Accounting Reports

You can view daily reports for application server (AS) accounting statistics by using the MWTM. You can also export the report. AS accounting describes MTP3 layer traffic in support of application servers.

| Field or Column | Description                                                                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date            | Date of the report.                                                                                                                                                                                                     |
| Node            | Name of the node for the linkset.                                                                                                                                                                                       |
| Network Name    | Name of the network for the linkset.                                                                                                                                                                                    |
| Signaling Point | Name of the signaling point for the linkset.                                                                                                                                                                            |
| AS              | Name of the application server.                                                                                                                                                                                         |
| OPC             | Originating point code of the traffic, which is a unique identifier for each set of statistics.<br><br>To see only statistics that match a specific OPC for a given linkset, find the linkset and click the point code. |
| DPC             | Destination point code of the traffic.<br><br>To see only statistics that match a specific DPC for a given linkset, find the linkset and click the point code.                                                          |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SI              | <p>Service indicator, which indicates the type of Signaling System 7 (SS7) traffic. Valid values include:</p> <ul style="list-style-type: none"> <li>• <b>0</b>—Signaling Network Management Message (SNM)</li> <li>• <b>1</b>—Maintenance Regular Message (MTN)</li> <li>• <b>2</b>—Maintenance Special Message (MTNS)</li> <li>• <b>3</b>—Signaling Connection Control Part (SCCP)</li> <li>• <b>4</b>—Telephone User Part (TUP)</li> <li>• <b>5</b>—ISDN User Part (ISUP)</li> <li>• <b>6</b>—Data User Part (call and circuit-related messages)</li> <li>• <b>7</b>—Data User Part (facility registration/cancellation messages)</li> </ul> <p>To see only more information for a specific type of SI, click the SI type.</p> |
| Send MSUs       | Total number of MTP3 MSUs sent on the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Receive MSUs    | Total number of MTP3 MSUs received on the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Send Bytes      | Total number of bytes sent on the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Receive Bytes   | Total number of bytes received on the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## GTT Accounting Reports

You can view summary reports of daily GTT accounting statistics. You can also export the reports.

### GTT Accounting Daily Reports

You can view a daily summary of GTT accounting reports for all nodes that the MWTM detected on a specified date. The GTT Accounting Daily Report page shows all MWTM daily GTT accounting reports by date. Each file contains a daily summary of GTT accounting statistics for all nodes that the MWTM detected on a specified date.

The GTT Accounting Daily Report table is sorted based on the information in the Packets column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

#### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column   | Description                                                                                                  |
|-------------------|--------------------------------------------------------------------------------------------------------------|
| Date              | Date of the report.                                                                                          |
| Node              | Name of the node associated with the <b>From Network Name</b> for which data is visible.                     |
| From Network Name | Name of the network from which GTT traffic originated, and for which data is visible.                        |
| Signaling Point   | Name of the signaling point associated with the <b>From Network Name</b> instance for which data is visible. |

| Field or Column | Description                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------|
| Linkset         | Name of the linkset associated with the <b>From Network Name</b> instance for which data is visible. |
| Selector        | Name of the selector.                                                                                |
| GTA             | Global Title Address (GTA) associated with the selector.                                             |
| To Network Name | Name of the network in which the translated point code resides.                                      |
| Point Code      | Destination point code for the GTA.                                                                  |
| Packets         | Total number of packets requiring translation by GTT on the specified date.                          |
| Octets          | Total number of octets requiring translation by GTT on the specified date.                           |

## MTP3 Accounting Reports

MTP3 accounting describes MTP3 layer traffic in support of linksets. You can also export the MTP3 accounting reports.

### Note

Every five minutes (by default), the ITP moves data records from a quick-access table to a database that stores long term accounting records. This database contains accumulated accounting data since the last clearing or from the time accounting was originally enabled. The MWTM shows only the data from this database, not from the quick-access table.

## MTP3 Accounting Daily Reports

You can view a daily summary of MTP3 accounting statistics for the MWTM on a specified date. The MTP3 Accounting Daily Report page shows detail reports of all MWTM daily MTP3 accounting statistics by date. Each file contains a daily summary of MTP3 accounting statistics for the MWTM on a specified date.

The MTP3 Accounting Daily Report table is sorted based on the information in the Send MSUs column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

### Note

If a statistics calculation results in an undefined value, such as a number divided by zero (0), or an undefined number, based on the configuration, then `MathError` appears in the field.

| Field or Column | Description                                  |
|-----------------|----------------------------------------------|
| Date            | Date of the report.                          |
| Node            | Name of the node for the linkset.            |
| Network Name    | Name of the network for the linkset.         |
| Signaling Point | Name of the signaling point for the linkset. |
| Linkset         | Name of the linkset.                         |

| Field or Column   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- [PDNGW Subscribers Reports, page 13-200](#)
- [PDSN Subscribers Reports, page 13-201](#)
- [SGW Subscribers Reports, page 13-202](#)

## Node Instance Counts in BWG and GGSN Subscriber Reports

When viewing BWG and GGSN subscriber reports, you might notice a discrepancy in the Node Instance column between the most recent record and older records. This occurs when the most recent record is not complete due to the differences in polling intervals of BWG and GGSN devices. Up to 6 BWG and GGSN IOS instances can run on a single SAMI card. MWTM sees each instance as a separate device and is not aware at the management level that different devices might run on the same physical card. As a result, the devices are polled and data is collected at different times during the regular polling interval.

For example, *GGSN A* on *SAMI 1* is polled at 12:01 p.m. and *GGSN B* on *SAMI 1* is polled at 12:14 p.m. during a regular 15-minute polling interval. When you view the latest report data for reports that aggregate data at the SAMI card level, such as subscriber reports, there are discrepancies. The subscriber report is a card-level report that aggregates the results of each device instance that runs on a SAMI card by adding the subscriber count of all devices with the same serial number. Using the times given in the above example, if you view the GGSN subscriber report for the last 6 hours at 12:10 p.m., you see the results from *GGSN A* only, and only *GGSN A* contributes to those results. If you view the same report at 12:15 p.m., you will see the sum of *GGSN A* and *GGSN B* subscriber counts, and both devices contribute to the results.

## BWG Subscribers Reports

You can view any of the following BWG Subscriber Count Reports

- [BWG Subscribers Hourly Reports, page 13-196](#)
- [BWG Subscribers Daily Reports, page 13-196](#)
- [BWG Subscribers Monthly Reports, page 13-197](#)

## BWG Subscribers Hourly Reports

The BWG Subscribers Hourly Report table is sorted based on the information in the **Subscriber Count** column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column               | Description                        |
|-------------------------------|------------------------------------|
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.           |
| Serial Number                 | Serial number of the chassis.      |
| Subscriber Count              | Number of subscribers per node.    |
| Node Instances                | Number of node instances per SAMI. |

## BWG Subscribers Daily Reports

The BWG Subscribers Daily Report table is sorted based on the information in the **Subscriber Count** column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column               | Description                        |
|-------------------------------|------------------------------------|
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.           |
| Serial Number                 | Serial number of the chassis.      |
| Subscriber Count              | Number of subscribers per node.    |
| Node Instances                | Number of node instances per SAMI. |

### BWG Subscribers Monthly Reports

The BWG Subscribers Monthly Report table is sorted based on the information in the **Subscriber Count** column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column               | Description                        |
|-------------------------------|------------------------------------|
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.           |
| Serial Number                 | Serial number of the chassis.      |
| Subscriber Count              | Number of subscribers per node.    |
| Node Instances                | Number of node instances per SAMI. |

### CSG Subscribers Reports

|-------------------------------|-------------------------------|
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.      |
| Node                          | Name of the node.             |
| Serial Number                 | Serial number of the chassis. |
| Subscriber Count              | Number of subscribers.        |

## SGW Subscribers Reports

You can view any of the following SGW Subscribers Reports:

- [SGW Subscribers Hourly Reports, page 13-202](#)
- [SGW Subscribers Daily Reports, page 13-203](#)
- [SGW Subscribers Monthly Reports, page 13-203](#)

## SGW Subscribers Hourly Reports

The SGW Subscribers Hourly Report table is sorted based on the information in the **Subscriber Count** column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column               | Description                   |
|-------------------------------|-------------------------------|
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.      |
| Node                          | Name of the node.             |
| Serial Number                 | Serial number of the chassis. |
| Subscriber Count              | Number of subscribers.        |

## SGW Subscribers Daily Reports

The SGW Subscribers Daily Report table is sorted based on the information in the **Subscriber Count** column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column               | Description                   |
|-------------------------------|-------------------------------|
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.      |
| Node                          | Name of the node.             |
| Serial Number                 | Serial number of the chassis. |
| Subscriber Count              | Number of subscribers.        |

## SGW Subscribers Monthly Reports

The SGW Subscribers Monthly Report table is sorted based on the information in the **Subscriber Count** column. However, you can sort the table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column               | Description                   |
|-------------------------------|-------------------------------|
| Timestamp ( <i>timezone</i> ) | Timestamp of the report.      |
| Node                          | Name of the node.             |
| Serial Number                 | Serial number of the chassis. |
| Subscriber Count              | Number of subscribers.        |

## Viewing File Archive Inventory Reports

Inventory Reports that have been archived are located within **File Archive > Inventory** in the MWTM web interface. You can also find archived reports in the `/opt/CSCOsgm/reports` directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All archived reports are saved as export files in .csv format.

You can view full descriptions of all fields in export file archive reports by clicking **Administrative** from the MWTM web interface, then clicking **Export Reports README** under System Information.

You can view any of the following Inventory archived reports:

- [Chassis Inventory Archived Reports, page 13-203](#)
- [Element Inventory Archived Reports, page 13-204](#)

## Chassis Inventory Archived Reports

You can access these following Chassis Inventory Archived Reports:

- [Chassis Inventory Daily Archived Reports, page 13-204](#)

## Chassis Inventory Daily Archived Reports

The Daily Chassis Inventory Archived Reports page shows summary reports for all archived MWTM daily chassis inventory statistics reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *mwtmChassisInventory.2010-06-17.csv.zip* file contains the summary report for daily chassis inventory statistics for June 17, 2010.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily chassis inventory statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## Element Inventory Archived Reports

You can access these following Element Inventory Archived Reports:

- [Element Inventory Daily Archived Reports, page 13-204](#)

## Element Inventory Daily Archived Reports

The Daily Element Inventory Archived Reports page shows summary reports for all archived MWTM daily element inventory statistics reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *mwtmElementInventory.2010-06-17.xml.zip* file contains the summary report for daily element inventory statistics for June 17, 2010.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily element inventory statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## Viewing File Archive Common Reports

Common Reports that have been archived are located within **File Archive > Common Statistics** in the MWTM web interface. You can also find archived reports in the */opt/CSCOs/gm/reports* directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All archived reports are saved as export files in *.csv* format.

You can view full descriptions of all fields in export file archive reports by clicking **Administrative** from the MWTM web interface, then clicking **Export Reports README** under System Information.

You can view any of the following Common archived reports:

- [AAA Archived Reports, page 13-205](#)
- [CPU Archived Reports, page 13-206](#)
- [IP Local Pool Archived Reports, page 13-207](#)
- [Interface Archived Reports, page 13-208](#)
- [Memory Archived Reports, page 13-209](#)

## AAA Archived Reports

You can access these following AAA Archived Reports:

- [AAA Accounting Statistics 15 Minute Archived Reports, page 13-205](#)
- [AAA Accounting Statistics Hourly Archived Reports, page 13-205](#)
- [AAA Accounting Statistics Daily Archived Reports, page 13-205](#)
- [AAA Authentication Statistics 15 Minute Archived Reports, page 13-206](#)
- [AAA Authentication Statistics Hourly Archived Reports, page 13-206](#)
- [AAA Authentication Statistics Daily Archived Reports, page 13-206](#)

### AAA Accounting Statistics 15 Minute Archived Reports

The 15 minute AAA Accounting Statistics Archived Reports page shows summary reports for all archived MWTM 15 minute AAA accounting statistics reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, hour, and minute; for example, the *AAAAccounting.2009-06-22-16-00.csv.zip* file contains the summary report of archived 15 minute AAA accounting statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minute AAA accounting statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### AAA Accounting Statistics Hourly Archived Reports

The Hourly AAA Accounting Statistics Archived Reports page shows all summary reports for archived MWTM hourly AAA accounting statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *AAAAccounting2009-06-22-11.csv.zip* file contains the summary report for hourly AAA accounting statistics for the 11th hour on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly AAA accounting statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### AAA Accounting Statistics Daily Archived Reports

The Daily AAA Accounting Statistics Archived Reports page shows all summary reports for archived MWTM daily AAA accounting statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the daily *AAAAccounting.2009-06-22-16-00.csv.zip* file contains the summary report of archived daily AAA accounting statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily AAA accounting statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### AAA Authentication Statistics 15 Minute Archived Reports

The 15 minute AAA Authentication Statistics Archived Reports page shows summary reports for all archived MWTM 15 minute AAA authentication statistics reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, hour, and minute; for example, the *AAAAuthentication.2009-06-22-16-00.csv.zip* file contains the summary report of archived 15 minute AAA authentication statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minute AAA authentication statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### AAA Authentication Statistics Hourly Archived Reports

The Hourly AAA Authentication Statistics Archived Reports page shows all summary reports for archived MWTM hourly AAA authentication statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *AAAAuthentication.2009-06-22-11.csv.zip* file contains the summary report for hourly AAA authentication statistics for the 11th hour on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly AAA authentication statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### AAA Authentication Statistics Daily Archived Reports

The Daily AAA Authentication Statistics Archived Reports page shows all summary reports for archived MWTM daily AAA authentication statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the daily *AAAAuthentication.2009-06-22.csv.zip* file contains the summary report of archived daily AAA authentication statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily AAA authentication statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## CPU Archived Reports

You can access these following CPU Archived Reports:

- [CPU Utilization 15 Minute Archived Reports, page 13-207](#)

- [CPU Utilization Hourly Archived Reports, page 13-207](#)
- [CPU Utilization Daily Archived Reports, page 13-207](#)

### CPU Utilization 15 Minute Archived Reports

The CPU Utilization 15 Minute Archived Reports page shows all summary reports for archived MWTM 15 minute CPU statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, hour, and minute; for example, the *CPUStats.2009-06-22-11-20.csv.zip* file contains the summary report of archived 15 minute CPU statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minute CPU statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### CPU Utilization Hourly Archived Reports

The CPU Utilization Hourly Archived Reports page shows all summary reports for archived MWTM hourly CPU statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *CPUStats.2009-06-22-11.csv.zip* file contains the summary report for hourly CPU statistics for the 11th hour on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly CPU statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### CPU Utilization Daily Archived Reports

The CPU Utilization Daily Archived Reports page shows summary reports for all archived MWTM daily CPU statistics reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *CPUStats.2009-06-22.csv.zip* file contains the summary report for daily CPU statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily CPU statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### IP Local Pool Archived Reports

You can access the following IP Local Pool Archived Reports. These reports are supported on mSEF platforms only:

- [IP Local Pool Statistics 15 Minute Archived Reports, page 13-208](#)
- [IP Local Pool Statistics Hourly Archived Reports, page 13-208](#)
- [IP Local Pool Statistics Daily Archived Reports, page 13-208](#)

## IP Local Pool Statistics 15 Minute Archived Reports

The IP Local Pool 15 Minute Archived Reports page shows summary reports of 15-minute statistical details of the IP Local Pool. The 15 Minute IP Local Pool Statistics Archived Report has the file name *IpLocalPoolStats.year-month-day-hour-minute.csv.zip*.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15-minute IP local pool statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

## IP Local Pool Statistics Hourly Archived Reports

The IP Local Pool Hourly Archived Reports page shows summary reports of hourly statistical details of the IP Local Pool. The Hourly IP Local Pool Statistics Archived Report has the filename *IpLocalPoolStats.year-month-day-hour.csv.zip*.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly IP local pool statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

## IP Local Pool Statistics Daily Archived Reports

The IP Local Pool Daily Archived Reports page shows summary reports of daily statistical details of the IP Local Pool. The Daily IP Local Pool Statistics Archived Report has the filename *IpLocalPoolStats.year-month-day.csv.zip*.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily IP local pool statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

## Interface Archived Reports

You can access the following Interface Archived Reports. These reports are supported on mSEF platforms only:

- [Interface Statistics 15 Minute Archived Reports, page 13-208](#)
- [Interface Statistics Hourly Archived Reports, page 13-209](#)
- [Interface Statistics Daily Archived Reports, page 13-209](#)

## Interface Statistics 15 Minute Archived Reports

The Interface Statistics 15 Minute Archived Reports page shows all summary reports for archived MWTM 15 minute interface statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, hour, and minute; for example, the *InterfaceStats.2009-06-22-16-00.csv.zip* file contains the summary report of archived 15 minute interface statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minutes Interface statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

### Interface Statistics Hourly Archived Reports

The Interface Statistics Hourly Archived Reports page shows all summary reports for archived MWTM hourly interface statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *InterfaceStats.2009-06-22-11.csv.zip* file contains the summary report for hourly interface statistics for the 11th hour on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly Interface statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

### Interface Statistics Daily Archived Reports

The Interface Statistics Daily Archived Reports page shows summary reports for all archived MWTM daily interface statistics reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *InterfaceStats.2009-06-22.csv.zip* file contains the summary report for daily interface statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily Interface statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

## Memory Archived Reports

You can access the following Memory Archived reports:

- [Memory Utilization 15 Minute Archived Reports, page 13-209](#)
- [Memory Utilization Hourly Archived Reports, page 13-210](#)
- [Memory Utilization Daily Archived Reports, page 13-210](#)

### Memory Utilization 15 Minute Archived Reports

The Memory Utilization 15 Minute Archived Reports page shows summary reports for all archived MWTM 15 minute memory statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, hour, and minute; for example, the *MemStats.2009-06-22-16-00.csv.zip* file contains the summary report for 15 minute memory statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minute memory statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### Memory Utilization Hourly Archived Reports

The Memory Utilization Hourly Archived Reports page shows all summary reports for archived MWTM hourly memory statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *MemStats.2009-06-22-08.csv.zip* file contains the summary report for hourly memory statistics for the 8th hour on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly memory statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### Memory Utilization Daily Archived Reports

The Memory Utilization Daily Archived Reports page shows summary reports for all archived MWTM daily memory statistics for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *MemStats.2009-06-22.csv.zip* file contains the summary report for daily memory statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily memory statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## Viewing File Archive ITP Reports

ITP Reports that have been archived are located within **File Archive > ITP Statistics** in the MWTM web interface. You can also find archived reports in the */opt/CSCOsgm/reports* directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All archived reports are saved as export files in *.csv* format.

You can view full descriptions of all fields in export file archive reports by clicking **Administrative** from the MWTM web interface, then clicking **Export Reports README** under System Information.

You can view any of the following ITP archived reports:

- [Custom Archived Reports, page 13-211](#)
- [Rolling Archived Reports, page 13-213](#)
- [Application Server Archived Reports, page 13-214](#)
- [Application Server Process Archived Reports, page 13-215](#)
- [GTT Rates Archived Reports, page 13-216](#)
- [Link Archived Reports, page 13-216](#)
- [Linkset Archived Reports, page 13-217](#)
- [MLR Archived Reports, page 13-218](#)
- [MSU Archived Reports, page 13-219](#)
- [MTP3/AS Events Archived Reports, page 13-220](#)

- [Point Code Archived Reports, page 13-221](#)
- [Q752 Archived Reports, page 13-221](#)
- [SCTP Archived Reports, page 13-222](#)

## Custom Archived Reports

The Custom Archived Report pages show all archived MWTM custom network and accounting statistics reports for the server to which you connect. These reports can be viewed on the web, or downloaded as .zip files. These .zip files are also stored in the default directory (/opt/CSCOs<sub>gm</sub> by default) in the /reports/custom directory.

### Note

Custom archive reports are supported on ITP platforms only.

### Note

Custom reports are *custom* because you can specify that they run at custom time intervals. The content of custom reports is the same as regularly scheduled reports.

Custom archived reports are those that you enable by using these commands:

| Command        | Generates these custom statistics:                |
|----------------|---------------------------------------------------|
| mwtm accstats  | MTP3/AS accounting                                |
| mwtm gttstats  | GTT                                               |
| mwtm linkstats | Link and linkset                                  |
| mwtm mlrstats  | MLR                                               |
| mwtm msustats  | MSU rates                                         |
| mwtm mtpevents | MTP3/AS events                                    |
| mwtm q752stats | Q.752                                             |
| mwtm xuastats  | Application server and application server process |

### Note

For detailed descriptions of these commands, see [Appendix B, “Command Reference.”](#)

### Note

Custom ITP reports can be run manually from the command line or setup to run at custom intervals by creating crontab entries. See [Generating Custom ITP Statistics Reports Using the CLI, page 13-254](#) and [Including or Excluding Specified Objects in ITP Reports, page 13-256](#) for more information.

The Custom Report tables are sorted based on the information in the Export File column. However, you can sort a table based on the information in one of the other columns (see [Navigating Table Columns, page 5-23](#)).

The Custom Report tables contain:

| Column                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Export File                            | <p>Name of the custom statistics export <i>.zip</i> file, archived by type, date, and hour; for example, the <i>sgmLinksetStats.custom.20867.2009-06-24-16:15.csv.zip</i> file contains the summary report of custom linkset statistics with the ID tag 20867 for the 15th minute of the 16th hour on June 24, 2009.</p> <p>Each archived <i>.zip</i> file contains a comma-separated value (CSV) text file with a daily statistics report for that date. You can download the <i>.zip</i> files and extract them.</p> <p>To download a <i>.zip</i> file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.</p> |
| Report Date ( <i>timezone</i> )        | Date the custom report began.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Report Hour                            | Time the custom report began.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Last Modified Date ( <i>timezone</i> ) | Date and time the custom report was last modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| View                                   | Shows the detail report for the object. Not available for Q.752 reports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

All custom detail reports contain these headings and general menu options:

| Heading/ Menu Option                    | Description                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date and Hour<br>(in heading)           | Date and hour of the report.                                                                                                                                                                                                                                                                                     |
| Offset (in heading)                     | Shows the number of rows in the table, prior to the first visible row; for example, if the first visible row is 501, the <b>Offset</b> is 500.                                                                                                                                                                   |
| Number and Sort Order<br>(in heading)   | Shows the number of records (rows) in the table, the column by which the table is sorted, and whether the sort is in ascending or descending order.                                                                                                                                                              |
| 10/Page                                 | Shows 10 rows in the table.                                                                                                                                                                                                                                                                                      |
| 20/Page                                 | Shows 20 rows in the table.                                                                                                                                                                                                                                                                                      |
| 50/Page                                 | Shows 50 rows in the table.                                                                                                                                                                                                                                                                                      |
| 100/Page                                | Shows 100 rows in the table.                                                                                                                                                                                                                                                                                     |
| 300/Page                                | Shows 300 rows in the table.                                                                                                                                                                                                                                                                                     |
| 500/Page                                | Shows 500 rows in the table.                                                                                                                                                                                                                                                                                     |
| Max/Page                                | Shows up to 15,000 rows in the table.<br><br><b>Note</b> Depending on the number of rows, this could take up to 15 minutes.                                                                                                                                                                                      |
| DefPrefs                                | Resets the <b>/Page</b> preferences for this web page to the default settings for the MWTM server.                                                                                                                                                                                                               |
| First<br>(at bottom of table)           | Shows the first page of entries for the table.<br><br>For example, if the table is sorted by <b>Total Aborted</b> in descending order, clicking this field shows the entries with the highest number of MSUs aborted by MLR.<br><br>You cannot click this field if the first page of entries is already visible. |
| Previous (Rows)<br>(at bottom of table) | Shows the previous page of entries for the table.<br><br>You cannot click this field if the first page of entries is already visible.                                                                                                                                                                            |
| Next (Rows)<br>(at bottom of table)     | Shows the next page of entries for the table.<br><br>You cannot click this field if the last page of entries is already visible.                                                                                                                                                                                 |
| Last<br>(at bottom of table)            | Shows the last page of entries for the table.<br><br>For example, if the table is sorted by <b>Total Aborted</b> in descending order, clicking this field shows the entries with the lowest number of MSUs aborted by MLR.<br><br>You cannot click this field if the last page of entries is already visible.    |
| Total<br>(at bottom of table)           | Shows the total number of entries in the table.                                                                                                                                                                                                                                                                  |

## Rolling Archived Reports

The All Rolling Reports page shows summary reports of concatenated MWTM hourly and daily network statistics for all of the following objects detected by the MWTM for the server you are connected to:

- Application servers

- Application server processes
- Links
- Linksets

These statistics are stored as downloadable *.zip* files. The *.zip* files are archived by type and number of days (7 or 30). For example:

- *sgmLinkStats.RollingSevenDayAllHours.csv.zip*
- *sgmLinkStats.Rolling30DayAllDays.csv.zip*
- *sgmASEStats.Rolling30DayAllDays.csv.zip*
- *sgmASEStats.RollingSevenDayAllHours.csv.zip*
- *sgmASPStats.Rolling30DayAllDays.csv.zip*
- *sgmASPStats.RollingSevenDayAllHours.csv.zip*

**Note** To limit the maximum number of rows in export CSV files (for example, Excel can only handle 65,535 rows.) See [mwtm statreps, page B-76](#).

**Note** Rolling Archived Reports are supported for ITP platforms only.

The MWTM creates a new set of files every hour.

You can download the *.zip* files and extract them. To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## Application Server Archived Reports

You can access the following Application Server Archived Reports. These reports are supported on ITP platforms only:

- [AS Statistics Hourly Archived Reports, page 13-214](#)
- [AS Statistics Daily Archived Reports, page 13-215](#)
- [AS Statistics Custom Archived Reports, page 13-215](#)

### AS Statistics Hourly Archived Reports

The AS Statistics Hourly Archived Reports page shows all summary reports for archived MWTM hourly network statistics for all application servers that the MWTM detects for the server to which you connect. The information is stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *sgmASEStats.2009-06-22-08.csv.zip* file contains the summary report for hourly application server statistics for the 8th hour on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly network statistics for all application servers that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## AS Statistics Daily Archived Reports

The AS Statistics Daily Archived Reports page shows summary reports for all archived MWTM daily network statistics for all application servers that the MWTM detects for the server to which you connect. The information is stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *sgmASEStats.DailySum.2009-06-22.csv.zip* file contains the summary report for daily application server statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily network statistics for all application servers that the MWTM detects on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## AS Statistics Custom Archived Reports

The Application Server Statistics Custom Archived Report pages show all archived MWTM custom network and accounting statistics reports for all application servers that the MWTM detects for the server to which you connect. These reports can be viewed on the web, or downloaded as *.zip* files. These *.zip* files are also stored in the default directory (*/opt/CSCOsgm* by default) in the */reports/custom* directory.

The detailed information about custom archived reports is available in [Custom Archived Reports](#).

## Application Server Process Archived Reports

You can access the following Application Server Process Archived Reports. These reports are supported on ITP platforms only:

- [ASP Statistics Hourly Archived Reports, page 13-215](#)
- [ASP Statistics Daily Archived Reports, page 13-215](#)
- [ASP Statistics Custom Archived Reports, page 13-216](#)

## ASP Statistics Hourly Archived Reports

The ASP Hourly Statistics Archived Reports page shows the summary reports of all archived MWTM hourly network statistics for all application server processes that the MWTM detects for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *sgmASPStats.2009-06-22-11.csv.zip* file contains the summary report of hourly application server process statistics for the 11th hour on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with the summary report for hourly network statistics for all application server processes that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## ASP Statistics Daily Archived Reports

The ASP Daily Statistics Archived Reports page shows summary reports of all archived MWTM daily network statistics for all application server processes that the MWTM detects for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *sgmASPStats.DailySum.2009-06-22.csv.zip* file contains the summary report of daily application server process statistics for June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily network statistics for all application server processes that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

## ASP Statistics Custom Archived Reports

The ASP Statistics Custom Archived Report pages show all archived MWTM custom network and accounting statistics reports for all application server processes that the MWTM detects for the server to which you connect. These reports can be viewed on the web, or downloaded as *.zip* files. These *.zip* files are also stored in the default directory (*/opt/CSCOsgm* by default) in the */reports/custom* directory.

The detailed information about custom archived reports is available in [Custom Archived Reports](#).

## GTT Rates Archived Reports

You can access the following GTT Rates Archived Report. This report is supported on ITP platforms only:

- [GTT Rates Statistics Hourly Archived Reports, page 13-216](#).

### GTT Rates Statistics Hourly Archived Reports

The GTT Rates Statistics Hourly Archived Reports page shows all archived MWTM hourly GTT rates statistics reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *sgmGTTRates.2009-06-22-11.csv.zip* file contains the hourly GTT rates statistics report for the 11th hour on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with an hourly GTT rates statistics report for that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## Link Archived Reports

You can access the following Link Archived Reports. These reports are supported on ITP platforms only:

- [Link Statistics Hourly Archived Reports, page 13-216](#)
- [Link Statistics Daily Archived Reports, page 13-217](#)
- [Link Statistics Custom Archived Reports, page 13-217](#)

### Link Statistics Hourly Archived Reports

The Link Statistics Hourly Archived Reports page shows summary reports for all archived MWTM hourly network statistics for all links that the MWTM detected for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *sgmLinkStats.2009-06-24-09.csv.zip* file contains the summary reports for hourly link statistics for June 24, 2009 at 9:00 a.m.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of an hourly network statistics for all links that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### Link Statistics Daily Archived Reports

The Link Statistics Daily Archived Reports page shows summary reports for all archived MWTM daily network statistics for all links that the MWTM detected for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *sgmLinkStats.DailySum.2009-06-24.csv.zip* file contains the summary report of daily link statistics for June 24, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily network statistics for all links that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### Link Statistics Custom Archived Reports

The Link Statistics Custom Archived Report pages show all archived MWTM custom network and accounting statistics reports for all Link statistics servers that the MWTM detects for the server to which you connect. These reports can be viewed on the web, or downloaded as *.zip* files. These *.zip* files are also stored in the default directory (*/opt/CSCOSgm* by default) in the */reports/custom* directory.

The detailed information about custom archived reports is available in [Custom Archived Reports](#).

## Linkset Archived Reports

You can access the following Linkset Archived Reports. These reports are supported on ITP platforms only:

- [Linkset Statistics Hourly Archived Reports, page 13-217](#)
- [Linkset Statistics Daily Archived Reports, page 13-218](#)
- [Linkset Statistics Custom Archived Reports, page 13-218](#)

### Linkset Statistics Hourly Archived Reports

The Linkset Statistics Hourly Archived Reports page shows summary reports of all archived MWTM hourly network statistics for all linksets that the MWTM detects for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *sgmLinksetStats.2009-06-24-09.csv.zip* file contains the summary report for the hourly linkset statistics for June 24, 2009 at 9:00 a.m.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly network statistics for all linksets that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## Linkset Statistics Daily Archived Reports

The Linkset Statistics Daily Archived Reports page shows the summary report of all archived MWTM daily network statistics for all linksets that the MWTM detected for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *sgmLinksetStats.DailySum.2009-06-24.csv.zip* file contains the summary reports of daily linkset statistics for June 24, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily network statistics for all linksets that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## Linkset Statistics Custom Archived Reports

The Link Statistics Custom Archived Report pages show all archived MWTM custom network and accounting statistics reports for all Linkset statistics servers that the MWTM detects for the server to which you connect. These reports can be viewed on the web, or downloaded as *.zip* files. These *.zip* files are also stored in the default directory (*/opt/CSCOSgm* by default) in the */reports/custom* directory.

The detailed information about custom archived reports is available in [Custom Archived Reports](#).

## MLR Archived Reports

You can access the following MLR Archived Reports. These reports are supported on ITP platforms only:

- [MLR Daily Archived Reports, page 13-218](#)
- [MLR Custom Archived Reports, page 13-219](#)

## MLR Daily Archived Reports

The MLR Daily Archived Reports pages show all archived MWTM daily MLR statistics for the server to which you connect, stored as downloadable *.zip* files. MWTM creates the following MLR archived report files:

- MLR Abort & Continues Statistics Daily Archived Reports
- MLR Processed Statistics Daily Archived Reports
- MLR ResultInvokes Statistics Daily Archived Reports
- MLR RuleMatches Statistics Daily Archived Reports
- MLR SubTriggers Statistics Daily Archived Reports
- MLR Triggers Statistics Daily Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a daily MLR statistics report for that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## MLR Custom Archived Reports

The MLR Custom Archived Report pages show all archived MWTM custom network and accounting statistics reports for all MLR servers that the MWTM detects for the server to which you connect. These reports can be viewed on the web, or downloaded as *.zip* files. These *.zip* files are also stored in the default directory (*/opt/CSCOsgm* by default) in the */reports/custom* directory.

MWTM displays the following MLR Custom archived reports:

- MLR Aborts & Continuous Statistics Custom Archived Reports
- MLR Processed Statistics Custom Archived Reports
- MLR ResultInvokes Statistics Custom Archived Reports
- MLR RuleMatches Statistics Custom Archived Reports
- MLR Sub Triggers Statistics Custom Archived Reports
- MLR Triggers Statistics Custom Archived Reports

The detailed information about custom archived reports is available in [Custom Archived Reports](#).

## MSU Archived Reports

You can access the following MSU Archived Reports. These reports are supported on ITP platforms only:

- [MSU Statistics Hourly Archived Reports, page 13-219](#)
- [MSU Statistics Daily Archived Reports, page 13-219](#)

### MSU Statistics Hourly Archived Reports

The MSU Statistics Hourly Archived Reports page shows summary reports of all archived MWTM hourly MSU rates that the MWTM detects for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type, date, and hour; for example, the *itpHourlyMsuLoad.2009-06-24-09.csv.zip* file contains the summary report for the hourly MSU rates for June 24, 2009 at 9:00 a.m.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly MSU rates that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

### MSU Statistics Daily Archived Reports

The MSU Daily Archived Reports page shows the summary report of all archived MWTM daily MSU rates that the MWTM detected for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by type and date; for example, the *itpDailyMsuLoad.2009-06-24.csv.zip* file contains the summary reports of daily MSU rates for June 24, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily MSU rates that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

## MTP3/AS Events Archived Reports

You can access the following MTP3/AS Events Reports. These reports are supported on ITP platforms only:

- [MTP3/AS Events Hourly Archived Reports](#), page 13-220
- [MTP3/AS Events Custom Archived Reports](#), page 13-221

### MTP3/AS Events Hourly Archived Reports

To create hourly MTP3/AS event reports for the MWTM:

- Step 1** Log in as the root user, as described in [Starting the MWTM Client](#), page 3-3, or as a superuser, as described in [Specifying a Super User \(Server Only\)](#), page 2-19.
- Step 2** Enter these commands:
- ```
# cd /opt/CSC0sgm/bin
# ./mwtm evreps enable
# ./mwtm evreps mtp
```

For more details on the **mwtm evreps** commands, see [Appendix B, “Command Reference.”](#)

Field or Column	Description
Export File	Name of the network events export <i>.zip</i> file, archived by type, date, and hour; for example, the <i>sgmMTP3Events.custom.20867.2009-06-24-16-15.csv.zip</i> file contains the summary report of custom network events with ID tag 20867 for the 15th minute of the 16th hour on June 24, 2009. Each archived <i>.zip</i> file contains a comma-separated value (CSV) text file with a daily statistics report for that date. You can download the <i>.zip</i> files and extract them. To download a <i>.zip</i> file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.
Report Start Date (<i>timezone</i>)	Date and time the custom report began.
Report Finish Date (<i>timezone</i>)	Date and time the custom report ended.
Last Modified Date (<i>timezone</i>)	Date and time the custom report was last modified.
View	Shows the custom detail report for the object.

MTP3/AS Events Custom Archived Reports

The MTP3/AS Custom Archived Report pages show all archived MWTM custom network and accounting statistics reports for all MTP3/AS servers that the MWTM detects for the server to which you connect. These reports can be viewed on the web, or downloaded as *.zip* files. These *.zip* files are also stored in the default directory (*/opt/CSCOsgm* by default) in the */reports/custom* directory.

The detailed information about custom archived reports is available in [Custom Archived Reports](#).

Point Code Archived Reports

You can access the following Point Code Archived Report. This report is supported on ITP platforms only:

- [Point Codes Daily Archived Reports, page 13-221](#)

Point Codes Daily Archived Reports

The Point Codes Daily Archived Reports page shows all archived MWTM daily point code inventory reports for the server to which you connect, stored as downloadable *.zip* files.

On the Point Codes Daily Archived Reports page, the *.zip* files are archived by date; for example, the *sgmPointCodes.DailyInv.2009-06-24.csv.zip* file contains the daily point code inventory report for June 24, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a list of all point codes that were being used by all nodes that the MWTM detected on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

Q752 Archived Reports

You can access the following Q752 Archived Reports:

- [Q752 Statistics Hourly Archived Reports, page 13-221](#)
- [Q752 Statistics Daily Archived Reports, page 13-222](#)
- [Q752 Statistics Custom Archived Reports, page 13-222](#)

Q752 Statistics Hourly Archived Reports

The Q752 Statistics Archived Reports page shows all archived MWTM hourly Q752 reports for the server to which you connect, stored as downloadable *.zip* files. The MWTM creates the following Q752 hourly archived report files each hour:

- Q752 Statistics Hourly
- Q752 Table 4 Statistics Hourly
- Q752 Table 5 Destination Congestion Statistics Hourly
- Q752 Table 5 Routing Drops Statistics Hourly
- Q752 Table 5 User Part Unavailable Statistics Hourly

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of all Q752 links that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

Q752 Statistics Daily Archived Reports

The Q752 Statistics Archived Reports page shows all archived MWTM daily Q752 reports for the server to which you connect, stored as downloadable *.zip* files. The MWTM creates the following Q752 daily archived report files each day:

- Q752 Statistics Daily
- Q752 Table 4 Statistics Daily
- Q752 Table 5 Destination Congestion Statistics Daily
- Q752 Table 5 Routing Drops Statistics Daily
- Q752 Table 5 User Part Unavailable Statistics Daily

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of all Q752 links that the MWTM detected on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

Q752 Statistics Custom Archived Reports

The Q752 Statistics Custom Archived Reports page shows all archived MWTM hourly Q752 reports for the server to which you connect, stored as downloadable *.zip* files.

On the Q752 Custom Archived Reports page, the *.zip* files are archived by date; for example, the *sgmQ752Stats.2009-06-24.csv.zip* file contains the Custom Q752 report for June 24, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of all Q752 links that the MWTM detected on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

SCTP Archived Reports

You can access the following SCTP Archived Report:

- [SCTP Statistics 15 Minute Archived Reports, page 13-222](#)
- [SCTP Statistics Hourly Archived Reports, page 13-223](#)
- [SCTP Statistics Daily Archived Reports, page 13-223](#)

SCTP Statistics 15 Minute Archived Reports

The SCTP Statistics 15 Minute Archived Reports page shows all archived MWTM SCTP 15 minute reports for the server to which you connect, stored as downloadable *.zip* files.

On the SCTP Statistics 15 Minute Archived Reports page, the *.zip* files are archived by date; for example, the *sgmSCTPStats.2009-06-22-11-30.csv.zip* file contains the SCTP 15-minute report for the 11th hour, 30 minutes on June 22, 2009.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of all SCTP links that the MWTM detected on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

SCTP Statistics Hourly Archived Reports

The SCTP Statistics Hourly Archived Reports page shows all archived MWTM SCTP hourly reports for the server to which you connect, stored as downloadable *.zip* files.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of all SCTP links that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

SCTP Statistics Daily Archived Reports

The SCTP Statistics Daily Archived Reports page shows all archived MWTM SCTP daily reports for the server to which you connect, stored as downloadable *.zip* files.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of all SCTP links that the MWTM detected on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

Viewing File Archive Mobile Reports

Mobile Reports that have been archived are located within **File Archive > Mobile Statistics** in the MWTM web interface. You can also find archived reports in the */opt/CSCOs/gm/reports* directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All archived reports are saved as export files in *.csv* format.

You can view full descriptions of all fields in export file archive reports by clicking **Administrative** from the MWTM web interface, then clicking **Export Reports README** under System Information.

You can view any of the following Mobile archived reports:

- [CSG Archived Reports, page 13-223](#)
- [GGSN Archived Reports, page 13-226](#)
- [HA Archived Reports, page 13-228](#)
- [PDNGW Archived Reports, page 13-229](#)
- [PDSN Archived Reports, page 13-231](#)
- [SGW Archived Reports, page 13-232](#)
- [SLB Archived Reports, page 13-235](#)

CSG Archived Reports

You can access the following CSG Archived Reports:

- [CSG 15 Minute Archived Reports, page 13-224](#)
- [CSG Hourly Archived Reports, page 13-224](#)
- [CSG Daily Archived Reports, page 13-225](#)

CSG 15 Minute Archived Reports

The 15 minute CSG Archived Reports page shows summary reports of all archived MWTM 15 minute CSG statistics. MWTM creates the following CSG 15 Minute archived report files for every 15 Minutes:

- CSG BMA Statistics 15 Minute Archived Reports
- CSG Global Peak Rates 15 Minute Archived Reports
- CSG Protocol Rates 15 Minute Archived Reports
- CSG Load Session Rates 15 Minute Archived Reports
- CSG Load Radius Rates 15 Minute Archived Reports
- CSG Load BMA Rates 15 Minute Archived Reports
- CSG Load User DB Rates 15 Minute Archived Reports
- CSG Load Quota Manager Rates 15 Minute Archived Reports
- CSG Load Gx Event Statistics 15 Minute Archived Reports
- CSG Quota Manager Statistics 15 Minute Archived Reports
- CSG Billing Plan Statistics 15 Minute Archived Reports
- CSG Gx Global Message Statistics 15 Minute Archived Reports
- CSG Gx Global Message Errors 15 Minute Archived Reports
- CSG Gx PCRF Method List Message Statistics 15 Minute Archived Reports
- CSG Gx PCRF Method List Message Errors 15 Minute Archived Reports
- CSG Gx Policy Preload Statistics 15 Minute Archived Reports
- CSG Gx Policy Preload Errors 15 Minute Archived Reports
- CSG Gx Policy Preload Accounting Policy Statistics 15 Minute Archived Reports
- CSG Gx Policy Preload Billing Plan Statistics 15 Minute Archived Reports
- CSG Gx Policy Preload Billing Services Statistics 15 Minute Archived Reports
- CSG Gx Policy Preload Content Policy Statistics 15 Minute Archived Reports
- CSG Gx Policy Preload Service Content Statistics 15 Minute Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minute CSG statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

CSG Hourly Archived Reports

The CSG Hourly Archived Reports page shows the summary reports of all archived MWTM hourly CSG statistics. MWTM creates the following CSG hourly archived report files each hour:

- CSG BMA Statistics Hourly Archived Reports
- CSG Global Peak Rates Hourly Archived Reports

- CSG Protocol Rates Hourly Archived Reports
- CSG Load Session Rates Hourly Archived Reports
- CSG Load Radius Rates Hourly Archived Reports
- CSG Load BMA Rates Hourly Archived Reports
- CSG Load User DB Rates Hourly Archived Reports
- CSG Load Quota Manager Rates Hourly Archived Reports
- CSG Load Gx Event Statistics Hourly Archived Reports
- CSG Quota Manager Statistics Hourly Archived Reports
- CSG Billing Plan Statistics Hourly Archived Reports
- CSG Gx Global Message Statistics Hourly Archived Reports
- CSG Gx Global Message Errors Hourly Archived Reports
- CSG Gx PCRF Method List Message Statistics Hourly Archived Reports
- CSG Gx PCRF Method List Message Errors Hourly Archived Reports
- CSG Gx Policy Preload Statistics Hourly Archived Reports
- CSG Gx Policy Preload Errors Hourly Archived Reports
- CSG Gx Policy Preload Accounting Policy Statistics Hourly Archived Reports
- CSG Gx Policy Preload Billing Plan Statistics Hourly Archived Reports
- CSG Gx Policy Preload Billing Services Statistics Hourly Archived Reports
- CSG Gx Policy Preload Content Policy Statistics Hourly Archived Reports
- CSG Gx Policy Preload Service Content Statistics Hourly Archived Reports

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

CSG Daily Archived Reports

The Daily CSG Archived Reports page shows summary reports of all archived MWTM daily CSG statistics. MWTM creates the following CSG daily archived report files each day:

- CSG BMA Statistics Daily Archived Reports
- CSG Global Peak Rates Daily Archived Reports
- CSG Protocol Rates Daily Archived Reports
- CSG Load Session Rates Daily Archived Reports
- CSG Load Radius Rates Daily Archived Reports
- CSG Load BMA Rates Daily Archived Reports
- CSG Load User DB Rates Daily Archived Reports
- CSG Load Quota Manager Rates Daily Archived Reports
- CSG Load Gx Event Statistics Daily Archived Reports
- CSG Quota Manager Statistics Daily Archived Reports
- CSG Billing Plan Statistics Daily Archived Reports
- CSG Gx Global Message Statistics Daily Archived Reports

- CSG Gx Global Message Errors Daily Archived Reports
- CSG Gx PCRF Method List Message Statistics Daily Archived Reports
- CSG Gx PCRF Method List Message Errors Daily Archived Reports
- CSG Gx Policy Preload Statistics Daily Archived Reports
- CSG Gx Policy Preload Errors Daily Archived Reports
- CSG Gx Policy Preload Accounting Policy Statistics Daily Archived Reports
- CSG Gx Policy Preload Billing Plan Statistics Daily Archived Reports
- CSG Gx Policy Preload Billing Services Statistics Daily Archived Reports
- CSG Gx Policy Preload Content Policy Statistics Daily Archived Reports
- CSG Gx Policy Preload Service Content Statistics Daily Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily CSG statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

GGSN Archived Reports

You can access these reports:

- [GGSN 15 Minute Archived Reports, page 13-226](#)
- [GGSN Hourly Archived Reports, page 13-227](#)
- [GGSN Daily Archived Reports, page 13-227](#)

GGSN 15 Minute Archived Reports

The 15 minute GGSN Archived Reports page shows summary reports of all archived MWTM 15 minute GGSN statistics. MWTM creates the following GGSN 15 Minute archived report files for every 15 Minutes:

- APN Aggregate Miscellaneous Statistics 15 Minute Archived Reports
- APN Aggregate PDP/Bearer Statistics 15 Minute Archived Reports
- APN Aggregate PDP/Bearer Extended Statistics 15 Minute Archived Reports
- APN Aggregate Throughput Statistics 15 Minute Archived Reports
- APN Instance Miscellaneous Statistics 15 Minute Archived Reports
- APN Instance PDP/Bearer Statistics 15 Minute Archived Reports
- APN Instance PDP/Bearer Extended Statistics 15 Minute Archived Reports
- APN Instance Throughput Statistics 15 Minute Archived Reports
- GTP Active Statistics 15 Minute Archived Reports
- GTP Error Statistics 15 Minute Archived Reports
- GTP PDP Statistics 15 Minute Archived Reports
- GTP Throughput Statistics 15 Minute Archived Reports
- GTP Path Throughput Statistics 15 Minute Archived Reports
- GTP Charging Statistics 15 Minute Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minute network statistics for all application servers that the MWTM detects on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

GGSN Hourly Archived Reports

The Hourly GGSN Archived Reports page shows all summary reports for archived MWTM hourly statistics. MWTM creates the following GGSN hourly archived report files for each hour:

- APN Aggregate Miscellaneous Statistics Hourly Archived Reports
- APN Aggregate PDP/Bearer Statistics Hourly Archived Reports
- APN Aggregate PDP/Bearer Extended Statistics Hourly Archived Reports
- APN Aggregate Throughput Statistics Hourly Archived Reports
- APN Instance Miscellaneous Statistics Hourly Archived Reports
- APN Instance PDP/Bearer Statistics Hourly Archived Reports
- APN Instance PDP/Bearer Extended Statistics Hourly Archived Reports
- APN Instance Throughput Statistics Hourly Archived Reports
- GTP Active Statistics Hourly Archived Reports
- GTP Error Statistics Hourly Archived Reports
- GTP PDP Statistics Hourly Archived Reports
- GTP Throughput Statistics Hourly Archived Reports
- GTP Path Throughput Statistics Hourly Archived Reports
- GTP Charging Statistics Hourly Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly network statistics for all application servers that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

GGSN Daily Archived Reports

The GGSN Daily Archived Reports page shows summary reports for all archived MWTM daily statistics. MWTM creates the following GGSN daily archived report files for each day:

- APN Aggregate Miscellaneous Statistics Daily Archived Reports
- APN Aggregate PDP/Bearer Statistics Daily Archived Reports
- APN Aggregate PDP/Bearer Extended Statistics Daily Archived Reports
- APN Aggregate Throughput Statistics Daily Archived Reports
- APN Instance Miscellaneous Statistics Daily Archived Reports
- APN Instance PDP/Bearer Statistics Daily Archived Reports
- APN Instance PDP/Bearer Extended Statistics Daily Archived Reports
- APN Instance Throughput Statistics Daily Archived Reports

- GTP Active Statistics Daily Archived Reports
- GTP Error Statistics Daily Archived Reports
- GTP PDP Statistics Daily Archived Reports
- GTP Throughput Statistics Daily Archived Reports
- GTP Path Throughput Statistics Daily Archived Reports
- GTP Charging Statistics Daily Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily network statistics for all application servers that the MWTM detects on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

HA Archived Reports

You can access these HA Archived Reports:

- [HA Registration Statistics 15 Minute Archived Reports, page 13-228](#)
- [HA Registration Statistics Hourly Archived Reports, page 13-228](#)
- [HA Registration Statistics Daily Archived Reports, page 13-228](#)

HA Registration Statistics 15 Minute Archived Reports

The HA Registration Statistics 15 Minute Archived Reports page shows summary reports of 15-minute statistical details on Home Agent registration and binding updates. The HA 15 Minute Archived Report has the file name *HomeAgentRegistrationStatsEntry.year-month-day-hour-minute.csv.zip*.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15-minute registration statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

HA Registration Statistics Hourly Archived Reports

The HA Registration Statistics Hourly Archived Reports page shows summary reports of hourly statistical details on Home Agent registration and binding updates. The HA Hourly Archived Report has the file name *HomeAgentRegistrationStatsEntry.year-month-day-hour.csv.zip*

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly registration statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

HA Registration Statistics Daily Archived Reports

The HA Registration Statistics Daily Archived Reports page shows summary reports of daily statistical details on Home Agent registration and binding updates. The HA Daily Archived Report has the file name *HomeAgentRegistrationStatsEntry.year-month-day.csv.zip*.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily registration statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDNGW Archived Reports

You can access these reports

- [PDNGW 15 Minute Archived Reports, page 13-229](#)
- [PDNGW Hourly Archived Reports, page 13-230](#)
- [PDNGW Daily Archived Reports, page 13-230](#)

PDNGW 15 Minute Archived Reports

The 15 minute PDNGW Archived Reports page shows summary reports of all archived MWTM 15 minute PDNGW statistics. MWTM creates the following PDNGW 15 Minute archived report files for every 15 Minutes:

- APN Aggregate Miscellaneous Statistics 15 Minute Archived Reports
- APN Aggregate PDP/Bearer Statistics 15 Minute Archived Reports
- APN Aggregate PDP/Bearer Extended Statistics 15 Minute Archived Reports
- APN Aggregate Throughput Statistics 15 Minute Archived Reports
- APN Instance Miscellaneous Statistics 15 Minute Archived Reports
- APN Instance PDP/Bearer Statistics 15 Minute Archived Reports
- APN Instance PDP/Bearer Extended Statistics 15 Minute Archived Reports
- APN Instance Throughput Statistics 15 Minute Archived Reports
- EPC Gateway Protection Statistics 15 Minute Archived Reports
- EPC Gateway Buffering Statistics 15 Minute Archived Reports
- GTP Active Statistics 15 Minute Archived Reports
- GTP Error Statistics 15 Minute Archived Reports
- GTP Path Errors 15 Minute Archived Reports
- GTP PDP/Bearer Statistics 15 Minute Archived Reports
- GTP Throughput Statistics 15 Minute Archived Reports
- GTP Path Throughput Statistics 15 Minute Archived Reports
- GTP Charging Statistics 15 Minute Archived Reports
- GTPv2 Bearer Statistics 15 Minute Archived Reports
- GTPv2 Session Statistics 15 Minute Archived Reports
- GTPv2 Path Bearer Statistics 15 Minute Archived Reports
- GTPv2 Path Session Statistics 15 Minute Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minute network statistics for all application servers that the MWTM detects on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDNGW Hourly Archived Reports

The Hourly PDNGW Archived Reports page shows all summary reports for archived MWTM hourly statistics. MWTM creates the following PDNGW hourly archived report files for each hour:

- APN Aggregate Miscellaneous Statistics Hourly Archived Reports
- APN Aggregate PDP/Bearer Statistics Hourly Archived Reports
- APN Aggregate PDP/Bearer Extended Statistics Hourly Archived Reports
- APN Aggregate Throughput Statistics Hourly Archived Reports
- APN Instance Miscellaneous Statistics Hourly Archived Reports
- APN Instance PDP/Bearer Statistics Hourly Archived Reports
- APN Instance PDP/Bearer Extended Statistics Hourly Archived Reports
- APN Instance Throughput Statistics Hourly Archived Reports
- EPC Gateway Protection Statistics Hourly Archived Reports
- EPC Gateway Buffering Statistics Hourly Archived Reports
- GTP Active Statistics Hourly Archived Reports
- GTP Error Statistics Hourly Archived Reports
- GTP Path Errors Hourly Archived Reports
- GTP PDP/Bearer Statistics Hourly Archived Reports
- GTP Throughput Statistics Hourly Archived Reports
- GTP Path Throughput Statistics Hourly Archived Reports
- GTP Charging Statistics Hourly Archived Reports
- GTPv2 Bearer Statistics Hourly Archived Reports
- GTPv2 Session Statistics Hourly Archived Reports
- GTPv2 Path Bearer Statistics Hourly Archived Reports
- GTPv2 Path Session Statistics Hourly Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly network statistics for all application servers that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

PDNGW Daily Archived Reports

The PDNGW Daily Archived Reports page shows summary reports for all archived MWTM daily statistics. MWTM creates the following PDNGW daily archived report files for each day:

- APN Aggregate Miscellaneous Statistics Daily Archived Reports
- APN Aggregate PDP/Bearer Statistics Daily Archived Reports
- APN Aggregate PDP/Bearer Extended Statistics Daily Archived Reports
- APN Aggregate Throughput Statistics Daily Archived Reports

- APN Instance Miscellaneous Statistics Daily Archived Reports
- APN Instance PDP/Bearer Statistics Daily Archived Reports
- APN Instance PDP/Bearer Extended Statistics Daily Archived Reports
- APN Instance Throughput Statistics Daily Archived Reports
- EPC Gateway Protection Statistics Daily Archived Reports
- EPC Gateway Buffering Statistics Daily Archived Reports
- GTP Active Statistics Daily Archived Reports
- GTP Error Statistics Daily Archived Reports
- GTP Path Errors Daily Archived Reports
- GTP PDP/Bearer Statistics Daily Archived Reports
- GTP Throughput Statistics Daily Archived Reports
- GTP Path Throughput Statistics Daily Archived Reports
- GTP Charging Statistics Daily Archived Reports
- GTPv2 Bearer Statistics Daily Archived Reports
- GTPv2 Session Statistics Daily Archived Reports
- GTPv2 Path Bearer Statistics Daily Archived Reports
- GTPv2 Path Session Statistics Daily Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily network statistics for all application servers that the MWTM detects on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

PDSN Archived Reports

You can access the following PDSN Archived Reports:

- [PDSN 15 Minute Archived Reports, page 13-231](#)
- [PDSN Hourly Archived Reports, page 13-232](#)
- [PDSN Daily Archived Reports, page 13-232](#)

PDSN 15 Minute Archived Reports

The PDSN 15 Minute Archived Reports page shows summary reports of 15-minute statistical details of the PDSN. The MWTM creates the following PDSN 15 minute archived report files for every 15 minutes:

- PDSN Session Statistics 15 Minute Archived Reports
- PDSN Session Bandwidth Statistics 15 Minute Archived Reports
- PDSN Flow Statistics 15 Minute Archived Reports
- PDSN Flow Extended Statistics 15 Minute Archived Reports
- PDSN Packet Control Function Statistics 15 Minute Archived Reports
- PDSN Traffic Statistics 15 Minute Archived Reports

- PDSN Traffic Extended Statistics 15 Minute Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15-minute PDSN statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDSN Hourly Archived Reports

The PDSN Hourly Archived Reports page shows summary reports of hourly statistical details of the PDSN. MWTM creates the following PDSN hourly archived reports every hour:

- PDSN Session Statistics Hourly Archived Reports
- PDSN Session Bandwidth Statistics Hourly Archived Reports
- PDSN Flow Statistics Hourly Archived Reports
- PDSN Flow Extended Statistics Hourly Archived Reports
- PDSN Packet Control Function Statistics Hourly Archived Reports
- PDSN Traffic Statistics Hourly Archived Reports
- PDSN Traffic Extended Statistics Hourly Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly PDSN statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDSN Daily Archived Reports

The PDSN Daily Archived Reports page shows summary reports of daily statistical details of the PDSN. MWTM creates the following PDSN daily archived reports each day:

- PDSN Session Statistics Daily Archived Reports
- PDSN Session Bandwidth Statistics Daily Archived Reports
- PDSN Flow Statistics Daily Archived Reports
- PDSN Flow Extended Statistics Daily Archived Reports
- PDSN Packet Control Function Statistics Daily Archived Reports
- PDSN Traffic Statistics Daily Archived Reports
- PDSN Traffic Extended Statistics Daily Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily PDSN statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

SGW Archived Reports

You can access these reports

- [SGW 15 Minute Archived Reports, page 13-233](#)

- [SGW Hourly Archived Reports, page 13-233](#)
- [SGW Daily Archived Reports, page 13-234](#)

SGW 15 Minute Archived Reports

The 15 minute SGW Archived Reports page shows summary reports of all archived MWTM 15 minute SGW statistics. MWTM creates the following SGW 15 Minute archived report files for every 15 Minutes:

- APN Aggregate Bearer Statistics 15 Minute Archived Reports
- APN Aggregate Throughput Statistics 15 Minute Archived Reports
- APN Instance Bearer Statistics 15 Minute Archived Reports
- APN Instance Throughput Statistics 15 Minute Archived Reports
- EPC Gateway Protection Statistics 15 Minute Archived Reports
- EPC Gateway Buffering Statistics 15 Minute Archived Reports
- GTP Active Statistics 15 Minute Archived Reports
- GTP Error Statistics 15 Minute Archived Reports
- GTP Path Errors 15 Minute Archived Reports
- GTP Bearer Statistics 15 Minute Archived Reports
- GTP Throughput Statistics 15 Minute Archived Reports
- GTP Path Throughput Statistics 15 Minute Archived Reports
- GTP Charging Statistics 15 Minute Archived Reports
- GTPv2 Bearer Statistics 15 Minute Archived Reports
- GTPv2 Session Statistics 15 Minute Archived Reports
- GTPv2 Path Bearer Statistics 15 Minute Archived Reports
- GTPv2 Path Session Statistics 15 Minute Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15 minute network statistics for all application servers that the MWTM detects on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

SGW Hourly Archived Reports

The Hourly SGW Archived Reports page shows all summary reports for archived MWTM hourly statistics. MWTM creates the following SGW hourly archived report files for each hour:

- APN Aggregate Bearer Statistics Hourly Archived Reports
- APN Aggregate Throughput Statistics Hourly Archived Reports
- APN Instance Bearer Statistics Hourly Archived Reports
- APN Instance Throughput Statistics Hourly Archived Reports
- EPC Gateway Protection Statistics Hourly Archived Reports
- EPC Gateway Buffering Statistics Hourly Archived Reports
- GTP Active Statistics Hourly Archived Reports

- GTP Error Statistics Hourly Archived Reports
- GTP Path Errors Hourly Archived Reports
- GTP Bearer Statistics Hourly Archived Reports
- GTP Throughput Statistics Hourly Archived Reports
- GTP Path Throughput Statistics Hourly Archived Reports
- GTP Charging Statistics Hourly Archived Reports
- GTPv2 Bearer Statistics Hourly Archived Reports
- GTPv2 Session Statistics Hourly Archived Reports
- GTPv2 Path Bearer Statistics Hourly Archived Reports
- GTPv2 Path Session Statistics Hourly Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly network statistics for all application servers that the MWTM detected on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

SGW Daily Archived Reports

The SGW Daily Archived Reports page shows summary reports for all archived MWTM daily statistics. MWTM creates the following SGW daily archived report files for each day:

- APN Aggregate Bearer Statistics Daily Archived Reports
- APN Aggregate Throughput Statistics Daily Archived Reports
- APN Instance Bearer Statistics Daily Archived Reports
- APN Instance Throughput Statistics Daily Archived Reports
- EPC Gateway Protection Statistics Daily Archived Reports
- EPC Gateway Buffering Statistics Daily Archived Reports
- GTP Active Statistics Daily Archived Reports
- GTP Error Statistics Daily Archived Reports
- GTP Path Errors Daily Archived Reports
- GTP Bearer Statistics Daily Archived Reports
- GTP Throughput Statistics Daily Archived Reports
- GTP Path Throughput Statistics Daily Archived Reports
- GTP Charging Statistics Daily Archived Reports
- GTPv2 Bearer Statistics Daily Archived Reports
- GTPv2 Session Statistics Daily Archived Reports
- GTPv2 Path Bearer Statistics Daily Archived Reports
- GTPv2 Path Session Statistics Daily Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily network statistics for all application servers that the MWTM detects on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

SLB Archived Reports

The SLB archived reports shows all the archived MWTM reports for the server to which you connected.

You can access these reports:

- [SLB 15 Minute Archived Reports, page 13-235](#)
- [SLB Hourly Archived Reports, page 13-235](#)
- [SLB Daily Archived Reports, page 13-235](#)

SLB 15 Minute Archived Reports

The 15 Minute SLB Archived Reports page shows all archived MWTM SLB 15 minute reports for the server to which you connect, stored as downloadable *.zip* files. MWTM creates the following SLB 15 Minute archived report files for every 15 minutes:

- SLB Global Statistics 15 Minute Archived Reports
- SLB Real Server Statistics 15 Minute Archived Reports
- SLB Virtual Server Statistics 15 Minute Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly SLB statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

SLB Hourly Archived Reports

The SLB Hourly Archived Reports page shows the summary reports of all archived MWTM hourly SLB statistic. MWTM creates the following SLB hourly archived report files for each hour:

- SLB Global Statistics Hourly Archived Reports
- SLB Real Server Statistics Hourly Archived Reports
- SLB Virtual Server Statistics Hourly Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly SLB statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

SLB Daily Archived Reports

The SLB Daily Archived Reports page shows summary reports of all archived MWTM daily SLB statistics. MWTM creates the following SLB daily archived report files each day:

- SLB Global Statistics Daily Archived Reports
- SLB Real Server Statistics Daily Archived Reports
- SLB Virtual Server Statistics Daily Archived Reports

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly SLB statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

Viewing File Archive RAN Reports

RAN Reports that have been archived are located within **File Archive > RAN Statistics** in the MWTM web interface. You can also find archived reports in the */opt/CSCOsgm/reports* directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All archived reports are saved as export files in *.csv* format.

You can view full descriptions of all fields in export file archive reports by clicking **Administrative** from the MWTM web interface, then clicking **Export Reports README** under System Information.

You can view any of the following RAN archived reports:

- [Ethernet Archived Reports, page 13-236](#)
- [PWE3 Archived Reports, page 13-237](#)
- [QOS Archived Reports, page 13-238](#)
- [RAN-Optimized Archived Reports, page 13-238](#)

Ethernet Archived Reports

The Ethernet archived reports shows all the archived MWTM reports for the server to which you connected.

You can access these reports:

- [Ethernet Statistics 15 Minute Archived Reports, page 13-236](#)
- [Ethernet Statistics Hourly Archived Reports, page 13-236](#)
- [Ethernet Statistics Daily Archived Reports, page 13-237](#)

Ethernet Statistics 15 Minute Archived Reports

The Ethernet Statistics 15 Minute Archived Reports page shows summary reports of 15-minute statistical details of the Ethernet.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15-minute Ethernet statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

Ethernet Statistics Hourly Archived Reports

The Ethernet Statistics Hourly Archived Reports page shows summary reports of hourly statistical details of the Ethernet

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly Ethernet statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

Ethernet Statistics Daily Archived Reports

The Ethernet Statistics Daily Archived Reports page shows summary reports of daily statistical details of the Ethernet.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily Ethernet statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PWE3 Archived Reports

The PWE3 archived reports shows all the archived MWTM reports for the server to which you connected.

Note PWE3 reports are available for IPRAN platforms with PWE3 data tunnels configured only. All other RAN reports are available for RAN-O platforms only.

You can access these reports:

- [PWE3 Performance 15 Minute Archived Reports, page 13-237](#)
- [PWE3 Performance Hourly Archived Reports, page 13-237](#)
- [PWE3 Performance Daily Archived Reports, page 13-237](#)

PWE3 Performance 15 Minute Archived Reports

The PWE3 Performance 15 Minute Archived Reports page shows summary reports of 15-minute statistical details of the PWE3 performance.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of 15-minute PWE3 Performance statistics on that date, hour, and minute. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PWE3 Performance Hourly Archived Reports

The PWE3 Performance Hourly Archived Reports page shows summary reports of hourly statistical details of the PWE3 Performance.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of hourly PWE3 Performance statistics on that date and hour. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PWE3 Performance Daily Archived Reports

The PWE3 Performance Daily Archived Reports page shows summary reports of daily statistical details of the PWE3 performance.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily PWE3 Performance statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

QOS Archived Reports

The QOS archived reports shows all the archived MWTM reports for the server to which you connected.

You can access these reports:

- QOS Class Map Statistics 15 Minute Archived Reports
- QOS Class Map Statistics Hourly Archived Reports
- QOS Class Map Statistics Daily Archived Reports
- QOS Match Statement Statistics 15 Minute Archived Reports
- QOS Match Statement Statistics Hourly Archived Reports
- QOS Match Statement Statistics Daily Archived Reports
- QOS Packet Marking Statistics 15 Minute Archived Reports
- QOS Packet Marking Statistics Hourly Archived Reports
- QOS Packet Marking Statistics Daily Archived Reports
- QOS Policing Statistics 15 Minute Archived Reports
- QOS Policing Statistics Hourly Archived Reports
- QOS Policing Statistics Daily Archived Reports
- QOS Queuing Statistics 15 Minute Archived Reports
- QOS Queuing Statistics Hourly Archived Reports
- QOS Queuing Statistics Daily Archived Reports
- QOS Traffic Shaping Statistics 15 Minute Archived Reports
- QOS Traffic Shaping Statistics Hourly Archived Reports
- QOS Traffic Shaping Statistics Daily Archived Reports

The QOS Archived Reports page shows all archived MWTM QOS reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by date; for example, the *QosClassMapStats.2009-10-21.csv.zip* file contains the daily QOS report for October 21, 2009.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

RAN-Optimized Archived Reports

The RAN-Optimized archived reports shows all the archived MWTM reports for the server to which you connected. You can access these reports:

- RAN-O Backhaul Statistics 15 Minute Archived Reports
- RAN-O Backhaul Statistics Hourly Archived Reports
- RAN-O Backhaul Statistics Daily Archived Reports

- RAN-O Congestion Statistics 15 Minute Archived Reports
- RAN-O Congestion Statistics Hourly Archived Reports
- RAN-O Congestion Statistics Daily Archived Reports
- RAN-O GSM Errors 15 Minute Archived Reports
- RAN-OGSM Errors Hourly Archived Reports
- RAN-OGSM Errors Daily Archived Reports
- RAN-O Shorthaul Performance 15 Minute Archived Reports
- RAN-O Shorthaul Performance Hourly Archived Reports
- RAN-O Shorthaul Daily Archived Reports
- RAN-O UMTS Errors 15 Minute Archived Reports
- RAN-O UMTS Errors Hourly Archived Reports
- RAN-O UMTS Errors Daily Archived Reports

The RAN-Optimized Archived Reports page shows all archived MWTM RAN-Optimized reports for the server to which you connect, stored as downloadable *.zip* files.

The *.zip* files are archived by date; for example, the *ranoBHStats2009-06-24.csv.zip* file contains the daily RAN Backhaul report for June 24, 2009.

To download a *.zip* file, click a filename, then save the file to a location of your choice. You can also import the file directly into Microsoft Excel.

Viewing ITP Accounting Archived Reports

ITP Accounting Reports that have been archived are located within **File Archive > ITP Accounting** in the MWTM web interface. You can also find archived reports in the */opt/CSCOs/gm/reports* directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All archived reports are saved as export files in *.csv* format.

You can view full descriptions of all fields in export file archive reports by clicking **Administrative** from the MWTM web interface, then clicking **Export Reports README** under System Information.

You can view any of the following ITP Accounting archived reports:

- [GTT Accounting Archived Reports, page 13-239](#)
- [MTP3/AS Accounting Archived Reports, page 13-240](#)

GTT Accounting Archived Reports

The GTT accounting archived reports shows all the archived MWTM reports for the server to which you connected. You can access these reports:

- [GTT Accounting Daily Archived Reports, page 13-239](#)
- [GTT Accounting Custom Archived Reports, page 13-240](#)

GTT Accounting Daily Archived Reports

The GTT Accounting Daily Archived Reports page shows summary reports of daily statistical details of the GTT Accounting Daily Reports.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily GTT accounting statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

GTT Accounting Custom Archived Reports

The GTT Accounting Custom Archived Reports page shows summary reports of daily statistical details of the GTT accounting custom reports.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily GTT accounting custom statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

MTP3/AS Accounting Archived Reports

The MTP3/AS Accounting archived reports shows all the archived MWTM reports for the server to which you connected. You can access these reports:

- [MTP3/AS Accounting Daily Archived Reports, page 13-240](#)
- [MTP3/AS Accounting Custom Archived Reports, page 13-240](#)

MTP3/AS Accounting Daily Archived Reports

The MTP3/AS Accounting Daily Archived Reports page shows summary reports of daily statistical details of the MTP3/AS Accounting Daily Reports.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily MTP3/AS accounting statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

MTP3/AS Accounting Custom Archived Reports

The MTP3/AS Accounting Custom Archived Reports page shows summary reports of daily statistical details of the GTT accounting custom reports.

Each archived *.zip* file contains a comma-separated value (CSV) text file with a summary report of daily MTP3/AS accounting custom statistics on that date. You can download the *.zip* files and extract them.

To download a *.zip* file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

Viewing Mobile Subscribers Archived Reports

Mobile Subscribers Reports that have been archived are located within **File Archive > Mobile Subscribers** in the MWTM web interface. You can also find archived reports in the */opt/CSCOsgm/reports* directory on the MWTM client or an alternate location as configured by the MWTM system administrator. All archived reports are saved as export files in *.csv* format.

You can view full descriptions of all fields in export file archive reports by clicking **Administrative** from the MWTM web interface, then clicking **Export Reports README** under System Information.

You can view the following Mobile Subscribers archived reports:

- [BWG Subscriber Statistics Archived Reports, page 13-241](#)
- [CSG Subscriber Statistics Archived Reports, page 13-242](#)
- [GGSN Subscriber Statistics Archived Reports, page 13-242](#)
- [HA Subscriber Statistics Archived Reports, page 13-243](#)
- [PDNGW Subscriber Statistics Archived Reports, page 13-244](#)
- [PDSN Subscriber Statistics Archived Reports, page 13-245](#)
- [SGW Subscriber Statistics Archived Reports, page 13-246](#)

BWG Subscriber Statistics Archived Reports

You can access the following BWG Subscribers Archived Reports:

- [BWG Subscriber Statistics Hourly Archived Reports, page 13-241](#)
- [BWG Subscriber Statistics Daily Archived Reports, page 13-241](#)
- [BWG Subscriber Statistics Monthly Archived Reports, page 13-241](#)

BWG Subscriber Statistics Hourly Archived Reports

The BWG Subscriber Statistics Hourly Archived Reports page shows summary reports of hourly statistical details of the BWG. The Hourly BWG Subscriber Statistics Archived Report has the filename `BWGSubsStats.year-month-day-hour.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of hourly BWG Subscriber statistics on that date and hour. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

BWG Subscriber Statistics Daily Archived Reports

The BWG Subscriber Statistics Daily Archived Reports page shows summary reports of daily statistical details of the BWG. The Daily BWG Subscriber Statistics Archived Report has the filename `BWGSubsStats.year-month-day.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of daily BWG Subscriber statistics on that date. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

BWG Subscriber Statistics Monthly Archived Reports

The BWG Subscriber Statistics Monthly Archived Reports page shows summary reports of monthly statistical details of the BWG. The monthly BWG Subscriber Statistics Archived Report has the filename `BWGSubsStats.year-month.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of monthly BWG Subscriber statistics on that month. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

CSG Subscriber Statistics Archived Reports

You can access the following CSG Subscribers Archived Reports:

- [CSG Subscriber Statistics Hourly Archived Reports, page 13-242](#)
- [CSG Subscriber Statistics Daily Archived Reports, page 13-242](#)
- [CSG Subscriber Statistics Monthly Archived Reports, page 13-242](#)

CSG Subscriber Statistics Hourly Archived Reports

The CSG Subscriber Statistics Hourly Archived Reports page shows summary reports of hourly statistical details of the CSG. The Hourly CSG Subscriber Statistics Archived Report has the filename `CSGSubsStats.year-month-day-hour.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of hourly CSG Subscriber statistics on that date and hour. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

CSG Subscriber Statistics Daily Archived Reports

The CSG Subscriber Statistics Daily Archived Reports page shows summary reports of daily statistical details of the CSG. The Daily CSG Subscriber Statistics Archived Report has the filename `CSGSubsStats.year-month-day.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of daily CSG Subscriber statistics on that date. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

CSG Subscriber Statistics Monthly Archived Reports

The CSG Subscriber Statistics Monthly Archived Reports page shows summary reports of monthly statistical details of the CSG. The monthly CSG Subscriber Statistics Archived Report has the filename `CSGSubsStats.year-month.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of monthly CSG Subscriber statistics on that month. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

GGSN Subscriber Statistics Archived Reports

You can access the following GGSN Subscribers Archived Reports:

- [GGSN Subscriber Statistics Hourly Archived Reports, page 13-243](#)
- [GGSN Subscriber Statistics Daily Archived Reports, page 13-243](#)
- [GGSN Subscriber Statistics Monthly Archived Reports, page 13-243](#)

GGSN Subscriber Statistics Hourly Archived Reports

The GGSN Subscriber Statistics Hourly Archived Reports page shows summary reports of hourly statistical details of the GGSN. The Hourly GGSN Subscriber Statistics Archived Report has the filename `GGSNSubsStats.year-month-day-hour.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of hourly GGSN Subscriber statistics on that date and hour. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

GGSN Subscriber Statistics Daily Archived Reports

The GGSN Subscriber Statistics Daily Archived Reports page shows summary reports of daily statistical details of the GGSN. The Daily GGSN Subscriber Statistics Archived Report has the filename `GGSNSubsStats.year-month-day.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of daily GGSN Subscriber statistics on that date. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

GGSN Subscriber Statistics Monthly Archived Reports

The GGSN Subscriber Statistics Monthly Archived Reports page shows summary reports of monthly statistical details of the GGSN. The monthly GGSN Subscriber Statistics Archived Report has the filename `GGSNSubsStats.year-month.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of monthly GGSN Subscriber statistics on that month. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

HA Subscriber Statistics Archived Reports

You can access the following HA Subscribers Archived Reports:

- [HA Subscriber Statistics Hourly Archived Reports, page 13-243](#)
- [HA Subscriber Statistics Daily Archived Reports, page 13-244](#)
- [HA Subscriber Statistics Monthly Archived Reports, page 13-244](#)

HA Subscriber Statistics Hourly Archived Reports

The HA Subscriber Statistics Hourly Archived Reports page shows summary reports of hourly statistical details of the HA. The Hourly HA Subscriber Statistics Archived Report has the filename `HASubsStats.year-month-day-hour.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of hourly HA Subscriber statistics on that date and hour. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

HA Subscriber Statistics Daily Archived Reports

The HA Subscriber Statistics Daily Archived Reports page shows summary reports of daily statistical details of the HA. The Daily HA Subscriber Statistics Archived Report has the filename `HASubsStats.year-month-day.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of daily HA Subscriber statistics on that date. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

HA Subscriber Statistics Monthly Archived Reports

The HA Subscriber Statistics Monthly Archived Reports page shows summary reports of monthly statistical details of the HA. The monthly HA Subscriber Statistics Archived Report has the filename `HASubsStats.year-month.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of monthly HA Subscriber statistics on that month. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDNGW Subscriber Statistics Archived Reports

You can access the following PDNGW Subscribers Archived Reports:

- [PDNGW Subscriber Statistics Hourly Archived Reports, page 13-244](#)
- [PDNGW Subscriber Statistics Daily Archived Reports, page 13-244](#)
- [PDNGW Subscriber Statistics Monthly Archived Reports, page 13-245](#)

PDNGW Subscriber Statistics Hourly Archived Reports

The PDNGW Subscriber Statistics Hourly Archived Reports page shows summary reports of hourly statistical details of the PDNGW. The Hourly PDNGW Subscriber Statistics Archived Report has the filename `PDNGWSubsStats.year-month-day-hour.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of hourly PDNGW Subscriber statistics on that date and hour. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDNGW Subscriber Statistics Daily Archived Reports

The PDNGW Subscriber Statistics Daily Archived Reports page shows summary reports of daily statistical details of the PDNGW. The Daily PDNGW Subscriber Statistics Archived Report has the filename `PDNGWSubsStats.year-month-day.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of daily PDNGW Subscriber statistics on that date. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDNGW Subscriber Statistics Monthly Archived Reports

The PDNGW Subscriber Statistics Monthly Archived Reports page shows summary reports of monthly statistical details of the PDNGW. The monthly PDNGW Subscriber Statistics Archived Report has the filename `PDNGWSubsStats.year-month.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of monthly PDNGW Subscriber statistics on that month. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDSN Subscriber Statistics Archived Reports

You can access the following PDSN Subscribers Archived Reports:

- [PDSN Subscriber Statistics Hourly Archived Reports, page 13-245](#)
- [PDSN Subscriber Statistics Daily Archived Reports, page 13-245](#)
- [PDSN Subscriber Statistics Monthly Archived Reports, page 13-245](#)

PDSN Subscriber Statistics Hourly Archived Reports

The PDSN Subscriber Statistics Hourly Archived Reports page shows summary reports of hourly statistical details of the PDSN. The Hourly PDSN Subscriber Statistics Archived Report has the filename `PDSNSubsStats.year-month-day-hour.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of hourly PDSN Subscriber statistics on that date and hour. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDSN Subscriber Statistics Daily Archived Reports

The PDSN Subscriber Statistics Daily Archived Reports page shows summary reports of daily statistical details of the PDSN. The Daily PDSN Subscriber Statistics Archived Report has the filename `PDSNSubsStats.year-month-day.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of daily PDSN Subscriber statistics on that date. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

PDSN Subscriber Statistics Monthly Archived Reports

The PDSN Subscriber Statistics Monthly Archived Reports page shows summary reports of monthly statistical details of the PDSN. The monthly PDSN Subscriber Statistics Archived Report has the filename `PDSNSubsStats.year-month.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of monthly PDSN Subscriber statistics on that month. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

SGW Subscriber Statistics Archived Reports

You can access the following SGW Subscribers Archived Reports:

- [SGW Subscriber Statistics Hourly Archived Reports, page 13-246](#)
- [SGW Subscriber Statistics Daily Archived Reports, page 13-246](#)
- [SGW Subscriber Statistics Monthly Archived Reports, page 13-246](#)

SGW Subscriber Statistics Hourly Archived Reports

The SGW Subscriber Statistics Hourly Archived Reports page shows summary reports of hourly statistical details of the SGW. The Hourly SGW Subscriber Statistics Archived Report has the filename `SGWSubsStats.year-month-day-hour.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of hourly SGW Subscriber statistics on that date and hour. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

SGW Subscriber Statistics Daily Archived Reports

The SGW Subscriber Statistics Daily Archived Reports page shows summary reports of daily statistical details of the SGW. The Daily SGW Subscriber Statistics Archived Report has the filename `SGWSubsStats.year-month-day.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of daily SGW Subscriber statistics on that date. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

SGW Subscriber Statistics Monthly Archived Reports

The SGW Subscriber Statistics Monthly Archived Reports page shows summary reports of monthly statistical details of the SGW. The monthly SGW Subscriber Statistics Archived Report has the filename `SGWSubsStats.year-month.csv.zip`.

Each archived `.zip` file contains a comma-separated value (CSV) text file with a summary report of monthly SGW Subscriber statistics on that month. You can download the `.zip` files and extract them.

To download a `.zip` file, right-click a filename, then save the file to a location of your choice. You can also import the file into Microsoft Excel.

Viewing the MWTM Statistics Reports Logs

You can view a log that contains all messages pertaining to MWTM reports, and a display of the current values of MWTM report parameters and timers.

This section contains this information:

- [Viewing the MWTM Report Log, page 13-247](#)
- [Viewing the MWTM Report Parameters and Timers, page 13-247](#)

Viewing the MWTM Report Log

For details on viewing the MWTM report log, see [Viewing the Report Log, page 12-17](#).

Viewing the MWTM Report Parameters and Timers

The Report Parameters and Timers page shows the current values of report parameters and timers for the server to which you connect, and which is currently running the MWTM server.

To access the Report Parameters and Timers page, you must run the **mwtm statrep** CLI command on the server. You can also see this information from the Administrative page of the MWTM web interface (**Administrative > General > Properties > Reports**).

Column	Description
AAAREports	Indicates whether the MWTM should generate AAA statistics reports. For more information, see the description of the mwtm statrep [aaa noaaa] command in mwtm statrep, page B-76
APNReports	Indicates whether the MWTM should APN reports. For more information, see the description of the mwtm statrep [apn noapn] command in mwtm statrep, page B-76 .
AcctReports	Indicates whether the MWTM should generate MTP3 accounting statistics reports. For more information, see the description of the mwtm statrep [acct noacct] command in mwtm statrep, page B-76 .
ChassisInventory	Indicates whether the MWTM should generate chassis inventory reports. For more information, see the description of the mwtm statrep [chassisinventory nochassisinventory] command in mwtm statrep, page B-76 .
CPUReports	Indicates whether the MWTM should generate CPU statistics reports. For more information, see the description of the mwtm statrep [ggsn noggsn] command in mwtm statrep, page B-76 .
CSGReports	Indicates whether the MWTM should generate CSG statistics reports. For more information, see the description of the mwtm statrep [ggsn noggsn] command in mwtm statrep, page B-76 .
Custom Age	Indicates the maximum number of days the MWTM should archive custom network statistics reports. For more information, see the description of the mwtm statrep custage and mwtm repcustage commands in mwtm statrep, page B-76 .
Daily Age	Indicates the maximum number of days the MWTM should archive daily network statistics reports. For more information, see the description of the mwtm statrep dailyage and mwtm repdailyage commands in mwtm statrep, page B-76 .
DiskCheck	Indicates whether the MWTM should verify that a disk has at least 10 MB of space remaining before enabling network statistics reports. For more information, see the description of the mwtm statrep [diskcheck nodiskcheck] command in mwtm statrep, page B-76 .
EPCReports	Indicates whether the MWTM should generate EPC reports. For more information, see the description of the mwtm statrep [epc noepc] command in mwtm statrep, page B-76 .

