CONTENTS

Preface xxxv

CHAPTER 1

Overview 1-1

- What Is MWTM? 1-1
 - Server and Network Features 1-2
 - Graphical User Interface and Web Features 1-2
 - Event Monitoring Features 1-3
 - Performance Features 1-3
 - Provisioning Features 1-3
 - Security Features 1-4
 - Topology Features 1-4
 - Troubleshooting Features 1-5
 - Customization Features 1-5
 - Integration Features 1-5
- What Is ITP? 1-6
- What Is CDT? 1-7
- What Is IPRAN? 1-7
- What Is PWE3? 1-8
- What Is RAN-O? 1-8
- What Is mSEF? 1-9
- What is LTE? 1-10
- How Do I Identify My Network Type? 1-10
- What Is Client/Server Architecture? 1-11

CHAPTER 2

Configuring Security 2-1

- Configuring User Access 2-1
 - Implementing Secure User Access (Server Only) 2-2
 - Security Authentication 2-2
 - Configuring User Levels 2-5
 - Configuring User Passwords 2-5
 - Enabling Secure User Access 2-6
 - Creating Secure Passwords 2-7
 - Configuring MWTM User Account Levels (Server Only) 2-7
 - Basic User (Level 1) Access 2-8

Power User (Level 2) Access	2-8
Network Operator (Level 3) Access	2-9
Network Administrator (Level 4) Access	2-9
System Administrator (Level 5) Access	2-9
Custom User Level 1 (Level 11) Access	2-10
Custom User Level 2 (Level 12) Access	2-10
Automatically Disabling Users and Passwords (Server Only)	2-10
Manually Disabling Users and Passwords (Server Only)	2-12
Enabling and Changing Users and Passwords (Server Only)	2-13
Displaying a Message of the Day	2-15
Manually Synchronizing Local MWTM Passwords (Server Only)	2-16
Listing All Currently Defined Users (Server Only)	2-16
Displaying the Contents of the System Security Log (Server Only)	2-17
Restoring Security-Related MWTM Data (Server Only)	2-18
Disabling MWTM User-Based Access (Server Only)	2-18
Specifying a Super User (Server Only)	2-19
Implementing SSL Support in the MWTM	2-21
Enabling SSL Support on the MWTM Server	2-21
Downloading the MWTM SSL Module for Windows Using the Web Interface	2-23
Downloading the Self-Signed SSL Certificate from the MWTM Server	2-23
Launching the MWTM Certificate Tool for SSL	2-24
Importing an SSL Certificate to an MWTM Client	2-25
Exporting an SSL Certificate	2-26
Viewing Detailed Information About a SSL Certificate	2-26
Managing SSL Support in the MWTM	2-27
Enabling SSL for the Firefox Web Client	2-28
Disabling SSL Support in the MWTM	2-28
Limiting MWTM Client Access to the MWTM Server (Server Only)	2-29
Backing Up or Restoring MWTM Files (Server Only)	2-30
Backing Up MWTM Data Files	2-30
Changing the Backup Directory	2-31
Setting the Number of Backup Days	2-31
Restoring MWTM Data Files	2-31
Removing MWTM Data from the MWTM Server	2-32
CHAPTER 3	Getting Started 3-1
Starting the MWTM Server	3-1
Becoming the Root User (Server Only)	3-2
Starting the MWTM Client	3-3