Column	Description
ExportReports	Indicates whether the MWTM should generate network statistics reports in export format. For more information, see the description of the mwtm statreps [export noexport] command in mwtm statreps, page B-76 .
GGSNReports	Indicates whether the MWTM should generate GGSN statistics reports. For more information, see the description of the mwtm statreps [ggsn noggsn] command in mwtm statreps, page B-76 .
GTPReports	Indicates whether the MWTM should generate GTP reports. For more information, see the description of the mwtm statreps [gtp nogtp] command in mwtm statreps, page B-76 .
GTTRatesReports	Indicates whether the MWTM should generate GTT Rates statistics reports. For more information, see the description of the mwtm statreps [gttrates nogttrates] command in mwtm statreps, page B-76 .
GTTReports	Indicates whether the MWTM should generate GTT accounting statistics reports. For more information, see the description of the mwtm statreps [gtt nogtt] command in mwtm statreps, page B-76 .
HAReports	Indicates whether the MWTM should generate HA statistics reports. For more information, see the description of the mwtm statreps [ha noha] command in mwtm statreps, page B-76 .
Hourly Age	Indicates the maximum number of days the MWTM should archive hourly network statistics reports. For more information, see the description of the mwtm statreps hourlyage and mwtm rephourlyage commands in mwtm statreps, page B-76 .
InterfaceReports	Indicates whether the MWTM should generate interface reports. For more information, see the description of the mwtm statreps [interface nointerface] command in mwtm statreps, page B-76 .
IPLinks	<i>For ITP link and linkset reports only.</i> Indicates whether the MWTM should include links that use the Stream Control Transmission Protocol (SCTP) IP transport protocol in network statistics reports. For more information, see the description of the mwtm statreps [iplinks noiplinks] command in mwtm statreps, page B-76 .
IpLocalPoolReports	Indicates whether the MWTM should generate IP Local Pool statistics reports. For more information, see the description of the mwtm statreps [iplocalpool noiplocalpool] command in mwtm statreps, page B-76 .
LinkReports	Reports of ITP link and linkset statistics.
Max CSV Rows	Indicates the maximum number of rows the MWTM should include in export CSV files. For more information, see the description of the mwtm statreps maxcsvrows command in mwtm statreps, page B-76 .
MEMReports	Indicates whether the MWTM should generate Memory statistics reports. For more information, see the description of the mwtm statreps [mem nomem] command in mwtm statreps, page B-76 .
MLRReports	Indicates whether the MWTM should generate MLR statistics reports. For more information, see the description of the mwtm statreps [mlr nomlr] command in mwtm statreps, page B-76 .

Column	Description
MSUReports	Indicates whether the MWTM should generate MSU rates reports. For more information, see the description of the mwtm statreps [msu nomsu] command in mwtm statreps, page B-76 .
NullCaps	Indicates whether the MWTM should include SCTP links that do not have planned send and receive capacities in network statistics reports. For more information, see the description of the mwtm statreps [nullcaps nonullcaps] command in mwtm statreps, page B-76 .
PDSNReports	Indicates whether the MWTM should generate PDSN statistics reports. For more information, see the description of the mwtm statreps [pdsn nopdsn] command in mwtm statreps, page B-76 .
PWE3Reports	Indicates whether the MWTM should generate PWE3 statistics reports. For more information, see the description of the mwtm statreps [pwe3 nopwe3] command in mwtm statreps, page B-76 .
QOSReports	Indicates whether the MWTM should generate QOS statistics reports. For more information, see the description of the mwtm statreps [qos noqos] command in mwtm statreps, page B-76 .
Q752Reports	Indicates whether the MWTM should generate Q752 reports. For more information, see the description of the mwtm statreps [q752 noq752] command in mwtm statreps, page B-76 .
RANOREports	Indicates whether the MWTM should generate RANO statistics reports. For more information, see the description of the mwtm statreps [rano norano] command in mwtm statreps, page B-76 .
Report Dir	Path and name of the directory in which the MWTM stores reports. The default reports directory is <code>/opt/CSCOSgm/reports</code> , but you can change the reports directory using the mwtm repdir command (see mwtm repdir, page B-55).
SCTPReports	Indicates whether the MWTM should generate SCTP statistics reports. For more information, see the description of the mwtm statreps [sctp nosctp] command in mwtm statreps, page B-76 .
ServRatio	<i>For ITP link and linkset reports only.</i> In-Service values that are outside a normal range are indicated with a red status ball icon in the In-Service cell. An In-Service value is outside the normal range if the following condition is met: Current In-Service < factor * Long-Term In-Service This inequality is used to recognize drops in the In-Service value. Assuming the default factor of 0.95, the Current In-Service value must be greater than or equal to 95% of the Long-Term In-Service value to be in the normal range. For more information, see the description of the mwtm statreps servratio command in mwtm statreps, page B-76.
SLBReports	Indicates whether the MWTM should generate SLB statistics reports. For more information, see the description of the mwtm statreps [slb noslb] command in mwtm statreps, page B-76 .
Status	Indicates whether the MWTM should generate network statistics reports. For more information, see the description of the mwtm statreps [disable enable] command in mwtm statreps, page B-76 .

Column	Description
TimeMode	Indicates the time mode for dates in network statistics reports. For more information, see the description of the mwtm statreps timemode [12 24] command in mwtm statreps, page B-76 .
Timer files	Indicates timer activities during the last report run by the MWTM. The timer file is useful for identifying how much time the MWTM spends gathering report data and generating reports.
UtilRatio	<i>For ITP link and linkset reports only.</i> Values that are outside a normal range are indicated with a red status ball icon in the Send or Receive cell. A value is outside the normal range if the following condition is met: $\text{Current} > \text{factor} * \text{Long-Term}$ This inequality is used to recognize increases in the value. Assuming the default factor of 1.5, the Current value must be less than or equal to 150% of the Long-Term value to be in the normal range. The default value for <i>factor</i> is 1.5. For more information, see the description of the mwtm statreps utilratio command in mwtm statreps, page B-76.
Web Names	Indicates whether the MWTM should show real node names or display names in web pages. For more information, see the description of the mwtm webnames [display real] command in the mwtm webnames, page B-94 .
Web Util	<i>For ITP link and linkset reports only.</i> Indicates whether the MWTM should display send and receive for linksets and links as percentages or in Erlangs (E), in web pages. For more information, see the description of the mwtm webutil [percent erlangs] command in mwtm who, page B-95 .
XUARports	Indicates whether the MWTM should generate accounting statistics reports for application servers and application server processes. For more information, see the description of the mwtm statreps [xua noxua] command in mwtm statreps, page B-76 .

Viewing Graph Series Editor Details

The Graph Series Editor window allows you to select data series to show or hide. This window box is available when you select the report output as *Graph*. Most network-level reports contain more than 12 series.

The Graph Series Editor window contains:

Column or Buttons	Description
Selected Series	Displays the FQDN IDs for the data that is used to create the report.
Available Series	Displays the list of available objects for this report. Note If there are many objects in the report, the objects in the Available Series column span multiple pages and not all objects are shown on one page. See Using the Toolbar, page 11-6 for more information on using the paging features. To view all selected objects, sort the table by the Display column.
Display Note Depending on the report type you select, other columns displayed will differ.	Column of check boxes that allow you to display (by checking) or hide (by unchecking) the data series associated with the chosen backhaul. The MWTM displays no more than 12 series by default. You can change this setting for the MWTM Client Display or the MWTM Web Display: MWTM Client Display To change the maximum number of data series that the MWTM client interface displays by default, edit the MAX_CHART_SERIES parameter in the client-side <i>System.properties</i> file: - For the Windows client: <i>C:\Program Files\Cisco Systems\MWTM Client\properties\System.properties</i> - For Solaris or Linux client: <i>/opt/CSCOsgmClient/System.properties</i>  Caution Depending on the processing power and memory of your client system, setting the MAX_CHART_SERIES parameter too high can cause the client display to become unresponsive. If the client becomes unresponsive, set the MAX_CHART_SERIES to a lower value. Remember to restart the client to activate the new MAX_CHART_SERIES value. MWTM Web Display To change the maximum number of data series that the MWTM web interface displays by default, edit the MAX_CHART_SERIES parameter in the server-side <i>System.properties</i> file: <i>/opt/CSCOsgm/properties/System.properties</i>.  Caution Depending on the number of shorthauls that you display, setting the MAX_CHART_SERIES parameter too high can cause the web display to become unresponsive. If the web become unresponsive, set the MAX_CHART_SERIES to a lower value. Remember to restart the client to activate the new MAX_CHART_SERIES value.
Clear Selection	Deselects the selected list of series and then the OK button is grayed out. This is a simple way to deselect all the display check boxes.
OK	Applies the selections you made. If you deselect all items in the dialog box, the OK and Clear Selection buttons are grayed out.
Cancel	Cancels your selections and closes the Graph Series Editor window.
Help	Opens the help system for the Graph Series Editor window.

Locating Stored Reports

The MWTM stores all reports in the report files directory on the */reports* directory. If you installed the MWTM in:

- The default directory, */opt*, then the default report files directory is */opt/CSCOsgm/reports*.
- A different directory or used the **mwtm repdir** command to specify a new directory in which the MWTM should store report files, then the default report files directory resides in that directory.

Note

For details on changing the default reports directory by using the **mwtm repdir** command, see [Changing the MWTM Reports Directory, page 13-253](#).

The */reports* directory contains these subdirectories:

Subdirectory	Description
<i>/custom</i>	Contains all custom report files. These are the report files that you generate using these commands: mwtm accstats , mwtm gttstats , mwtm linkstats , mwtm mlrstats , mwtm mtpevents , mwtm q752stats , and mwtm xuastats Note A unique ID tag, specified when you enter the command, identifies each file. If the user does not specify an ID tag, the MWTM uses the process ID of the command.
<i>/etc</i>	Contains additional files that the MWTM reporting scripts and web pages use, including the <i>nodes.include</i> , <i>linksets.include</i> , <i>nodes.exclude</i> , <i>linksets.exclude</i> and <i>filter.include</i> files, if they exist.
<i>/export15min</i>	Contains all 15 minute report files exported in <i>csv.zip</i> format.
<i>/exportdaily</i>	Contains all daily report files exported in <i>csv.zip</i> format.
<i>/exporthourly</i>	Contains all hourly report files exported in <i>csv.zip</i> format.
<i>/exportmonthly</i>	Contains all monthly report files exported in <i>csv.zip</i> format.
<i>/exportrolling</i>	Contains all rolling report files for these statistics: • Application server • Application server process • Link • Linkset Files are edited and formatted for export and stored as <i>.zip</i> files in CSV format. The MWTM rebuilds the files in this subdirectory every hour.

Changing the MWTM Reports Directory

On the server, you can change the directory in which the MWTM stores reports.

To change the MWTM report files directory, log in as the root user, as described in [Starting the MWTM Client, page 3-3](#); or, as a superuser, as described in [Specifying a Super User \(Server Only\), page 2-19](#), and enter:

```
# cd /opt/CSCOsgm/bin
```

```
# ./mwtm repdir directory
```

where *directory* is the new directory.

**Note**

This command copies all files in the current directory to the new directory. If you log in as the superuser and you do not own the new directory, you might not be able to copy the files. In that case, you must specify a directory that you own or log in as the root user.

Customizing ITP Reports

The following sections include information about generating and modifying ITP reports:

- [Generating Custom ITP Statistics Reports Using the CLI, page 13-254](#)
- [Including or Excluding Specified Objects in ITP Reports, page 13-256](#)

Generating Custom ITP Statistics Reports Using the CLI

In the MWTM, you can use custom ITP CLI commands to create summary reports of custom ITP statistics and open them as an export file. To create a custom report:

- Step 1** Log in as the root user, as described in [Starting the MWTM Client, page 3-3](#), or as a superuser, as described in [Specifying a Super User \(Server Only\), page 2-19](#).
- Step 2** Enter:
- ```
cd /opt/CSC0sgm/bin
```
- Step 3** Based on the type of custom report you want to generate, enter one of these commands to enable the report:

**Note**

For complete information about these commands, see [Appendix B, “Command Reference.”](#)

**Table 13-1** Custom Report Commands

| Custom Report                                                         | Command        |
|-----------------------------------------------------------------------|----------------|
| Application server and application server processes custom statistics | mwtm xuastats  |
| GTT accounting statistics                                             | mwtm gttstats  |
| Link and linkset summary                                              | mwtm linkstats |
| MLR statistics                                                        | mwtm mlrstats  |
| MTP3 accounting statistics                                            | mwtm accstats  |
| MTP3 event summary                                                    | mwtm mtpevents |
| Q.752 statistics                                                      | mwtm q752stats |

For example, if you entered the command:

```
./mwtm accstats mwtm-2600a.cisco.com test1
```

where *test1* is name tag added to the file name to make it easier to find the report.

The MWTM generates these reports:

```
mwtmAccStats.custom.test1.2004-02-13:15.csv.zip
mwtmAccStats.custom.test1.2004-02-13:15.csv.zip
```

To generate a report for all nodes, do not specify a node name as shown in the following example:

```
./mwtm accstats
```

**Step 4** (Optional) To include or exclude specific nodes, signaling points or linksets in the report, see [NoteThe MWTM processes the include files first, then the exclude files., page 13-256](#).

**Step 5** (First-time users only) If this is your first time using the **mwtm accstats**, **mwtm gttstats**, **mwtm mlrstats**, **mwtm mtpevents**, **mwtm q752stats**, or **mwtm xuastats** command to generate a custom ITP report, you must enter the command one more time. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the data being collected appears valid, begins generating the report.

or

If this is your first time using the **mwtm linkstats** command to generate a custom ITP report, you must enter the command two more times. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful link and linkset statistics.
- Third entry continues to calculate statistics, calculates long-term averages, and, if the data being collected appears to be valid, begins generating the report.

Thereafter, you need only enter these commands once to generate the ITP custom report.

**Step 6** (Optional) You can automate custom ITP report generation using crontab. For example, to run custom MTP3 accounting statistics every 30 minutes, enter:

```
00, 30 * * * * /opt/CSCOsrgm/bin/mwtm accstats quiet
```

or, to run custom link statistics every 15 minutes, enter:

```
00,15,30,45 * * * * /opt/CSCOsrgm/bin/mwtm linkstats quiet
```

**Step 7** You can view custom ITP reports on the MWTM Web interface under **File Archive > Reports > Custom**. Click on the respective link in the View column to see the data in HTML, or click on a *.zip* file to see the data in *.csv* format.

**Note** You can only view Q752 reports in *.csv* format.

The MWTM also stores custom reports in the */custom* directory (for details, see [Locating Stored Reports, page 13-253](#).)

## Including or Excluding Specified Objects in ITP Reports

You can include or exclude specific nodes, signaling points, or linksets in ITP reports by creating user-defined files. The nodes, signaling points, and/or linksets that you specify in these files will be included or excluded from enabled MWTM statistics reports and in custom reports enabled with the **default** keyword (or no *node-list* keyword at all), which include:

| Command        | Filename <sup>1</sup>                                  |
|----------------|--------------------------------------------------------|
| mwtm linkstats | nodes.include.linkstats or nodes.include               |
|                | nodes.exclude.linkstats or nodes.exclude               |
|                | linksets.include.linkstats or linkstats.include        |
|                | linksets.exclude.linkstats or linkstats.exclude        |
| mwtm q752stats | nodes.include.q752stats or nodes.include               |
|                | nodes.exclude.q752stats or nodes.exclude               |
|                | linksets.include.q752stats or linkstats.include        |
|                | linksets.exclude.q752stats or linkstats.exclude        |
| mwtm accstats  | nodes.include.accstats or nodes.include                |
|                | nodes.exclude.accstats or nodes.exclude                |
|                | linksets.include.accstats or linkstats.include         |
|                | linksets.exclude.accstats or linkstats.exclude         |
|                | filter.include.accstats or filter.include <sup>2</sup> |
| mwtm gttstats  | nodes.include.gttstats or nodes.include                |
|                | nodes.exclude.gttstats or nodes.exclude                |
|                | linksets.include.gttstats or linkstats.include         |
|                | linksets.exclude.gttstats or linkstats.exclude         |
|                | filter.include.gttstats or filter.include <sup>3</sup> |
| mwtm mtpevents | nodes.include.mtpevents or nodes.include               |
|                | nodes.exclude.mtpevents or nodes.exclude               |
| mwtm mlrstats  | nodes.include.mlrstats or nodes.include                |
|                | nodes.exclude.mlrstats or nodes.exclude                |
| mwtm xuastats  | nodes.include.xuastats or nodes.include                |
|                | nodes.exclude.xuastats or nodes.exclude                |

1. Files on the command line override system files. For example, nodes.include.accstats overrides nodes.include.
2. Format is opc:dpc (originating point code and destination point code).
3. Format is gta:sel (global title address and selector).

### Note

The MWTM processes the include files first, then the exclude files.

When creating user-defined files, remember that if you installed the MWTM in:

- The default directory, */opt*, then the user-defined file resides in */opt/CSCOsrgm/reports/etc/<user-defined file>*.  
A different directory, or if you moved the report files directory using the **mwtm repdir** command, then the */reports/etc/<user-defined file>* resides in that directory.
- Wildcard matching is not supported.
- If a node, signaling point, or linkset appears in both the *include* file and the *exclude* file, it is excluded. That is, excluding an object overrides including the same object.
- If you specify a special *include* file on the **mwtm accstats**, **mwtm gttstats**, **mwtm linkstats**, **mwtm mlrstats**, **mwtm mtpevents**, **mwtm q752stats**, or **mwtm xuastats** command, the MWTM ignores the *include* or *exclude* file.

When creating a *nodes.include* or *nodes.exclude* file:

Each line in the file must contain a single node name, or node name and signaling point name, separated by a colon (:) that matches exactly the real, fully qualified name of the node; for example:

```
mwtm-75-59a.cisco.com
mwtm-26-51a.cisco.com
```

To include a specific signaling point, specify the node name and signaling point:

```
mwtm-75-59a.cisco.com;net0
mwtm-26-51a.cisco.com;net0
```

When creating a *linksets.include* or *linksets.exclude* file:

Each line in the file must contain a single linkset name that matches exactly the real, fully qualified linkset name of the linkset, including the node name and signaling point name; for example:

```
mwtm-75-59a.cisco.com;net0:linkset2
mwtm-26-51a.cisco.com;net0:linkset1
```

When creating a *filter.include* file:

Each line in the file must contain a single originating point code and destination point code (for accounting statistics) that matches the current point code format; or a single phone number and selector name (for GTT statistics); for example:

```
1.2.3:5.6.7
8882214040:Selector_1
```

# CHAPTER 14

## Editing an ITP Route Table File

---

Cisco IP Transfer Points (ITPs) use a route table to select the appropriate signaling path for each message, or signal unit, that it must forward. The route table provides the destination point code of the packet and the linkset name that it uses to forward the packet.

**Note**

---

ITP route tables do not support Virtual linksets, and the Cisco Mobile Wireless Transport Manager (MWTM) does not display Virtual linksets in the Route Table dialog box.

---

This chapter contains:

- [Editing an MWTM ITP Route Table File, page 14-1](#)
- [Editing a Non-MWTM ITP Route Table, page 14-14](#)

## Editing an MWTM ITP Route Table File

You use the MWTM to edit ITP route table files for an ITP.

To edit a route table file by using the MWTM, open the route table file by using one of these procedures:

- [Opening a Route Table File from a File, page 14-2](#)
- [Opening a Route Table File from a Node, page 14-3](#)
- [Opening a Route Table File from an Archive, page 14-4](#)
- [Editing ITP Route Tables, page 14-5](#)
- [Loading an Existing Route Table File, page 14-11](#)
- [Deploying a Route Table File, page 14-12](#)
- [Saving a Route Table File, page 14-12](#)
- [Reverting to the Last Saved Route Table File, page 14-14](#)

## Opening a Route Table File from a File

To open a route table file from a file, choose **Tools > Route Table Editor > From File** from the MWTM main menu, select the name of a route table file, then click **OK**.

**Note** When you open a route table from a file or archive, the MWTM preserves the order of entries that have the same Destination Point Code, Mask, and Cost.

If the chosen route table file contains incorrect linkset entries (for example, if your network configuration changed since the last time the route table file was saved), the Replace Linkset dialog box appears.

You can use the Replace Linkset dialog box to quickly replace incorrect linkset entries in route table files when your network configuration changes.

| Field or Button                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Linksets That Are No Longer Valid          | Indicates the incorrect linksets in the route table file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Auto Replace with Linkset                  | Replaces the highlighted incorrect linkset with a correct linkset, chosen from the drop-down list box, in all affected entries in the route table file.<br><br>To replace an incorrect linkset with a correct linkset, select an incorrect linkset in the Linksets That Are No Longer Valid table, then select a correct linkset from the Auto Replace with Linkset drop-down list box, then click <b>Apply</b> . The MWTM automatically replaces the incorrect linkset with the chosen correct linkset in all affected entries in the route table file. |
| Remove Entries Containing Selected Linkset | Removes all entries that contain the highlighted incorrect linkset from the route table file.<br><br>To remove all entries that contain an incorrect linkset from the route table file, select an incorrect linkset in the Linksets That Are No Longer Valid table, then check the Remove Entries Containing Selected Linkset check box, then click <b>Apply</b> . The MWTM automatically removes all entries that contain the incorrect linkset from the route table file.                                                                              |
| Apply                                      | Applies any changes you made to the route table file and closes the Replace Linkset dialog box. When you have corrected all incorrect linkset entries in the route table file, the <b>Apply</b> button becomes the <b>Done</b> button.                                                                                                                                                                                                                                                                                                                   |
| Done                                       | Closes the Replace Linkset dialog box and opens the Route Table dialog box.<br><br>When you have corrected all incorrect linksets in the route table file, click <b>Done</b> . The Route Table dialog box appears.                                                                                                                                                                                                                                                                                                                                       |
| Cancel                                     | Closes the Replace Linkset dialog box without saving any changes to the route table file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Help                                       | Shows online help for the current window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

If the chosen route table file does not contain any incorrect linkset entries, the MWTM skips the Replace Linkset dialog box and the Route Table dialog box appears.

[Editing ITP Route Tables, page 14-5.](#)

## Opening a Route Table File from a Node

To open a route table file from a node, use one of these procedures:

- Select a network object in a window, then choose **Tools > Route Table Editor > From Node** from the MWTM main menu. (If you select an Unmanaged node, this option is dimmed and cannot be chosen.)
- Right-click a signaling point in a window, then choose **Edit > Route Table** from the right-click menu. (If you select an Unmanaged signaling point, this option is dimmed and cannot be chosen.)

**Note**

When you open a route table from a node, the MWTM cannot preserve the order of entries that have the same Destination Point Code, Mask, and Cost. Instead, the MWTM loads the entries based on the Destination Linkset. If you need to preserve the order of entries that have the same Destination Point Code, Mask, and Cost, right-click one of the entries and select **Move Up** or **Move Down** to move the entry up or down in the route table. The MWTM preserves the new order of the entries when you save the route table.

If more than one signaling point is associated with the node, the Choose Signaling Point dialog box appears, which you use to select the signaling point whose route table you want to edit.

| Field or Button      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signaling Point List | Drop-down list box of signaling points. Select the signaling point with the point code, variant, and network name that matches the route table file you want to edit. If you select a signaling point that has the: <ul style="list-style-type: none"> <li>• Wrong variant, the MWTM shows the message:<br/>Point code out of range.</li> <li>• Correct variant but the wrong instance, the Replace Linkset dialog box appears, prompting you to replace or remove most or all of the linksets.</li> </ul> |
| OK                   | Opens the route table associated with the chosen signaling point.<br><br>The MWTM reads the active route table from the node and shows it in the Route Table dialog box                                                                                                                                                                                                                                                                                                                                    |
| Cancel               | Closes the Choose Signaling Point dialog box without selecting a signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Help                 | Shows online help for the Choose Signaling Point dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Opening a Route Table File from an Archive

To open a route table file from an archive, use one of these procedures:

- Select a network object in a window, then choose **Tools > Route Table Editor > From Archive** from the MWTM main menu. (If you select an **Unmanaged** node, this option is dimmed and cannot be chosen.)
- From the Route Table dialog box, choose **File > Load from Archive**.
- From the Archive Management window, select a route table file from the list, then choose **File > Open File**.

**Note** When you open a route table from a file or archive, the MWTM preserves the order of entries that have the same Destination Point Code, Mask, and Cost.

The Load Route Table from Archive wizard appears. If more than one signaling point is associated with the node, the Select Node/SP dialog box appears, which you use to select the node and signaling point whose route table you want to edit.

The left pane of the Load Route Table from Archive wizard contains:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Node/SP  | <p>You can select the signaling point from which the route table file should be loaded. You can optionally check the <b>Filter by Node</b> check box, which limits signaling point selection to a specific node.</p> <p>Select a signaling point and node (optional) from the drop-down list boxes in the right pane. The MWTM retrieves route table filenames from the chosen signaling point.</p> <p>If no route table filenames are available, the process ends with errors. If route table filenames are available, the MWTM proceeds directly to the <b>Select Version</b> step.</p> |
| Select Version  | <p>You can select the version you want to load. Click a version to highlight it, then select <b>Next</b>. The table includes:</p> <ul style="list-style-type: none"><li>• <b>Rev</b>—Revision number.</li><li>• <b>Date</b>—Date and time the version was created.</li><li>• <b>Comments</b>—Provided at the time of creation, if applicable.</li><li>• <b>Author</b>—Initiator of the comments.</li></ul>                                                                                                                                                                                |
| Load            | Loads the chosen file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Next>           | Advances to the next step in the Deployment wizard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Cancel          | Closes the wizard without loading a file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Help            | Shows online help for the Load Route Table from Archive wizard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Editing ITP Route Tables

You use the MWTM to edit ITP route tables for an ITP. ITP uses route tables to locate a destination linkset for a packet whose destination point code does not match the ITP's local point code.

The Route Table dialog box appears when you open a route table from one of these objects:

- **File**—See [Opening a Route Table File from a File, page 14-2](#)
- **ITP**—See [Opening a Route Table File from a Node, page 14-3](#)
- **Archive**—See [Opening a Route Table File from an Archive, page 14-4](#)

The Route Table dialog box appears, which contains

- [Route Table Dialog Menu, page 14-6](#)
- [Route Table Dialog Right-Click Menu, page 14-7](#)
- [Route Table, page 14-7](#)

## Route Table Dialog Menu

The menu on the Route Table dialog box contains:

| Menu Command                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Load from Archive (Ctrl-H)         | Opens the Load Route Table from Archive wizard, which you use to load an archived route table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| File > Load from File (Ctrl-L)            | Opens the Load File dialog, which you use to load an already existing route table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| File > Load from Signaling Point (Ctrl-F) | Opens the Choose Signaling Point dialog box, which you use to select the signaling point whose route table you want to edit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| File > Revert (Ctrl-R)                    | Reverts to the last saved version of the route table file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| File > Save to File (Ctrl-S)              | <p>Saves changes you made to the route table. If you are editing a route table from:</p> <ul style="list-style-type: none"> <li>An ITP (that is, if you chose <b>Tools &gt; Route Table Editor &gt; From ITP</b> from the MWTM main menu), the default filename is the name of the signaling point.</li> <li>A file (that is, if you chose <b>Tools &gt; Route Table Editor &gt; From File</b> from the MWTM main menu), the default filename is the name of the file that you are currently editing.</li> </ul> <p>The MWTM stores the modified route table file in the route table directory on the MWTM server. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>The default directory, <i>/opt</i>, then the MWTM route table directory is <i>/opt/CSCOs-gm/routes</i>.</li> <li>A different directory, then the MWTM route table directory resides in that directory.</li> </ul> |
| File > Save As                            | Opens the Save File dialog: Route Table file list, which you use to save the route table file with a new name, or overwrite an existing route table file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| File > Print (Ctrl-P)                     | <p>Opens the Print window where you can:</p> <ul style="list-style-type: none"> <li>Specify options for printing.</li> <li>Print the current window.</li> <li>Save the current window to a file.</li> </ul> <p>The MWTM printing options require that you define a printer on your system. If you click <b>Print</b> and the Print window does not appear, ensure that you defined a printer on your system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| File > Find (Ctrl-F)                      | Opens the Find dialog box, which you use to find a specific character string in the window (see <a href="#">Finding Information in a Window, page 5-22</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| File > Deploy (Ctrl-Y)                    | Opens the Deployment wizard, which you use to validate a route table file, upload it to an ITP, and activate it on the ITP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Menu Command                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Close<br>(Ctrl-W)    | Closes the Route Table dialog box. If you made any changes, the MWTM asks if you want to apply the changes before leaving the window. Click: <ul style="list-style-type: none"> <li>• <b>Yes</b> to apply the changes and close the prompt window and the Route Table dialog box.</li> <li>• <b>No</b> to close the prompt window and the Route Table dialog box without applying or saving any changes.</li> <li>• <b>Cancel</b> to close the prompt window without applying any changes. The Route Table dialog box remains open.</li> </ul> |
| Help > Topics<br>(F1)       | Shows the table of contents for the MWTM online help.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Help > Window<br>(Shift-F1) | Shows online help for the current window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Help > About<br>(F3)        | Shows build date, version, SSL support, and copyright information about the MWTM application.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Route Table Dialog Right-Click Menu

The right-click menu on the Route Table dialog box contains:

| Menu Command | Description                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| Move Up      | Moves the chosen entry up in the route table. The MWTM preserves the new order of the entries when you save the route table.   |
| Move Down    | Moves the chosen entry down in the route table. The MWTM preserves the new order of the entries when you save the route table. |

### Note

The only entries that you can move up or down in the route table are adjacent entries that have the same **Destination Point Code, Mask, and Cost**.

## Route Table

The route table lists destination point codes and associated destination linkset names, as well as other important information used to route packets on a node.

Press **Enter** to move down to the next row in the route table; press **Tab** to move to the next field.

You can resize each column in the route table, but you cannot sort the table based on the information in one of the columns (see [Navigating Table Columns, page 5-23](#)).

| Column or Button       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Row Num                | <p>Unique number identifying each entry in the route table. You cannot edit this field, but the number might change as you add entries to or delete entries from the route table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Destination Point Code | <p>Destination point code for packets on the chosen node. The destination point code is the point code to which a given packet is routed. To edit the destination point code, enter the new code in this field.</p> <p>If you enter a new destination point code that is less restrictive than the mask, the MWTM shows a message to that effect at the bottom of the Route Table dialog box, and performs one of these actions. If you:</p> <ul style="list-style-type: none"> <li>Modified an existing point code, the MWTM restores the previous point code.</li> <li>Entered an entirely new point code, the MWTM leaves this field blank.</li> </ul> <p>For example, a destination point code of <b>7.7.7</b>, which specifies 14 bits, is less restrictive than a mask of <b>7.255.0</b>, which specifies only 11 bits. The MWTM ignores the extra bits in the last digit of the destination point code and converts it to <b>7.7.0</b>.</p> <p>To add a new route to the route table, select the Destination Point Code field in a blank row, then fill in the field with the destination point code for the new route. When you move the cursor to another field in the row, the MWTM automatically populates the rest of the fields with the default values for those fields.</p> <p><b>Note</b> You can prevent the MWTM from automatically populating the fields with default values (see <a href="#">mwtm routetabledefs</a>, page B-124).</p> <p>You can specify the point code mask when you enter a destination point code. To do so, enter the destination point code, then a slash (/), then the number of bits in the mask. For example, if you specify <b>7.255.6/14</b>, the MWTM shows <b>7.255.7</b> in the Destination Point Code field and <b>7.255.7</b> (or <b>14</b>) in the Mask field.</p> |

| Column or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Mask             | <p>Mask specifying the significant bits of the point code.</p> <p>The MWTM can display point code masks in dotted-decimal format (the default setting) or as a number of bits (see <a href="#">General Display Settings, page 5-4</a>). For:</p> <ul style="list-style-type: none"> <li>ANSI and China standard networks using the default 24-bit point code format, the default mask is <b>255.255.255</b> (or <b>24</b>).</li> </ul> <p>If the Destination Point Code is a network route with the format <b>x.x.0</b>, the default mask is <b>255.255.0</b> (or <b>16</b>).</p> <p>If the Destination Point Code is a cluster route with the format <b>x.0.0</b>, the default mask is <b>255.0.0</b> (or <b>8</b>).</p> <ul style="list-style-type: none"> <li>ITU networks using the default 14-bit point code format, the default mask is <b>7.255.7</b> (or <b>14</b>).</li> </ul> <p>If the Destination Point Code is a network route with the format <b>x.x.0</b>, the default mask is <b>7.255.0</b> (or <b>11</b>).</p> <p>If the Destination Point Code is a cluster route with the format <b>x.0.0</b>, the default mask is <b>7.0.0</b> (or <b>3</b>).</p> <ul style="list-style-type: none"> <li>NTT and TTC networks using the default 16-bit point code format, the default mask is <b>31.15.127</b> (or <b>16</b>).</li> </ul> <p>If the Destination Point Code is a network route with the format <b>x.x.0</b>, the default mask is <b>31.15.0</b> (or <b>9</b>).</p> <p>If the Destination Point Code is a cluster route with the format <b>x.0.0</b>, the default mask is <b>31.0.0</b> (or <b>5</b>).</p> <p>To edit the mask, make the changes in this field.</p> |

| Column or Button    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mask<br>(continued) | <p>If you enter a new mask, the binary conversion of the mask cannot contain ones (1) to the right of zeros (0). For example:</p> <ul style="list-style-type: none"> <li>• <b>7.255.7</b> is a valid mask because it converts to binary <b>111.11111111.111</b>.</li> <li>• <b>7.255.1</b> is <i>not</i> a valid mask because it converts to binary <b>111.11111111.001</b>.</li> </ul> <p>If you enter an invalid mask, such as <b>7.255.1</b>, a message appears to that effect at the bottom of the Route Table dialog box, and performs one of these actions. If you:</p> <ul style="list-style-type: none"> <li>• Modified an existing mask, the MWTM restores the previous mask.</li> <li>• Entered an entirely new mask, the MWTM leaves this field blank.</li> </ul> <p>If you enter a new mask that is more restrictive than the destination point code, the MWTM asks if you want to adjust the point code automatically based on the new mask. Click:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b> if you want to adjust the point code. For example, if the point code is <b>7.7.7</b>, and you enter the new mask <b>7.255.0</b>, the MWTM automatically adjusts the point code to <b>7.7.0</b>.</li> <li>• <b>No</b> if you do not want to adjust the point code. If you: <ul style="list-style-type: none"> <li>– Modified an existing mask, the MWTM restores the previous mask.</li> <li>– Entered an entirely new mask, the MWTM leaves this field blank.</li> </ul> </li> </ul> <p>If the MWTM is displaying point code masks in dotted-decimal format and you enter a number of bits, the MWTM automatically converts the number of bits to dotted-decimal format. For example, if you enter <b>24</b>, the MWTM automatically converts the mask to <b>255.255.255</b>.</p> <p>If the MWTM is displaying point code masks in bits format and you enter a mask in dotted-decimal format, the MWTM automatically converts the mask to a number of bits. For example, if you enter <b>255.255.255</b>, the MWTM automatically converts the mask to <b>24</b>.</p> |
| Cost                | <p>Cost of the route to the destination, relative to other routes. Select a cost from the drop-down list box. The valid costs range from <b>1</b> (lowest cost and highest priority) through <b>9</b> (highest cost and lowest priority).</p> <p><b>Note</b> If you configure two routes to the same node and do not specify a cost for one of them, then the cost for that node defaults automatically to <b>5</b>. The default cost appears here in the Cost column, and in the output of the <b>show cs7 route</b> command.</p> <p>Similarly, if you add a new line to this table and leave the Cost column blank, the MWTM automatically enters a default cost of <b>5</b>.</p> <p>Linksets with the same cost form a combined linkset. Do not specify more than two linksets with the same cost, under the same destination point code and mask.</p> <p>If the Destination Point Code is an adjacent point code, the default Cost is <b>1</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Destination Linkset | <p>Destination linkset associated with the destination point code. The destination linkset is also called the output linkset. To edit the destination linkset, select a destination linkset from the drop-down list box. <b>None</b> is the default setting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Column or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| QoS              | <p>Quality of service (QoS) class of the route, that the network administrator configured. To edit the QoS class of the route, select a QoS class from the drop-down list box. Valid QoS classes range from <b>1</b> through <b>7</b>. Select <b>ALL</b> if you want the route to accept all QoS classes. <b>ALL</b> is the default value.</p> <p>When you change the QoS class for a route, the MWTM automatically changes the QoS classes for all other routes in that route set (that is, all other routes with the same Destination Point Code) to the new class.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Sort Table       | Sorts the entries in the route table field-by-field, beginning with Dest. Point Code, then Mask, Cost, Dest.Linkset, and finally QoS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Add Entry        | Scrolls to a blank row in the route table and selects the Destination Point Code field. Fill in the field with the destination point code for the new route, then fill in the rest of the fields in the row.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Delete Entry     | <p>Deletes one or more chosen rows from the table. The Confirm Deletion dialog box appears. To:</p> <ul style="list-style-type: none"> <li>• Delete the chosen rows, click <b>Yes</b>. The rows are deleted from the table and the Confirm Deletion dialog box closes.</li> <li>• Retain the chosen rows, click <b>No</b>. The rows are kept in the table and the Confirm Deletion dialog box closes.</li> <li>• Prevent MWTM from displaying the Confirm Deletion dialog box, check the <b>Do not show this again</b> check box.</li> </ul> <p><b>Note</b> If you check the <b>Do not show this again</b> check box, and you later decide you want MWTM to begin displaying the Confirm Deletion dialog box again, you must check the <b>Confirm Deletions</b> check box in the General GUI settings in the Preferences window. For more information, see the description of the <b>Confirm Deletions</b> check box in <a href="#">Startup/Exit Settings, page 5-3</a>.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.</p> |

## Loading an Existing Route Table File

You use the MWTM to load a specific route table file and change the list of route table files. To load an existing route table file, use one of these procedures. Choose:

- **File > Load from Archive** from the route table menu. The Load Route Table from Archive wizard appears. For details, see [Opening a Route Table File from an Archive, page 14-4](#).
- **File > Load from Signaling Point** from the route table menu. The Choose Signaling Point dialog box appears. For details, see [Opening a Route Table File from a Node, page 14-3](#). In the Signaling Point List drop-down list box, select the signaling point with the point code, variant, and network name that matches the route table file that you want to edit, then click **OK**. The MWTM reads the active route table from the ITP and shows it in the Route Table dialog box. For details, see [Editing ITP Route Tables, page 14-5](#).
- **File > Load from File** from the route table menu. The Load File dialog: Route Table file list appears.

| Number of Files<br>(visible in bottom left corner) | Total number of route table files and folders.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OK                                                 | Loads the chosen route table file, saves any changes you made to the list of files, and closes the dialog box.<br><br>To load a route table file, double-click it in the list, select it in the list and click <b>OK</b> ; or, enter the name of the file and click <b>OK</b> . The MWTM loads the route table file, saves any changes you made to the list of files, closes the Load File dialog: Route Table file list, and returns to the Route Table dialog box. |
| Delete                                             | Deletes the chosen file from the route table file list. The MWTM issues an informational message containing the name and location of the deleted file.                                                                                                                                                                                                                                                                                                               |
| Cancel                                             | Closes the dialog box without loading a route table file or saving any changes to the route table file list.                                                                                                                                                                                                                                                                                                                                                         |
| Help                                               | Shows online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Deploying a Route Table File

You use the Deployment wizard to validate a route table file, upload it to an ITP, archive the file, and activate it on the ITP. To launch the Deployment wizard for a route table file, choose **File > Deploy** from the route table menu (see [Deploying ITP Files, page 5-33](#)).

## Saving a Route Table File

You use the MWTM to save a specific route table file and change the list of route table files.

Use one of these procedures. To save the changes you made to the route table file:

- Without changing the name of the file, choose **File > Save** from the route table menu.
- With a new name, choose **File > Save As** from the route table menu. The Save File dialog: Route Table file list dialog box appears.

The MWTM stores the modified route table file in the route table file directory on the MWTM server. If you installed the MWTM in:

- The default directory, */opt*, then the MWTM route table file directory is */opt/CSCOs/gm/routes*.
- A different directory, then the MWTM route table file directory resides in that directory.

You can use the **mwtm routedir** command to change the directory in which the MWTM stores ITP route table files (and to enable the TFTP path to deploy a route table; see [mwtm routedir, page B-123](#)).

**Note**

If another user modifies and saves the route table file before you save your changes, the MWTM asks if you want to overwrite that user's changes. If you do, the other user's changes are overwritten and lost. If you do not, your changes are lost, unless you save the route table file to a different filename.

| Name                                               | Name of the route table file or folder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Last Modified                                      | Date and time the route table file or folder was last modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Size (bytes)                                       | Size of the route table file or folder, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Filename                                           | Name by which you want to save the route table file.<br><br>If you create a new route table filename, you can use any letters, numbers, or characters in the name that your operating system allows. However, if you include any spaces in the new name, the MWTM converts those spaces to dashes. For example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Number of Files<br>(visible in bottom left corner) | Total number of route table files and folders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OK                                                 | Saves any changes you made to the route table file being edited and any changes you made to the list of files and closes the dialog box.<br><br>To save the route table file with a new name, use one of these procedures. To save the file with: <ul style="list-style-type: none"> <li>• A completely new name, enter the new name and click <b>OK</b>.</li> <li>• An existing name, overwriting an old route table file, select the name in the list and click <b>OK</b>.</li> </ul> The MWTM saves the route table file with the new name, saves any changes you made to the list of files, closes the Save File dialog: Route Table file list dialog box, and returns to the Route Table dialog box.<br><br>If two or more entries in the route table have the same Destination Point Code, Mask, and Cost, the MWTM preserves the order of the entries when you save the route table. |
| Delete                                             | Deletes the chosen file from the route table file list. The MWTM issues an informational message containing the name and location of the deleted file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Cancel                                             | Closes the dialog box without saving the route table file or saving any changes to the route table file list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Help                                               | Shows online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Reverting to the Last Saved Route Table File

To revert to the last saved version of the route table file, choose **File > Revert** from the route table menu. The MWTM shows the last saved version of the file.

## Editing a Non-MWTM ITP Route Table

You use the MWTM to create and edit ITP route table files for an ITP (see [Editing an MWTM ITP Route Table File, page 14-1](#)).

If you want to edit a route table file that was created with a product other than the MWTM, to ensure that the MWTM can use the file, you must:

- 
- Step 1** Ensure that the route table file uses the MWTM route table file extension, *.rou*.
  - Step 2** Place the route table file in the MWTM route table directory on the MWTM server. If you installed the MWTM in:
    - The default directory, */opt*, then the MWTM route table directory is */opt/CSCOs/gm/routes*.
    - A different directory, then the MWTM route table directory resides in that directory.
  - Step 3** Ensure that the MWTM header lines in the file precede the ITP route table entries. The MWTM header lines use this format:

```
!! Created by MWTM 6.1.2
!! on June 12, 2009 6:42:54 PM
!! Do not edit this file by hand.
!v6.1.0
!ted220dbc4a
!p800:ITU:National:[net0]
```

where:

- Comment lines begin with double exclamation points (!!).
- The version line begins with **!v**. This line indicates the version of MWTM that was used to create the file.
- The timestamp line begins with **!t**. This line indicates the date and time, in hexadecimal, that the file was created.
- The point code line begins with **!p**. This line indicates the point code that the ITP used, in hexadecimal, followed by the point code variant (ANSI, China, ITU, NTT, or TTC), the network indicator (National, NationalSpare, International, or InternationalSpare), and the network name. In this example:

**!p8b0:ITU:National:[net0]**

the point code is **1.22.0**, the point code variant is **ITU**, the network indicator is **National**, and the network name is **net0**.

---

# CHAPTER 15

## Editing an ITP Global Title Translation Table

You can use the Global Title Translation (GTT) Editor of the Cisco Mobile Wireless Transport Manager (MWTM) to configure GTT entries.

A global title is an application address, such as a toll-free telephone number, calling card number, or mobile subscriber identification number. GTT is the process by which the Signaling Connection Control Part (SCCP) translates a global title into the point code and subsystem number (SSN) of the destination service switching point (SSP), where higher-layer protocol processing occurs. GTT entries reside in GTT files, which are comma-separated value (CSV) text files with point codes written in hexadecimal notation.

### Note

The MWTM 6.1.3 supports GTT files with file format versions 3.1, 4.0, 4.1, 4.2, 4.3, 4.4, or 4.5. You can load GTT files that use lower or higher file-format versions; but, fields or features that are unique to the lower or higher version are not visible and they disappear from the GTT file the next time you save the file. The file is saved as a version 3.1 file if the file is lower than version 3.1; or, as a version 4.5 file if the file is higher than version 4.5.

For more detailed information about GTT, including configuration procedures and scenarios, see the IP Transfer Point (ITP) feature module for Cisco IOS software release 12.2(25)SW4 or later.

## Launching the GTT Editor

The MWTM provides you with a GTT Editor to edit GTT files. The GTT Editor runs as a separate application in the MWTM; so, it requires a separate login, just like the MWTM client.

To launch the GTT Editor, use one of these procedures:

- Choose **Tools > Global Title Translator Editor** from the MWTM main menu.
- Enter the **mwtm gttclient** command (see [mwtm gttclient, page B-109](#)).

The Startup Options dialog box appears, which you use to load a specific GTT file or create a new GTT file.

The Startup Options dialog box provides options to load GTT data from:

| Field or Button | Description                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| New File        | Opens the Create New Table dialog box, which you use to create a new GTT file (see <a href="#">Creating a New GTT File, page 15-27</a> ). Create the new GTT file.                                                    |
| File            | Opens the Load File dialog box: GTT File List, which you use to load a specific GTT file and change the list of GTT files (see <a href="#">Loading an Existing GTT File, page 15-28</a> ). Select a GTT file to load. |
| ITP             | Opens the Load GTT from ITP wizard, which you use to choose the node and signaling point whose GTT file you want to edit (see <a href="#">Loading a GTT File from a Node, page 15-30</a> ).                           |
| Archive         | Opens the Load GTT from Archive wizard, which you use to choose the node and signaling point whose GTT file you want to edit (see <a href="#">Loading a GTT File from the Archive, page 15-31</a> ).                  |

When you close the Startup Options dialog box by creating a new GTT file or loading an existing GTT file, the GTT Editor window appears with the Selectors and GTA tab clicked.

The GTT Editor window provides a set of tabs. Each tab contains a series of tables with GTT data. Some of the tables may be blank at first, while others contain rows of data.

In each table, you can edit the values in each row by typing over the current value or selecting a new value from a drop-down list box.

To reset a cell to its previous value, press **Esc**. (If you have edited more than one cell in a row, pressing **Esc** resets all cells in the row.) To save your changes, click outside the row. Once you save your changes, pressing **Esc** does not reset the cells in the row.

To add a row to a table, select the table, then choose **Edit > Add** from the GTT menu or **Add** from the right-click menu.

To delete one or more rows from a table, select the rows, then choose **Edit > Delete** from the GTT menu or **Delete** from the right-click menu (see [Deleting Rows from a Table, page 15-26](#)).

The GTT Editor window contains:

- [GTT Menu, page 15-3](#)
- [GTT Editor: Selectors and GTA Tab, page 15-5](#)
- [GTT Editor: App Group Tab, page 15-9](#)
- [GTT Editor: MAPs Tab, page 15-10](#)
- [GTT Editor: CPC Tab, page 15-11](#)
- [GTT Editor: Address Conversion Tab, page 15-12](#)

## GTT Menu

The menu on the GTT Editor window contains:

| Menu Command                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > New Table<br>(Ctrl-N)             | Opens the Create New Table dialog box.                                                                                                                                                                                                                                                                                                                                                                                         |
| File > Load > Load From Archive (Ctrl-H) | Opens the Load GTT from Archive wizard from which you choose the node and signaling point whose GTT file you want to edit (see <a href="#">Loading a GTT File from the Archive, page 15-31</a> ).<br><br>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.                                                                    |
| File > Load > Load From File (Ctrl-L)    | Loads an already existing GTT file. The MWTM prompts you for the name of the GTT file you want to load: <ul style="list-style-type: none"> <li>• Enter the name of the GTT file; or, choose the file from the list, then click <b>OK</b> to load the GTT file.</li> <li>• Click <b>Cancel</b> to close the prompt window without loading a GTT file.</li> </ul> See <a href="#">Loading an Existing GTT File, page 15-28</a> . |
| File > Load > Load From ITP (Ctrl-T)     | Opens the Load GTT from ITP wizard, which you use to choose the node and signaling point whose GTT file you want to edit (see <a href="#">Loading a GTT File from a Node, page 15-30</a> ).<br><br>If you implement MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.                                                                                 |
| File > Revert (Ctrl-R)                   | Reverts to the last saved version of the GTT file.                                                                                                                                                                                                                                                                                                                                                                             |

| Menu Command                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Save<br>(Ctrl-S)                 | Saves the changes you made to the GTT file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| File > Save As                          | Opens the Save File dialog box: GTT File List, which you use to save the GTT file with a new name or overwrite an existing GTT file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| File > Semantic Check<br>(Ctrl-K)       | Opens the Semantic Check GTT dialog box, which you use to check the semantics of a GTT file against a specific ITP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| File > Deploy<br>(Ctrl-Y)               | Opens the Deployment wizard, which you use to validate a GTT file, upload it to an ITP, and activate it on the ITP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| File > Exit<br>(Ctrl-Q)                 | <p>Closes the GTT Editor window. If you make any changes to the GTT file, the MWTM asks if you want to save the changes before leaving the window. Click:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b> to save the changes.<br/>The MWTM opens the Save File dialog box: GTT File List, which you use to save the GTT file with a new name, or overwrite an existing GTT file.</li> <li>• <b>No</b> to close the prompt window.<br/>The MWTM closes the GTT Editor window without saving any changes to the GTT file.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Edit > Version and Instance<br>(Ctrl-I) | Opens the Edit GTT Table dialog box, which you use to change the variant, version, and instance number of a GTT file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Edit > Add<br>(Ctrl-E)                  | <p>Opens the Add dialog box for the chosen table.</p> <p>For example, if you click the Selector Table, opens the Selector Add dialog box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Edit > Delete<br>(Ctrl-Delete)          | <p>Deletes one or more chosen rows from a GTT table. The Confirm Delete dialog box appears, in which you confirm the deletion. To:</p> <ul style="list-style-type: none"> <li>• Delete the chosen rows, click <b>Yes</b>. The rows disappear from the table and the Confirm Delete dialog box closes.</li> <li>• Retain the chosen rows, click <b>No</b>. The rows remain in the table and the Confirm Delete dialog box closes.</li> </ul> <p>You can select more than one row to delete; but, all chosen rows must reside in the same table. For example, you cannot simultaneously delete rows from the Selector Table and the MAP (mated application) Table.</p> <p>If deleting a row from a table causes one or more rows in the table to remain at the top of the page or the bottom of the next, such that no remaining entries reference the single rows, the MWTM shows the number of single rows and asks whether you also want to delete the single rows. (The MWTM shows the number of rows and not the rows themselves; because, a document could contain thousands of single rows.)</p> |

## GTT Editor: Selectors and GTA Tab

Click the **Selectors and GTA** tab to display data for a specific GTT selector and see the GTA entries for that selector.

A GTT selector defines the parameters that select the translation table that the MWTM uses to translate an SCCP message to its next or final destination.

A Global Title Address (GTA) entry is associated with a selector and defines the result of a translation for a particular address mask. The result of a GTA entry can be a final translation or an intermediate translation.

The GTT Editor: Selectors and GTA tab contains:

- [Selector Table, page 15-6](#)
- [GTA Table, page 15-7](#)
- [App Group Table, page 15-8](#)
- [MAP Table, page 15-9](#)
- [CPC List, page 15-9](#)

When you click the GTT Editor: Selectors and GTA tab, the MWTM might populate the Selector Table and the other tables with data. To populate the:

- Selector Table, right-click in the table and choose **Add**. See [Adding a Selector to a Selector Table, page 15-16](#).
- GTA Table, select a row in the Selector Table. The MWTM populates the GTA Table with all associated GTA entries.

If the GTA Table remains blank, the chosen row has no associated GTA entries. You can also add entries to the GTA Table, by right-clicking in the table and choosing **Add** from the right-click menu (see [Adding a GTA Entry to a GTT, page 15-17](#)).

- App Group Table, select a row in the GTA Table that has an associated Application Group. The MWTM populates the App Group Table with all application group entries for that application group name.

You can also add entries to the App Group Table, by right-clicking in the table and choosing **Add** from the right-click menu (see [Adding an Application Group Entry to an App Group Table, page 15-21](#)).

- MAP Table, select a row in the GTA Table that does not have an associated Application Group. The MWTM populates the MAP Table with all MAP entries that match the chosen row's point code-SSN combination.

To add entries to the MAP Table, right-click in the table and choose **Add** from the right-click menu (see [Adding a MAP Entry to a GTT, page 15-22](#)).

- CPC List, select a row in the MAP Table that has an associated CPC List Name. The MWTM populates the CPC List with all point codes in that CPC list.

To add entries to the CPC List, right-click in the list and choose **Add** from the right-click menu (see [Adding a CPC List to a GTT, page 15-23](#)).

## Selector Table

The Selector Table contains:

| Column                      | Description                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                        | Name of the selector.                                                                                                                                                                                                                                                                                                                                 |
| Translation Type            | Translation type that the selector uses. Valid values are in the range 0 through 255.                                                                                                                                                                                                                                                                 |
| Global Title Indicator      | (China, ITU, NTT, and TTC only) Global title indicator for the selector. Valid values are in the range 2 and 4.                                                                                                                                                                                                                                       |
| Numbering Plan              | (China, ITU, NTT, and TTC only) Numbering plan for the selector. Valid values are in the range 0 through 15.                                                                                                                                                                                                                                          |
| Nature of Address Indicator | (China, ITU, NTT, and TTC only) Nature of address indicator for the selector. Valid values are in the range 0 through 127.                                                                                                                                                                                                                            |
| Pre-Address Conversion      | GTT address conversion table to apply prior to performing local GTT translation. If: <ul style="list-style-type: none"> <li>• This field contains an address conversion table name, the referenced table must exist and contain at least one address-conversion entry.</li> <li>• This field is blank, no address conversion is necessary.</li> </ul> |

| Column                  | Description                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Post-Address Conversion | GTT address conversion table to apply after performing local GTT translation. If: <ul style="list-style-type: none"> <li>This field contains an address conversion table name, the referenced table must exist and contain at least one address conversion entry.</li> <li>This field is blank, no address conversion is necessary.</li> </ul> |
| QoS                     | Quality of service (QoS) class of the selector. Valid QoS classes range from 1 through 7. <b>ALL</b> indicates that the selector accepts all QoS classes.                                                                                                                                                                                      |

## GTA Table

The GTA Table contains:

| Column                      | Description                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                        | Selector name for this GTA.                                                                                                                                                                                                                                                                                                                                        |
| Global Title Address Digits | Address digits for the GTA.                                                                                                                                                                                                                                                                                                                                        |
| Point Code                  | Destination point code for the GTA.                                                                                                                                                                                                                                                                                                                                |
| Routing Indicator           | Routing indicator for the GTA. Valid values are: <ul style="list-style-type: none"> <li><b>none</b>—No routing indicator.</li> <li><b>gt</b>—Route on the global title.</li> <li><b>pcssn</b>—Route on the point code and SSN.</li> </ul> This field is dimmed if you check Configure By App Group (see <a href="#">Adding a GTA Entry to a GTT, page 15-17</a> ). |
| Subsystem Number            | Destination SSN for the GTA. Valid values are in the range 2 through 255.                                                                                                                                                                                                                                                                                          |
| New Translation Type        | Translation type that the GTA uses. Valid values are in the range 0 through 255.                                                                                                                                                                                                                                                                                   |
| Application Group           | Name of the application group that should provide the point code, routing indicator, and SSN that the GTA uses.                                                                                                                                                                                                                                                    |
| Application Server Name     | Name of the application server that should provide the point code, routing indicator, and SSN that the GTA uses.                                                                                                                                                                                                                                                   |
| QoS                         | Quality of service (QoS) class of the GTA. Valid QoS classes range from 1 through 7. <b>ALL</b> indicates that the GTA accepts all QoS classes.                                                                                                                                                                                                                    |

## App Group Table

The App Group Table contains:

| Column                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                    | <p>Name of the application group.</p> <p>For ITPs with multiple instances enabled, do not use the same application group name in two or more different instances. For example, if you use application group name <i>appgrp1</i> in instance 1, then do not use <i>appgrp1</i> in instance 0, or any other instance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Multiplicity            | <p>Multiplicity setting for the application group. Valid values are:</p> <ul style="list-style-type: none"> <li>• <b>egp</b>—Use SCCP calling party address (CGPA) load sharing, if available. CGPA load sharing uses a weighting factor to choose the destination. This is applicable to GTT versions 4.0 and higher.</li> <li>• <b>cos</b>—Use the destination with the least cost, if available.</li> <li>• <b>sha</b>—Share equally among all destinations.</li> <li>• <b>wrr</b>—Weighted balancing sccp class 0 and class 1 traffic based on weighed factor. This is applicable to GTT versions 4.5 and higher.</li> </ul>                                                                                                                                                                      |
| Weight Factor or Cost   | <p>If you set multiplicity to <b>egp</b>, this field specifies the relative weighting factor of the application group. Choose a relative cost, <b>1</b> through <b>999</b>, from the drop-down list box. The default value is <b>1</b>.</p> <p>If you set multiplicity to <b>cos</b> or <b>sha</b>, this field specifies the relative cost of the application group. Choose a relative cost, <b>1</b> through <b>8</b>, from the drop-down list box. The default value is <b>1</b>.</p> <p>If you set multiplicity to <b>wrr</b>, this field specifies the relative cost of the application group. Choose a relative cost, <b>1</b> through <b>10</b>, from the drop-down list box. The default value is <b>1</b>.</p> <p>For file format 4.4, the cost range is from <b>1</b> through <b>64</b>.</p> |
| Point Code              | Destination point code for the application group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Routing Indicator       | <p>Routing indicator for the application group. Valid values are:</p> <ul style="list-style-type: none"> <li>• <b>none</b>—No routing indicator.</li> <li>• <b>gt</b>—Route on the global title. This is the default routing indicator.</li> <li>• <b>pcssn</b>—Route on the point code and SSN.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Subsystem Number        | Destination SSN for the application group. Valid values are in the range 2 through 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Application Server Name | Name of the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Network Name            | Network name that the application group uses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| New Translation Type    | (Available in version 4.4 and later) Translation type that the selector uses. Valid values are in the range 0 through 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Rate Limit              | (Available in version 4.5 and later) Traffic rate limitation (MSU/sec) for the associated PC/SSN or AS directing over-flow traffic to the higher cost DPC/ASNAME. Rate-limit is only valid for multiplicity cost mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## MAP Table

The MAP Table contains:

| Column                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary Pt. Code      | Primary point code for the MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Primary SSN           | Primary SSN for the MAP. Valid values are in the range 2 through 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Multiplicity          | Multiplicity setting for the MAP. Valid values are: <ul style="list-style-type: none"> <li>• <b>dom</b>—Dominant. Always translate to the primary point-code-SSN combination if it is available. Translate to the backup point code-SSN combination only if the primary combination is not available.</li> <li>• <b>sha</b>—Share equally between the primary point-code-SSN combination and the backup point-code-SSN combination.</li> <li>• <b>sol</b>—Solitary MAP. No alternate if the point code or SSN is not available.</li> </ul> |
| Backup Pt. Code       | Backup point code for the MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Backup SSN            | Backup SSN for the MAP. Valid values are in the range 2 through 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Re-route if Congested | Indicates whether to route the MAP to the backup point-code-SSN combination if the primary combination is congested. If you: <ul style="list-style-type: none"> <li>• Check the check box, you route the MAP to the backup combination when the primary combination is congested.</li> <li>• Uncheck the check box, you do not route the MAP to the backup.</li> </ul>                                                                                                                                                                     |
| Adjacency             | Indicates whether to consider a point-code-SSN combination adjacent to the local node for SCCP management. If you: <ul style="list-style-type: none"> <li>• Check the check box, you do consider the point code-SSN combination adjacent to the local node.</li> <li>• Uncheck the check box, you do not consider the point code-SSN combination adjacent to the local node.</li> </ul>                                                                                                                                                    |
| CPC List Name         | Name of the CPC list associated with this MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## CPC List

The CPC List contains:

| Field      | Description                         |
|------------|-------------------------------------|
| Point Code | Point codes in the chosen CPC list. |

## GTT Editor: App Group Tab

Click the **App Group** tab to display data for application groups. The App Group tab shows the same information as the Selectors and GTA tab; but, from the perspective of the application groups.

An application group is an alternative result for the explicit point code and SSN in a GTA entry. You can use an application group entry for:

- Intermediate translation.
- Load-sharing across more than two destinations.
- Load-sharing of intermediate translation.

The GTT Editor: App Group tab contains:

- [App Group Table, page 15-8](#)
- [MAP Table, page 15-9](#)
- [CPC List, page 15-9](#)
- [Selector Table, page 15-6](#)
- [GTA Table, page 15-7](#)

When you click the **GTT Editor: App Group** tab, the App Group Table and Selector Table might contain data. To:

- Add entries to the App Group Table, right-click in the table and choose **Add** from the right-click menu (see [Adding an Application Group Entry to an App Group Table, page 15-21](#)).
- Add entries to the Selector Table, right-click in the table and choose **Add** from the right-click menu (see [Adding a Selector to a Selector Table, page 15-16](#)).

- Populate the MAP Table, select a row in the App Group Table. The MAP Table contains all MAP entries that match the chosen row's point code-SSN combination.

You can also add entries to the MAP Table, by right-clicking in the table and choosing **Add** from the right-click menu (see [Adding a MAP Entry to a GTT, page 15-22](#)).

- Populate the CPC List, select a row in the MAP Table that has an associated CPC List Name. The CPC List contains all point codes in that CPC list.

You can also add entries to the CPC List, by right-clicking in the list and choosing **Add** from the right-click menu (see [Editing an ITP Global Title Translation Table, page 15-1](#)).

- Populate the GTA Table, select a row in the Selector Table. The GTA Table contains all associated GTA entries.

If the GTA Table remains blank, the chosen row has no associated GTA entries. You can also add entries to the GTA Table, by right-clicking in the table and choosing **Add** from the right-click menu (see [Editing an ITP Global Title Translation Table, page 15-1](#)).

You can also add entries to the Selector Table, by right-clicking in the list and choosing **Add** from the right-click menu (see [Adding a Selector to a Selector Table, page 15-16](#)).

## GTT Editor: MAPs Tab

Click the **MAPs** tab if you are primarily interested in displaying data for MAPs. The MAPs tab shows the same information as the Selectors and GTA tab, but from the perspective of the MAPs.

A mated application (MAP) entry has two uses:

- The SCCP application uses MAP entries internally to track point code states and SSN states, such as congestion and availability.
- To define backups or alternates for point code-SSN combination.

The GTT Editor: Maps tab contains:

- [MAP Table, page 15-9](#)
- [CPC List, page 15-9](#)

- [Selector Table, page 15-6](#)
- [GTA Table, page 15-7](#)
- [App Group Table, page 15-8](#)

When you launch the GTT Editor: MAPs tab, the MAP Table and Selector Table might or might not be populated with data. To:

- Add entries to the MAP Table, right-click in the table and choose **Add** from the right-click menu (see [Adding a MAP Entry to a GTT, page 15-22](#)).
- Add entries to the Selector Table, right-click in the table and choose **Add** from the right-click menu (see [Adding a Selector to a Selector Table, page 15-16](#)).
- Populate the CPC List, select a row in the MAP Table that has an associated CPC List Name. The CPC List contains all point codes in that CPC list.

You can also add entries to the CPC List, by right-clicking in the list and choosing **Add** from the right-click menu (see [Editing an ITP Global Title Translation Table, page 15-1](#)).

- Populate the App Group Table and GTA Table, select a row in the MAP Table. The App Group Table and GTA Table contain all application group and GTA entries that match the chosen row's point code-SSN combination.

If the App Group Table or GTA Table remains blank, the chosen row has no associated application group or GTA entries.

You can add entries to the App Group Table, by right-clicking in the table and choosing **Add** from the right-click menu (see [Adding an Application Group Entry to an App Group Table, page 15-21](#)).

You can add entries to the GTA Table, by right-clicking in the table and choosing **Add** from the right-click menu (see [Editing an ITP Global Title Translation Table, page 15-1](#)).

## GTT Editor: CPC Tab

A concerned point code (CPC) is a node that should be notified when the status of the associated SSN changes.

Click the **CPC** tab if you are primarily interested in displaying data for concerned point code names. The CPC tab appears.

The GTT Editor: CPC tab contains:

- [Concerned Pt. Code Name List, page 15-12](#)
- [CPC List, page 15-9](#)
- [MAP Table, page 15-9](#)

When you launch the GTT Editor: CPC tab, the Concerned Pt. Code Name List contains data. To populate the CPC List and MAP Table, select a row in the Concerned Pt. Code Name List. The CPC List and MAP Table contain all point codes and MAP entries that match that concerned point code name.

## Concerned Pt. Code Name List

The Concerned Pt. Code Name List contains:

| Field         | Description                                                                            |
|---------------|----------------------------------------------------------------------------------------|
| CPC List Name | Name of the CPC list to add. Enter an alphanumeric string between 1 and 12 characters. |
| CPC List      | List of point codes associated with the entered CPC list name.                         |

To copy one or more point codes from one CPC list to another, select a CPC list in the CPC List Name column. The MWTM shows the point codes that are associated with that CPC list in the Point Code column. Select one or more of the point codes and drag them to the new CPC list.

### Note

The MWTM copies the point codes to the new CPC list; it does not move them from the old CPC list. If you want to move the point codes, you must copy them to the new CPC list, then delete them from the old CPC list.

## GTT Editor: Address Conversion Tab

You use GTT address conversion tables to specify mappings such as E.212-to-E.214 address conversion and E.212-to-E.164 address conversion in ITU networks.

Click the **Address Conversion** tab to display GTT address conversion tables. The Address Conversion tab appears.

The GTT Editor: Address Conversion tab contains:

- [Address Conversion Table, page 15-13](#)
- [Conversion Entry Table, page 15-13](#)
- [Selector Table for Address Conversion, page 15-14](#)

## Address Conversion Table

The Address Conversion Table contains:

| Field                       | Description                                                                                                                                                                                                                                                  |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                        | Name of the GTT address conversion table. Enter a 1- to 12-character name.                                                                                                                                                                                   |
| Numbering Plan              | (China, ITU, NTT, and TTC only) Numbering plan associated with the address conversion table. For all addresses that are converted, the numbering plan is converted to the value of this field.<br><br>The valid range is 0 to 15.                            |
| Nature of Address Indicator | (China, ITU, NTT, and TTC only) Nature of address indicator associated with the address conversion table. For all addresses that are converted, the nature of address indicator is converted to the value of this field.<br><br>The valid range is 0 to 127. |

## Conversion Entry Table

The Conversion Entry Table contains:

| Field                       | Description                                                                                                                                                                                                                                                                                                    |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In Address                  | Input SCCP address entry. Enter an address as a 1- to 15-digit hexadecimal string.                                                                                                                                                                                                                             |
| Out Address                 | Output SCCP address entry. Enter an address as a 1- to 15-digit hexadecimal string.                                                                                                                                                                                                                            |
| Numbering Plan              | (China, ITU, NTT, and TTC only) Numbering plan associated with this entry in the address conversion table. If specified, the value of this field overrides the value of the Numbering Plan field in the Address Conversion Table for this entry.<br><br>The valid range is 0 to 15.                            |
| Nature of Address Indicator | (China, ITU, NTT, and TTC only) Nature of address indicator associated with this entry in the address conversion table. If specified, the value of this field overrides the value of the Nature of Address Indicator field in the Address Conversion Table for this entry.<br><br>The valid range is 0 to 127. |

| Field           | Description                                                                                                                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encoding Scheme | The encoding scheme to be used for output GTT address: <ul style="list-style-type: none"> <li>Unknown—Encoding scheme is not specified at the address level</li> <li>bcdOdd—Use BCD odd encoding scheme</li> <li>bcdEven—Use BCD even encoding scheme</li> <li>National—National specific</li> </ul> |
| Remove Digits   | Specifies the number of digits that should be removed from the original address prefix when the in-address prefix is matched                                                                                                                                                                         |

## Selector Table for Address Conversion

The Selector Table for Address Conversion contains:

| Column                      | Description                                                                                                                                                                                                                                                                                                    |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                        | Name of the selector.                                                                                                                                                                                                                                                                                          |
| Translation Type            | Translation type that the selector uses. Valid values are in the range 0 through 255.                                                                                                                                                                                                                          |
| Global Title Indicator      | Global title indicator for the selector. Valid values are in the range 2 and 4.                                                                                                                                                                                                                                |
| Numbering Plan              | (China, ITU, NTT, and TTC only) Numbering plan for the selector. Valid values are in the range 0 through 15.                                                                                                                                                                                                   |
| Nature of Address Indicator | (China, ITU, NTT, and TTC only) Nature of address indicator for the selector. Valid values are in the range 0 through 127.                                                                                                                                                                                     |
| Pre-Address Conversion      | GTT address conversion table to apply prior to performing local GTT translation.<br><br>If this field contains an address conversion table name, the referenced table must exist and it must contain at least one address-conversion entry.<br><br>If this field is blank, no address conversion is necessary. |
| Post-Address Conversion     | GTT address conversion table to apply after performing local GTT translation.<br><br>If this field contains an address-conversion table name, the referenced table must exist and it must contain at least one address conversion entry.<br><br>If this field is blank, no address conversion is necessary.    |
| QoS                         | Quality of service (QoS) class of the selector. Valid QoS classes range from 1 through 7. ALL indicates that the selector accepts all QoS classes.                                                                                                                                                             |

## Editing a GTT Table

You use the MWTM to change the variant and instance number associated with a GTT file.

To change the variant and instance number associated with a GTT file choose **Edit > Version and Instance** from the GTT menu. The Edit GTT Table dialog box appears.

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Adding a Selector to a Selector Table

You use the MWTM to add a selector to a GTT. A GTT selector defines the parameters that select the translation table used to translate an SCCP message to its next or final destination.

To add a new selector to a Selector Table, choose a Selector Table in the GTT Editor window, then use one of these procedures. From the:

- GTT menu, choose **Edit > Add**.
- Right-click menu, choose **Add**.

The Selector Add dialog box appears.

| Field or Button           | Description                                                                                                                                                                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Selector Name             | Name of the selector to add. Enter 1- to 12-character alphanumeric string.                                                                                                                                                                      |
| Translation Type          | Translation type that the selector uses. Enter a value in the range <b>0</b> through <b>255</b> .                                                                                                                                               |
| Global Title Indicator    | (China, ITU, NTT, and TTC only) Global title indicator for the selector. Choose a value from the drop-down list box. Valid values are: <ul style="list-style-type: none"> <li>• <b>2</b></li> <li>• <b>4</b></li> </ul> The default value is 4. |
| Numbering Plan            | (China, ITU, NTT, and TTC only) Numbering plan for the selector. Enter a value in the range <b>0</b> through <b>15</b> .<br><br>This field is dimmed if Global Title Indicator is set to 2.                                                     |
| Nature of Addr. Indicator | (China, ITU, NTT, and TTC only) Nature of address indicator for the selector. Enter a value in the range <b>0</b> through <b>127</b> .<br><br>This field is dimmed if Global Title Indicator is set to 2.                                       |

## Adding a GTA Entry to a GTT

You use the MWTM to add a Global Title Address (GTA) entry to a GTT. A GTA entry is associated with a selector and defines the result of a translation for a particular address mask. The result of a GTA entry can be a final translation or an intermediate translation.

To add a new GTA entry to a GTA Table, choose a selector in the GTT Editor window and a GTA Table; then, use one of these procedures.

From the:

- GTT menu, choose **Edit > Add**.
- Right-click menu, choose **Add**.

The GTA Add dialog box appears.

| Field                     | Description                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------|
| Selector Name             | Name of the selector associated with this GTA. You cannot edit this field.                                      |
| Global Title Addr. Digits | Address digits for the GTA. Enter a 1- to 15-digit hexadecimal string. Enter 'default' to create a default GTA. |

| Field                                | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QoS                                  | Quality of service (QoS) class of the GTA. Choose a value from the drop-down list box. Valid QoS classes range from 1 through 7. Choose <b>ALL</b> if you want the GTA to accept all QoS classes. The default value is <b>ALL</b> .                                                                                                                                                              |

## Searching the GTA Table for GTA Digits

You use the MWTM to search the GTA Table for the Global Title Address Digits for a specific selector. The MWTM shows the entries that contain the GTA digits in the GTA Table.

To search the GTA Table, click the **Selectors and GTA** tab in the GTT Editor window, then choose **View > Phone Number Config** from the GTT menu. The Phone Number Lookup dialog box appears.

| Table, Field, or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                               |

# Adding an Application Group Entry to an App Group Table

You use the MWTM to add an application group to a GTT. An application group is an alternative result for the explicit point code and SSN in a GTA entry. You can use an application group entry for:

- Intermediate translation.
- Load-sharing across more than two destinations.
- Load-sharing of intermediate translation.

To add an application group to a GTT, choose an App Group Table in the GTT Editor window, then use one of these procedures.

From the:

- GTT menu, choose **Edit > Add**.
- Right-click menu, choose **Add**.

The App Group Add dialog box appears.

| Field or Button         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| App. Group              | Name of the application group to add. Enter 1- to 12-character alphanumeric string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Multiplicity            | Multiplicity setting for the application group. Choose a value from the drop-down list box. Valid values are: <ul style="list-style-type: none"> <li>• <b>cos</b>—Use the destination with the least cost, if available.</li> <li>• <b>sha</b>—Share equally between all destinations. This is the default value.</li> <li>• <b>wrr</b>—Weighted balancing sccp class 0 and class 1 traffic based on weighed factor. This is applicable to GTT versions 4.5 and higher.</li> </ul>                                                                                                                                                                                                                                  |
| Weight Factor or Cost   | <p>If Multiplicity is set to <b>cgp</b>, this field specifies the relative weighting factor of the application group. Choose a relative cost, <b>1</b> through <b>999</b>, from the drop-down list box. The default value is <b>1</b>.</p> <p>If Multiplicity is set to <b>cos</b> or <b>sha</b>, this field specifies the relative cost of the application group. Choose a relative cost, <b>1</b> through <b>8</b>, from the drop-down list box. The default value is <b>1</b>.</p> <p>If Multiplicity is set to <b>wrr</b>, this field specifies the relative cost of the application group. Choose a relative cost, <b>1</b> through <b>10</b>, from the drop-down list box. The default value is <b>1</b>.</p> |
| Point Code              | Destination point code for the application group. Click this radio button and enter a point code. This field is mutually exclusive with the Application Server Name field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Application Server Name | Name of the application server. Click this radio button and enter an application server name. This field is mutually exclusive with the Point Code field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Routing Indicator       | Routing indicator for the application group. Choose a value from the drop-down list box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Adding a MAP Entry to a GTT

You use the MWTM to add a mated application (MAP) entry to a GTT.

A MAP entry has two purposes:

- The SCCP application uses them internally to track point-code states and SSN states, such as congestion and availability.
- To define backups or alternates for point-code-SSN combination.

To add a MAP entry, choose a MAP Table in the GTT Editor window, then use one of these procedures.

From the:

- GTT menu, choose **Edit > Add**.
- Right-click menu, choose **Add**.

(Optional) To add a new MAP entry to a MAP Table, choose a MAP Table, then use one of these procedures.

From the:

- GTT menu, choose **Edit > Add**.
- Right-click menu, choose **Add**.

The MAP Add dialog box appears.

| Field or Button  | Description                                                                       |
|------------------|-----------------------------------------------------------------------------------|
| Primary Pt. Code | Primary point code for the MAP. Enter a point code.                               |
| Primary SSN      | Primary SSN for the MAP. Enter a value in the range <b>2</b> through <b>255</b> . |

| Field or Button       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multiplicity          | <p>Multiplicity setting for the MAP. Choose a value from the drop-down list box. Valid values are:</p> <ul style="list-style-type: none"> <li><b>dom</b>—Dominant. Always translate to the primary point-code-SSN combination if it is available. Translate to the backup point-code-SSN combination only if the primary combination is not available.</li> <li><b>sha</b>—Share equally between the primary point-code-SSN combination and the backup point code-SSN combination. This is the default value.</li> <li><b>sol</b>—Solitary MAP. No alternate if the point code or SSN is not available.</li> </ul> |
| Backup Pt. Code       | Backup point code for the MAP. Enter a point code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Backup SSN            | Backup SSN for the MAP. Enter an a value in the range <b>2</b> through <b>255</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CPC List Name         | Name of the CPC list to be associated with this MAP. Enter a CPC list name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Re-route if Congested | <p>Indicates whether the MAP should be routed to the backup point code-SSN combination if the primary combination is congested. If you:</p> <ul style="list-style-type: none"> <li>Want to route the MAP to the backup combination when the primary combination is congested, check the check box.</li> <li>Do not want to route the MAP to the backup, uncheck the check box. This is the default setting.</li> </ul>                                                                                                                                                                                             |
| Adjacency             | <p>Indicates whether a point code-SSN combination should be considered adjacent to the local node for SCCP management. If you:</p> <ul style="list-style-type: none"> <li>Want the point code-SSN combination be considered adjacent to the local node, check the check box.</li> <li>Do not want the point code-SSN combination be considered adjacent to the local node, uncheck the check box. This is the default setting.</li> </ul>                                                                                                                                                                          |
| Add                   | <p>Adds the MAP to the GTT.</p> <p>Enter or choose values for the new MAP entry, then click <b>Add</b>. The MWTM adds the MAP entry to the MAP Table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Adding a CPC List to a GTT

You use the MWTM to add a new concerned point code (CPC) list to a GTT. A CPC is a node that should be notified when the status of the associated SSN changes.

To add a new CPC list, choose a Concerned Pt. Code Name List or a CPC List in the GTT Editor window, then use one of these procedures. From the:

- GTT menu, choose **Edit > Add**.
- Right-click menu, choose **Add**.

The CPC Add dialog box appears.

| Field or Button         | Description                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPC List Name           | Name of the CPC list to be added. Enter 1- to 12-character alphanumeric string.                                                                        |
| Concerned Pt. Code List | One or more CPCs to be added to the new CPC list. Enter one or more CPCs, separated by spaces.                                                         |
| Add                     | Adds the CPC list to the GTT.<br><br>Enter or choose values for the new CPC list, then click <b>Add</b> . The MWTM adds the CPC list to the MAP Table. |
| Close                   | Closes the CPC Add dialog box.<br><br>When you finish adding CPC lists, click <b>Close</b> to close the CPC Add dialog box.                            |
| Help                    | Shows online help for the current window.                                                                                                              |

## Adding a GTT Address Conversion Table

You use the MWTM to add a new address conversion table to a GTT. To do so, choose an Address Conversion Table in the GTT Editor window, then use one of these procedures. From the:

- GTT menu, choose **Edit > Add**.
- Right-click menu, choose **Add**.

The Address Conversion Add dialog for a Table window appears.

| Field or Button           | Description                                                                                                                                                                                                                                                  |

## Adding an Entry to a GTT Conversion Table Entry

You use the MWTM to add a new entry to a GTT Conversion Entry Table. To do so, choose a Conversion Entry Table in the Address Conversion tab of the GTT Editor, then use one of these procedures. From the:

- GTT menu, choose **Edit > Add**.
- Right-click menu, choose **Add**.

The Address Conversion Add dialog for an entry window appears.

| Field or Button                 | Description                                                                                                                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                            | Name of the GTT address conversion table. Enter a 1- to 12-character name. If the table name does not already exist, the MWTM creates a new address conversion table with this name.                                                                                             |
| Table Numbering Plan            | (China, ITU, NTT, and TTC only) Numbering plan associated with the address conversion table. For all addresses that are converted, the numbering plan is converted to the value of this field.<br>The valid range is 0 to 15.                                                    |
| Table Nature of Addr. Indicator | (China, ITU, NTT, and TTC only) Nature of address indicator associated with the address conversion table. For all addresses that are converted, the nature of address indicator is converted to the value of this field.<br>The valid range is 0 to 127.                         |
| In Address                      | Input SCCP address entry. Enter an address as a 1- to 15-digit hexadecimal string.                                                                                                                                                                                               |
| Out Address                     | Output SCCP address entry. Enter an address as a 1- to 15-digit hexadecimal string.                                                                                                                                                                                              |
| Numbering Plan                  | (China, ITU, NTT, and TTC only) Numbering plan associated with this entry in the address conversion table. If specified, the value of this field overrides the value of the Numbering Plan field in the Address Conversion Table, for this entry.<br>The valid range is 0 to 15. |

| Field or Button             | Description                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nature of Address Indicator | (China, ITU, NTT, and TTC only) Nature of address indicator associated with this entry in the address conversion table. ## Deleting Rows from a Table

To delete one or more rows from a table, select the rows, then choose **Edit > Delete** from the GTT menu or **Delete** from the right-click menu. The Confirm Delete dialog box appears to confirm the deletion. To:

- Delete the chosen rows, click **Yes**. The rows are deleted from the table and the Confirm Delete dialog box closes.
- Retain the chosen rows, click **No**. The rows are kept in the table and the Confirm Delete dialog box closes.

You can select more than one row to delete, but all chosen rows must be in the same table. For example, you cannot delete rows from both the Selector Table and the MAP Table at the same time.

If deleting a row from a table causes one or more rows in the table to remain at the top of the page or the bottom of the next, such that no remaining entries reference the single rows, the MWTM shows the number of single rows and asks whether you want to also delete the single rows. (The MWTM shows the number of rows and not the rows themselves, because there could be thousands of single rows.)

## Creating a New GTT File

You use the MWTM to create a new GTT file. To do so, choose **File > New Table** from the GTT menu. The Create New Table dialog box appears.

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Loading an Existing GTT File

You use the MWTM to load a specific GTT file and change the list of GTT files.

When you load a GTT file, the name of the server associated with the GTT Editor and the filename are visible in the window name:

```
MWTM: GTT Editor -- mwtm-sun8 -- GTT.File.1
```

If you have not yet loaded or saved a GTT file, the MWTM displays a No File Loaded message in place of the GTT filename.

#### Note

The MWTM 6.1.3 supports GTT files with file format versions 3.1, 4.0, 4.1, 4.2, 4.3, 4.4, or 4.5. You can load GTT files that use lower or higher file-format versions; but, fields or features that are unique to the lower or higher version are not visible and they disappear from the GTT file the next time you save. The file is saved as a version 3.1 file if the file is lower than version 3.1, or as a version 4.5 file if the file is higher than version 4.5.

To load an existing GTT file, or to change the list of GTT files, choose **File > Load > Load From File** from the GTT menu. The Load File dialog box: GTT File List appears.

## Loading a GTT File from a Node

You use the Load GTT from Node wizard to choose the node and signaling point whose GTT file you want to edit.

To launch the Load GTT from Node wizard, choose **File > Load > Load From Node** from the GTT menu. Or, from the Startup Options dialog box, choose **Load GTT Data From: Node**. If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.

The Load GTT from Node wizard appears. The left pane of the Load GTT from Node wizard contains:

| Step           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Node/SP | <p>You can choose the signaling point from which to load the GTT file. You can optionally check the <b>Filter by Node</b> check box, which limits signaling point selection to a specific node.</p> <p>Choose a signaling point and node (optional) from the drop-down list boxes. The MWTM retrieves GTT filenames from the chosen signaling point.</p> <p>If no GTT filenames are available, the process ends with errors. If GTT filenames are available, the MWTM proceeds directly to the Login step.</p> |
| Login          | <p>You can log in to the signaling point. Once you have logged in initially, the MWTM skips this step. Enter the:</p> <ul style="list-style-type: none"> <li>• Log in username and password.</li> <li>• Enable username and password.</li> </ul> <p><b>Note</b> To avoid entering username and password information each time, you can set up credentials (see <a href="#">Configuring Login Credentials, page 4-20</a>).</p>                                                                                  |
| Load           | Reads the GTT table from the node and loads it into the GTT Editor.                                                                                                                                                                                                                                                                                                                                                                                                                                            |

The bottom line of the Load GTT from Node wizard contains:

| Field or Button   | Description                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Progress Bar      | Indicates that the file is being validated or uploaded.                                                                                         |
| Show Log/Hide Log | Shows or hides the session between the MWTM and the node.                                                                                       |
| Next >            | Advances to the next step in the wizard.                                                                                                        |
| Finish            | Closes the wizard. The <b>Finish</b> button appears when deployment completes successfully; or, when it detects errors and cancels the process. |
| Cancel            | Closes the wizard without deploying the file.                                                                                                   |
| Help              | Shows online help for the wizard.                                                                                                               |

## Loading a GTT File from the Archive

You use the Load GTT from Archive wizard to choose the node and signaling point whose archived GTT file you want to edit.

To launch the Load GTT from Archive wizard, choose **File > Load > Load From Archive** from the GTT menu; or, from the Startup Options dialog box, choose **Load GTT Data From: Archive**. If you implement MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.

The Load GTT from Archive wizard appears.

The left pane of the Load GTT from Archive wizard contains:

| Step           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Node/SP | <p>You can choose the signaling point from which to load the GTT file. You can optionally check the <b>Filter by Node</b> check box, which limits signaling-point selection to a specific node.</p> <p>Choose a signaling point and node (optional) from the drop-down list boxes. The MWTM retrieves GTT filenames from the chosen signaling point.</p> <p>If no GTT filenames are available, the process ends with errors. If GTT filenames are available, the MWTM proceeds directly to the Select Version step.</p> |
| Select Version | Select a previously deployed version of the configuration from the archive.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Load           | Checks the archived GTT file for errors and loads the file into the GTT Editor.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The bottom line of the Load GTT from Archive wizard contains:

| Field or Button | Description                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------|
| Progress Bar    | Indicates that the file is being validated or uploaded.                                                                       |
| Next >          | Advances to the next step in the wizard.                                                                                      |
| Finish          | Closes the wizard. The Finish button appears when deployment is successful; or, it encounters errors and cancels the process. |
| Cancel          | Closes the wizard without deploying the file.                                                                                 |
| Help            | Shows online help for the wizard.                                                                                             |

## Displaying the Progress Dialog Box

The Progress dialog box shows the percent of a GTT file that was loaded, saved, or checked semantically, as well as any messages that appear while loading or checking the file.

To display the Progress dialog box, use one of these procedures.

Choose:

- **File > Load > Load From File** or **Load From ITP** from the GTT menu, then select a GTT file from the Load File dialog box: GTT File List and click **OK**.
- **File > Save As** from the GTT menu, then select a GTT file from the Load File dialog box: GTT File List and click **OK**.
- **File > Semantic Check** from the GTT menu, then enter an ITP's name or IP address in the Semantic Check GTT dialog box and click **OK**.

The Progress dialog box appears.

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Progress Bar    | Indicates the percent of the GTT file that was loaded, saved, or checked.                                                                                                                                                                                                                                                                                                  |
| Messages        | Messages that appear while loading, saving, or checking the GTT file.                                                                                                                                                                                                                                                                                                      |

## Checking the Semantics of a GTT File

The MWTM strongly recommends that you check the semantics of a GTT file against a specific ITP and validate this data in the GTT file:

- **ITP Point Code**—For version 2.0 GTT files, the point code in the GTT file must differ from the primary, secondary, or capability point code of the ITP. If the file is the same, the MWTM generates an error. This restriction is not for GTT files of version 3.0 or later.
- **Route Table**—The ITP route table must contain all point codes in the GTT file, other than the primary, secondary, or capability point code of the ITP. If the route table does not contain the point codes, the MWTM generates an error.
- **Route Status**—All route entries for point codes in the GTT file, other than the ITP's primary, secondary, or capability point code, must be available. If they are not, the MWTM generates a warning.

- **GTA and Application Group**—If an application server configures the GTA or the application group, then that application server must reside on the ITP. If it does not, the MWTM generates an error.

If the application server resides on the ITP, but it is not available, the MWTM generates a warning.

For example, ITP limits XUA configuration to instance 0. The MWTM semantic check verifies that XUA is not configured on any other instance.

To check the semantics of a GTT file, choose **File > Semantic Check** from the GTT menu. The Semantic Check GTT dialog box appears.

| Field or Button        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ITP Name or IP Address | Name or IP address of the ITP against which to check the GTT file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| OK                     | <p>Closes the Semantic Check GTT dialog box and opens the Progress dialog box, which shows the progress of the semantic check for the GTT file.</p> <p>Enter the name or IP address of an ITP, and click <b>OK</b>. The MWTM closes the Semantic Check GTT dialog box and opens the Progress dialog box.</p> <p>The Progress dialog box shows the progress of the semantic check for the GTT file and any messages that appear while checking the file.</p> <p>After the check, click <b>OK</b>. The MWTM closes the Progress dialog box and returns to the Semantic Check GTT dialog box.</p> |
| Cancel                 | Closes the Semantic Check GTT dialog box without checking the semantics of the GTT file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Note**

You can also use the **mwtm checkggt** command to semantics of a GTT file (see [mwtm checkggt](#), page B-101).

## Deploying a GTT File

You use the Deployment wizard to validate a GTT file, upload it to an ITP, archive the file, and activate it on the ITP. To launch the Deployment wizard for a GTT file, choose **File > Deploy** from the GTT menu (see [Deploying ITP Files, page 5-33](#)).

## Displaying Basic Information About a GTT File

You use the MWTM to view basic information about the current GTT file. Choose **View > GTT Table Info** from the GTT menu. The GTT Table Info dialog box appears.

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Filename        | Name of the GTT file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Version         | <p>Version of the file format that the GTT uses. Valid versions are:</p> <ul style="list-style-type: none"> <li>• <b>3.1</b>—Corresponds to ITP software releases 12.2(4)MB9 and 12.2(4)MB9a. Two or more entries in the same application group can have the same cost. This is the default version in the MWTM.</li> <li>• <b>4.0</b>—Corresponds to ITP software release 12.2(4)MB10 or higher. Supports multiple instances on a single node.</li> <li>• <b>4.1</b>—Corresponds to ITP software release 12.2(20)SW or higher. Supports multiple instances on a single node.</li> <li>• <b>4.2</b>—Corresponds to ITP software release 12.2(21)SW1 or higher. Supports subsystem numbers equal to zero (0) for GTA entries and application group entries.</li> <li>• <b>4.3</b>—Corresponds to these ITP software releases: <ul style="list-style-type: none"> <li>– 12.2(25)SW1 or higher</li> <li>– 12.2(18)IXA or higher</li> <li>– 12.4(11)SW or higher</li> </ul> Supports latest encoding scheme (not for ANSI).</li> <li>• <b>4.4</b>—Corresponds to these ITP software releases: <ul style="list-style-type: none"> <li>– 12.2(18)IXE or higher</li> <li>– 12.4(15)SW or higher</li> </ul> </li> <li>• <b>4.5</b>—Corresponds to these ITP software releases: <ul style="list-style-type: none"> <li>– 12.2(33)IRD or higher</li> <li>– 12.4(15)SW4 or higher</li> </ul> Supports higher destination cost and removing digits.</li> </ul> <p>The MWTM 6.1.3 supports GTT files with file format versions 3.1, 4.0, 4.1, 4.2, 4.3, 4.4, or 4.5. You can load GTT files that use lower or higher file format versions; but, fields or features that are unique to the lower or higher version are not visible and they disappear from the GTT file the next time you save. The file is saved as a version 3.1 file if the file is lower than version 3.1 or as a version 4.5 file if the file is higher than version 4.5.</p> |
| Variant         | <p>SS7 protocol variant. Valid variants are:</p> <ul style="list-style-type: none"> <li>• <b>ANSI</b></li> <li>• <b>China</b></li> <li>• <b>ITU</b></li> <li>• <b>NTT</b></li> <li>• <b>TTC</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Network Name    | <p>Network name that the GTT file uses.</p> <p>This field appears only for GTT files of version 4.1 or higher.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Field or Button | Description                                                                                                                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance Number | Number of the instance that the GTT uses. Valid numbers are 0 to 7. The default instance number is 0.<br><br>If no instance is associated with the GTT, this field contains N/A. This field appears only for GTT files of version 4.0. |
| Last Modified   | Date and time the GTT file was last modified.                                                                                                                                                                                          |
| Total Entries   | Total number of entries in the GTT file.                                                                                                                                                                                               |
| OK              | Closes the GTT Table Info dialog box.                                                                                                                                                                                                  |

## Supporting Cross-Instance GTT Files

You use the ITP Multiple Instance feature to connect an ITP to more than one network at the same time, each with specific variant and network indicator values. The ITP treats each combination of variant and network indicator as a separate instance with its own local point code, routing table, and GTT file on the ITP. Instances in the same network must have the same network name.

In support of the Multiple Instance feature, ITP Instance Translation enables the conversion of packets between instances of any variants. Each instance is a separate domain with a defined variant, network indicator, ITP point code, optional capability point code, and optional secondary point code.

For more information about the ITP Multiple Instance and Instance Translation features, see the IP Transfer Point (ITP) feature module for Cisco IOS software release 12.2(4)MB10 or later.

GTT files that support the Multiple Instance and Instance Translation features are called cross-instance GTT files, because they contain application groups that reference point codes in other GTT files.

To handle cross-instance GTT files, the MWTM uses a server-wide network name mapping file, which maps the available network names to GTT variants and network indicators. The MWTM looks up network names in the file to parse point codes correctly, based on the user's cross-instance configuration.

When the MWTM discovers your network, it automatically creates and populates the network name-mapping file. Therefore, in most cases, you do not need to manually create the network name mapping file. For more information about running Discovery, see [Managing and Deploying ITP Files, page 5-24](#).

In some cases, you might want to create the network name mapping file manually; for example, if you have not run Discovery yet, but you want to prepare for a future GTT configuration. Also, while you cannot change or delete entries that the MWTM automatically populated, you can add entries manually, and you can change or delete those manual entries.

To create the network name mapping file manually; or, to add, change, or delete manual entries, choose **View > Network Name Configuration** from the GTT menu. If you have implemented MWTM User-Based Access, this option is available to users with authentication level System Administrator (level 5). The Network Name Configuration dialog box appears.

The Network Name Configuration dialog box contains:

- [Network Name Configuration Dialog Box Menu, page 15-36](#)
- [Network Name Configuration Dialog Box Table, page 15-37](#)

## Network Name Configuration Dialog Box Menu

The menu on the Network Name Configuration dialog box contains:

| Menu Command                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Revert<br>(Ctrl-R)   | Loads the most recent network name mapping file from the MWTM server.<br><br>If the MWTM discovers new entries for the network name mapping file while you are editing a GTT file (for example, if it adds a new network instance or it discovers a new network), the GTT Editor is unaware of the new entries and they are not visible in the Network Name Configuration dialog box. To see the new entries in the dialog box, choose <b>File &gt; Revert</b> . (You can also restart the GTT Editor to automatically load the most recent network name mapping file from the MWTM server.) |
| File > Save<br>(Ctrl-S)     | Saves the changes you make to the network name mapping file.<br><br>After you add, change, or delete entries and save the file, the MWTM uses the file the next time it discovers the network. However, if the MWTM discovers entries that conflict with manual entries in the file, the MWTM uses (and shows in the Network Name Configuration dialog box) the discovered entries, not the manual entries.                                                                                                                                                                                  |
| File > Print<br>(Ctrl-P)    | Prints the contents of the network name mapping file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| File > Close<br>(Ctrl-W)    | Closes the network name mapping file without saving any additions, changes, or deletions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Edit > Add<br>(Alt-A)       | Adds an entry to the network name mapping file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Edit > Delete<br>(Delete)   | Deletes the chosen entry from the network name mapping file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Saving a GTT File

You use the MWTM to save a specific GTT file and change the list of GTT files.

### Note

The MWTM 6.1.3 supports GTT files with file format versions 3.1, 4.0, 4.1, 4.2, 4.3, 4.4, or 4.5. You can load GTT files that use lower or higher file format versions; but, fields or features that are unique to the lower or higher version are not visible and they disappear from the GTT file the next time you save. The file is saved as a version 3.1 file if the file is lower than version 3.1 or as a version 4.5 file if the file is higher than version 4.5.

To save the changes make to a GTT file or change the list of GTT files, use one of these procedures. To save the changes you have made to the GTT file:

- Without changing the name of the file, choose **File > Save** from the GTT menu.
- With a new name, choose **File > Save As** from the GTT menu. The Save File dialog box: GTT File List appears.

| Field or Button                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Size (bytes)                                       | Size of the GTT file or folder, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Filename                                           | Name by which you want to save the GTT file.<br><br>If you create a new GTT filename, you can use any letters, numbers, or characters in the name that your operating system allows. However, if you include any spaces in the new name, the MWTM converts those spaces to hyphens (-). For example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Number of Files<br>(visible in bottom left corner) | Total number of GTT files and folders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OK                                                 | Saves the GTT file or any changes you make to the list of files and closes the dialog box.<br><br>To save the GTT file with a new name, use one of these procedures. To save the file with: <ul style="list-style-type: none"> <li>• A completely new name, enter the new name and click <b>OK</b>.</li> <li>• An existing name, overwriting an old GTT file, choose the name from the list and click <b>OK</b>.</li> </ul> The MWTM closes the Save File dialog box: GTT File List and the Progress dialog box appears.<br><br>The Progress dialog box shows the progress of the GTT file save, as well as any messages that appear while saving the file.<br><br>When the file is saved, click <b>OK</b> . The MWTM closes the Progress dialog box, saves the GTT file with the new name, and returns to the GTT Configuration window.<br><br><b>Note</b> If another user modifies and saves the GTT file before you save your changes, the MWTM asks if you want to overwrite that user's changes. If you do, the other user's changes are overwritten and lost. If you choose not to, your changes are lost; unless you save the GTT file to a different filename. |
| Delete                                             | Deletes the chosen file from the GTT file list. An informational message appears that contains the name and location of the deleted file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Field or Button | Description                                                                            |
|-----------------|----------------------------------------------------------------------------------------|
| Cancel          | Closes the dialog box without saving the GTT file or any changes to the GTT file list. |
| Help            | Shows online help for the dialog box.                                                  |

When you are ready to exit the GTT Editor window, choose **File > Exit** from the GTT menu.

If you make any changes to the GTT file, the MWTM asks if you want to save the changes before leaving the window. Click:

- **Yes** to save the changes.

The MWTM opens the Save File dialog box: GTT File List, which you use to save the GTT file with a new name, or overwrite an existing GTT file.

- **No** to close the prompt window.

The MWTM closes the GTT Editor window without saving any changes to the GTT file.

By default, GTT files reside in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the default directory is */opt/CSCOs/gm/gtt*.
- A different directory, then the default directory resides in that directory.

To change the directory in which the MWTM stores GTT files, use the **mwtm gttmdir** command (see [mwtm gttmdir](#), page B-109).

## Reverting to the Last Saved GTT File

To revert to the last saved version of the GTT file, choose **File > Revert** from the GTT menu. The MWTM shows the last saved version of the file.

# CHAPTER 16

## Editing ITP MLR Address Table Files

---

You use the Cisco Mobile Wireless Transport Manager (MWTM) to configure Multi-Layer Routing (MLR) address table files by using the MWTM Address Table Editor. You can:

- Create new address table files.
- Load existing address table files.
- Edit address table files.
- Perform semantic checks on address table files.
- Deploy address table files to an ITP.
- Save address table files.

If you implement MWTM User-Based Access, the Address Table Editor is available to users with authentication level Network Operator (level 3) and higher.

For more detailed information about address tables, including configuration procedures and scenarios, see the *IP Transfer Point (ITP)* feature module for Cisco IOS software release 12.2(25)SW3 or later.

This chapter contains:

- [Launching the Address Table Editor, page 16-2](#)
- [Creating a New Address Table File, page 16-5](#)
- [Loading an Existing Address Table File, page 16-6](#)
- [Loading an Address Table File from a Node, page 16-8](#)
- [Loading an Address Table File from the Archive, page 16-9](#)
- [Working in Address Table Files, page 16-10](#)
- [Editing Address Table Properties, page 16-12](#)
- [Checking the Semantics of an Address Table File, page 16-13](#)
- [Deploying an Address Table File, page 16-14](#)
- [Displaying Basic Information About an Address Table File, page 16-14](#)
- [Listing Archived Address Tables, page 16-14](#)
- [Creating Network Name Mapping Files, page 16-15](#)
- [Saving an Address Table File, page 16-17](#)
- [Reverting to the Last Saved Address Table File, page 16-18](#)

# Launching the Address Table Editor

The Address Table Editor runs as a separate application in the MWTM, so it requires a separate log in, just like the MWTM client.

If you implement MWTM User-Based Access, the Address Table Editor is available to users with authentication level Network Operator (level 3) and higher.

To launch the Address Table Editor, use one of these procedures:

- Choose **Tools > Address Table Editor** from the MWTM main menu.
- Enter the **mwtm atblclient** command (see [mwtm atblclient](#), page B-99) from the command prompt.

The Startup Options dialog box appears, which you use to load a specific address-table file or create a new address table file.

The Startup Options dialog box contains options for loading or creating the address table data from:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| New File        | Opens the Address Table Properties dialog box, which you use to create a new address table file (see <a href="#">Creating a New Address Table File</a> , page 16-5). Create the new address table file.<br><br>If you implement MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.                                                                                                 |
| From File       | Opens the Load File Dialog: Address Table File list, which you use to load a specific address table file and change the list of address table files (see <a href="#">Loading an Existing Address Table File</a> , page 16-6). Select an address table file to load.                                                                                                                                                                                             |
| From ITP        | Opens the Load Address Table from ITP wizard, which you use to select the ITP release 12.2(25)SW3 or later signaling point whose address table file you want to edit (see <a href="#">Loading an Address Table File from a Node</a> , page 16-8). Select a signaling point.<br><br>If you implement MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.                                  |
| From Archive    | Opens the Load Address Table from Archive wizard, which you use to select the ITP release 12.2(25)SW3 or later node and signaling point whose address table file you want to edit (see <a href="#">Loading an Address Table File from the Archive</a> , page 16-9). Select a signaling point and table type.<br><br>If you implement MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher. |

Once you close the Startup Options dialog box by creating a new address table file or loading an existing address table file, the Address Table Editor window appears. If you have created a new address table file, the table will be blank. If you have opened an existing address table file, the table will be populated.

## Address Table Menu

The menu on the Address Table Editor window contains:

| Menu Command                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > New Table<br>(Ctrl-N)             | <p>Opens the Address Table Properties dialog box. The MWTM prompts you to:</p> <ul style="list-style-type: none"> <li>Enter the table name, variant, instance number, and network name, then click <b>OK</b> to create the address table file.</li> <li>Click <b>Cancel</b> to close the prompt window without creating an address table file.</li> </ul> <p>For more information, see <a href="#">Creating a New Address Table File, page 16-5</a>.</p> <p>If you implement MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| File > Load > Load From File<br>(Ctrl-L) | <p>Opens the Load File dialog box, allowing you to load an already existing address table file. The MWTM prompts you to:</p> <ul style="list-style-type: none"> <li>Select the file from the list, then click <b>OK</b> to load the address table file.</li> <li>Click <b>Cancel</b> to close the prompt window without loading an address table file.</li> </ul> <p>For more information, see <a href="#">Loading an Existing Address Table File, page 16-6</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| File > Load > Load From Node<br>(Ctrl-T) | <p>Opens the Load Address Table from ITP Wizard, which you use to select the ITP release 12.2(25)SW3 or later signaling point whose address table file you want to edit, as well as the table type.</p> <p><b>Tip</b> Click <b>Show Log</b> at any time to view the process details.</p> <p>To load the address table from a node:</p> <ol style="list-style-type: none"> <li>Select a node and signaling point from the drop-down list boxes, then click <b>Next</b> to load the address table list.</li> <li>Select an address table list from the drop-down list box, then click <b>Next</b> to enter your passwords.</li> <li>Enter the login password, then click <b>Next</b>.</li> <li>Enter the enable password, then click <b>Next</b>.</li> <li>Click <b>Finish</b> to complete the loading process.</li> </ol> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.</p> <p>For more information, see <a href="#">Loading an Address Table File from a Node, page 16-8</a>.</p> |

| Menu Command                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Creating a New Address Table File

You use the MWTM to create a new address table file. If you:

- Launch the Address Table Editor from the Startup Options window, click **New File**.
- Are already in the Address Table Editor, choose **File > New Table** from the Address Table Editor menu. You are prompted to save changes if you are currently working on an unsaved file.

### Note

If you implement MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.

The Address Table Properties dialog box appears.

| Field or Button | Description                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Table Name      | User-defined unique table name.                                                                                                                                                                                |
| Variant         | SS7 protocol variant. Select a variant from the drop-down list box. Valid variants are: <ul style="list-style-type: none"> <li>• ANSI</li> <li>• China</li> <li>• ITU</li> <li>• NTT</li> <li>• TTC</li> </ul> |

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version         | Version of the file format that the address table uses. Choose either: <ul style="list-style-type: none"> <li>1.1—Available beginning with 12.2(25)SW4a or 12.2(18)IXA</li> <li>1.3—Available beginning with 12.2(25)SW9, 12.2(18)IXC, 12.4(11)SW, or 12.2(33)IRA</li> <li>1.5—Available beginning with 12.2(18)IXG, 12.4(15)SW2, or 12.2(33)IRB. This version supports optional specification of instance number with a point code result.</li> </ul> |
| Instance Number | Number of the instance that the address table uses. Select an instance number from the drop-down list box. Valid numbers are <b>0</b> to <b>7</b> . The default instance number is <b>0</b> .                                                                                                                                                                                                                                                          |
| Network Name    | Network name that the address table uses. Select a network name from the drop-down list box. When you select the network name, the MWTM automatically sets the corresponding variant in the Variant field.<br>If you change the network name for an existing address table file, the new network name must use the same variant.                                                                                                                       |
| OK              | Creates the new address table file and closes the Address Table Properties dialog box.<br>Enter or select values for the new address table file, then click <b>OK</b> . The MWTM creates the new address table file and closes the Address Table Properties dialog box.                                                                                                                                                                                |
| Cancel          | Closes the Address Table Properties dialog box without creating a new address table file.<br>To close the Address Table Properties dialog box without creating a new address table file, click <b>Cancel</b> .                                                                                                                                                                                                                                         |

## Loading an Existing Address Table File

You use the MWTM to load a specific address table file and change the list of address table files. If you:

- Launch the Address Table Editor from the Startup Options window, click **From File**.
- Are already in the Address Table Editor, choose **File > Load > Load From File** from the Address Table Editor menu. You are prompted to save changes if you are currently working on an unsaved file.

**Note**

When you load an address table file, the name of the server that is associated with the address table client and the filename, as well as the table type and mode (can be edit or view only), appear in the window name:

```
MWTM: Address Table Editor -- mwtm-sun8 -- address table.File.1 (MLR edit mode)
```

If you have not yet loaded or saved an address table file, the message `No File Loaded` appears in place of the address-table filename.

The Load File Dialog: Address Table File List appears.

# Loading an Address Table File from a Node

## Note

Before using the Load Address Table From ITP wizard to load address table files, you must enable TFTP file transfer for the address table staging directory by using the **mwtm atbldir** command (see [mwtm atbldir](#), page B-100).

You use the Load Address Table From ITP wizard to load an existing address table file from a node. If you:

- Launch the Address Table Editor from the Startup Options window, click **From Node**.
- Are already in the Address Table Editor, choose **File > Load > Load From Node** from the Address Table Editor menu.

If you implement MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.

The Load Address Table From ITP wizard appears. The left pane of the Load Address Table From ITP wizard contains:

| Step           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Node/SP | <p>You can select the signaling point from which the address table should be loaded. You can optionally check the <b>Filter by Node</b> check box, which limits signaling point selection to a specific node.</p> <p>Select a signaling point and node (optional) from the drop-down list boxes, then click <b>Next</b>. The MWTM retrieves address table names from the chosen signaling point.</p> <p>If no address table names are available, the process ends with errors. If address table names are available, the MWTM proceeds directly to the Select Table step.</p> |
| Login          | <p>You can log in to the ITP. ## Loading an Address Table File from the Archive

**Note**

Before using the Load Address Table From Archive wizard to load address table files, you must use the **mwtm atbldir** command to enable TFTP file transfer for the address table staging directory (see [mwtm atbldir, page B-100](#)).

You can use the Load Address Table From Archive wizard to load an existing address table file from the archive. If you:

- Launch the Address Table Editor, from the Startup Options window, click **From Archive**.
- Are already in the Address Table Editor, choose **File > Load > Load From Archive** from the Address Table Editor menu.

If you implement MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.

The Load Address Table From Archive wizard appears. The left pane of the Load Address Table From Archive wizard contains:

| Step           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select Node/SP | <p>You can select the signaling point from which to load the address table. You can optionally check the <b>Filter by Node</b> check box, which limits signaling point selection to a specific node.</p> <p>Select a signaling point and node (optional) from the drop-down list boxes, then click <b>Next</b>. The MWTM retrieves address table names from the chosen signaling point.</p> <p>If no address table names are available, the process completes with errors. ## Working in Address Table Files

After you create a new address table file or load an existing address table file, you can manage the address table entries.

If you implement MWTM User-Based Access, these options are available to users with authentication level Network Administrator (level 4) and higher. To:

- Add a row to a table, select the table and choose **Edit > Add** from the address table menu; or, **Add** from the right-click menu.
- Delete one or more rows from a table, select the rows and choose **Edit > Delete** from the address table menu; or, **Delete** from the right-click menu.
- Edit the values in each row in each table, type over the current value or select a new value from a drop-down list box. If you are editing a row, you cannot move on until all fields in the row are completed.
- Reset a cell to its previous value. Press **Esc**. Press **Esc** twice to reset the entire row.
- Commit your changes, click outside the row or press **Enter**.

**Note** Once you commit your changes, pressing **Esc** does not reset the cells in the row.

The Address Table Editor window contains:

| Heading        | Description                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------|
| Address Digits | Address digits for the address table. Enter a 1- to 20-digit hexadecimal string. The value must be unique in an address table. |
| Exact Match    | Considers the address an exact match.                                                                                          |
| Result Type    | Type of action to perform on a match.                                                                                          |
| Result Value   | Values to use with the matching action.                                                                                        |

## Result Types and Values

This table defines the list of result types from which to choose when you click in the Result Types column and the drop-down arrow that appears, also the corresponding result values that you enter for MLR address tables:

| Result Type | Result Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Description                                                                   |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| asname      | Route to the specified application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Message is routed to a particular destination M3UA or SUA application server. |
| block       | <p>(Optional, version 1.3 and higher) The Edit SCCP Error window appears. Enter a value:</p> <ul style="list-style-type: none"> <li>• 0—No data for TT</li> <li>• 1—No translation for address</li> <li>• 2—Subsystem congestion</li> <li>• 3—Subsystem is failed</li> <li>• 4—Subsystem is unequipped</li> <li>• 5—SS7 network failure</li> <li>• 6—SS7 network congestion</li> <li>• 7—Unqualified</li> <li>• 8—XUDTS error in message transport</li> <li>• 9—XUDTS error in local processing</li> <li>• A—XUDTS cannot perform reassembly</li> <li>• B—SCCP failure</li> <li>• C—SCCP hop counter violation</li> <li>• D—Segmentation not supported</li> <li>• E—Segmentation failure</li> <li>• WORD ITU SCCP Spare Error Codes in Hex {F..FF}</li> </ul> <p>Click <b>Add</b> to accept the value.</p> | Indicates that you should discard the short message.                          |
| continue    | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Message that the normal SCCP routing will process the message.                |
| group       | Specify the name of the result group to which to route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Indicates that a result group is used for routing.                            |

| Result Type | Result Value                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gt          | <SCCP address> <b>tt</b> <number><br><b>gti</b> <number> | <p>Indicates that the message is routed by using SCCP global title. Places the specified address in the SCCP Called Party Address. The routing indicator changes to <b>RI=GT</b>. Then routed based on the locally provisioned global-title translation table. When you select this parameter and click the corresponding space in the Result Value column, the Edit GTT dialog box appears and contains:</p> <ul style="list-style-type: none"> <li>• <b>SCCP Address</b>—An address string of 1-15 hexadecimal characters. The string is not input in BCD-String format, but in normal form.</li> <li>• <b>Translation Type</b>—Identifies the translation type that the address specifies. Valid values are 0-255.</li> <li>• <b>Global Title Indicator</b>—Identifies the global title indicator value for the specified address. This value is always <b>2</b> for an ANSI variant and might be 2 or 4 for other variant types.</li> <li>• <b>Numbering Plan</b>—Identifies the numbering plan of the specified address. This value is only specified when the <b>gti</b> parameter value is 4. Valid values are 0-15.</li> <li>• <b>Nature of Address Indicator</b>—Identifies the nature of the specified address. ## Editing Address Table Properties

You can use the MWTM to edit the address table properties associated with an address table file. Choose **Edit > Address Table Properties** from the Address Table Editor menu. The Edit Address Table Properties dialog box appears.

| Field or Button | Description                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Table Name      | User-defined unique table name.                                                                                                                                                                                                                                |
| Variant         | SS7 protocol variant. You cannot edit this field.                                                                                                                                                                                                              |
| Version         | Version of the file format that the address table uses. You cannot edit this field.                                                                                                                                                                            |
| Instance Number | Number of the instance that the address table uses. Valid numbers are <b>0</b> to <b>7</b> ; the default instance number is <b>0</b> .                                                                                                                         |
| Network Name    | Network name that the address table uses.<br><br>If you change the network name for an existing address table file, the new network name must use the same variant.                                                                                            |
| OK              | Saves the changes to the address table file.<br><br>Enter or select values, then click <b>OK</b> . The MWTM saves your changes to the address table file.                                                                                                      |
| Cancel          | Closes the Edit Address Table Properties dialog box without saving any changes to the address table file.<br><br>To close the Edit Address Table Properties dialog box at any time without saving any changes to the address table file, click <b>Cancel</b> . |
| Help            | Shows online help for the current window.                                                                                                                                                                                                                      |

## Checking the Semantics of an Address Table File

In using the MWTM, Cisco strongly recommends that you check the semantics of an address table file against a specific ITP, validating these data in the address table file:

**Group Name**—In the Address Table entries, when the result type is *group* the result value is a group name. You must configure the group name in the address entry on the ITP prior to the deployment of the address table. During the validation process, if the group name in the address entry does not have a corresponding match on the ITP, the MWTM generates an error.

To check the semantics of an address table file, choose **File > Semantic Check** from the Address Table Editor menu. The Semantic Check address table dialog box appears.

| Field or Button        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ITP Name or IP Address | Name or IP address of the ITP against which to check the address table file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| OK                     | Closes the Semantic Check Address Table dialog box and opens the Progress dialog box, which shows the progress of the semantic check for the address table file.<br><br>Enter the name or IP address of an ITP, and click <b>OK</b> . The the Semantic Check Address Table dialog box closes and the Progress dialog box opens, which shows the progress of the semantic check for the address table file and any messages that appear while checking the file.<br><br>When the check ends, click <b>OK</b> . The Progress dialog box closes and returns to the Semantic Check Address Table dialog box. |
| Cancel                 | Closes the Semantic Check Address Table dialog Box without checking the semantics of the address table file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Note**

You can also use the **mwtm checkmlr** command to check the semantics of an MLR address table file (see [mwtm checkmlr](#), page B-102).

## Deploying an Address Table File

You use the Deployment wizard to validate an address table file, upload it to an ITP, archive the file, and activate it on the ITP. To launch the Deployment wizard for an address table file, use one of these procedures:

- Choose **File > Deploy** from the Address Table Editor menu (see [Deploying ITP Files](#), page 5-33).
- Enter the **mwtm pushmlr** command (see [mwtm pushmlr](#), page B-120).

## Displaying Basic Information About an Address Table File

You use the MWTM to view basic information about the current address table file. Choose **View > Address Table Info** from the address table menu. The Address Table Information dialog box appears.

The Address Table Information dialog box is read-only.

| Field or Button | Description                                                                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Table Name      | User-defined unique table name.                                                                                                                                  |
| Filename        | Name of the address table file.                                                                                                                                  |
| Version         | Version of the file format that the address table uses.                                                                                                          |
| Variant         | SS7 protocol variant. Valid variants are: <ul style="list-style-type: none"> <li>• ANSI</li> <li>• China</li> <li>• ITU</li> <li>• NTT</li> <li>• TTC</li> </ul> |
| Network Name    | Network name that the address table file uses.                                                                                                                   |
| Instance Number | Number of the instance that the address table uses. Valid numbers are 0 to 7. The default instance number is 0.                                                  |
| Last Modified   | Date and time that someone last modified the address table file.                                                                                                 |
| Total Entries   | Total number of entries in the address table file.                                                                                                               |
| OK              | Closes the address table Table Info dialog box.                                                                                                                  |

## Listing Archived Address Tables

To view a list of deployed and archived MLR address tables, do one of the following:

- Enter the **mwtm listarchive** command (see [mwtm listarchive](#), page B-113).

- In the MWTM Address Table Editor, choose **Edit > Node Archive Management** (see [Node Archive Management, page 5-31](#)).

For a list of current MLR address table files in the address table staging directory, enter the **mwtm listmlr** command (see [mwtm listmlr, page B-115](#)).

## Creating Network Name Mapping Files

When the MWTM discovers your network, it automatically creates and populates the network name-mapping file; therefore, in most cases, you do not need to manually create the network name-mapping file. For more information about running Discovery, see [Discovering Your Network, page 3-4](#).

In some cases, you might want to manually create the network name-mapping file; for example, you might not have run **Discovery** yet, but you want to prepare for a future address table configuration. Also, while you cannot change or delete entries that have been populated automatically by the MWTM, you can add entries manually; and, you can change or delete those manual entries.

To create the network name-mapping file manually; or, add, change, or delete manual entries, choose **View > Network Name Configuration** from the address table menu. If you implement MWTM User-Based Access, this option is available to users with authentication level System Administrator (level 5). The Network Name Configuration dialog box appears.

The Network Name Configuration dialog box contains:

- [Network Name Configuration Dialog Menu, page 16-15](#)
- [Network Name Configuration Dialog Table, page 16-16](#)

## Network Name Configuration Dialog Menu

The menu on the Network Name Configuration dialog box contains:

| Menu Command              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Revert<br>(Ctrl-R) | Loads the most recent network name-mapping file from the MWTM server.<br><br>If the MWTM discovers new entries for the network name-mapping file while you are editing an address table file (for example, if a new network instance is added, or a new network is discovered), the Address Table Editor does not detect the new entries and they do not appear in the Network Name Configuration dialog box. To see the new entries in the dialog box, choose <b>File &gt; Revert</b> . (You can also restart the Address Table Editor to automatically load the most recent network name-mapping file from the MWTM server.) |
| File > Save<br>(Ctrl-S)   | Saves the changes that you make to the network name-mapping file.<br><br>After you add, change, or delete entries and save the file, the MWTM uses the file the next time it discovers the network. However, if the MWTM discovers entries that conflict with manual entries in the file, the MWTM uses (and shows in the Network Name Configuration dialog box) the discovered entries; not the manual entries.                                                                                                                                                                                                               |
| File > Print<br>(Ctrl-P)  | Prints the contents of the network name-mapping file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| File > Close<br>(Ctrl-W)  | Closes the network name-mapping file without saving any additions, changes, or deletions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Menu Command                | Description                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------|
| Edit > Add<br>(Alt-A)       | Adds an entry to the network name-mapping file.                                               |
| Edit > Delete<br>(Delete)   | Deletes the chosen entry from the network name-mapping file.                                  |
| Help > Topics<br>(F1)       | Shows the table of contents for the MWTM online help.                                         |
| Help > Window<br>(Shift-F1) | Shows online help for the current window.                                                     |
| Help > About<br>(F3)        | Shows build date, version, SSL support, and copyright information about the MWTM application. |

## Network Name Configuration Dialog Table

The Network Name Configuration Dialog table contains:

| Field             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network Name      | Network name that the address table file uses.<br><br>If you change the network name for an existing address table file, the new network name must use the same variant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Variant           | SS7 protocol variant. Valid variants are: <ul style="list-style-type: none"> <li>• ANSI</li> <li>• China</li> <li>• ITU</li> <li>• NTT</li> <li>• TTC</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Network Indicator | Type of call that a user places. Valid values are: <ul style="list-style-type: none"> <li>• <b>National</b>—National-bound call. The MWTM routes national calls through the national network.</li> <li>• <b>NationalSpare</b>—National-bound call, used in countries in which more than one carrier can share a point code. In those countries, the Network Indicator differentiates networks.</li> <li>• <b>International</b>—International-bound call. The MWTM forwards international-bound calls to an STP pair that acts as an international gateway.</li> <li>• <b>InternationalSpare</b>—International-bound call, used in countries in which more than one carrier can share a point code. In those countries, networks are differentiated by the Network Indicator.</li> </ul> |
| Discovered        | Indicates whether the: <ul style="list-style-type: none"> <li>• MWTM (Yes) discovered the entry.</li> <li>• A user entered it manually (No).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# Saving an Address Table File

You use the MWTM to save a specific address table file and change the list of address table files.

If you implement MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.

To save the changes that you make to an address table file or change the list of address table files, use one of these procedures. To save the changes that you make to the address table file:

- Without changing the name of the file, choose **File > Save** from the address table menu.
- With a new name, choose **File > Save As** from the address table menu. The Save File Dialog: Address Table File List appears.

| Field or Button or Icon                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Last Modified                                      | Date and time a user last modified the address table file or folder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Size (bytes)                                       | Size of the address table file or folder, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Filename                                           | Name by which you want to save the address table file.<br><br>If you create a new address table filename, you can use any letters, numbers, or characters in the name that your operating system allows. However, if you include spaces in the new name, the MWTM converts those spaces to hyphens (-); for example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Number of Files<br>(visible in bottom left corner) | Total number of address table files and folders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OK                                                 | <p>Saves the address table file or any changes you made to the list of files and closes the dialog box.</p> <p>To save the address table file with a new name, use one of these procedures. To save the file with:</p> <ul style="list-style-type: none"> <li>• A completely new name, enter the new name and click <b>OK</b>.</li> <li>• An existing name, overwriting an old address table file, select the name in the list and click <b>OK</b>.</li> </ul> <p>The MWTM closes the Save File Dialog: Address Table File List and the Progress dialog box appears, which shows the progress of the address table file save, as well as any messages that appear while saving the file.</p> <p>When the file is saved, click <b>OK</b>. The MWTM:</p> <ul style="list-style-type: none"> <li>• Closes the Progress dialog box.</li> <li>• Saves the address table file with the new name</li> <li>• Returns to the Address Table Editor window.</li> </ul> <p><b>Note</b> If another user modifies and saves the address table file before you save your changes, the MWTM asks if you want to overwrite that user's changes. If you do, the other user's changes are overwritten and lost. If you choose not to, your changes are lost; unless you save the address table file to a different filename.</p> |

| Field or Button or Icon | Description                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                  | Deletes the chosen file from the address table file list. The MWTM issues an informational message containing the name and location of the deleted file. |
| Cancel                  | Closes the dialog box without saving the address table file or any changes to the address table file list.                                               |
| Help                    | Shows online help for the dialog box.                                                                                                                    |

When you are ready to exit the Address Table Editor window, choose **File > Exit** from the address table menu.

If you made any changes to the address table file, the MWTM asks if you want to save the changes before leaving the window. Click:

- **Yes** to save the changes.

The MWTM opens the Save File Dialog: Address Table File List, which you use to save the address table file with a new name, or overwrite an existing address table file.

- **No** to close the prompt window.

The MWTM closes the Address Table Editor window without saving any changes to the address table file.

By default, address table files reside in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the default directory is */opt/CSCOsgm/atbl*.
- A different directory, then the default directory resides in that directory.

To change the directory in which the MWTM stores address table files, use the **mwtm atbldir** command (see [mwtm atbldir](#), page B-100).

## Reverting to the Last Saved Address Table File

To revert to the last saved version of the address table file, choose **File > Revert** from the address table menu. The MWTM shows the last saved version of the file.

If you implement MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.

# APPENDIX A

## Client Object Map Reference

In the Mobile Wireless Transport Manager (MWTM) client navigation tree, if you click on an object in a view, the associated tabs appear in the content area in the right pane. This appendix provides an overview of the tabs available for each MWTM object in a view, and contains:

### Note

The MWTM client has a subset of the tabs described in this section.

| Object Type | Related Content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Applicable To                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>     |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>     |
| Syslog              | <a href="#">Viewing the Syslog, page 8-55</a>                   |
| Performance         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a>   |
| Statistics          | <a href="#">Displaying BWG Real-Time Statistics, page 11-48</a> |

| Tab                                                                                                                    | Related Content                                  |
|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| <b>HSRP</b><br><br><b>Note</b> This tab is available only for the CSG2 devices having 7600 chassis and the SAMI cards. | <a href="#">Viewing HSRP details, page 8-134</a> |
| Reports                                                                                                                | <a href="#">Viewing Reports, page 13-3</a>       |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

## CSG1 and CSG2 Node Tabs

Clicking a CSG node in a MWTM view provides you with the following tabs:

| Tab                                                                                                                    | Related Content                                                  |
|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|

| Performance                                                                                                            | <a href="#">Viewing CPU and Memory Performance, page 8-56</a>    |
| Statistics                                                                                                             | <a href="#">Displaying CSG2 Real-Time Statistics, page 11-34</a> |
| <b>HSRP</b><br><br><b>Note</b> This tab is available only for the CSG2 devices having 7600 chassis and the SAMI cards. | <a href="#">Viewing HSRP details, page 8-134</a>                 |
| Reports                                                                                                                | <a href="#">Viewing Reports, page 13-3</a>                       |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

## CSR Node Tabs

Clicking a Cell Site Router (CSR) node in a MWTM view provides you with the following tabs:

| Tab                                                                          | Related Content                                               |
|------------------------------------------------------------------------------|---------------------------------------------------------------|
| Details                                                                      | <a href="#">Viewing Details, page 8-9</a>                     |
| Status Contributors                                                          | <a href="#">Viewing Status Contributors, page 8-7</a>         |
| Notes                                                                        | <a href="#">Viewing Notes, page 7-43</a>                      |
| Troubleshooting                                                              | <a href="#">Viewing Troubleshooting, page 8-40</a>            |
| PWE3 Statistics                                                              | <a href="#">Viewing PWE3 Statistics, page 8-115</a>           |
| <b>Note</b> This tab is only available for CSR nodes operating Pseudo Wires. |                                                               |
| Events                                                                       | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Alarms                                                                       | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Syslog                                                                       | <a href="#">Viewing the Syslog, page 8-55</a>                 |
| Performance                                                                  | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |
| Trap Settings                                                                | <a href="#">Viewing Trap Settings, page 8-62</a>              |
| QOS                                                                          | <a href="#">Displaying QoS Statistics, page 11-101</a>        |
| PWE3 Statistics                                                              | <a href="#">Viewing PWE3 Statistics, page 8-115</a>           |
| Reports                                                                      | <a href="#">Viewing Reports, page 13-3</a>                    |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

## Generic Node Tabs

Clicking a generic node in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                               |
|---------------------|---------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                     |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>         |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                      |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>            |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Performance         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |
| Reports             | <a href="#">Viewing Reports, page 13-3</a>                    |

# GGSN Node Tabs

Clicking a GGSN node in a MWTM view provides you with the following tabs:

| Tab                                                                                                 | Related Content                                                  |
|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| Details                                                                                             | <a href="#">Viewing Details, page 8-9</a>                        |
| Status Contributors                                                                                 | <a href="#">Viewing Status Contributors, page 8-7</a>            |
| Notes                                                                                               | <a href="#">Viewing Notes, page 7-43</a>                         |
| Troubleshooting                                                                                     | <a href="#">Viewing Troubleshooting, page 8-40</a>               |
| Events                                                                                              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>      |
| Alarms                                                                                              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>      |
| Chassis View                                                                                        | <a href="#">Viewing Chassis View, page 8-137</a>                 |
| Syslog                                                                                              | <a href="#">Viewing the Syslog, page 8-55</a>                    |
| <b>Note</b> The syslog tab is available for GGSN R8 and later.                                      |                                                                  |
| Performance                                                                                         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a>    |
| Statistics                                                                                          | <a href="#">Displaying GGSN Real-Time Statistics, page 11-62</a> |
| <b>Note</b> The Statistics tab is available for GGSN R8 and later.                                  |                                                                  |
| APN Instances                                                                                       | <a href="#">Viewing APN Instances, page 8-140</a>                |
| HSRP                                                                                                | <a href="#">Viewing HSRP details, page 8-134</a>                 |
| <b>Note</b> This tab is available only for the CSG2 devices having 7600 chassis and the SAMI cards. |                                                                  |
| Reports                                                                                             | <a href="#">Viewing Reports, page 13-3</a>                       |

## Note

To view all nodes in your system, see [Nodes Table, page 7-5](#).

# HA Node Tabs

Clicking an HA node in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>          |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

| Tab                                                                                                 | Related Content                                                |
|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Alarms                                                                                              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>    |
| Syslog                                                                                              | <a href="#">Viewing the Syslog, page 8-55</a>                  |
| Performance                                                                                         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a>  |
| Statistics                                                                                          | <a href="#">Displaying HA Real-Time Statistics, page 11-59</a> |
| HSRP                                                                                                | <a href="#">Viewing HSRP details, page 8-134</a>               |
| <b>Note</b> This tab is available only for the CSG2 devices having 7600 chassis and the SAMI cards. |                                                                |
| Reports                                                                                             | <a href="#">Viewing Reports, page 13-3</a>                     |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

# IP-RAN Node Tabs

Clicking an IP-RAN node in a MWTM view provides you with the following tabs:

| Tab                                                                                    | Related Content                                               |
|----------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Details                                                                                | <a href="#">Viewing Details, page 8-9</a>                     |
| Status Contributors                                                                    | <a href="#">Viewing Status Contributors, page 8-7</a>         |
| Notes                                                                                  | <a href="#">Viewing Notes, page 7-43</a>                      |
| Troubleshooting                                                                        | <a href="#">Viewing Troubleshooting, page 8-40</a>            |

## Note

To view all nodes in your system, see [Nodes Table, page 7-5](#).

# ITP Node Tabs

Clicking an IP Transfer Point (ITP) node in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                               |
|---------------------|---------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                     |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>         |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                      |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>            |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Syslog              | <a href="#">Viewing the Syslog, page 8-55</a>                 |
| Performance         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |
| Trap Settings       | <a href="#">Viewing Trap Settings, page 8-62</a>              |
| MTP3 Errors         | <a href="#">Viewing ITP MTP3 Errors, page 8-93</a>            |

| Tab                                                                                                            | Related Content                                       |
|----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
| MSU Rates<br><b>Note</b> Only available for ITPs that have an IOS that implements the CISCO-ITP-MSU-RATES-MIB. | <a href="#">Viewing ITP MSU Rates, page 8-94</a>      |
| Non-Stop Operation<br><b>Note</b> Only available for ITPs with the NSO feature: 7500 or 7600 devices.          | <a href="#">Viewing Non-Stop Operation, page 8-95</a> |
| Reports                                                                                                        | <a href="#">Viewing Reports, page 13-3</a>            |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

## Metro Ethernet Node Tabs

Clicking a Metro Ethernet node in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                               |
|---------------------|---------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                     |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>         |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                      |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>            |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Syslog              | <a href="#">Viewing the Syslog, page 8-55</a>                 |
| Performance         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |

## mSEF Node Tabs

This is a 7600 supervisor card in a chassis that contains SAMI cards.

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>          |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

|                                                                                     |                                                               |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Syslog                                                                              | <a href="#">Viewing the Syslog, page 8-55</a>                 |
| Performance                                                                         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |
| Statistics                                                                          | <a href="#">Viewing Statistics, page 11-28</a>                |
| <b>Note</b> Only available for mSEF devices supporting Server Load Balancing (SLB). |                                                               |
| Reports                                                                             | <a href="#">Viewing Reports, page 13-3</a>                    |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

## ONS Node Tabs

Clicking an Optical Networking System (ONS) node in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

## PDNGW Node Tabs

Clicking a Packet Data Node Gateway (PDNGW) in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>          |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Chassis View        | <a href="#">Viewing Chassis View, page 8-137</a>            |

| Tab                                                                                                 | Related Content                                               |
|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Performance                                                                                         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |
| Statistics                                                                                          | <a href="#">Viewing Statistics, page 11-28</a>                |
| APN Instances                                                                                       | <a href="#">Viewing APN Instances, page 8-140</a>             |
| HSRP                                                                                                | <a href="#">Viewing HSRP details, page 8-134</a>              |
| <b>Note</b> This tab is available only for the CSG2 devices having 7600 chassis and the SAMI cards. |                                                               |
| Reports                                                                                             | <a href="#">Viewing Reports, page 13-3</a>                    |

## SGW Node Tabs

Clicking a Serving Gateway (SGW) in a MWTM view provides you with the following tabs:

| Tab                                                                                                 | Related Content                                               |
|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Details                                                                                             | <a href="#">Viewing Details, page 8-9</a>                     |
| Status Contributors                                                                                 | <a href="#">Viewing Status Contributors, page 8-7</a>         |
| Notes                                                                                               | <a href="#">Viewing Notes, page 7-43</a>                      |
| Troubleshooting                                                                                     | <a href="#">Viewing Troubleshooting, page 8-40</a>            |
| Events                                                                                              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Alarms                                                                                              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Chassis View                                                                                        | <a href="#">Viewing Chassis View, page 8-137</a>              |
| Performance                                                                                         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |
| Statistics                                                                                          | <a href="#">Viewing Statistics, page 11-28</a>                |
| APN Instances                                                                                       | <a href="#">Viewing APN Instances, page 8-140</a>             |
| HSRP                                                                                                | <a href="#">Viewing HSRP details, page 8-134</a>              |
| <b>Note</b> This tab is available only for the CSG2 devices having 7600 chassis and the SAMI cards. |                                                               |
| Reports                                                                                             | <a href="#">Viewing Reports, page 13-3</a>                    |

## PDSN Node Tabs

Clicking a Packet Data Serving Node (PDSN) in a MWTM view provides you with the following tabs:

| Tab                                                                                                 | Related Content                                               |
|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Details                                                                                             | <a href="#">Viewing Details, page 8-9</a>                     |
| Status Contributors                                                                                 | <a href="#">Viewing Status Contributors, page 8-7</a>         |
| Notes                                                                                               | <a href="#">Viewing Notes, page 7-43</a>                      |
| Troubleshooting                                                                                     | <a href="#">Viewing Troubleshooting, page 8-40</a>            |
| Events                                                                                              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Alarms                                                                                              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Chassis View                                                                                        | <a href="#">Viewing Chassis View, page 8-137</a>              |
| Performance                                                                                         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |
| Statistics                                                                                          | <a href="#">Viewing Statistics, page 11-28</a>                |
| HSRP                                                                                                | <a href="#">Viewing HSRP details, page 8-134</a>              |
| <b>Note</b> This tab is available only for the CSG2 devices having 7600 chassis and the SAMI cards. |                                                               |
| Reports                                                                                             | <a href="#">Viewing Reports, page 13-3</a>                    |

## RAN Service Card Node Tabs

Clicking a Radio Access Network (RAN) Service Card (SVC) node in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                               |
|---------------------|---------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                     |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>         |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                      |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>            |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>   |
| Syslog              | <a href="#">Viewing the Syslog, page 8-55</a>                 |
| Performance         | <a href="#">Viewing CPU and Memory Performance, page 8-56</a> |
| Trap Settings       | <a href="#">Viewing Trap Settings, page 8-62</a>              |
| QOS                 | <a href="#">Displaying QoS Statistics, page 11-101</a>        |
| Reports             | <a href="#">Viewing Reports, page 13-3</a>                    |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

## CDT Node Tabs

Clicking a CDT node tab provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

## Unknown Node Tabs

**Note**

Unknown nodes will show a performance tab when the unknown node implements the CISCO-PROCESS-MIB and either the CISCO-ENHANCED-MEMPOOL-MIB or CISCO-MEMORY-POOL-MIB.

Clicking a node in a MWTM view with unknown node status provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

**Note**

To view all nodes in your system, see [Nodes Table, page 7-5](#).

# Signaling Point Tabs

Clicking on a signaling point in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>          |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| ITP Access Lists    | <a href="#">Viewing Route Detail, page 8-119</a>            |
| Route Detail        | <a href="#">Viewing Route Detail, page 8-119</a>            |
| GTT MAP Status      | <a href="#">Viewing GTT MAP Status, page 8-120</a>          |
| GTT Statistics      | <a href="#">Viewing GTT Statistics, page 8-121</a>          |
| MLR Details         | <a href="#">Viewing MLR Details, page 8-125</a>             |
| MTP3 Event Log      | <a href="#">Viewing the MTP3 Event Log, page 8-124</a>      |
| Reports             | <a href="#">Viewing Reports, page 13-3</a>                  |

## Note

To view all signaling points in your system, see [Signaling Points Table, page 7-9](#).

# Linkset Tabs

Clicking on a linkset in a MWTM view provides you with the following tabs:

| Tab                  | Related Content                                              |
|----------------------|--------------------------------------------------------------|
| Details              | <a href="#">Viewing Details, page 8-9</a>                    |
| Status Contributors  | <a href="#">Viewing Status Contributors, page 8-7</a>        |
| Notes                | <a href="#">Viewing Notes, page 7-43</a>                     |
| Troubleshooting      | <a href="#">Viewing Troubleshooting, page 8-40</a>           |
| Events               | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>  |
| Alarms               | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>  |
| Linkset Access Lists | <a href="#">Viewing ITP Linkset Access Lists, page 8-117</a> |
| Reports              | <a href="#">Viewing Reports, page 13-3</a>                   |
| Statistics           | <a href="#">Viewing ITP Linkset Statistics, page 8-117</a>   |

**Note**

To view all linksets in your system, see [Linksets Table, page 7-11](#).

## Link Tabs

Clicking on a link in a MWTM view provides you with the following tabs:

| Tab                        | Related Content                                                                |
|----------------------------|--------------------------------------------------------------------------------|
| Details                    | <a href="#">Viewing Details, page 8-9</a>                                      |
| Notes                      | <a href="#">Viewing Notes, page 7-43</a>                                       |
| Troubleshooting            | <a href="#">Viewing Troubleshooting, page 8-40</a>                             |
| Events                     | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>                    |
| Alarms                     | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>                    |
| Reports                    | <a href="#">Viewing Reports, page 13-3</a>                                     |
| Interface Details          | <a href="#">Interface Details, page 8-75</a>                                   |
| Statistics                 | <a href="#">Statistics: Application Server Process Associations, page 8-84</a> |
| SCTP Assoc. Config Details | <a href="#">SCTP Association Configuration Details, page 8-80</a>              |
| SCTP Assoc. Stats Details  | <a href="#">SCTP Association Statistics Details, page 8-82</a>                 |
| Q.752 Measurements         | <a href="#">Q.752 Measurements, page 8-78</a>                                  |
| Status Details             | <a href="#">Status Details, page 8-89</a>                                      |

**Note**

To view all links in your system, see [Links Table, page 7-14](#).

## Application Server Tabs

Clicking on an application server in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>          |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

| Tab        | Related Content                                            |
|------------|------------------------------------------------------------|
| Statistics | <a href="#">Statistics: Application Servers, page 8-83</a> |
| Reports    | <a href="#">Viewing Reports, page 13-3</a>                 |

**Note**

To view all application servers in your system, see [Application Servers Table, page 7-15](#).

## Application Server Process Tabs

Clicking on an application server process in a MWTM view provides you with the following tabs:

| Tab     | Related Content                                             |
|---------|-------------------------------------------------------------|
| Details | <a href="#">Viewing Details, page 8-9</a>                   |
| Notes   | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events  | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms  | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

**Note**

To view all application server processes in your system, see [Application Server Processes Table, page 7-17](#).

## Application Server Process Association Tabs

Clicking on an application server process association in a MWTM view provides you with the following tabs:

| Tab                        | Related Content                                                                |
|----------------------------|--------------------------------------------------------------------------------|
| Details                    | <a href="#">Viewing Details, page 8-9</a>                                      |
| Notes                      | <a href="#">Viewing Notes, page 7-43</a>                                       |
| Troubleshooting            | <a href="#">Viewing Troubleshooting, page 8-40</a>                             |
| Events                     | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>                    |
| Alarms                     | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>                    |
| Statistics                 | <a href="#">Statistics: Application Server Process Associations, page 8-84</a> |
| SCTP Assoc. Config Details | <a href="#">SCTP Association Configuration Details, page 8-80</a>              |
| SCTP Assoc. Stats Details  | <a href="#">SCTP Association Statistics Details, page 8-82</a>                 |
| Interface Details          | <a href="#">Interface Details, page 8-75</a>                                   |
| Reports                    | <a href="#">Viewing Reports, page 13-3</a>                                     |

**Note**

To view all application server process associations in your system, see [Application Server Process Associations Table, page 7-19](#).

## Signaling Gateway-Mated Pair Tabs

Clicking on a signaling gateway-mated pair in a MWTM view provides you with the following tabs:

| Tab                        | Related Content                                                   |
|----------------------------|-------------------------------------------------------------------|
| Details                    | <a href="#">Viewing Details, page 8-9</a>                         |
| Notes                      | <a href="#">Viewing Notes, page 7-43</a>                          |
| Troubleshooting            | <a href="#">Viewing Troubleshooting, page 8-40</a>                |
| Events                     | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>       |
| Alarms                     | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>       |
| SCTP Assoc. Config Details | <a href="#">SCTP Association Configuration Details, page 8-80</a> |
| SCTP Assoc. Stats Details  | <a href="#">SCTP Association Statistics Details, page 8-82</a>    |
| Interface Details          | <a href="#">Interface Details, page 8-75</a>                      |

**Note**

To view all signaling gateway-mated pairs in your system, see [Signaling Gateway Mated Pairs Table, page 7-21](#).

## Interface Tabs

Clicking on an interface in a MWTM view provides you with the following tabs:

| Tab                                    | Related Content                                             |
|----------------------------------------|-------------------------------------------------------------|
| Details                                | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors                    | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes                                  | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events                                 | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms                                 | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Troubleshooting                        | <a href="#">Viewing Troubleshooting, page 8-40</a>          |
| Interface Performance <sup>1</sup>     | <a href="#">Viewing Data for Interfaces, page 8-64</a>      |
| Interface Errors/Discards <sup>2</sup> | <a href="#">Viewing Data for Interfaces, page 8-64</a>      |

| Tab                                                                                                                                   | Related Content                                        |
|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| Interface Advanced Details <sup>3</sup>                                                                                               | <a href="#">Viewing Data for Interfaces, page 8-64</a> |
| TDM Statistics                                                                                                                        | <a href="#">Viewing TDM Statistics, page 8-101</a>     |
| <b>Note</b> TDM statistics are available only on some interfaces on nodes that implement either the CISCO-ICSUDSU-MIB or RFC1406-MIB. |                                                        |

1. May not be applicable for interfaces that do not collect statistics.
2. May not be applicable for interfaces that do not collect statistics.
3. May not be applicable for interfaces that do not collect statistics.

**Note**

To view all interfaces in your system, see [Interfaces Table, page 7-23](#).

## UMTS and GSM Interface Tabs

Clicking on a RAN shorthaul (either UMTS or GSM) in a MWTM view provides you with the following tabs:

| Tab                   | Related Content                                                |
|-----------------------|----------------------------------------------------------------|
| Alarms                | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>    |
| Details               | <a href="#">Viewing Details, page 8-9</a>                      |
| Errors                | <a href="#">Viewing Shorthaul Errors, page 8-111</a>           |
| Notes                 | <a href="#">Viewing Notes, page 7-43</a>                       |
| Recent Events         | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>    |
| Shorthaul Performance | <a href="#">Viewing Shorthaul Performance Data, page 8-106</a> |
| Shorthaul Errors      | <a href="#">Viewing Shorthaul Errors, page 8-111</a>           |
| Status Contributors   | <a href="#">Viewing Status Contributors, page 8-7</a>          |
| Troubleshooting       | <a href="#">Viewing Troubleshooting, page 8-40</a>             |

**Note**

To view all interfaces in your system, see [Interfaces Table, page 7-23](#).

## Card Tabs

Clicking on a card in a MWTM view provides you with the following tabs:

| Tab                                                                            | Related Content                                             |
|--------------------------------------------------------------------------------|-------------------------------------------------------------|
| Details                                                                        | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors                                                            | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| <b>Note</b> Only available when the card has child objects such as interfaces. |                                                             |
| Notes                                                                          | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events                                                                         | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms                                                                         | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

**Note**

To view all cards in your system, see [Cards Table, page 7-25](#).

## RAN Backhaul Tabs

Clicking on a RAN backhaul in a MWTM view provides you with the following tabs:

| Tab                  | Related Content                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Details              | <a href="#">Viewing Details, page 8-9</a>                                                                                                                                                                               |
| Status Contributors  | <a href="#">Viewing Status Contributors, page 8-7</a>                                                                                                                                                                   |
| Notes                | <a href="#">Viewing Notes, page 7-43</a>                                                                                                                                                                                |
| Troubleshooting      | <a href="#">Viewing Troubleshooting, page 8-40</a>                                                                                                                                                                      |
| Events               | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>                                                                                                                                                             |
| Alarms               | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>                                                                                                                                                             |
| RAN Shorthauls       | <a href="#">Viewing RAN Shorthauls, page 8-137</a>                                                                                                                                                                      |
| Backhaul Performance | <a href="#">Viewing Backhaul Performance Data, page 8-107</a> (Real-time data on the MWTM client)<br><a href="#">Displaying Backhaul Performance Statistics, page 11-29</a> (Historical data on the MWTM web interface) |
| Backhaul Errors      | <a href="#">Viewing Backhaul Errors, page 8-115</a> (Real-time data on the MWTM client)<br><a href="#">Displaying Backhaul Error Statistics, page 11-33</a> (Historical data on the MWTM web interface)                 |

**Note**

To view all RAN backhauls in your system, see [RAN Backhauls Table, page 7-27](#).

## PWE3 Backhaul Tabs

Clicking on a PWE3 backhaul in a MWTM view provides you with the following tabs:

| Tab                   | Related Content                                             |
|-----------------------|-------------------------------------------------------------|
| Details               | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors   | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes                 | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events                | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms                | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| PWE3 Virtual Circuits | <a href="#">PWE3 Virtual Circuits, page 7-33</a>            |

## PWE3 Virtual Circuits Tabs

Clicking on a PWE3 virtual circuit in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>          |
| PWE3 Statistics     | <a href="#">Viewing PWE3 Statistics, page 8-115</a>         |
| Reports             | <a href="#">Viewing Reports, page 13-3</a>                  |

## Access Point Name Node Tabs

This section provides information about the tabs available for Access Point Name nodes.

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Troubleshooting     | <a href="#">Viewing Troubleshooting, page 8-40</a>          |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| APN Instances       | <a href="#">Viewing APN Instances, page 8-140</a>           |

| Tab   | Related Content                                       |
|-------|-------------------------------------------------------|
| Nodes | <a href="#">Viewing GGSN Nodes, page 8-141</a>        |
| Tools | <a href="#">Using the APN Search Tool, page 8-142</a> |

## Physical and Management Interface Folder Tabs

The Physical folder that contains a list of the physical interfaces and cards that belong to the node. The Management Interface folder contains a list of interfaces that the MWTM uses to manage the node.

Clicking on a Physical or Management Interface folder in a MWTM view provides you with the following tabs:

| Tab                 | Related Content                                             |
|---------------------|-------------------------------------------------------------|
| Details             | <a href="#">Viewing Details, page 8-9</a>                   |
| Status Contributors | <a href="#">Viewing Status Contributors, page 8-7</a>       |
| Notes               | <a href="#">Viewing Notes, page 7-43</a>                    |
| Events              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |
| Alarms              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a> |

# APPENDIX **B**

## Command Reference

---

This appendix provides the format and a brief description of these Cisco Mobile Wireless Transport Manager (MWTM) commands, listed alphabetically. Each command is available on the:

- Server only (including Solaris and Linux).
- Server and Solaris or Linux clients only.
- Server and all clients (including windows) as indicated.

You can run commands from:

- *install\_directory/bin*  
where *install\_directory* is the directory where the MWTM server is installed (by default, */opt/CSCOsgm*).
- Alternatively, if you have the *install\_directory/bin* in your path, you can simply run commands from in your path.

This appendix contains:

- [General Commands, page B-1](#)
- [ITP-Only Commands, page B-96](#)
- [mSEF-Only Commands, page B-126](#)

**Note**

---

General commands are for ITP, IP-RAN, and mSEF networks; ITP commands are only for ITP networks. mSEF commands are only for mSEF networks.

---

## mwtm

### Server and Solaris or Linux Clients Only

#### Command Description

Displays the command syntax for the **mwtm** command and all of its options. The function of this command is identical to **mwtm help**.

MWTM help is network specific, so only the commands pertaining to each network type appear. If you set all network types, you can see all the commands.

## mwtm addcreds

### Server Only

#### Full Syntax

**mwtm addcreds** [**-d** *nodetype*] [**-u** *username* **-n** *enable username*] [**-i** *ipaddress*] [**-r** *protocoltype*]

#### Command Description

Adds credentials for a given IP address, if specified. Otherwise, credentials are added to the system as Default, which applies the specified credentials to all nodes in the MWTM database.

- To add credentials for a specific node type, specify **-d** and the **nodetype**, which can be:
  - **itp**—ITP nodes
  - **ons**—ONS nodes
  - **csr**—Cell Site Router (CSR) nodes (Cisco MWR and Cisco 3825)
  - **ran\_svc**—RAN\_SVC nodes
  - **ip-ran**—IP-RAN nodes
- To add username credentials, specify **-u** and the username.
- To add **enable** username credentials, specify **-n** and the **enable** username.
- To add credentials for a particular IP address only, specify **-i** and the IP address of the node.

- To add the protocol type, specify **-r** and one protocol, which can be:
  - **telnet**—Telnet access
  - **ssh**—Secure shell access

You must log in as the root user or superuser to use this command.

## mwtm addsnmpcomm

#### Full Syntax

**mwtm addsnmpcomm** **-i** *ipaddress* [**-r** *retry* | **-t** *timeout* | **-p** *poll*] **-c** *community*

#### Command Description

Adds an SNMP configuration to the MWTM server.

- **-i** *ipaddress*—the IP address of the device (required)
- **-r** *retry*—the number of times to retry connecting to the device (optional)
- **-t** *timeout*—the timeout value, in seconds (optional)
- **-p** *poll*—the poll interval, in minutes (optional)
- **-c** *community*—the read community string of the device (required)

You do not need to restart the MWTM server.

## mwtm adduser

#### Server Only

#### Full Syntax

**mwtm adduser** [*username*]

#### Command Description

If you enable MWTM User-Based Access, adds the specified user to the authentication list.

When you add a user, the MWTM prompts you for this information:

- User's password. When setting the password, follow the rules and considerations in [Creating Secure Passwords, page 2-7](#).
- Whether to force the user to change the password at the next log in. The default is not to force the user to change the password.

- Authentication level for the user. Valid levels are:
  - 1—Basic User
  - 2—Power User
  - 3—Network Operator
  - 4—Network Administrator
  - 5—System Administrator
  - 11—Custom Level 1
  - 12—Custom Level 2

You must log in as the root user or superuser to use this command.

**Note**

If you enable Solaris authentication, you must log in as the root user, not as superuser, to use this command (see [Implementing Secure User Access \(Server Only\)](#), page 2-2).

**Related Topic**

- [Configuring User Access](#), page 2-1
- [Implementing Secure User Access \(Server Only\)](#), page 2-2

## mwtm archivedirsize

**Server Only****Full Syntax**

**mwtm archivedirsize** [*megs*]

**Command Description**

Sets the maximum size (in megabytes) of the console log archive directory.

To view help for this command, include the following parameter: -h.

## mwtm authtype

**Server Only****Full Syntax**

**mwtm authtype** [*local | solaris | linux*]

**Command Description**

Configures MWTM security authentication:

- **local**—Allows creation of user accounts and passwords that are local to the MWTM system. When using this method, you manage usernames, passwords, and access levels by using MWTM commands.

- **solaris**—Uses standard Solaris-based user accounts and passwords, as the */etc/nsswitch.conf* file specifies. You can provide authentication with the local */etc/passwd* file; from a distributed Network Information Services (NIS) system; or with any other authentication tool, such as RADIUS or TACACS+ (for details, see [Additional Authentication Tools, page 2-4](#)).
- **linux**—Uses standard Linux-based user accounts and passwords, as the */etc/nsswitch.conf* file specifies. You can provide authentication with the local */etc/passwd* file; from a distributed NIS system; or with any other authentication tool, such as RADIUS or TACACS+ (for details, see [Additional Authentication Tools, page 2-4](#)).

**Note** When using the **solaris** or **linux** options, if you have enabled user access, you must enable SSL (see [Implementing SSL Support in the MWTM, page 2-21](#) to ensure secure passwords between the MWTM client and server.)

You must log in as the root user to use this command.

#### Related Topic

- [Configuring User Access, page 2-1](#)
- [Implementing Secure User Access \(Server Only\), page 2-2](#)

## mwtm backup

### Server Only

#### Command Description

**Note**

Since backups can be large, ensure that your file system has enough space to handle them.

Backs up MWTM data files to the MWTM installation directory. The MWTM automatically backs up all data files nightly at 1:30 AM; but, you can use this command to back up the files at any other time. If you installed the MWTM in:

- The default directory, */opt*, then the locations of the backup files are */opt/mwtm61-client-backup.tar.Z* and */opt/mwtm61-server-backup.tar.Z*.
- A different directory, then the backup files reside in that directory.

To restore the MWTM data files from the previous night's backup, use the **mwtm restore** command. Do not try to extract the backup files manually.

You must log in as the root user (not as a superuser) to use this command.

**Note**

The MWTM performs a database integrity check during the backup. If the check fails, the previous backup is not overwritten. Instead, the MWTM creates a new failed file (for example: *mwtm61-server-backup-failed.tar.Z*).

#### Related Topic

- [Configuring a Backup MWTM Server, page 4-10](#)
- [mwtm backupdays, page B-10](#)

- [mwtm backupdir](#), page B-11
- [mwtm restore](#), page B-58

## mwtm backupdays

### Server Only

### Full Syntax

**mwtm backupdays** [*days*]

### Command Description

This command sets the number of days to save backup files on the MWTM server and client. The default value is 1 day, but you can configure the MWTM to save multiple days of backup files.

This command accepts values from 1 to 30 days. If you attempt to set a value outside of this range, the MWTM responds with this message:

Value out of range of 1-30.

The MWTM stores backup files in the backup directory (see [mwtm backupdir](#), page B-11). The MWTM uses this file naming convention when there are multiple backup files:

mwtm<releasenumber>-[server|client]-backup.tar.[date].Z

For example:

mwtm61-client-backup.tar.[date].Z

mwtm61-server-backup.tar.[date].Z

If the number of backup days is more than one, and you run the **mwtm restore** command, the MWTM will prompt you for a server or client backup file to restore from (because there would be more than one backup file to choose from). See [mwtm restore](#), page B-58.

Here is an example of setting the number of backup days to 5 days:

```
./mwtm backupdays
```

```
Current value is: 1
```

```
Enter number of days to save backup files <1-30>: [1] 5
```

```
Setting number of days to save backup files to 5 days.
```

In this example, the MWTM saves backup files for the last five days. The MWTM deletes backup files that are older than five days.

### Note

If you notice multiple backups, ensure that there is enough free space in the backupdir file system (see [mwtm backupdir](#), page B-11).

### Related Topic

- [Backing Up or Restoring MWTM Files \(Server Only\)](#), page 2-30
- [mwtm backupdir](#), page B-11
- [mwtm restore](#), page B-58

## mwtm backupdir

### Server Only

### Full Syntax

**mwtm backupdir** [*directory*]

### Command Description

#### Note

You must stop the MWTM server before performing this command. You are prompted whether to continue.

You can change the directory in which the MWTM stores its nightly backup files. The default backup directory is the directory in which the MWTM is installed. If you installed the MWTM in:

- The default directory, */opt*, then the default backup directory is also */opt*.
- A different directory, then the default backup directory is that directory.

If you specify a new directory that does not exist, the MWTM does not change the directory and issues an appropriate message.

You must log in as the root user to use this command.

### Related Topic

- [Configuring a Backup MWTM Server, page 4-10](#)
- [mwtm backupdays, page B-10](#)

## mwtm backuplog

### Server Only

### Full Syntax

**mwtm backuplog** [**clear** | **-r**]

### Command Description

Uses PAGER to display the contents of the system backup log.

To clear the log, enter **mwtm backuplog clear**.

To display the contents of the log in reverse order, with the most recent commands at the beginning of the log, enter **mwtm backuplog -r**.

You must log in as the root user or superuser to use this command.

## mwtm backupstats

### Server Only

### Full Syntax

**mwtm backupstats**

### Command Description

This command displays statistics on backup process.

You must log in as the root user or superuser to use this command.

## mwtm badloginalarm

### Server Only

### Full Syntax

**mwtm badloginalarm** [*number-of-attempts* | **clear**]

### Command Description

If you enable MWTM User-Based Access, number of unsuccessful log-in attempts allowed before the MWTM generates an alarm.

The valid range is 1 unsuccessful attempt to an unlimited number of unsuccessful attempts. The default value is 5 unsuccessful attempts.

The MWTM records alarms in the system security log file. The default path and filename for the system security log file is */opt/CSCOsgm/logs/sgmSecurityLog.txt*. If you installed the MWTM in a directory other than */opt*, then the system security log file resides in that directory.

To view the system security log file, enter **mwtm seclog**. You can also view the system security log on the MWTM System Security Log web page (see [Displaying the Contents of the System Security Log \(Server Only\)](#), page 2-17).

To disable this function (that is, to prevent the MWTM from automatically generating an alarm after unsuccessful log-in attempts), enter **mwtm badloginalarm clear**.

You must log in as the root user or superuser to use this command.

### Related Topic

[Automatically Disabling Users and Passwords \(Server Only\)](#), page 2-10

## mwtm badlogindisable

### Server Only

### Full Syntax

**mwtm badlogindisable** [*number-of-attempts* | **clear**]

**Command Description**

If you enable MWTM User-Based Access, number of unsuccessful log-in attempts by a user allowed before the MWTM disables the user's authentication. The MWTM does not delete the user from the authentication list, the MWTM only disables the user's authentication. To re-enable the user's authentication, use the **mwtm enableuser** command.

The valid range is 1 unsuccessful attempt to an unlimited number of unsuccessful attempts. The default value is 10 unsuccessful attempts.

To disable this function (that is, to prevent the MWTM from automatically disabling a user's authentication after unsuccessful log-in attempts), enter **mwtm badlogindisable clear**.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Automatically Disabling Users and Passwords \(Server Only\), page 2-10](#)

## mwtm browserpath

**Server and Solaris or Linux Clients Only****Command Description**

Sets a user-defined MWTM web browser path and verifies that the browser specified by the user exists.

You must log in as the root user (not as a superuser) to use this command.

**Related Topic**

[Chapter 11, "Accessing Data from the Web Interface"](#)

## mwtm certgui

**Solaris Clients Only****Command Description**

If you enable the Secure Sockets Layer (SSL) on your MWTM system, opens the MWTM Certificate Tool window in which you manage SSL certificates on the MWTM client.

**Note**

If you installed the MWTM server and client on the same workstation, running this command is not necessary. Instead, when you use the **mwtm keytool** command to manage SSL certificates on the server, the MWTM automatically manages the certificates on the client.

You must log in as the root user (not as a superuser) to use this command in Solaris.

**Related Topic**

[Launching the MWTM Certificate Tool for SSL, page 2-24](#)

## mwtm certtool

### Server and Solaris Clients Only

#### Full Syntax

**mwtm certtool** [**clear** | **delete** *alias* | **export** *alias* [-**file** *filename*] | **import** *alias* [-**file** *filename*] | **list**]

#### Command Description

If you enable the Secure Sockets Layer (SSL) on your MWTM system, you can use this command to manage SSL certificates on the MWTM client from the command line.

#### Note

If you installed the MWTM server and client on the same workstation, running this command is not necessary. Instead, when you use the **mwtm keytool** command to manage SSL certificates on the server, the MWTM automatically manages the certificates on the client.

Use these keywords and arguments with this command:

- **import** *alias* [-**file** *filename*]—Imports a signed SSL certificate in X.509 format. This is the most common use for this command.

The *alias* argument can be any character string; the hostname of the server from which you are importing the certificate is a good choice.

To import the certificate from a file, specify the optional **-file** keyword and a filename.

- **export** *alias* [-**file** *filename*]—Exports the specified SSL certificate in X.509 format. To export the certificate to a file, specify the optional **-file** keyword and a filename.
- **list**—Lists all SSL certificates on the MWTM client.
- **delete** *alias*—Removes the specified SSL certificate from the MWTM client.
- **clear**—Removes all SSL certificates from the MWTM client.

**Solaris Only:** You must log in as the root user (not as a superuser) to use this command in Solaris.

#### Related Topic

[Importing an SSL Certificate to an MWTM Client, page 2-25](#)

## mwtm changes

### Server Only

#### Command Description

Displays the contents of the MWTM CHANGES file. The CHANGES file lists all bugs that have been resolved in the MWTM, sorted by release. If you installed the MWTM in:

- The default directory, */opt*, then the MWTM CHANGES file resides in the */opt/CSCOs/gm/install* directory.
- A different directory, then the file resides in that directory.

## mwtm chartwindow

### Server Only

### Full Syntax

**mwtm chartwindow** [*mins* | **clear**]

### Command Description

Specifies the maximum amount of data appearing (in minutes) for real-time ITP charts.

For example, if you set this command to 20 minutes, the charts are refreshed every 20 minutes to show the latest data. The valid range is between 5 and 120 minutes, and the default setting is 15 minutes.

To return to the default setting, enter the **mwtm chartwindow clear** command.

You must log in as the root user or superuser to use this command.

## mwtm checksystem

### Server Only

### Command Description

Checks the system for a server installation and reviews the:

- System requirements
- TCP/IP address and port usage checks
- Disk space usage check
- Server summary
- Error summary

You must log in as the root user (not as a superuser) to use all features of this command. The *logs/troubleshooting* folder has limited permissions to read when the user is not a root user.

## mwtm clean

### Server Only

### Command Description

Removes all MWTM data from the MWTM server, excluding message log files, backup files, and report files. This command restores the MWTM server to a state that would exist after a new installation of the MWTM; *except for the message log files, backup files, and report files.*

Removed data includes all:

- MWTM data
- Notes
- Preferences
- Security settings
- Route files

- GTT files
- Address table files
- Seed files
- Event filters
- Report control files
- Views
- Any user-created files stored in the MWTM directories

You must log in as the root user (not as a superuser) to use this command.

## mwtm cleanall

### Server Only

#### Command Description

Removes all MWTM data from the MWTM server, including message log files, backup files, report files, configuration settings, and security settings. This command restores the MWTM server to a state that would exist after a new installation of the MWTM.

Data removed includes all:

- MWTM data
- Notes
- Preferences
- Security settings
- Route files
- GTT files
- Address table files
- Seed files
- Event filters
- Report control files
- Views
- Any user-created files stored in the MWTM directories

You must log in as the root user (not as a superuser) to use this command.

## mwtm cleandb

### Server Only

#### Command Description

Removes all MWTM data from the MWTM server, including the:

- Core data model database
- All view files

- Notes associated with objects
- Event filters
- MWTM data
- Any user-created files stored in the MWTM directories

This command restores the MWTM server to a state that would exist after a new installation of the MWTM; *except for the presence of the retained files.*

The following data is excluded:

- Message log files
- Backup files
- Report files
- Configuration settings
- Security settings
- User credentials
- Route files
- GTT files
- Address table files

You must log in as the root user (not as a superuser) to use this command.

## mwtm cleandiscover

### Server Only

### Full Syntax

**mwtm cleandiscover** [*seed-node*] [*seed-node*]...

### Command Description

You can use this command to delete all current network data and begin a clean discovery of the network from the command line. Use the *seed-node* arguments to specify the DNS names or IP addresses of one or more seed nodes.

#### Note

When you begin a clean discovery, the MWTM stops any real-time polls that are running and issues appropriate messages.

Running this command does not remove any notes, preferences, route files, views, message log files, backup files, or report files, nor any user-created files stored in the MWTM directories.

You must log in as the root user or superuser to use this command.

### Related Topic

[Discovering Your Network, page 3-4](#)

## mwtm cliconntimer

### Server Only

#### Full Syntax

**mwtm cliconntimer** [*number-of-seconds* | **clear**]

#### Command Description

Specifies how long, in seconds, an MWTM client should wait for a message from the MWTM server before the client attempts to contact the server and takes one of these actions. If the server:

- Responds to the client, the client reconnects to the server.
- Does not respond to the client, but a backup server is configured, the client attempts to connect to the backup server.
- Does not respond to the client and no backup server is configured, the client displays a dialog box with this message:

Connection to the server has timed out.  
Client could not establish 2-way communications with the server.  
If you are running through a VPN you may have entered the wrong client IP address.

Click **OK** to exit the client.

The MWTM writes this message to the client console log:

- Solaris client—*/opt/CSCOsgmClient/logs/sgmConsoleLog.txt*
- Windows client—*C:\Program Files\Cisco Systems\MWTM Client\logs\consoleLog.txt*

The valid range is 10 seconds to an unlimited number of seconds. The default value is 60 seconds.

To restore the default timeout of 60 seconds, enter the **mwtm cliconntimer clear** command.

Any changes you make take effect when you restart the MWTM server.

You must log in as the root user or superuser to use this command.

## mwtm client

### Solaris or Linux Clients Only

#### Full Syntax

**mwtm client** [*hostname*]

#### Command Description

Starts an MWTM client on the specified host. If no hostname is specified, starts an MWTM client on the default host, as specified during installation. See [Connecting to a New Server, page 5-40](#) for information about determining the default host.

If you access a remote workstation by Telnet, the DISPLAY variable must be set to your local display or you cannot use this command. If the DISPLAY variable is not set automatically, you must set it manually. See [Setting the DISPLAY Variable for Solaris or Linux Clients, page 3-3](#) for details.

#### Related Topic

[Starting the MWTM Client, page 3-3](#)

## mwtm clientfailoverprompt

### Solaris or Linux Clients Only

#### Full Syntax

**mwtm clientfailoverprompt** [enable | disable | status]

#### Command Description

Indicates whether or not a prompt is issued when the primary server fails over to the secondary server:

- **enable**—Enables the prompt, and you are prompted to provide credentials before failing over to the secondary server.

#### Note

MWTM user access must be enabled, and your user ID and password must be the same on both servers. Also, ensure that the backup server is defined (see [Configuring a Backup MWTM Server, page 4-10](#)).

- **disable**—Disables the prompt, and you are connected to the secondary server automatically.
- **status**—Displays the current status of prompt (whether enabled or disabled).

You must log in as the root user or superuser to use this command.

## mwtm clientlogs

### Server Only

#### Command Description

Uses PAGER to display the MWTM client log files.

The MWTM client log files contain client console output for all MWTM clients, one file per local or remote client. The MWTM automatically creates the file for a client when the client starts. If you installed the MWTM in:

- The default directory, */opt*, then the MWTM client log file resides in the */opt/CSCOs/gm/logs/clientLogs* directory.
- A different directory, then the file resides in that directory.

## mwtm clitimeout

### Server Only

#### Full Syntax

**mwtm clitimeout** [mins | clear]

#### Command Description

Specifies how long, in minutes, an MWTM client can be inactive before the MWTM automatically disconnects it.

This function is disabled by default. If you do not specify this command, clients are never disconnected as a result of inactivity.

If you enter the **mwtm clitimeout** command, the valid range is 1 minute to an unlimited number of minutes. No default value exists.

If you enable this function and you want to disable it (that is, never disconnect a client as a result of inactivity), enter the **mwtm clitimeout clear** command.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Automatically Disabling Users and Passwords \(Server Only\), page 2-10](#)

## mwtm cmdlog

### Server Only

#### Full Syntax

**mwtm cmdlog** [**clear** | **-r**]

#### Command Description

Uses PAGER to display the contents of the system command log. The system command log lists:

- All **mwtm** commands that were entered for the MWTM server.
- The time each command was entered.
- The user who entered the command.

To clear the log, enter **mwtm cmdlog clear**.

To display the contents of the log in reverse order, with the most recent commands at the beginning of the log, enter **mwtm cmdlog -r**.

You must log in as the root user or superuser to use this command.

## mwtm collectstats

### Server Only

#### Full Syntax

**mwtm collectstats** [**-h** *hostname(s)*] {**-d** *date(s)* | **-s** *starttime* **-e** *endtime*} [**clean**]

#### Command Description

Gathers report and event information from the database for the input criteria. The output appears here:

*/opt/CSCOs/gm/tmp/cisco\_mwtm\_stats\_<date>\_<timestamp>.zip*

Use the following keywords and arguments with this command:

- **-h** *hostname(s)*—Narrow your search to specific devices by entering each hostname individually. For example:

```
./mwtm collectstats -h hostname1 hostname2 hostname3
```

- **-d *date(s)***—Collects reports and events for the devices indicated for the given specific dates. The date format must be in YYYYMMDD. Enter each date individually. For example:  

```
./mwtm collectstats -h hostname1 hostname2 hostname3 20070621 20070622 20070623
```
- **-s *starttime* and -e *endtime***—Collects reports and events for the devices indicated from a start time to an end time. The date format must be in YYYYMMDD-HHMM. For example:  

```
./mwtm collectstats -h hostname1 hostname2 hostname3 -s 02232008-1500 -e 03012008-2300
```
- **clean**—Removes older *.zip* files.

If no data is available, a message appears, and the MWTM does not create a *.zip* file.

If you specify hostnames, the MWTM creates a separate log file for each hostname with the events and trap details. For each report category, the MWTM creates a log file in *.csv* format, with a name similar to:

```
cisco_mwtm_stats_report_<NameOfReport>.csv
cisco_mwtm_stats_event_trap_<Hostname>.csv
```

In addition, the MWTM creates a consolidated log file for all events and all report data separately.

You must log in as the root user or superuser to use this command.

## mwtm compressdb

### Server only

#### Full syntax

**mwtm compressdb**

#### Command Description

Compresses the MWTM database tables.

You must log in as the root user or superuser to use this command.

## mwtm console

### Server Only

#### Command Description

Displays the contents of the console log file, *sgmConsoleLog.latest*. The console log file contains unexpected error and warning messages from the MWTM server, such as those that might occur if the MWTM server cannot start.

You must log in as the root user or superuser to use this command.

## mwtm consolelogsize

### Server Only

#### Full Syntax

**mwtm consolelogsize** [*megs*]

**Command Description**

Sets the maximum size (in megabytes) of the console log file.

To view help for this command, include the following parameter: -h.

## mwtm countnodes

**Server Only****Command Description**

Displays the number of nodes in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm countobjects

**Server Only****Command Description**

Displays a count of all objects in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm cwsetup

**Solaris Server Only****Full Syntax**

**mwtm cwsetup** [install | uninstall]

**Command Description**

Manages the integration of the MWTM with CiscoWorks:

- **install**—Checks to see which CiscoWorks files are installed and installs additional files as necessary. Use this command to integrate the MWTM and CiscoWorks in these instances:
  - You installed CiscoWorks after you installed the MWTM.
  - The MWTM and CiscoWorks are no longer integrated for some reason.
- **uninstall**—Removes MWTM files from the CiscoWorks area.

**Note**

Always run **mwtm cwsetup uninstall** before uninstalling CiscoWorks from your system.

- The command prompts you to enter:
  - The CiscoWorks server name
  - The port number for the CiscoWorks web server (the default setting is 1741)
  - The secure port number for the CiscoWorks web server (the default setting is 443)
  - Whether or not CiscoWorks security is enabled

**Note**

Changing CiscoWorks settings by using the **mwtm cwsetup** command sets all clients on the MWTM server to use these settings. You can configure a particular MWTM client to use different CiscoWorks settings by changing the client's preferences. See [Changing CiscoWorks Server Settings, page 5-13](#).

You must log in as the root user (not as a superuser) to use this command.

You must restart the MWTM server for your changes to take effect. After the server restart, you can launch these applications from the MWTM Tools menu:

- CiscoWorks Device Center
- CiscoView

Also, you can launch the MWTM web interface from the CiscoWorks dashboard. In this scenario, CiscoWorks and MWTM are running on the same server.

**Related Topic**

[Changing CiscoWorks Server Settings, page 5-13](#)

## mwtm datadir

**Server Only****Full Syntax**

**mwtm datadir** [*directory*]

**Command Description****Note**

You must stop the MWTM server before performing this command. You are prompted whether to continue.

Sets the directory in which the MWTM stores data files. Use this command when you want to move the data directory to a larger filing system to accommodate the increasing size of the directory.

The default directory for data files resides in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the default directory is */opt/CSCOs/gm/data*.
- A different directory, then the default directory resides in that directory.

Use this command if you want to store data files in a different directory; for example, in a Network File System location on another server.

**Note**

This command copies all files in the current directory to the new directory. If you are not logged in as the superuser and you do not own the new directory, you might not be able to copy the files. In that case, you must specify a directory that you own or log in as the root user.

Do not set the new directory to any of these: */usr*, */var*, */opt*, or */tmp*.

Do not set the new directory to the same directory in which you are storing GTT files (**mwtm gttmdir**), message log files (**mwtm msglogdir**), route table files (**mwtm routedir**), or address table files (**mwtm atbldir**).

---

After you change the directory, the MWTM asks if you want to restart the MWTM server. The new directory takes effect when you restart the MWTM server.

You must log in as the root user or superuser to use this command.

## mwtm dbcheckdir

### Server Only

### Full Syntax

**mwtm dbcheckdir** [*directory*]

### Command Description

Sets the directory used for database checks.

You must log in as the root user or superuser to use this command.

## mwtm dbtool

### Server Only

### Full Syntax

**mwtm dbtool** {*SQL*}

### Command Description

Issues a SQL query against the MWTM database. Use a standard SQL query, except replace any instances of the asterisk (\*) with a question mark (?). For example, a sample SQL query might be:

```
"select * from events"
```

Using the **mwtm dbtool** command, this SQL query would be:

```
mwtm dbtool "select ? from events"
```

You must log in as the root user or superuser to use this command.

## mwtm delete

### Server Only

### Full Syntax

**mwtm delete** [**all** | **node** [**all** | *node* [*node*]...] | **sp** [**all** | *point-code:net* [*point-code:net*]...] | **linkset** [**all** | *node/linkset* [*node/linkset*]...]

### Command Description

Deletes objects from the MWTM database.

- **all**—Deletes all objects from the MWTM database.
- **node all**—Deletes all nodes from the MWTM database.
- **node node [node]...**—Deletes one or more nodes from the MWTM database. Use the *node* arguments to specify one or more nodes.
- **sp all**—Deletes all nodes from the MWTM database.
- **sp point-code:net [point-code:net]...**—Deletes one or more signaling points from the MWTM database. Use the *point-code:net* arguments to specify one or more signaling points, which the point code and network name identify; for example, 1.22.0:net0.
- **linkset all**—Deletes all linksets from the MWTM database.
- **linkset node/linkset [node/linkset]...**—Deletes one or more linksets from the MWTM database. Use the *node/linkset* arguments to specify one or more linksets associated with specific nodes.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Deleting Objects, page 7-44](#)

## mwtm deletecreds

### Server Only

#### Full Syntax

**mwtm deletecreds** [-d *nodetype*] [-i *ipaddress*] [-a]

#### Command Description

Deletes credentials for a given IP address, if specified. Otherwise, Default credentials are deleted. To delete:

- Credentials for a specific node type, specify **-d** and the nodetype:
  - **itp**—ITP nodes
  - **ons**—ONS nodes
  - **csr**—Cell Site Router (CSR) nodes
  - **ran\_svc**—RAN\_SVC nodes
  - **ip-ran**—IP-RAN nodes
- Credentials for a particular IP address only, specify **-i** and the IP address of the node.
- All credentials, specify **-a**.

#### Related Topic

## mwtm deletesnmpcomm

#### Full Syntax

**mwtm deletesnmpcomm** -i *ipaddress*

**Command Description**

Deletes an SNMP configuration from the MWTM server.

**-i** *ipaddress*—the IP address of the device (required)

You do not need to restart the MWTM server.

**Related Topic**

- [mwtm addsnmpcomm](#), page B-7
- [mwtm modifysnmpcomm](#), page B-46
- [mwtm showsnmpcomm](#), page B-64

## mwtm deluser

**Server Only****Full Syntax**

**mwtm deluser** [*username*]

**Command Description**

If you enable MWTM user-based access, deletes the specified user from the authentication list. To add the user back to the list, use the **mwtm adduser** command.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Manually Disabling Users and Passwords \(Server Only\)](#), page 2-12

## mwtm disablepass

**Server Only****Full Syntax**

**mwtm disablepass** [*username*]

**Command Description**

If you enable the MWTM User-Based Access, and set **mwtm authtype** to **local**, disables the specified user's authentication and password. The MWTM does not delete the user from the authentication list; rather, the MWTM only disables the user's authentication and password. To re-enable the user's authentication with:

- The same password as before, use the **mwtm enableuser** command.
- A new password, use the **mwtm userpass** command.

**Note**

The user can re-enable authentication with a new password by attempting to log in by using the old password; the MWTM then prompts the user for a new password.

If you set **mwtm authtype** to **solaris** or **linux**, you cannot use this command; instead, you must manage passwords on the external authentication servers.

You must log in as the root user or superuser to use this command. You must also set the **mwtm authtype** to **local**.

**Related Topic**

[Manually Disabling Users and Passwords \(Server Only\), page 2-12](#)

## mwtm disableuser

**Server Only****Full Syntax**

**mwtm disableuser** [*username*]

**Command Description**

If you enable MWTM User-Based Access, disables the specified user's authentication. The MWTM does not delete the user from the authentication list, the MWTM only disables the user's authentication. To re-enable the user's authentication with:

- The same password as before, use the **mwtm enableuser** command.
- A new password, use the **mwtm userpass** command.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Manually Disabling Users and Passwords \(Server Only\), page 2-12](#)

## mwtm discover

**Server Only****Full Syntax**

**mwtm discover** [*seed-node*] [*seed-node*]...

**Command Description**

You use this command to discover the network from the command line. Use the *seed-node* arguments to specify the DNS names or IP addresses of one or more seed nodes.

**Note**

This command does not perform a clean discovery. To do so, see the **mwtm cleandiscover** command.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Discovering Your Network, page 3-4](#)

## mwtm diskmonitor

### Server Only

#### Full Syntax

**mwtm diskmonitor** [**enable** | **disable** | **status**] | **warning** *megs* | **shutdown** *megs*

#### Command Description

Monitors the disk space usage of the MWTM installed directories. When enabled, a script (*diskWatcher.sh*) runs every hour to check two thresholds:

- **Warning**—Warns the MWTM operator when the disk space usage exceeds the threshold value. The MWTM logs the warning in the *sgmConsoleLog.txt* file. For example:

```
WARNING: The following partition is getting low on free disk space:
/opt
Space left = 905 MB
```

- **Shutdown**—Shuts down the MWTM server when the disk space usage exceeds the threshold value.

The parameters of the **mwtm diskmonitor** command are:

- **enable**—Enables the hourly check of disk space usage of MWTM installed directories.
- **disable**—Disables the hourly check of disk space usage of MWTM installed directories.
- **status**—Displays the current status of the disk monitor feature (whether enabled or disabled).
- **warning** *megs*—Sets the warning threshold in MBs. The default setting is 1000 MB.
- **shutdown** *megs*—Sets the shutdown threshold in MBs. The default setting is 100 MB.

You must log in as the root user or superuser to use this command.

## mwtm enableuser

### Server Only

#### Full Syntax

**mwtm enableuser** [*username*]

#### Command Description

If you enable MWTM user-based access, re-enables the specified user's authentication, which had been disabled either automatically by the MWTM or by a superuser.

The user's authentication is re-enabled with the same password as before.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Enabling and Changing Users and Passwords \(Server Only\), page 2-13](#)

## mwtm eventautolog

### Server Only

#### Full Syntax

**mwtm eventautolog** [clear | -r]

#### Command Description

Uses PAGER to display the contents of the MWTM event automation log. The event automation log lists all messages generated by scripts launched by event automation.

To clear the log and restart the server, enter **mwtm eventautolog clear**.

To display the contents of the log in reverse order, with the most recent events at the beginning of the log, enter **mwtm eventautolog -r**.

You must log in as the root user or superuser to use this command.

## mwtm eventconfig

### Server Only

#### Full Syntax

**mwtm eventconfig** [view | edit | restore | master]

#### Command Description

Allows you to manage the event configuration:

- To view the event configuration file, use the **mwtm eventconfig view** command.
- To edit the event configuration file in your environment with a text editor, use the **mwtm eventconfig edit** command. (The default text editor is 'vi'.)
- To restore the event configuration file to the last active copy, use the **mwtm eventconfig restore** command.
- To restore the event configuration file to the master copy (the default copy shipped with the MWTM), use the **mwtm eventconfig master** command.

You must log in as the root user or superuser to use this command.

## mwtm eventeditor

### Solaris or Linux Clients Only

#### Full Syntax

**mwtm eventeditor** [hostname]

#### Command Description

Starts an MWTM Event Editor on the specified host. If no hostname is specified, starts an MWTM Event Editor on the default host, as specified during installation. See [Connecting to a New Server, page 5-40](#) for information about determining the default host.

For more information about the MWTM Event Editor, see [Changing the Way the MWTM Processes Events](#), page 9-23.

If you Telnet into a remote workstation, the DISPLAY variable must be set to your local display, or you cannot use this command. If the DISPLAY variable is not set automatically, you must set it manually (see [Setting the DISPLAY Variable for Solaris or Linux Clients](#), page 3-3).

## mwtm eventtool

### Server Only

#### Full Syntax

**mwtm eventtool** {-a *actionName*} {*parameters*}

#### Command Description

Invokes MWTM event API operations.

These action names (and any corresponding required parameters) can be specified with the **-a** option:

| Option | Action Names      | Required Parameters        |
|--------|-------------------|----------------------------|
| -a     | acknowledgeEvents | -l or -L<br>-u<br>-n       |
|        | appendNote        | -e<br>-n<br>-u             |
|        | changeSeverities  | -s<br>-l or -L<br>-u<br>-n |
|        | clearEvents       | -l or -L<br>-u<br>-n       |
|        | deleteEvents      | -l or -L<br>-u<br>-n       |

| Option | Action Names             | Required Parameters |
|--------|--------------------------|---------------------|
|        | getAllEventsAsTraps      | -t                  |
|        | getFilteredEventsAsTraps | -t<br>-f            |
|        | getNote                  | -e                  |
|        | setNote                  | -e<br>-n<br>-u      |

These parameters can be used:

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -e        | Specifies an event ID parameter.                                                                                                                            |
| -f        | Specifies a file name for EventFilter, which is an XML element defined in MWTM WSDL definitions.                                                            |
| -l        | Specifies a file name for EventIDList, which is an XML element defined in MWTM WSDL definitions.                                                            |
| -n        | Specifies an event note string.                                                                                                                             |
| -s        | Specifies an event severity.                                                                                                                                |
| -t        | Specifies a file name for TrapTarget, which is an XML element defined in MWTM WSDL definitions.                                                             |
| -u        | Specifies a user ID for event operation.                                                                                                                    |
| -H        | Specifies a hostname to connect to. If unspecified, the default value is obtained from the MWTM server <i>System.properties</i> file, SERVER_NAME property. |
| -p        | Specifies a port to connect to. If unspecified, the default value is obtained from the MWTM server <i>System.properties</i> file, WEB_PORT property.        |
| -L        | Specifies a list of event IDs, separated by ' '.                                                                                                            |
| -S        | Specifies whether to use SSL (https) for NAPI access. Default is no SSL.                                                                                    |
| -h        | Prints help information.                                                                                                                                    |

You must log in as the root user or superuser to use this command.

#### Related Documentation

See the [OSS Integration Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

## mwtm evilstop

### Server Only

#### Command Description

Forcefully stops all MWTM servers on the local host. This command can be useful if a normal **mwtm stop** does not stop the servers.

You must log in as the root user (not as a superuser) to use this command.

## mwtm export

### Server Only

#### Full Syntax

**mwtm export** [-d {bar | comma | tab}] [all | as | asp | aspa | links | linksets | nodes | mwtmp | sps]

#### Command Description

Exports current MWTM data.

By default, the MWTM separates data fields with vertical bars (|). However, you can specify commas (,) or tabs as the separator:

- **-d bar**—Separate data fields with vertical bars (|). This is the default setting.
- **-d comma**—Separate data fields with commas (,).
- **-d tab**—Separate data fields with tabs.

By default, the MWTM exports all data. However, you can limit the data that the MWTM exports:

- **all**—Exports all current MWTM data. This is the default selection.
- **as**—Exports application server data only.
- **asp**—Exports application server process data only.
- **aspa**—Exports application server process association data only.
- **links**—Exports link data only.
- **linksets**—Exports linkset data only.

---

**Note** Links and linkset output totals might not match what appears in the MWTM client (see [ITP Specific FAQs, page C-14](#)).

---

- **nodes**—Exports node data only.
- **mwtmp**—Exports signaling gateway-mated pair data only.
- **sps**—Exports signaling point data only.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Exporting Data, page 5-35](#)

## mwtm export cw

### Solaris Server Only

#### Full Syntax

**mwtm export cw**

#### Command Description

Exports current MWTM node names, and read and write SNMP community names, in CiscoWorks import format, with fields separated by commas (.). You can export this data to a file, then use the file to import the nodes into the CiscoWorks database.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Exporting Data, page 5-35](#)

## mwtm groups

You must log in as the root user to use this command.

#### Full Syntax

**mwtm groups** [**list** | **detail** *groupName* | **create** *groupName* *groupType* *nodeName1* *nodeName2* ... | **add** *groupName* *nodeName1* *nodeName2* ... | **remove** *groupName* *nodeName1* | **delete** *groupName* | **master** *groupName* *nodeName* | **import** *filename* | **export** *filename*]

#### Command Description

Allows you to manage groups:

- *GroupType* can be one of the following:
  - ggsn\_config
  - csg\_config
  - ha\_config
  - ipran\_config
  - rano\_config
  - msef\_config
  - ggsn\_report
  - csg\_report
  - ha\_report
  - general
- To view all groups, use the **mwtm groups list all** command. You can also specify to view specific groups by using **mwtm group list** *groupName*.
- To view group details, use the **mwtm groups detail** *groupName* command.
- To create a group, use the **mwtm groups create** *groupName* *groupType* *nodeName1* *nodeName2* ... command.

- To add node(s) to a group, use the **mwtm groups add** *groupName nodeName1 nodeName 2 ...* command. The group must exist before you execute this command.
- To remove node(s) from a group, use the **mwtm groups remove** *groupName nodeName1 nodeName 2 ...* command. The group must exist before you execute this command.
- To delete a group, use the **mwtm groups delete** *groupName* command.
- To assign a master group, use the **mwtm groups master** *groupName nodeName* command.
- To import a group, use the **mwtm groups import** *filename* command, where the format of *filename* is:

*GroupName1, groupType1, nodeName1, nodeName2, nodeName3*

*GroupName2, groupType2, nodeName1, nodeName4, ...*

*GroupName3, groupType3*

The last example creates *GroupName3* with zero nodes.

The *groupName* you want to import must be new; it cannot already exist. If a group with the specified name already exists, you get an error message.

- To export a group, use the **mwtm groups export** *filename* command, where the format of *filename* is:

*GroupName1, groupType1, nodeName1, nodeName2, nodeName3*

*GroupName2, groupType2, nodeName1, nodeName4, ...*

*GroupName3, groupType3*

#### Related Topic

- [Understanding Groups, page 11-23](#)

## mwtm help

### Server and Solaris or Linux Clients Only

#### Full Syntax

**mwtm help** [*keyword*]

#### Command Description

Displays the command syntax for the **mwtm** command and all of its options. The function of this command is identical to **mwtm**.

MWTM help is network specific, so only the commands pertaining to each network type appear. If you set all network types, you can see all the commands.

To see the syntax for a specific command, enter **mwtm help** and that command. For example, if you enter **mwtm help restart**, the MWTM displays:

```
mwtm restart - Restarts all MWTM Servers on the local host.
mwtm restart web - Restarts Web servers on the local host.
mwtm restart jsp - Restarts JSP servers on the local host.
mwtm restart pm - Restarts Process Manager on the local host.
```

#### Related Topic

[Chapter 11, “Accessing Data from the Web Interface”](#)

## **mwtm ignorephysicalfolders**

### **Server and Solaris or Linux Clients Only**

#### **Full Syntax**

**mwtm ignorephysicalfolders** [**true** | **false**]

#### **Command Description**

Specifies whether MWTM should set alarm aggregation path preferences.

- **true**—Sets alarm aggregation path preferences.
- **false**—Does not set alarm aggregation path preferences.

You must log in as the root user or superuser to use this command.

## **mwtm importcw**

#### **Full Syntax**

**mwtm importcw** [*cwfile*]

#### **Command Description**

Imports node hostname and read-community strings from the CiscoWorks server to MWTM.

*cwfile*—File name of the CiscoWorks export file (export format must be in CSV file format).

You must log in as the root user or superuser to use this command. You do not need to restart the server to activate this command. After running this command, the MWTM discovers the imported nodes.

## **mwtm inactiveuserdays**

### **Server Only**

#### **Full Syntax**

**mwtm inactiveuserdays** [*number-of-days* | **clear**]

#### **Command Description**

If you enable MWTM user-based access, number of days a user can be inactive before disabling that user account.

This function is disabled by default. If you do not specify this command, user accounts are never disabled as a result of inactivity.

If you enter the **mwtm inactiveuserdays** command, the valid range is 1 day to an unlimited number of days. There is no default setting.

If you have enabled this function and you want to disable it (that is, prevent the MWTM from automatically disabling user accounts as a result of inactivity), enter **mwtm inactiveuserdays clear**.

To re-enable the user's authentication, use the **mwtm enableuser** command.

You must log in as the root user or superuser to use this command.

**Related Topics**

- [Chapter 2, “Configuring Security”](#)
- [Automatically Disabling Users and Passwords \(Server Only\), page 2-10](#)

## mwtm installlog

**Server and Solaris or Linux Clients Only****Full Syntax**

**mwtm installlog** [server | client]

**Command Description**

Displays the latest install log for the **server** or **client**. If you do not specify **server** or **client**, displays the latest install log for both the server and client.

You must log in as the root user or superuser to use this command.

## mwtm inventorytool

**Server Only****Full Syntax**

**mwtm inventorytool -a** *actionName* [*parameters*]

**Command Description**

Invokes inventory API operations.

These action names (and any corresponding required parameters) can be specified with the **-a** option:

| Option | Action Names                | Parameters |
|--------|-----------------------------|------------|
| -a     | getAllNEs                   | -c         |
|        | getRootNEs                  | -H         |
|        |                             | -p         |
|        |                             | -S         |
|        |                             | -h         |
|        | getAllNEsWithFeature        | -F         |
|        | getRootNEsWithFeature       | -c         |
|        |                             | -H         |
|        |                             | -p         |
|        |                             | -S         |
|        |                             | -h         |
|        | getNE                       | -f         |
|        | getChildNEs                 | -c         |
|        | getDescendantNEs            | -H         |
|        | getNote                     | -p         |
|        |                             | -S         |
|        |                             | -h         |
|        | getChildNEsWithFeature      | -f         |
|        | getDescendantNEsWithFeature | -F         |
|        |                             | -c         |
|        |                             | -H         |
|        |                             | -p         |
|        |                             | -S         |
|        |                             | -h         |
|        | setNote                     | -f         |
|        | appendNote                  | -u         |
|        |                             | -n         |
|        |                             | -H         |
|        |                             | -p         |
|        |                             | -S         |
|        |                             | -h         |

You can use these parameters:

| Parameter | Description                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -c        | (Optional) Specifies the context of the inventory. Valid contexts include: <b>config</b> , <b>monitor</b> , and <b>all</b> . If unspecified, the default value is <b>all</b> . |
| -f        | Specifies a fully qualified domain name (FQDN).                                                                                                                                |
| -F        | Specifies a feature name.                                                                                                                                                      |
| -S        | (Optional) Specifies whether to use SSL (https) for NBAPI access. The default is no SSL.                                                                                       |
| -n        | Specifies a note string. Enclose the string in double quotes.                                                                                                                  |
| -u        | Specifies a user ID for inventory operation.                                                                                                                                   |
| -H        | (Optional) Specifies a hostname to connect to. If unspecified, the system obtains the default value from the MWTM server <i>System.properties</i> file, SERVER_NAME property.  |
| -p        | (Optional) Specifies a port to which to connect. If unspecified, the system obtains the default value from the MWTM server <i>System.properties</i> file, WEB_PORT property.   |
| -h        | (Optional) Prints help information.                                                                                                                                            |

You must log in as the root user or superuser to use this command.

#### Related Documentation

See the [OSS Integration Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

## mwtm iosreport

### Server Only

### Full Syntax

**mwtm iosreport**

### Command Description

You use this command to create a report, in CSV format, of the IOS versions of all the nodes that the MWTM is managing. The format for the output is:

*node name, custom name, node type, IOS version, serial number*

For example:

```
./mwtm iosreport
'NODE NAME','Custom Name','NODE TYPE','IOS VERSION','SERIAL NUMBER',
'ems15454ec.cisco.com',null,'CiscoONS15454','7.2','SMA08040634',
'ems1900ke.cisco.com',null,'CiscoMWR-1900','12.4 (20070313:074027) ','JMX0650L264',
```

You must log in as the root user or superuser to use this command.

## mwtm ipaccess

### Server Only

#### Full Syntax

**mwtm ipaccess** [**add** *[ip-addr]* | **clear** | **edit** | **list** | **rem** *[ip-addr]* | **sample**]

#### Command Description

You use this command to create and manage a list of client IP addresses that can connect to the MWTM server.

The list of allowed client IP addresses resides in the *ipaccess.conf* file. By default, when you first install the MWTM, the *ipaccess.conf* file does not exist and all client IP addresses can connect to the MWTM server. To create the *ipaccess.conf* file and specify the list of allowed client IP addresses, use one of these keywords:

- **add**—Add the specified client IP address to the *ipaccess.conf* file. If the *ipaccess.conf* file does not already exist, this command creates a file with the first entry.
- **clear**—Remove all client IP addresses from the *ipaccess.conf* file and allow connections from any MWTM client IP address.
- **edit**—Open and edit the *ipaccess.conf* file directly. If the *ipaccess.conf* file does not already exist, this command creates an empty file.
- **list**—List all client IP addresses currently in the *ipaccess.conf* file. If no client IP addresses appear (that is, the list is empty), connections from any MWTM client IP address are allowed.
- **rem**—Remove the specified client IP address from the *ipaccess.conf* file.
- **sample**—Print out a sample *ipaccess.conf* file.

Any changes you make take effect when you restart the MWTM server.

See [Implementing Secure User Access \(Server Only\)](#), page 2-2 for more information about using this command.

You must log in as the root user or superuser to use this command.

## mwtm jspport

### Server Only

#### Full Syntax

**mwtm jspport** [*port-number*]

#### Command Description

Sets a new port number for the JSP server, where *port-number* is the new, numeric port number. The MWTM verifies that the new port number is not already in use.

This command is needed only if you must change the port number after you install the MWTM; because another application must use the current port number.

The new port number must contain only numbers. If you enter a port number that contains nonnumeric characters, such as **mwtm13**, an error message appears, and the MWTM returns to the command prompt without changing the port number.

You must log in as the root user (not as a superuser) to use this command.

## mwtm keytool

### Solaris Server Only

#### Full Syntax

**mwtm keytool** [**clear** | **genkey** | **import\_cert** *cert\_filename* | **import\_key** *key\_filename* *cert\_filename* | **list** | **print\_csr** | **print\_crt**]

#### Command Description

If you implement SSL in your MWTM system, manages SSL keys and certificates on the MWTM server.

If you installed the MWTM server and client on the same workstation, it also automatically manages the certificates on the client.

Use these keywords and arguments with this command:

- **clear**—Stops the MWTM server, if necessary, and removes all SSL keys and certificates from the server. Before restarting the server, you must either generate new SSL keys by using the **mwtm keytool genkey** command; or, you must completely disable SSL by using the **mwtm ssl disable** command.
- **genkey**—Stops the MWTM server, if necessary, and generates a new self-signed public or private SSL key pair on the MWTM server. The new keys take effect when you restart the server.
- **import\_cert** *cert\_filename*—Imports the specified signed SSL certificate in X.509 format.
- **import\_key** *key\_filename* *cert\_filename*—Imports the specified SSL key in OpenSSL format and the specified signed SSL certificate in X.509 format.
- **list**—Lists all SSL key-certificate pairs on the MWTM server.
- **print\_csr**—Prints a certificate signing request (CSR) in X.509 format.
- **print\_crt**—Prints the MWTM server's SSL certificate in X.509 format.

You must log in as the root user (not as a superuser) to use this command.

#### Related Topic

[Implementing SSL Support in the MWTM, page 2-21](#)

## mwtm killclients

### Server Only

#### Command Description

Forcefully stops all MWTM clients on the local host, including all GTT clients and Event Editors.

You must log in as the root user (not as a superuser) to use this command.

## mwtm licenseinfo

### Server Only

#### Full Syntax

**mwtm licenseinfo**

#### Command Description

Displays the MWTM licensable object count. This generates mSEF, IP-RAN, and ITP licensing reports.

You must log in as the root user or superuser to use this command.

## mwtm listusers

### Server Only

#### Full Syntax

**mwtm listusers** [*username*]

#### Command Description

If you enable MWTM User-Based Access, lists all currently defined users in the authentication list, including this information for each user:

- username.
- Last time the user logged in.
- User's authentication access level.
- User's current authentication status, such as **Account Enabled** or **Password Disabled**.

To list information for a specific user, use the *username* argument to specify the user.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Listing All Currently Defined Users \(Server Only\), page 2-16](#)

## mwtm logger

### Server Only

#### Command Description

Displays the system messages *messageLog.txt* file with tail -f.

To stop the display, press **Ctrl-C**.

## mwtm logincreds

### Server Only

#### Full Syntax

**mwtm logincreds** [**prompt** | **stored** | **status**]

#### Command Description

Requires the user to always provide credentials upon log in:

- **prompt**—User is always prompted for credentials in the following instances:
  - Running these commands—mwtm pushgtt, mwtm pushroute, mwtm pushmlr, and mwtm deployarchive
  - Deployment in the Route Table Editor, GTT Editor, and Address Table Editor
  - SSH connection protocol
  - Provisioning
- **stored**—If credentials are cached/configured, the user is not prompted to enter them. However, the user will be prompted if credentials are not cached or configured.
- **status**—Reflects the current status of the command (whether it is set to prompt or stored)

You must log in as the root user or superuser to use this command.

#### Related Topic

[Configuring Login Credentials, page 4-20](#)

## mwtm logsize

### Server Only

#### Full Syntax

**mwtm logsize** [*number-of-lines*]

#### Command Description

Sets the maximum size for truncating and rolling log files.

- Message log files are in *\$LOGDIR/messageLog-archives* (typically, */opt/CSCOsgm/logs/messageLog-archives*).
- Network log files are in *\$LOGDIR/netStatus/archive*

If you enter this command without the *number-of-lines* argument, the MWTM displays the current maximum number of lines. You can then change that value or leave it (by pressing the Enter key).

The message and network log process archives the log file when the maximum number of lines is reached. The filename format of archived log files is:

messageLog.YYYY:MMDD:hhmm:y.txt.Z

or

networkLog.YYYY:MMDD:hhmm:y.txt.Z

where:

- *YYYY* is the year
- *MM* is the month in a two-digit format
- *DD* is the day of the month
- *hh* is the hour of the day in 24-hour notation
- *mm* is the minute within the hour
- *y* is one of these variables:

| Variable             | Meaning                                                                                                       | Example                                                                |
|----------------------|---------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| r                    | The log file was created because the MWTM server restarted.                                                   | messageLog.2008:0328:1427:r.txt.Z<br>networkLog.2008:0328:1427:r.txt.Z |
| c                    | The log file was created because a user ran the <b>mwtm msglog clear</b> command.                             | messageLog.2008:0328:1433:c.txt.Z<br>networkLog.2008:0328:1433:c.txt.Z |
| o                    | The log file was created from a pre-existing <i>messageLog-old.txt</i> file (used in previous MWTM releases). | messageLog.2008:0328:1413:o.txt.Z<br>networkLog.2008:0328:1413:o.txt.Z |
| 0 (or higher number) | A counter that starts at 0 and increments sequentially. The number resets to 0 when the server restarts.      | messageLog.2008:0328:1427:3.txt.Z<br>networkLog.2008:0328:1427:3.txt.Z |

When *messageLog.txt* or *networkLog.txt* reaches the number of lines specified by the **mwtm logsize** command, the MWTM creates a new log archive file by using the filename format above. When the maximum number of lines is reached, the log filename contains a counter value to differentiate itself from other archived files (for example, *messageLog.2008:0328:1427:1.txt.Z* and *messageLog.2008:0328:1427:2.txt.Z*).

The default value for *number-of-lines* is 500,000 lines.

The valid range is 1,000 lines to an unlimited number of lines. The default value is 500,000 lines. If you specify a larger file size for the log file, the log file and its copy require proportionally more disk space.

When changing the number of lines to display, remember that every 5,000 lines require approximately 1 MB of disk space. You need to balance your need to refer to old messages against the amount of disk space they occupy.

#### Note

All log files are aged out by a timing mechanism (**mwtm msglogage**). You can estimate a size for the *\$LOGDIR/messageLog-archives* directory based on the number of lines, the amount of data that is logged (**mwtm mldebug**), and the log age.

You must log in as the root user or superuser to use this command. If you change the *number-of-lines* value, you must restart the server (**mwtm restart**).

## mwtm logtimemode

### Server Only

### Full Syntax

**mwtm logtimemode** [12 | 24]

**Command Description**

Sets the time mode for dates in log files:

- **12**—Use 12-hour time, with AM and PM so that 1:00 in the afternoon is 1:00 PM.
- **24**—Use 24-hour time, also called military time so that 1:00 in the afternoon is 13:00. This is the default setting.

You must log in as the root user or superuser to use this command.

## mwtm manage

**Full Syntax**

**mwtm manage** [itp | ipran | csg1 | csg2 | ggsn | bwg | ha | pdsn] [enable | disable | status]

**Command Description**

Enables, disables, or checks the status of managed network(s):

- **itp, ipran, csg1, csg2, ggsn, bwg, ha, or pdsn**—Type of network.
- **disable**—Disables the MWTM from managing the chosen network.
- **enable**—Enables the MWTM to manage the chosen networks.
- **status**—Displays the status of networks (whether enabled or disabled).

You must log in as the root user or superuser to use this command.

## mwtm maxascirows

**Server Only****Full Syntax**

**mwtm maxascirows** [*number-of-rows*]

**Command Description**

Sets the maximum number of rows for MWTM ASCII web output; for example, detailed debugging information.

If you enter this command without the *number-of-rows* argument, the MWTM displays the current maximum number of rows. You can then change that value or leave it. The valid range is 1 row to an unlimited number of rows. The default value is 6000 rows.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Chapter 11, “Accessing Data from the Web Interface”](#)

## mwtm maxevhist

### Server Only

### Full Syntax

**mwtm maxevhist** [*number-of-rows*]

### Command Description

Sets the maximum number of rows for the MWTM to search in the event history logs. The event history logs are the current and archived MWTM network status logs for status change and SNMP trap messages. The MWTM sends the results of the search to the web browser, where the setting of the *mwtm maxhtmlrows* command further limits the results.

If you enter this command without the *number-of-rows* argument, the MWTM displays the current maximum number of rows. You can then change that value or leave it. The valid range is 1 row to an unlimited number of rows. The default value is 15,000 rows.

The default setting is sufficient in most MWTM environments. However, you might need to increase the setting if the MWTM has archived a large number of event history logs, each log contains thousands of messages, and you want to search more than 15,000 rows. Remember that increasing this setting can increase the search time.

You must log in as the root user or superuser to use this command.

### Related Topic

[Chapter 11, “Accessing Data from the Web Interface”](#)

## mwtm maxhtmlrows

### Server Only

### Full Syntax

**mwtm maxhtmlrows** [*number-of-rows*]

### Command Description

Sets the maximum number of rows for MWTM HTML web output; for example, statistics reports, status change messages, or SNMP trap messages.

#### Note

If you have set the Page Size on the MWTM web interface, this command does not override that setting. When you set the Page Size feature on the MWTM web interface, browser cookies store the setting until the cookie expires or the MWTM deletes it.

If you enter this command without the *number-of-rows* argument, the MWTM displays the current maximum number of rows. You can then change that value or leave it. The valid range is 1 row to an unlimited number of rows. The default value is 200 rows.

You must log in as the root user or superuser to use this command.

### Related Topic

[Chapter 11, “Accessing Data from the Web Interface”](#)

## mwtm mldebug

### Server Only

#### Full Syntax

**mwtm mldebug** [*mode*]

#### Command Description

Sets the mode for logging MWTM debug messages:

- **normal**—Logs all action, error, and info messages. Use **mwtm mldebug normal** to revert to the default settings if you accidentally enter the **mwtm mldebug** command.
- **list**—Displays the current settings for the **mwtm mldebug** command.
- **all**—Logs all messages, of any type.
- **none**—Logs no messages at all.
- **minimal**—Logs all error messages.
- **action**—Logs all action messages.
- **debug**—Logs all debug messages.
- **dump**—Logs all dump messages.
- **error**—Logs all error messages.
- **info**—Logs all info messages.
- **NBAPI-SOAP**—Logs all northbound SOAP messages.
- **snmp**—Logs all SNMP messages.
- **trace**—Logs all trace messages.
- **trapsIn**—Logs all incoming trap messages.
- **trapsOut**—Logs all outgoing trap messages.

This command can adversely affect the MWTM performance. Use this command **only** under guidance from the Cisco Technical Assistance Center (TAC).

You must log in as the root user or superuser to use this command.

## mwtm modifysnmpcomm

#### Full Syntax

**mwtm modifysnmpcomm -i** *ipaddress* { **-r** *retry* | **-t** *timeout* | **-p** *poll* **-c** *community* }

#### Command Description

Modifies an existing SNMP configuration on the MWTM server.

- **-i** *ipaddress*—the IP address of the device (required)
- At least one of the following:
  - **-r** *retry*—the number of times to retry connecting to the device
  - **-t** *timeout*—the timeout value, in seconds
  - **-p** *poll*—the poll interval, in minutes

- **-c community**—the read community string of the device

You do not need to restart the MWTM server.

#### Related Topic

- [mwtm addsnmpcomm](#), page B-7
- [mwtm deletesnmpcomm](#), page B-25
- [mwtm showsnmpcomm](#), page B-64
- [mwtm snmpsetup](#), page B-70

## mwtm motd

#### Full Syntax

**mwtm motd** [cat | disable | edit | enable]

#### Command Description

Manages the MWTM message of the day file, which is a user-specified MWTM system notice. You can set the message of the day to inform users of important changes or events in the MWTM system. The message of the day also provides users with the chance to exit the MWTM or GTT client before launching.

If you enable the message of the day, it appears whenever a user attempts to launch an MWTM or GTT client. If the user:

- Accepts the message, the client launches.
- Declines the message, the client does not launch.

Use these keywords with this command:

- **enable**—Enables the message of the day function. Initially, the message of the day file is blank; use the **mwtm motd edit** command to specify the message text.
- **edit**—Edits the message of the day.
- **cat**—Displays the contents of the message of the day file.
- **disable**—Disables this function (that is, stops displaying the message of the day whenever a user attempts to launch an MWTM or GTT client).

You must log in as the root user or superuser to use this command.

#### Related Topic

[Displaying a Message of the Day](#), page 2-15

## mwtm msglog

#### Server Only

#### Full Syntax

**mwtm msglog** [clear | -r]

**Command Description**

Uses **PAGER** to display the contents of the system message log.

To save the current contents of the log, clear the log, and restart the server, enter **mwtm msglog clear**.

To display the contents of the log in reverse order, with the most recent messages at the beginning of the log, enter **mwtm msglog -r**.

You must log in as the root user or superuser to use this command.

## mwtm msglogage

**Server Only****Full Syntax**

**mwtm msglogage** [*number-of-days*]

**Command Description**

Sets the maximum number of days to archive all types of log files before deleting them from the MWTM server.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 31 days.

The start date for aging out and deleting files is always yesterday at 12 AM. For example, say that you set the value to 1 day. You run the **mwtm msglogage** command at 3 PM on January 10th. To find files that will be deleted by the aging process, count back to 12 AM on January 10th, then add the number of days set in the command. In this example, we added 1 more day, so any file with an earlier timestamp than January 9th at 12 AM will be removed.

You must log in as the root user or superuser to use this command.

## mwtm msglogdir

**Server Only****Full Syntax**

**mwtm msglogdir** [*directory*]

**Command Description****Note**

You must stop the MWTM server before performing this command. You are prompted whether to continue.

Changes the default location of all MWTM system message log files. By default, the system message log files reside on the MWTM server at */opt/CSCOs/gm/logs*.

**Note**

Do not set the new directory to any of these: */usr*, */var*, */opt*, or */tmp*. Also, do not set the new directory to the same directory in which you are storing GTT files (**mwtm gttmdir**), report files (**mwtm repdir**), route table files (**mwtm routedir**), or address table files (**mwtm atbldir**).

After you change the directory, the MWTM asks if you want to restart the MWTM server. The new directory takes effect when you restart the MWTM server.

You must log in as the root user or superuser to use this command. If you change to a default location outside the MWTM, you must have appropriate permissions for that location.

## mwtm netlog

**Server Only****Full Syntax**

**mwtm netlog** [**clear** | **-r**]

**Command Description**

Uses PAGER to display the contents of the network status log. To:

- Save the current contents of the log, clear the log, and restart the server, enter **mwtm netlog clear**.
- Display the contents of the log in reverse order, with the most recent network status messages at the beginning of the log, enter **mwtm netlog -r**.

You must log in as the root user or superuser to use this command.

## mwtm netlogger

**Server Only****Command Description**

Displays the current contents of the network status log file with tail -f.

To stop the display, enter **Ctrl-c**.

## mwtm newlevel

**Server Only****Full Syntax**

**mwtm newlevel** [*username*]

**Command Description**

If you enable MWTM User-Based Access, changes the authentication level for the specified user. Valid levels are:

- **1**—Basic User
- **2**—Power User

- 3—Network Operator
- 4—Network Administrator
- 5—System Administrator

You must log in as the root user or superuser to use this command.

**Related Topic**

[Enabling and Changing Users and Passwords \(Server Only\), page 2-13](#)

## mwtm osinfo

**Server Only****Command Description**

Depending on the network(s) that you have set, displays the operating system versions of software that the MWTM supports.

## mwtm passwordage

**Note**

You must have already changed your password at least once for this command to properly age the password.

**Server Only****Full Syntax**

**mwtm passwordage** [*number-of-days* | **clear**]

**Command Description**

If you enable MWTM User-Based Access and you set **mwtm authtype** to **local**, number of days allowed before forcing users to change passwords. The number of days start to accrue beginning yesterday at 12 AM.

**Note**

For more details on how this works, see [mwtm msglogage, page B-48](#).

This function is disabled by default. If you do not specify this command, users will never need to change their passwords.

If you enter the **mwtm passwordage** command, the valid range is 1 day to an unlimited number of days. No default setting exists.

If you enabled this function and you want to disable it (that is, prevent the MWTM from forcing users to change passwords), enter **mwtm passwordage clear**.

**Note**

If **mwtm authtype** is set to **solaris**, you cannot use this command; instead, you must manage passwords on the external authentication servers.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Automatically Disabling Users and Passwords \(Server Only\)](#), page 2-10

## mwtm patchlog

**Server Only****Full Syntax**

**mwtm patchlog**

**Command Description**

Uses PAGER to display the contents of the patch log, which lists the patches that you installed on the MWTM server.

The default path and filename for the patch log file is */opt/CSCOs/gm/install/sgmPatch.log*. If you installed the MWTM in a directory other than */opt*, then the patch log file resides in that directory.

You must log in as the root user or superuser to use this command.

## mwtm poll

**Server Only****Full Syntax**

**mwtm poll** [*node*] [*node*]...

**Command Description**

You use this command to poll one or more known nodes from the command line. Use the *node* arguments to specify the DNS names or IP addresses of one or more known nodes.

You must log in as the root user or superuser to use this command.

## mwtm pollertimeout

**Server Only****Full Syntax**

**mwtm pollertimeout** [*number-of-seconds*]

**Command Description**

Specifies how long, in seconds, MWTM clients that are connected to the MWTM server can run a demand poller, as in a real-time data window or web page, before the MWTM automatically stops the poller to prevent unnecessary traffic on the network. When the demand poller times out, the MWTM stops the poller and sends an appropriate error message to the client.

The valid range is 1 second to an unlimited number of seconds. The default timeout is 8 hours (28800 seconds).

After you change the timeout, the MWTM asks if you want to restart the MWTM server. The new poller timeout takes effect when you restart the MWTM server.

See [Server Status Information: Pollers, page 5-41](#) for more information on demand pollers.

You must log in as the root user or superuser to use this command.

## mwtm print

### Server Only

#### Full Syntax

**mwtm print** {all | device | snmp | task | alarmsummary} [*severity*] [quiet]}

#### Command Description

Displays information about device versions, SNMP settings, running tasks, summary of alarms, or all of this information.

Use these keywords with this command:

- **device**—Prints name, state, and system description of all nodes in the network.
- **snmp**—Prints SNMP information such as read and write community strings.
- **task**—Prints a list of task IDs and related information.
- **alarmsummary**—Prints a list of alarms sorted by severity types (critical, major, minor, and so on).
  - *severity*—Prints a list of alarms of a specified severity type. The *severity* takes one of these values: critical, major, minor, warning, informational, or indeterminate.
  - **quiet**—Use this keyword to print only the alarm counts (without the severity label)
- **all**—Prints the information available in all of the keywords of this command.

You must log in as the root user or superuser to use this command.

## mwtm props

### Server and Solaris or Linux Clients Only

#### Command Description

Displays the contents of the *System.properties* files for both MWTM server and client installs.

You must log in as the root user or superuser to use this command.

## mwtm provisiontool

### Server Only

#### Full Syntax

**mwtm provisiontool -a** *actionName* [*parameters*]

**Command Description**

Invokes provisioning API operations.

You can specify these action names (and any corresponding required parameters) by using the **-a** option:

| Option | Action Names      | Parameters                 |
|--------|-------------------|----------------------------|
| -a     | provision         | -r<br>-H<br>-p<br>-S<br>-h |
|        | syncFromDevice    | -f                         |
|        | iosWriteToStartup | -H<br>-p<br>-S<br>-h       |

You can use these parameters:

| Parameter | Description                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -r        | Specifies a file name for <b>ProvisionRequest</b> , which is an XML element from the MWTM WSDL definitions.                                                                                |
| -f        | Specifies a fully qualified domain name (FQDN).                                                                                                                                            |
| -H        | (Optional) Specifies a hostname to connect to. If unspecified, the system obtains the default value from the MWTM server <i>System.properties</i> file, <code>SERVER_NAME</code> property. |
| -p        | (Optional) Specifies a port to which to connect. If unspecified, the system obtains the default value from the MWTM server <i>System.properties</i> file, <code>WEB_PORT</code> property.  |
| -S        | (Optional) Specifies whether to use SSL (https) for NBAPI access. The default is no SSL.                                                                                                   |
| -h        | (Optional) Print help information.                                                                                                                                                         |

You must log in as the root user or superuser to use this command.

**Related Documentation**

See the [OSS Integration Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

## mwtm purgedb

**Server Only****Command Description**

Permanently deletes all components in the MWTM database marked for deletion.

The MWTM keeps information about older objects in its database even after they have been deleted. This is considered a logically deleted state. MWTM retains this information to try and maintain any user customized data associated with an object (for instance, a customized name) in case the object is rediscovered at some point in the future. Logically deleted data is physically deleted after seven days if it is not reused by then. You can use the `mwtm purgedb` command to immediately remove this logically deleted data from the MWTM database.

Unfortunately, this benefit may have a side effect. In certain cases, rediscovery of a deleted object may cause the MWTM to use obsolete information in the database, rather than the new information. Ultimately, some configuration changes are not detected, and the viewable data from the client application is incorrect.

**Note**

---

The **`mwtm purgedb`** command does not cause the loss of any collected statistical data.

---

You must log in as the root user or superuser to use this command.

## **mwtm readme**

**Server and Solaris or Linux Clients Only****Command Description**

Displays the contents of the README file for the MWTM.

**Related Topic**

[Chapter 11, “Accessing Data from the Web Interface”](#)

## **mwtm reboot**

**Server Only****Command Description**

Reboots the Solaris MWTM system.

**Note**

---

Use this command with care. Rebooting the Solaris MWTM system disconnects all MWTM clients that are using the system. Before using this command, use the **`mwtm who`** command to list all current users; and, the **`mwtm wall`** command to warn all current users that you are rebooting the system.

---

You must log in as the root user (not as a superuser) to use this command.

## **mwtm rep15minage**

**Server Only****Full Syntax**

**`mwtm rep15minage`** *[number-of-days]*

**Command Description**

Maximum number of days the MWTM should archive 15-minute reports.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 31 days.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Locating Stored Reports, page 13-253](#)

## mwtm repdailyage

**Server Only****Full Syntax**

**mwtm repdailyage** [*number-of-days*]

**Command Description**

Maximum number of days the MWTM should archive daily reports.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 90 days.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Locating Stored Reports, page 13-253](#)

## mwtm repdir

**Server Only****Full Syntax**

**mwtm repdir** [*directory*]

**Command Description****Note**

You must stop the MWTM server before performing this command. You are prompted whether to continue.

Sets the directory in which the MWTM stores report files. See [Chapter 13, “Managing Reports”](#) for information about MWTM reports.

The default directory for report files resides in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the default directory is */opt/CSCOs/gm/reports*.

- A different directory, then the default directory resides in that directory.

Use this command if you want to store report files in a different directory; for example, in a Network File System location on another server.

**Note**

This command copies all files in the current directory to the new directory. If you are not logged in as the superuser and you do not own the new directory, you might not be able to copy the files. In that case, you must specify a directory that you own or log in as the root user.

Do not set the new directory to any of these: */usr*, */var*, */opt*, or */tmp*.

Do not set the new directory to the same directory in which you are storing GTT files (**mwtm gttmdir**), message log files (**mwtm msglogdir**), route table files (**mwtm routedir**), or address table files (**mwtm atbldir**).

After you change the directory, the MWTM asks if you want to restart the MWTM server. The new directory takes effect when you restart the MWTM server.

You must log in as the root user or superuser to use this command.

## mwtm rephelp

**Server Only****Command Description**

Displays help for all commands that are related to MWTM reports.

You must log in as the root user or superuser to use this command.

## mwtm rephourlyage

**Server Only****Full Syntax**

**mwtm rephourlyage** [*number-of-days*]

**Command Description**

Maximum number of days the MWTM should archive hourly reports.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 31 days.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Locating Stored Reports, page 13-253](#)

## mwtm replog

### Server Only

#### Full Syntax

**mwtm replog** [clear | -r]

#### Command Description

Uses PAGER to display the contents of the system reports log. The reports log lists all messages that you use for the creation and maintenance of MWTM reports.

To clear the log and restart the server, enter **mwtm replog clear**.

To display the contents of the log in reverse order, with the most recent commands at the beginning of the log, enter **mwtm replog -r**.

The default path and filename for the system reports log file is */opt/CSCOs/gm/logs/sgmReportLog.txt*. If you installed the MWTM in a directory other than */opt*, then the system reports log file resides in that directory.

You must log in as the root user or superuser to use this command.

## mwtm repmonthlyage

### Server Only

#### Full Syntax

**mwtm repmonthlyage** [*number-of-days*]

#### Command Description

Maximum number of days the MWTM should archive monthly reports.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 1,825 days.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Locating Stored Reports, page 13-253](#)

## mwtm restart

### Server Only

#### Full Syntax

**mwtm restart** [jsp | pm | web]

#### Command Description

Restarts MWTM servers on the local host:

- **jsp**—Restarts the MWTM JSP Server.
- **pm**—Restarts the MWTM Application Server and all managed processes.
- **web**—Restarts the MWTM web Server.

If you do not specify a keyword, **mwtm restart** restarts all MWTM servers.

You must log in as the root user or superuser to use this command.

## mwtm restore

### Server Only

### Full Syntax

**mwtm restore** [**archive** | **atbl** | **data** | **gtt** | **logs** | **reports** | **routes** | **security**]

### Command Description

Restores the MWTM data files from a previous backup, stored in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the locations of the backup files are */opt/mwtm61-client-backup.tar.Z* and */opt/mwtm61-server-backup.tar.Z*.
- A different directory, then the backup files reside in that directory.

You can restore data files on the same Solaris or Linux server; or, on a different Solaris or Linux server that is running MWTM 6.1.x.

To restore only specific parts of the MWTM data files, use these keywords:

- **archive**—Restores the MWTM archive repository.
- **atbl**—Restores only MWTM Address Table Editor files.
- **gtt**—Restores only MWTM GTT files.
- **logs**—Restores only MWTM log files, such as the message log files.
- **reports**—Restores only MWTM report files, such as the statistics report files.
- **routes**—Restores only MWTM ITP route table files.
- **security**—Restores only the security-related parts of the MWTM data files. This command is useful if you inadvertently delete your user accounts or make other unwanted changes to your MWTM security information.

### Note

If **mwtm backupdays** was previously used to set the number of backup days to more than one day, the **mwtm restore** command will prompt you for a server or client backup file to restore from (because there would be more than one backup file to choose from).

To change the directory in which the MWTM stores these backup files, use the **mwtm backupdir** command.

You must log in as the root user (not as a superuser) to use this command.

### Related Topic

- [Backing Up or Restoring MWTM Files \(Server Only\), page 2-30](#)

- [mwtm backupdays](#), page B-10
- [mwtm backupdir](#), page B-11

## mwtm restoreprops

### Server and Solaris or Linux Clients Only

#### Command Description

Restores the MWTM server and client *System.properties* files and other important configuration files to the backup versions of the files.

You must log in as the root user (not as a superuser) to use this command.

## mwtm rootvars

### Server and Solaris or Linux Clients Only

#### Command Description

Displays the contents of the */etc/CSCOsgm.sh* file, which determines the root location of the MWTM server and client installation.

## mwtm sechelp

### Server Only

#### Command Description

Displays help for all commands that are related to MWTM security.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Chapter 2, “Configuring Security”](#)

## mwtm seclog

### Server Only

#### Full Syntax

**mwtm seclog** [clear | -r]

#### Command Description

Uses PAGER to display the contents of the system security log.

These security events are recorded in the log:

- All changes to system security, including adding users.
- Log-in attempts, whether successful or unsuccessful, and logoffs.

- Attempts to switch to another user's account, whether successful or unsuccessful.
- Attempts to access files or resources of higher authentication level.
- Access to all privileged files and processes.
- Operating system configuration changes and program changes, at the Solaris level.
- The MWTM restarts.
- Failures of computers, programs, communications, and operations, at the Solaris level.

To clear the log, enter **mwtm seclog clear**.

To display the contents of the log in reverse order, with the most recent security events at the beginning of the log, enter **mwtm seclog -r**.

The default path and filename for the system security log file is */opt/CSCOSgm/logs/sgmSecurityLog.txt*. If you installed the MWTM in a directory other than */opt*, then the system security log file resides in that directory.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Displaying the Contents of the System Security Log \(Server Only\), page 2-17](#)

## mwtm secondaryserver

### Server Only

#### Full Syntax

**mwtm secondaryserver** [*hostname naming-port webport*] | [**list**] | [**clear**]

#### Command Description

Configures a secondary MWTM server, where:

- *hostname* is the name of the host on which you installed the secondary MWTM server.
- *naming-port* is the MWTM Naming Server port number for the secondary MWTM server. The default port number is 44742.
- *webport* is the MWTM web port number for the secondary MWTM server. The default port number is 1774.

For best results, Cisco recommends that you configure the primary server and the secondary server as secondaries for each other.

If you use the **mwtm secondaryserver** command to configure a secondary MWTM server, but the primary MWTM server fails before you launch the MWTM client, the MWTM client does not detect the secondary server.

To list the secondary MWTM server that you configured for this primary MWTM server, enter the **mwtm secondaryserver list** command. If a secondary server is not yet configured, an informative message appears.

To remove the current settings for the secondary server, enter the **mwtm secondaryserver clear** command. This command stops the server and removes the current values for these properties in the *System.properties* file:

- BACKUP\_SERVER

- BACKUP\_RMIPORT
- BACKUP\_WEBPORT

The **mwtm secondaryserver clear** command also restarts the server to activate the changes.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Configuring a Backup MWTM Server, page 4-10](#)

## mwtm serverlist add

### Server Only

#### Full Syntax

**mwtm serverlist list add** [*servername*] [*port number*]

#### Command Description

Adds new MWTM server to the list, where *servername* is the name of the new server added and *port number* is the port number of the corresponding client.

You must log in as the root user or superuser to use this command.

## mwtm serverlist delete

### Server Only

#### Full Syntax

**mwtm serverlist delete** [*servername* | **all**]

#### Command Description

Deletes the MWTM server from the list, where *servername* is the name of the server deleted.

You must log in as the root user or superuser to use this command.

## mwtm serverlist list

### Server Only

#### Full Syntax

**mwtm serverlist list**

#### Command Description

Lists all the MWTM servers configured.

- Add—Adds new MWTM server to the list, where *servername* is the name of the new server added and *port number* is the port number of the corresponding client.
- Delete—Deletes the MWTM server from the list, where *servername* is the name of the server deleted.

You must log in as the root user or superuser to use this command.

## mwtm servername

### Server and Solaris or Linux Clients Only

#### Full Syntax

**mwtm servername** [*hostname*]

#### Command Description

Resets the MWTM server' default hostname, where *hostname* is the new default hostname:

- Ensure that the new default hostname is valid and defined in your */etc/hosts* file. If not, you might not be able to start the MWTM server.
- If you are not logged in as the root user or as a superuser when you enter this command from an MWTM client, the default hostname changes only for that MWTM client and the user who entered the command.
- If you are logged in as the root user or superuser when you enter this command, the default hostname changes for the MWTM server and client, and it restarts the MWTM server. The MWTM server uses the new default hostname to register RMI services, and MWTM clients use the new default hostname to connect to the server.
- If you are logged into a *client-only* installation as the root user or as a superuser when you enter this command, the default hostname changes only for that MWTM client. The MWTM client uses the new default hostname to connect to the MWTM server.

#### Note

Using the **mwtm servername** command to reset the MWTM server's default hostname does not affect communication between the MWTM server and the ITPs.

#### Related Topic

- [Appendix C, “FAQs”](#)
- [Appendix H, “Configuring MWTM to Run with Various Networking Options”](#)

## mwtm setpath

### Server and Solaris or Linux Clients Only

#### Full Syntax

**mwtm setpath** [*username*]

#### Command Description

Appends binary (*bin*) directories to the path for a user. Users can then append the proper MWTM binary directories to their paths without manually editing the *.profile* and *.cshrc* files.

This command appends lines such as these to the user's *.profile* file:

**PATH=\$PATH:/opt/CSCOsgm/bin:/opt/CSCOsgmClient/bin # CiscoSGM**

and appends lines such as these to the user's *.cshrc* file:

```
set path=($path /opt/CSCOsgm/bin /opt/CSCOsgmClient/bin) # CiscoSGM
```

Thereafter, you can enter MWTM commands as:

```
mwtm help
```

instead of:

```
/opt/CSCOsgm/bin/mwtm help
```

When entering this command, remember that:

- If you enter this command and you do not specify a *username*, the MWTM appends the *bin* directories to your path (that is, to the path for the user who is currently logged in and entering the **mwtm setpath** command).
- If you enter this command and you specify a *username*, the MWTM appends the *bin* directories to the path for the specified user. To specify a *username*, follow these conditions:
  - You must log in as the root user.
  - The specified *username* must exist in the local */etc/passwd* file.
  - You cannot specify a *username* that is defined in a distributed Network Information Services (NIS) system or in an Network File System-mounted (NFS-mounted) home directory.
- If you enter this command more than once for the same user, each command overwrites the previous command. The MWTM does not append multiple *bin* directories to the same path.
- You might have to use the **su** - command when you enter root-level commands. If you use the **su** command to become the root user, rather than logging in as the root user, then you must use the - option.

## mwtm showcreds

### Server Only

### Full Syntax

```
mwtm showcreds [-i ipaddress] [-d nodetype]
```

### Command Description

Displays credentials for a given IP address, if specified. Otherwise, the Default credentials are used. To:

- Display credentials for a particular IP address only, use **-i** and the IP address of the node.
- Add credentials for a specific node type, specify **-d** and the nodetype, which can be:
  - **itp**—ITP nodes.
  - **ons**—ONS nodes.
  - **csr**—Cell Site Router (CSR) nodes.
  - **ran\_svc**—RAN\_SVC nodes.
  - **ip-ran**—IP-RAN nodes

You must log in as the root user or superuser to use this command.

### Related Topic

[Credentials Commands, page 4-22](#)

## mwtm showsnmpcomm

### Full Syntax

**mwtm showsnmpcomm** [-i *ipaddress*]

### Command Description

Shows the specified SNMP configuration, or all SNMP configurations, on the MWTM server.

-i *ipaddress*—the IP address of the device (optional). If not specified, displays all SNMP configurations on the server.

### Related Topic

- [mwtm addsnmpcomm, page B-7](#)
- [mwtm deletesnmpcomm, page B-25](#)
- [mwtm modifiesnmpcomm, page B-46](#)
- [mwtm snmpsetup, page B-70](#)

## mwtm snmpcomm

### Server Only

### Full Syntax

**mwtm snmpcomm** [*name*]

### Command Description

You use this command to set a new default SNMP read community name. The MWTM automatically updates the name in the SNMP parameters file. The default path and filename for the SNMP parameters file is */opt/CSCOs-gm/etc/communities.conf*.

You must log in as the root user or superuser to use this command.

### Related Topic

[SNMP Configuration Commands, page 4-18](#)

## mwtm snmpconf

### Server Only

### Full Syntax

**mwtm snmpconf** [*filename*]

### Command Description

Sets the file used for SNMP parameters, such as community names, timeouts, and retries.

The default path and filename for the SNMP parameters file is */opt/CSCOs-gm/etc/communities.conf*. If you installed the MWTM in a directory other than */opt*, then the file resides in that directory.

When you specify a new path or filename, the MWTM restarts the servers.

**Note**

The SNMP parameters file uses the HP OpenView format; therefore, you can set this path and filename to point to the HP OpenView *ovsnmp.conf* file in an existing OpenView system. For information about exporting SNMP community names from CiscoWorks Resource Manager Essentials (RME), see [Importing SNMP Community Names from CiscoWorks \(Solaris Only\)](#), page 4-2.

You must log in as the root user or superuser to use this command.

**Related Topic**

[SNMP Configuration Commands](#), page 4-18

## mwtm snmpget

**Server Only****Full Syntax**

```
mwtm snmpget [-JJVM_ARG1 [-JJVM_ARG2]...] [-v snmp_version] [-c community_string] [-r retry]
[-t timeout] [-d output_delimiter] [--header|--no-header] [--raw-octets|--no-raw-octets]
[--str-octets|--no-str-octets] [--raw-timeticks|--no-raw-timeticks]
[--resolve-integer|--no-resolve-integer] [--resolve-bits|--no-resolve-bits]
[--get-sysuptime|--no-get-sysuptime] [--detect-mib-error] [--instance oids] [--int-instance integer]
[--str-instance string] [hostname] [oid] [oid]...
```

**Command Description**

Queries the specified *hostname* by using SNMP **GetRequests**. Use these optional keywords and arguments with this command:

- **-JJVM\_ARG1**—JVM options. You must specify the **-J** keyword and arguments before any other keywords and arguments.

For example, by default JVM uses a maximum of 64 MB of memory; however, if you are walking a large table, JVM might require more memory. To enable JVM to use a maximum of 256 MB of memory, use this syntax:

**-J-Xmx256m**

- **-v snmp\_version**—SNMP protocol version. Valid versions are **1** or **2c**. The default version is **2c**.
- **-c community\_string**—SNMP community string. You specify the default community string in the SNMP parameters file, *communities.conf*.
- **-r retry**—SNMP retry count. You specify the default retry count in the SNMP parameters file, *communities.conf*.
- **-t timeout**—SNMP timeout, in seconds. You specify the default timeout in the SNMP parameters file, *communities.conf*.
- **-d output\_delimiter**—Output delimiter. The default output delimiter is a colon (:).
- **--header|--no-header**—Specifies whether to display variable names as table headers:
  - Specify **--header** to display variable names as table headers for tabular output, or to display MIB variable OIDs with the value for nontabular output. This is the default setting.
  - Specify **--no-header** if you do not want to display variable names as table headers for tabular output, or MIB variable OIDs with the value for nontabular output.

- **--raw-octets|--no-raw-octets**—Specifies whether to display octets as raw octets:
  - Specify **--raw-octets** to display raw octets, such as **6c 69 6e 6b**, for octet strings.
  - Specify **--no-raw-octets** if you do not want to display raw octets for octet strings. This is the default setting.

The other option for displaying octets is **--str-octets|--no-str-octets**.

- **--str-octets|--no-str-octets**—Specifies whether to display octets as strings:
  - Specify **--str-octets** to display octets as strings, such as **link**. This is the default setting.
  - Specify **--no-str-octets** if you do not want to display octets as strings.

The other option for displaying octets is **--raw-octets|--no-raw-octets**.

- **--raw-timeticks|--no-raw-timeticks**—Specifies the time format:
  - Specify **--raw-timeticks** to specify raw timeticks, such as **2313894**.
  - Specify **--no-raw-timeticks** to specify formatted timeticks, such as **6 Hours 26 Mins 12 Secs**. This is the default setting.
- **--resolve-integer|--no-resolve-integer**—Specifies the time format. Use:
  - **--resolve-integer** to display integers using the string description in the MIB, such as **available** or **unavailable**.
  - **--no-resolve-integer** to display integers as numbers. This is the default setting.
- **--resolve-bits|--no-resolve-bits**—Specifies the time format. Use:
  - **--resolve-bits** to display bits using the string description in the MIB, such as **continue** or **ruleset**.
  - **--no-resolve-bits** to display bits as numbers, such as **1** or **14**. This is the default setting.
- **--get-sysuptime|--no-get-sysuptime**—Specifies whether to retrieve the **sysuptime**. Use:
  - **--get-sysuptime** to retrieve the sysuptime in the same packet as each SNMP operation.
  - **--no-get-sysuptime** if you do not want to retrieve the sysuptime in the same packet. This is the default setting.
- **--detect-mib-error**—Detects errors in returned MIB variables, such as **noSuchInstance**, **noSuchObject**, and **endOfMibView**. If the system detects any such errors, an error message and error code appear.

Sometimes multiple MIB variables are returned at the same time, some of which are in error; others are not. If this occurs and you:

- Specified **--detect-mib-error**, none of the correct values appear, only the error message, and it returns an error code.
- Did not specify **--detect-mib-error**, a return code of 0 is returned and all MIB variables appear. (Even **noSuchInstance** appears as a returned value.) This is the default setting, with **--detect-mib-error** not specified.
- **--instance *oids***—Appends instance OIDs to each polling MIB variable. For example, these commands perform the same function:
 

```
mwtm snmpget --instance 172.18.16.10 node_1 ipAdEntIfIndex ipAdEntNetMask
```

```
mwtm snmpget node_1 ipAdEntIfIndex.172.18.16.10 ipAdEntNetMask.172.18.16.10
```
- **--int-instance *integer***—Appends the specified integer instance OID to each polling MIB variable.

- **--str-instance** *string*—Appends string instance OIDs to each polling MIB variable; for example, these commands perform the same function:

```
mwtm snmpget --str-instance link_1 node_1 cItpSpLinksetState
```

```
mwtm snmpget node_1 cItpSpLinksetState.6.108.115.110.97.109.101
```

- *hostname*—Name of the host to query.
- *oid*—One or more OIDs or variable names.

The default path for the SNMP parameters file, *communities.conf*, is */opt/CSCOsgm/etc/communities.conf*. If you installed the MWTM in a directory other than */opt*, then the file resides in that directory. You can edit the file manually or using the MWTM client (see [Launching the Discovery Dialog](#), page 3-6).

You must log in as the root user or superuser to use this command.

[SNMP Configuration Commands](#), page 4-18

## mwtm snmphelp

### Server Only

#### Command Description

Displays help for all commands that are related to SNMP queries.

You must log in as the root user or superuser to use this command.

#### Related Topic

[SNMP Configuration Commands](#), page 4-18

## mwtm snmpmaxrows

### Server Only

#### Full Syntax

```
mwtm snmpmaxrows [number-of-rows]
```

#### Command Description

Sets the value of maximum rows for SNMP walk.

The MWTM collects network information from device MIBs using SNMP protocol. In certain ITP networks, some MIB tables can be very large (such as GTT tables, MTP3 accounting statistics tables, etc.) The default value of 100,000 rows is usually sufficient even for large networks. However, for very large networks, if the limit needs to be increased, you can customize the this parameter. It is not recommended to exceed 300,000 rows.

If you enter this command without the *number-of-rows* argument, the MWTM displays the current maximum number of rows. You can then change that value or leave it. The valid range is 1 row to an unlimited number of rows; however, it is not recommended to set this number at less than 10,000. The default value is 100,000 rows.

You must log in as the root user or superuser to use this command.

## mwtm snmpnext

### Server Only

#### Full Syntax

```
mwtm snmpnext [-JJVM_ARG1 [-JJVM_ARG2]...] [-v snmp_version] [-c community_string] [-r retry]
[-t timeout] [-d output_delimiter] [--header|--no-header] [--raw-octets|--no-raw-octets]
[--str-octets|--no-str-octets] [--raw-timeticks|--no-raw-timeticks]
[--resolve-integer|--no-resolve-integer] [--resolve-bits|--no-resolve-bits]
[--get-sysuptime|--no-get-sysuptime] [--detect-mib-error] [--instance oids] [--int-instance integer]
[--str-instance string] [hostname] [oid] [oid]...
```

#### Command Description

Queries the specified *hostname* by using SNMP **GetNextRequests**. Use these optional keywords and arguments with this command:

- **-JJVM\_ARG1**—JVM options. You must specify the **-J** keyword and arguments before any other keywords and arguments.

For example, by default JVM uses a maximum of 64 MB of memory; however, if you explore a large table, JVM might require more memory. To enable JVM to use a maximum of 256 MB of memory, use this option:

**-J-Xmx256m**

- **-v snmp\_version**—SNMP protocol version. Valid versions are **1** or **2c**. The default version is **2c**.
- **-c community\_string**—SNMP community string. You specify the default community string in the SNMP parameters file, *communities.conf*.
- **-r retry**—SNMP retry count. You specify the default retry count in the SNMP parameters file, *communities.conf*.
- **-t timeout**—SNMP timeout, in seconds. You specify the default timeout in the SNMP parameters file, *communities.conf*.
- **-d output\_delimiter**—Output delimiter. The default output delimiter is a colon (:).
- **--header|--no-header**—Specifies whether to display variable names as table headers:
  - Specify **--header** to display variable names as table headers for tabular output or MIB variable OIDs with the value for nontabular output. This is the default setting.
  - Specify **--no-header** if you do not want to display variable names as table headers for tabular output or MIB variable OIDs with the value for nontabular output.
- **--raw-octets|--no-raw-octets**—Specifies whether to display octets as raw octets. Use:
  - **--raw-octets** to display raw octets, such as **6c 69 6e 6b**, for octet strings.
  - **--no-raw-octets** if you do not want to display raw octets for octet strings. This is the default setting.

The other option for displaying octets is **--str-octets|--no-str-octets**.

- **--str-octets|--no-str-octets**—Specifies whether to display octets as strings. Use:
  - **--str-octets** to display octets as strings, such as **link**. This is the default setting.

- **--no-str-octets** if you do not want to display octets as strings.

The other option for displaying octets is **--raw-octets|--no-raw-octets**.

- **--raw-timeticks|--no-raw-timeticks**—Specifies the time format:
  - Specify **--raw-timeticks** to specify raw timeticks, such as **2313894**.
  - Specify **--no-raw-timeticks** to specify formatted timeticks, such as **6 Hours 26 Mins 12 Secs**. This is the default setting.
- **--resolve-integer|--no-resolve-integer**—Specifies the time format. Use:
  - **--resolve-integer** to display integers using the string description in the MIB, such as **available** or **unavailable**.
  - **--no-resolve-integer** to display integers as numbers. This is the default setting.
- **--resolve-bits|--no-resolve-bits**—Specifies the time format:
  - Specify **--resolve-bits** to display bits using the string description in the MIB, such as **continue** or **ruleset**.
  - Specify **--no-resolve-bits** to display bits as numbers, such as **1** or **14**. This is the default setting.
- **--get-sysuptime|--no-get-sysuptime**—Specifies whether to retrieve the **sysuptime**. Use:
  - **--get-sysuptime** to retrieve the sysuptime in the same packet as each SNMP operation.
  - **--no-get-sysuptime** if you do not want to retrieve the sysuptime in the same packet. This is the default setting.
- **--detect-mib-error**—Detects errors in returned MIB variables, such as **noSuchInstance**, **noSuchObject**, and **endOfMibView**. If the system detects any such errors, an error message appears and an error code is returned.
 

Sometimes multiple MIB variables are returned at the same time, some of which are in error; others are not. If this occurs and you:

  - Specified **--detect-mib-error**, none of the correct values appear, only the error message and it returns an error code.
  - Did not specify **--detect-mib-error**, a return code of 0 is returned and all MIB variables appear (even **noSuchInstance** appears as a returned value). This is the default setting, with **--detect-mib-error** not specified.
- **--instance *oids***—Appends instance OIDs to each polling MIB variable. For example, these commands perform the same function:

```
mwtm snmpget --instance 172.18.16.10 node_1 ipAdEntIfIndex ipAdEntNetMask
```

```
mwtm snmpget node_1 ipAdEntIfIndex.172.18.16.10 ipAdEntNetMask.172.18.16.10
```

- **--int-instance *integer***—Appends the specified integer instance OID to each polling MIB variable.
- **--str-instance *string***—Appends string instance OIDs to each polling MIB variable. For example, these commands perform the same function:

```
mwtm snmpget --str-instance link_1 node_1 cItpSpLinksetState
```

```
mwtm snmpget node_1 cItpSpLinksetState.6.108.115.110.97.109.101
```

- *hostname*—Name of the host to be queried.
- *oid*—One or more OIDs or variable names.

The default path for the SNMP parameters file, *communities.conf*, is */opt/CSCOsgrm/etc/communities.conf*. If you installed the MWTM in a directory other than */opt*, then the file resides in that directory. You can edit the file manually or by using the MWTM client (see [Launching the Discovery Dialog](#), page 3-6).

You must log in as the root user or superuser to use this command.

**Related Topic**

[SNMP Configuration Commands](#), page 4-18

## mwtm snmpsetup

**Server Only****Full Syntax**

**mwtm snmpsetup**

**Command Description**

Sets up SNMP configurations on the MWTM server for multiple devices and optionally discovers the new nodes. This command interactively prompts you to add, modify, or delete one or more SNMP configurations, which include values for:

- Hostname
- Read community string
- Poll interval (in minutes)
- Timeout (in seconds)
- Number of retries

When modifying poll interval, retry, and timeout values, this command displays the currently available value in brackets [ ]. When adding new SNMP configurations, this command displays default values.

After adding, modifying, or deleting an SNMP configuration, this command prompts you to discover the node (only this node is discovered).

You do not need to restart the server when using this command.

**Related Topic**

## mwtm snmpwalk

### Server Only

#### Full Syntax

```
mwtm snmpwalk [-JJVM_ARG1 [-JJVM_ARG2]...] [-v snmp_version] [-c community_string]
[-r retry] [-t timeout] [-x maximum_rows] [-d output_delimiter] [--tabular|--no-tabular]
[--getbulk|--no-getbulk] [--header|--no-header] [--raw-octets|--no-raw-octets]
[--str-octets|--no-str-octets] [--raw-timeticks|--no-raw-timeticks]
[--resolve-integer|--no-resolve-integer] [--resolve-bits|--no-resolve-bits]
[--get-sysuptime|--no-get-sysuptime] [--detect-mib-error] [--instance oids] [--int-instance integer]
[--str-instance string] [hostname] [oid] [oid]...
```

#### Command Description

Queries the specified *hostname* by using SNMP **GetNextRequests** to go through the MIB. Use these optional keywords and arguments with this command:

- **-JJVM\_ARG1**—JVM options. You must specify the **-J** keyword and arguments before any other keywords and arguments.

For example, by default JVM uses a maximum of 64 MB of memory; however, if you are going through a large table, JVM might require more memory. To enable JVM to use a maximum of 256 MB of memory, use this option:

#### **-J-Xmx256m**

- **-v snmp\_version**—SNMP protocol version. Valid versions are **1** or **2c**. The default version is **2c**.
- **-c community\_string**—SNMP community string. You specify the default community string in the SNMP parameters file, *communities.conf*.
- **-r retry**—SNMP retry count. You specify the default retry count in the SNMP parameters file, *communities.conf*.
- **-t timeout**—SNMP timeout, in seconds. You specify the default timeout in the SNMP parameters file, *communities.conf*.
- **-x maximum\_rows**—Maximum number of rows to go through. If a table has more than the maximum number of rows, the **mwtm snmpwalk** command fails. You can use the **-m** keyword and argument to increase the maximum number of rows to go through. The default setting is 10,000 rows.  
However, for every 10,000 rows gone through, JVM requires an additional 10 MB of memory. You can use the **-J** keyword and argument to increase the memory available to JVM.
- **-d output\_delimiter**—Output delimiter. The default output delimiter is a colon (:).
- **--tabular|--no-tabular**—Specifies whether to print the result of the query in tabular format. Use:
  - **--tabular** to print the result in tabular format. This is the default setting.
  - **--no-tabular** if you do not want to print the result in tabular format.
- **--getbulk|--no-getbulk**—(SNMP version 2c only) Specifies whether to use the **getbulk** command to go through the table. Use:
  - **--getbulk** to use the **getbulk** command. This is the default setting.
  - **--no-getbulk** if you do not want to use the **getbulk** command.
- **--header|--no-header**—Specifies whether to display variable names as table headers. Use:

- **--header** to display variable names as table headers for tabular output or to display MIB variable OIDs with the value for nontabular output. This is the default setting.
- **--no-header** if you do not want to display variable names as table headers for tabular output or MIB variable OIDs with the value for nontabular output.
- **--raw-octets|--no-raw-octets**—Specifies whether to display octets as raw octets. Use:
  - **--raw-octets** to display raw octets, such as **6c 69 6e 6b**, for octet strings.
  - **--no-raw-octets** if you do not want to display raw octets for octet strings. This is the default setting.

The other option for displaying octets is **--str-octets|--no-str-octets**.

- **--str-octets|--no-str-octets**—Specifies whether to display octets as strings. Use:
  - **--str-octets** to display octets as strings, such as **link**. This is the default setting.
  - **--no-str-octets** if you do not want to display octets as strings.

The other option for displaying octets is **--raw-octets|--no-raw-octets**.

- **--raw-timeticks|--no-raw-timeticks**—Specifies the time format. Use:
  - **--raw-timeticks** to specify raw timeticks, such as **2313894**.
  - **--no-raw-timeticks** to specify formatted timeticks, such as **6 Hours 26 Mins 12 Secs**. This is the default setting.
- **--resolve-integer|--no-resolve-integer**—Specifies the time format. Use:
  - **--resolve-integer** to display integers using the string description in the MIB, such as **available** or **unavailable**.
  - **--no-resolve-integer** to display integers as numbers. This is the default setting.
- **--resolve-bits|--no-resolve-bits**—Specifies the time format. Use:
  - **--resolve-bits** to display bits using the string description in the MIB, such as **continue** or **ruleset**.
  - **--no-resolve-bits** to display bits as numbers, such as **1** or **14**. This is the default setting.
- **--get-sysuptime|--no-get-sysuptime**—Specifies whether to retrieve the sysuptime. Use:
  - **--get-sysuptime** to retrieve the sysuptime in the same packet as each SNMP operation.
  - **--no-get-sysuptime** if you do not want to retrieve the **sysuptime** in the same packet. This is the default setting.

- **--detect-mib-error**—Detects errors in returned MIB variables, such as **noSuchInstance**, **noSuchObject**, and **endOfMibView**. If the system detects any such errors, an error message and error code appear.

Sometimes multiple MIB variables are returned at the same time, some of which are in error; others are not. If this occurs and you:

- Specified **--detect-mib-error**, none of the correct values appear, only the error message and an error code is returned.
- Did not specify **--detect-mib-error**, a return code of 0 and all MIB variables appear; even **noSuchInstance** appears as a returned value. This is the default setting, with **--detect-mib-error** not specified.
- **--instance oids**—Appends instance OIDs to each polling MIB variable. For example, these commands perform the same function:

```
mwtm snmpget --instance 172.18.16.10 node_1 ipAdEntIfIndex ipAdEntNetMask
```

```
mwtm snmpget node_1 ipAdEntIfIndex.172.18.16.10 ipAdEntNetMask.172.18.16.10
```

- **--int-instance** *integer*—Appends the specified integer instance OID to each polling MIB variable.
- **--str-instance** *string*—Appends string instance OIDs to each polling MIB variable. For example, these commands perform the same function:

```
mwtm snmpget --str-instance link_1 node_1 cItpSpLinksetState
```

```
mwtm snmpget node_1 cItpSpLinksetState.6.108.115.110.97.109.101
```

- *hostname*—Name of the host to query.
- *oid*—One or more OIDs or variable names.

The default path for the SNMP parameters file, *communities.conf*, is */opt/CSCOs/gm/etc/communities.conf*. If you installed the MWTM in a directory other than */opt*, then the file resides in that directory. You can edit the file manually or using the MWTM client (see [Launching the Discovery Dialog](#), page 3-6).

You must log in as the root user or superuser to use this command.

#### Related Topic

[SNMP Configuration Commands](#), page 4-18

## mwtm sounddir

### Server Only

### Full Syntax

```
mwtm sounddir [directory]
```

### Command Description

#### Note

You must stop the MWTM server before performing this command. You are prompted whether to continue.

Sets the directory in which the MWTM server stores event automation sound files (see [Changing the Way the MWTM Processes Events](#), page 9-23 for information about sound files).

The default directory for sound files resides in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the default directory is */opt/CSCOs/gm/sounds*.
- A different directory, then the default directory resides in that directory.

Use this command if you want to use a different directory for MWTM server event automation sound files, such as a Network File System location on another server.

**Note**

This command copies all files in the current directory to the new directory. If you are not logged in as the superuser and you do not own the new directory, you might not be able to copy the files. In that case, you must specify a directory that you own, or you must log in as the root user.

You must log in as the root user to use this command.

## mwtm ssl

### Server Only

#### Full Syntax

**mwtm ssl** [enable | disable | status]

#### Command Description

If you enable the SSL on the MWTM and you have an SSL key-certificate pair on the MWTM, you can use this command to manage SSL support in the MWTM:

- **enable**—Enables SSL support.
- **disable**—Disables SSL support.
- **status**—Displays the current status of SSL support in the MWTM, including whether you enabled or disabled SSL support, and which SSL keys and certificates exist.

You must log in as the root user (not as a superuser) to use this command. See [Implementing SSL Support in the MWTM, page 2-21](#) for more information.

## mwtm sslstatus

### Server Only

#### Command Description

Displays the current status for SSL that the MWTM supports, including whether you enabled or disabled SSL support; and, which SSL keys and certificates exist.

You must log in as the root user to use this command.

#### Related Topic

[Implementing SSL Support in the MWTM, page 2-21](#)

## mwtm start

### Server Only

#### Command Description

Starts all MWTM servers on the local host.

You must log in as the root user or superuser to use this command.

**Note**

If the database has an exception during start up, the server will fail to start.

**Related Topic**

[Starting the MWTM Server, page 3-1](#)

## mwtm start client

**Server and all Clients****Full Syntax**

**mwtm start client** [*hostname*]

**Command Description**

Starts an MWTM client on the specified host. If you did not specify a hostname, starts an MWTM client on the default host, as specified during installation. See [Connecting to a New Server, page 5-40](#) for information about determining the default host.

If you log in to a remote workstation through Telnet or SSH, you must set the DISPLAY variable to your local display, or you cannot use this command. If the DISPLAY variable is not set automatically, you must set it manually (see [Setting the DISPLAY Variable for Solaris or Linux Clients, page 3-3](#)).

This command has the same function as the **mwtm client** command.

## mwtm start jsp

**Server Only****Command Description**

Starts the MWTM JSP Server on the local host.

You must log in as the root user or superuser to use this command.

## mwtm start pm

**Server Only****Command Description**

Starts the MWTM Application Server and all managed processes on the local host.

You must log in as the root user or superuser to use this command.

## mwtm start web

### Server Only

#### Command Description

Starts the MWTM web server on the local host.

You must log in as the root user or superuser to use this command.

## mwtm statreps

### Full Syntax

```
mwtm statreps [aaa | noaaa] [acct | noacct] [allmi] [apn | noapn]
[chassisinventory | nochassisinventory] [clean] [cleancustom tag] [cpu | nocpu] [csg | nocsg]
[custage number-of-days] [dailyage number-of-days] [dailycsvage number-of-days]
[diskcheck | nodiskcheck] [disable | enable] [epc | noepc] [export | noexport] [ggsn | noggsn]
[gtp | nogtp] [gttacct | nogttacct] [gttrates | nogttrates] [ha | noha] [hourlyage number-of-days]
[hourlycsvage number-of-days] [interface | nointerface] [invage number-of-days]
[iplinks | noiplinks] [iplocalpool | noiplocalpool] [link | nolink] [maxcsvrows rows]
[mem | nomem] [mlr | nomlr] [monthlyage number_of_days] [monthlycsvage number_of_days]
[msu | nomsu] [nullcaps | nonullcaps] [pdsn | nopdsn] [pwe3 | nopwe3]
[qos | noqos][q752 | noq752] [rano | norano] [setp | nosetp] [servratio factor] [status] [slb | noslb]
[timemode [12 | 24] [timer] [utilratio factor] [xua | noxua] [15minage number_of_days]
[15mincsvage number_of_days]
```

Optionally, you can specify a hostname or IP address to enable or disable the specified report for a specific device. For example the following command enables CPU reports for the device 172.16.1.1:

```
mwtm statreps cpu 172.16.1.1
```

If you specify a command in which the hostname or IP address is not applicable, the host parameter is ignored and does not cause an error.

#### Command Description

You must log in as the root user or superuser to use these commands.

- **aaa**—Specifies whether MWTM should generate AAA reports.
  - **aaa**—Generate AAA reports.
  - **noaaa**—Do not generate AAA reports.
- **acct**—*ITP only*. Specifies whether the MWTM should generate MTP3 and XUA accounting reports. MTP3 accounting describes MTP3 layer traffic in support of linksets; XUA accounting describes MTP3 layer traffic in support of application servers.
  - **acct**—Generate MTP3 and XUA accounting reports. You must enable MTP3 accounting on the links for the MWTM to generate MTP3 accounting reports.
  - **noacct**—Do not generate MTP3 or XUA accounting reports. This is the default setting.

#### Note

This command does not trigger the immediate collection of statistics. By default, MWTM collects MTP3 and XUA accounting statistics nightly. It might take up to 2 days before the first reports are generated.

See [MTP3 Accounting Reports, page 13-194](#) for more information on MTP3 accounting reports. See [AS Accounting Reports, page 13-192](#), for more information on XUA accounting reports.

- **allmi**—Generates all mobile internet reports.
- **apn**—Specifies whether MWTM should generate APN reports:
  - **apn**—Generate APN reports.
  - **noapn**—Do not generate APN reports.
- **chassisinventory**—Specifies whether MWTM should generate chassis inventory reports.
  - **chassisinventory**—Generate chassis inventory reports.
  - **nochassisinventory**—Do not generate chassis inventory reports.
- **clean**—Removes all data from MWTM network statistics reports, restoring the reports to an unchanged state. You must log in as the root user or superuser to use this command.
- **cleancustom**—*ITP only*. Removes all data from one or more MWTM custom statistics reports, restoring the reports to an unchanged state. To clean:
  - All custom reports, enter **mwtm statreps cleancustom**.
  - A single custom report, enter **mwtm statreps cleancustom tag**, where *tag* is the ID tag of the custom report that you want to clean.

See [Locating Stored Reports, page 13-253](#) for more information.

- **cpu**—Generate CPU statistics reports.
  - **cpu**—Generate CPU statistics reports.
  - **nocpu**—Do not generate CPU statistics reports. This is the default setting.
- **csg**—*CSG only*. Specifies whether the MWTM should generate CSG subscriber reports:
  - **csg**—Generate CSG subscriber statistics reports. You must enable CSG accounting for the MWTM to generate CSG accounting statistics.
  - **nocsg**—Do not generate CSG subscriber statistics reports. This is the default setting.
- **custage**—*ITP only*. Specifies the maximum number of days the MWTM should archive custom reports. If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 10 days.

This command has the same function as the **mwtm repcustage** command. See [Locating Stored Reports, page 13-253](#) for more information.

- **dailyage**—Specifies the maximum number of days to archive the daily network statistics reports. If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 90 days.

This command has the same function as the **mwtm repdailyage** command. See [Locating Stored Reports, page 13-253](#) for more information.

- **dailycsvage**—Specifies the maximum number of days to archive the daily CSV reports.
- **diskcheck**—Specifies whether the MWTM should verify that a disk has at least 10 MB of space remaining before generating network statistics reports:
  - **diskcheck**—Verify the disk space. This is the default setting.
  - **nodiskcheck**—Do not verify the disk space.

If your system does not return the necessary amount of free space, in a correct format that the MWTM can parse, use this command to disable checking to allow reporting to continue.

- **enable**—Specifies to generate network statistics and accounting reports:
  - **enable**—Generate network statistics and accounting reports. This is the default setting.
  - **disable**—Do not generate network statistics and accounting reports.

You must enter this command to generate network statistics and accounting reports before entering the **mwtm accstats**, **mwtm gttstats**, **mwtm linkstats**, **mwtm mlrstats**, and **mwtm xuastats** commands.

See [Chapter 13, “Managing Reports”](#) for more information on network statistics and accounting reports.

- **epc**—Generate EPC reports.
  - **epc**—Generate EPC reports.
  - **noepc**—Do not generate EPC reports.
- **export**—*ITP only*. Specifies whether the MWTM should generate network statistics and accounting reports in export format:
  - **export**—Generate network statistics reports in export format. This is the default setting.
  - **noexport**—Do not generate network statistics reports in export format.

Network statistics reports in export format are *.zip* files that contain comma-separated value (CSV) text files that you can download and unzip. See [Enabling Automatic Reports Using the CLI, page 13-2](#) for more information.

- **ggsn**—*GGSN only*. Specifies whether the MWTM should generate GGSN subscriber statistics reports:
  - **ggsn**—Generate GGSN subscriber statistics reports.
  - **noggsn**—Do not generate GGSN subscriber statistics reports. This is the default setting.
- **gtp**—Specifies whether MWTM should generate GTP reports.
  - **gtp**—Generate GTP reports.
  - **nogtp**—Do not generate GTP reports. This is the default setting.
- **gttacct**—*ITP only*. Specifies whether the MWTM should generate GTT accounting statistics reports:
  - **gttacct**—Generate GTT accounting statistics reports. You must enable GTT accounting for the MWTM to generate GTT accounting statistics.
  - **nogttacct**—Do not generate GTT accounting statistics reports. This is the default setting.

#### Note

This command does not trigger immediate collection of statistics. By default, MWTM collects GTT accounting statistics nightly. It might take up to 2 days before the first reports are generated.

See [GTT Accounting Reports, page 13-193](#) for more information on GTT accounting statistics reports.

- **gttrates**—*ITP only*. Generate GTT rates reports.
  - **gttrates**—Generate GTT rates reports.
  - **nogttrates**—Do not generate GTT rates reports. This is the default setting.

- **ha**—*HA only*. Generate HA reports.
  - **ha**—Generate HA reports.
  - **noha**—Do not generate HA reports. This is the default setting.
- **hourlyage**—Specifies the maximum number of days to archive the hourly network statistics reports. If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 31 days.  
This command has the same function as the **mwtm rephourlyage** command.
- **hourlycsvage**—Specifies the maximum number of days to archive the hourly CSV reports.
- **interface**—Specifies whether the MWTM should generate Interface reports:
  - **interface**—Generate Interface reports.
  - **nointerface**—Do not generate Interface reports.
- **invage**—Specifies the maximum number of days to archive the inventory reports.
- **iplinks**—*ITP only*. Specifies whether the MWTM should include links that use the Stream Control Transmission Protocol (SCTP) IP transport protocol in network statistics reports:
  - **iplinks**—Include SCTPIP links. This is the default setting.
  - **noiplinks**—Do not include SCTPIP links.
- **iplocalpool**— Specifies whether the MWTM should generate IP local pool reports:
  - **iplocalpool**—Generate IP local pool reports.
  - **noiplocalpool**—Do not generate IP local pool reports.
- **link**—*ITP only*. Specifies whether the MWTM should generate link and linkset statistics summary reports:
  - **link**—Generate link and linkset statistics summary reports.
  - **nolink**—Do not generate link and linkset statistics summary reports. This is the default setting.

**Note**

This command does not trigger immediate collection of statistics. By default, MWTM collects link and linkset statistics hourly. It might take up to 2 hours before the first reports are generated. See [PDSN Reports, page 13-137](#) and [Linkset Reports, page 13-64](#) for more information on link and linkset statistics summary reports.

- **maxcsvrows**—*ITP only*. Specifies the maximum number of rows that the MWTM includes in export CSV files. *Rows* indicates the maximum number of rows to include.

**Note**

If you want to limit export CSV files to a size that Microsoft Excel can handle, set the value to 65535.

This command only applies to these files:

- *MWTMLinksetStats.RollingSevenDayAllHours.csv.zip*
- *MWTMLinkStats.RollingSevenDayAllHours.csv.zip*
- *MWTMAccStats.DailyDetail.<yyyy-mm-dd>.csv.zip*
- **mem**—Generates memory statistics reports.

- **mem**—Generate memory statistics reports.
- **nomem**—Do not generate memory statistics reports. This is the default setting.
- **mlr**—*ITP only*. Specifies whether the MWTM should generate MLR accounting reports:
  - **mlr**—Generate MLR reports. You must also enable MLR reporting for the MWTM to generate MLR reports.
  - **nomlr**—Do not generate MLR reports. This is the default setting.

**Note**

This command does not trigger immediate collection of statistics. By default, MWTM collects MLR accounting statistics nightly. It might take up to 2 days before the first reports are generated.

See [MLR Reports, page 13-75](#) for more information on MLR reports.

- **monthlyage**—Specifies the number of days to archive the monthly report data. If you do not specify a value for the number of days, you are prompted to enter a number.
- **monthlycsvage**—Specifies the maximum number of days to archive the monthly CSV reports.
- **msu**—*ITP only*. Specifies whether the MWTM should generate MSU rates reports:
  - **msu**—Generate MSU rates reports. You must also enable reporting for the MWTM to generate MSU rates reports.
  - **nomsu**—Do not generate MSU rates reports. This is the default setting.

See [MSU Rates Reports, page 13-80](#) for more information on MSU rates reports.

- **nullcaps**—*ITP only*. Specifies whether the MWTM should include SCTP links that do not have planned send and receive capacities in network statistics reports:
  - **nullcaps**—Include SCTP links that do not have planned send and receive capacities. This is the default setting.
  - **nonnullcaps**—Do not include SCTP links that do not have planned send and receive capacities.
- **pdsn**—*PDSN only*. Specifies to generate PDSN reports.
  - **pdsn**—Generate PDSN reports.
  - **nopdsn**—Do not generate PDSN reports.
- **pwe3**—*RANO only*. Specifies to generate PWE3 reports.
  - **pwe3**—Generate PWE3 reports.
  - **nopwe3**—Do not generate PWE3 reports.
- **qos**— Specifies whether the MWTM should generate QOS reports:
  - **qos**—Generate QOS reports.
  - **noqos**—Do not generate QOS reports.
- **q752**—*ITP only*. Specifies whether the MWTM should generate Q.752 daily statistics reports:
  - **q752**—Generate Q.752 statistics reports.
  - **noq752**—Do not generate Q.752 statistics reports. This is the default setting.

**Note**

This command does not trigger immediate collection of statistics. By default, MWTM collects Q.752 statistics nightly. It might take up to 2 days before the first reports are generated.

- **rano**—*RANO only*. Specifies whether the MWTM should generate RANO reports:
  - **rano**—Generate RANO reports.
  - **norano**—Do not generate RANO reports. This is the default setting.
- **sctp**—*ITP only*. Generates SCTP reports.
  - **sctp**—Generate SCTP reports.
  - **nosctp**—Do not generate SCTP reports. This is the default setting.
- **servratio**—*ITP only*. Displays a red ball in the In-Service cell in a network statistics report, if this condition is met:

#### Current In-Service < *factor* \* Long-Term In-Service

The default value for *factor* is **0.95**. Therefore, when the percentage of time that a link is in service (for an hour) falls below 95% of the long-term in-service percentage for that link, a red ball appears in the In-Service cell.

- **status**—Displays the current status of all MWTM network statistics report parameters. You use the other **mwtm statreps** commands, such as **mwtm statreps [disable | enable]** and **mwtm statreps [diskcheck | nodiskcheck]** to set these parameters.

You can also use the follow syntax to query the statistics reports of individual nodes:

```
mwtm statreps status [ip address]
```

- **slb**—Specifies whether the MWTM should generate SLB reports:
  - **slb**—Generate SLB reports.
  - **noslb**—Do not generate SLB reports. This is the default setting.
- **timemode**—Sets the time mode for dates in network statistics reports:
  - **12**—Use 12-hour clock, with AM and PM. 1:00 in the afternoon is 1:00 PM.
  - **24**—Use 24-hour clock, also called military time. 1:00 in the afternoon is 13:00. This is the default setting.
- **timer**—Displays the timer file for MWTM network statistics reports. The timer file is useful for identifying how much time the MWTM spends gathering report data and generating reports.
- **utilratio**—*ITP only*. Displays a red ball in the Send or Receive cell in a network statistics report, if this condition is met:

#### Current > *factor* \* Long-Term

The default value for *factor* is **1.50**. Therefore, if the link for a particular hour is more than 150% of the long-term average for that link, the red ball appears in the Send or Receive cell.

- **xua**—*ITP only*. Specifies whether the MWTM should generate statistics reports for application servers and application server processes:
  - **xua**—Generate statistics reports for application servers and application server processes.
  - **noxua**—Do not generate statistics reports for application servers and application server processes. This is the default setting.

#### Note

This command does not trigger immediate collection of statistics. By default, MWTM collects XUA statistics hourly. It might take up to 2 hours before the first reports are generated.

See [AS Reports, page 13-26](#) and [ASP Reports, page 13-34](#) for more information on statistics reports for application servers and application server processes.

- **15minage**—Specifies the maximum number of days to archive the 15 minute statistics reports.
- **15mincsvage**—Specifies the maximum number of days to archive the 15 minute CSV reports.

## mwtm statreps 15minage

### Server Only

### Full Syntax

**mwtm statreps 15minage** [*number-of-days*]

### Command Description

Maximum number of days the MWTM should archive 15-minute network statistics reports.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 31 days.

This command has the same function as the **mwtm rep15minage** command.

You must log in as the root user or superuser to use this command.

### Related Topic

[Locating Stored Reports, page 13-253](#)

## mwtm statreps monthlyage

### Server Only

### Full Syntax

**mwtm statreps monthlyage** [*number-of-days*]

### Command Description

Maximum number of days the MWTM should archive monthly network statistics reports.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 1,825 days.

This command has the same function as the **mwtm repmonthlyage** command.

You must log in as the root user or superuser to use this command.

### Related Topic

[Locating Stored Reports, page 13-253](#)

## mwtm status

### Server Only

#### Command Description

Displays the status of all MWTM servers on the local host.

#### Related Topic

[Chapter 11, “Accessing Data from the Web Interface”](#)

## mwtm stop

### Server Only

#### Command Description

Stops all MWTM servers on the local host.

You must log in as the root user or superuser to use this command.

## mwtm stopclients

### Server and Solaris or Linux Clients Only

#### Command Description

Stops all MWTM clients, including all GTT clients and Event Editors, on the local host.

You must log in as the root user (not as a superuser) to use this command.

## mwtm stop jsp

### Server Only

#### Command Description

Stops the MWTM JSP Server on the local host.

You must log in as the root user or superuser to use this command.

## mwtm stop pm

### Server Only

#### Command Description

Stops the MWTM Application Server and all managed processes on the local host.

You must log in as the root user or superuser to use this command.

## mwtm stop web

### Server Only

#### Command Description

Stops the MWTM web server on the local host.

You must log in as the root user or superuser to use this command.

## mwtm superuser

### Server Only

#### Full Syntax

**mwtm superuser** [*username*]

#### Command Description

Allows the specified user to perform most functions that otherwise require the user to log in as the root user. (The root user can still perform those functions, too.) The specified user account must exist in the local */etc/passwd* file. You cannot specify a user that is defined in a distributed Network Information Services (NIS) system.

#### Note

As a superuser, you can adversely affect your operating environment if you lack a sufficient understanding of the commands that you use. If you are a relatively inexperienced UNIX user, Cisco recommends that you limit your activities as a superuser to the tasks in this document.

For a complete list of the MWTM commands that a superuser cannot use, as well as other superuser considerations, see [Specifying a Super User \(Server Only\)](#), page 2-19.

You must log in as the root user (not as a superuser) to use this command.

## mwtm syncusers

### Server Only

#### Command Description

If you enable MWTM User-Based Access and you set **mwtm authtype** to **solaris**, synchronizes local MWTM passwords with Solaris.

You must log in as the root user (not as a superuser) to use this command.

#### Related Topic

[Manually Synchronizing Local MWTM Passwords \(Server Only\)](#), page 2-16

## mwtm tac

### Server Only

### Full Syntax

**mwtm tac** [short]

### Command Description

Collects important troubleshooting information for the Cisco Technical Assistance Center and writes the information to the */opt/CSCOsgm/tmp/cisco\_mwtm\_tshoot.log* file.

- **short**—Collects the basic information required for diagnosis of the problem.

You must log in as the root user or superuser to use this command.

### Related Topic

[Appendix D, “Troubleshooting the MWTM and the Network”](#)

## mwtm termproxy

### Server Only

### Full Syntax

**mwtm termproxy** [disable | enable | status]

### Command Description

Manages a terminal proxy that resides on a server and forwards terminal requests from clients to nodes that are accessible only from that server. You use a terminal proxy to enable remote clients on desktop networks to connect to nodes that otherwise would be unreachable. You can use these options with this command:

- **disable**—Disables MWTM proxy support. This is the default setting.
- **enable**—Enables the MWTM to use a proxy and prompts you to restart the MWTM server. When you restart the server, the MWTM automatically starts the proxy process.
- **status**—Indicates whether MWTM proxy support is currently enabled or disabled.

You must log in as the root user or superuser to use this command.

### Related Topic

[Enabling the Terminal Server Proxy Service, page 4-11](#)

## mwtm trapaccess

### Server Only

### Full Syntax

**mwtm trapaccess** [add [ip-addr] | clear | edit | list | rem [ip-addr] | sample]

### Command Description

You use this command to create and manage a list of IP addresses that can send traps to the MWTM server.

The list of allowed IP addresses resides in the *trapaccess.conf* file. By default, when you first install the MWTM, the *trapaccess.conf* file does not exist and the MWTM allows all IP addresses to send traps to the MWTM server. To create the *trapaccess.conf* file and work with the list of allowed client IP addresses, specify one of these keywords:

- **add**—Add the specified IP address to the *trapaccess.conf* file. If the file does not already exist, this command creates the file containing the first entry.
- **clear**—Remove all IP addresses from the *trapaccess.conf* file and allow traps from any MWTM client IP address.
- **edit**—Open and edit the *trapaccess.conf* file directly. If the *trapaccess.conf* file does not already exist, this command creates an empty file.
- **list**—List all IP addresses currently in the *trapaccess.conf* file. If no IP addresses appear (that is, the list is empty), the system allows traps from any MWTM IP address.
- **rem**—Removes the specified IP address from the *trapaccess.conf* file.
- **sample**—Prints out a sample *trapaccess.conf* file.

Any changes that you make take effect when you restart the MWTM server.

For more information about using this command, see [Limiting Traps by IP Address, page 4-9](#).

You must log in as the root user or superuser to use this command.

## mwtm trapratelimit abate

### Server Only

### Full Syntax

**mwtm trapratelimit abate [offset]**

### Command Description

This option configures the trap abate offset.

By default, a node generating 2,000 or more traps (major limiting count) in the last 30 minutes (limiting interval) is considered to generate too many traps.

MWTM raises a TrapRateStatus major alarm and stops trap processing for this node. If the node no longer experiences a trap storm in the next cycle (limiting interval), MWTM will automatically reset the ProcessTrap flag and begin processing traps again.

The abate offset is the offset value from the trap major limit count. The abate threshold limit is the limiting count minus the offset value. By default, the offset value is 200. For example, if a node generates 2,000 traps (major limiting count) minus 200 traps (the default offset value), which equals 1,800 or more traps, it is considered to be faulty and MWTM stops trap processing for this node.

You must log in as the root user or superuser to use this command.

## mwtm trapratelimit major

### Server Only

#### Full Syntax

**mwtm trapratelimit major [count]**

#### Command Description

This option configures the trap major limiting count or the major threshold limit.

By default, a node generating 2,000 or more traps (major limiting count) in the last 30 minutes (limiting interval) is considered to generate too many traps.

MWTM raises a TrapRateStatus major alarm and stops trap processing for this node. If the node no longer experiences a trap storm in the next cycle (limiting interval), MWTM will automatically reset the ProcessTrap flag and begin processing traps again.

You must log in as the root user or superuser to use this command.

## mwtm trapratelimit interval

### Server Only

#### Full Syntax

**mwtm trapratelimit interval [min]**

#### Command Description

This option configures the interval at which nodes are checked for a trap storm.

By default, a node generating 2,000 or more traps (major limiting count) in the last 30 minutes (limiting interval) is considered to generate too many traps.

MWTM raises a TrapRateStatus major alarm and stops trap processing for this node. If the node no longer experiences a trap storm in the next cycle (limiting interval), MWTM will automatically reset the ProcessTrap flag and begin processing traps again.

You must log in as the root user or superuser to use this command.

## mwtm trapratelimit minor

### Server Only

#### Full Syntax

**mwtm trapratelimit minor [count]**

#### Command Description

This option configures the trap minor limiting count or the minor threshold limit.

By default, if a node generates 1,000 or more traps (minor limiting count) in the last 30 minutes (limiting interval) MWTM raises a TrapRateStatus minor alarm. MWTM will continue to process traps from the node.

If the node no longer experiences a trap storm in the next cycle (limiting interval), MWTM will automatically clear the minor alarm. If on the other hand if the node continues to receive 2,000 or more traps (major limiting count) MWTM raises TrapRateStatus major alarm and stop trap processing for this node.

You must log in as the root user or superuser to use this command.

## mwtm trapsetup

### Server Only

### Full Syntax

**mwtm trapsetup** [**disable**]

### Command Description

Stops the MWTM server, configures the MWTM to receive SNMP traps (or prevents the MWTM from receiving traps), then restarts the MWTM server.

When you select an SNMP trap port number for the MWTM server, ensure that your ITPs use the same SNMP trap port number. See the description of the **snmp-server host** command in the “ITP Requirements” section of the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#) for more information.

To prevent the MWTM from receiving traps, enter the **mwtm trapsetup disable** command. The MWTM restarts the MWTM server.

You must log in as the root user (not as a superuser) to use this command.

### Related Topic

- [Chapter 2, “Configuring Security”](#)
- [Enabling SNMP Traps, page 4-7](#)

## mwtm trapstatus

### Server Only

### Command Description

Displays the current trap reception configuration for the MWTM, including:

- Whether you enabled or disabled receiving traps.
- On which UDP port the MWTM trap receiver listens.

### Related Topic

[Enabling SNMP Traps, page 4-7](#)

## mwtm tshootlog

### Server Only

#### Full Syntax

**mwtm tshootlog** { **all** | **trace** | **action** | **list** | **none** }

#### Command Description

The MWTM can record all output from troubleshooting commands into a log file. To:

- To enable both troubleshooting action and trace logging, specify **all**.
- To record all troubleshooting output to a log file, specify **trace**.
- To enable troubleshooting action logging, specify **action**.
- To list the status of action and trace logging, specify **list**.
- To disable both action and trace logging, specify **none**.

The default path for the troubleshooting trace logging is */opt/CSCOs/gm/logs/troubleshooting*. The default path for the troubleshooting action log file is */opt/CSCOs/gm/logs/sgmTroubleshootingLog.txt*. If you installed the MWTM in a directory other than */opt*, then the troubleshooting log file resides in that directory.

#### Related Topic

[Appendix D, “Troubleshooting the MWTM and the Network”](#)

## mwtm uninstall

### Server and Solaris or Linux Clients Only

#### Command Description

Uninstalls the MWTM.

You must log in as the root user (not as a superuser) to use this command.

## mwtm unknownage

### Server Only

#### Full Syntax

**mwtm unknownage** [*number-of-days*]

#### Command Description

Sets the maximum number of days to retain **Unknown** objects before deleting them from the MWTM database.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 7 days. Setting this value to 0 days means that, after one hour, the system deletes **Unknown**.

You must log in as the root user or superuser to use this command.

## mwtm updateuser

### Server Only

#### Full Syntax

**mwtm updateuser** *[username]*

#### Command Description

If you enable MWTM User-Based Access, changes the authentication level for the specified user. Valid levels are:

- 1—Basic User.
- 2—Power User.
- 3—Network Operator.
- 4—Network Administrator.
- 5—System Administrator.

If you set **mwtm authtype** to **local**, you also use this command to change the user's password. When setting the password, follow the rules and considerations in [Creating Secure Passwords, page 2-7](#).

See [Enabling and Changing Users and Passwords \(Server Only\), page 2-13](#) for more information on authentication levels and the use of this command.

You must log in as the root user or superuser to use this command.

#### Note

If you have enabled Solaris authentication, you must log in as the root user, not a superuser, to use this command (see [Configuring User Access, page 2-1](#)).

## mwtm useraccess

### Server Only

#### Full Syntax

**mwtm useraccess** **[disable | enable]**

#### Command Description

Enables or disables MWTM User-Based Access. User-Based Access provides multilevel password-protected access to MWTM features. Each user can have a unique username and password. You can also assign each user to one of five levels of access, which control the list of MWTM features accessible by that user.

#### Note

You must enable MWTM User-Based Access to use the associated MWTM security commands (see [Configuring User Access, page 2-1](#)).

The `mwtm useraccess` command goes through the following stages, checking the status of:

1. `mwtm useraccess`—Enabled or disabled.
2. `mwtm authtype`—If you have not already set the `mwtm` authentication type, you must do so now.
3. `mwtm adduser`—If you have already assigned users, the MWTM asks if you want to use the same user database, or create a new one. If you have not assigned users, you must do so now.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Configuring User Access, page 2-1](#)

## mwtm userpass

### Server Only

#### Full Syntax

**mwtm userpass** [*username*]

#### Command Description

If you enable MWTM User-Based Access and **mwtm authtype** is set to **local**, changes the specified user's MWTM security authentication password.

If the MWTM or a superuser automatically disables the user's authentication, this command re-enables the user's authentication with a new password.

If **mwtm authtype** is set to **solaris**, you cannot use this command; instead, you must manage passwords on the external authentication servers.

You must log in as the root user to use this command.

#### Related Topic

[Enabling and Changing Users and Passwords \(Server Only\), page 2-13](#)

## mwtm version

### Server and Solaris or Linux Clients Only

#### Command Description

Displays version information for MWTM servers and clients on the local host.

#### Related Topic

[Chapter 11, “Accessing Data from the Web Interface”](#)

## mwtm viewlog

### Server Only

#### Command Description

Uses PAGER to display the contents of the system message log. To:

- Save the current contents of the log, clear the log, and restart the server, enter **mwtm viewlog clear**.
- Display the contents of the log in reverse order, with the most recent messages at the beginning of the log, enter **mwtm msglog -r**.

This command has the same function as the **mwtm msglog** command.

You must log in as the root user or superuser to use this command.

## mwtm wall

### Server Only

#### Full Syntax

**mwtm wall** *message\_string*

#### Command Description

Sends a message to all clients that are connected to the server. For example:

**./mwtm wall Server going down at 9:00 pm tonight.**

sends this message:

**Server going down at 9:00 pm tonight.**

The MWTM ignores quotation marks (""") in *message\_string*. To include quotation marks ("""), use the escape character (\) in combination with quotation marks ("""). For example:

**./mwtm wall Example of the \"mwtm wall\" command.**

sends this message:

**Example of the "mwtm wall" command.**

You must log in as the root user or superuser to use this command.

## mwtm webaccesslog

### Server Only

#### Full Syntax

**mwtm webaccesslog** [clear | -r]

**Command Description**

Uses PAGER to display the MWTM system web access log file for the server to which you connect and which is currently running the MWTM server. The system web access log lists all MWTM system web access messages that it logged for the MWTM server. This method provides an audit trail of all access to the MWTM server via the web interface. To:

- Clear the log and restart the server, enter **mwtm webaccesslog clear**.
- Display the contents of the log in reverse order, with the most recent web access messages at the beginning of the log, enter **mwtm webaccesslog -r**.

You must log in as the root user or superuser to use this command.

## mwtm weberrorlog

**Server Only****Full Syntax**

**mwtm weberrorlog** [clear | -r]

**Command Description**

Uses PAGER to display the MWTM web server error log file for the server to which you connect, and which is currently running the MWTM server. The web server error log lists all MWTM web error messages that it logged for the MWTM web server. To:

- Clear the log and restart the server, enter **mwtm weberrorlog clear**.
- Display the contents of the log in reverse order, with the most recent web error messages at the beginning of the log, enter **mwtm weberrorlog -r**.

You must log in as the root user or superuser to use this command.

## mwtm weblogupdate

**Server Only****Full Syntax**

**mwtm weblogupdate** [interval | disable]

**Command Description**

Controls how often, in seconds, the MWTM updates certain web output.

When you enter this command, the MWTM displays the current interval. You can then change that value or leave it. The valid range is 1 second to an unlimited number of seconds. The default value is 300 seconds (5 minutes).

To disable the update interval, enter the **mwtm weblogupdate disable** command. This option reduces the CPU usage on the server and client.

You must log in as the root user or superuser to use this command.

## mwtm webnames

### Server Only

#### Full Syntax

**mwtm webnames** [**display** | **real**]

#### Command Description

Specifies whether the MWTM should show real node names or display names in web pages:

- **real**—Displays the real DNS names of nodes in web pages, as discovered by the MWTM.
- **display**—Shows display names in web pages. Display names are new names that you specify for nodes. This is the default setting. For more information about display names, see [Editing Properties, page 7-37](#).

You must log in as the root user or superuser to use this command.

## mwtm webport

### Server Only

#### Full Syntax

**mwtm webport** [*port-number*]

#### Command Description

Sets a new port number for the web server, where *port-number* is the new, numeric port number. The MWTM verifies that the new port number is not already in use.

The new port number must contain only numbers. If you enter a port number that contains nonnumeric characters, such as **mwtm13**, the MWTM displays an error message and returns to the command prompt without changing the port number.

You must log in as the root user (not as a superuser) to use this command.

## mwtm webutil

### Server Only

#### Full Syntax

**mwtm webutil** [**percent** | **erlangs**]

#### Command Description

Specifies whether the MWTM should display send and receive for linksets and links as percentages or in Erlangs (E), in web pages:

- **percent**—The MWTM displays as a percentage (%). This is the default setting.
- **erlangs**—The MWTM displays in Erlangs (E).

You must log in as the root user or superuser to use this command.

**Related Topic**

- [Chapter 11, “Accessing Data from the Web Interface”](#)
- [Chapter 13, “Managing Reports”](#)
- [Locating Stored Reports, page 13-253](#)

## mwtm who

**Server Only****Command Description**

Displays a list of all client usernames and processes connected to the server.

## mwtm xterm

**Server or Solaris or Linux Clients Only****Command Description**

Specifies the path to the **xterm** application to use for xterm sessions on the MWTM client, as well as any special parameters to pass to the xterm application. The default path is */usr/openwin/bin/xterm*.

If one of the special parameters that you pass to the **xterm** application is a title, the title can contain hyphens (-) and underscores (\_), but no spaces.

You must log in as the root user (not as a superuser) to use this command.

## mwtm accstats

### Server Only

### Full Syntax

**mwtm accstats** [*nodes* [*linksets* [*filter*]] [*idtag*]] [*sortopts*] [**quiet**]

### Command Description

Generates MWTM accounting statistics reports. To:

- Include or exclude specific objects in the reports, use the *nodes* argument. To include:
  - All nodes, specify **all**.
  - A single node or signaling point, specify a single node name, or node name and signaling-point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name; for example:

```
mwtm-75-59a.cisco.com
```

To specify a node name and signaling point:

```
mwtm-75-59a.cisco.com;net0
```

- Linksets, specify a filename with a list of linksets:  
`mwtm-75-96a.cisco.com;net0:7291p_to_7591a0`
- A filter, specify a filename with a list of filters in the format *dpc:opc*:  
`1.2.0:1.17.0`
- Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This is also the default setting for this command; you only need to specify **default** if you also want to specify an *idtag*, *sortopts*, or **quiet**.
- A group of nodes or signaling points other than the one specified in the *nodes.include* file, create a file that contains the list of nodes and signaling points to include and specify the full path and name of the file as the *nodes* argument.

**Note** The MWTM processes the include files first, then the exclude files.

If you specify *nodes*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm accstats** command.

- Specify the sort order for the reports, specify one of these keywords for the *sortopts* argument:
  - **-sdp**—Sort based on the destination point code (DPC) of the node, in ascending order.
  - **-sno**—Sort based on the node name, in ascending order.
  - **-sop**—Sort based on the originating point code (OPC) of the node, in ascending order.
  - **-srb**—Sort based on the number of bytes received, in descending order.
  - **-srm**—Sort based on the number of MTP3 message signal units (MSUs) received, in descending order.
  - **-ssb**—Sort based on the number of bytes sent, in descending order.
  - **-ssi**—Sort numerically based on service indicator (SI), in ascending order.
  - **-ssm**—Sort based on the number of MTP3 MSUs sent, in descending order.
- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you view by using the MWTM web interface.

The first time you use the **mwtm accstats** command to generate a report, you must enter the command at least twice. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the collected data appears valid, begins generating the report.

Thereafter, you need only to enter this command once to generate the report.

You must log in as the root user or superuser to use this command.

[Customizing ITP Reports, page 13-254](#)

## mwtm archivedir

### Server Only

### Full Syntax

**mwtm archivedir** [*directory*]

### Command Description

**Note**

You must stop the MWTM server before performing this command. The system prompts you whether to continue.

Sets the Version Control System (VCS) repository directory, the directory in which the MWTM stores archived files.

The default VCS repository directory resides in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the directory is */opt/CSCOs/gm/vcs-repository*.
- A different directory, then the directory resides in that directory.

Use this command if you want to use a different directory; for example, a Network File System location on another server.

- This command copies all files in the current directory to the new directory. If you do not log in as the superuser and do not own the new directory, you might not be able to copy the files. In that case, you must specify a directory that you own or you must log in as the root user. Do not set the new directory to:
  - Any of these: */usr*, */var*, */opt*, or */tmp*.
  - The same directory in which you are storing message log files (**mwtm msglogdir**), report files (**mwtm repdir**), route table files (**mwtm routedir**), GTT files (**mwtm gttidir**), or address table files (**mwtm atbldir**).

You must log in as the root user or superuser to use this command.

**Note**

If you are setting up a new repository directory on a Network File System location on another (remote) server, ensure that the server allows read-write access to the user account that you use to run the MWTM and run this command as a superuser.

## mwtm atblclient

### Solaris or Linux Clients Only

### Full Syntax

**mwtm atblclient** [*hostname*]

**Command Description**

Starts an MWTM Address Table Editor client on the specified host. If you do not specify a hostname, starts an MWTM Address Table Editor client on the default host, as specified during installation. See [Connecting to a New Server, page 5-40](#) for information about determining the default host.

For more information about the MWTM Address Table Editor, see [Chapter 16, “Editing ITP MLR Address Table Files.”](#)

If you log in to a remote workstation through Telnet, you must set the DISPLAY variable to your local display or you cannot use this command. If the system does not automatically set the DISPLAY variable, you must set it manually (see [Setting the DISPLAY Variable for Solaris or Linux Clients, page 3-3](#)).

## mwtm atbldir

**Server Only****Full Syntax**

**mwtm atbldir** [*directory*]

**Command Description****Note**

You must stop the MWTM server before performing this command. The system then prompts you whether to continue.

Sets the address-table staging directory, the directory in which the MWTM stores address table files. For more information about address table files, see [Chapter 16, “Editing ITP MLR Address Table Files.”](#)

The default address table staging directory resides in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the directory is */opt/CSCOs/gm/atbl*.
- A different directory, then the directory resides in that directory.

Use this command if you want to use a different directory to stage address tables, such as */tftpboot*, or such as a Network File System location on another server, used as the TFTP server for server configuration files for ITPs in the network.

This command copies all files in the current directory to the new directory. If you are not logged in as the superuser and do not own the new directory, the MWTM provides this prompt:

```
Can't create directory!! Address Table Staging Directory not changed!!
```

```
Directory could be located on a remote NFS server.
Manually create directory and try again.
Set permissions using chmod 777.
```

You must specify a directory that you own, or you must log in as the root user. Do not set the new directory to:

- Any of these: */usr*, */var*, */opt*, or */tmp*.
- The same directory in which you are storing message log files (**mwtm msglogdir**), report files (**mwtm repdir**), route table files (**mwtm routedir**), or GTT files (**mwtm gttdir**).

When you enter this command, the MWTM also prompts you to enable TFTP file transfer for the address table staging directory and prompts you for the TFTP path for the directory, **tftp://hostname/path**, where:

- *hostname* is the name or IP address of the host on which the address-table staging directory resides. If you enter a DNS name (such as **mwm-jumbo**) instead of an IP address (such as **172.18.12.10**), then the ITP must be able to resolve the DNS name; otherwise, when you try to deploy a file, the MWTM issues an appropriate error message and does not deploy the file.  
To enable the ITP to resolve DNS names, enter the **ip domain-lookup** command on the ITP. For more information about this command, see the *Cisco IOS IP Command Reference, Volume 1 of 4: Addressing and Services*, Release 12.3 or later.
- *path* is the path to the address table staging directory.

After you change the directory or enable TFTP file transfer for the directory, the MWTM asks if you want to restart the MWTM server. The new directory and TFTP setting take effect when you restart the MWTM server.

You must log in as the root user or superuser to use this command.

#### Note

If you are setting up a new address table staging directory on a Network File System location on another (remote) server, ensure that the server allows read-write access to the user account through which the MWTM is running and run this command as a superuser.

## mwtm autosyncconfig

### Server Only

### Full Syntax

**mwtm autosyncconfig** [enable | disable | status]

### Command Description

Manages **auto sync** configuration settings to automatically save the IOS configuration changes.

## mwtm checkgtt

### Server Only

### Full Syntax

**mwtm checkgtt** [-l logfilename] filename signalingpointname

### Command Description

Checks the semantics and syntax of the specified GTT file on the specified signaling point. To write detailed syntax- and semantics-checking results to a file, specify **-l** and the name of the file.

You must log in as the root user or superuser to use this command.

## mwtm checkmlr

### Server Only

### Full Syntax

**mwtm checkmlr** [-l *logfile*] *filename* *signalingpointname*

### Command Description

Checks the semantics and syntax of the specified MLR address table on the specified signaling point. To write detailed syntax- and semantics-checking results to a file, specify -l and the name of the file.

You must log in as the root user or superuser to use this command.

## mwtm checkroute

### Server Only

### Full Syntax

**mwtm checkroute** [-l *logfile*] *filename* *signalingpointname*

### Command Description

Checks the semantics and syntax of the specified route table file on the specified signaling point. To write detailed syntax- and semantics-checking results to a file, specify -l and the name of the file.

You must log in as the root user or superuser to use this command.

## mwtm countas

### Server Only

### Command Description

Displays a count of application servers in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm countasp

### Server Only

### Command Description

Displays a count of application server processes in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm countaspa

### Server Only

#### Command Description

Displays a count of application server process applications in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm countlinks

### Server Only

#### Command Description

Displays a count of links in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm countlinksets

### Server Only

#### Command Description

Displays a count of linksets in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm countsgmp

### Server Only

#### Command Description

Displays a count of signaling gateway-mated pairs in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm countsp

### Server Only

#### Command Description

Displays a count of signaling points in the current MWTM database.

You must log in as the root user or superuser to use this command.

## mwtm deletearchive

### Server Only

#### Full Syntax

**mwtm deletearchive** *{-s signaling-point-name} {-t type} [-a address-table-name]*

#### Command Description

Deletes a file from the archive.

- To delete an archived file, specify **-s** and the name of the signaling point, and specify **-t** and the type, which can be one of these:
  - gtt**
  - route**
  - mlr**

**Note** If you specify the *type* as **mlr**, you must also specify **-a** and the name of the address table.

You must log in as the root user or superuser to use this command.

## mwtm deployarchive

### Server Only

#### Full Syntax

**mwtm deployarchive** *{-s signaling point name of source configuration} {-t type} [-a address table name] [-r revision number of file] [-c archive comment for deploy]*

#### Command Description

Allows you to deploy an archived file to a specified signaling point. To:

- Deploy an archived file, specify **-s** and the name of the source configuration signaling point and specify **-t** and the type, which can be one of these:
  - gtt**
  - route**
  - mlr**

**Note** If you specify the *type* as **mlr**, you must also specify **-a** and the name of the address table.

- Deploy a specific revision number of the archive file, specify **-r** and the revision number. If the revision is not specified, the current revision is deployed.
- Provide archive comments during deployment, specify **-c** and add your comments.

Once you have entered the command, you will receive a prompt to enter the destination signaling-point name.

You must log in as the root user or superuser to use this command.

## mwtm deploycomments

### Server Only

#### Full Syntax

**mwtm deploycomments** { **require** | **optional** | **status** }

#### Command Description

Allows you to require or make optional user comments during deployment. To:

- Prompt the user for comments during file archiving by using the wizard, specify **require**.
- Skip the prompt for comments during file archiving by using the wizard, specify **optional**. You can still specify comments by using CLI commands, such as **mwtm pushgtt**, **mwtm pushmlr**, and **mwtm pushroute**.
- Show the current settings on the command line, specify **status**.

You must log in as the root user or superuser to use this command.

## mwtm evreps clean

### Server Only

#### Command Description

Removes all data from MWTM network event reports, restoring the reports to an unchanged state.

You must log in as the root user or superuser to use this command.

## mwtm evreps cleancustom

### Server Only

#### Full Syntax

**mwtm evreps cleancustom** [*tag*]

#### Command Description

Removes all data from one or more MWTM custom event reports, restoring the reports to an unchanged state. To clean:

- All custom reports, enter **mwtm evreps cleancustom**.
- A single custom report, enter **mwtm evreps cleancustom tag**, where *tag* is the ID tag of the custom report that you want to clean.

You must log in as the root user or superuser to use this command.

## mwtm evreps diskcheck

#### Full Syntax

**mwtm evreps** [**diskcheck** | **nodiskcheck**]

**Command Description**

Specifies whether the MWTM should verify that a disk has at least 10 MB of space remaining before generating network event reports:

- **diskcheck**—Verify the disk space. This is the default setting.
- **nodiskcheck**—Do not verify the disk space.

If your system does not return the necessary amount of free space in a correct format that the MWTM can parse, use this command to disable checking and to allow reporting to continue.

See [Chapter 13, “Managing Reports”](#) for more information on the output of this command.

You must log in as the root user or superuser to use this command.

## **mwtm evreps enable**

**Server Only****Full Syntax**

**mwtm evreps** [**disable** | **enable**]

**Command Description**

Enables the MWTM to generate event reports:

- **enable**—Generate network event reports. This is the default setting.
- **disable**—Do not generate network event reports.

The **mwtm evreps** command enables or disables the MWTM event reporting feature. To enable a specific type of event reporting, you must also enable that report type.

**Note**

In this release, the only event reports that the MWTM can generate are MTP3 events (see [mwtm evreps mtp](#), page B-107). To enable the MWTM event reporting feature, enter **mwtm evreps enable**. Then, to enable MTP3 event reporting, enter **mwtm evreps mtp**. To manually generate an MTP report from the command line, see [mwtm mtpevents](#), page B-117.

You must log in as the root user or superuser to use this command.

**Related Topic**

[Chapter 13, “Managing Reports”](#)

## **mwtm evreps hourlyage**

**Server Only****Full Syntax**

**mwtm evreps hourlyage** [*number-of-days*]

**Command Description**

Maximum number of days the MWTM should archive hourly network event reports.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 31 days.

You must log in as the root user or superuser to use this command.

## mwtm evreps mtp

### Server Only

#### Full Syntax

**mwtm evreps** [**mtp** | **nomtp**]

#### Command Description

Specifies whether the MWTM should generate MTP3 event reports:

- **mtp**—Generate MTP3 event reports.
- **nomtp**—Do not generate MTP3 event reports. This is the default setting.

#### Note

The default setting for MTP3 event reporting is disabled. To enable MTP3 event reporting, first enter **mwtm evreps enable** (see [mwtm evreps enable](#), page B-106). Then enter **mwtm evreps mtp**.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Chapter 13, “Managing Reports”](#)

## mwtm evreps status

### Server Only

#### Command Description

Displays the current status of all MWTM network event report parameters. You set these parameters by using the other **mwtm evreps** commands, such as:

- **mwtm evreps** [**disable** | **enable**]
- **mwtm evreps** [**diskcheck** | **nodiskcheck**]

You must log in as the root user or superuser to use this command.

## mwtm evreps timer

### Server Only

#### Command Description

Displays the timer file for MWTM network event reports. The timer file is useful for identifying how much time the MWTM spends gathering report data and generating reports.

You must log in as the root user or superuser to use this command.

## mwtm gttacct

### Server Only

### Full Syntax

**mwtm gttacct** [*nodes* [*linksets* [*filter*]] [*idtag*]] [*sortopts*] [**quiet**]

### Command Description

Generates MWTM GTT accounting reports. To:

- Include or exclude specific objects in the reports, use the *nodes* argument. To include:
  - All nodes, specify **all**.  
A single node or signaling point, specify a single node name, or node name and signaling-point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name, and each line must end with a colon (:).  
For example:  
`mwtm-75-59a.cisco.com:`
  - To specify a node name and signaling point, enter:  
`mwtm-75-59a.cisco.com;net0:`
  - Linksets, specify a filename with a list of linksets:  
`mwtm-75-96a.cisco.com;net0:7291p_to_7591a0`
  - A filter, specify a filename with a list of filters in the format:  
`selname:gta:pc`
  - Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This setting is also the default for this command; you only need to specify **default** if you also want to specify an *idtag*, *sortopts*, or **quiet**.
  - A group of nodes or signaling points other than the one that the *nodes.include* file specifies, create a file that contains the list of nodes and signaling points to include, and specify the full path and name of the file as the *nodes* argument.

**Note** The MWTM processes the include files first, then the exclude files.

If you specify a *node*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm gttacct** command.

- Specify the sort order for the reports, specify one of these keywords for the *sortopts* argument:
  - **-sgt**—Sort based on the GTA, in descending order.
  - **-sno**—Sort based on the node name, in ascending order.
  - **-spc**—Sort based on the point code, in ascending order.
  - **-ssn**—Sort based on the selector name, in ascending order.

- **-sto**—Sort based on the total number of octets translated by GTT, in descending order.
- **-stp**—Sort based on the total number of packets translated by GTT, in descending order. This is the default setting.
- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you can view by using the MWTM web interface.

The first time you use the **mwtm gttacct** command to generate a report, you must enter the command at least twice. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the collected data appears valid, begins generating the report.

Thereafter, you only need to enter this command once to generate the report.

You must log in as the root user or superuser to use this command.

## mwtm gttclient

### Solaris or Linux Clients Only

#### Full Syntax

**mwtm gttclient** [*hostname*]

#### Command Description

Starts an MWTM GTT client on the specified host. If no hostname is specified, starts an MWTM GTT client on the default host, as specified during installation. See [Connecting to a New Server, page 5-40](#) for information about determining the default host.

For more information about the MWTM GTT client, see [Chapter 15, “Editing an ITP Global Title Translation Table.”](#)

If you access a remote workstation through Telnet, you must set the DISPLAY variable to your local display or you cannot use this command. If the DISPLAY variable is not set automatically, you must set it manually (see [Setting the DISPLAY Variable for Solaris or Linux Clients, page 3-3](#)).

## mwtm gttmdir

### Server Only

#### Full Syntax

**mwtm gttmdir** [*directory*]

#### Command Description

#### Note

You must stop the MWTM server before performing this command. The system prompts you whether to continue.

Sets the GTT staging directory, the directory in which the MWTM stores GTT files and enables Trivial File Transfer Protocol (TFTP) file transfer for the directory. See [Chapter 15, “Editing an ITP Global Title Translation Table”](#) for information about GTT files.

The default GTT staging directory resides in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the directory is */opt/CSCOs/gtm/gtt*.
- A different directory, then the directory resides in that directory.

Use this command if you want to use a different GTT staging directory, such as */tftpboot* or the Network File System location on another server, which is used as the TFTP server for server configuration files for ITPs in the network.

This command copies all files in the current directory to the new directory. If you are not logged in as the superuser and do not own the new directory, the MWTM provides this prompt:

```
Can't create directory!! GTT Directory not changed!!
```

```
Directory could be located on a remote NFS server.
Manually create directory and try again.
Set permissions using chmod 777.
```

You must specify a directory that you own, or you must log in as the root user. Do not set the new directory to any of these: */usr*, */var*, */opt*, or */tmp*.

Do not set the new directory to the same directory in which you are storing:

- Message log files (**mwtm msglogdir**)
- Report files (**mwtm repdir**)
- Route table files (**mwtm routedir**)
- Address table files (**mwtm atbldir**)

When you enter this command, the MWTM also prompts you to enable TFTP file transfer for the GTT staging directory and prompts you for the TFTP path for the directory, **tftp://hostname/path**, where:

- *hostname* is the name or IP address of the host on which the GTT staging directory resides.

If you enter a DNS name (such as **mwm-jumbo**) instead of an IP address (such as **172.18.12.10**), then the ITP must be able to resolve the DNS name; otherwise, when you try to deploy a file, the MWTM issues an appropriate error message and does not deploy the file.

To enable the ITP to resolve DNS names, enter the **ip domain-lookup** command on the ITP. For more information about this command, see the *Cisco IOS IP Command Reference, Volume 1 of 4: Addressing and Services*, Release 12.3 or later.

- *path* is the path to the GTT staging directory.

After you change the directory or enable TFTP file transfer for the directory, the MWTM asks if you want to restart the MWTM server. The new directory and TFTP setting take effect when you restart the MWTM server.

You must log in as the root user or superuser to use this command.

#### Note

If you are setting up a new GTT staging directory on a Network File System location on another (remote) server, ensure that the server allows read-write access to the user account through which the MWTM is running and run this command as a superuser.

# mwtm gttstats

## Server Only

### Full Syntax

**mwtm gttstats** [*nodes* [*linksets* [*filter*]] [*idtag*]] [*sortopts*] [**quiet**]

### Command Description

Generates MWTM GTT accounting statistics reports. To:

- Include or exclude specific objects in the reports, use the *nodes* argument. To include:

- All nodes, specify **all**.

A single node or signaling point, specify a single node name, or node name and signaling-point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name, and each line must end with a colon (:).

For example:

```
mwtm-75-59a.cisco.com:
```

To specify a node name and signaling point, enter:

```
mwtm-75-59a.cisco.com;net0:
```

- Linksets, specify a filename with a list of linksets:

```
mwtm-75-96a.cisco.com;net0:7291p_to_7591a0
```

- A filter, specify a filename with a list of filters in the format:

```
selname:gta:pc
```

- Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This setting is also the default for this command; you only need to specify **default** if you also want to specify an *idtag*, *sortopts*, or **quiet**.
- A group of nodes or signaling points other than the one that the *nodes.include* file specifies, create a file that contains the list of nodes and signaling points to include, and specify the full path and name of the file as the *nodes* argument.

**Note** The MWTM processes the include files first, then the exclude files.

If you specify a *nodes*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm gttstats** command.

- Specify the sort order for the reports, specify one of these keywords for the *sortopts* argument:
  - **-sgt**—Sort based on the GTA, in descending order.
  - **-sno**—Sort based on the node name, in ascending order.
  - **-spc**—Sort based on the point code, in ascending order.
  - **-ssn**—Sort based on the selector name, in ascending order.
  - **-sto**—Sort based on the total number of octets translated by GTT, in descending order.

- **-stp**—Sort based on the total number of packets translated by GTT, in descending order. This is the default setting.
- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you can view by using the MWTM web interface.

The first time you use the **mwtm gttstats** command to generate a report, you must enter the command at least twice. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the collected data appears valid, begins generating the report.

Thereafter, you only need to enter this command once to generate the report.

You must log in as the root user or superuser to use this command.

## mwtm linkstats

### Server Only

#### Full Syntax

**mwtm linkstats** [*nodes* [*linksets*] [*idtag*]] [*sortopts*] [**quiet**]

#### Command Description

Generates MWTM link and linkset statistics summary reports. To include:

- Or exclude specific objects in the reports, use the *nodes* argument. To include:
  - All nodes, specify **all**.
  - A single node or signaling point, specify a single node name, or node name and signaling-point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name, and each line must end with a colon (:).

For example:

```
mwtm-75-59a.cisco.com:
```

A node name and signaling point:

```
mwtm-75-59a.cisco.com;net0:
```

- Linksets, specify a filename with a list of linksets:
 

```
mwtm-75-96a.cisco.com;net0:7291p_to_7591a0
```
- Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This setting is also the default for this command; you only need to specify **default** if you also want to specify an *idtag*, *sortopts*, or **quiet**.
- A group of nodes or signaling points other than the one specified in the *nodes.include* file, create a file that contains the list of nodes and signaling points to include; and, specify the full path and name of the file as the *nodes* argument.

If you specify *nodes*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm linkstats** command.

- Specify the sort order for the reports, specify one of these keywords for the *sortopts* argument:
  - **-sco**—Sort based on the average Congestion for each link (**Avg Cong %**), in descending order.
  - **-sis**—Sort based on in-service percentage for each link (**InSrv**), in descending order.
  - **-sls**—Sort based on the linkset name, in ascending order.
  - **-srm**—Sort based on the total number of MTP3 MSUs that each link (**Recv MSUs**) receives, in descending order.
  - **-sru**—Sort based on the average Receive for each link (**Avg Receive Util** or **Avg Receive Erls**), in descending order.
  - **-ssm**—Sort based on the total number of MTP3 MSUs that each link (**Send MSUs**) sends, in descending order.
  - **-ssu**—Sort based on the average Send for each link (**Avg Send Util** or **Avg Send Erls**), in descending order. This is the default setting.
- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you can view by using the MWTM web interface.

The first time you use the **mwtm linkstats** command to generate a report, you must enter the command at least three times. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful link and linkset statistics.
- Third entry continues to calculate statistics, calculates long-term averages; and, if the collected data appears valid, begins generating the report.

Thereafter, you only need to enter this command once to generate the report.

You must log in as the root user or superuser to use this command.

## mwtm listarchive

### Server Only

#### Full Syntax

**mwtm listarchive** {**-n** *node name* | **-s** *signaling point name*} {**-t** *type*} [**-a** *address table name*]

#### Command Description

Displays a list of all the files in the Version Control System (VCS) archive or just those of a particular type for a specified node or signaling point. To show a list of files in the VCS of a particular:

- Node, specify **-n** and the node name.
- Signaling point, specify **-s** and the name of the signaling point.

- Type, specify **-t** and the type, which can be one of these:
  - **gtt**
  - **route**
  - **mlr**

---

**Note** If you specify the *type* as **mlr**, you must also specify **-a** and the name of the address table.

---

You must log in as the root user or superuser to use this command.

## mwtm listgtt

### Server Only

#### Full Syntax

**mwtm listgtt** [*directory*]

#### Command Description

Lists all current GTT files in the specified directory (*directory* must be a subdirectory of the GTT staging directory). If no directory is specified, lists all current GTT files in the GTT staging directory.

You must log in as the root user or superuser to use this command.

## mwtm listhistory

### Server Only

#### Full Syntax

**mwtm listhistory** **{-s signaling point name}** **{-t type}** **[-a address table name]**

#### Command Description

Displays the revision history for a specified archive file. To show the revision history for a particular:

- Signaling point, specify **-s** and the name of the signaling point.
- Type of file, specify **-t** and the type, which can be one of these:
  - **gtt**
  - **route**
  - **mlr**

---

**Note** If you specify the *type* as **mlr**, you must also specify **-a** and the name of the address table.

---

You must log in as the root user or superuser to use this command.

## mwtm listmlr

### Server Only

#### Full Syntax

**mwtm listmlr** [*directory*]

#### Command Description

Lists all current MLR address files in the address table staging directory (for details on setting the address table staging directory, see [mwtm atbldir](#), page B-100.) If a subdirectory is specified, lists all current MLR address files in the specified subdirectory (*directory* must be a subdirectory of the address table staging directory).

You must log in as the root user or superuser to use this command.

## mwtm listroute

### Server Only

#### Full Syntax

**mwtm listroute** [*directory*]

#### Command Description

Lists all current route table files in the specified directory (*directory* must be a subdirectory of the DPC Route staging directory). If no directory is specified, lists all current route table files in the DPC Route staging directory.

You must log in as the root user or superuser to use this command.

## mwtm mlrstats

### Server Only

#### Full Syntax

**mwtm mlrstats** [*nodes* [*idtag*]] [*sortopts*] [**quiet**]

#### Command Description

Generates MWTM MLR processed, aborts, continues, result invokes, rule matches, subtriggers, and triggers reports. To:

- Include or exclude specific objects in the reports, use the *nodes* argument. To include:
  - All nodes, specify **all**.
  - A single node or signaling point, specify a single node name, or node name and signaling point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name.

For example:

```
mwtm-75-59a.cisco.com
```

To specify a node name and signaling point:

```
mwtm-75-59a.cisco.com;net0
```

- Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This setting is also the default for this command; you only need to specify **default** if you also want to specify an *idtag*, *sortopts*, or **quiet**.
- A group of nodes or signaling points other than the one specified in the *nodes.include* file, create a file that contains the list of nodes and signaling points to include and specify the full path and name of the file as the *nodes* argument.

**Note** The MWTM processes the include files first, then the exclude files.

If you specify *nodes*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm mlrstats** command.

- Specify the sort order for the reports, specify one of these keywords for the *sortopts* argument:
  - **-sab**—Sort based on the number of MSUs not processed by MLR (**Aborts**), in descending order.
  - **-sal**—Sort based on the number of MSUs of type GSM-MAP AlertSc that MLR (**MAP Alerts**) processed, in descending order.
  - **-sco**—Sort based on the number of MSUs passed back to SCCP that MLR (**Continue**) processed, in descending order.
  - **-smo**—Sort based on the number of MSUs of type GSM-MAP SMS-MO that MLR (**MAP SMS-MOs**) processed, in descending order.
  - **-smt**—Sort based on the number of MSUs of type GSM-MAP SMS-MT that MLR (**MAP SMS-MTs**) processed, in descending order.
  - **-sno**—Sort based on the node name, in ascending order.
  - **-snt**—Sort based on the number of MSUs of type ANSI-41 SMSNotify that MLR (**ANSI-41 SMS-Notifys**) processed, in descending order.
  - **-spp**—Sort based on the number of MSUs of type ANSI-41 SMD-PP that MLR (**ANSI-41 SMD-PPs**) processed, in descending order.
  - **-sre**—Sort based on the number of MSUs of type ANSI-41 SMSRequest that MLR (**ANSI-41 SMD-Reqs**) processed, in descending order.
  - **-sri**—Sort based on the number of MSUs of type GSM-MAP SRI-SM that MLR (**MAP SRI-SMs**) processed, in descending order.
  - **-sro**—Sort based on the number of packets that MLR (**Routed**) routed, in descending order.
- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you can view by using the MWTM web interface.

If you do not specify the **quiet** keyword (that is, if you view the output on your terminal), the MWTM displays only instance-level statistics (as listed in the description of the *sortopts* argument). To see the full set of trigger-level statistics, you must use the MWTM web interface (see [MLR Reports, page 13-75](#)).

The first time you use the **mwtm mlrstats** command to generate a report, you must enter the command at least twice. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the collected data appears valid, begins generating the report.

Thereafter, you only need to enter this command once to generate the report.

See [MLR Reports, page 13-75](#) for more information on MLR reports.

You must log in as the root user or superuser to use this command.

## mwtm msustats

### Server Only

### Full Syntax

**mwtm msustats**

### Command Description

Displays ITP MSU statistics reports.

You must log in as the root user or superuser to use this command.

## mwtm mtpevents

### Server Only

### Full Syntax

**mwtm mtpevents** [*nodes* [*idtag*]] [**quiet**]

### Command Description

Generates MWTM MTP3 event reports. To:

- Include or exclude specific objects in the reports, use the *nodes* argument. To include:
  - All nodes, specify **all**.
  - A single node or signaling point, specify a single node name, or node name and signaling-point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name.

For example:

```
mwtm-75-59a.cisco.com
```

To specify a node name and signaling point:

```
mwtm-75-59a.cisco.com;net0
```

- Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This setting is also the default for this command; you only need to specify **default** if you also want to specify an *idtag* or **quiet**.
- A group of nodes or signaling points other than the one that the *nodes.include* file specified, create a file that contains the list of nodes and signaling points to include; and, specify the full path and name of the file as the *nodes* argument.

**Note** The MWTM processes the include files first, then the exclude files.

If you specify *nodes*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm mtpevents** command.

- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you can view by using the MWTM web interface.

The first time you use the **mwtm mtpevents** command to generate a report, you must enter the command at least twice. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the collected data appears valid, begins generating the report.

Thereafter, you need only enter this command once to generate the report.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Customizing ITP Reports, page 13-254](#)

## mwtm pcformat

### Server Only

#### Full Syntax

**mwtm pcformat** {**edit** | **list** | **master** | **restore**}

#### Command Description

You use this command to set the point code format for this MWTM server and for all associated MWTM clients to use. You need to set the point code format usually only once, after installation.

You also use this command to configure the MWTM to recognize a single-instance ITP connecting to multiple instances on a multiple-instance ITP. In effect, the MWTM views the multiple networks as a single all-encompassing network.

The point code format configuration is contained in the *PointCodeFormat.xml* file. To work with the file, specify one of these keywords:

- **edit**—Opens the *PointCodeFormat.xml* file for editing.
- **list**—Displays the current contents of the *PointCodeFormat.xml* file.
- **master**—Restores the *PointCodeFormat.xml* file to the default settings.
- **restore**—Restores the *PointCodeFormat.xml* file to the last saved copy.

Any changes that you make take effect when you restart the MWTM server.

The MWTM preserves customized point code formats when you upgrade to a new version or release of the MWTM.

See [Setting the ITP Point Code Format, page 4-5](#) and [Connecting a Single-Instance ITP to a Multiple-Instance ITP, page 4-6](#) for more information about using this command.

You must log in as the root user or superuser to use this command.

## mwtm pclist

### Server Only

#### Command Description

Lists all point codes that all nodes that the MWTM detects are currently using.

You must log in as the root user or superuser to use this command.

## mwtm pushgtr

### Server Only

#### Full Syntax

**mwtm pushgtr** [-l *logfilename*] [-u *username*] [-p *password*] [-n *enableusername*] [-e *enablepassword*] [-s *storagedevicename*] [-c *archive comments*] [--overwrite|--no-overwrite] [--activate|--no-activate] *filename signalingpointname*

#### Command Description

Uploads the specified GTT file to the specified ITP signaling point.

Use these keywords and arguments with this command. If you do not specify a required keyword or argument, the MWTM prompts you to specify it.

- **-l *logfilename***—Writes detailed syntax and semantics checking results, as well as a detailed Telnet log, to the specified file.
- **-u *username***—Log in username, if required by the ITP.
- **-p *password***—Log in password, if required by the ITP.
- **-n *enableusername***—Enable username, if required by the ITP.
- **-e *enablepassword***—Enable password, if required by the ITP.
- **-s *storagedevicename***—If the ITP has more than one storage device, uploads the file to the specified device, such as **disk1**, **flash**, or **slot0**.
- **-c *archive comments***—Allows you to provide optional archive comments.
- **--overwrite**—If the specified file already exists on the specified ITP signaling point, overwrites the file.
- **--no-overwrite**—If the specified file already exists on the specified ITP signaling point, does not overwrite the file.
- **--activate**—Uploads the file and activates it (replaces the currently running file with the uploaded file).
- **--no-activate**—Uploads the file without activating it (does not replace the currently running file).

You must log in as the root user or superuser to use this command.

## mwtm pushmlr

### Server Only

#### Full Syntax

```
mwtm pushmlr [-l logfile] [-u username] [-p password] [-n enableusername]
[-e enablepassword] [-s storagedevicename] [-c archive comments] [--overwrite|-no-overwrite]
[--activate|-no-activate] filename signalingpointname
```

#### Command Description

Uploads the specified address table file to the specified ITP signaling point.

Use these keywords and arguments with this command. If you do not specify a required keyword or argument, the MWTM prompts you to specify it.

- **-l logfile**—Writes detailed syntax and semantics checking results, as well as a detailed Telnet log, to the specified file.
- **-u username**—Log in username, if the ITP requires.
- **-p password**—Log in password, if the ITP requires.
- **-n enableusername**—Enable username, if the ITP requires.
- **-e enablepassword**—Enable password, if the ITP requires.
- **-s storagedevicename**—If the ITP has more than one storage device, uploads the file to the specified device, such as **disk1**, **flash**, or **slot0**.
- **-c archive comments**—Allows you to provide optional archive comments.
- **--overwrite**—If the specified file already exists on the specified ITP signaling point, overwrites the file.
- **--no-overwrite**—If the specified file already exists on the specified ITP signaling point, does not overwrite the file.
- **--activate**—Uploads the file and activates it (replaces the currently running file with the uploaded file).
- **--no-activate**—Uploads the file without activating it (does not replace the currently running file).

You must log in as the root user or superuser to use this command.

## mwtm pushroute

### Server Only

#### Full Syntax

```
mwtm pushroute [-l logfile] [-u username] [-p password] [-n enableusername]
[-e enablepassword] [-s storagedevicename] [-c archive comments] [--overwrite|-no-overwrite]
[--activate|-no-activate] filename signalingpointname
```

#### Command Description

Uploads the specified route table file to the specified ITP signaling point.

Use these keywords and arguments with this command. If you do not specify a required keyword or argument, the MWTM prompts you to specify it.

- **-l *logfilename***—Writes detailed syntax and semantics checking results, as well as a detailed Telnet log, to the specified file.
- **-u *username***—Log in username, if the ITP requires.
- **-p *password***—Log in password, if the ITP requires.
- **-n *enableusername***—Enable username, if the ITP requires.
- **-e *enablepassword***—Enable password, if the ITP requires.
- **-s *storagedevicename***—If the ITP has more than one storage device, uploads the file to the specified device, such as **disk1**, **flash**, or **slot0**.
- **-c *archive comments***—Allows you to provide optional archive comments.
- **--overwrite**—If the specified file already exists on the specified ITP signaling point, overwrites the file.
- **--no-overwrite**—If the specified file already exists on the specified ITP signaling point, does not overwrite the file.
- **--activate**—Uploads the file and activates it (replaces the currently running file with the uploaded file).
- **--no-activate**—Uploads the file without activating it (does not replace the currently running file).

You must log in as the root user or superuser to use this command.

## mwtm q752stats

### Server Only

### Full Syntax

**mwtm q752stats** [*nodes* [*linksets*] [*idtag*]] [**quiet**]

### Command Description

Manually generates MWTM Q.752 statistics reports. To include:

- Or exclude specific objects in the reports, use the *nodes* argument. To include:
  - All nodes, specify **all**.
  - A single node or signaling point, specify a single node name, or node name and signaling point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name.

For example:

```
mwtm-75-59a.cisco.com
```

To specify a node name and signaling point:

```
mwtm-75-59a.cisco.com;net0
```

- Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This is also the default setting for this command; you only need to specify **default** if you also want to specify an *idtag* or **quiet**.

- A group of nodes or signaling points other than the one specified in the *nodes.include* file, create a file that contains the list of nodes and signaling points to include and specify the full path and name of the file as the *nodes* argument.

**Note** The MWTM processes the include files first, then the exclude files.

If you specify *nodes*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm q752stats** command.

- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you can view by using the MWTM web interface.

The first time you use the **mwtm q752stats** command to generate a report, you must enter the command at least twice. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the collected data appears valid, begins generating the report.

Thereafter, you only need to enter this command once to generate the report.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Customizing ITP Reports, page 13-254](#)

## mwtm repcstage

#### Server Only

#### Full Syntax

**mwtm repcstage** [*number-of-days*]

#### Command Description

Maximum number of days the MWTM should archive custom reports.

If you enter this command without the *number-of-days* argument, the MWTM displays the current maximum number of days. You can then change that value or leave it. The valid range is 1 day to an unlimited number of days. The default value is 10 days.

You must log in as the root user or superuser to use this command.

#### Related Topic

[Locating Stored Reports, page 13-253](#)

# mwtm routedir

## Server Only

### Full Syntax

**mwtm routedir** [*directory*]

### Command Description

#### Note

You must stop the MWTM server before performing this command. The system prompts you whether to continue.

Sets the DPC Route staging directory, the directory in which the MWTM stores ITP route table files, and enables Trivial File Transfer Protocol (TFTP) file transfer for the directory. See [Chapter 14, “Editing an ITP Route Table File”](#) for information about ITP route table files.

The default DPC Route staging directory resides in the MWTM installation directory. If you installed the MWTM in:

- The default directory, */opt*, then the directory is */opt/CSCOsgm/routes*.
- A different directory, then the directory resides in that directory.

Use this command if you want to use a different DPC Route staging directory, such as */tftpboot* or a Network File System location on another server that is used as the Trivial File Transfer Protocol (TFTP) server for server configuration files for ITPs in the network.

This command copies all files in the current directory to the new directory. If you are not logged in as the superuser and do not own the new directory, the MWTM provides this prompt:

```
Can't create directory!! DPC Route Staging Directory not changed!!
```

```
Directory could be located on a remote NFS server.
Manually create directory and try again.
Set permissions using chmod 777.
```

You must specify a directory that you own, or you must log in as the root user. Do not set the new directory to any of these: */usr*, */var*, */opt*, or */tmp*.

Do not set the new directory to the same directory in which the GTT files (**mwtm gttmdir**), message log files (**mwtm msglogdir**), report files (**mwtm repdir**), or address table files (**mwtm atbldir**) reside.

When you enter this command, the MWTM also prompts you to enable TFTP file transfer for the DPC Route staging directory and for the TFTP path for the directory, **tftp://hostname/path**, where:

- *hostname* is the name or IP address of the host on which the DPC Route staging directory resides.

If you enter a DNS name (such as **mwm-jumbo**) instead of an IP address (such as **172.18.12.10**), then the ITP must be able to resolve the DNS name; otherwise, when you try to deploy a file, the MWTM issues an appropriate error message and does not deploy the file.

To enable the ITP to resolve DNS names, enter the **ip domain-lookup** command on the ITP. For more information about this command, see the *Cisco IOS IP Command Reference, Volume 1 of 4: Addressing and Services*, Release 12.3 or later.

- *path* is the path to the DPC Route staging directory.

After you change the directory or enable TFTP file transfer for the directory, the MWTM asks if you want to restart the MWTM server. The new directory and TFTP setting take effect when you restart the MWTM server.

You must log in as the root user or superuser to use this command.

**Note**

If you are setting up a new DPC Route staging directory on a Network File System location on another (remote) server, ensure that the server allows read-write access to the user account through which the MWTM runs and run this command as a superuser.

## mwtm routetabledefs

### Server Only

### Full Syntax

**mwtm routetabledefs** [true | false]

### Command Description

Specifies whether the MWTM should automatically populate the Route Table dialog box with default values:

- **true**—Automatically populate the Route Table dialog box with default values. This is the default setting.
- **false**—Do not automatically populate the Route Table dialog box with default values; that is, force the user to enter values in the dialog box.

When you enter this command, the new setting takes effect when you restart the MWTM server.

You must log in as the root user or superuser to use this command.

## mwtm start atblclient

### Server and all Clients

### Full Syntax

**mwtm start atblclient** [hostname]

### Command Description

Starts an MWTM Address Table Editor client on the specified host. If no hostname is specified, starts an MWTM Address Table Editor client on the default host, as specified during installation. See [Connecting to a New Server, page 5-40](#) for information about determining the default host.

If you access a remote workstation through Telnet, you must set the DISPLAY variable to your local display or you cannot use this command. If the DISPLAY variable is not set automatically, you must set it manually (see [Setting the DISPLAY Variable for Solaris or Linux Clients, page 3-3](#)).

This command has the same function as the **mwtm atblclient** command.

## mwtm start gttclient

### Server and all Clients

#### Full Syntax

**mwtm start gttclient** [*hostname*]

#### Command Description

Starts an MWTM GTT client on the specified host. If no hostname is specified, starts an MWTM GTT client on the default host, as specified during installation. See [Connecting to a New Server, page 5-40](#) for information about determining the default host.

If you access a remote workstation through Telnet, you must set the DISPLAY variable to your local display or you cannot use this command. If the DISPLAY variable is not set automatically, you must set it manually (see [Setting the DISPLAY Variable for Solaris or Linux Clients, page 3-3](#)).

This command has the same function as the **mwtm gttclient** command.

## mwtm xuastats

### Server Only

#### Full Syntax

**mwtm xuastats** [*nodes* [*idtag*]] [*sortopts*] [**quiet**]

#### Command Description

Generates MWTM accounting statistics reports for application servers and application server processes. To:

- Include or exclude specific objects in the reports, use the *nodes* argument. To include:
  - All nodes, specify **all**.
  - A single node or signaling point, specify a single node name, or node name and signaling-point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name, and each line must end with a colon (:).

For example:

```
mwtm-75-59a.cisco.com:
```

To specify a node name and signaling point:

```
mwtm-75-59a.cisco.com;net0:
```

- Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This is also the default setting for this command; you only need to specify **default** if you also want to specify an *idtag*, *sortopts*, or **quiet**.
- A group of nodes or signaling points other than the one specified in the *nodes.include* file, create a file that contains the list of nodes and signaling points to include and specify the full path and name of the file as the *nodes* argument.

**Note**

For more details on including and excluding objects, see [NoteThe MWTM processes the include files first, then the exclude files., page 13-256.](#)

If you specify *nodes*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm xuastats** command.

- Specify the sort order for an application server report, specify one of these keywords for the *sortopts* argument:
  - **-sfm**—Sort based on the Packets From MTP3 column, in descending order. This is the default setting.
  - **-sta**—Sort based on the Packets To ASPs column, in descending order.
- Specify the sort order for an application server process report, specify one of these keywords for the *sortopts* argument:
  - **-sfa**—Sort based on the Packets From ASPs column, in descending order. This is the default setting.
  - **-sfm**—Sort based on the Packets From MTP3 column, in descending order.
  - **-sre**—Sort based on the Receive Errors column, in descending order.
  - **-sse**—Sort based on the Send Errors column, in descending order.
  - **-sta**—Sort based on the Packets To ASPs column, in descending order.
  - **-stm**—Sort based on the Packets To MTP3 column, in descending order.
- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you can view by using the MWTM web interface.

The first time you use the **mwtm xuastats** command to generate a report, you must enter the command at least twice. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the collected data appears valid, begins generating the report.

Thereafter, you need only enter this command once to generate the report.

You must log in as the root user or superuser to use this command.

**Related Topic**

[AS Reports, page 13-26](#)

## mSEF-Only Commands

mSEF-only commands include:

- [mwtm chassisinventory, page B-127](#)
- [mwtm ggsnstats, page B-127](#)
- [mwtm msefsubcount, page B-128](#)

## mwtm chassisinventory

### Server Only

#### Full Syntax

**mwtm chassisinventory** [**report** | **csv**]

#### Command Description

Displays current 7600 chassis and SAMI Inventory reports.

Report—Displays current 7600 chassis and SAMI Inventory reports.

CSV—Displays current 7600 chassis and SAMI Inventory reports in CSV format.

You must log in as the root user or superuser to use this command.

## mwtm ggsnstats

### Server Only

#### Full Syntax

**mwtm ggsnstats** [*nodes* [*idtag*]] [**quiet**]

#### Command Description

Manually generates MWTM GGSN statistics reports. To include:

- Or exclude specific objects in the reports, use the *nodes* argument. To include:
  - All nodes, specify **all**.
  - A single node or signaling point, specify a single node name, or node name and signaling point name, as the *nodes* argument. The node name must exactly match the node name that the MWTM discovered, including the domain name.

For example:

```
mwtm-75-59a.cisco.com
```

To specify a node name and signaling point:

```
mwtm-75-59a.cisco.com;net0
```

- Or exclude objects based on the contents of the user-defined *nodes.include*, *linksets.include*, *nodes.exclude*, and *linksets.exclude* files, create the files, then specify **default**. This is also the default setting for this command; you only need to specify **default** if you also want to specify an *idtag* or **quiet**.
- A group of nodes or signaling points other than the one specified in the *nodes.include* file, create a file that contains the list of nodes and signaling points to include and specify the full path and name of the file as the *nodes* argument.

#### Note

The MWTM processes the include files first, then the exclude files.

If you specify *nodes*, you can also specify an *idtag* to identify the reports. The *idtag* can be any meaningful character string, but it cannot contain any spaces. The default value for *idtag* is the process ID of the **mwtm ggsnstats** command.

- Disable automatic output to the terminal when running this command in a script, specify the **quiet** keyword. The MWTM generates the report in export format, which you can view by using the MWTM web interface.

The first time you use the **mwtm ggsnstats** command to generate a report, you must enter the command at least twice. The:

- First entry gets the first set of raw data.
- Second entry begins calculating useful accounting statistics and, if the collected data appears valid, begins generating the report.

Thereafter, you only need to enter this command once to generate the report.

You must log in as the root user or superuser to use this command.

## mwtm msefsubcount

### Server Only

### Full Syntax

**mwtm msefsubcount** [bwg | csg2 | ggsn | ha | pdngw | pdsn | sgw] [hourly | daily | monthly | all]

### Command Description

Collects mSEF subscriber count from the database.

Generates a zip file with separate and consolidated logs for each mSEF device type (BWG, CSG2, GGSN, HA, PDNGW, PDSN, and SGW).

The data can be collected for specific interval (hourly, daily, or monthly) or all.

You must log in as the root user or superuser to use this command.

# APPENDIX **C**

## FAQs

---

This appendix contains:

- [General FAQs, page C-1](#)
- [ITP Specific FAQs, page C-14](#)
- [IP-RAN Specific FAQs, page C-20](#)
- [mSEF Internet Specific FAQs, page C-26](#)

## General FAQs

These categories of frequently asked questions are general questions about the Cisco Mobile Wireless Transport Manager (MWTM):

- [Installation Questions, page C-1](#)
- [Server Questions, page C-2](#)
- [GUI Questions, page C-5](#)
- [Browser Questions, page C-6](#)
- [Topology Questions, page C-7](#)
- [Events and Alarms Questions, page C-7](#)
- [Polling Questions, page C-9](#)
- [MIB Questions, page C-10](#)
- [Miscellaneous Questions, page C-10](#)

## Installation Questions

This section addresses the following installation questions:

- [How do I install the MWTM client?, page C-2](#)
- [After a failed uninstall of the Windows client, I am prompted to uninstall again, but the procedure does not work. Why?, page C-2](#)
- [Why do I see strange character strings when I install the MWTM?, page C-2](#)

**How do I install the MWTM client?**

You can install the MWTM client either from the DVD distributed with the MWTM, or by using a web browser to download the MWTM client from an MWTM server. See the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#) for full details.

**After a failed uninstall of the Windows client, I am prompted to uninstall again, but the procedure does not work. Why?**

If for some reason the Windows MWTM client uninstall procedure fails before the client is completely uninstalled, the MWTM prompts you to uninstall the client again. However, this might not be possible using the standard **Add/Remove Programs** icon in the Windows Control Panel, or from the Windows Start menu.

If you cannot uninstall the MWTM client using the standard procedure, use this procedure:

- 
- |               |                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Delete the MWTM client installation directory and its contents. If you installed the MWTM client in the default directory, <i>C:\Program Files</i> , then the installation directory is <i>C:\Program Files\Cisco Systems\MWTM Client</i> . If you installed the MWTM client in a different directory, then the installation directory resides in that directory. |
| <b>Step 2</b> | Delete the MWTM Client entries from the Windows Start menu and desktop.                                                                                                                                                                                                                                                                                           |
- 

**Why do I see strange character strings when I install the MWTM?**

Some UNIX systems use the LANG variable to indicate the locale. The setting of the LANG environment variable can cause syntax errors in the MWTM setup scripts, which can result in messages that contain strange character strings such as *?y?d@O*. To correct this problem, unset the LANG environment variable in the workstation from which you are installing the MWTM, using one of these commands:

- If you are running sh, enter the **unset LANG** command.
- If you are running csh, enter the **unsetenv LANG** command.

Then install the MWTM again.

## Server Questions

This section addresses the following server questions:

- [What workstation and network devices do I need to run the MWTM?, page C-3](#)
- [Why can't my remote workstation access the MWTM on my local workstation?, page C-3](#)
- [I moved the server on which I had installed the MWTM and now I can't start the MWTM client or server. Why?, page C-3](#)
- [Why did I receive a "cannot connect to server" message?, page C-4](#)
- [Will the MWTM server processes restart automatically after a system reboot?, page C-5](#)
- [Why doesn't my MWTM server start after installing SSL?, page C-5](#)

**What workstation and network devices do I need to run the MWTM?**

The MWTM comprises two distinct pieces of functionality.

- The MWTM server application runs on Solaris/Linux only.
- The MWTM client application, including the user interface, runs on Solaris/Linux and Windows XP Professional. For Solaris/Linux, the MWTM client can run on the same system as the MWTM server, or on a different system.

**Note**

The Linux client is unsupported.

For further hardware and software requirements, see the “Preparing to Install the MWTM” chapter of the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

**Why can't my remote workstation access the MWTM on my local workstation?**

Keep in mind that performance is always better if you access the MWTM by installing the MWTM client on the remote workstation.

However, if you want to enable a remote Solaris/Linux workstation to access the MWTM on a local workstation, enter the **xhost + remote\_workstation** UNIX command on your local workstation, where *remote\_workstation* is the remote device you are enabling to access your local workstation.

To enable a remote Windows workstation to access the MWTM on a local workstation, you can use an X-Window system emulator such as eXceed or Reflection X, but be aware that there might be display problems. For example, the window borders might disappear, or the keyboard focus might be missing.

The **X Performance Enhancer (AntiAliasing Off)** check box in the Preferences window specifies whether antialiasing is turned on in the topology map. Antialiasing, which is turned on by default, improves the appearance of the icons and connections in the map.

You can improve the performance of the MWTM client on a remote workstation by turning off antialiasing in the topology map. For more information, see [Turning Off Antialiasing, page 10-23](#).

**I moved the server on which I had installed the MWTM and now I can't start the MWTM client or server. Why?**

If you change the IP address of the server on which you installed the MWTM, or if you move the server to a new network, you must reboot the server to prevent MWTM connection problems.

To reboot the server, use this procedure:

**Step 1** Log in as the root user, as described in [Becoming the Root User \(Server Only\), page 3-2](#).

**Step 2** Enter:

```
cd /opt/CSCOsgrm/bin
./mwtm reboot
```

If you change the server's Solaris/Linux hostname, you must reset the default hostname on the MWTM server and client, using this procedure:

**Step 3** Log in as the root user, as described in [Becoming the Root User \(Server Only\), page 3-2](#).

**Step 4** Enter:

```
cd /opt/CSCOsgrm/bin
./mwtm evilstop
```

The MWTM stops all MWTM servers on the local host.

**Step 5** Enter:

```
./mwtm servername hostname
```

where *hostname* is the new default hostname. Ensure that the new name is valid and is defined in your */etc/hosts* file.

The MWTM resets the default hostname for the MWTM server and client and automatically restarts the MWTM server.

**Step 6** Any remote clients connecting to this new host should also change their default server name. From Windows, choose **Start > Programs > Cisco MWTM Client > Modify Default MWTM Server Name**.**Why did I receive a “cannot connect to server” message?**

When you launch the MWTM client, the GTT Editor, Address Table Editor, or the Event Editor, or when you connect to a new server (whether manually or automatically as the result of a server failure), you might receive this message:

This client is not allowed to connect to the server or the server is listening on a port the client does not know about or cannot reach. Click the help button for a more detailed explanation.

If you receive this message, one of these situations has occurred:

- An MWTM administrator has prevented your MWTM client from connecting to the MWTM server, using the **mwtm ipaccess** command.

To resolve this problem, contact the MWTM administrator and ask to have your client's IP address added to the *ipaccess.conf* file (see [Limiting MWTM Client Access to the MWTM Server \(Server Only\)](#), page 2-29).

- The MWTM server has more than one IP address, but the MWTM server's default hostname is set to an IP address that your MWTM client cannot access.

To resolve this problem in Solaris/Linux, use the **mwtm servername** command to reset the MWTM server's default hostname to an IP address that your client can access and restart the server (see [mwtm servername](#), page B-62).

To resolve this problem in Windows, choose **Start > Programs > Cisco MWTM Client > Modify Default MWTM Server Name**, then you can enter the **mwtm servername** command.

**Note** Using the **mwtm servername** command to reset the MWTM server's default hostname does not affect communication between the MWTM server and the nodes.

- A firewall is installed between the MWTM server and your MWTM client that only allows traffic to pass through to the MWTM server's port numbers 1774 (the MWTM web server port) and 44742 (the MWTM Naming server port), but communication between the MWTM servers and clients requires additional ports.

To resolve this problem, set up the firewall correctly (see [Firewall Communication](#), page H-5).

**Will the MWTM server processes restart automatically after a system reboot?**

Yes. When you install the MWTM server, the MWTM modifies your system startup scripts to ensure that the MWTM server processes start up again after a system reboot. To accomplish this, the MWTM adds these lines to your system startup scripts:

```
/etc/init.d/sgm
/etc/rc0.d/K99sgm
/etc/rc1.d/K99sgm
/etc/rc2.d/K99sgm
/etc/rc3.d/K99sgm
/etc/rc3.d/S99sgm
```

These lines ensure that the MWTM shutdown and startup scripts run in the correct order for each system initiation state.

Note that for Linux only, these lines are modified as well:

```
/etc/rc5.d/S99sgm
/etc/rc6.d/K99sgm
```

**Why doesn't my MWTM server start after installing SSL?**

If you have not installed the SSL key and certificate, the MWTM server will not start. For exact details on this process, see [Enabling SSL Support on the MWTM Server, page 2-21](#).

## GUI Questions

This section addresses the following GUI questions:

- [Some of my MWTM windows are showing up with small, unusable text entry fields. How can I correct this?, page C-5](#)
- [Sometimes my MWTM display seems to lock up. Why?, page C-5](#)

**Some of my MWTM windows are showing up with small, unusable text entry fields. How can I correct this?**

Depending on your system, as well as other factors, the MWTM windows can sometimes display so small that text is illegible, and columns and text entry fields are very narrow and unusable. If this happens, resize the window and widen the individual columns until the information is again legible and the columns and text entry fields are usable.

To make a column wider or narrower, click the column divider in the heading and move the divider to the right or left while holding down the right mouse button.

**Sometimes my MWTM display seems to lock up. Why?**

In the MWTM, events might cause message popups to remain in the background of your display, preventing you from interacting with other windows. If you suspect that your display has locked up, perform these tasks:

- Ensure that you are running the MWTM on a supported operating system. For more information about supported operating systems, see “Preparing to Install the MWTM” in the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).
- Minimize windows and look for an MWTM message popup in the background.

## Browser Questions

This section addresses the following browser questions:

- [Sometimes when browsing the MWTM web interface, a popup appears with this message: Unresponsive Script. Why does this happen and how can I prevent it from reoccurring?, page C-6](#)
- [The MWTM web pages appear empty \(without content\). Why does this happen and how can I prevent it from reoccurring?, page C-6](#)
- [What is the difference between the Java and Web client?, page C-7](#)

### **Sometimes when browsing the MWTM web interface, a popup appears with this message: Unresponsive Script. Why does this happen and how can I prevent it from reoccurring?**

This problem occurs when using the Firefox browser version 1.5. It is not an MWTM bug. You can prevent the popup from occurring with this workaround:

- 
- Step 1** In the address bar of a Firefox browser window, enter **about:config**
- Step 2** In the filter bar, enter **dom.max\_script\_run\_time**.
- You should now see a setting appear in the window below the filter bar. The setting's name should match what you entered previously (dom.max\_script\_run\_time) and most likely shows a default value of 5.
- Step 3** Double-click this setting. Firefox will prompt you for a new value. Enter **10**.
- If changing this setting still causes the Unresponsive Script popup to appear, repeat these steps but increase the number that you enter in this step.
- 

### **The MWTM web pages appear empty (without content). Why does this happen and how can I prevent it from reoccurring?**

Your Internet Explorer browser settings in the MWTM client are disabling active scripting. To modify this, in Internet Explorer, change the browser settings as follows:

- 
- Step 1** Choose **Tools > Internet Options**.
- Step 2** Select the Security tab.
- Step 3** Click the **Custom Level** button.
- Step 4** Search for Active Scripting in the Scripting section.
- Step 5** Click the **Enable** radio button to enable Active Scripting.
- Step 6** Search for Logon in the User Authentication section.
- Step 7** Click the **Automatic Logon with current username and password** radio button.
-

**What is the difference between the Java and Web client?**

The following table compares MWTM features for Java and Web Client:

| Feature                                              | Java Client   | Web Client    |
|------------------------------------------------------|---------------|---------------|
| Topology                                             | Available     | Not Available |
| Custom views                                         | Performed     | Not Available |
| Network Discovery                                    | Available     | Available     |
| ITP Route table, GTT, and Address file configuration | Performed     | Not Available |
| Real-time statistical graphs                         | Performed     | Not Available |
| Device credentials and SNMP settings configuration   | Available     | Available     |
| Historical statistical reports                       | Not Available | Performed     |
| Provisioning, including batch provisioning           | Not Available | Performed     |
| Group management                                     | Not Available | Performed     |
| mSEF management and subscriber search                | Not Available | Available     |

## Topology Questions

This section addresses the following topology questions:

- [How does “zoom in on an area” work in a topology map?, page C-7](#)
- [Can I add my own icons to the topology map?, page C-7](#)

**How does “zoom in on an area” work in a topology map?**

With this feature, you can zoom in on a chosen area of the topology map in the topology window. To do so, click the **Zoom in on an area** button, or choose **Topology Tools > Zoom > Area** from the MWTM main menu, then click in the topology map and drag a rectangle around the area you want to zoom in on. The MWTM expands the chosen area to fill the topology map.

**Can I add my own icons to the topology map?**

No. To ensure that icons on the topology map can be resized cleanly, they are drawn as special vector-based images. Raster images, such as GIF files, do not resize cleanly.

## Events and Alarms Questions

This section addresses the following events and alarms questions:

- [If I select the Clear Event Icon menu option, does that delete the event from the MWTM database?, page C-8](#)
- [Can I add my own sounds to the Event Sound Filter?, page C-8](#)
- [Why are the age of my alarms always 0 minutes?, page C-8](#)
- [Why are objects in the Physical folder ignored?, page C-8](#)

- [How do I enable CPU usage threshold alarms?](#), page C-9

#### **If I select the Clear Event Icon menu option, does that delete the event from the MWTM database?**

No. When you select the **Clear Event Icon** menu option for an object, the MWTM does not delete the actual event from its database. The MWTM only deletes the event icon (an orange triangle) from its displays for the object, and only for the MWTM client on which you are currently working.

#### **Can I add my own sounds to the Event Sound Filter?**

Yes. You can add sound files to an MWTM client. The MWTM clients can play these sound file formats: AIFC, AIFF, AU, SND, and WAV.

#### **Note**

---

WAV files encoded using MPEG Layer-3 are not supported.

---

The MWTM client sound files are stored in the MWTM client's *sounds* directory:

- If you installed the MWTM client for Solaris/Linux in the default directory, */opt*, then the sound file directory is */opt/CSCOsgmClient/sounds*.
- If you installed the MWTM client for Windows in the default directory, */Program Files*, then the sound file directory is *C:\Program Files\Cisco Systems\MWTM Client\sounds*.
- If you installed the MWTM in a different directory, then the sound file directory resides in that directory.

If for some reason the MWTM cannot play a specified sound file, the MWTM plays a default beep. For example, the MWTM cannot play a sound file if one of these conditions exists:

- The file has been moved or deleted from the *sounds* directory.
- The *sounds* directory has been deleted or cannot be found.
- Some other application is using all of the sound resources.
- No sound card is present.

#### **Why are the age of my alarms always 0 minutes?**

If the server clock is ahead of the client clock, the value will be 0 until the client clock catches up to the server clock. To get accurate values, use a time service such as Network Time Protocol (NTP) or similar, which keeps server and client clocks in sync.

#### **Why are objects in the Physical folder ignored?**

Interfaces that are not configured for ITP, IPTRAN, mSEF, or management connections could be set as administratively up on the node; however, since these interfaces are not connected and/or not configured, they appear to be operationally down, even though this status does not affect the behavior of the network (for example, unconnected E1 ports on cards in an ONS chassis). To make sure that these interfaces do not contribute to the overall status of the parent node, the Physical folder status is ignored.

Objects that appear in the Physical folder but also outside of the Physical folder are *not* ignored, and their status does contribute to the status of the parent node.

To change the default behavior, you can set all physical folders to unignored using the [mwtm ignorephysicalfolders](#) command.

If you want to monitor the status of objects that are ignored in the Physical folder:

#### **Step 1**

---

In the MWTM client navigation tree, expand the node that contains the Physical folder you want to unignore. Right-click and choose **Physical > Unignore**.

- Step 2** In the Status Contributors tab for the Physical folder, in the Ignored column, check the boxes for the objects you want to keep ignoring. Only the objects with unchecked boxes will not be ignored.

#### How do I enable CPU usage threshold alarms?

MWTM does not currently poll the device for CPU threshold alarms. MWTM recognizes the `cpmCPURisingThreshold` and `cpmCPUFallingThreshold` traps defined in the CISCO-PROCESS-MIB and creates events for them in the Event History table. You can modify the MWTM event configuration to raise and clear an alarm when these traps are received. Using the Event Editor, enable the raise alarm check box of both the `CPURisingThreshold` and `CPUFallingThreshold` events. Select File -> Deploy to make your changes active.

To enable the `cpmCPURisingThreshold` and `cpmCPUFallingThreshold` traps on the device, execute the following commands. It is recommended that the rising and falling intervals be 900 seconds or greater to ensure that the traps convey reliable information.

```
snmp-server enable traps cpu threshold
```

```
process cpu threshold type <total|process|interrupt> rising <rising threshold> interval
<rising interval> falling <falling threshold> interval <falling interval>
```

If needed, also consult the IOS command reference for your platform.

## Polling Questions

This section addresses the following polling questions:

- [How often does the MWTM poll nodes?, page C-9](#)
- [How do I change the default status polling interval?, page C-9](#)

#### How often does the MWTM poll nodes?

By default, the MWTM polls the nodes in the network every 15 minutes. However, you can initiate a poll for one or more nodes at any time by selecting the nodes in the Discovery tab in the Discovery dialog box and pressing **Poll**.

You can also change the default poll interval for one or more nodes in the SNMP Configuration dialog box. You must be logged in as the root user or as a superuser to access this dialog box.

Finally, the Node Details window polls the visible node and its adjacent node every 15 seconds, but you can change that poll interval, too.

#### How do I change the default status polling interval?

The MWTM polls the MWR node for status information (for example, interface up or down) every 15 minutes. The size of this poll depends on the number and type of interfaces that are enabled on the MWR.

To change the default polling interval of 15 minutes, open the SNMP Configuration dialog box by selecting **Network > SNMP Configuration** from the MWTM main window. You can use this dialog box to change the default polling interval to any number of minutes from 5 to 1440.

#### Note

The status information in the GUI is only as good as the most recent poll.

## MIB Questions

### What are the names of the MIBs used by the MWTM?

You can find the complete list of MIBs that the MWTM configures and queries in [Appendix F, “MIB Reference.”](#)

You can obtain the latest versions of these MIBs from one of these locations:

- The Zip file *mibs.zip*, located at the top of the MWTM DVD Image, contains these MIBs.
- You can download these MIBs from the Cisco website:  
<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>
- The MIBs are also accessible from the MWTM web interface by clicking **Administrative** in the navigation tree, then clicking **MWTM supported SNMP MIBs**.

## Miscellaneous Questions

This section addresses the following miscellaneous questions:

- [Does the MWTM require any other NMS applications?, page C-10](#)
- [Can I run the MWTM on my Windows PC?, page C-11](#)
- [What is a superuser?, page C-11](#)
- [Does the MWTM Java RMI use TCP or UDP?, page C-11](#)
- [What does a status of Deleted, Uninhibited, or NoShutdown mean?, page C-11](#)
- [Why don't the contents of the syslog tab match the log files of my syslog server?, page C-11](#)
- [When I start my MWTM client, I get a login window. However, I did not specify a user password during installation. How do I fix this?, page C-11](#)
- [I'm field testing MWTM in my lab and I see confusing results when discovering new network configurations. What's going on?, page C-13](#)
- [Why can't I discover primary and standby devices at the same time?, page C-13](#)
- [How do I increase the swap size in Solaris?, page C-13](#)
- [How do I increase the swap size in Linux?, page C-14](#)

### Does the MWTM require any other NMS applications?

The MWTM is functionally a standalone product and does not require any other products. However, you can integrate the MWTM with other products to provide added value.

For example, you can integrate the MWTM with CiscoWorks, which provides access to the full suite of CiscoWorks products, including the Device Center, the CiscoView Element Manager, Resource Manager Essentials (RME), the Internetwork Performance Monitor (IPM), and the Access Control List Manager. See [Integrating the MWTM with CiscoWorks, page 5-36](#) for more information.

You can also forward the MWTM events to other hosts, in the form of SNMP traps. This enables the MWTM to integrate with high-level event- and alarm-monitoring systems such as the Cisco Info Center (CIC) and Macrames's Netcool suite of products. These systems can provide a single high-level view of all alarm monitoring in your network, making it easier to detect and resolve problems (see [Forwarding Events as Traps to Other Hosts, page 9-35](#)).

**Can I run the MWTM on my Windows PC?**

You can run the MWTM client on Windows XP Professional on your PC. However, the MWTM server must run on a Solaris/Linux system.

**What is a superuser?**

A superuser is an MWTM user who has been enabled to perform most of the MWTM functions that otherwise require the user to be logged in as the root user.

For a complete description of the functions that a superuser can and cannot perform, as well as instructions for enabling a superuser, see [Specifying a Super User \(Server Only\)](#), page 2-19.

**Does the MWTM Java RMI use TCP or UDP?**

The two-way RMI communication in the MWTM that occurs between Java-based GUI clients and Java-based server processes uses TCP sockets.

**What does a status of Deleted, Uninhibited, or NoShutdown mean?**

A status of Deleted, Uninhibited, or NoShutdown indicates a possible problem with the MWTM. If you see one of these status settings, contact Cisco TAC or your Cisco Account Team.

**Why don't the contents of the syslog tab match the log files of my syslog server?**

The MWTM client shows current syslog information available from a node, which reflects what content the node has stored in its internal memory. It is possible to configure your node to send its syslog messages to a host that stores these messages in files (usually under */var/adm*). The MWTM does not access these persisted log messages, even if the host on which your MWTM server is running is logging syslog messages from your node. To access these persisted log messages, use CiscoWorks, or other software with syslog viewing capabilities.

**When I start my MWTM client, I get a login window. However, I did not specify a user password during installation. How do I fix this?**

When you install the MWTM and if you select all the default settings, user security is enabled (default option) which causes the MWTM login window to appear when you start the MWTM client. However, if you did not provide a user password during the installation, you must disable user security before you can log into the MWTM client or add user passwords to the MWTM.

To *disable* user security:

---

**Step 1** Log in as the root user on the MWTM server.

**Step 2** Run the following command:

```
/opt/CSCOsgm/bin/mwtm useraccess disable
```

Output similar to the following appears:

```
[root@mwtm-server bin]# /opt/CSCOsgm/bin/mwtm useraccess disable
```

```
User Based Access Protection is Disabled.
MWTM server must be restarted for changes to take effect.
Use the following command to restart the server:
```

```
mwtm restart
```

```
Clear browser cache and restart browser after changing MWTM Security!!
[root@mwtm-server bin]#
```

- Step 3** Make sure you restart the MWTM server (using the **mwtm restart** command) to activate the new security settings.
- 

To *enable* user security:

---

- Step 1** Log in as the root user on the MWTM server.

- Step 2** Run the following command:

```
/opt/CSCOs-gm/bin/mwtm useraccess enable
```

- Step 3** Run the following command:

```
/opt/CSCOs-gm/bin/mwtm adduser <username>
```

Output similar to the following appears:

```
[root@mwtm-server bin]# /opt/CSCOs-gm/bin/mwtm useraccess enable
```

User Based Access Protection is Enabled.

Use the "mwtm adduser" command to add users.

Log in with usernames and passwords for access to MWTM Features.

MWTM server must be restarted for changes to take effect.

Use the following command to restart the server:

```
mwtm restart
```

Clear browser cache and restart browser after changing MWTM Security!!

```
[root@mwtm-server bin]# /opt/CSCOs-gm/bin/mwtm adduser newuser
```

Adding user newuser

New password:

Re-enter new password:

Adding password for user newuser

Should user be forced to change this password at the next login? [n] n

Access Level

=====

1 - Basic User

2 - Power User

3 - Network Operator

4 - Network Administrator

5 - System Administrator

Enter access level for user newuser: 5

User newuser added with level 5 access.

User Based Access Protection is Enabled.

Clear browser cache and restart browser after changing MWTM Security.

```
[root@mwtm-server bin]#
```

- Step 4** Make sure you restart the MWTM server (using the **mwtm restart** command) to activate the new security settings.
-

### **I'm field testing MWTM in my lab and I see confusing results when discovering new network configurations. What's going on?**

The MWTM keeps information about older objects in its database even after they have been deleted. This is considered a logically deleted state. MWTM retains this information to try and maintain any user customized data associated with an object (for instance, a customized name) in case the object is rediscovered at some point in the future. Logically deleted data is physically deleted after seven days if it is not reused by then. You can use the `mwtm purgedb` command to immediately remove this logically deleted data from the MWTM database.

Unfortunately, this benefit might have a side effect. In certain cases, rediscovery of a deleted object may cause the MWTM to use obsolete information in the database, rather than the new information. Ultimately, some configuration changes are not detected, and the viewable data from the client application is incorrect.

There are 2 alternatives to address this behavior in a lab environment:

1. Change the default setting of 7 days to 0 in the `Server.properties` file (using the `DELETE_AGING_TIMEOUT` variable).
2. Issue the `mwtm purgedb` command to immediately remove this logically deleted data from the MWTM database (for details, see [mwtm purgedb](#), page B-53).

### **Why can't I discover primary and standby devices at the same time?**

In MWTM, nodes are identified by their management IP address, from which MWTM initiates SNMP polling of a device. In various redundancy scenarios, different devices respond to requests on the same IP address. When this happens, MWTM is unable to differentiate between the multiple devices and considers them the same device.

For example, if two routers share the same physical link via a Y-cable where only one of the devices can use the IP address at a time (even though there are actually two devices), MWTM discovers and displays a single device only.

If a redundancy mechanism is instantiated where two devices share the same virtual IP address but only one device responds to any given request, MWTM discovers and displays a single device only.

### **How do I increase the swap size in Solaris?**

To create a new swap file on Solaris:

---

**Step 1** Use `mkfile` to create a file suitable for a local swap area.

For example, to create a 1GB swap file, enter the following command:

```
/usr/sbin/mkfile 1024m /opt/swapfile
```

where `/opt/swapfile` is the name of the file to be used as swap space. Units for the size can be kilobytes (k), blocks (b), or megabytes (m). Choose carefully the disk location to create the swap file. Choose a disk partition with plenty of free disk space.

**Step 2** Tell the system to start using the file as swap by entering the following command:

```
/usr/sbin/swap -a /opt/swapfile
```

**Step 3** Run `swap -l` to verify that the swap file has been activated.

```
/usr/sbin/swap -l
```

**Step 4** Add the following line to `/etc/vfstab` to assure the new swapfile is maintained across system reboots:

```
/opt/swapfile - - swap - no -
```

---

### How do I increase the swap size in Linux?

To create a new swap file on Linux:

**Step 1** Use `dd` to create a file suitable for a local swap area.

For example, to create a 1GB swap file, enter the following command:

```
/bin/dd if=/dev/zero of=/opt/swapfile bs=1M count=1024
```

where `/opt/swapfile` is the name of the file to be used as swap space. This specifies a blocksize of 1Mb and 1024 of them for 1Gb total. Choose carefully the disk location to create the swap file. Choose a disk partition with plenty of free disk space.

**Step 2** Tell the system to start using the file as swap and activate it:

```
/sbin/mkswap /opt/swapfile
/sbin/swapon /opt/swapfile
```

**Step 3** Run `swap -l` to verify that the swap file has been activated.

```
/sbin/swapon -s
```

**Step 4** Add the following line to `/etc/fstab` to assure the new swapfile is maintained across system reboots:

```
/opt/swapfile swap swap defaults 0 0
```

---

## ITP Specific FAQs

This section addresses frequently asked questions related to ITP operations:

- [Can ITPs send traps to the MWTM and to another process on the same node?, page C-14](#)
- [Why did the MWTM not discover all of my ITP nodes?, page C-15](#)
- [How can the Received for some of my links be 105%?, page C-15](#)
- [What does the asterisk \(\\*\) mean next to an SLC number?, page C-15](#)
- [When I try to deploy routes, GTT files, or address table files from the MWTM, why does TFTP fail or time out?, page C-15](#)
- [Why don't my linkset and link totals match?, page C-16](#)
- [How do I enable accounting collection in the MWTM?, page C-16](#)
- [How do I generate custom ITP reports quarter hourly instead of hourly or daily?, page C-17](#)
- [Why do I have limited functionality on certain tabs?, page C-18](#)

### Can ITPs send traps to the MWTM and to another process on the same node?

Yes. You can configure your ITPs to send SNMP traps to more than one process on a single node. Each process receives traps on a different port number. However, to do so, you must configure a different community string for each process.

For example, your ITP configurations could include these lines:

```
snmp-server host 1.2.3.4 public udp-port 162
snmp-server host 1.2.3.4 otherCommunity udp-port 44750
```

where:

- The first line configures the HP OpenView trap receiver, with community string **public** and UDP port number **162**.
- The second line configures the MWTM trap receiver, with community string **otherCommunity** and UDP port number **44750**.

You would then configure the MWTM to receive traps on port number 44740. For information about how to configure the MWTM port number, see [Enabling SNMP Traps, page 4-7](#).

#### Why did the MWTM not discover all of my ITP nodes?

After you discover the network, examine the Discovered Nodes table to verify that the MWTM discovered all of the nodes in the network. If you suspect that the MWTM did not discover all of the nodes, verify these conditions:

- Verify that the MWTM server can ping the nodes.
- Verify that the nodes are running ITP IOS images that are compatible with the MWTM server.
- Verify that the SNMP is enabled on the nodes.
- Verify that the MWTM is configured with the correct SNMP community name (see [Launching the Discovery Dialog, page 3-6](#)).
- Verify that the missing nodes are connected to the seed nodes by SCTP connections, not just serial connections.
- Verify that you chose **Entire Network** when you ran Discovery. If you suspect that you did not, run Discovery again with **Entire Network** chosen.

#### How can the Received for some of my links be 105%?

For serial and HSL links on Cisco 7507 and 7513 series routers, in the Received and Send real-time data charts for links and linksets, the visible data can vary by up to 5% from the actual—the MWTM might even display data above 100%. This variance results from the synchronization of Layer 2 counters between the Versatile Interface Processor (VIP) CPU and the Route Switch Processor (RSP) CPU on 7500 series routers. This variance does not occur for links on Cisco 2600, 7200, or 7300 series routers.

#### What does the asterisk (\*) mean next to an SLC number?

In the MWTM, each link is identified by its signaling link code ID (SLC). An asterisk indicates that a link is not configured, or that a poll could not get data for the link.

The placement of the asterisk, to the left or right of the SLC, indicates whether the missing link is associated with the chosen linkset or with its adjacent linkset. For example, **SLC (\*)3** means that no link is associated with the chosen linkset for SLC 3, and **SLC 3(\*)** means that no link is associated with the adjacent linkset for SLC 3.

#### When I try to deploy routes, GTT files, or address table files from the MWTM, why does TFTP fail or time out?

There are three primary causes for TFTP failure or timeout errors:

- You might not have enabled TFTP on your server, which will cause a timeout error (see [Setting Up TFTP on Your Server \(ITP Only\), page 4-12](#)).
- You might have specified your tftp root directory (by default, /tftpboot) in the tftp path, which is not necessary and will cause TFTP to fail. For details on specifying the correct path, see these sections:

[mwtm atbldir, page B-100](#)

[mwtm gttdir, page B-109](#)

[mwtm routedir, page B-123](#)

- If the staging directory (created using the previous commands) does not have write permissions for the MWTM server processes, the TFTP will fail.

#### Why don't my linkset and link totals match?

When you run the **mwtm export** command for a link or linkset, you might notice the output totals do not match the totals in the MWTM client. This discrepancy occurs because the **mwtm export** command counts each side of the linkset or link as a individual linkset or link, whereas the MWTM client (assuming it knows both sides) counts both sides as one linkset or link pair. Therefore, the **mwtm export** command might have more linksets and links than the MWTM client shows.

#### How do I enable accounting collection in the MWTM?

Enabling accounting collection in the MWTM is described next. First, you must enable accounting on each ITP node using IOS commands. Then you can enable accounting in the MWTM.

#### Note

Enable accounting on each ITP node using IOS commands. Accounting can be enabled on the ITP globally or per linkset. For detailed information on IOS modes and commands, see the Cisco IOS software documentation.

To enable accounting globally for all linksets on an ITP node:

**Step 1** Go into IOS global configuration (**configure terminal**) mode.

**Step 2** Enter these commands and arguments:

```
node name(config)#cs7 accounting global-gtt
node name(config)#cs7 accounting global-mtp3
node name(config)#cs7 accounting global-unrouteable
```

#### Note

These IOS arguments are the recommended defaults for the MWTM.

To enable accounting per linkset on an ITP node:

**Step 1** Go into IOS global configuration (**configure terminal**) mode.

**Step 2** Enter these commands and arguments:

```
node name(config)#cs7 instance number linkset name
node name(config)#accounting
node name(config)#gtt-accounting
node name(config)#unrouteable-accounting
```

**Note**

These arguments are the recommended defaults for the MWTM. The instance number argument is not required if you have only one instance.

The MWTM accounting reports are disabled by default. Enable them:

**Step 1** Enter these commands:

```
node name#/opt/CSCOsgm/bin/sgm statreps acct
node name#/opt/CSCOsgm/bin/sgm statreps gtt
```

Data is collected daily, and is not affected by polling interval preferences in the Java or web clients.

**Note**

These arguments are the recommended defaults for the MWTM. However, other arguments are available. For a full list of **mwtm statreps** commands, see [Appendix B, “Command Reference.”](#)

**Step 2** Polling intervals for historical reports are controlled by the root user’s crontab file. To display the current values for crontab, and to verify that accounting reports are enabled, run this command:

```
node name#crontab -l
```

The list should include statreps acct and statreps gtt.

### How do I generate custom ITP reports quarter hourly instead of hourly or daily?

You can manually generate custom reports using the MWTM command line interface (CLI).

**Note**

Custom reports are *custom* because you can specify that they run at custom time intervals. The content of custom reports is the same as the regularly scheduled reports.

These commands apply to generating custom reports:

- mwtm accstats quiet
- mwtm gttstats quiet
- mwtm linkstats quiet
- mwtm mlrstats quiet
- mwtm q752stats quiet
- mwtm xuastats quiet

The quiet option disables output to the console.

The output of these commands is placed in this directory:

```
/opt/CSCOsgm/reports/custom
```

**Note**

For details on these commands, see [Appendix B, “Command Reference.”](#)

Use the UNIX cron facility to schedule the CLI commands to be run every quarter hour:

- 
- Step 1** Log in as the root user, as described in [Becoming the Root User \(Server Only\)](#), page 3-2.
- Step 2** Enter this command to edit the crontab:
- ```
crontab -e
```
- Step 3** For example, if you wanted to have the link and XUA statistic reports run every quarter hour instead of hourly or daily:
- Comment out these lines:

```
54 * * * * /opt/CSCOsgm/bin/sgmCron.sh xuastats
56 * * * * /opt/CSCOsgm/bin/sgmCron.sh linkstats
```
 - Add a line similar to these for each report command:

```
00,15,30,45 * * * * /opt/CSCOsgm/bin/mwtm linkstats quiet
00,15,30,45 * * * * /opt/CSCOsgm/bin/mwtm xuastats quiet
```
- You can find these reports in this directory:
- ```
/opt/CSCOsgm/reports/custom
```
- There will be 15 minute timestamps on each report file.
- Step 4** To view these reports on the web, open the MWTM web interface (see [Accessing the MWTM Web Interface, page 11-2](#)) then choose **File Archive > Reports > Custom**.
- 

**Note**

You can keep both the standard hourly reports and the 15 minute reports by leaving both types in the crontab instead of commenting out the lines in the previous steps. This will generate a heavier load on the system for a few minutes at the top of the hour when both are running at the same time.

---

**Why do I have limited functionality on certain tabs?**

You might notice limited functionality on the following ITP tabs:

- MSU Rates
- MLR Details
- Non-Stop Operation

These tabs are available on certain nodes, and also require specific IOS images:

| Tab       | Node Availability | IOS Required Images                                                                                                                           |
|-----------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| MSU Rates | All               | <ul style="list-style-type: none"> <li>• 12.2 (18) IXB or later</li> <li>• 12.2 (25) SW7 or later</li> <li>• 12.4 (11) SW or later</li> </ul> |

| Tab                | Node Availability                    | IOS Required Images                                                                                                                     |
|--------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| MLR Details        | All                                  | <ul style="list-style-type: none"><li>• 12.2(18)IXA or later</li><li>• 12.2(21)SW1 or later</li><li>• 12.4(11)SW or later</li></ul>     |
| Non-Stop Operation | Cisco 7500 and Cisco 7600 nodes only | <ul style="list-style-type: none"><li>• 12.2 (18) IXA or later</li><li>• 12.2(21)SW or later</li><li>• 12.2 (4)MB13a or later</li></ul> |

# IP-RAN Specific FAQs

This section addresses frequently asked questions related to IP-RAN operations:

- [What is the difference between in-band and out-of-band management?, page C-20](#)
- [How does the MWTM server communicate to the IP-RAN node at the remote cell site?, page C-21](#)
- [When viewing capacity planning information in the RAN Backhaul report, the peak timestamps are sometimes outside the chosen range. For example, 2005-12-01 appears in the report window, but I see Nov 30, 2005 11:58:37 PM in the Peak Timestamp information. Why is the peak timestamp outside the chosen range?, page C-22](#)
- [Does the MWTM support the use of Hot Standby Router Protocol \(HSRP\) for a pair of redundant nodes?, page C-22](#)
- [How do I sync up the time/date display on my IP-RAN performance and error data with the time/date on the MWR?, page C-23](#)
- [Why are my MWR nodes yellow when I discover them?, page C-24](#)
- [Why does my backhaul graph show greater than 100% for transmit traffic?, page C-25](#)
- [How to create SAToP and CESoPSN Interfaces?, page C-25](#)

## What is the difference between in-band and out-of-band management?

Nodes located at the cell site are usually accessible only over the same path used to transport voice traffic. Collecting management information over this path is called in-band management and has an impact on backhaul. The MWTM can reduce the amount and frequency of collecting management information when information is collected in-band.

Nodes located at the aggregation site are managed using different paths than those used by voice traffic. Collecting management information in this configuration is called out-of-band management and has no impact on backhaul.

The following table compares MWTM features for in-band and out-of-band management:

| Feature                      | In-band Management for MWR   | Out-of-band Management for MWR |
|------------------------------|------------------------------|--------------------------------|
| Historical reports           | Not available <sup>1</sup>   | Generated                      |
| Trap polling                 | Traps do not trigger polling | Traps do trigger polling       |
| Regular polling <sup>2</sup> | Performed                    | Performed                      |
| Real-time polling            | Available <sup>3</sup>       | Performed                      |

1. However, you can always collect historical reports from the aggregation node site (that is, the RAN SVC module in the ONS). The receiving traffic on the RAN SVC shorthaul and backhaul matches transmitting traffic from the MWR shorthaul and backhaul.
2. Polls are performed every 15 minutes. To change this rate, see the SNMP and Credentials Dialog Box (for details, see [SNMP Settings Table, page 4-16](#)).
3. To perform real-time polling in-band, you must configure it in the Preferences window (for details, see [Startup/Exit Settings, page 5-3](#)).

- These cell-site node configuration statements provide the MWTM with information required to optimize data collection:

```
conf t
 ipran-mib location cellSite
 ipran-mib snmp-access inBand
```

- If you have a cell-site node that is managed out-of-band, or you have sufficient bandwidth for in-band managed traffic, you can configure the cell-site node as follows:

```
conf t
 ipran-mib location cellSite
 ipran-mib snmp-access outOfBand
```

- These aggregation-site node configuration statements provide the MWTM with information required to optimize data collection:

```
conf t
 ipran-mib location aggSite
 ipran-mib snmp-access outOfBand
```

This example shows the range of options that are available for the **ipran-mib** command:

```
ems1941ka#conf t
Enter configuration commands, one per line. End with CNTL/Z.
ems1941ka(config)#ipran-mib ?
 backhaul-notify-interval Interval for backhaul
 location Location of device
 snmp-access Specify type snmp connectivity
 threshold-acceptable Acceptable threshold
 threshold-overloaded Overloaded threshold
 threshold-warning Warning threshold

ems1941ka(config)#ipran-mib location ?
 aggSite Located at BSC or RNC site
 cellSite Located at BTS or Node B site
 undefined Undefined location

ems1941ka(config)#ipran-mib snmp-access ?
 inBand In Band SNMP connectivity
 outOfBand Out of Band SNMP connectivity
 undefined Undefined connectivity
```

#### How does the MWTM server communicate to the IP-RAN node at the remote cell site?

The MWTM server must communicate to the cell-site node using IP routing. If the cell-site node is reachable only through the backhaul interface, add a static route on the MWTM server to point to the cell-site node. Use the IP address of the local (aggregation site) IP-RAN node as the next-hop address.

These examples of static routing for Solaris and Linux platforms are based on the diagram in [Figure C-1](#).

**Figure C-1** Example of Static Routing

To create a static route on a Solaris MWTM server, use this procedure:

- 
- Step 1** Log in as the root user, as described in [Becoming the Root User \(Server Only\)](#), page 3-2.
- Step 2** Enter this command:
- ```
/usr/sbin/route add host 10.1.1.1 20.1.1.1
```
-

To create a static route on a Linux MWTM server, use this procedure:

-
- Step 1** Log in as the root user, as described in [Becoming the Root User \(Server Only\)](#), page 3-2.
- Step 2** Enter this command:
- ```
route add -host 10.1.1.1 gw 20.1.1.1
```
- 

**When viewing capacity planning information in the RAN Backhaul report, the peak timestamps are sometimes outside the chosen range. For example, 2005-12-01 appears in the report window, but I see Nov 30, 2005 11:58:37 PM in the Peak Timestamp information. Why is the peak timestamp outside the chosen range?**

Summaries do not end on fifteen-minute boundaries such as 12:00:00, 12:15:00, 12:30:00, because the node processes system time from its own start time, not from the current hour and minute. Therefore, when the timestamps are normalized to the MWTM server time, the end timestamp might appear as 12:03:15, 12:18:15, or 12:33:15.

When you run a capacity planning report, the MWTM retrieves records for the fifteen-minute period that has an end timestamp in the start and stop range that you specify. Using the previous timestamps as examples, if a user runs a report for the 12:00-to-13:00 time range, the 12:03:15 record is retrieved. That record is a fifteen-minute summary of the period between 11:48:16 and 12:03:15. If the Peak Timestamp for this record occurred at 11:55:44, the user would observe this value in the capacity planning report.

A user might observe Peak Timestamps that occur up to fifteen minutes before the start timestamp specified in the capacity planning report query. This is the expected behavior.

#### **Does the MWTM support the use of Hot Standby Router Protocol (HSRP) for a pair of redundant nodes?**

The MWTM supports HSRP for the Cisco Mobile Wireless Router (MWR) 1941-DC-A operating in an active-standby configuration. The MWTM supports these scenarios:

- An MWR fails at the cell site, and you install a new MWR to replace it. The MWTM applies the same IP address and configuration to the new MWR, but shows a different serial number. The MWTM detects that the new MWR is at the same cell site as the old MWR, and reuses the historical statistics for this node.
- You deploy two MWRs as a redundant pair by using the Y-cable configuration described in the [Cisco MWR 1941-DC-A Mobile Wireless Edge Router Software Configuration Guide](#). When a failover occurs, the MWTM detects that the newly active node is at the same cell site as the standby node. The MWTM reuses the historical statistics for this node.
- The MWTM shows a failover alarm or a series of events associated with the failover between the active and standby nodes in a redundant pair of MWRs.

**Note** The MWTM GUI shows only the active MWR in an active-standby pair.

Because the IOS configurations are not synchronized between MWR nodes, make sure the IOS configs are identical (except HSRP settings) on both nodes.

#### How do I sync up the time/date display on my IP-RAN performance and error data with the time/date on the MWR?

For the performance and error data to match the time/date on the MWRs, all equipment (Cisco and MWTM server) must be configured with the same Network Time Protocol (NTP) server.

To configure NTP on the Cisco node:

- 
- Step 1** Log in to the node.
  - Step 2** Go into config mode.
  - Step 3** Enter:  
`ntp server <ip-address-of-ntp-server>`
  - Step 4** Exit the config mode.
  - Step 5** Save the configuration.
- 

To configure NTP on a Solaris-based MWTM server:

- 
- Step 1** Log in as the root user.
  - Step 2** Edit the `/etc/ntp.conf` file by adding this line:  
`server <ip-address-of-ntp-server>`
  - Step 3** Restart the NTP software using this command:  
`/etc/init.d/ntpd restart`
  - Step 4** Run the `date` command and ensure the clock has been set properly.  
If the date is still incorrect, follow these instructions:
    - a. Stop the NTP software using the following command:  
`/etc/init.d/ntpd stop`
    - b. Manually sync the date using the following command:  
`/usr/sbin/ntpdate <ip-address-of-ntp-server>`
    - c. Start the NTP software using the following command:  
`/etc/init.d/ntp start`
- 

**Note** To enable the NTP software, the packages `SUNWntpr` and `SUNWntpu` are required. As the root user, run the command: `pkginfo | grep SUNWntp`. You can download missing packages from [Sunfreeware.com](http://Sunfreeware.com).

---

To configure NTP on a Linux-based server:

- 
- Step 1** Log in as the root user
- Step 2** Edit the *ntp.conf* file (usually located in */etc*, */etc/inet*, or */etc/ntp/ntpervers*) by adding the following line:
- ```
server <ip-address-of-ntp-server>
```
- Step 3** Restart the NTP software using this command:
- ```
/etc/init.d/ntpd restart
```
- Step 4** Run the date command and ensure the clock has been set properly.
- If the date is still incorrect, follow these instructions:
- Stop the NTP software using the following command:
- ```
/etc/init.d/ntpd stop
```
- Manually sync the date using the following command:
- ```
/usr/sbin/ntpdate <ip-address-of-ntp-server>
```
- Start the NTP software using the following command:
- ```
/etc/init.d/ntp start
```

Note The NTP package is required to enable the NTP software. To determine if the NTP package has been installed, run the command **rpm -qa | grep -i ntp** as the root user. Missing packages can be downloaded from RPMFind.net.

Why are my MWR nodes yellow when I discover them?

When the MWTM discovers or polls a node, a list of all interfaces and their corresponding status are reported back to the MWTM server. If the MWTM determines that one or more interfaces are operationally down, the MWR node is marked with a yellow status symbol unless the interface has an administrative status of Down (coming from the IOS shutdown directive). To determine the status of an interface, the MWTM uses the following logic matrix:

Interface Admin Status	Interface Operational Status	Reported Interface Status	MWTM Ignored Status
Up	Up	Up	Not ignored
Up	Down	Down	Not ignored
Down	Down	Down	Ignored
Down	Up	Down	Ignored

Note As shown in the above matrix, MWTM automatically ignores any interface with an administrative status of Down.

Why does my backhaul graph show greater than 100% for transmit traffic?

When the backhaul for transmit traffic exceeds 100%, the likely cause is oversubscription of the shorthaul links that constitute the backhaul. The backhaul is the amount of traffic that the system attempted to send, not the amount that was actually sent. If it is greater than 100%, you should see queue drops or other errors during the same time period. A backhaul of greater than 100% is possible for a heavily loaded link with some occasional oversubscription.

How to create SAToP and CESoPSN Interfaces?

There is no separate interface type for SAToP. For TDM over PWE3, MWTM supports provisioning of both SAToP and CESoPSN by selecting the TDM group as unframed vs framed with time slots where as, the user is choosing between SAToP vs CESoPSN.

The SAToP and CESoPSN Interfaces can be created as follows:

-
Step 1	Open the MWTM application.
Step 2	Select the IP-RAN device.
Step 3	Select an unused T1 or E1 interface in the left pane.
Step 4	Click the Details tab.
Step 5	Click Provision . The provisioning screen is displayed.
Step 6	Select Type as CEMGroup from the drop-down list.
Step 7	Click New . The Basic panel is displayed.
Step 8	Enter the CEM Group Number.
Step 9	Select the type of Controller from the drop-down list.
Step 10	Check the Unframed check box to create SAToP and uncheck the check box to create CESoPSN Interface. Begin time slot and End time slot text fields are disabled if you check the Unframed check box and the text fields are enabled if you uncheck Unframed check box. The remaining text fields displayed in the Basic panel are optional.
Step 11	Click Next . The Feature panel is displayed.
Step 12	Click the Feature button to add new features.
Step 13	Click Next . The Summary panel is displayed.
Step 14	Click Submit .
-

mSEF Internet Specific FAQs

This section addresses frequently asked questions related to mSEF operations:

- [What is SAMI card? What are SAMI processors? What is single IP architecture versus IP address for individual processors? For each architecture, how they are shown in MWTM? How is the Cisco 7600 chassis shown in MWTM?, page C-26](#)
- [What is a managed node? For network scalability planning, how do I count managed nodes in MWTM versus the number of SAMI cards?, page C-27](#)
- [Why does the HA subscriber count show the count by processor and not per SAMI card?, page C-27](#)
- [When I enable CiscoWorks integration, why do some devices have the options to Launch CiscoView and Device Center, while other screens have the Device Center option only and not CiscoView?, page C-27](#)
- [Why the provision button is not displayed for discovered mSEF devices?, page C-27](#)
- [Why and how to display the HA IP mobile statistics based on CLIDs or in NAI format?, page C-28](#)

What is SAMI card? What are SAMI processors? What is single IP architecture versus IP address for individual processors? For each architecture, how they are shown in MWTM? How is the Cisco 7600 chassis shown in MWTM?

The Cisco SAMI, is a high-performance Cisco software application module that occupies one slot in the Cisco 7600 series router platform. With a network processor and six PowerPCs (PPCs), the Cisco SAMI offers a parallel architecture for Cisco software applications such as the Cisco Content Services Gateway - 2nd Generation (CSG2), the Cisco Gateway GPRS Support Node (GGSN), the Cisco Mobile Wireless Home Agent (HA), the Cisco Broadband Wireless Gateway (BWG), and the Cisco IP Transfer Point (ITP).

In early releases of the mSEF technologies, each of the six PPCs ran an individual, separately addressable IOS image. As such, in MWTM a single SAMI card appeared as six separate Node objects. In later releases, the individual PPCs are combined into one IOS image and as such a single SAMI card appears as a single Node object. In ITP, the SAMI card serves as a line processor and does not appear as a Node in MWTM. The following table shows the technologies supported by MWTM in which the SAMI is used and how they appear in MWTM.

Technology	Number of Nodes in MWTM
ITP	Not applicable
CSG2	1
GGSN R8	6
GGSN R9	6
HA R4.0	6
HA R5.0	1
BWG R1	6
BWG R2	6
SGW R1	1
PDNGW R1	1
PDSN R5.1	1

The 7600 routers that house the mSEF-related SAMI cards are manageable in MWTM; and if they are discovered, they appear in MWTM as a Node object with the MWTM feature type of *mSEF*. A Cisco 7600 router that houses SAMI cards functioning as an ITP appears in MWTM as a Node object with the MWTM feature type of *ITP*.

What is a managed node? For network scalability planning, how do I count managed nodes in MWTM versus the number of SAMI cards?

In MWTM a managed Node is defined as a network element that has a unique management IP address and responds to an SNMP poll. In some cases, each processor on a SAMI card responds individually to SNMP requests and has a unique management IP address. (Refer to the prior FAQ section for information on which technologies instantiate multiple IOS images on a SAMI card.) For scalability planning purposes, use the following table to estimate the number of managed nodes:

Technology	Number of Nodes in MWTM
7600-ITP	1
7600-mSEF	1
SAMI-CSG2	1
SAMI-GGSN R8	6
SAMI-GGSN R9	6
SAMI-HA R4.0	6
SAMI-HA R5.0	1
SAMI-BWG R1	6
SAMI-BWG R2	6
SAMI-SGW R1	1
SAMI-PDNGW R1	1
SAMI-PDSN R5.1	1

Why does the HA subscriber count show the count by processor and not per SAMI card?

The MWTM Subscriber report attempts to report the number of subscribers per SAMI card. The SAMI card can, in certain instances, host multiple IOS images with separately addressable management IP addresses. Typically, each IOS image on a SAMI card, when polled for a serial number, returns the serial number of the SAMI card. In the case of SAMI cards running HA R4.0, which present six IOS images, a null serial number is returned. MWTM cannot correlate the individual IOS images to a given SAMI card, and, therefore, cannot aggregate the subscriber counts.

When I enable CiscoWorks integration, why do some devices have the options to Launch CiscoView and Device Center, while other screens have the Device Center option only and not CiscoView?

CiscoView is for the chassis level only, and the **Launch CiscoView** option is available for 7600 chassis supervisor cards. CiscoView is not supported for SAMI cards.

Why the provision button is not displayed for discovered mSEF devices?

Assuming the credentials are correct for the discovered devices, there may be some additional basic configurations that need to be done on the devices before MWTM can recognize the device as belonging to a particular feature. Below are some procedures to debug the reason for some of the mSEF device type:

For BWG:

Step 2 If the Feature for the device is displayed as Generic, then include the following config-line on the device.

This enables MWTM to recognize the device as BWG, the feature now gets displayed as BWG and the **Provision** button comes up.

Step 1 Click on the node and view the Details tab.

Step 2 If the Feature for the device is displayed as Generic, then include the following config on the device.

This enables MWTM to recognize the device as a Home Agent. The feature now gets displayed as HA and the **Provision** button comes up.

Step 1 Click on the node and view the Details tab.

Step 2 If the Feature for the device is displayed as GGSN, then include the following config-line on the device.

This config-line brings up the **Provision** button.

Other mSEF devices do not require basic config-lines, so **Provision** button is displayed automatically.

Why and how to display the HA IP mobile statistics based on CLIDs or in NAI format?

The CLID (Calling station Identifier) format is a subset of the NAI (Network Access Identifier) format. While the basic NAI format is 'user@domain', the format for the CLID is 'user'. In case of NAI the 'user' part can be a phone number or name, while in case of CLID the 'user' is a phone number (series of digits) only.

Currently MWTM supports NAI format in troubleshooting (**show ip mobile binding nai**).

To switch to CLID's format comment the following lines in */opt/CSCOs/gm/etc/SystemDefinedInputData.ts*

The following will match NAI:

REGEX(NAI,^((([a-zA-Z0-9_!@#%&'*+^/\%\'{}|~\-\.]/(\\:)/(\\;)/(\\,)/(\\[/)(\\])/(\<)/(\>)/(\\")/(\@)/(\\[/)(\\[/)(\\[/)))*([a-zA-Z0-9_!@#%&'*+^/\%\'{}|~\-\.]/(\\:)/(\\;)/(\\,)/(\\[/)(\\])/(\<)/(\>)/(\\")/(\@)/(\\[/)(\\[/)(\\[/)))*((@((([a-zA-Z0-9\-\.]+\.))+)(([a-zA-Z0-9\-\.])*([a-zA-Z0-9\-\.])?)?)\$)

Comment the line above and uncomment the REGEX below to switch between NAI and CLID specific editing.

The following will match CLID:

```
# REGEX(NAI,[0-9]+)
#
```

APPENDIX **D**

Troubleshooting the MWTM and the Network

This appendix provides this information for troubleshooting basic Cisco Mobile Wireless Transport Manager (MWTM) network problems.

This appendix contains:

- [Clearing a Locked-Up MWTM Display, page D-1](#)
- [Investigating Data Problems, page D-1](#)
- [Understanding MWTM Client Start Error Messages, page D-2](#)
- [Checking MWTM Server Start Processes, page D-3](#)
- [Viewing MWTM Data on the Web, page D-3](#)
- [Viewing MWTM Data on the Web, page D-3](#)
- [Troubleshooting IOS Commands on the Web, page D-4](#)
- [Viewing Detailed Troubleshooting Instructions for Events, page D-5](#)
- [Diagnosing a Typical Network Problem, page D-5](#)

Clearing a Locked-Up MWTM Display

In the MWTM, events might cause message popups to remain in the background of your display, preventing you from interacting with other windows. If you suspect that your display has locked up, perform these tasks:

- Ensure that you are running the MWTM on a supported operating system. For details on supported operating systems, see Chapter 1, “Preparing to Install the MWTM” in the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).
- Minimize windows and look for an MWTM message popup in the background.

Investigating Data Problems

If you suspect that there are problems with the data that the MWTM is displaying, perform these tasks:

- Enter equivalent **show** commands on the router. Is the data the same as that visible by the MWTM?
- Send SNMP queries to the nodes. Do all queries complete?

The results of these tasks can help you distinguish between a router problem and an MWTM problem.

Understanding MWTM Client Start Error Messages

If you encounter one of these errors upon starting the MWTM client, follow the subsequent procedures:

- **DataModelMediatorService:** Could not find service in RMI registry or the RMI Registry may be down.
- **DemandPollerManagerService:** Could not find service in RMI registry or the RMI registry may be down. Check the MWTM server and ensure that it is running.

Data Model Mediator Service Error

If you have received this message: “DataModelMediatorService: Could not find service in RMI registry or the RMI Registry may be down” either you have specified an incorrect port number when installing the MWTM, or the server or RMI registry is unavailable.

To correct this problem:

-
- Step 1** Verify that you specified a correct port number.
- Step 2** Enter the **mwtm status** command on the server to determine the status of all MWTM servers on the local host.
- Step 3** Enter the **mwtm restart** command to restart any servers that are not running.
-

Demand Poller Manager Service Error

If you have received this message: “DemandPollerManagerService: Could not find service in RMI registry or the RMI registry may be down. Check the MWTM server and ensure that it is running” one or more of the MWTM server processes may not have started.

To diagnose and correct this problem:

-
- Step 1** Enter the **mwtm status** command on the server to determine the status of all MWTM processes.
- Check the output to see if the *sgmDataServer* and *sgmTrapReceiver* processes are in the “Not Running” state as shown in the following example:

```
MWTM Web      Server IS Running.
Version Control System IS Initialized....
MWTM App      Server IS Running.
-- MWTM Database      Server IS Running.
-- MWTM Naming         Server IS Running.
-- MWTM MessageLog     Server IS Running.
-- MWTM DataServer     Server NOT Running.
-- MWTM Provision      Server IS Running.
-- MWTM TrapReceiver   Server NOT Running.
-- MWTM TerminalProxy  Server IS Running.
-- MWTM JSP            Server IS Running.
-- MWTM Launch         Server IS Running.
```

- Step 2** If the processes are not all in the “Is Running” state, search log file */opt/CSCOsgm/logs/messageLog.txt* for this error message:

```
A java.IO.EOFException was encountered against the persisted.server.data file.
```

- Step 3** Enter the **mwtm cleandb** command on the server, which will restore the *persisted.server.data* file to a valid state. The output should now show all processes running as shown in the following example:

```
MWTM Web      Server IS Running.
Version Control System IS Initialized....
MWTM App      Server IS Running.
-- MWTM Database      Server IS Running.
-- MWTM Naming         Server IS Running.
-- MWTM MessageLog     Server IS Running.
-- MWTM DataServer     Server IS Running.
-- MWTM Provision      Server IS Running.
-- MWTM TrapReceiver   Server IS Running.
-- MWTM TerminalProxy  Server IS Running.
-- MWTM JSP            Server IS Running.
-- MWTM Launch         Server IS Running.
```

- Step 4** Start the MWTM client, then re-discover the network (for details, see [Discovering Your Network, page 3-4.](#))

Checking MWTM Server Start Processes

When you run the **mwtm start** command, normal output appears:

```
MWTM App      Server IS Started.
-- MWTM Database      Server IS Started.
-- MWTM Naming         Server IS Started.
-- MWTM MessageLog     Server IS Started.
-- MWTM DataServer     Server IS Started.
-- MWTM Provision      Server IS Started.
-- MWTM TrapReceiver   Server IS Started.
-- MWTM TerminalProxy  Server IS Started.
-- MWTM JSP            Server IS Started.
Starting MWTM Web      Server on Port 1774...
-- MWTM Web           Server Started.
Version Control System IS Initialized....
```

If the `sgmDataServer` and `sgmTrapReceiver` process do not appear in the Ready state, see [Demand Poller Manager Service Error, page D-2](#) for details on fixing this issue.

Viewing MWTM Data on the Web

The MWTM provides an enormous amount of web-based troubleshooting information. From the MWTM web interface, you can access many web pages containing MWTM data, including server status, network status, installation logs, message logs, product documentation, and other important troubleshooting information about the MWTM. For full details, see [Chapter 11, “Accessing Data from the Web Interface.”](#)

Troubleshooting IOS Commands on the Web

Note

If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.

You can perform troubleshooting on a node or an object in the node's hierarchy by:

1. Selecting an object in a view in the navigation tree
2. Clicking the Troubleshooting tab in the right pane

Note

The Troubleshooting tab is not available for all objects in the navigation tree.

Tip

To save the output of all executed commands to a log file, see [mwtm tshootlog](#), page B-89.

Before you can run commands and view output, credentials must be properly configured. You can configure credentials using the CLI command (see [mwtm addcreds](#), page B-6) or through the MWTM client (see [Configuring Login Credentials](#), page 4-20). If credentials are not configured, the message “No credentials available. Add credentials and reload the page” appears in the output pane.

The right pane for the Troubleshooting table shows these fields and toolbar buttons for the chosen object:

Field or Toolbar Button	Description
Object Name (in heading)	Name as discovered by the MWTM.
Server Name (in heading)	Name of the MWTM server associated with the node.
Category	Related commands are grouped together in categories. Some categories are provided by default and cannot be modified. Additional categories are user-defined.
Command	List of commands or tasks associated with the chosen category. A chosen command can be executed using the Execute Command button.
Suffix	Filters the output of troubleshooting commands. For example: • include—Includes the lines matching the specified regular expression. • exclude—Excludes the lines matching the specified regular expression. • begin—Starts the printout at the line matching a regular expression. • section—Outputs only the matching sections of the printout.
 Execute Command	Executes the chosen command only.

Note

The suffixes allowed here are those supported by the IOS version.

Field or Toolbar Button	Description
 Execute Category	Executes all commands in the chosen category.
 Cancel Execution	Stops any execution process.
 Clear Output	Clears all output from the screen.
Output Pane	Pane at bottom where command output appears.

Viewing Detailed Troubleshooting Instructions for Events

The MWTM provides extensive type-specific help and troubleshooting instructions for events. To see help and troubleshooting instructions for an event, right-click the event and select **Help for Event**.

You can also provide your own enterprise-specific instructions to operators in the event help. For more information, see [Changing the Way the MWTM Processes Events, page 9-23](#).

Diagnosing a Typical Network Problem

This section contains this content:

- [Diagnosing a Typical ITP Network Problem, page D-6](#)
- [Diagnosing a Typical RAN-O Network Problem, page D-8](#)

When you use the MWTM to diagnose a problem in a network, follow these basic steps:

-
Step 1	Monitor the network using the MWTM main window and the topology window. For example, an object in the topology map that changes color from green to yellow or red indicates a problem in the network.
Step 2	Use MWTM windows, especially the Details window, to begin investigating the problem.
Step 3	As you identify the source of the problem, examine the messages logged by the MWTM for more detailed information about the sequence of events that led to the problem.
Step 4	Connect (by using Telnet or SSH) to the problematic node, if necessary.
-

Diagnosing a Typical ITP Network Problem

This real-life example provides detailed information about using the MWTM to diagnose a problem in an ITP network:

-
- Step 1** A network operator (we'll call him Joe) is using the MWTM to monitor an ITP network. Joe has customized his view, limiting it to only those nodes for which he is responsible.
- (For more information about customizing views, see [Chapter 6, "Managing Views."](#))
- Step 2** In the topology map, Joe notices a signaling point that has changed color from green to yellow. Yellow indicates a status of Warning, which means that one or more links or linksets associated with that signaling point is in Unknown or Warning status and is not flagged as Ignored.
- (For more information about signaling point status, see [Viewing Details, page 8-9.](#))
- Step 3** Joe single-clicks the signaling point in the topology map.
- The MWTM highlights the signaling point in the topology map, and in the topology ASP/SP/view table, in the left pane of the topology window. With the signaling point highlighted, Joe can easily see that the name of the signaling point is sgm-7500j.
- The MWTM also shows all associated linksets in the topology ASPA/linkset table.
- Joe double-clicks the signaling point's name in the topology ASP/SP/view table.
- The MWTM redraws the topology map, centered on sgm-7500j, making it easier for Joe to see the relevant portion of the map.
- (For more information about the topology window and how to use it, see [Chapter 10, "Viewing Network Topology."](#))
- Step 4** Joe notices that one of sgm-7500j's diamonds is red, indicating that the associated linkset is either Unavailable or Unknown. Joe single-clicks the red diamond.
- The MWTM highlights the linkset in the topology map and in the topology ASPA/linkset table. The table entry indicates that the linkset is Unavailable.
- (For more information about linkset status, see [Viewing Details, page 8-9.](#))
- Step 5** Joe right-clicks the linkset in the topology map and selects **View > Details** in the right-click menu.
- The MWTM opens the Details window, showing detailed information for the linkset.
- In the Details window, detailed information for the chosen linkset appears in the left column and for the adjacent linkset in the right column
- Immediately, Joe sees that the left column is populated with MWTM data, but the right column is not. The problem is in the adjacent signaling point-to-primary signaling point linkset.
- (For more information about linkset details, see [Chapter 8, "Understanding Detailed Object Functions."](#))
- Step 6** Joe clicks on Linkset under Summary Lists to display the list of links associated with the linkset, identified by their signaling link code IDs (SLCs). In this case, only one link is listed, SLC 0, and it is red, meaning it has failed and no traffic is flowing on the link.
- Joe selects SLC 0, and the MWTM shows detailed information for the link in the left column. Normally the MWTM also shows detailed information for links associated with the adjacent linkset in the right column, but in this case, that column is blank.
- (For more information about linkset status, see [Viewing Details, page 8-9.](#))
- Step 7** Joe decides to investigate the adjacent signaling point, so he double-clicks the adjacent signaling point in the topology map.

The resulting display shows that the adjacent signaling point, sgm-2600a, is Unmanaged.

(For more information about signaling point details, see [Chapter 8, “Understanding Detailed Object Functions.”](#))

Step 8 Joe closes the Details window and returns to the topology window. He tries to find sgm-2600a in the topology map, but the map is too complex. So Joe lets the MWTM find the signaling point or application server process for him:

- a. He selects **Edit > Find** in the MWTM main menu. The Find dialog box appears.
- b. He enters sgm-2600a in the Search string field and makes sure the Name, check box is checked.
- c. He clicks **OK** to launch the search. Almost immediately, the MWTM finds the signaling point or application server process and the Choose dialog box appears, listing all found objects.
- d. Joe selects sgm-2600a, and the MWTM automatically highlights sgm-2600a in the topology ASP/SP/view table and in the topology map, and redraws the map centered on sgm-2600a.

(For more information about finding objects in the topology map, see [Chapter 10, “Viewing Network Topology.”](#))

Step 9 Joe wants to see recent events for sgm-2600a, so he clicks the signaling point in the topology map and selects **View > Events** in the MWTM main menu. The Recent Events tab appears for the chosen object, in this case showing recent events for sgm-2600a.

(For more information about viewing events, see [Chapter 9, “Managing Alarms and Events.”](#))

Step 10 Joe decides to see if the MWTM can manage the signaling point. He right-clicks sgm-2600a in the topology map and selects Manage in the right-click menu.

The MWTM changes the status of the signaling point from Unmanaged (red) to Warning (yellow), which means the signaling point is active, but one or more associated linksets or links has a status of Failed, Unavailable, Unknown, or Warning and is not flagged as Ignored.

(For more information, see [Unmanaging and Managing Nodes or ITP Signaling Points, page 7-46.](#))

Step 11 Joe wants to see status change messages for sgm-2600a, so he right-clicks the signaling point again and selects **Event History > Status Change Messages** in the right-click menu. The MWTM shows recent status change messages for the signaling point in a web browser.

Joe sees that many of the links and linksets associated with sgm-2600a have a status of Unknown.

(For more information about displaying messages on the web, see [Chapter 11, “Accessing Data from the Web Interface.”](#))

Step 12 At this point, Joe must determine why so many of the links and linksets are Unknown. He must verify that the MWTM server can ping the node (see [Enabling the Terminal Server Proxy Service, page 4-11](#)), and that the MWTM is configured with the correct SNMP community name for the node (see [Launching the Discovery Dialog, page 3-6](#)).

(For a list of some other actions Joe can take, see [Verifying Discovery, page 3-14](#).)

Step 13 Finally, Joe can use another product, such as CiscoView, to further investigate the problem.

(For more information about integrating the MWTM with CiscoView and other products, see [Integrating the MWTM with Other Products, page 5-36](#).)

Diagnosing a Typical RAN-O Network Problem

This real-life example provides detailed information about using the MWTM to diagnose a problem in a RAN-O network:

-
- Step 1** A network operator (we'll call him Joe) is using the MWTM to monitor a RAN-O network. Joe has customized his view, limiting it to only those nodes for which he is responsible.
- (For more information about customizing views, see [Chapter 6, "Managing Views."](#))
- Step 2** In the topology map, Joe notices a node that has changed color from green to yellow. Yellow indicates a status of Warning, which means that one or more interfaces associated with that node is in Unknown or Warning status and is not flagged as Ignored.
- (For more information about node status, see the ["Viewing Details" section on page 8-9.](#))
- Step 3** Joe single-clicks the node in the topology map.
- The MWTM highlights the node in the topology map and in the topology view table in the left pane of the topology window. With the node highlighted, Joe can easily see that the name of the node is MWR-1941a.
- The MWTM also shows all associated interfaces in the topology Connections table.
- Joe clicks the node's name and the zoom button in the topology view table.
- The MWTM redraws the topology map, centered on MWR-1941a, making it easier for Joe to see the relevant portion of the map.
- (For more information about the topology window and how to use it, see [Chapter 10, "Viewing Network Topology."](#))
- Step 4** Joe notices that one of MWR-1941a's diamonds is red, indicating that the associated interface is either Unavailable or Unknown. Joe single-clicks the red diamond.
- The MWTM highlights the connection in the topology map and in the topology Connections table. The table entry indicates that the connection is Unavailable.
- Step 5** Joe right-clicks the connection in the topology map and selects **View > Configuration Details** in the right-click menu.
- The MWTM opens the Details window (in the main MWTM window), showing detailed information for the connection. In the Details window, detailed information for the chosen connection appears in the Configuration Data section.
- Immediately, Joe sees that the Operational Status is Down but notices that the Operational Status for E1 1/0 is Up.
- Step 6** Joe selects the Recent Events tab and notices that a Critical Alarm for E1 1/0 was recently added.
- Joe logs into the MWR-1941a node (right-click on node name and choose **Node Connect**) and runs the **show controller E1 1/0** command. He learns that the node recently loss physical connectivity.
- Step 7** Joe goes to the router and discovers that the cable is physically damaged. He replaces the cable and returns to the MWTM server.
- Step 8** Joe views the MWTM main window and observes that the MWTM has already polled the node and changed the state color from yellow to green.
- Step 9** Joe looks at the MWTM topology window again and verifies the interface status has changed from yellow to green.
-

APPENDIX **E**

Status Definitions

This appendix defines the default status settings for all Cisco Mobile Wireless Transport Manager (MWTM) network objects and lists the values of each of the icons.

Table E-1 **Definition of Status Icons**

Icon	GUI Element	Possible Values
	Node status	Active—Node is fully functional.
	View status	Active—All objects in the chosen view are currently Active and fully functional
	Folder status	Active—All objects in the chosen folder are currently Active and fully functional.
	Admin status	Up—Administratively up.
	Operational status	Up—Interface is up.
	Interface status	Active—Interface is Active.
	Application Server status (<i>ITP only</i>)	Active—The application server is available and application traffic is Active. At least one application server process serving this application server is Active.
	Application Server Process Associations status (<i>ITP only</i>)	Active—The remote peer at the application server process association is available and application traffic is Active.
	Links status (<i>ITP only</i>)	Active—The link is currently fully functional.
	Linksets status (<i>ITP only</i>)	Active—The linkset is currently fully functional.
	Signaling Gateway Mated Pairs status (<i>ITP only</i>)	Active—The signaling gateway-mated pair is available and application traffic is active.
	Signaling Point status (<i>ITP only</i>)	Active—The signaling point is currently fully functional.
	GSM Abis Connect status (<i>RAN-O only</i>)	Connected—The node is monitoring local and remote alarm status.
	UMTS Iub Connect status (<i>RAN-O only</i>)	Open—Connection is open and available for traffic.
	UMTS Iub Alarm status (<i>RAN-O only</i>)	No alarm—No alarm is present.
	UMTS Iub Redundancy status (<i>RAN-O only</i>)	Active—Active owner of interface Standby—Standby owner of interface.
	UMTS Iub Interface status (<i>RAN-O only</i>)	Active—The interface is currently fully functional.
	Card definition status	Active—The card is currently fully functional.
	RAN-O status	Active—The RAN backhaul is currently fully functional.
	PWE3 Virtual Circuit	Active— The virtual circuit is active.
	Inbound Operational Status (<i>IPRAN only</i>)	Up —Virtual circuit operationally active.
	Outbound Operational Status (<i>IPRAN only</i>)	Up —Virtual circuit operationally active.
	APN status (<i>mSEF only</i>)	Active—The APN is currently fully functional.

Table E-1 **Definition of Status Icons (continued)**

	Node status	Discovering—The node is being discovered and Simple Network Management Protocol (SNMP) queries have been sent to the node. Polling—The node is being polled.
	Node status	Unknown—The node failed to respond to an SNMP request. The MWTM sets all associated signaling points, linksets, and links to <i>Unknown</i> .
	Admin status	Unknown—Unknown administrative status.
	Operational status	Unknown—Unknown operational status. Down—Interface is down. Dormant—Interface is dormant. Not present—An interface component is missing. Lower Layer Down—An interface is down because of a lower-layer interface.
	Interface status	Down—The interface is not available. Unknown—The MWTM cannot determine the current status of the interface.
	Application Server status (ITP only)	Down —The application server is not available. All application server processes that serve this application server are Down. This is the initial status for application servers. Inactive—The application server is available, but no application traffic is active (that is, at least one application server process is Inactive, and no application server process is Active). Pending—The last remaining Active application server process serving this application server has become Inactive or Down. The next status for this application server will be Active, Inactive, or Down, depending on the recovery timer, and whether an application server process can become Active. Unknown—The MWTM cannot determine the current status of the application server.
	Application Server Process status (ITP only)	Unknown—The MWTM cannot determine the current status of the application server process.
	Application Server Process Associations status (ITP only)	Blocked—The application server process association cannot receive normal data traffic, but it can send and receive control messages. Down—The remote peer at the application server process association is not available, or the related SCTP association is down. This is the initial status for application server process associations. Inactive—The remote peer at the application server process association is available, and the related SCTP association is up, but application traffic has stopped. The application server process association should not receive any data or SNMP messages for the application server. Pending—The last remaining Active application server process serving this application server process association has become Inactive or Down. The next status for this application server process association will be Active, Inactive, or Down, depending on the recovery timer, and whether an application server process can become Active. Unknown—The MWTM cannot determine the current status of the application server process association.

Table E-1 **Definition of Status Icons (continued)**

Links status (ITP only)	Blocked—Traffic on this link is disabled by protocol. Failed—An error is preventing traffic from flowing on this link, or the associated linkset has been set to Shutdown status. A link can be Failed from an MTP3 perspective, but control messages might still be sent or received on the link, resulting in changing packet/second and bit/second rates. The rates might also be different at each end of the link, depending on the reason for the failure and the timing related to each endpoint. Unknown—Either the node associated with this link has failed to respond to an SNMP request, or the MWTM found that the link no longer exists.
Linksets status (ITP only)	Unavailable—An error is preventing traffic from flowing on this linkset. Unknown—Either the node associated with this linkset has failed to respond to an SNMP request, or the MWTM found that the linkset no longer exists.
Signaling Gateway Mated Pairs status (ITP only)	Down—The signaling gateway-mated pair is not available. Inactive—The signaling gateway-mated pair is available, but application traffic has stopped. Unknown—The MWTM cannot determine the current status of the signaling gateway-mated pair.
Signaling Point status (ITP only)	Unknown—The MWTM cannot determine the current status of the signaling point.
GSM Abis Connect status (RAN-O only)	Disconnected—The system ignores the local alarm status. The local transmitter on the short-haul is disabled. Capability messages are transmitted to the remote describing the provisioning. The system stays disconnected until the remote capabilities are known and the peer state transitions to connected.
UMTS Iub Connect status (RAN-O only)	Starting—The shorthaul interface is administratively active, but the backhaul interface is down. Stopped—Unable to connect to peer in specified time interval. Additional attempts will be tried based on peer request or restart timers.
UMTS Iub Alarm status (RAN-O only)	Local Alarm—Indicates local interface problem. The interface has not received synchronization from the GSM node. The node stops transmitting backhaul samples. Alarm State Unavailable—Indicates the alarm state is not available. This state only applies to the remote and occurs when the peer connection is inactive.
Card definition status (RAN-O only)	Not Present—Preconfigured but not inserted in the ONS chassis Failed—Not functional Unknown—Failed SNMP
RAN-O status (RAN-O only)	Failed—None of the shorthaul or IP backhaul interfaces are active. Unknown—The MWTM cannot determine the current status of the RAN backhaul.
PWE3 Virtual Circuit status	Down—The virtual circuit is down. Unknown—MWTM cannot determine the current status of the interface.
APN status (mSEF only)	Unknown—The node failed to respond to an SNMP request.

Table E-1 **Definition of Status Icons (continued)**

	Node status	Warning—The node is active, but one or more associated objects are in Failed, Unavailable, Unknown, or Warning status and are not Ignored.
	Folder status	Warning—At least one object is not Active.
	Interface status	Warning—The interface status is Active, but some underlying facility is not fully functional.
	Application Server status (ITP only)	Warning—The application server is Active, but one of these conditions exists: - At least one application server process association for this application server is not fully functional. - A signaling gateway-mated pair has been defined for this signaling point, but no application server exists on the mate. - The mate's application server is not Active.
	Application Server Process Associations status (ITP only)	Warning—The application server process association is Active, but some underlying facility is not fully functional.
	Links status (ITP only)	Warning—The link is active and traffic is flowing, but one or more of these situations has occurred: - The link is congested. - The link has exceeded the defined Receive % or Send %. - One or more of the local or remote IP addresses defined for SCTP is not active.
	Linksets status (ITP only)	Warning—The linkset is Active, but one or more links in the linkset is congested or is in Failed, Unavailable, Unknown, or Warning status, and is not Ignored. At least one link is available and can carry traffic.
	Signaling Gateway Mated Pairs status (ITP only)	Warning—The signaling gateway-mated pair is Active, but some underlying facility is not fully functional.
	Signaling Point status (ITP only)	Warning—The signaling point is Active, but one or more associated links or linksets is in Failed, Unavailable, Unknown, or Warning status, and is not flagged as Ignored.
	GSM Abis Connect status (RAN-O only)	Send Connect—One or more attempts have been made to connect to remote peer. Receive Connect—The local peer has received a connect request from the remote peer. Connect Rejected—Connection was rejected. ACK Connect—The initial connect request was sent and acknowledged by remote peer. The local peer is now waiting for a connect request from the remote peer. Check Connect—The local peer has reason to believe its remote peer has failed. Additional tests are being processed to verify peer's state.
	UMTS Iub Connect status (RAN-O only)	Initialized—The connection is starting initialization. Stopping—Connection shut down by peer's Term-Request. Will transition to stopped state. Connect Sent—Connection request sent to peer. ACK Received—Connection request sent and acknowledgement has been received from peer. Now waiting for peer's connection request. ACK Sent—Connection request received and acknowledgement has been sent to peer Connection request sent and waiting for peer's acknowledgement.

Table E-1 **Definition of Status Icons (continued)**

	UMTS Iub Alarm status (<i>RAN-O only</i>)	Received Alarm—Indicates receive problem in the local node. The remote node stops transmitting backhaul data and indicates a blue alarm.
	UMTS Iub Interface status (<i>RAN-O only</i>)	Warning—The interface is Active, but some underlying object is not fully functional.
	Card definition status (<i>RAN-O only</i>)	Warning—Not in configured protection state.
	RAN-O status (<i>RAN-O only</i>)	Warning—At least one of the shorthaul interfaces or IP backhaul interfaces is not Active.
	PWE3 Virtual Circuit	Warning—At least one of the components of the virtual circuit is not active.
	APN status (<i>mSEF only</i>)	Warning—An APN instance associated with a top-level APN is not active.
	Node status	Unmanaged—One of these situations exists: - The node is known indirectly by the MWTM. In other words, the MWTM knows the node exists but there is no known SNMP stack on the node for the MWTM to query. - An MWTM user has set the node to Unmanaged status, to prevent the MWTM from polling the node. (ITP only) If the associated signaling points are referenced via linksets to other signaling points, the MWTM automatically sets all associated signaling points to Unmanaged, and deletes all associated linksets and links, as well as all linksets and links that reference the node as an adjacent node. (ITP only) If the associated signaling points are not referenced to other signaling points, the MWTM automatically deletes the signaling points, all associated linksets and links, and all linksets and links that reference the node as an adjacent node. Waiting—The node is in the Discovery queue but is not currently being discovered.
	View status	Unmanaged—All objects in the chosen view are currently Unmanaged.
	Application Server Process status (<i>ITP only</i>)	Unmanaged—The MWTM cannot determine the status of the application server process because there is no known SNMP stack on the node that hosts this application server process for the MWTM to query.
	Signaling Point status (<i>ITP only</i>)	Unmanaged—The MWTM cannot discover the signaling point. It is not an ITP node.

Table E-1 **Definition of Status Icons (continued)**

	Admin status	Shutdown—Status is Down. Testing—Object is in Test mode.
	Operational status	Testing—Object is in Test mode.
	Application Server status (ITP only)	Shutdown—An administrator has forced the application server to an unavailable state.
	Application Server Process Associations status (ITP only)	Shutdown—An administrator has forced the application server process association to an unavailable state.
	Links status (ITP only)	InhibitLoc—A local ITP administrator has set the link to prevent traffic from flowing. InhibitRem—A remote ITP administrator has set the link to prevent traffic from flowing. Shutdown—An ITP administrator has set the link to prevent traffic from flowing.
	Linksets status (ITP only)	Shutdown—An ITP administrator has set the linkset to prevent traffic from flowing. When a linkset is set to Shutdown, all its associated links are set to Failed by Cisco IOS.
	PWE3 Virtual Circuit	Shutdown—The virtual circuit is administratively closed.
	Signaling Gateway Mated Pairs status (ITP only)	Shutdown—An administrator has forced the signaling gateway-mated pair to an unavailable state.
	UMTS Iub Connect status (RAN-O only)	Closed—The backhaul interface is active, but the shorthaul is administratively closed. Closing—Connection closed by administration request.
	UMTS Iub Alarm status (RAN-O only)	Remote Alarm—Indicates a problem at the remote end. The alarm generated by the remote interface in the E1/T1 data stream is sent and no other action is required.

BWG Specific MIBs

The Cisco Mobile Wireless Transport Manager (MWTM) queries these BWG specific Management Information Bases (MIBs), listed in alphabetical order:

MIB	Description
CISCO-ASN-GATEWAY-MIB.my	Manages Cisco's Broadband Wireless Gateway (BWG).
CISCO-SLB-DFP-MIB.my	Reports the congestion status of the real server. This MIB generates notifications when the congestion state is detected on the real server.

MIB	Description
CISCO-SLB-EXT-MIB.my	Supports Server Load Balancing Manager(s). This MIB extends the SLB management functionality in the CISCO-SLB-MIB. The Cisco Content Switching Module (CSM) product is the first SLB product to support this MIB.
CISCO-SLB-MIB.my	Supports Server Load Balancing Manager(s), such as the Cisco IOS SLB product. This MIB includes instrumentation for the manager-side implementation of the Dynamic Feedback Protocol (DFP). A DFP uses the DFP protocol to communicate with DFP agents in order to obtain information about Servers. This MIB includes the objects required for implementing the load balancer management side of the Server/Application State Protocol (SASP). The load balancer is responsible for registering Members with a SASP-Agent. A Member is an entity that is defined on the load balancer to service Internet traffic. The responsibility of the Agent is to monitor the Members, and report a recommended weight to the load balancer. The weight is then used in load balancing decisions.

Common MIBs

The MWTM queries these general MIBs, listed in alphabetical order:

MIB	Description
ATM-MIB.my	Module for ATM and AAL5-related objects for managing ATM interfaces, ATM virtual links, ATM cross-connects, AAL5 entities, and AAL5 connections.
ATM-TC-MIB.my	Provides Textual Conventions and OBJECT-IDENTITY Objects to be used by ATM systems.
CISCO-AAA-SERVER-MIB.my	Provides configuration and statistics reflecting the state of authentication, authorization, and accounting (AAA) server operation in the node and AAA communications with external servers.
CISCO-ACCESS-ENVMON-MIB.my	Describes the additional status of the Environmental Monitor on those Cisco Access devices which support one.
CISCO-CLASS-BASED-QOS-MIB.my	Class-Based QoS Configuration and Statistics MIB. This MIB provides read access to Quality of Service (QoS) configuration and statistics information for Cisco platforms that support the Modular Quality of Service Command-line Interface (Modular QoS CLI).
CISCO-CONFIG-MAN-MIB.my	Provides configuration management, primarily by tracking changes and saving the running configuration. This MIB represents a model of configuration data that exists in various locations: • running—In use by the running system • terminal—Logical or attached hardware • local—Saved locally in NVRAM or flash • remote—Saved to a server on the network
CISCO-ENHANCED-MEMPOOL-MIB.my	Monitors the memory pools of all physical entities on a managed system.
CISCO-ENTITY-FRU-CONTROL CAPABILITY.my	Provides additional capabilities for various platforms that are needed by the <i>CISCO-ENTITY-FRU-CONTROL-MIB</i> .

MIB	Description
CISCO-ENTITY-FRU-CONTROL-MIB.my	Monitors and configures the operational status of Field Replaceable Units (FRUs) of the system listed in the Entity-MIB (RFC 2037) entPhysicalTable. FRUs include assemblies such as power supplies, fans, processor modules, interface modules, and so forth.
CISCO-ENTITY-SENSOR-MIB.my	Monitors the values of sensors in the Entity-MIB (RFC 2037) entPhysicalTable.
CISCO-ENTITY-VENDORTYPE-OID-MIB.my	Defines the object identifiers that are assigned to various components on Cisco products, which are used by the entPhysicalTable of the ENTITY-MIB to uniquely identify the type of each physical entry.
CISCO-ENVMON-MIB.my	Provides environmental monitoring information on Cisco ITPs.
CISCO-EPM-NOTIFICATION-MIB.my	Defines the trap structure that carries the identity and status information of the managed object. The MWTM can send internal events as traps defined in this MIB to third-party network management system (NMS) applications for further processing.
CISCO-FLASH-MIB.my	Provides management of Cisco Flash Devices.
CISCO-FRAME-RELAY-MIB.my	Cisco Frame Relay MIB file. This MIB provides Frame Relay specific information.
CISCO-HSRP-EXT-MIB.my	Provides an extension to the <i>CISCO-HSRP-MIB</i> which defines Cisco's proprietary Hot Standby Routing Protocol (HSRP). The extensions cover assigning of secondary HSRP IP addresses and modifying an HSRP group's priority by tracking the operational status of interfaces.
CISCO-HSRP-MIB.my	Provides a means to monitor and configure the Cisco IOS proprietary Hot Standby Router Protocol (HSRP). Cisco HSRP protocol is defined in RFC2281.
CISCO-ICSUDSU-MIB.my	Integrated CSU/DSU MIB module for T1 and switched 56 kbps interfaces.
CISCO-IF-EXTENSION-MIB.my	Extension to the <i>CISCO-IETF-SCTP-MIB</i> used to provide additional information to manage the Stream Control Transmission Protocol (RFC 2960).
CISCO-MEMORY-POOL-MIB.my	Module for monitoring memory pools.
CISCO-PROCESS-MIB.my	Shows memory and CPU on Cisco nodes. CPU gives a general idea of how busy the processor is. The numbers are a ratio of the current idle time divided by the longest idle time.
CISCO-PRODUCTS-MIB.my	Defines the object identifiers that are assigned to various hardware platforms, and hence are returned as values for sysObjectID.
CISCO-QOS-PIB-MIB.my	Cisco QoS Policy PIB for provisioning QoS policy.
CISCO-RF-MIB.my	Provides configuration control and status for the Redundancy Framework (RF) subsystem. RF provides a mechanism for logical redundancy of software functionality and is designed to support 1-to-1 redundancy on processor cards. Redundancy is concerned with the duplication of data elements and software functions to provide an alternative in case of failure.
CISCO-RTTMON-MIB.my	Defines a MIB for Round Trip Time (RTT) monitoring of a list of targets, using a variety of protocols.

MIB	Description
CISCO-SMI.my	Defines the Structure of Management Information for the Cisco enterprise.
CISCO-STACK-MIB.my	Provides configuration and runtime status for chassis, modules, ports, and so on, on the Catalyst systems.
CISCO-SYSLOG-MIB.my	Provides a means of gathering syslog messages generated by the Cisco IOS. The MWTM can send internal events as traps defined in this MIB to third-party NMS applications for further processing.
CISCO-TC.my	Defines textual conventions used throughout Cisco enterprise MIBs.
CISCO-VTP-MIB.my	Module for entities implementing the VTP protocol and VLAN management.
ENTITY-MIB.my	Module that represents multiple logical entities supported by a single SNMP agent. This MIB is based on RFC 2737. For more information on entity MIBs, see RFC 2037 section 3.
EtherLike-MIB.my	Describes generic objects for ethernet-like network interfaces.
FDDI-SMT73-MIB.my	Contains information for FDDI (Fiber Distributed Data Interface).
HCNUM-TC.my	Contains textual conventions for high capacity data types. This module addresses an immediate need for data types not directly supported in the SMIV2. This short-term solution is meant to be deprecated when a long-term solution is deployed.
IANAifType-MIB.my	Defines the IANAifType Textual Convention, and thus the enumerated values of the ifType object defined in MIB-II's ifTable.
IF-MIB.my	Describes generic objects for network interface sublayers. This MIB is an updated version of MIB-II's ifTable, and incorporates the extensions defined in RFC 1229.
IMA-MIB.my	Module that manages ATM Forum Inverse Multiplexing for ATM (IMA) interfaces.
INET-ADDRESS-MIB.my	Defines textual conventions for representing Internet addresses. An Internet address can be an IPv4 address, an IPv6 address, or a DNS domain name. This module also defines textual conventions for Internet port numbers, autonomous system numbers, and the length of an Internet address prefix.
OLD-CISCO-INTERFACES-MIB.my	Defines interfaces for the Cisco enterprise.
OLD-CISCO-SYS-MIB.my	Provides a means of gathering basic information for an IOS node.
OLD-CISCO-SYSTEM-MIB.my	Old Cisco System MIB file.
OLD-CISCO-TCP-MIB.my	Old Local TCP MIB file.
OLD-CISCO-TS-MIB.my	Cisco Terminal Service MIB file.
OSPF-MIB.my	Describes the OSPF version 2 protocol.
OSPF-TRAP-MIB.my	Describes the traps for the OSPF version 2 protocol.
PerfHist-TC-MIB.my	Provides Textual Conventions to be used by systems supporting 15 minute-based performance history counts.
RFC1213-MIB.my	Provides basic management information on the ITP (RFC 1213).
RFC1315-MIB.my	Frame Relay MIB file.

MIB	Description
RFC-1406-MIB.my	Contains DS1 (T1/E1) line information.
RMON2-MIB.my	Module for managing remote monitoring device implementations. This MIB module augments the original <i>RMON MIB</i> as specified in RFC 1757.
RMON-MIB.my	Remote network monitoring devices, often called monitors or probes, are instruments that exist for the purpose of managing a network. This MIB defines objects for managing remote network monitoring devices.
SNMP-FRAMEWORK-MIB.my	Defines the SNMP Management Architecture.
SNMP-TARGET-MIB.my	Defines the MIB objects that provide mechanisms to remotely configure the parameters used by an SNMP entity for the generation of SNMP messages.
SNMPv2-CONF.my	Defines SNMPv2 conformance.
SNMPv2-MIB.my	Defines SNMPv2 entities.
SNMPv2-SMI.my	Defines the Structure of Management Information for SNMPv2.
SNMPv2-TC.my	Defines textual conventions for SNMPv2.
TOKEN-RING-RMON-MIB.my	Contains Token Ring monitoring information.

CSG1 Specific MIBs

The MWTM queries these CSG1 specific MIBs, listed in alphabetical order:

MIB	Description
CISCO-CSG-MIB.my	Supports the Cisco Content Services Gateway (CSG) product. It includes five traps and four tables that enable querying CSG resource statistics.
CISCO-SLB-DFP-MIB.my	Reports the congestion status of the real server. This MIB generates notifications when the congestion state is detected on the real server.
CISCO-SLB-EXT-MIB.my	Supports Server Load Balancing Manager(s). This MIB extends the SLB management functionality in the CISCO-SLB-MIB. The Cisco Content Switching Module (CSM) product is the first SLB product to support this MIB.
CISCO-SLB-MIB.my	Supports Server Load Balancing Manager(s), such as the Cisco IOS SLB product. This MIB includes instrumentation for the manager-side implementation of the Dynamic Feedback Protocol (DFP). A DFP uses the DFP protocol to communicate with DFP agents in order to obtain information about Servers. This MIB includes the objects required for implementing the load balancer management side of the Server/Application State Protocol (SASP). The load balancer is responsible for registering Members with a SASP-Agent. A Member is an entity that is defined on the load balancer to service Internet traffic. The responsibility of the Agent is to monitor the Members, and report a recommended weight to the load balancer. The weight is then used in load balancing decisions.

CSG2 Specific MIBs

The MWTM queries these CSG2 specific MIBs, listed in alphabetical order:

MIB	Description
CISCO-CONTENT-SERVICES-MIB.my	Content Service is a capability to examine IP/TCP/UDP headers, payload and enable billing based on the content being provided.
CISCO-DIAMETER-BASE-PROTOCOL-MIB.my	Module for the entities implementing the Diameter Base Protocol.
CISCO-MOBILE-POLICY-CHARGING-CONTROL-MIB.my	Contains the Policy Control and Charging (PCC) configurations/statistics which are implemented on the Mobile PCC infrastructure.
CISCO-SLB-DFP-MIB.my	Reports the congestion status of the real server. This MIB generates notifications when the congestion state is detected on the real server.
CISCO-SLB-EXT-MIB.my	Supports Server Load Balancing Manager(s). This MIB extends the SLB management functionality in the CISCO-SLB-MIB. The Cisco Content Switching Module (CSM) product is the first SLB product to support this MIB.
CISCO-SLB-MIB.my	Supports Server Load Balancing Manager(s), such as the Cisco IOS SLB product. This MIB includes instrumentation for the manager-side implementation of the Dynamic Feedback Protocol (DFP). A DFP uses the DFP protocol to communicate with DFP agents in order to obtain information about Servers. This MIB includes the objects required for implementing the load balancer management side of the Server/Application State Protocol (SASP). The load balancer is responsible for registering Members with a SASP-Agent. A Member is an entity that is defined on the load balancer to service Internet traffic. The responsibility of the Agent is to monitor the Members, and report a recommended weight to the load balancer. The weight is then used in load balancing decisions.

GGSN Specific MIBs

The MWTM queries these GGSN specific MIBs, listed in alphabetical order:

MIB	Description
CISCO-DIAMETER-BASE-PROTOCOL-MIB.my	Module for the entities implementing the Diameter Base Protocol.
CISCO-GGSN-EXT-MIB.my	Extends extends the CISCO-GGSN-MIB and manages the Gateway GPRS Support Node (GGSN) devices. A GGSN device provides interworking with external packet-data network of a particular GPRS service provider. It provides a combination of IP routing and GPRS specific functionality to support mobile users.
CISCO-GGSN-MIB.my	Manages the Gateway GPRS Support Node (GGSN) devices.
CISCO-GGSN-QOS-MIB.my	Manages the Quality of Service parameters of GGSN in a GPRS system.

MIB	Description
CISCO-GGSN-SERVICE-AWARE-MIB.my	Manages the service-aware feature of Gateway GPRS Support Node (GGSN). This MIB is an enhancement of the <i>CISCO-GGSN-MIB</i> .
CISCO-GPRS-ACC-PT-MIB.my	Supports access point configuration for GGSN in a GPRS system. GPRS [1] is a GSM network providing mobile wireless data communication services.
CISCO-GPRS-CHARGING-MIB.my	Manages the charging related function on the GGSN node of a GPRS system.
CISCO-GTP-MIB.my	Manages the GPRS Tunnelling Protocol (GTP) on GGSN and SGSN.
CISCO-IP-LOCAL-POOL-MIB.my	Defines the configuration and monitoring capabilities relating to local IP pools.
CISCO-PSD-CLIENT-MIB.my	Manages the client side functionality of the Persistent Storage Device (PSD).
CISCO-SLB-DFP-MIB.my	Reports the congestion status of the real server. This MIB generates notifications when the congestion state is detected on the real server.
CISCO-SLB-EXT-MIB.my	Supports Server Load Balancing Manager(s). This MIB extends the SLB management functionality in the CISCO-SLB-MIB. The Cisco Content Switching Module (CSM) product is the first SLB product to support this MIB.
CISCO-SLB-MIB.my	Supports Server Load Balancing Manager(s), such as the Cisco IOS SLB product. This MIB includes instrumentation for the manager-side implementation of the Dynamic Feedback Protocol (DFP). A DFP uses the DFP protocol to communicate with DFP agents in order to obtain information about Servers. This MIB includes the objects required for implementing the load balancer management side of the Server/Application State Protocol (SASP). The load balancer is responsible for registering Members with a SASP-Agent. A Member is an entity that is defined on the load balancer to service Internet traffic. The responsibility of the Agent is to monitor the Members, and report a recommended weight to the load balancer. The weight is then used in load balancing decisions.

HA Specific MIBs

The MWTM queries these HA specific MIBs, listed in alphabetical order:

MIB	Description
CISCO-IP-LOCAL-POOL-MIB.my	Defines the configuration and monitoring capabilities relating to local IP pools.
CISCO-MOBILE-IP-MIB.my	Extension to the <i>IETF MIB</i> module defined in RFC-2006 for managing Mobile IP implementations.
CISCO-SLB-DFP-MIB.my	Reports the congestion status of the real server. This MIB generates notifications when the congestion state is detected on the real server.
CISCO-SLB-EXT-MIB.my	Supports Server Load Balancing Manager(s). This MIB extends the SLB management functionality in the CISCO-SLB-MIB. The Cisco Content Switching Module (CSM) product is the first SLB product to support this MIB.

MIB	Description
CISCO-SLB-MIB.my	Supports Server Load Balancing Manager(s), such as the Cisco IOS SLB product. This MIB includes instrumentation for the manager-side implementation of the Dynamic Feedback Protocol (DFP). A DFP uses the DFP protocol to communicate with DFP agents in order to obtain information about Servers. This MIB includes the objects required for implementing the load balancer management side of the Server/Application State Protocol (SASP). The load balancer is responsible for registering Members with a SASP-Agent. A Member is an entity that is defined on the load balancer to service Internet traffic. The responsibility of the Agent is to monitor the Members, and report a recommended weight to the load balancer. The weight is then used in load balancing decisions.
RFC2006-MIB.my	Module for the Mobile IP.

ITP Specific MIBs

The MWTM queries these ITP specific MIBs, listed in alphabetical order:

MIB	Description
CISCO-BITS-CLOCK-MIB.my	Provides information on Building Integrated Timing Supply (BITS) clocking sources and operation modes. The MWTM can generate notifications to indicate when clocking sources change roles or become unavailable.
CISCO-IETF-SCTP-EXT-MIB.my	Extension to <i>CISCO-IETF-SCTP-MIB</i> that provides additional information to manage SCTP (RFC 2960).
CISCO-IETF-SCTP-MIB.my	The MIB module for managing SCTP protocol (RFC 2960).
CISCO-ITP-ACL-MIB.my	Manages access lists that control messages sent over SS7 networks using ITP.
CISCO-ITP-ACT-MIB.my	Provides information specified in ITU Q752 Monitoring and Measurements for SS7 networks. This information is used to manage messages sent over SS7 networks using ITP. This MIB has been deprecated and replaced by the <i>CISCO-ITP-GACT-MIB</i> .
CISCO-ITP-DSMR-MIB.my	Provides information about Distributed Short Message Routing for Short Message Service Center. This MIB will provide information used to control and measure SS7 messages signalling units in a SS7 Network. Message Signalling Units are routed based on information found in the SCCP, TCAP, MAP, and MAP-user layers.
CISCO-ITP-DSMR-SMPP-MIB.my	Provides information about Distributed Short Message Routing delivery using Short Message Peer-to-Peer protocol.
CISCO-ITP-DSMR-UCP-MIB.my	Provides information about Distributed Short Message Routing delivery using Universal Computer Protocol.
CISCO-ITP-GACT-MIB.my	Provides information specified in ITU Q752 Monitoring and Measurements for SS7 networks. This information is used to manage messages sent over SS7 networks using ITP. This MIB replaces the <i>CISCO-ITP-ACT-MIB</i> and supports multiple instances of a signaling point in the same configuration.
CISCO-ITP-GRT-MIB.my	Manages information required to route messages sent over SS7 networks using ITP. This MIB replaces the <i>CISCO-ITP-RT-MIB</i> and supports multiple instances of a signaling point in the same configuration.

MIB	Description
CISCO-ITP-GSCCP-MIB.my	Provides information specified in ITU Q752 Monitoring and Measurements for SS7 networks. This information is used to manage Signaling Connection Control Part (SCCP) messages sent over SS7 networks using ITP. This MIB replaces the <i>CISCO-ITP-SCCP-MIB</i> and supports multiple instances of a signaling point in the same configuration.
CISCO-ITP-GSP-MIB.my	Manages signaling points and associated messages sent over SS7 networks using ITP. This MIB replaces the <i>CISCO-ITP-SP-MIB</i> and supports multiple instances of a signaling point in the same configuration.
CISCO-ITP-GSP2-MIB.my	Provides information specified in ITU Q752 Monitoring and Measurements for SS7 networks. This information is used to manage messages sent over SS7 networks using ITP. This MIB replaces the <i>CISCO-ITP-SP2-MIB</i> and supports multiple instances of a signaling point in the same configuration.
CISCO-ITP-MLR-MIB.my	Provides information about Multi-Layer Routing (MLR). This information is used to control and measure SS7 message signaling units (MSUs) in an SS7 network.
CISCO-ITP-MONITOR-MIB.my	Provides information about monitoring SS7 links. This information is used to manage the state of software used to collect all packets transported and received over an SS7 link.
CISCO-ITP-MSU-RATES-MIB.my	Provides information used to manage the number of MTP3 MSUs transmitted and received per processor. Many of the higher level protocols require several MSUs per transaction. Traffic capacity planning is based on MSUs, not transactions. This MIB provides information to determine current traffic.
CISCO-ITP-RT-MIB.my	Manages the route tables used to control messages sent over SS7 networks using ITP. This MIB has been deprecated and replaced by the <i>CISCO-ITP-GRT-MIB</i> .
CISCO-ITP-SCCP-MIB.my	Manages SCCP messages sent over SS7 networks using ITP, and provides information specified in ITU Q752 Monitoring and Measurements for SS7 networks. This MIB has been deprecated and replaced by the <i>CISCO-ITP-GSCCP-MIB</i> .
CISCO-ITP-SP-MIB.my	Manages signaling points and associated linksets and links in SS7 networks using ITP.
CISCO-ITP-SP2-MIB.my	Provides Quality of Service (QoS) information related to the configuration of an SS7 network. Also provides MTP3 event history information. This MIB has been deprecated and replaced by the <i>CISCO-ITP-GSP2-MIB</i> .
CISCO-ITP-TC-MIB.my	Defines textual conventions used to manage nodes related to the SS7 network. The ITU documents that describe this technology are the ITU Q series, including: - ITU Q.700: Introduction to CCITT SS7 - ITU Q.701: Functional description of the message transfer part (MTP) of SS7.
CISCO-ITP-XUA-MIB.my	Manages MTP3 User Adaptation (M3UA) and SCCP User Adaptation (SUA) for ITP.
NetNumber-MIB.my	Common Object Definitions for the NetNumber enterprise MIBs.
TITAN-MIB.my	Module for the NetNumber TITAN.

IPRAN Specific MIBs

The MWTM queries these IPRAN specific MIBs, listed in alphabetical order:

MIB	Description
CERENT-454-MIB.mib	Defines the alarms and events for the Cisco ONS 15454. The MWTM processes each ONS event by creating an MWTM event with a severity that maps to the severity of the ONS event.
CERENT-ENVMON-MIB.mib	Provides environmental status information.
CERENT-FC-MIB.mib	Defines the managed objects for performance monitoring of supported Fibre Channel interfaces.
CERENT-GLOBAL-REGISTRY.mib	Provides the global registrations for all other CERENT MIB modules.
CERENT-MSDWDM-MIB.mib	Defines the managed objects for physical layer related interface configurations and objects for the protocol specific error counters for dense wavelength division multiplexing (DWDM) optical switches.
CERENT-OPTICAL-MONITOR-MIB.mib	Defines objects to monitor optical characteristics and set corresponding thresholds on the optical interfaces in a network element.
CERENT-TC.mib	Provides the global Textual Conventions for all other CERENT MIB modules.
CISCO-IETF-PW-MIB.my	Contains managed object definitions for Pseudo Wire operation.
CISCO-IETF-PW-TC-MIB.my	Used to identify the VC (together with some other fields) in the signaling session. Zero if the VC is set-up manually.
CISCO-IP-RAN-BACKHAUL-MIB.my	Provides information on the optimization of IP-RAN traffic between the cell site and the aggregation node site. It handles both GSM Abis and UMTS Iub traffic.
MPLS-VPN-MIB.my	Contains managed object definitions for the Multiprotocol Label Switching (MPLS)/Border Gateway Protocol (BGP) Virtual Private Networks (VPNs).

PCRF Specific MIBs

The MWTM queries the following MIB:

MIB	Description
FusionWorks.mib	Describes the system management information available from the SNMP agent in the FusionWorks SystemManager.

PDNGW Specific MIBs

The MWTM queries these specific MIBs, listed in alphabetical order:

MIB	Description
CISCO-DIAMETER-BASE-PROTOCOL-MIB.my	The MIB module for entities implementing the Diameter Base Protocol. Initial Cisco'ized version of the IETF draft draft-zorn-dime-diameter-base-protocol-mib-00.txt.
CISCO-EPC-GATEWAY-MIB	Manages the EPC 3GPP release 8 features and configuration for PGW and SGW.
CISCO-EPC-GATEWAY-QOS-MIB.my	Manages the Quality of Service parameters of PGW and SGW in LTE SAE Architecture.
CISCO-GGSN-EXT-MIB.my	Manages the Gateway GPRS Support Node (GGSN) devices. This MIB is an extension of the CISCO-GGSN-MIB.
CISCO-GGSN-MIB.my	Manages the Gateway GPRS Support Node (GGSN) devices.
CISCO-GGSN-SERVICE-AWARE-MIB.my	Manages the service-aware feature of Gateway GPRS Support Node (GGSN).
CISCO-GPRS-ACC-PT-MIB.my	Supports access point configuration for GGSN in a GPRS system.
CISCO-GPRS-CHARGING-MIB.my	Manages the charging related function on the GGSN node of a GPRS system.
CISCO-GTP-MIB.my	Manages the GPRS Tunnelling Protocol (GTP) on GGSN and SGSN.
CISCO-GTPV2-MIB.my	Manages the GTP path with GTPv2 statistics and system based aggregated statistics for the GGSN evolved gateway.
CISCO-IP-LOCAL-POOL-MIB.my	Defines the configuration and monitoring capabilities relating to local IP pools.
CISCO-SLB-DFP-MIB.my	Reports the congestion status of the real server. This MIB generates notifications when the congestion state is detected on the real server.
CISCO-SLB-EXT-MIB.my	Supports Server Load Balancing Manager(s). This MIB extends the SLB management functionality in the CISCO-SLB-MIB. The Cisco Content Switching Module (CSM) product is the first SLB product to support this MIB.
CISCO-SLB-MIB.my	Supports Server Load Balancing Manager(s), such as the Cisco IOS SLB product. This MIB includes instrumentation for the manager-side implementation of the Dynamic Feedback Protocol (DFP). A DFP uses the DFP protocol to communicate with DFP agents in order to obtain information about Servers. This MIB includes the objects required for implementing the load balancer management side of the Server/Application State Protocol (SASP). The load balancer is responsible for registering Members with a SASP-Agent. A Member is an entity that is defined on the load balancer to service Internet traffic. The responsibility of the Agent is to monitor the Members, and report a recommended weight to the load balancer. The weight is then used in load balancing decisions.

PDSN Specific MIBs

The MWTM queries these specific MIBs, listed in alphabetical order:

MIB	Description
CISCO-CDMA-AHDLC-MIB.my	Provides details concerning Asynchronous High-level Data Link Control (AHDLC) engine state, performance, configuration and notification.
CISCO-CDMA-PDSN-EXT-MIB.my	Supports the Code Division Multiple Access (CDMA) Packet Data Serving Node (PDSN) feature. This MIB is an extension to the CISCO-CDMA-PDSN-MIB. A CDMA2000 network supports wireless data communication through 3G CDMA radio access technology and 3G A10/A11 interface. PDSN acts as a foreign agent that establishes, maintains, and terminates the link layer to a mobile station.
CISCO-CDMA-PDSN-MIB.my	Supports the CDMA PDSN (Packet Data Serving Node) feature. A CDMA2000 network supports wireless data communication through 3G CDMA radio access technology and 3G A10/A11 interface. PDSN acts as a foreign agent that establishes, maintains, and terminates the link layer to a mobile station.
CISCO-MOBILE-IP-MIB.my	Extension to the <i>IETF MIB</i> module defined in RFC-2006 for managing Mobile IP implementations.
CISCO-RADIUS-MIB.my	Radius Configuration MIB. This MIB module is for monitoring and configuring authentication and logging services using RADIUS (Remote Authentication Dial In User Service) related objects.
CISCO-VPDN-MGMT-EXT-MIB.my	VPDN management MIB extension Module. This MIB is a supplement to CISCO-VPDN-MGMT-MIB.my.
CISCO-VPDN-MGMT-MIB.my	MIB module for VPDN.
RFC2006-MIB.my	Module for the Mobile IP.

SGW Specific MIBs

The MWTM queries these specific MIBs, listed in alphabetical order:

MIB	Description
CISCO-DIAMETER-BASE-PROTOCOL-MIB.my	The MIB module for entities implementing the Diameter Base Protocol. Initial Cisco'ized version of the IETF draft draft-zorn-dime-diameter-base-protocol-mib-00.txt.
CISCO-EPC-GATEWAY-MIB	Manages the EPC 3GPP release 8 features and configuration for PGW and SGW.
CISCO-EPC-GATEWAY-QOS-MIB.my	Manages the Quality of Service parameters of PGW and SGW in LTE SAE Architecture.
CISCO-GGSN-EXT-MIB.my	Manages the Gateway GPRS Support Node (GGSN) devices. This MIB is an extension of the CISCO-GGSN-MIB.
CISCO-GGSN-MIB.my	Manages the Gateway GPRS Support Node (GGSN) devices.
CISCO-GGSN-SERVICE-AWARE-MIB.my	Manages the service-aware feature of Gateway GPRS Support Node (GGSN).
CISCO-GPRS-ACC-PT-MIB.my	Supports access point configuration for GGSN in a GPRS system.

MIB	Description
CISCO-GPRS-CHARGING-MIB.my	Manages the charging related function on the GGSN node of a GPRS system.
CISCO-GTP-MIB.my	Manages the GPRS Tunnelling Protocol (GTP) on GGSN and SGSN.
CISCO-GTPV2-MIB.my	Manages the GTP path with GTPv2 statistics and system based aggregated statistics for the GGSN evolved gateway.
CISCO-IP-LOCAL-POOL-MIB.my	Defines the configuration and monitoring capabilities relating to local IP pools.
CISCO-SLB-DFP-MIB.my	Reports the congestion status of the real server. This MIB generates notifications when the congestion state is detected on the real server.
CISCO-SLB-EXT-MIB.my	Supports Server Load Balancing Manager(s). This MIB extends the SLB management functionality in the CISCO-SLB-MIB. The Cisco Content Switching Module (CSM) product is the first SLB product to support this MIB.
CISCO-SLB-MIB.my	Supports Server Load Balancing Manager(s), such as the Cisco IOS SLB product. This MIB includes instrumentation for the manager-side implementation of the Dynamic Feedback Protocol (DFP). A DFP uses the DFP protocol to communicate with DFP agents in order to obtain information about Servers. This MIB includes the objects required for implementing the load balancer management side of the Server/Application State Protocol (SASP). The load balancer is responsible for registering Members with a SASP-Agent. A Member is an entity that is defined on the load balancer to service Internet traffic. The responsibility of the Agent is to monitor the Members, and report a recommended weight to the load balancer. The weight is then used in load balancing decisions.

You can obtain the latest versions of these MIBs from one of these locations:

- The zip file *mibs.zip*, located at the top of the MWTM DVD Image, contains these MIBs.
- You can download these MIBs from the Cisco website:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

Trap Reference

This appendix contains:

- [General Traps, page G-1](#)
- [ITP Specific Traps, page G-7](#)
- [IPRAN Specific Traps, page G-11](#)
- [mSEF Specific Traps, page G-14](#)

General Traps

The Cisco Mobile Wireless Transport Manager (MWTM) supports these general traps/notifications, which apply to:

- IP Transfer Point (ITP) networks
- IP Radio Access Network (IPRAN) networks
- Mobile Services Exchange Framework (mSEF) networks, which include:
 - Content Services Gateway (CSG)
 - Gateway GPRS Support Node (GGSN)
 - Home Agent (HA)
 - Broadband Wireless Gateway (BWG)
 - Packet Data Serving Node (PDSN)

Note

Some traps are platform/IOS specific.

Trap Name	Description
authenticationFailure	An authenticationFailure trap signifies that the IP address is accessing this node using the wrong community string.
caemTemperatureNotification	A caemTemperatureNotification is sent if the over temperature condition is detected in the managed system. This is a replacement for the ciscoEnvMonTemperatureNotification trap because the information ciscoEnvMonTemperatureStatusValue required by the trap is not available in the managed system.

Trap Name	Description
caemVoltageNotification	A caemVoltageNotification is sent if the over voltage condition is detected and ciscoEnvMonVoltageState is not set to notPresent in the managed system. This is a replacement for the ciscoEnvMonVoltageNotification trap because the information ciscoEnvMonVoltageStatusValue required by the trap is not available in the managed system.
casServerStateChange	An AAA server state change notification is generated whenever an AAA server connection state changes value. An AAA server state can be either <i>up</i> or <i>dead</i> .
ccmCLIRunningConfigChanged	Indicates that the running configuration of the managed system has changed from the CLI. If the managed system supports a separate configuration mode (where the configuration commands are entered under a configuration session which affects the running configuration of the system), then this notification is sent when the configuration mode is exited. During this configuration session there can be one or more running configuration changes.
cefcFRUInserted	Indicates that a FRU was inserted. The varbind for this notification indicates the entPhysicalIndex of the inserted FRU, and the entPhysicalIndex of the FRU container.
cefcFRURemoved	Indicates that a FRU was removed. The varbind for this notification indicates the entPhysicalIndex of the removed FRU, and the entPhysicalIndex of the FRU container.
cefcModuleStatusChange	This notification is generated when the value of cefcModuleOperStatus changes. It can be utilized by an NMS to update the status of the module it is managing.
cefcPowerStatusChange	Indicates that the power status of a FRU has changed. The varbind for this notification indicates the entPhysicalIndex of the FRU, and the new operational-status of the FRU.
cempMemBufferNotify	Whenever the cempMemBufferPeak object is updated in the buffer pool, a cempMemBufferNotify notification is sent. The sending of these notifications can be enabled/disabled via the cempMemBufferNotifyEnabled object.
cEventMgrPolicyEvent	This notification is configured to be sent from within an Embedded Event Manager policy after an Embedded Event Manager event ceemHistoryEventType has occurred. If one or more of the objects ceemHistoryPolicyIntData1, ceemHistoryPolicyIntData2, and ceemHistoryPolicyStrData are not instantiated, the varbind for the object(s) not instantiated contains the value noSuchInstance.
cEventMgrServerEvent	This notification is sent by the Embedded Event Manager server after it has run a policy associated with the event ceemHistoryEventType that was received.
chassisAlarmOff	Signifies that the agent entity has detected that the chassisTempAlarm, chassisMinorAlarm, or chassisMajorAlarm object in this MIB has transitioned to the off(1) state. The generation of this trap can be controlled by the sysEnableChassisTraps object in this MIB
chassisAlarmOn	Signifies that the agent entity has detected that the chassisTempAlarm, chassisMinorAlarm, or chassisMajorAlarm object in this MIB has transitioned to the on(2) state. The generation of this trap can be controlled by the sysEnableChassisTraps object in this MIB.
chSrpStateChange	A chSrpStateChange notification is sent when a chSrpGrpStandbyState transitions to either active or standby state, or leaves active or standby state. There will be only one notification issued when the state change is from standby to active and vice versa.

Trap Name	Description
cisco_authenticationFailure	Signifies that the IP address is accessing this node using the wrong community string.
cisco_coldStart	Signifies that the SNMPv2 entity, acting in an agent role, is reinitializing itself such that its configuration might be altered.
cisco_linkDown	Signifies a failure in one of the communication links represented in the node's configuration has occurred.
cisco_linkUp	Signifies that one of the communication links represented in a node's configuration has come up.
cisco_warmStart	Signifies that the SNMPv2 entity, acting in an agent role, is reinitializing itself such that its configuration is unaltered.
ciscoConfigManEvent	Notification of a configuration management event as recorded in ccmHistoryEventTable.
ciscoEnvMonFanNotification	A ciscoEnvMonFanNotification trap is generated if any one of the fans in the fan array (where extant) fails. Since such a notification is usually generated before the shutdown state is reached, it can convey more data and has a better chance of being sent than does the ciscoEnvMonShutdownNotification.
ciscoEnvMonFanStatusChangeNotif	<i>A ciscoEnvMonFanStatusChangeNotif is sent if there is change in the state of a device being monitored by ciscoEnvMonFanState.</i>
ciscoEnvMonRedundantSupply Notification	A ciscoEnvMonRedundantSupplyNotification trap is generated if the redundant power supply (where extant) fails. Since such a notification is usually generated before the shutdown state is reached, it can convey more data and has a better chance of being sent than does the ciscoEnvMonShutdownNotification.
ciscoEnvMonShutdownNotification	A ciscoEnvMonShutdownNotification trap is generated if the environmental monitor detects a testpoint reaching a critical state and is about to initiate a shutdown. This notification contains no objects so that it can be encoded and sent in the shortest amount of time possible. Even so, management applications should not rely on receiving such a notification as it might not be sent before the shutdown completes.
ciscoEnvMonSuppStatusChangeNotif	A ciscoEnvMonSupplyStatChangeNotif is sent if there is change in the state of a device being monitored by ciscoEnvMonSupplyState.
ciscoEnvMonTemperatureNotification	A ciscoEnvMonTemperatureNotification trap is generated if the temperature measured at a given testpoint is outside the normal range for the testpoint (that is, is at the warning, critical, or shutdown stage). Since such a Notification is usually generated before the shutdown state is reached, it can convey more data and has a better chance of being sent than does the ciscoEnvMonShutdownNotification.
ciscoEnvMonTempStatusChangeNotif	A ciscoEnvMonTempStatusChangeNotif is sent if there is change in the state of a device being monitored by ciscoEnvMonTemperatureState.
ciscoEnvMonVoltageNotification	A ciscoEnvMonVoltageNotification trap is generated if the voltage measured at a given testpoint is outside the normal range for the testpoint (that is, is at the warning, critical, or shutdown stage). Since such a notification is usually generated before the shutdown state is reached, it can convey more data and has a better chance of being sent than does the ciscoEnvMonShutdownNotification.
ciscoEnvMonVoltStatusChangeNotif	A ciscoEnvMonVoltStatusChangeNotif is sent if there is change in the state of a device being monitored by ciscoEnvMonVoltageState.

Trap Name	Description
ciscoFlashCopyCompletionTrap	A ciscoFlashCopyCompletionTrap is sent at the completion of a flash copy operation if such a trap was requested when the operation was initiated.
ciscoFlashDeviceChangeTrap	A ciscoFlashDeviceChangeTrap is sent whenever a removable Flash device is inserted or removed.
ciscoFlashDeviceInsertedNotif	A ciscoFlashDeviceInsertedNotif notification is sent whenever a removable Flash device is inserted.
ciscoFlashDeviceInsertedNotifRev1	A ciscoFlashDeviceInsertedNotif notification is sent whenever a removable Flash device is inserted ciscoFlashDeviceInsertedNotifRev1 deprecates ciscoFlashDeviceInsertedNotif since it uses ciscoFlashDeviceName as a varbind which is deprecated.
ciscoFlashDeviceRemovedNotif	A ciscoFlashDeviceRemovedNotif notification is sent whenever a removable Flash device is removed.
ciscoFlashDeviceRemovedNotifRev1	A ciscoFlashDeviceRemovedNotif notification is sent whenever a removable Flash device is removed. ciscoFlashDeviceRemovedNotifRev1 deprecates ciscoFlashDeviceRemovedNotif since it uses ciscoFlashDeviceName as a varbind, which is deprecated.
ciscoFlashMiscOpCompletionTrap	A ciscoFlashMiscOpCompletionTrap is sent at the completion of a miscellaneous flash operation (enumerated in ciscoFlashMiscOpCommand) if such a trap was requested when the operation was initiated.
ciscoFlashPartitioningCompletionTrap	A ciscoFlashPartitioningCompletionTrap is sent at the completion of a partitioning operation if such a trap was requested when the operation was initiated.
ciscoICsuDsuT1LoopStatus Notification	Indicates a change in T1 Loop Status.
ciscoRFProgressionNotif	A ciscoRFProgressionNotif trap is sent by the active redundant unit whenever its RF state changes or the RF state of the peer unit changes.
ciscoRFSwactNotif	A ciscoRFSwactNotif trap is sent by the newly active redundant unit whenever a switch of activity (SWACT) occurs. In the case where a SWACT event might be indistinguishable from a reset event, a network management station should use this notification to differentiate the activity.
clogMessageGenerated	When a syslog message is generated by the node a clogMessageGenerated notification is sent. The sending of these notifications can be enabled/disabled via the clogNotificationsEnabled object.
coldStart	Signifies that the SNMPv2 entity, acting in an agent role, is reinitializing itself such that its configuration might be altered.
cpmCPUFallingThreshold	A cpmCPUFallingThreshold trap is generated when CPU is below the falling threshold.
cpmCPURisingThreshold	A cpmCPURisingThreshold trap is generated when CPU is above the rising threshold.

Trap Name	Description
entConfigChange	An entConfigChange notification is generated when the value of entLastChangeTime changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls. An agent should not generate more than one entConfigChange notification-event in a given time interval (five seconds is the suggested default). A notification-event is the transmission of a single trap or inform PDU to a list of notification destinations. If additional configuration changes occur in the throttling period, then notification-events for these changes should be suppressed by the agent until the current throttling period expires. At the end of a throttling period, one notification-event should be generated if any configuration changes occurred since the start of the throttling period. In such a case, another throttling period is started right away. An NMS should periodically check the value of entLastChangeTime to detect any missed entConfigChange notification-events (for example, because of throttling or transmission loss).
entSensorThresholdNotification	The sensor value crossed the threshold listed in entSensorThresholdTable. This notification is generated once each time the sensor value crosses the threshold.
fallingAlarm	The SNMP trap that is generated when an alarm entry crosses its falling threshold and generates an event that is configured for sending SNMP traps.
linkDown	Signifies a failure in one of the communication links represented in the node's configuration has occurred.
linkUp	Signifies that one of the communication links represented in a node's configuration has come up.
moduleDown	Signifies that the agent entity has detected that the moduleStatus object in this MIB has transitioned out of the ok(2) state for one of its modules. The generation of this trap can be controlled by the sysEnableModuleTraps object in this MIB
moduleUp	Signifies that the agent entity has detected that the moduleStatus object in this MIB has transitioned to the ok(2) state for one of its modules. The generation of this trap can be controlled by the sysEnableModuleTraps object in this MIB.
risingAlarm	The SNMP trap that is generated when an alarm entry crosses its rising threshold and generates an event that is configured for sending SNMP traps.
rttMonConnectionChangeNotification	This notification is only valid when the RttMonRttType is <i>echo</i> or <i>pathEcho</i> . An rttMonConnectionChangeNotification indicates that a connection to a target (not to a hop along the path to a target) has either failed on establishment or been lost and when reestablished. This causes rttMonCtrlOperConnectionLostOccurred to change value. If history is not being collected, the instance values for the rttMonHistoryCollectionAddress object will not be valid. When RttMonRttType is not <i>echo</i> or <i>pathEcho</i> , the rttMonHistoryCollectionAddress object will be null.
rttMonLpdDiscoveryNotification	Indicates that the LSP Path Discovery to the target PE has failed, and it also indicates the clearing of such condition. This causes rttMonLpdGrpStatsLPDFailOccurred to change value. When the rttMonLpdGrpStatsLPDFailOccurred is <i>false</i> , the instance value for rttMonLpdGrpStatsLPDFailCause is not valid.
rttMonLpdGrpStatusNotification	Indicates that the LPD Group status rttMonLpdGrpStatsGroupStatus has changed, indicating some connectivity change to the target PE. This causes rttMonLpdGrpStatsGroupStatus to change value.

Trap Name	Description
rttMonNotification	Indicates the occurrence of a threshold violation, and it indicates the previous violation has subsided for a subsequent operation. When the RttMonRttType is <i>pathEcho</i> , this notification will only be sent when the threshold violation occurs during an operation to the target and not to a hop along the path to the target. This also applies to the subsiding of a threshold condition. If history is not being collected, the instance values for the rttMonHistoryCollectionAddress object will not be valid. When RttMonRttType is not <i>echo</i> or <i>pathEcho</i> , the rttMonHistoryCollectionAddress object will be null. rttMonReactVar defines the type of reaction that is configured for the probe (for example, jitterAvg). Trap definitions for the probes are in the rttMonReactTable, and each probe can have more than one trap definition for various types (for example, jitterAvg). So the object rttMonReactVar indicates the type (for example, packetLossSD) for which threshold violation traps have been generated. The object rttMonEchoAdminLSPSelector will be valid only for the probes based on <i>mplsLspPingAppl</i> RttMonProtocol. For all other probes it will be null.
rttMonThresholdNotification	Indicates the occurrence of a threshold violation for a RTT operation, and it indicates the previous violation has subsided for a subsequent RTT operation. This causes rttMonCtrlOperOverThresholdOccurred to change value. When the RttMonRttType is <i>pathEcho</i> , this notification will only be sent when the threshold violation occurs during an operation to the target and not to a hop along the path to the target. This also applies to the subsiding of a threshold condition. If history is not being collected, the instance values for the rttMonHistoryCollectionAddress object will not be valid. When RttMonRttType is not <i>echo</i> or <i>pathEcho</i> the rttMonHistoryCollectionAddress object will be null.
rttMonTimeoutNotification	Indicates the occurrence of a timeout for a RTT operation, and it indicates the clearing of such a condition by a subsequent RTT operation. This causes rttMonCtrlOperTimeoutOccurred to change value. When the RttMonRttType is <i>pathEcho</i> , this notification will only be sent when the timeout occurs during an operation to the target and not to a hop along the path to the target. This also applies to the clearing of the timeout. If history is not being collected, the instance values for the rttMonHistoryCollectionAddress object will not be valid. When RttMonRttType is not <i>echo</i> or <i>pathEcho</i> , the rttMonHistoryCollectionAddress object will be null.
rttMonVerifyErrorNotification	Indicates the occurrence of a data corruption in an RTT operation.
tcpConnectionClose	A tty trap signifies that a TCP connection, previously established with the sending protocol entity for the purposes of a tty session, has been terminated.
warmStart	Signifies that the SNMPv2 entity, acting in an agent role, is reinitializing itself such that its configuration is unaltered.

ITP Specific Traps

The MWTM supports these ITP specific traps, listed in alphabetical order:

Trap Name	Description
ciscoBitsClockFreerun	This trap is for Building Integrated Timing Supply (BITS) clocking sources. It is used to generate notifications to indicate when clocking source is unavailable. The internal clock will operate in <i>freerun</i> mode using appropriate local oscillator. Therefore, it does not provide synchronous clocking. This is the least stable of all operating modes.
ciscoBitsClockHoldover	This trap is for Building Integrated Timing Supply (BITS) clocking sources. It is used to generate notifications to indicate when clocking source is unavailable and the internal clock will operate in holdover mode. The network clock module has stored information about the incoming clock signal, it can faithfully reproduce the lost signal while in holdover mode until a switchover to another clock source occurs.
ciscoBitsClockSource	This trap is for Building Integrated Timing Supply (BITS) clocking sources. It is used to generate notifications to indicate when clocking sources change.
ciscoGftDestStateChangeRev1	A ciscoGftDestStateChangeRev1 trap is generated whenever one or more destination changes states within the cgrtDestNotifWindowTimeRev1 duration. Latest state information at the end of cgrtDestNotifWindowTimeRev1 is provided. It may be necessary to suppress the sending of notification when a large number destinations change state, due the failure of some common resource. The number of notifications can be controlled by specifying values for cgrtDestNotifWindowTimeRev1 and cgrtDestNotifMaxPerWindowRev1 objects. When the number of destination state changes exceed the specified value, the notification will provide a count of notifications that got suppressed for the remainder of the window.
ciscoGrtDestStateChange	A ciscoGrtDestStateChange trap is generated whenever one or more destination changes states. This notification contains a list of destination state changes in the cgrtDestNotifChanges object. State changes are accumulated until the cgrtDestNotifChanges is full or the maximum delay time is reached. The delay time is specified by the cgrtDestNotifDelayTime object. It might be necessary to suppress the sending of notification when a large number destinations change state, due to the failure of some common resource. The number of notifications can be controlled by specifying values for cgrtDestNotifWindowTime and cgrtDestNotifMaxPerWindow objects. When the number of destination state changes exceed the specified value the last notification will indicate that notifications are suppressed for the remainder of the window. This notification deprecates ciscoGrtDestStateChange.

Trap Name	Description
ciscoGrtMgmtStateChange	A ciscoGrtMgmtStateChange trap is generated whenever one or more management routes change state. This notification contains a list of management route state changes in the cgrtMgmtNotifChanges object. State changes are accumulated until the cgrtMgmtNotifChanges is full or the maximum delay time is reached. The delay time is specified by the cgrtMgmtNotifDelayTime object. It might be necessary to suppress the sending of notification when a large number of routes change state, due to the failure of some common resource. The number of notifications can be controlled by specifying values for cgrtMgmtNotifWindowTime and cgrtMgmtNotifMaxPerWindow objects. When the number of route state changes exceed the specified value the last notification will indicate that notifications are suppressed for the remainder of the window.
ciscoGrtMgmtStateChangeRev1	This notification is generated whenever one or more management routes change states within the cgrtMgmtNotifWindowTimeRev1 duration. Latest state information at the end of cgrtMgmtNotifWindowTimeRev1 is provided. It may be necessary to suppress the sending of notification when a large number of routes change state, due the failure of some common resource. The number of notifications can be controlled by specifying values for cgrtMgmtNotifWindowTimeRev1 and cgrtMgmtNotifMaxPerWindowRev1 objects. When the number of route state changes exceed the specified value, the last notification will provide a count of notifications that got suppressed for the remainder of the window. This notification deprecates ciscoGrtMgmtStateChange.
ciscoGrtNoRouteMSUDiscards	This notification is generated whenever one or more MSU discards happen due to route data error for a specific signalling point instance in the configured cgrtNoRouteMSUsNotifWindowTime. For cases when there is a non-zero number of MSUs discarded, this notification will be sent at the end of the cgrtNoRouteMSUsNotifWindowTime interval, with cgrtIntervalNoRouteMSUs indicating the total count of MSUs discarded for that specific signalling point instance during the entire cgrtNoRouteMSUsNotifWindowTime interval Q752/5.5.
ciscoGrtRouteTableLoad	A ciscoGrtRouteTableLoad trap is generated whenever a load operation is started or completed. Route table configurations can be loaded by CLI requests. In addition, route tables can loaded using configuration statements. This allows route tables to be reloaded whenever a node restarts.
ciscoGsccpGttErrors	This notification is generated whenever any global title error is encountered in last interval specified by the cgsccpGttErrorPeriod and the cgsccpInstErrorIndicator will be set to true. The notification will also be generated when errors have abated. The notification is generated after the number of recovery intervals as specified by the cgsccpGttErrorRecoveryCount object has passed without any global title errors.
ciscoGsccpGttLoadTable	A ciscoGsccpGttLoadTable trap is generated whenever a load operation is started or completes.
ciscoGsccpGttMapStateChange	A ciscoGsccpGttMapStateChange is generated when a mated application subsystem changes to a new state. The value of cgsccpGttMapSsStatus indicates the new state for the subsystem.
ciscoGspCongestionChange	A ciscoGspCongestionChange trap is generated when a link changes to a new congestion level as specified by the cgspLinkCongestionState object.

Trap Name	Description
ciscoGspIsolation	This notification indicates the instance specified by cgspInstDisplayName and cgspInstDescription has become isolated. All linkset used to connect MTP3 node (instance) are unavailable. Isolation is ended when any linkset supported by this instance reaches the active state.
ciscoGspLinkRcvdUtilChange	A ciscoGspLinkRcvdUtilChange trap is generated when the cgspLinkUtilStateRcvd changes states.
ciscoGspLinkSentUtilChange	A ciscoGspLinkSentUtilChange trap is generated when the cgspLinkUtilStateSent changes states.
ciscoGspLinksetStateChange	A ciscoGspLinksetStateChange trap is generated when a linkset changes to a new state. The value of cItpSpLinksetState indicates the new state.
ciscoGspLinkStateChange	A ciscoGspLinkStateChange trap is generated when a link changes to a new state. The value of cItpSpLinkState indicates the new state.
ciscoGspUPUReceived	The notification is generated when a UPU MSU is received from a remote signalling point, for a specific instance and user part for the first time in the configured cgspUPUNotifWindowTime. For cases when there is a non-zero number of UPU MSUs received, this notification will be sent at the end of the cgspUPUNotifWindowTime interval, with cgspIntervalUPUs indicating the total count of UPU MSUs received for that specific instance and user part during the entire cgspUPUNotifWindowTime interval Q752/5.6.
ciscoGspUPUTransmitted	The notification is generated when a UPU MSU is transmitted to a remote signalling point, for a specific instance and user part for the first time in the configured cgspUPUNotifWindowTime. For cases when there is a non-zero number of UPU MSUs received, this notification will be sent at the end of the cgspUPUNotifWindowTime interval, with cgspIntervalUPUs indicating the total count of UPU MSUs transmitted for that specific instance and user part during the entire cgspUPUNotifWindowTime interval Q752/5.7.
ciscoItpMsuRateState	This notification is generated once for the interval specified by the cimrMsuRateNotifyInterval object when the cimrMsuTrafficRateState object has the following state transitions: • acceptable to warning • acceptable to overloaded • warning to overloaded At the end of the interval specified by the cimrMsuRateNotifyInterval object another notification will be generated if the current state is different from state sent in last notification even if the state transition is not one of the previously mentioned transitions. When the cimrMsuRateNotifyInterval is set to zero all state changes will generate notifications.
ciscoItpXuaAspAssocStateChange	The ciscoItpXuaAspAssocStateChange trap is generated when the association used to connect to the ASP changes state.
ciscoItpXuaAspCongChange	A ciscoItpXuaAspCongChange trap is generated when an ASP changes to a congestion level as specified by the cItpXuaAspCongLevel object.
ciscoItpXuaAspDestAddrStateChange	The ciscoItpXuaAspDestAddrStateChange trap is generated when a destination IP address used by ASP changes state.

Trap Name	Description
ciscoItpXuaAspStateChange	A ciscoItpXuaAspStateChange trap is generated when an ASP changes to a new state. The value of cItpXuaAspAsState indicates the new state for the ASP that is serving the AS specified by cItpXuaAsDisplayName.
ciscoItpXuaAsStateChange	A ciscoItpXuaAsStateChange trap is generated when an AS changes to a new state. The value of cItpXuaAsState indicates the new state for the AS.
ciscoItpXuaSgmAssocStateChange	The ciscoItpXuaSgmAssocStateChange trap is generated when the association used to connect to the SG Mate changes state.
ciscoItpXuaSgmCongChange	A ciscoItpXuaSgmCongChange trap is generated when an SGMP changes to a congestion level as specified by the cItpXuaSgmCongLevel object.
ciscoItpXuaSgmDestAddrStateChange	The ciscoItpXuaSgmDestAddrStateChange trap is generated when a destination IP address used by SG Mate changes state.
ciscoItpXuaSgmStateChange	A ciscoItpXuaSgmStateChange trap is generated when an SG Mate changes to a new state. The value of cItpXuaSgmState indicates the new state for the SG Mate.
ciscoMlrTableLoad	A ciscoMlrTableLoad trap is generated when a load operation is started or completed. Route table configurations can be loaded by CLI requests. In addition, route tables can be loaded using configuration statements, which allows route tables to be reloaded whenever a node restarts.
cItpRouteStateChange	A cItpRouteStateChange trap is generated whenever one or more route destination status changes states and includes the count of all route state changes. This notification contains a list of route state changes in the cItpRtNotifInfoStateChanges object. State changes are accumulated until the cItpRtNotifInfoStateChanges is full or the maximum delay time is reached. The delay time is specified by the cItpRtChangeNotifDelayTime object. It might be necessary to suppress the sending of notification when a large number route change state, due the failure of some common resource. The number of notifications can be controlled by specifying values for cItpRtChangeNotifWindowTime and cItpRtChangeNotifMaxPerWindow objects. When the number of route state changes exceed the specified value the last notification will indicate that notifications are suppressed for the remainder of the window.
cItpSccpGttMapStateChange	A cItpSccpGttMapStateChange trap is generated when a mated application subsystem changes to a new state. The value of cItpSccpGttMapSsStatus indicates the new state for the subsystem.
cItpSpCongestionChange	A cItpSpCongestionChange trap is generated when a link changes to a new congestion level as specified by the cItpLinkCongestionState object.
cItpSpLinkRcvdUtilChange	A cItpSpLinkRcvdUtilChange trap is generated when the cItpSpLinkUtilStateRcvd changes states.
cItpSpLinkSentUtilChange	A cItpSpLinkSentUtilChange trap is generated when the cItpSpLinkUtilStateSent changes states.
cItpSpLinksetStateChange	A cItpSpLinksetStateChange trap is generated when a linkset changes to a new state. The value of cItpSpLinksetState indicates the new state.
cItpSpLinkStateChange	A cItpSpLinkStateChange trap is generated when a link changes to a new state. The value of cItpSpLinkState indicates the new state.
cSctpExtDestAddressStateChange	A cSctpExtDestAddressStateChange trap is generated when the state transition of cSctpAssocRemAddressStatus has occurred.

IPRAN Specific Traps

- [OSPF Specific Traps, page G-11](#)
- [RAN-O Specific Traps, page G-12](#)
- [PWE3 Specific Traps, page G-13](#)

OSPF Specific Traps

The MWTM supports these OSPF specific traps, listed in alphabetical order:

Trap Name	Description
ospfInterfaceAuthenticationFailure	An ospfInterfaceAuthenticationFailure trap signifies that a packet has been received on a non-virtual interface from a router whose authentication key or authentication type conflicts with this router's authentication key or authentication type.
ospfInterfaceConfigError	An ospfInterfaceConfigError trap signifies that a packet has been received on a non-virtual interface from a router whose configuration parameters conflict with this router's configuration parameters. Note that the event optionMismatch should cause a trap only if it prevents an adjacency from forming.
ospfBadPacketReceived	An ospfInterfaceBadPacketReceived trap signifies that an OSPF packet has been received on a non-virtual interface that cannot be parsed.
ospfInterfaceState	An ospfInterfaceState trap signifies that there has been a change in the state of a non-virtual OSPF interface. This trap should be generated when the interface state regresses (e.g., goes from Dr to Down) or progresses to a terminal state (i.e., Point-to-Point, DR Other, Dr, or Backup).
ospfLinkStateDbOverflow	An ospfLinkStateDbOverflow trap signifies that the number of LSAs in the router's link state database has exceeded ninety percent of ospfExtLsdbLimit.
ospfMaxAgeLsa	An ospfMaxAgeLsa trap signifies that one of the LSAs in the router's link state database has aged to MaxAge.
ospfNeighborRestartHelperState	An ospfNeighborRestartHelperStatus trap signifies that there has been a change in the graceful restart helper state for the neighbor. This trap should be generated when the neighbor restart helper status transitions for a neighbor.
ospfNeighborState	An ospfNeighborState trap signifies that there has been a change in the state of a non-virtual OSPF neighbor. This trap should be generated when the neighbor state regresses (e.g., goes from Attempt or Full to 1-Way or Down) or progresses to a terminal state (e.g., 2-Way or Full). When an neighbor transitions from or to Full on non-broadcast multi-access and broadcast networks, the trap should be generated by the designated router. A designated router transitioned to Down will be noted by ospfIfStateChange.
ospfNssaTranslatorState	An ospfNssaTranslatorStatus trap indicates that there has been a change in the router's ability to translate OSPF type-7 LSAs into OSPF type-5 LSAs. This trap should be generated when the translator status transitions from or to any defined status on a per-area basis.

Trap Name	Description
ospfOriginateLsa	An ospfOriginateLsa trap signifies that a new LSA has been originated by this router. This trap should not be invoked for simple refreshes of LSAs (which happens every 30 minutes), but instead will only be invoked when an LSA is (re)originated due to a topology change. Additionally, this trap does not include LSAs that are being flushed because they have reached MaxAge.
ospfRestartState	An ospfRestartStatus trap signifies that there has been a change in the graceful restart state for the router. This trap should be generated when the router restart status changes.
ospfRetransmit	An ospfRetransmit trap signifies that an OSPF packet has been retransmitted on a non-virtual interface. All packets that may be retransmitted are associated with an LSDB entry. The LS type, LS ID, and Router ID are used to identify the LSDB entry.
ospfVirtualInterfaceAuthenticationFailure	An ospfVirtualInterfaceAuthenticationFailure trap signifies that a packet has been received on a virtual interface from a router whose authentication key or authentication type conflicts with this router's authentication key or authentication type.
ospfVirtualInterfaceConfigError	An ospfVirtualInterfaceConfigError trap signifies that a packet has been received on a virtual interface from a router whose configuration parameters conflict with this router's configuration parameters. Note that the event optionMismatch should cause a trap only if it prevents an adjacency from forming.
ospfVirtualBadPacketReceived	An ospfVirtualInterfaceBadPacketReceived trap signifies that an OSPF packet has been received on a virtual interface that cannot be parsed.
ospfVirtualInterfaceState	This ospfVirtualInterfaceState trap should be generated when the interface state regresses (e.g., goes from Point-to-Point to Down) or progresses to a terminal state (i.e., Point-to-Point).
ospfVirtualRetransmit	An ospVirtualRetransmit trap signifies that an OSPF packet has been retransmitted on a non-virtual interface. All packets that may be retransmitted are associated with an LSDB entry. The LS type, LS ID, and Router ID are used to identify the LSDB entry.
ospfVirtualNeighborRestartHelperState	An ospfVirtualNeighborRestartHelperStatus trap signifies that there has been a change in the graceful restart helper state for the virtual neighbor. This trap should be generated when the virtual neighbor restart helper status transitions for a virtual neighbor.
ospfVirtualNeighborState	An ospfVirtualNeighborState trap signifies that there has been a change in the state of an OSPF virtual neighbor. This trap should be generated when the neighbor state regresses (e.g., goes from Attempt or Full to 1-Way or Down) or progresses to a terminal state (e.g., Full).

RAN-O Specific Traps

The MWTM supports these RAN-O specific traps, listed in alphabetical order:

Trap Name	Description
cerent454Events	The CERENT-454-MIB defines the events and alarms that are raised by the ONS 15454. The MWTM processes each ONS event by creating an MWTM event with a severity that maps to the severity of the ONS event.
ciscoIpRanBackHaulGsmAlarm	A ciscoIpRanBackHaulGsmAlarm trap is generated when the values of these objects change: connect state, local alarm state, remote alarm state, and redundancy state.
ciscoIpRanBackHaulUmtsAlarm	A ciscoIpRanBackHaulUmtsAlarm trap is generated when the values of these objects change: connect state, received local state, received remote state, transmit local state, transmit remote state, and redundancy state.

PWE3 Specific Traps

The MWTM supports these PWE3 specific traps, listed in alphabetical order:

Trap Name	Description
cpwVcDown	The cpwVcDown trap is generated when the cpwVcOperStatus object for one or more contiguous entries in cpwVcTable are about to enter the down(2) state from some other state. The included values of cpwVcOperStatus MUST all be set equal to this down(2) state. The two instances of cpwVcOperStatus in this notification indicate the range of indexes that are affected. Note that all the indexes of the two ends of the range can be derived from the instance identifiers of these two objects. For cases where a contiguous range of cross-connects have transitioned into the down(2) state at roughly the same time, the device SHOULD issue a single notification for each range of contiguous indexes in an effort to minimize the emission of a large number of notifications. If a notification has to be issued for just a single cross-connect entry, then the instance identifier (and values) of the two cpwVcOperStatus objects MUST be identical.
cpwVcUp	This notification is generated when the cpwVcOperStatus object for one or more contiguous entries in cpwVcTable are about to enter the up(1) state from some other state. The included values of cpwVcOperStatus MUST both be set equal to this new state (that is, up(1)). The two instances of cpwVcOperStatus in this notification indicate the range of indexes that are affected. Note that all the indexes of the two ends of the range can be derived from the instance identifiers of these two objects. For cases where a contiguous range of cross-connects have transitioned into the up(1) state at roughly the same time, the device SHOULD issue a single notification for each range of contiguous indexes in an effort to minimize the emission of a large number of notifications. If a notification has to be issued for just a single cross-connect entry, then the instance identifier (and values) of the two cpwVcOperStatus objects MUST be the identical.

mSEF Specific Traps

The MWTM supports these mSEF specific traps, listed in alphabetical order:

- [Generic mSEF Traps, page G-14](#)
- [CSG1 Traps, page G-15](#)
- [CSG2 Traps, page G-16](#)
- [GGSN Traps, page G-18](#)
- [BWG Traps, page G-20](#)
- [HA Traps, page G-21](#)
- [PDNGW Traps, page G-21](#)
- [SGW Traps, page G-24](#)
- [PCRF Traps, page G-27](#)
- [PDSN Traps, page G-27](#)

Generic mSEF Traps

The MWTM supports these generic mSEF traps, listed in alphabetical order:

Trap Name	Description
ciscoSlbRealState Change	The notification generated when a real server changes to a new state. The value of slbRealServerState indicates the new state.
ciscoSlbVirtualState Change	The notification generated when a virtual server changes to a new state. The value of slbVirtualServerState indicates the new state.
cslbxFtStateChange	The notification generated when the Fault Tolerance process changes to a new state. The value of cslbxFtState indicates the new state.

CSG1 Traps

The MWTM supports these CSG1 traps, listed in alphabetical order:

Trap Name	Description
ciscoCsgAgentLostRecordEvent	This notification is issued when <code>csgAgentNotifsEnabled</code> is set to true, and the CSG must discard accounting records that should be sent to the billing mediation agent. Initially, <code>csgAgentLostRecords</code> is set to 0. When a record is discarded, <code>csgAgentLostRecords</code> is incremented, a period timer is started, and this notification is issued. The NMS and the agent save this value. The agent continues to increment <code>csgAgentLostRecords</code> each time a record is lost. When the period timer expires, the agent compares the current value of <code>csgAgentLostRecords</code> with the previous (saved) value. If the values are equal this notification is issued again, signalling to the NMS that the condition has been cleared. Otherwise, the timer is restarted to monitor the next period. When a record is lost and no period timer is active, this notification is issued and the above procedure is repeated.
ciscoCsgAgentStateChange	This notification is issued when <code>csgAgentNotifsEnabled</code> is set to 'true', and the billing mediation agent changes state. There is one exception: No notification is issued for state changes involving <i>echowait</i> because this would cause an excessive number of notifications.
ciscoCsgQuotaMgrLostRecordEvent	This notification is issued when <code>csgQuotaNotifsEnabled</code> is set to true, and the CSG must discard request records to be sent to the quota manager. The processing is the same as described in the description for <code>ciscoCsgAgentLostRecordEvent</code>.
ciscoCsgQuotaMgrStateChange	This notification is issued when <code>csgQuotaNotifsEnabled</code> is set to true, and the quota manager changes state. There is one exception: No notification is issued for state changes involving <i>echowait</i> because this would cause an excessive number of notifications.
ciscoCsgUserDbStateChange	This notification is issued when <code>csgDatabaseNotifsEnabled</code> is set to true, and the user database changes state.

CSG2 Traps

The MWTM supports these CSG2 traps, listed in alphabetical order:

Trap Name	Description
ciscoContentServicesBMALostRecordEvent	This notification is issued when <code>ccsBMALostRecords</code> is set to true, and accounting records, which should be sent to the billing mediation agent, must be discarded. Initially, <code>ccsBMALostRecords</code> is set to 0. When a record is discarded, <code>ccsBMALostRecords</code> is incremented, a period timer is started, and this notification is issued. The NMS and the agent save this value. The agent continues to increment <code>ccsBMALostRecords</code> each time a record is lost. When the period timer expires, the agent compares the current value of <code>ccsBMALostRecords</code> with the previous (saved) value. If the values are equal this notification is issued again, signalling to the NMS that the condition has been cleared. Otherwise, the timer is restarted to monitor the next period. When a record is lost and no period timer is active, this notification is issued and the above procedure is repeated.
ciscoContentServicesBMALostRecordEvent	This notification is issued when <code>ccsBMALostRecords</code> is set to true, and the billing mediation agent changes state. There is one exception: No notification is issued for state changes involving <i>echowait</i> because this would cause an excessive number of notifications.
ciscoContentServicesQuotaMgrLostRecordEvent	This notification is issued when <code>ccsQuotaMgrLostRecords</code> is set to true, and request records to be sent to the quota manager must be discarded. The processing is the same as described in the description for <code>ccsQuotaMgrLostRecordEvent</code>.
ciscoContentServicesQuotaMgrStateChange	This notification is issued when <code>ccsQuotaMgrStateChangeNotifEnabled</code> is set to true, and the quota manager changes state. There is one exception: No notification is issued for state changes involving <i>echowait</i> because this would cause an excessive number of notifications.
ciscoContentServicesUserDbStateChange	This notification is issued when <code>ccsUserDbStateChangeNotifEnabled</code> is set to true, and the user database changes state.
ciscoContentServicesUserThresholdExceeded	This notification is issued when <code>ccsUserThresholdExceededNotifEnabled</code> is set to 'true', and when actual users limit exceeds threshold which is set by <code>ccsgsUserThreshold</code>.
ciscoDiaBaseProtPeerConnectionDownNotif	An <code>ciscoDiaBaseProtPeerConnectionDownNotif</code> notification is sent when both the following conditions are true: - The value of <code>ciscoDiaBaseProtEnablePeerConnectionDownNotif</code> is true(1) <code>cdpbPeerStatsState</code> changes to closed(1). It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtPeerConnectionUpNotif	A <code>ciscoDiaBaseProtPeerConnectionUpNotif</code> notification is sent when both the following conditions are true: - The value of <code>ciscoDiaBaseProtEnablePeerConnectionUpNotif</code> is true(1) - The value of <code>cdpbPeerStatsState</code> changes to either rOpen(6) or iOpen(7). It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.

Trap Name	Description
ciscoDiaBaseProtPermanentFailureNotif	A ciscoDiaBaseProtPermanentFailureNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePermanentFailureNotif is true(1) - The value of cdbpPeerStatsPermanentFailures changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtProtocolErrorNotif	A ciscoDiaBaseProtProtocolErrorNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnableProtocolErrorNotif is true(1) - The value of cdbpPeerStatsProtocolErrors changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtTransientFailureNotif	An ciscoDiaBaseProtTransientFailureNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnableTransientFailureNotif is true(1) - The value of cdbpPeerStatsTransientFailures changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoMobilePolicyChargingControlPreloadError	This notification is issued when cmpccPreloadErrorNotifEnabled is set to true, and an error occurs in preloading as indicated by the value of cmpccppsErrorState: - Indicates PCRF has sent an incomplete Policy object. - Indicates a mandatory AVP in the preloading message is missing. - Indicates PCEF is not able to install/modify/remove a policy preloading object. - Indicates PCRF sent the preloading objects in wrong order. - Indicates PCRF tried to preload an object, which is already statically configured in PCEF. 255 indicates no error has occurred so far.
cmpccPreloadRollbackFailed	This notification is generated when rollback of an object fails, which indicates that object could be out of sync. The cmpccppsRollbackFailedReason present in the varbind list, indicates the reason that triggers the sending for 'cmpccPreloadRollbackFailed' notification. The entPhysicalName identifies the entity that implements the PCEF functionality of the Gx interface.
cPsdClientDiskFullNotif	This notification is generated when the PSD server's disk become full. If the disk of a writable PSD server becomes full, the client shall not be able to write any CDR into the server. It shall then behave as a retrieve only PSD server.
cPsdClientDownNotif	A notification of this type is generated when the PSD server goes DOWN. If the PSD client was in write/retrieving state, then that operation shall be stopped.
cPsdClientUpNotif	A notification of this type is generated when the PSD server comes UP. A GTP' (GTP enhanced for charging) path will be created fulfilling all the specific requirements of the PSD interface.

GGSN Traps

The MWTM supports these GGSN traps, listed in alphabetical order:

Trap Name	Description
cGgsnAccessPointNameNotif	This notification indicates the occurrence of an APN (Access Point Name) related alarm.
cGgsnGlobalErrorNotif	This notification indicates the occurrence of a GGSN related alarm.
cGgsnInServiceNotif	A notification of this type is generated when GGSN is placed in inService mode, which is specified by cGgsnServiceModeStatus.
cGgsnMaintenanceNotif	A notification of this type is generated when GGSN is placed in maintenance mode which is specified by cGgsnServiceModeStatus.
cGgsnMemThresholdClearedNotif	A notification of this type is generated when GGSN retains the memory and falls below threshold value specified by cGgsnMemoryThreshold.
cGgsnMemThresholdReachedNotif	A notification of this type is generated when GGSN reaches the memory threshold value specified by cGgsnMemoryThreshold.
cGgsnNotification	This notification indicates the occurrence of a GGSN related alarm. If and when additional useful information is available for specific types of alarms, then that information may be appended to the end of the notification in additional varbinds.
cGgsnPacketDataProtocolNotif	This notification indicates the occurrence of a user related alarm.
cGgsnPdfStateDownNotif	A notification of this type is generated when PDF (Policy Decision Function) connection goes DOWN.
cGgsnPdfStateUpNotif	A notification of this type is generated when PDF connection comes UP.
cGgsnSACsgStateDownNotif	This notification is generated when CSG state goes down.
cGgsnSACsgStateUpNotif	This notification is generated when CSG state goes up.
cGgsnSADccaAuthRejectedNotif	This notification is generated when credit-control server failed in authorization of end user. The PDP (Packet Data Protocol) context is deleted and category is blacklisted.
cGgsnSADccaCreditLimReachedNotif	This notification is generated when the credit limit is reached. The credit-control server denies the service request since the end user's account could not cover the requested service. Client shall behave exactly as with cGgsnSADccaEndUsrServDeniedNotif.
cGgsnSADccaEndUsrServDeniedNotif	This notification is generated when the credit-control server denies the service request due to service restrictions. On reception of this notification on category level, the CLCI-C shall discard all future user traffic for that category on that PDP context and not attempt to ask for more quotas during the same PDP context.
cGgsnSADccaRatingFailed	This notification is generated when the credit-control server cannot rate the service request, due to insufficient rating input, incorrect AVP combination or due to an AVP (Attribute Value Pair) or an AVP value that is not recognized or supported in the rating.
cGgsnSADccaUserUnknownNotif	This notification is generated when the specified end user is unknown in the credit-control server. Such permanent failures cause the client to enter the Idle state. The client shall reject or terminate the PDP context depending on whether the result code was received in a CCA (Credit Control Answer) (Initial) or CCA (Update).
cgprsAccPtCfgNotif	A notification of this type is generated when an entry is generated in the cgprsAccPtCfgNotifHistTable and cgprsAccPtCfgNotifEnable is set to true.

Trap Name	Description
cgprsAccPtInServiceNotif	A notification of this type is generated when APN is placed in <i>in-service</i> mode which is specified by cgprsAccPtOperationMode.
cgprsAccPtMaintenanceNotif	A notification of this type is generated when APN is placed in maintenance mode which is specified by cgprsAccPtOperationMode.
cgprsAccPtSecDestViolNotif	A notification of this type is generated when security violation as specified by cgprsAccPtVerifyUpStrTpduDstAddr occurs on an APN.
cgprsAccPtSecSrcViolNotif	A notification of this type is generated when security violation as specified by cgprsAccPtVerifyUpStrTpduSrcAddr occurs on an APN.
cgprsCgAlarmNotif	A cgprsCgAlarmNotif signifies that a GPRS (General Packet Radio Service) related alarm is detected in the managed system. This alarm is sent after an entry has been added to cgprsCgAlarmHistTable.
cgprsCgGatewaySwitchoverNotif	A notification of this type is generated when the charging gateway is switched, the new charging gateway is identified by cgprsCgActiveChgGatewayAddress and the old charging gateway is identified by cgprsCgOldChgGatewayAddress. The switchover will happen according to the value set in cgprsCgGroupSwitchOverTime and the selection of the new CG will be according to the value set in cgprsCgSwitchOverPriority.
cgprsCgInServiceModeNotif	A notification of this type is generated when the GGSN charging function is in normal mode. This can be identified by cgprsCgServiceMode object.
cgprsCgInServiceModeNotif	A notification of this type is generated when the GGSN charging function is in normal mode. This can be identified by cgprsCgServiceMode object.
cgprsCgMaintenanceModeNotif	A notification of this type is generated when the GGSN charging function is in maintenance mode. This can be identified by cgprsCgServiceMode object.
cGtpPathFailedNotification	This notification is sent when one of this GSN's peers failed to respond to the GTP (GPRS Tunneling Protocol) Echo Request message for the waiting interval.
cilpPercentAddrUsedHiNotif	A notification indicating that the percentage of used addresses of an IP local pool is equal to or exceeds the threshold value indicated by cIpLocalPoolPercentAddrThldHi.
cilpPercentAddrUsedLoNotif	A notification indicating that the percentage of used addresses of an IP local pool went below the threshold value indicated by cIpLocalPoolPercentAddrThldLo.
ciscoDiaBaseProtPeerConnectionDownNotif	A ciscoDiaBaseProtPeerConnectionDownNotif notification is sent when both the following conditions are true: The value of ciscoDiaBaseProtEnablePeerConnectionDownNotif is true(1) cdbpPeerStatsState changes to closed(1). It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtPeerConnectionUpNotif	A ciscoDiaBaseProtPeerConnectionUpNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePeerConnectionUpNotif is true(1) - The value of cdbpPeerStatsState changes to either rOpen(6) or iOpen(7). It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtPermanentFailureNotif	A ciscoDiaBaseProtPermanentFailureNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePermanentFailureNotif is true(1) - The value of cdbpPeerStatsPermanentFailures changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.

Trap Name	Description
ciscoDiaBaseProtProtocolErrorNotif	A ciscoDiaBaseProtProtocolErrorNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnableProtocolErrorNotif is true(1) - The value of cdbpPeerStatsProtocolErrors changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtTransientFailureNotif	A ciscoDiaBaseProtTransientFailureNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnableTransientFailureNotif is true(1) - The value of cdbpPeerStatsTransientFailures changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoIpLocalPoolInUseAddrNotif	A notification indicating that number of used addresses of an IP local pool exceeded the threshold value indicated by cIpLocalPoolStatInUseAddrThldHi.
cPsdClientDiskFullNotif	A notification of this type is generated when the PSD (Persistent Storage Device) server's disk become full. If the disk of writable PSD server becomes full, the client shall not be able to write any CDR into the server. It shall then behave as a retrieve only PSD server.
cPsdClientDownNotif	A notification of this type is generated when the PSD server goes DOWN. If the PSD client was in write/retrieving state, then that operation shall be stopped.
cPsdClientUpNotif	A notification of this type is generated when the PSD server comes UP. A GTP' (GTP enhanced for charging) path will be created fulfilling all the specific requirements of the PSD interface.

BWG Traps

The MWTM supports these BWG traps, listed in alphabetical order:

Trap Name	Description
ciscoAgwMaxBaseStationExceededAbateNotif	A notification of this type is generated when the number of base stations goes below the percent of the maximum number of base stations as specified by the object cagwMaxBaseStationExceededNotifThreshold.
ciscoAgwMaxBaseStationExceededOnsetNotif	A notification of this type is generated when the number of base stations exceeded the percent of the maximum number of base stations as specified by the object cagwMaxBaseStationExceededNotifThreshold.
ciscoAgwMaxSubscribersExceededAbateNotif	A notification of this type is generated when the number of subscribers goes below the percent of the maximum number of base stations as specified by the object cagwMaxSubscribersExceededNotifThreshold.
ciscoAgwMaxSubscribersExceededOnsetNotif	A notification of this type is generated when the number of subscribers exceeded the percent of the maximum number of base stations as specified by the object cagwMaxSubscribersExceededNotifThreshold.
ciscoAgwServiceDownNotif	A notification of this type is generated when the BWG is not in service.
ciscoAgwServiceUpNotif	A notification of this type is generated when the BWG is in service.

HA Traps

The MWTM supports these HA traps, listed in alphabetical order:

Trap Name	Description
cilpPercentAddrUsedHi Notif	A notification indicating that the percentage of used addresses of an IP local pool is equal to or exceeds the threshold value indicated by cIpLocalPoolPercentAddrThldHi.
cilpPercentAddrUsedLo Notif	A notification indicating that the percentage of used addresses of an IP local pool went below the threshold value indicated by cIpLocalPoolPercentAddrThldLo.
ciscoIpLocalPoolInUseAddrNotif	A notification indicating that number of used addresses of an IP local pool exceeded the threshold value indicated by cIpLocalPoolStatInUseAddrThldHi.
cmiHaMaxBindingsNotif	The HA total registrations reached maximum bindings. This notification is sent when the registration request from MN is rejected by the HA.
cmiHaMnRegReqFailed	The Mobile Node (MN) registration request failed notification. This notification is sent when the registration request from MN is rejected by the HA.
crRadiusServerRetransHiNotif	This notification indicates that the current number of server retransmissions are greater than or equal to crRadiusServerRetransThldHi. Once sent, this notification will be disarmed until the number of retransmissions falls below the value configured through crRadiusServerRetransThldNorm.
crRadiusServerRetransNormNotif	This notification indicates that the current number of server retransmissions are less than or equal to crRadiusServerRetransThldNorm. Once sent, this notification will be disarmed until the number of retransmissions exceed the value configured through crRadiusServerRetransThldHi.
crRadiusServerRTTHiNotif	This notification indicates that the current server round-trip time is greater than or equal to crRadiusServerRTTThldHi. Once sent, this notification is disarmed until the round-trip time falls below the value configured through crRadiusServerRTTThldNorm.
crRadiusServerRTTNormNotif	This notification indicates that the current server round-trip time is less than or equal to crRadiusServerRTTThldNorm. Once sent, this notification is disarmed until the round-trip time exceeds the value configured through crRadiusServerRTTThldHi.
csIbcSIbDfpCongestionAbate	The server generates this notification when value of csIbcInstanceDfpValue object rises above the threshold indicated by the csIbcDfpCongestionAbateThreshold object.
csIbcSIbDfpCongestionOnset	The server generates this notification when value of csIbcInstanceDfpValue object drops below the threshold indicated by the csIbcDfpCongestionOnsetThreshold object.
mipAuthFailure	Indicates that the Mobile IP entity has an authentication failure when it validates the mobile Registration Request or Reply.

PDNGW Traps

Trap Name	Description
cGgsnAccessPointNameNotif	This notification indicates the occurrence of a APN related alarm.
cGgsnGlobalErrorNotif	This notification indicates the occurrence of a GGSN related alarm.
cGgsnInServiceNotif	A notification of this type is generated when GGSN is placed in inService mode which is specified by cGgsnServiceModeStatus.

Trap Name	Description
cGgsnMaintenanceNotif	A notification of this type is generated when GGSN is placed in maintenance mode which is specified by cGgsnServiceModeStatus.
cGgsnMemThresholdClearedNotif	A notification of this type is generated when GGSN retains the memory and falls below threshold value specified by cGgsnMemoryThreshold.
cGgsnMemThresholdReachedNotif	A notification of this type is generated when GGSN reaches the memory threshold value specified by cGgsnMemoryThreshold.
cGgsnPacketDataProtocolNotif	This notification indicates the occurrence of a User related alarm.
cGgsnSACsgStateDownNotif	This notification is generated when CSG state goes down.
cGgsnSACsgStateUpNotif	This notification is generated when CSG state goes up.
cGgsnSADccaAuthRejectedNotif	This notification is generated when credit-control server failed in authorization of end user. The PDP context is deleted and category is blacklisted.
cGgsnSADccaCreditLimReachedNotif	This notification is generated when the credit limit is reached. The credit-control server denies the service request since the end user's account could not cover the requested service. Client shall behave exactly as with cGgsnSADccaEndUsrServDeniedNotif.
cGgsnSADccaEndUsrServDeniedNotif	This notification is generated when the credit-control server denies the service request due to service restrictions. On reception of this notif on category level, the CLCI-C shall discard all future user traffic for that category on that PDP context and not attempt to ask for more quotas during the same PDP context.
cGgsnSADccaRatingFailed	This notification is generated when the credit-control server cannot rate the service request, due to insufficient rating input, incorrect AVP combination or due to an AVP or an AVP value that is not recognized or supported in the rating.
cGgsnSADccaUserUnknownNotif	This notification is generated when the specified end user is unknown in the credit-control server. Such permanent failures cause the client to enter the Idle state. The client shall reject or terminate the PDP context depending on whether the result code was received in a CCA (Initial) or CCA (Update).
cGtpPathFailedNotification	This notification is sent when one of this GSN's peers failed to respond to the GTP 'Echo Request' message for the waiting interval.
cegCongestionClearedNotif	The gateway sends this notification, when the gateway congestion level goes below cegLowCongestionThreshold value. This gives an indication that the gateway has recovered from congestion and it can accept all calls.
cegCongestionHighThresholdNotif	The gateway sends this notification when the gateway congestion level goes above cegHighCongestionThreshold value. This gives an indication that the gateway is running at high congestion and at this state it would reject all new calls.
cegCongestionLowThresholdNotif	The gateway sends this notification when the gateway congestion level goes above cegLowCongestionThreshold value. This gives an indication that the gateway has returned back from the high congestion mark to the low congestion mark and at this state it can accept only the high priority calls and those with a lower priority would be rejected.
cegqR8CacMaxPdpExceededNotif	This notification is sent when the number of pdps on the gateway has reached the user-configured maximum (or threshold).
cegqR8CacUpgBRateBearerRejNotif	This notification is sent when bearers are Rejected/Downgraded by CAC due to requesting for higher bit rate than user-configured maximum for a certain QCI class.

Trap Name	Description
cegqR8QciBWMaxReachedNotif	This notification is sent when the bandwidth allocated for a certain QCI class has been fully utilized and no further bearer can be admitted for this QCI class. The notification is sent when the bandwidth pool utilization reaches the value in the object cegqR8BWPoolQciAbsVal.
cgprsAccPtCfgNotif	A notification of this type is generated when an entry is generated in thecgprsAccPtCfgNotifHistTable and cgprsAccPtCfgNotifEnable is set to true.
cgprsAccPtInServiceNotif	A notification of this type is generated when APN is placed in in-service mode which is specified by cgprsAccPtOperationMode.
cgprsAccPtMaintenanceNotif	A notification of this type is generated when APN is placed in maintenance mode which is specified by cgprsAccPtOperationMode.
cgprsAccPtSecDestViolNotif	A notification of this type is generated when security violation as specified by cgprsAccPtVerifyUpStrTpduDstAddr occurs on an APN.
cgprsAccPtSecSrcViolNotif	A notification of this type is generated when security violation as specified by cgprsAccPtVerifyUpStrTpduSrcAddr occurs on an APN.
cgprsCgAlarmNotif	A cgprsCgAlarmNotif signifies that a GPRS related alarm is detected in the managed system. This alarm is sent after an entry has been added to cgprsCgAlarmHistTable.
cgprsCgGatewaySwitchoverNotif	A notification of this type is generated when the charging gateway is switched, the new charging gateway is identified by cgprsCgActiveChgGatewayAddress and the old charging gateway is identified by cgprsCgOldChgGatewayAddress. The switchover will happen according to the value set in cgprsCgGroupSwitchOverTime and the selection of the new CG will be according to the value set in cgprsCgSwitchOverPriority.
cgprsCgInServiceModeNotif	A notification of this type is generated when the GGSN charging function is in normal mode. This can be identified by cgprsCgServiceMode object.
cgprsCgMaintenanceModeNotif	A notification of this type is generated when the GGSN charging function is in maintenance mode. This can be identified by cgprsCgServiceMode object.
cilpPercentAddrUsedHiNotif	A notification indicating that the percentage of used addresses of an IP local pool is equal to or exceeds the threshold value indicated by cIpLocalPoolPercentAddrThldHi.
cilpPercentAddrUsedLoNotif	A notification indicating that the percentage of used addresses of an IP local pool went below the threshold value indicated by cIpLocalPoolPercentAddrThldLo.
ciscoDiaBaseProtPeerConnectionDownNotif	A ciscoDiaBaseProtPeerConnectionDownNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePeerConnectionDownNotif is true(1) - cdbpPeerStatsState changes to closed(1). It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtPeerConnectionUpNotif	A ciscoDiaBaseProtPeerConnectionUpNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePeerConnectionUpNotif is true(1) - The value of cdbpPeerStatsState changes to either rOpen(6) or iOpen(7). It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.

Trap Name	Description
ciscoDiaBaseProtPermanentFailureNotif	A ciscoDiaBaseProtPermanentFailureNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePermanentFailureNotif is true(1) - The value of cdbpPeerStatsPermanentFailures changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtProtocolErrorNotif	A ciscoDiaBaseProtProtocolErrorNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnableProtocolErrorNotif is true(1) - The value of cdbpPeerStatsProtocolErrors changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtTransientFailureNotif	A ciscoDiaBaseProtTransientFailureNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnableTransientFailureNotif is true(1) - The value of cdbpPeerStatsTransientFailures changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoIpLocalPoolInUseAddrNotif	A notification indicating that number of used addresses of an IP local pool exceeded the threshold value indicated by cIpLocalPoolStatInUseAddrThldHi.

SGW Traps

Trap Name	Description
cGgsnAccessPointNameNotif	This notification indicates the occurrence of a APN related alarm.
cGgsnGlobalErrorNotif	This notification indicates the occurrence of a GGSN related alarm.
cGgsnInServiceNotif	A notification of this type is generated when GGSN is placed in inService mode which is specified by cGgsnServiceModeStatus.
cGgsnMaintenanceNotif	A notification of this type is generated when GGSN is placed in maintenance mode which is specified by cGgsnServiceModeStatus.
cGgsnMemThresholdClearedNotif	A notification of this type is generated when GGSN retains the memory and falls below threshold value specified by cGgsnMemoryThreshold.
cGgsnMemThresholdReachedNotif	A notification of this type is generated when GGSN reaches the memory threshold value specified by cGgsnMemoryThreshold.
cGgsnPacketDataProtocolNotif	This notification indicates the occurrence of a User related alarm.
cGgsnSACsgStateDownNotif	This notification is generated when CSG state goes down.
cGgsnSACsgStateUpNotif	This notification is generated when CSG state goes up.
cGgsnSADccaAuthRejectedNotif	This notification is generated when credit-control server failed in authorization of end user. The PDP context is deleted and category is blacklisted.
cGgsnSADccaCreditLimReachedNotif	This notification is generated when the credit limit is reached. The credit-control server denies the service request since the end user's account could not cover the requested service. Client shall behave exactly as with cGgsnSADccaEndUsrServDeniedNotif.

Trap Name	Description
cGgsnSADccaEndUsrServDeniedNif	This notification is generated when the credit-control server denies the service request due to service restrictions. On reception of this notif on category level, the CLCI-C shall discard all future user traffic for that category on that PDP context and not attempt to ask for more quotas during the same PDP context.
cGgsnSADccaRatingFailed	This notification is generated when the credit-control server cannot rate the service request, due to insufficient rating input, incorrect AVP combination or due to an AVP or an AVP value that is not recognized or supported in the rating.
cGgsnSADccaUserUnknownNotif	This notification is generated when the specified end user is unknown in the credit-control server. Such permanent failures cause the client to enter the Idle state. The client shall reject or terminate the PDP context depending on whether the result code was received in a CCA (Initial) or CCA (Update).
cGtpPathFailedNotification	This notification is sent when one of this GSN's peers failed to respond to the GTP 'Echo Request' message for the waiting interval.
cegCongestionClearedNotif	The gateway sends this notification, when the gateway congestion level goes below cegLowCongestionThreshold value. This gives an indication that the gateway has recovered from congestion and it can accept all calls.
cegCongestionHighThresholdNotif	The gateway sends this notification when the gateway congestion level goes above cegHighCongestionThreshold value. This gives an indication that the gateway is running at high congestion and at this state it would reject all new calls.
cegCongestionLowThresholdNotif	The gateway sends this notification when the gateway congestion level goes above cegLowCongestionThreshold value. This gives an indication that the gateway has returned back from the high congestion mark to the low congestion mark and at this state it can accept only the high priority calls and those with a lower priority would be rejected.
cegqR8CacMaxPdpExceededNotif	This notification is sent when the number of pdps on the gateway has reached the user-configured maximum (or threshold).
cegqR8CacUpgBRateBearerRejNotif	This notification is sent when bearers are Rejected/Downgraded by CAC due to requesting for higher bit rate than user-configured maximum for a certain QCI class.
cegqR8QciBWMaxReachedNotif	This notification is sent when the bandwidth allocated for a certain QCI class has been fully utilized and no further bearer can be admitted for this QCI class. The notification is sent when the bandwidth pool utilization reaches the value in the object cegqR8BWPoolQciAbsVal.
cgprsAccPtCfgNotif	A notification of this type is generated when an entry is generated in thecgprsAccPtCfgNotifHistTable and cgprsAccPtCfgNotifEnable is set to true.
cgprsAccPtInServiceNotif	A notification of this type is generated when APN is placed in in-service mode which is specified by cgprsAccPtOperationMode.
cgprsAccPtMaintenanceNotif	A notification of this type is generated when APN is placed in maintenance mode which is specified by cgprsAccPtOperationMode.
cgprsAccPtSecDestViolNotif	A notification of this type is generated when security violation as specified by cgprsAccPtVerifyUpStrTpduDstAddr occurs on an APN.
cgprsAccPtSecSrcViolNotif	A notification of this type is generated when security violation as specified by cgprsAccPtVerifyUpStrTpduSrcAddr occurs on an APN.
cgprsCgAlarmNotif	A cgprsCgAlarmNotif signifies that a GPRS related alarm is detected in the managed system. This alarm is sent after an entry has been added to cgprsCgAlarmHistTable.

Trap Name	Description
cgprsCgGatewaySwitchoverNotif	A notification of this type is generated when the charging gateway is switched, the new charging gateway is identified by cgprsCgActiveChgGatewayAddress and the old charging gateway is identified by cgprsCgOldChgGatewayAddress. The switchover will happen according to the value set in cgprsCgGroupSwitchOverTime and the selection of the new CG will be according to the value set in cgprsCgSwitchOverPriority.
cgprsCgInServiceModeNotif	A notification of this type is generated when the GGSN charging function is in normal mode. This can be identified by cgprsCgServiceMode object.
cgprsCgMaintenanceModeNotif	A notification of this type is generated when the GGSN charging function is in maintenance mode. This can be identified by cgprsCgServiceMode object.
cilpPercentAddrUsedHiNotif	A notification indicating that the percentage of used addresses of an IP local pool is equal to or exceeds the threshold value indicated by cIpLocalPoolPercentAddrThldHi.
cilpPercentAddrUsedLoNotif	A notification indicating that the percentage of used addresses of an IP local pool went below the threshold value indicated by cIpLocalPoolPercentAddrThldLo.
ciscoDiaBaseProtPeerConnectionDownNotif	A ciscoDiaBaseProtPeerConnectionDownNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePeerConnectionDownNotif is true(1) - cdbpPeerStatsState changes to closed(1). It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtPeerConnectionUpNotif	A ciscoDiaBaseProtPeerConnectionUpNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePeerConnectionUpNotif is true(1) - The value of cdbpPeerStatsState changes to either rOpen(6) or iOpen(7). It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtPermanentFailureNotif	A ciscoDiaBaseProtPermanentFailureNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnablePermanentFailureNotif is true(1) - The value of cdbpPeerStatsPermanentFailures changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtProtocolErrorNotif	A ciscoDiaBaseProtProtocolErrorNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnableProtocolErrorNotif is true(1) - The value of cdbpPeerStatsProtocolErrors changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoDiaBaseProtTransientFailureNotif	A ciscoDiaBaseProtTransientFailureNotif notification is sent when both the following conditions are true: - The value of ciscoDiaBaseProtEnableTransientFailureNotif is true(1) - The value of cdbpPeerStatsTransientFailures changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.
ciscoIpLocalPoolInUseAddrNotif	A notification indicating that number of used addresses of an IP local pool exceeded the threshold value indicated by cIpLocalPoolStatInUseAddrThldHi.

PCRF Traps

Trap Name	Description
alarmNotification	This is a notification of an alarm generated within the FusionWorks system.
applicationStateNotification	This notification is issued when an application changes state.
componentStateNotification	This notification is issued when a component changes state.
groupStateNotification	This notification is issued when a component group changes state.
objectStateNotification	This notification is issued when an object changes state.

PDSN Traps

The MWTM supports these PDSN traps, listed in alphabetical order:

Trap Name	Description
cCdmaAhdIcEngineDownNotif	This notification indicates an AHDLC engine is 'down' due to some fault through the desired state of the engine is 'up'.
cCdmaClusterCtrlStatusChange	Cluster member PDSN detects controller PDSN status change.
cCdmaClusterCtrlStatusChange2	Cluster member PDSN detects controller PDSN status change.
cCdmaClusterMemberStatusChange	Cluster controller detects member PDSN status change.
cCdmaClusterMemberStatusChange2	Cluster controller detects member PDSN status change.
cCdmaClusterSessionHighReached	This notification indicates a cluster session high threshold has been reached by PDSN cluster controller.
cCdmaClusterSessionLowReached	This notification indicates a cluster session low threshold has been reached by PDSN cluster controller. Service affected level: Major/Warning
cCdmaPcfMaxAllowedNotif	This notification indicates PDSN has reached the maximum number of allowed PCF. In this state request from new PCF will be rejected. Service affected level: critical
cCdmaPdsnStatusChange	This notification indicates status change of PDSN.
cCdmaSessionFormatErrorNotif	This notification indicates PDSN received invalid arguments from PCF leading to session termination. The agent should not generate more than 1 trap of this type per second to minimize the level of management traffic on the network
cCdmaSessionHighReached	This notification indicates a session high threshold has been reached.
cCdmaSessionLowReached	This notification indicates a session low threshold has been reached.
cCdmaSessionLowReached2	This notification indicates a session low threshold has been reached.
cCdmaSessionMaxAllowedNotif	This notification indicates PDSN has reached the maximum number of sessions the system can handle. In this state new session request will be rejected. Service affected level: critical

Trap Name	Description
cCdmaSessionRegReqFailedNotif	This notification indicates a Registration Request received has failed which may be due to one of the following reasons: • Insufficient resource • Administrative prohibition • MN authentication failure • Registration id mismatch • Bad request • Unknown HA address • T bit not set or unsupported VID The agent should not generate more than 1 trap of same type per second to minimize the level of management traffic on the network. Service affected level: minor
ciscoCdmaExtLoadHighReachedNotif	A notification of this type is generated by PDSN to indicated that PDSN has exceeds the maximum load configured. Maximum load on PDSN is based on the any one of following parameters bandwidth, cputhreshold, procmemthreshold and iomemthreshold. The notification reason object indicates the parameter that has exceeds the configured load.
ciscoCdmaExtLoadLowReachedNotif	his notification indicates PDSN has reached the ninety percent of the configured load after generating the ccpCdmaExtLoadHighReachedNotif notification. In this state new session request will be accepted.
cvpdnNotifSession	Conveys an event regarding the L2X session with the indicated session ID and Xconnect VCID.

APPENDIX H

Configuring MWTM to Run with Various Networking Options

In addition to running on standard IP-connected networks, the Cisco Mobile Wireless Transport Manager (MWTM) has the flexibility to adapt to a variety of different networking environments, including Virtual Private Network (VPN), Network Address Translation (NAT), firewall, port-forwarding, and Secure Sockets Layer (SSL). The MWTM software can run in each of these environments individually, or in any combination of networking environments.

This appendix describes communication between the MWTM client and the MWTM server. [Figure H-1](#) includes the following:

- Two-way Remote Method Invocation (RMI) communication between a Java-based GUI client and Java-based server processes. The client can send requests to and receive responses from the server, and the server can send unsolicited notifications to the client. For example, if the server detects that an ITP's state has changed, it sends a notification to all MWTM clients to update their topology windows.
- One-way HTTP communication between a web browser and an MWTM-embedded web server, using the request/response model.

Figure H-1 MWTM Communication

Note

This appendix does not address communication between the MWTM server and the ITP, which uses the SNMP protocol for network management.

This appendix contains:

- [How Does RMI Work?](#), page H-2

- [VPN Communication, page H-3](#)
- [NAT Communication, page H-4](#)
- [Firewall Communication, page H-5](#)
- [Port-Forwarding Communication, page H-10](#)
- [Configuring MWTM to Work With a Dual-Interface Machine Connected to Separate Networks, page H-12](#)
- [Additional Network Configurations, page H-15](#)
- [Configuring MWTM with IOS Server Load Balancing, page H-16](#)

How Does RMI Work?

RMI is a Java-based technology that allows a Java application to communicate with another Java application (usually residing on different hosts) using remote method invocation. RMI marshals and unmarshals method parameters and return values using Java object serialization. It uses TCP connections as the default communication mechanism.

Understanding how RMI works can assist your understanding of the different scenarios presented in this appendix.

The types of RMI components that exist between the MWTM client and server communication are:

- **RMI name server**—Runs on the MWTM server
- **MWTM RMI services**—Runs on the MWTM server
- **MWTM client process**—Runs on the MWTM client

Figure H-2 RMI Components

When the MWTM server starts, the MWTM RMI services register with the RMI name server. These registered RMI services have one single published IP address.

When the MWTM client starts, it first establishes a TCP connection to the RMI name server and performs a service lookup. The RMI name server returns the published IP address for the MWTM RMI services. The MWTM client then establishes another TCP connection to the published IP address of the MWTM RMI services for client and server communication.

This appendix describes how to configure the MWTM software to adjust the communication process outlined previously, in order to make the MWTM work with NAT, Port-Forwarding, and/or a Dual-Interface MWTM server.

VPN Communication

Note

VPN configuration is transparent to the user; no manual configuration is needed.

MWTM client/server communication can run transparently through a VPN tunnel, which is a secure IP layer, without any user intervention. You can use VPN to connect to a corporate network, then start the MWTM client to connect through the VPN tunnel to an MWTM server in the corporate network.

When the client host establishes a VPN tunnel, the operating system (or system library) sees this as another virtual IP interface. The VPN tunnel does not affect HTTP communication between the web browser and server, it only affects RMI communication between the MWTM client and server processes.

For HTTP communication, the virtual IP address is transparent to the upper layer. The operating system automatically chooses the correct IP address to send out the request packet. For RMI communication, the MWTM client must register with the MWTM server using the correct IP address, so that the server can invoke RMI callbacks and send unsolicited notifications to the client.

The MWTM software solves this problem by automatically detecting the local IP interface so that the MWTM server can send unsolicited notification to the correct IP address.

Figure H-3 shows a sample VPN network with these characteristics:

- The MWTM client with IP address 192.168.0.1 is connected to the MWTM server network through a VPN tunnel.
- The MWTM client host has obtained VPN IP address 10.1.1.2, which is a virtual IP interface.

Figure H-3 **VPN Communication**

When connecting to the MWTM server, the MWTM client automatically recognizes its VPN IP address, 10.1.1.2, and uses that address to register with the MWTM server to receive RMI callbacks.

NAT Communication

MWTM client/server communication can run through one or more static NAT-connected networks.

Note

The MWTM software does not support dynamic NAT or dynamic NAT pool overloading.

In a static NAT network, the MWTM client and server reside on different sides of the NAT network, with no routes between the client network and the server network. The NAT device statically maps the client IP address to a NAT address in the server network, and the server IP address to a NAT address in the client network.

The NAT device translates packets between the MWTM client and server by replacing IP address headers when packets pass through. From the client's point of view, the server appears to be at a NAT IP address in the client network, and vice versa. For most protocols, this technique is sufficient to enable the client and server to communicate.

However, for the RMI protocol, this is not sufficient. The RMI protocol requires the client and server to keep remote object references by remote stubs. These remote stubs contain the remote objects' IP addresses, and are passed between the client and server using Java serialization. The NAT device only converts the IP addresses in the IP packet header, but the remote stub object is in the packet content. Therefore, the NAT device cannot recognize the IP address inside the packet, and fails to route it correctly.

The MWTM software solves this problem by creating a specialized NAT-aware socket factory. The user must perform some manual configuration to enable the MWTM to “know” the network NAT configuration.

Figure H-4 shows a sample static NAT network with these characteristics:

- A static NAT device connects Network A (192.168.*.*) to Network B (10.*.*.*), with no routes between Network A and Network B.
- The NAT device maps the MWTM client IP address 192.168.0.1 in Network A to 10.1.1.2 in Network B.
- The NAT device maps the MWTM server IP address 10.0.0.1 in Network B to 192.168.1.2 in Network A.

Figure H-4 Static NAT Communication

To configure the MWTM software in this static NAT network, you must change the MWTM client's *RMIOverNAT.properties* file.

- In Solaris/Linux, if you installed the MWTM software in the default directory, */opt*, then the location of the file is */opt/CSCOsgmClient/properties/RMIOverNAT.properties*.
- In Windows, if you installed the MWTM software in the default directory, *C:\Program Files*, then the location of the file is *C:\Program Files\SGMClient\properties\RMIOverNAT.properties*.
- If you installed the MWTM software in a different directory, then the file resides in that directory.

For the example shown in [Figure H-4](#), you must add this line to the file:

```
10.0.0.1 = 192.168.1.2
```

This line maps the MWTM server's real IP address, 10.0.0.1 in Network B, to its NAT address, 192.168.1.2, in Network A, which is the server's IP address as seen by the client.

Note

The MWTM server automatically detects the MWTM client's NAT address. No manual configuration on the part of the user is needed at the server side.

When the MWTM server starts, it starts MWTM services that register with the RMI server and publish themselves with the IP address specified in the `SERVER_NAME` property of *System.properties* file on the MWTM server. In the given example, the published IP address is 10.0.0.1.

The MWTM client starts and connects to 192.168.1.2 (specified as the MWTM client's default server address). The NAT device translates the MWTM client's request to the RMI server at 10.0.0.1.

The MWTM client then asks where the MWTM services are located. The RMI server replies that these MWTM services reside at 10.0.0.1. Without the *RMIOverNAT.properties* file on the MWTM client, the client will try to connect to 10.0.0.1, which would fail.

If we have configured the *RMIOverNAT.properties* file on the MWTM client as in the example, the MWTM client will still connect to 192.168.1.2 for name lookup, and the name server will return that MWTM services are running on 10.0.0.1. The MWTM client then looks in the *RMIOverNAT.properties* file, and discovers that the translated address for 10.0.0.1 is 192.168.1.2. With this configuration, the MWTM client will try to connect to 192.168.1.2 for RMI services (instead of 10.0.0.1). As the result, the connection will be established successfully.

Firewall Communication

To enable MWTM client/server communication through a firewall, you need to set up the firewall so that it allows MWTM communication packets to pass through freely.

This section contains:

- [Configuring Port Numbers and Parameters, page H-5](#)
- [Configuring Firewalls, page H-7](#)
- [Sample Firewall Configuration, page H-9](#)

Configuring Port Numbers and Parameters

Note

The MWTM client and server communicate using TCP sockets. All port numbers in this section are TCP ports.

The port number used by the MWTM software is configured in the *System.properties* file:

- If you installed the MWTM software in the default directory, */opt*, then the location of the file is */opt/CSCOsgm/properties/System.properties*.
- If you installed the MWTM software in a different directory, then the file resides in that directory.

Set these parameters on the *server* side of the file:

RMIREGISTRY_PORT = 44742

DATASERVER_PORT = 0

LOGINSERVER_PORT = 0

WEB_PORT = 1774

where:

- RMIREGISTRY_PORT is the port on which the RMI naming server listens. You must specify a port number; **0** is not allowed.
- DATASERVER_PORT is the port on which the Data Service listens. If you specify **0**, the MWTM software uses a random available port, 1024 and above. The MWTM maintains the chosen port until the next server restart.
- LOGINSERVER_PORT is the port on which the Log in Service listens. If you specify **0**, the MWTM software uses a random available port, 1024 and above. The MWTM maintains the chosen port until the next server restart.
- WEB_PORT is the port on which the MWTM web server listens. You must specify a port number; **0** is not allowed. To change the WEB_PORT number, use the **mwtm webport** command (see [mwtm webport](#), page B-94).

Note

If any of these port numbers change, you must restart the MWTM server before the changes take effect.

Set these parameters in the MWTM *client's* *System.properties* file:

RMIREGISTRY_PORT = 44742

CLIENT_PORT = 0

where:

- RMIREGISTRY_PORT is the port on which the server-side RMI naming server listens. This port number must match the one specified for the RMIREGISTRY_PORT on the server side.
- CLIENT_PORT is the port on which the MWTM client listens for RMI callbacks (unsolicited notifications):
 - If you specify CLIENT_PORT = 0, the MWTM software uses any available port, 1024 and above.
 - If you specify CLIENT_PORT with a single value other than 0, such as CLIENT_PORT = 33459, the MWTM software uses that port, and you can run only one MWTM client process at a time.
 - If you specify CLIENT_PORT with a range of values other than 0, such as CLIENT_PORT = 33459-33479, the MWTM software can use any of the ports in the range, including the beginning and ending ports, and you can run more than one MWTM client process at a time.

Note

If any of these port numbers change, you must restart the MWTM client before the changes take effect.

The MWTM client's *System.properties* file resides in the *properties* directory:

- In Solaris/Linux, if you installed the MWTM software in the default directory, */opt*, then the location of the file is */opt/CSCOsgmClient/properties/System.properties*.

- In Windows, if you installed the MWTM software in the default directory, *C:\Program Files*, then the location of the file is *C:\Program Files\SGMClient\properties\System.properties*.
- If you installed the MWTM software in a different directory, then the file resides in that directory.

Configuring Firewalls

Step 1 Identify the TCP port numbers to use between the MWTM server and client applications.

The MWTM software uses four TCP port numbers on the server side and two TCP port numbers on the client side to communicate between the MWTM server and client(s). These ports include the RMI Registry Port, the Data Server Port, the Login Server Port, the Client Port, and the HTTP Web Server port.

These ports are used for two way TCP connections between the MWTM server and client as follows:

1. For a client initiating a connection to the server, the initiating port on the client side is dynamic, and the target port on the server can be fixed by the `DATASERVER_PORT` and `LOGINSERVER_PORT` properties on the server.
2. For the server initiating a connection to the client (this is used for status change notifications), the initiating port on the server side is dynamic, and the target port on the client can be fixed by the `CLIENT_PORT` property on the client side.

You configure these port numbers in a plain-text file named *System.properties* located on the MWTM server and client. When configuring the MWTM software in a firewall deployment, you should use these port numbers:

- **RMI Registry Port**—44742
- **Data Server Port**—44751
- **Login Server Port**—44752
- **Client Port**—56173
- **HTTP Web Server Port**—1774

Step 2 Modify the *System.properties* file on the MWTM server. The *System.properties* file resides on the MWTM server under the */opt/CSCOsgm/properties* directory.

Note If the you installed the MWTM software in a location other than the default (*/opt/CSCOsgm*), substitute the correct directory name to locate the properties directory.

Caution Before editing, always make a backup of the file. This ensures a valid file exists in case an error is made during the editing process.

Using a text editor, edit this file and specify the appropriate port number where indicated subsequently:

Port Name	Keyword	Value
RMI Registry Port	RMIREGISTRY_PORT	44742
Data Server Port	DATASERVER_PORT	44751

Port Name	Keyword	Value
Login Server Port	LOGINSERVER_PORT	44752
HTTP Web Server Port	WEB_PORT	1774

Step 3 Modify the *System.properties* file on the MWTM client. The *System.properties* file resides on the MWTM client machine under:

- `/opt/CSCOsgm/properties` directory for Solaris clients
- `C:\Program Files\MWTMClient\properties` for Windows clients

Note If you installed the MWTM software in a location other than the default (*/opt/CSCOsgmClient*), substitute the correct directory name to locate the properties directory.

Caution Before editing, always make a backup of the file. This ensures a valid file exists in case an error is made during the editing process.

Using a text editor, edit this file and specify the appropriate port number where indicated subsequently:

Port Name	Keyword	Value
RMI Registry Port	RMIREGISTRY_PORT	44742
Client Port	CLIENT_PORT	56173

Step 4 Modify the node configuration files with the chosen port numbers.

On Cisco nodes, you can use extended access lists to allow the chosen TCP port numbers to pass between the appropriate interface(s). Assuming a single node separates the MWTM client and server, you can use the following extended access list:

Note The *established* entries are necessary, as they allow data to flow between the server and client that initiated the session. Without this keyword, clients will not have access to the MWTM server.

```
# MWTM Client Interface
interface FastEthernet 1/1
 ip address 192.168.1.100 255.255.255.0
 ip access-group client-to-server in

# MWTM Server Interface
interface FastEthernet 2/1
 ip address 192.168.2.100 255.255.255.0
 ip access-group server-to-client in

# Access list from client to server
ip access-list extended client-to-server
 10 permit tcp any any established
 20 permit tcp 192.168.1.0 0.0.0.255 host 192.168.2.2 eq 44742
 30 permit tcp 192.168.1.0 0.0.0.255 host 192.168.2.2 eq 44751
 40 permit tcp 192.168.1.0 0.0.0.255 host 192.168.2.2 eq 44752
 50 permit tcp 192.168.1.0 0.0.0.255 host 192.168.2.2 eq 1774
```

```
# Access list from server to client
ip access list extended server-to-client
 10 permit tcp any established
 20 permit tcp host 192.168.2.2 192.168.1.0 0.0.0.255 eq 56173
```

Step 5 Restart the MWTM server to use the newly chosen TCP port numbers.

As the root user, on the MWTM server, type:

```
#/opt/CSCosgm/bin
#./mwtm restart
```

The server processes restart using the newly chosen port numbers.

Sample Firewall Configuration

This sample shows how to configure your firewall from the server side, client side, and Cisco node side.

Figure H-5 shows a sample firewall network with these parameters set in the *System.properties* file:

- On the MWTM server side:
 - RMIREGISTRY_PORT = 44742
 - DATASERVER_PORT = 44751
 - LOGINSERVER_PORT = 44752
 - WEB_PORT = 1774
- On the MWTM client side:
 - RMIREGISTRY_PORT = 44742
 - CLIENT_PORT = 56173

Figure H-5 Firewall Communication

This example illustrates a typical firewall configuration for Cisco nodes using access lists. This examples has two extended access lists:

- **ip access-list extended client-to-server**—This access list is applied on the input interface from the client to the server (FE 1/1).
- **ip access-list extended server-to-client**—This access list is applied on the input interface from the server to the client (FE 2/1).

```

!
ip access-list extended client-to-server
  10 permit tcp any any established
  20 permit tcp 192.168.1.0 0.0.0.255 host 192.168.2.2 eq 44742
  30 permit tcp 192.168.1.0 0.0.0.255 host 192.168.2.2 eq 44751
  40 permit tcp 192.168.1.0 0.0.0.255 host 192.168.2.2 eq 44752
  50 permit tcp 192.168.1.0 0.0.0.255 host 192.168.2.2 eq 1774
  60 ...
!
ip access list extended server-to-client
  10 permit tcp any any established
  20 permit tcp host 192.168.2.2 192.168.1.0 0.0.0.255 eq 56173
  30 ...
!
interface FastEthernet 1/1
  ip address 192.168.1.100 255.255.255.0
  ip access-group client-to-server in
!
!
interface FastEthernet 2/1
  ip address 192.168.2.100 255.255.255.0
  ip access-group server-to-client in
!
!
!

```

Note

Both of these access lists allow established TCP connections (*10 permit tcp any any established, see previous*). When the MWTM client or server establishes a TCP connection to the other end, it uses a fixed destination port. However, the source port from the initiating party is random. The established keyword allows a returning TCP packet to go back to the random initiating source port.

Port-Forwarding Communication

To enable the MWTM software to operate in a TCP port-forwarding environment, perform these configuration tasks:

-
- Step 1** Configure the server hostname and port number mapping in the MWTM client's *RMIOverNAT.properties* file, as described in [NAT Communication, page H-4](#).
 - Step 2** Configure the port numbers used by the MWTM client and server in the *System.properties* file, as described in [Firewall Communication, page H-5](#).
 - Step 3** Configure the port-forwarding tunnel to forward each side's TCP connection to the other side.
-

Figure H-6 shows a sample network that uses Secure Shell (SSH) port-forwarding. Other port-forwarding configurations might use a single host with dual interfaces at the client's and server's networks. While other port-forwarding configurations might differ from this example, the general rules to configure the MWTM software to operate in a port-forwarding environment are the same.

Figure H-6 Port-Forwarding Communication

The port-forwarding network shown in Figure H-6 has these parameters set:

- In the *System.properties* file, on the MWTM server side:
`RMIREGISTRY_PORT = 44742`
`DATASERVER_PORT = 44751`
`LOGINSERVER_PORT = 44752`
`WEB_PORT = 1774`
- In the *System.properties* file, on the MWTM client side:
`RMIREGISTRY_PORT = 44742`
`CLIENT_PORT = 56173`
- In the MWTM client's *RMIOverNAT.properties* file:
`10.0.0.1/44742 = 127.0.0.1/25742`
`10.0.0.1/44751 = 127.0.0.1/25751`
`10.0.0.1/44752 = 127.0.0.1/25752`
`10.0.0.1/1774 = 127.0.0.1/8080`
- In the port-forwarding network:
`Local port 25751 => remote host 127.0.0.1, port 44742`
`Local port 25751 => remote host 127.0.0.1, port 44751`
`Local port 25752 => remote host 127.0.0.1, port 44752`
`Local port 8080 => remote host 127.0.0.1, port 1774`
`Remote port 56173 => local host 127.0.0.1, port 56173`

**Note**

For port-forwarding setup, the backward-forwarding port numbers must match each other. In the previous example, both are 56173. The forward-forwarding port numbers do not need to match each other.

If you want to run more than one MWTM client process at the same time on the same node, you must specify `CLIENT_PORT` with a range of values other than 0, such as `CLIENT_PORT = 33459-33479`, in the MWTM client's *RMIOverNAT.properties* file. See [Firewall Communication, page H-5](#) for more information about specifying the `CLIENT_PORT` parameter. You must also set up the backward-forwarding port numbers to use a range of values.

When the MWTM server starts, underlying network services register with the RMI server and publish themselves with the IP address specified in the `SERVER_NAME` property of the *System.properties* file on the MWTM server. In the given example, the published IP address is 10.0.0.1.

The MWTM client starts and connects to the localhost/127.0.0.1 (specified as the MWTM client's default server address). The SSH port-forwarding tunnel forwards the MWTM client's request to the RMI server at the MWTM server's localhost/127.0.0.1.

The MWTM client then asks where the MWTM services are located, and the RMI server replies that these MWTM services reside at 10.0.0.1. Without the *RMIOverNAT.properties* file on the MWTM client, the client would try to connect to 10.0.0.1, which would fail because of a network routing problem.

If we have configured the *RMIOverNAT.properties* file on the MWTM client as in the example, the MWTM client will still connect to the localhost/127.0.0.1 for name lookup, and the name server would return that MWTM services are running on 10.0.0.1. The MWTM client then looks in the *RMIOverNAT.properties* file, and discovers that the translated address for 10.0.0.1 is 127.0.0.1. With this configuration, the MWTM client will try to connect to 127.0.0.1 for RMI services (instead of 10.0.0.1). As a result, the connection will establish successfully.

Configuring MWTM to Work With a Dual-Interface Machine Connected to Separate Networks

The MWTM client and server communication is based on Java RMI protocol. A limitation of RMI is its inability to publish itself with more than one specific IP address. This means that the RMI service can only register to one single interface on a dual interface machine. You can deploy the MWTM server on a dual interface machine in various scenarios:

- In some scenarios, all MWTM clients run on one side of the MWTM server interface, with no MWTM clients on the other side of the interface (for example, the other MWTM server interface is exclusively used for network management/SNMP traffic). In this scenario, ensure that the MWTM server published address is the interface connected to the MWTM clients. To change the published address of the MWTM server, see [mwtm servername, page B-62](#).
- In some other scenarios, the two MWTM server interfaces are connected to the same network, or the two interfaces are connected to two different networks, but these networks are routed between each other. Typically, the intention is to use two physical interfaces to provide redundancy on the MWTM server. When providing physical interface redundancy, you should use Cisco Server Load Balancing technology. For details on configuring the MWTM software with this scenario, see [Configuring MWTM with IOS Server Load Balancing, page H-16](#).

This section describes a third scenario: how to configure the MWTM software to work with a dual-interface machine that is connected to two separate networks. Both networks have MWTM clients that need to connect to the MWTM server. [Figure H-7](#) is a diagram of a sample network where a single MWTM server is connected to two separate networks. Two MWTM clients, A and B, are on these two separate networks and need to communicate with the MWTM server.

Figure H-7 Sample Network

In this network configuration, the two networks (192.168.1.0/24 and 10.0.0.0/24) are not routed between each other. If the two networks were routed between each other (for example, if MWTM client B at 10.0.0.2 could reach the MWTM server at 192.168.1.1), you would configure the MWTM server with the 192.168.1.1 address, which would enable MWTM client A and MWTM client B to connect to the MWTM server.

The following sections give an example of how to configure the MWTM software to work with MWTM clients on both networks.

MWTM Server Configuration

The MWTM server can publish only one single IP address on the MWTM server machine. To configure this published address, use the **mwtm servername** command (see [mwtm servername](#), page B-62).

For example, a system administrator configures the MWTM server to use the 192.168.1.1 address, by running the command **mwtm servername 192.168.1.1** on the MWTM server machine. The MWTM server will restart for the change to take effect. The command changes the *System.properties* file on the MWTM server to contain following line:

```
SERVER_NAME = 192.168.1.1
```

MWTM Client A Configuration

No special configurations are required on MWTM client A. Because this client is on the same network as the MWTM server binding interface, MWTM client A can communicate freely with the MWTM server.

You do need to ensure that during installation, MWTM client A has set up the MWTM server IP address as 192.168.1.1.

If the initial installation has incorrect information, you can change the MWTM server IP address to 192.168.1.1 using the **mwtm servername** command, or you can use the Change Default MWTM Server option on the MWTM client menu. For detailed information, see [mwtm servername](#), page B-62, or [Changing the Default MWTM Server Name](#), page 3-26.

MWTM Client B Configuration

When the MWTM server starts up on a dual-interface machine, it starts the RMI server and binds it to all the interfaces.

The MWTM server then starts all MWTM services and binds them to all the interfaces. These MWTM services then register with the RMI server and publish themselves with the IP address specified in the `SERVER_NAME` property of the *System.properties* file on the MWTM server. In the given example, the published IP address is 192.168.1.1.

MWTM client B starts up, connecting to 10.0.0.1 (specified as the MWTM client B default server address). MWTM client B connects to the RMI server at 10.0.0.1.

MWTM client B then asks where the MWTM services are located. The RMI server replies that these MWTM services reside at 192.168.1.1. Without the *RMIOverNAT.properties* file on the MWTM client B, the client would try to connect to 192.168.1.1, which would fail.

If we have configured the *RMIOverNAT.properties* file on MWTM client B as in the example, MWTM client B will still connect to 10.0.0.1 for name lookup, and the name server will return that MWTM services are running on 192.168.1.1. The MWTM client then looks in the *RMIOverNAT.properties* file, and discovers that the translated address for 192.168.1.1 is 10.0.0.1. With this configuration, MWTM client B will try to connect to 10.0.0.1 (instead of 192.168.1.1) for RMI services. As the result, the connection will establish successfully.

Configuring MWTM client B involves two things:

- First, ensure that MWTM client B has setup the MWTM server IP address as 10.0.0.1 during installation.
If the initial installation has incorrect information, you can also change the MWTM server IP address to 10.0.0.1 using the **mwtm servername 10.0.0.1** command, or using the Change Default MWTM Server option on the MWTM client menu.
- Next, you must edit the *RMIOverNAT.properties* file on the MWTM client machine. On a Windows client, the default location of this file is *C:\ProgramFiles\SGMClient\properties\RMIOverNAT.properties*. On a Solaris client, the default location of this file is */opt/CSCOmwcClient/properties/RMIOverNAT.properties*.

Add this line in the *RMIOverNAT.properties* file:

```
192.168.1.1 = 10.0.0.1
```

After you have completed these steps, MWTM client B will be able to connect to the MWTM server even if the MWTM server published address 192.168.1.1 is unreachable from MWTM client B. MWTM client B will convert 192.168.1.1 to a reachable IP address 10.0.0.1 for client to server TCP connection.

Additional Network Configurations

Numerous other network configurations are not directly addressed here. The MWTM client and server can work with most of these networks, as long as the MWTM client and server can establish an SSH connection.

A few examples of alternative network configurations are:

- Dynamic NAT, where the MWTM client and server are on two different sides of the dynamic NAT network.
- A situation where the MWTM client is in a trusted network and the MWTM server is in a public network, but the firewall does not allow a direct TCP connection made from the MWTM server to the MWTM client.
- A situation where the MWTM server is in a trusted network and the MWTM client is in a public network, but the firewall does not allow a direct TCP connection made from MWTM client to MWTM server.

To allow the MWTM client and server communication in these network environments, you can establish a SSH connection between the MWTM client and the MWTM server using SSH port-forwarding (for details, see [Port-Forwarding Communication, page H-10](#)).

SSL Communication

If SSL is implemented and enabled in your MWTM system, the MWTM software uses secure socket communication for both RMI and HTTP communication between the MWTM client and server.

The MWTM software supports standard-based SSL encryption algorithms, including RSA, DSA public key algorithms, and 40-bit or 128-bit encryption. The MWTM software can generate an X.509 certificate and a certificate signing request (CSR), which is interoperable with most certificate authorities (CAs).

Both the MWTM web server and the MWTM server processes share the same SSL key/certificate pair. In addition, the MWTM client and the web browser can examine the server's certificate.

For more information, including descriptions of the MWTM commands and procedures used to implement, enable, manage, and monitor SSL support, see [Implementing SSL Support in the MWTM, page 2-21](#).

[Figure H-8](#) shows a sample MWTM-over-SSL network with these characteristics:

- A user-generated SSL key pair on the MWTM server.
- The server's certificate is trusted on the MWTM client.
- Communication between the client and server is RMI-over-SSL and HTTPS. Both protocols are encrypted and secure.

Figure H-8 SSL Communication

Configuring MWTM with IOS Server Load Balancing

If a network failure causes the MWTM software to fail, you can no longer monitor your network. You can solve this potential problem by configuring a backup MWTM server, as detailed in [Configuring a Backup MWTM Server, page 4-10](#). However, this solution requires a connection to the backup MWTM server, which might not mirror exactly the primary MWTM server.

A better solution is to use IOS Server Load Balancing (IOS SLB), which provides transparent failover of the MWTM client connection.

Use this procedure to configure the MWTM software with IOS SLB:

-
- Step 1** Ensure that you have this required hardware and software:
- Solaris/Linux server with at least two network interface cards (NICs)
 - Cisco 7204VXR or 7206VXR series node
 - IOS SLB release 12.1(11b)E or later
 - MWTM release 6.1 or later
- Step 2** Configure the Solaris/Linux server with at least two active NICs.
- Step 3** Configure a routing protocol on the Solaris/Linux server, such that if one network interface fails, the other interfaces can still contact the monitored networks and the MWTM client:
- Run **in.routed** on the Solaris/Linux server, with two RIP-based nodes on two separate networks providing routing tables for the server. See the **in.routed** man page for more information on this configuration.
 - Use the GateD routing software developed by NextHop Technologies.
- Step 4** Configure the Cisco 7204VXR or 7206VXR series router, with the Solaris/Linux server network interfaces configured as real servers in the server farm. Refer to the IOS SLB feature module for more information on configuring the IOS SLB node.
- Step 5** Configure a virtual interface, lo0:1 with the Internet address that matches the virtual IP address configured on the IOS SLB node:
- ```
ifconfig lo0:1 addif ip-address
```

- Step 6** Install the MWTM software.
- Step 7** Edit the */opt/CSCOsgm/properties/System.properties* file, and replace the SERVER NAME variable with the DNS entry that matches the virtual IP address configured on the IOS SLB node. Save your changes and restart the MWTM server.
- Step 8** Configure your MWTM clients to match the same DNS entry.
- Your configuration is complete.
- 

Remember that:

- Failover of the MWTM client is transparent to the user. No additional changes are needed at that end.
- A failure of either interface, or of the surrounding networks, might cause the MWTM client to hang for a short period, depending on the convergence of the routing protocol used by the MWTM server. For example, with RIP, the MWTM client might hang for up to two minutes while RIP converges after a network failure. Faster protocols might result in shorter MWTM client hang times.

## MWTM Ports

The Cisco Mobile Wireless Transport Manager (MWTM) uses the following default ports to provide services:

| Port Name or Number | Port Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1774                | tcp       | Apache web server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 1775                | tcp       | TOMCAT Java Server Pages (JSP) server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 44742               | tcp       | Java Remote Method Invocation (RMI) naming service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| dynamic port 1      | tcp       | Java RMI service for Login Service. A network or system administrator can specify a fixed port using the LOGINSERVER_PORT parameter in the <i>System.properties</i> file.<br><b>Note</b> If you installed the MWTM in the default directory, <i>/opt</i> , then the location of the <i>System.properties</i> file is <i>/opt/CSCOsgm/properties/System.properties</i> . If you installed the MWTM in a different directory, then the <i>System.properties</i> file resides in that directory.                                                                                   |
| dynamic port 2      | tcp       | Java RMI service for the MWTM Data Server. A network or system administrator can specify a fixed port using the DATASERVER_PORT parameter in the <i>System.properties</i> file.<br><b>Note</b> If you installed the MWTM in the default directory, <i>/opt</i> , then the location of the <i>System.properties</i> file is <i>/opt/CSCOsgm/properties/System.properties</i> . If you installed the MWTM in a different directory, then the <i>System.properties</i> file resides in that directory.                                                                             |
| 162                 | udp       | Simple Network Management Protocol (SNMP) trap listener                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| dynamic ports 1-25  | udp       | SNMP request senders. These ports are used by the SNMP stack for sending SNMP requests. A maximum of 25 can be opened in the MWTM. You can customize the number of ports by changing the SNMP_SOCKET_NUMBER parameter in the <i>Server.properties</i> file.<br><b>Note</b> If you installed the MWTM in the default directory, <i>/opt</i> , then the location of the <i>Server.properties</i> file is <i>/opt/CSCOsgm/properties/Server.properties</i> . If you installed the MWTM in a different directory, then the <i>Server.properties</i> file resides in that directory. |

## GLOSSARY

This glossary contains Cisco Mobile Wireless Transport Manager (MWTM) specific terms. For an online listing of other internetworking terms and acronyms, see this URL:

### A

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access list</b>                            | A list kept by routers to control access to or from the router for a number of services (for example, to prevent packets with a certain IP address from leaving a particular interface on the router).                                                                                                                                                                                          |
| <b>accounting</b>                             | Collection of SS7 accounting statistics.                                                                                                                                                                                                                                                                                                                                                        |
| <b>adjacent node</b>                          | In the MWTM, for a given pair of connected nodes, the node that the MWTM discovered second. See <a href="#">primary node</a> .                                                                                                                                                                                                                                                                  |
| <b>adjacent point code</b>                    | Point code of the adjacent ITP signaling point for the linkset. Contrast with <a href="#">local point code</a> .                                                                                                                                                                                                                                                                                |
| <b>aggregation site</b>                       | A Base Station Controller (BSC) or Radio Network Controller (RNC) site where traffic is collected for multiple cell sites. See <a href="#">cell site</a> .                                                                                                                                                                                                                                      |
| <b>alarm</b>                                  | An alarm is a sequence of events, each representing a specific occurrence in the alarm lifecycle. The lifecycle of an alarm can include any number of related events that are triggered by changes in severity, updates to services, and so on. See <a href="#">event</a> .                                                                                                                     |
| <b>alias point code</b>                       | See <a href="#">capability point code</a> .                                                                                                                                                                                                                                                                                                                                                     |
| <b>ANSI</b>                                   | American National Standards Institute.                                                                                                                                                                                                                                                                                                                                                          |
| <b>API</b>                                    | Application Programming Interface. A source code interface that a computer system or program library provides to support requests for services by a computer program.                                                                                                                                                                                                                           |
| <b>APN</b>                                    | Access Point Name.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>application server</b>                     | Logical entity serving a specific routing key. The application server implements a set of one or more unique application server processes, of which one or more is normally actively processing traffic. See <a href="#">application server process</a> , <a href="#">application server process association</a> , <a href="#">routing key</a> , <a href="#">signaling gateway-mated pair</a> . |
| <b>application server process</b>             | IP-based instance of an application server, such as Call Agents, HLRs, SMSCs, and so on. An application server process can implement more than one application server. See <a href="#">application server</a> , <a href="#">application server process association</a> , <a href="#">routing key</a> , <a href="#">signaling gateway-mated pair</a> .                                           |
| <b>application server process association</b> | ITP's virtual view of an application server process. The application server process association is defined on, and resides on, the ITP. See <a href="#">application server</a> , <a href="#">application server process</a> , <a href="#">routing key</a> , <a href="#">signaling gateway-mated pair</a> .                                                                                      |

|                   |                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>arrowhead</b>  | In topology maps, indicator for an application server process association connection. See <a href="#">topology map</a> .                                                                                                                     |
| <b>auto save</b>  | Setting that enables the MWTM to save changes automatically when you exit the MWTM.                                                                                                                                                          |
| <b>auto start</b> | Setting that enables the MWTM to start a process automatically when the Process Manager is started. See <a href="#">Data Server</a> , <a href="#">Message Log Server</a> , <a href="#">Process Manager</a> , <a href="#">Trap Receiver</a> . |

|                                 |                                                                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>base station controller</b>  | See <a href="#">BSC</a> .                                                                                                                                                                                                   |
| <b>base transceiver station</b> | See <a href="#">BTS</a> .                                                                                                                                                                                                   |
| <b>browser</b>                  | GUI-based hypertext client application, such as Internet Explorer or Mozilla, used to access hypertext documents and other services located on innumerable remote servers throughout the World Wide Web (WWW) and Internet. |
| <b>BSC</b>                      | Base Station Controller. Equipment that manages radio resources in a GSM network.                                                                                                                                           |
| <b>BTS</b>                      | Base Transceiver Station. The equipment in a GSM network that is used to transmit radio frequencies over the air waves.                                                                                                     |

## C

|                              |                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>capability point code</b> | Point code shared by more than one signaling point, each of which is also assigned a “real” point code. Also called <a href="#">alias point code</a> .                                                                                                                                                                                                                |
| <b>CDMA</b>                  | Code Division Multiple Access.                                                                                                                                                                                                                                                                                                                                        |
| <b>cell site</b>             | A Base Transceiver Station (BTS) or Node B site, usually located at the remote site with limited connectivity. See <a href="#">aggregation site</a> .                                                                                                                                                                                                                 |
| <b>circle</b>                | In topology maps, indicator for a link that is part of a virtual linkset, associated with the closest node. See <a href="#">topology</a> .                                                                                                                                                                                                                            |
| <b>circle layout</b>         | Topology map layout in which objects are arranged in a circle, connected by links. Contrast with <a href="#">spring layout</a> . See <a href="#">topology map</a> .                                                                                                                                                                                                   |
| <b>Cisco IOS software</b>    | Cisco Internetwork Operating System software. Cisco system software that provides common functionality, scalability, and security for many Cisco products. The Cisco IOS software allows centralized, integrated, and automated installation and management of internetworks, while ensuring support for a wide variety of protocols, media, services, and platforms. |
| <b>CLI</b>                   | Command line interface. An interface that allows the user to interact with the Cisco IOS software operating system by entering commands and optional arguments.                                                                                                                                                                                                       |
| <b>client</b>                | Node or software program that requests services from a server. The MWTM user interface is an example of a client. See also <a href="#">server</a> .                                                                                                                                                                                                                   |

|                                |                                                                                                                                                                                                                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>client view</b>             | User-customized subset of the DEFAULT view. See also <a href="#">DEFAULT view</a> , <a href="#">view</a> , <a href="#">subview</a> .                                                                                                                                                                          |
| <b>CLLI code</b>               | COMMON LANGUAGE Location Identification Code for a node. A CLLI code is a standardized 11-character identifier that uniquely identifies the geographic location of the node.                                                                                                                                  |
| <b>COA</b>                     | Change of Authorization.                                                                                                                                                                                                                                                                                      |
| <b>command line interface</b>  | See <a href="#">CLI</a> .                                                                                                                                                                                                                                                                                     |
| <b>community name</b>          | See <a href="#">community string</a> .                                                                                                                                                                                                                                                                        |
| <b>community string</b>        | Text string that acts as a password and is used to authenticate messages sent between a management station and a node containing an SNMP agent. The community string is sent in every packet between the manager and the agent. Also called <a href="#">community name</a> , <a href="#">read community</a> . |
| <b>congestion</b>              | Condition in which a link has too many packets waiting to be sent. This condition could be caused by the failure of an element in the network. Possible levels are None, Low, High, and Very High, which correspond roughly to equivalent ANSI, China standard, ITU, NTT, and TTC congestion levels.          |
| <b>console log</b>             | Log containing unexpected error and warning messages from the MWTM server, such as those that might occur if the MWTM server cannot start.                                                                                                                                                                    |
| <b>cost</b>                    | Measure of the suitability of a route to a destination, relative to other routes. Costs range from 1 (lowest cost and highest priority) through 9 (highest cost and lowest priority).                                                                                                                         |
| <b>credentials</b>             | Login credentials that are stored in an encrypted file on the server, eliminating the need for users to login before running commands. The MWTM enables a system administrator to configure the login credentials using the Node SNMP and Credentials Editor dialog box.                                      |
| <b>cross-instance GTT file</b> | Global Title Translation file that supports the Multiple Instance and Instance Translation ITP features. Cross-instance GTT files contain application groups that reference point codes in other GTT files. See <a href="#">Instance Translation</a> , <a href="#">Multiple Instance</a> .                    |
| <b>CSV</b>                     | Comma-separated values. A widely-used file format for storing tabular data.                                                                                                                                                                                                                                   |
| <b>current view</b>            | View that is currently in use on an MWTM client. The view can be the DEFAULT view or a customized view. Also called <a href="#">current view</a> . See <a href="#">client view</a> , <a href="#">DEFAULT view</a> .                                                                                           |

## D

|                            |                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Data Server</b>         | Multi-threaded process that handles most of the work done by the MWTM, including discovery, polling, and scheduling. See also <a href="#">Message Log Server</a> , <a href="#">Process Manager</a> , <a href="#">Trap Receiver</a> .                                   |
| <b>DEFAULT view</b>        | View into which the MWTM places all discovered objects when discovering the network. The DEFAULT view is stored on the MWTM server and shared by all MWTM clients, but it cannot be modified by the clients. See <a href="#">current view</a> , <a href="#">view</a> . |
| <b>demand polling</b>      | User-initiated poll of selected nodes. Contrast with <a href="#">status polling</a> .                                                                                                                                                                                  |
| <b>destination linkset</b> | In ITP route tables, linkset associated with the destination point code. Also called the <a href="#">output linkset</a> . See <a href="#">linkset</a> , <a href="#">destination point code</a> , <a href="#">route table</a> .                                         |

|                               |                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination point code</b> | In ITP route tables, point code of the adjacent signaling point, the destination for packets on the selected signaling point. See <a href="#">destination linkset</a> , <a href="#">point code</a> , <a href="#">route table</a> .                      |
| <b>device</b>                 | See <a href="#">node</a> .                                                                                                                                                                                                                              |
| <b>device type</b>            | In MWTM, the type of a discovered device, either a Cisco device or a BTS, BSC, or legacy SS7 device. Also called <a href="#">system object ID</a> . See <a href="#">legacy device</a> .                                                                 |
| <b>diamond</b>                | In topology maps, indicator for a connection that is part of a configured interface, associated with the closest node. See <a href="#">topology</a> .                                                                                                   |
| <b>discovered</b>             | Object that has been discovered by the MWTM. Also called <i>known</i> . Contrast with <a href="#">unknown</a> .                                                                                                                                         |
| <b>Discovery</b>              | Process by which the MWTM discovers objects in your network. See also <a href="#">nonrecursive Discovery</a> , <a href="#">recursive Discovery</a> .                                                                                                    |
| <b>display name</b>           | User-specified name for a node. Contrast with <a href="#">DNS name</a> . See also <a href="#">node name</a> .                                                                                                                                           |
| <b>domain name</b>            | The style of identifier—a sequence of case-insensitive ASCII labels separated by dots (“bbn.com.”)—defined for subtrees in the Internet Domain Name System [R1034] and used in other Internet identifiers, such as host names, mailbox names, and URLs. |
| <b>Domain Name System</b>     | See <a href="#">DNS</a> .                                                                                                                                                                                                                               |
| <b>double triangle</b>        | In topology maps, indicator for a connection that has multiple interfaces, such as two linksets between the same two signaling points. See <a href="#">topology map</a> .                                                                               |
| <b>DNS</b>                    | Domain Name System. System used on the Internet for translating names of network nodes into addresses.                                                                                                                                                  |
| <b>DNS name</b>               | Initial name of a node, as discovered by the MWTM. Contrast with <a href="#">display name</a> . See also <a href="#">node name</a> .                                                                                                                    |
| <b>DPC</b>                    | See <a href="#">destination point code</a> .                                                                                                                                                                                                            |

## E

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Erlang (E)</b>       | The international (dimensionless) unit of the average traffic intensity (occupancy) of a facility during a period of time, normally, a busy hour. The number of Erlangs is the ratio of the time during which a facility is occupied (continuously or cumulatively) to the time this facility is available for occupancy. Another definition is the ratio of the average call arrival rate into the system, to the average call duration. One Erlang is equivalent to 36 ccs (completed call seconds), which is another traffic intensity unit. |
| <b>event</b>            | <p>An event is a singular occurrence in time. Events are derived from incoming traps and notifications, and from detected status changes.</p> <p>The MWTM can detect events that are triggered by SNMP traps or notifications, status changes, and user actions. See <a href="#">trap</a>, <a href="#">alarm</a>.</p>                                                                                                                                                                                                                           |
| <b>event forwarding</b> | See <a href="#">trap forwarding</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>exclude</b>          | Removing a network object from a view, while retaining the object in the MWTM database.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## F

**Field Replaceable Units** See [FRU](#).

**FRU** Assemblies such as power supplies, fans, processor modules, interface modules, and so forth.

## G

**GGSN** Gateway GPRS Support Node. A gateway that provides mobile cell phone users access to a public data network or specified private IP networks.

**GPRS** General Packet Radio Service. A 2.5G mobile communications technology that enables mobile wireless service providers to offer their mobile subscribers packet-based data services over GSM networks.

**GSM** ITU standard for defining the Global System for Mobile communications, a digital cellular telephone standard.

**Global System for Mobile communications** See [GSM](#).

**graphical element** Graphical representation of an object or view in the topology map. See [topology map](#).

**graphical user interface** See [GUI](#).

**GTP** GPRS Tunneling Protocol. A protocol that enables the connection between the SGSN and the GGSN.

**GTT** Global Title Translation. The process by which the SCCP translates a global title into the point code and subsystem number of the destination service switching point where the higher-layer protocol processing occurs.

**GUI** Graphical user interface. User environment that uses pictorial as well as textual representations of the input and output of applications and the hierarchical or other data structure in which information is stored. Conventions such as buttons, icons, and windows are typical, and many actions are performed using a pointing device (such as a mouse). Microsoft Windows and the Apple Macintosh are prominent examples of platforms utilizing a GUI.

## H

**host** Computer system on a network. Similar to the term node except that host usually implies a computer system, whereas node generally applies to any network system, including access servers and ITP, IPRAN, or mSEF devices. See also [node](#).

**host address** See [host number](#).

**host number** Part of an IP address that designates which node on the subnetwork is being addressed. Also called a [host address](#).

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>HSL</b>                       | High-speed link. An HSL link is one that uses the SS7-over-ATM (Asynchronous Transfer Mode) high-speed protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>HTML</b>                      | Hypertext Markup Language. Simple hypertext document formatting language that uses tags to indicate how a given part of a document should be interpreted by a viewing application, such as a web browser. See also <a href="#">hypertext</a> and <a href="#">browser</a> .                                                                                                                                                                                                                                                                                                                                                                         |
| <b>hypertext</b>                 | Electronically-stored text that allows direct access to other texts by way of encoded links. Hypertext documents can be created using HTML, and often integrate images, sound, and other media that are commonly viewed using a browser. See also <a href="#">HTML</a> and <a href="#">browser</a> .                                                                                                                                                                                                                                                                                                                                               |
| <b>Hypertext Markup Language</b> | See <a href="#">HTML</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>ignore</b>                    | Exclude an object when aggregating and displaying MWTM status information. See also <a href="#">unignore</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>IMSI</b>                      | International Mobile Subscriber Identity. A unique 15-digit code that identifies an individual user on a GSM network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>installation log</b>          | Log containing messages and other information recorded during installation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Instance Translation</b>      | ITP feature in support of the Multiple Instance feature that enables the conversion of packets between instances of any variant. Each instance is a separate domain with a defined variant, network indicator, ITP point code, optional capability point code, and optional secondary point code. Each instance also has its own routing table and GTT file. See <a href="#">cross-instance GTT file</a> , <a href="#">Multiple Instance</a> .                                                                                                                                                                                                     |
| <b>interface</b>                 | Connection between two systems or devices. In the MWTM, an interface is a connection on an ITP, IPRAN, or mSEF node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>internal ID</b>               | Unique identifier assigned by the MWTM, for its own internal use, to every event, link, linkset, and node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Internet Protocol</b>         | See <a href="#">IP</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>IP</b>                        | Internet Protocol. Network layer protocol in the TCP/IP stack offering a connectionless internetwork service. IP provides features for addressing, type-of-service specification, fragmentation and reassembly, and security. Documented in RFC 791.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>IP address</b>                | 32-bit address assigned to hosts using TCP/IP. An IP address belongs to one of five classes (A, B, C, D, or E) and is written as 4 octets separated by periods (dotted decimal format). Each address consists of a network number, an optional subnetwork number, and a host number. The network and subnetwork numbers together are used for routing, while the host number is used to address an individual host within the network or subnetwork. A subnet mask is used to extract network and subnetwork information from the IP address. CIDR provides a new way of representing IP addresses and subnet masks. See also <a href="#">IP</a> . |
| <b>IP backhaul</b>               | A trunk that transports optimized voice and data traffic between a remote cell-site, RAN-O node and an aggregation RAN-O node at a central site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>IPC</b>                       | Inter Processor Communication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>ITP</b>                  | Part of Cisco's hardware and software SS7-over-IP (SS7oIP) solution. ITP provides a reliable, cost-effective medium for migrating Signaling System 7 (SS7), the telecommunications network signaling technology, to the mobile wireless industry IP environment. ITP off-loads SS7 Short Messaging Service (SMS) traffic onto the IP network, replacing the mobile service provider's signaling network with a redundant IP cloud. |
| <b>ITU</b>                  | International Telecommunication Union.                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>LAN</b>                  | Local Area Network.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>legacy device</b>        | In the MWTM, an SS7 device that is not a Cisco ITP or a Cisco RAN-O node. Legacy devices include MSCs, SCPs, SSPs, STPs, BSCs, and BTSs. See <a href="#">MSC</a> , <a href="#">SCP</a> , <a href="#">SS7</a> , <a href="#">SSP</a> , <a href="#">STP</a> , <a href="#">BTS</a> , <a href="#">BSC</a> .                                                                                                                             |
| <b>link</b>                 | In ITP, the connection between nodes. See <a href="#">ITP</a> , <a href="#">linkset</a> , <a href="#">node</a> .                                                                                                                                                                                                                                                                                                                   |
| <b>link type</b>            | In the MWTM, the type of a discovered ITP link, either SCTP IP or serial. See <a href="#">HSL</a> , <a href="#">SCTP</a> , <a href="#">serial</a> , <a href="#">virtual link</a> .                                                                                                                                                                                                                                                 |
| <b>linkset</b>              | In ITP, a grouped set of links. In the MWTM, a representation of two linksets associated with two nodes, one for each side of a logical connection. See <a href="#">ITP</a> , <a href="#">link</a> , <a href="#">node</a> .                                                                                                                                                                                                        |
| <b>linkset pair</b>         | In the MWTM, a single linkset with input from the perspective of both of its endpoints. See also <a href="#">linkset</a> .                                                                                                                                                                                                                                                                                                         |
| <b>linkset type</b>         | In the MWTM, the type of a discovered linkset, either SCTP IP, serial, HSL, mixed, or other. Other means no links have been defined for the linkset. See <a href="#">HSL</a> , <a href="#">mixed linkset</a> , <a href="#">SCTP</a> , <a href="#">serial</a> , <a href="#">virtual linkset</a> .                                                                                                                                   |
| <b>local authentication</b> | Type of MWTM security authentication that allows the creation of user accounts and passwords local to the MWTM system. When using this method, usernames, passwords, and access levels are managed using MWTM commands. Contrast with <a href="#">Solaris authentication</a> .<br><br>For more information on Solaris authentication, see the "Implementing Secure User Access (Server Only)" section on page 2.                   |
| <b>local IP address</b>     | IP address used by the MWTM client to connect to the MWTM server.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>local point code</b>     | Point code of the primary signaling point for a linkset. Contrast with <a href="#">adjacent point code</a> .                                                                                                                                                                                                                                                                                                                       |
| <b>local VPN IP address</b> | IP address used by the MWTM client to connect to the MWTM server via VPN. See <a href="#">local IP address</a> , <a href="#">VPN</a> .                                                                                                                                                                                                                                                                                             |

## M

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>M3UA</b>                        | MTP3 User Adaptation layer. A protocol for supporting the transport of any SS7 MTP3 user signaling over the IP network. M3UA provides a seamless operation of the MTP3 user peers in the SS7 and IP domains. See <a href="#">MTP3</a> .                                                                                                                                                                                                                            |
| <b>managed object</b>              | Node, application server, application server process, application server process association, link, linkset, node, signaling gateway-mated pair, or signaling point that is being managed by the MWTM.                                                                                                                                                                                                                                                             |
| <b>Management Information Base</b> | See <a href="#">MIB</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>MAP</b>                         | Mobile Application Part. An SS7 protocol that allows for the implementation of mobile network signaling infrastructure. See <a href="#">SS7</a> .                                                                                                                                                                                                                                                                                                                  |
| <b>mask</b>                        | <p>Bit combination used in the MWTM to indicate the significant bits of the point code.</p> <p>For ANSI and China standard networks using the default 24-bit point code format, the default mask is <b>255.255.255</b>.</p> <p>For ITU networks using the default 14-bit point code format, the default mask is <b>7.255.7</b>.</p> <p>For NTT and TTC networks using the default 16-bit point code format, the default mask is <b>31.15.127</b>.</p>              |
| <b>Message Log Server</b>          | Multi-threaded process that logs messages from the Data Server, Process Manager, and MWTM client. See also <a href="#">Data Server</a> , <a href="#">Process Manager</a> , <a href="#">Trap Receiver</a> .                                                                                                                                                                                                                                                         |
| <b>MIB</b>                         | Management Information Base. Database of network management information that is used and maintained by a network management protocol such as SNMP. The value of a MIB object can be changed or retrieved using SNMP commands, usually through a GUI network management system. MIB objects are organized in a tree structure that includes public (standard) and private (proprietary) branches.                                                                   |
| <b>mixed linkset</b>               | Linkset in which the links are of two or more types. (This configuration is not recommended.)                                                                                                                                                                                                                                                                                                                                                                      |
| <b>MLR</b>                         | Multi-Layer SMS Routing. Scheme that enables intelligent routing of Short Message Service (SMS) mobile originated (MO) messages based on the application or service from which they originated or to which they are destined. The MLR feature can make SMS message routing decisions based on information found in the TCAP, MAP, and MAP-user layers; MAP operation codes MAP-MT-FORWARD-SM and SEND-ROUTING-INFO-FOR-SM; and ANSI TCAP and IS-41 MAP operations. |
| <b>mobile switching center</b>     | See <a href="#">MSC</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>MSC</b>                         | Mobile switching center. Provides telephony switching services and controls calls between telephone and data systems.                                                                                                                                                                                                                                                                                                                                              |
| <b>MSU</b>                         | Message Signal Unit. MSUs provide MTP protocol fields and are the workhorses of the SS7 network. All signaling associated with call setup and teardown, database query and response, and SS7 management requires the use of MSUs. See <a href="#">MTP3</a> .                                                                                                                                                                                                       |

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MTP3</b>                        | Message Transfer Part, level 3. An SS7 protocol that routes SS7 signaling messages to public network nodes by means of destination point codes, which allow messages to be addressed to specific signaling points. See <a href="#">SS7</a> .                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Multi-Layer SMS Routing</b>     | See <a href="#">MLR</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Multiple Instance</b>           | ITP feature that makes it possible to connect an ITP to different networks at one time, each with specific variant and network indicator values. The ITP treats each combination of variant and network indicator as a separate “instance” or signaling point with its own local point code and routing table on the ITP. Each instance is part of the SS7 network and shares the same variant and network indicator. In order for instances in the same network to be properly managed they must be assigned the same network name. See <a href="#">cross-instance GTT file</a> , <a href="#">Instance Translation</a> . |
| <b>N</b>                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>name server</b>                 | Server connected to a network that resolves network names into network addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>NAT</b>                         | Network Address Translation. Internet standard that enables a LAN to use one set of IP addresses for internal traffic and a second set of addresses for external traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Network Address Translation</b> | See <a href="#">NAT</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>network indicator</b>           | See <a href="#">NI</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>network management system</b>   | See <a href="#">NMS</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>network view</b>                | See <a href="#">view</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Network Time Protocol</b>       | See <a href="#">NTP</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>new node</b>                    | Node that the MWTM has newly discovered, and that has not yet been added to the current view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>NI</b>                          | Network indicator. Information within the service information octet of the MSU that permits discrimination between national and international messages. See <a href="#">MSU</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>NMS</b>                         | Network management system. System responsible for managing at least part of a network. An NMS is generally a reasonably powerful and well-equipped computer such as an engineering workstation. NMSes communicate with agents to help keep track of network statistics and resources.                                                                                                                                                                                                                                                                                                                                     |

**node** Endpoint of a network connection or a junction common to two or more lines in a network. Nodes can be processors, controllers, or workstations. Nodes, which vary in routing and other functional capabilities, can be interconnected by links, and serve as control points in the network.

In ITP, a node is a Cisco ITP or a legacy SS7 device (SSP, SCP, or STP).

In RAN-O networks, a node is a Cisco Mobile Wireless Router (MWR), Optical Networking System (ONS), RAN service module, or a legacy RAN device (BTS or BSC).

See [legacy device](#).

**Node B** Physical unit for radio transmission/reception with cells in the UTRAN.

**node name** Name of a node. This is either the DNS name of the node, or a user-specified name. See [display name](#), [DNS name](#).

**nonrecursive Discovery** Discovery of seed nodes only. The MWTM discovers all seed nodes and attempts to manage them, then marks all nodes that are adjacent to those seed nodes as Unmanaged. Contrast with [recursive Discovery](#).

**Non-Stop Operation** See [NSO](#).

**note** User-defined descriptive string attached to an object.

**NSO** Non-Stop Operation. Implementation of redundant data elements and software functionality, enabling networks to approach 99.999% availability. See also [RF](#).

**NTP** Network Time Protocol. Timing protocol that maintains a common time among Internet hosts in a network.

## O

**object** Node, application server, application server process, application server process association, link, linkset, node, signaling gateway-mated pair, or signaling point that has been discovered by the MWTM.

**output linkset** See [destination linkset](#).

## P

**PDP** Packet Data Protocol. Network protocol used by external packet data networks that communicate with a GPRS network. IP is an example of a PDP supported by GPRS. Refers to a set of information (such as a charging ID) that describes a mobile wireless service call or session, which is used by mobile stations and GGSNs in a GPRS network to identify the session.

**PCRF** Policy and Charging Rules Function.

**PDNGW** Packet Data Node Gateway.

**PDSN** Packet Data Serving Node.

**PDU** Protocol Data Unit. OSI term for packet.

|                             |                                                                                                                                                                                                                                                                                                      |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ping</b>                 | Packet internet groper. ICMP echo message and its reply. Often used in IP networks to test the reachability of a network device.                                                                                                                                                                     |
| <b>point code</b>           | A unique address code that identifies a service provider within a signaling network. Also called <a href="#">primary point code</a> . See <a href="#">capability point code</a> , <a href="#">destination point code</a> , <a href="#">local point code</a> , <a href="#">secondary point code</a> . |
| <b>polling</b>              | Access method in which a primary network device inquires, in an orderly fashion, whether secondaries have data to transmit. The inquiry occurs in the form of a message to each secondary that gives the secondary the right to transmit.                                                            |
| <b>poll interval</b>        | Time between polls.                                                                                                                                                                                                                                                                                  |
| <b>poll response</b>        | Time taken by a node to respond to MWTM poll requests.                                                                                                                                                                                                                                               |
| <b>port</b>                 | In IP terminology, an upper-layer process that receives information from lower layers. Ports are numbered, and each numbered port is associated with a specific process. For example, SMTP is associated with port 25. A port number is also called a well-known address.                            |
| <b>preferences</b>          | Settings that enable a user to change the way the MWTM presents information.                                                                                                                                                                                                                         |
| <b>primary node</b>         | In the MWTM, for a given pair of connected signaling points or nodes, the signaling point or node that the MWTM discovered first. See <a href="#">adjacent node</a> .                                                                                                                                |
| <b>primary point code</b>   | See <a href="#">point code</a> .                                                                                                                                                                                                                                                                     |
| <b>primary SNMP address</b> | IP address used by SNMP to poll the node. (There might be other IP addresses on the node that are not the primary SNMP address.) Contrast with <a href="#">secondary IP address</a> .                                                                                                                |
| <b>process</b>              | Internal component of the MWTM. See <a href="#">Data Server</a> , <a href="#">Message Log Server</a> , <a href="#">Process Manager</a> , <a href="#">Trap Receiver</a> .                                                                                                                             |
| <b>Process Manager</b>      | Multi-threaded process that handles the management of registered MWTM processes. See also <a href="#">Data Server</a> , <a href="#">Message Log Server</a> , <a href="#">Trap Receiver</a> .                                                                                                         |

## Q

|                           |                                                                                                                                       |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>QoS</b>                | Quality of service. Measure of performance for a transmission system that reflects its transmission quality and service availability. |
| <b>Quality of Service</b> | See <a href="#">QoS</a> .                                                                                                             |

## R

|                                 |                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Radio Network Controller</b> | See <a href="#">RNC</a> .                                                                                                                                                   |
| <b>RAN</b>                      | Radio Access Network.                                                                                                                                                       |
| <b>RAN backhaul</b>             | The end-to-end RAN connections between the BTS or Node B at the cell site and the BSC or RNC. See also <a href="#">virtual RAN backhaul</a> , <a href="#">IP backhaul</a> . |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RAN shorthaul</b>        | An interface that transports GSM or UMTS voice and data traffic between the BTS or Node-B and the RAN-O node at the cell site. At the aggregation site, RAN shorthauls exist between the RAN-O node and the BSC or RNC.                                                                                                                                                                                                                                                |
| <b>RAN-O</b>                | RAN optimization. Standard-based, end-to-end, IP connectivity for GSM and UMTS RAN transport. The Cisco solution puts RAN voice and data frames into IP packets at the cell-site, and transports them seamlessly over an optimized backhaul network. At the central site, the RAN frames are extracted from IP packets, and the GSM or UMTS data streams are rebuilt.                                                                                                  |
| <b>read community</b>       | See <a href="#">community string</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>recursive Discovery</b>  | Discovery of the entire network. The MWTM discovers all seed nodes and attempts to manage them; then attempts to discover and manage all ITP nodes that are adjacent to those seed nodes (unless the nodes are connected by serial links only); then attempts to discover and manage all ITP nodes that are adjacent to <i>those</i> nodes; and so on, until the MWTM has discovered the entire network.<br><br>Contrast with <a href="#">nonrecursive Discovery</a> . |
| <b>Redundancy Framework</b> | See <a href="#">RF</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>RF</b>                   | Redundancy Framework. Mechanism for logical redundancy of software functionality, designed to support 1:1 redundancy on processor cards. See also <a href="#">NSO</a> .                                                                                                                                                                                                                                                                                                |
| <b>RNC</b>                  | Radio Network Controller. Network element that controls one or more Node B transceiver stations in the UTRAN.                                                                                                                                                                                                                                                                                                                                                          |
| <b>route</b>                | Path through an internetwork.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>route set</b>            | Set of routes with the same destination point code.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>route table</b>          | Table used in ITP to locate a destination linkset for a packet whose destination point code does not match the ITP's local point code.                                                                                                                                                                                                                                                                                                                                 |
| <b>routing key</b>          | Set of SS7 parameters that uniquely define the range of signaling traffic to be handled by a particular application server or application server route table. Thus, the routing key identifies an application server or an application server route table. See <a href="#">application server</a> , <a href="#">application server process</a> , <a href="#">application server process association</a> , <a href="#">signaling gateway-mated pair</a>                 |

## S

|             |                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SCCP</b> | Signaling Connection Control Part. A routing protocol in SS7 protocol suite in layer 4 that provides end-to-end routing for TCAP messages. SCCP also provides the means by which an STP can perform global title translation, a procedure by which the destination signaling point and subsystem number is determined from digits present in the signaling message. See also <a href="#">TCAP</a> . |
| <b>SCP</b>  | Service control point. An element of an SS7-based Intelligent Network that performs various service functions, such as number translation, call setup and teardown, and so on.                                                                                                                                                                                                                      |
| <b>SCTP</b> | Stream Control Transmission Protocol. An end-to-end, connection-oriented protocol that transports data in independent sequenced streams.                                                                                                                                                                                                                                                            |
| <b>SGW</b>  | Serving Gateway.                                                                                                                                                                                                                                                                                                                                                                                    |

|                                           |                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>secondary IP address</b>               | Alternate or backup IP address used by a node. Contrast with <a href="#">primary SNMP address</a> .                                                                                                                                                                                                                                                 |
| <b>secondary point code</b>               | Alternate or backup point code used by a signaling point. See <a href="#">point code</a> .                                                                                                                                                                                                                                                          |
| <b>seed file</b>                          | List of seed nodes. See <a href="#">seed node</a> .                                                                                                                                                                                                                                                                                                 |
| <b>seed node</b>                          | Node used by the MWTM to discover the other objects in your network.                                                                                                                                                                                                                                                                                |
| <b>serial</b>                             | Method of data transmission in which the bits of a data character are transmitted sequentially over a single channel.                                                                                                                                                                                                                               |
| <b>server</b>                             | Node or software program that provides services to clients. See <a href="#">client</a> .                                                                                                                                                                                                                                                            |
| <b>service control point</b>              | See <a href="#">SCP</a> .                                                                                                                                                                                                                                                                                                                           |
| <b>service switching point</b>            | See <a href="#">SSP</a> .                                                                                                                                                                                                                                                                                                                           |
| <b>SGMP</b>                               | See <a href="#">signaling gateway-mated pair</a> .                                                                                                                                                                                                                                                                                                  |
| <b>SGSN</b>                               | Serving GPRS Support Node. Node that connects the radio access network to the GPRS or UMTS core and tunnels user sessions to the GGSN.                                                                                                                                                                                                              |
| <b>signaling gateway-mated pair</b>       | Pair of signaling gateways that exchange necessary state information using the Signaling Gateway-Mated Protocol (SGMP). See <a href="#">application server</a> , <a href="#">application server process</a> , <a href="#">application server process association</a> , <a href="#">routing key</a> , <a href="#">signaling gateway-mated pair</a> . |
| <b>Signaling Gateway-Mated Protocol</b>   | Protocol that enables two Cisco ITP M3UA/SUA signaling gateways to act as a mated pair and exchange necessary state information. See <a href="#">signaling gateway-mated pair</a> .                                                                                                                                                                 |
| <b>signaling point</b>                    | See <a href="#">SP</a> .                                                                                                                                                                                                                                                                                                                            |
| <b>signal transfer point</b>              | See <a href="#">STP</a> .                                                                                                                                                                                                                                                                                                                           |
| <b>Signaling System 7</b>                 | See <a href="#">SS7</a> .                                                                                                                                                                                                                                                                                                                           |
| <b>Simple Network Management Protocol</b> | See <a href="#">SNMP</a> .                                                                                                                                                                                                                                                                                                                          |
| <b>SMPP</b>                               | Short Message Peer-to-Peer Protocol. A messaging protocol meant to simplify integration of data applications with wireless mobile networks such as GSM.                                                                                                                                                                                             |
| <b>SNMP</b>                               | Simple Network Management Protocol. Network management protocol used almost exclusively in TCP/IP networks. SNMP provides a means to monitor and control network devices, and to manage configurations, statistics collection, performance, and security.                                                                                           |
| <b>SOAP</b>                               | Simple Object Access Protocol. A protocol for exchanging XML-based messages over computer networks. See <a href="#">XML</a> .                                                                                                                                                                                                                       |

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Solaris authentication</b>               | <p>Type of MWTM security authentication that uses standard Solaris-based user accounts and passwords, as specified in the <i>/etc/nsswitch.conf</i> file. You can provide authentication with the local <i>/etc/passwd</i> file or from a distributed Network Information Services (NIS) system. Contrast with <a href="#">local authentication</a>.</p> <p>For more information on Solaris authentication, see the “Implementing Secure User Access (Server Only)” section on page 2.</p> |
| <b>SP</b>                                   | Signaling point. An SCP, SSP, or STP, or an ITP instance. See <a href="#">SCP</a> , <a href="#">SSP</a> , or <a href="#">STP</a> .                                                                                                                                                                                                                                                                                                                                                         |
| <b>spring layout</b>                        | Topology map layout in which objects are arranged in a spring layout. Objects with the most links are drawn closer to the center of the map, while objects with fewer links are drawn farther away. Contrast with <a href="#">circle layout</a> . See <a href="#">topology map</a> .                                                                                                                                                                                                       |
| <b>SS7</b>                                  | Signaling System 7. Standard CCS system used with BISDN and ISDN. Developed by Bellcore.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SSL</b>                                  | Secure Sockets Layer. A protocol for transmitting private documents via the Internet.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SSP</b>                                  | Service switching point. Element of an SS7-based Intelligent Network that performs call origination, termination, or tandem switching.                                                                                                                                                                                                                                                                                                                                                     |
| <b>status</b>                               | Current condition, such as Active or Unknown, of a network object.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>status polling</b>                       | Regularly scheduled polling of nodes performed by the MWTM. Contrast with <a href="#">demand polling</a> .                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>STP</b>                                  | Signal transfer point. Element of an SS7-based Intelligent Network that performs routing of the SS7 signaling.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>SUA</b>                                  | SCCP User Adaptation. A client/server protocol that provides a gateway to the legacy SS7 network for IP-based applications that interface at the SCCP layer. See also <a href="#">SCCP</a> .                                                                                                                                                                                                                                                                                               |
| <b>Stream Control Transmission Protocol</b> | See <a href="#">SCTP</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>subview</b>                              | A view within a customized view. You can create subviews on an MWTM client, with each subview devoted to a different part of the network. You can then load a subview to manage a different part of the network, or switch to the DEFAULT view to see the entire network. See also <a href="#">DEFAULT view</a> .                                                                                                                                                                          |
| <b>superuser</b>                            | <p>User specified in the MWTM to be able to perform most functions that otherwise require the user to be logged in as the root user.</p> <p>For more information, see the “Specifying a Super User (Server Only)” section on page 19.</p>                                                                                                                                                                                                                                                  |
| <b>system object ID</b>                     | See <a href="#">device type</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|             |                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TCP</b>  | Transmission Control Protocol. Connection-oriented transport layer protocol that provides reliable full-duplex data transmission. TCP is part of the TCP/IP protocol stack. See also <a href="#">TCP/IP</a> .                                                                          |
| <b>TCAP</b> | Transaction Capabilities Application Part. An SS7 protocol that enables the deployment of advanced intelligent network services by supporting non-circuit related information exchange between signaling points using the SCCP connectionless service. See also <a href="#">SCCP</a> . |

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TCP/IP</b>                                          | Transmission Control Protocol/Internet Protocol. Common name for the suite of protocols developed by the U.S. DoD in the 1970s to support the construction of worldwide internetworks. TCP and IP are the two best-known protocols in the suite. See also <a href="#">IP</a> and <a href="#">TCP</a> .                                                                               |
| <b>TFTP</b>                                            | Trivial File Transfer Protocol. A protocol that is used to transfer small files between hosts of a network. See also <a href="#">host</a> .                                                                                                                                                                                                                                          |
| <b>thread name</b>                                     | Task name.                                                                                                                                                                                                                                                                                                                                                                           |
| <b>timeout</b>                                         | Event that occurs when one network device expects to hear from another network device within a specified period of time, but does not. The resulting timeout usually results in a retransmission of information or the dissolving of the session between the two devices.                                                                                                            |
| <b>tooltip</b>                                         | Popups that display information about objects and table entries.                                                                                                                                                                                                                                                                                                                     |
| <b>topology</b>                                        | See <a href="#">topology map</a> .                                                                                                                                                                                                                                                                                                                                                   |
| <b>topology map</b>                                    | Graphical representation by the MWTM of the network. Also called <a href="#">topology</a> .                                                                                                                                                                                                                                                                                          |
| <b>Transmission Control Protocol</b>                   | See <a href="#">TCP</a> .                                                                                                                                                                                                                                                                                                                                                            |
| <b>Transmission Control Protocol/Internet Protocol</b> | See <a href="#">TCP/IP</a> .                                                                                                                                                                                                                                                                                                                                                         |
| <b>trap</b>                                            | Unsolicited message sent by an SNMP agent to an NMS, console, or terminal to indicate the occurrence of a significant event, such as a specifically defined condition or a threshold that has been reached.                                                                                                                                                                          |
| <b>trap forwarding</b>                                 | Forwarding MWTM events to other hosts, in the form of SNMP traps. This enables the MWTM to integrate with high-level event- and alarm-monitoring systems such as the Cisco Info Center (CIC) and Micromuse's Netcool suite of products. These systems can provide a single high-level view of all alarm monitoring in your network, making it easier to detect and resolve problems. |
| <b>Trap Receiver</b>                                   | Multi-threaded process that receives SNMP traps for the MWTM. See also <a href="#">Data Server</a> , <a href="#">Message Log Server</a> , <a href="#">Process Manager</a> .                                                                                                                                                                                                          |
| <b>Trivial File Transfer Protocol</b>                  | See <a href="#">TFTP</a> .                                                                                                                                                                                                                                                                                                                                                           |
| <b>U</b>                                               |                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>UDP</b>                                             | User Datagram Protocol. Connectionless transport layer protocol in the TCP/IP protocol stack. UDP is a simple protocol that exchanges datagrams without acknowledgments or guaranteed delivery, requiring that error processing and retransmission be handled by other protocols. UDP is defined in RFC 768.                                                                         |
| <b>UMTS</b>                                            | Universal Mobile Telecommunications System. Third generation wireless standard for supporting data transfer rates of 144 kbs (vehicular), 384 kbs (pedestrian), or up to 2 Mbps in buildings.                                                                                                                                                                                        |
| <b>UMTS Terrestrial RAN</b>                            | See <a href="#">UTRAN</a> .                                                                                                                                                                                                                                                                                                                                                          |

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>unignore</b>                                   | Stop ignoring the selected object at the next polling cycle. See also <a href="#">ignore</a> .                                                                                                                                                                                                                                                                                                     |
| <b>unknown</b>                                    | Device type for which the MWTM is unable to determine the device type. If a node, the node failed to respond to an SNMP request. If a linkset or link, either the associated node failed to respond to an SNMP request, or the MWTM found that the linkset or link no longer exists. Contrast with <a href="#">discovered</a> .                                                                    |
| <b>Universal Mobile Telecommunications System</b> | See <a href="#">UMTS</a> .                                                                                                                                                                                                                                                                                                                                                                         |
| <b>unmanaged</b>                                  | Node status in which the node is known indirectly by the MWTM (the MWTM knows the device exists but no known SNMP stack exists on the device for the MWTM to query), or a user has set the node to this status to prevent the MWTM from polling the node.                                                                                                                                          |
| <b>User-Based Access</b>                          | <p>MWTM security scheme that provides multi-level password-protected access to MWTM features. Each user can have a unique username and password. Each user can also be assigned to one of five levels of access, which control the list of MWTM features accessible by that user.</p> <p>For more information, see the “Configuring User Access” section in Chapter 2, “Configuring Security.”</p> |
| <b>User Datagram Protocol</b>                     | See <a href="#">UDP</a> .                                                                                                                                                                                                                                                                                                                                                                          |
|                                                   | Amount of an object’s send or receive capacity that is being used, expressed as a percentage or in Erlangs.                                                                                                                                                                                                                                                                                        |
| <b>UTRAN</b>                                      | UMTS Terrestrial RAN. Radio access network for UMTS networks.                                                                                                                                                                                                                                                                                                                                      |
| <b>V</b>                                          |                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>variant</b>                                    | <p>A method of identifying SS7 point codes. Example point code variants are:</p> <p>ITU: 3-8-3 format is common, made up of 14 bits</p> <p>ANSI: 8-8-8 format is common, made up of 24 bits</p>                                                                                                                                                                                                    |
| <b>view</b>                                       | View that is currently in use on an MWTM client. The current view can be the DEFAULT view or a customized view. A customized view can have one or more subviews. See <a href="#">client view</a> , <a href="#">current view</a> , <a href="#">DEFAULT view</a> .                                                                                                                                   |
| <b>virtual RAN backhaul</b>                       | A grouping of RAN backhauls. A virtual RAN backhaul is useful if you have configured several RAN backhauls for the same interface. To view the for that interface, create a virtual RAN backhaul that contains all the real backhauls that you have configured for the interface. See <a href="#">RAN backhaul</a> .                                                                               |
| <b>virtual link</b>                               | Link that connects signaling point instances running on the same device. The MWTM does not poll virtual links, nor does it display real-time data or accounting statistics for virtual links.                                                                                                                                                                                                      |

**virtual linkset** Linkset in which the links are virtual links, which connect signaling point instances running on the same device. The MWTM does not poll virtual linksets, nor does it display real-time data or accounting statistics for virtual linksets.

**Note** Prior to IOS release 12.2(23)SW1, virtual linksets on multi-instance routers were created manually by the user. Within and after that release, virtual linksets are created automatically.

**Virtual Private Network** See [VPN](#).

**VPDN** Virtual Private Dialup Network.

**VPN** Virtual Private Network. Enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic from one network to another. A VPN uses “tunneling” to encrypt all information at the IP level.

**VRF** Virtual Routing and Forwarding.

## W

**World Wide Web** See [WWW](#).

**WWW** World Wide Web. Large network of Internet servers providing hypertext and other services to terminals running client applications such as a browser. See also *browser*.

## X

**XML** Extended Markup Language. A general-purpose markup language for to facilitating the sharing of data across different information systems connected through the Internet. See [SOAP](#).