Before Starting the MWTM Client	3-3
Setting the DISPLAY Variable for Solaris or Linux Clients	3-3
Starting the MWTM Client on Solaris or Linux	3-3
Access the Node	3-4
Starting the MWTM Client on Windows	3-4
Discovering Your Network	3-4
Discovery Overview	3-5
Launching the Discovery Dialog	3-6
Discovery Dialog Menu	3-6
Discovery Dialog Tabs	3-7
Loading Seed Nodes and Seed Files	3-7
Loading a Seed Node	3-7
Loading a Seed File	3-8
Saving a Seed File	3-8
Creating a New Seed File	3-10
Changing an Existing Seed File	3-11
Creating and Changing Seed Files Using a Text Editor	3-11
Running Discovery	3-12
Discovery Settings	3-12
Discovered Nodes	3-14
Verifying Discovery	3-14
Displaying the MWTM Main Window	3-14
Navigational Features	3-15
MWTM Client Navigation Tree	3-16
MWTM Client Content Area	3-17
Displaying Summary Lists Alarms	3-17
Right-Click Menu for the Summary Lists	3-18
Using the MWTM Main Menu	3-18
Using the MWTM Toolbar	3-23
Accessing the MWTM Through a Web Browser	3-24
Loading and Saving MWTM Files	3-25
Using the Windows Start Menu	3-26
Changing the Default MWTM Server Name	3-26
Launching the MWTM Client	3-27
Launching the MWTM DOS Prompt	3-27
Launching the MWTM Event Editor	3-27
Launching the MWTM SSL Certificate Tool	3-27
Displaying the MWTM README File	3-27
Uninstalling the MWTM	3-28

Locating Technology Specific Information 3-28

Exiting the MWTM Client 3-30

CHAPTER 4

Setting Up Your Server 4-1

Importing SNMP Community Names from CiscoWorks (Solaris Only) 4-2

Changing MWTM Server Poller Settings 4-2

Changing the Message Display 4-4

Changing the Location of MWTM Message Log Files 4-4

Changing the Size of the MWTM Message Log Files 4-4

Changing the Time Mode for Dates in Log Files 4-5

Changing the Age of the MWTM Message Log Files 4-5

Setting the ITP Point Code Format 4-5

Connecting a Single-Instance ITP to a Multiple-Instance ITP 4-6

Enabling SNMP Traps 4-7

Limiting Traps by IP Address 4-9

Configuring a Backup MWTM Server 4-10

Configuring an MWTM Client Connection Timer 4-11

Enabling the Terminal Server Proxy Service 4-11

Setting Up TFTP on Your Server (ITP Only) 4-12

Setting Up TFTP on Solaris 4-12

Setting Up TFTP on Linux 4-13

Configuring Nodes 4-14

Node SNMP and Credentials Menu 4-15

Configuring SNMP Settings 4-15

SNMP Settings Table 4-16

SNMP Configuration Table 4-16

SNMP Configuration Buttons 4-18

SNMP Configuration Commands 4-18

Configuring Login Credentials 4-20

Setting Up Login Credentials 4-20

Credentials Fields 4-21

Credentials Buttons 4-22

Adding Nodes 4-22

Credentials Commands 4-22

Creating New Troubleshooting Categories and Commands 4-23

CHAPTER 5

Basic Operations 5-1

Changing Client and Web Preference Settings 5-1

Changing Client Preference Settings	5-2
Displaying the Preferences Menu	5-2
Changing General GUI Settings	5-3
Changing Alarm and Event Settings	5-7
Changing Charts Settings	5-11
Changing Status Settings	5-11
Changing CiscoWorks Server Settings	5-13
Changing Topology Settings	5-13
Changing Deploy Settings	5-15
Customizing Colors	5-16
Restoring Default Preference Settings	5-18
Changing Web Preference Settings	5-18
Changing Real-Time Poller and Counter Settings	5-20
Viewing Online Help	5-21
Finding Information in a Window	5-22
Navigating Table Columns	5-23
Printing Windows	5-24
Managing and Deploying ITP Files	5-24
Node File Management	5-24
Node File Management Menu	5-25
Node File Management MWTM Pane	5-28
Node File Management Node Pane	5-29
Node Archive Management	5-31
Node Archive Management Menu	5-31
Node Archive Management Selector Pane	5-31
Node Archive Management Display Pane	5-32
Deploying ITP Files	5-33
Exporting Data	5-35
Exporting Current Data for Network Objects	5-35
Exporting Current Node Names and SNMP Community Names	5-36
Integrating the MWTM with Other Products	5-36
Integrating the MWTM with CiscoWorks	5-36
Launch CiscoWorks Applications from the MWTM Client	5-37
Launch Integrated Applications from the MWTM Web Interface	5-38
Launch the MWTM Web Interface from the CiscoWorks Dashboard	5-38
Forwarding Traps to Other Hosts (Server Only)	5-38
Running Simultaneous Client Sessions	5-39
Performing Basic Server Operations	5-39
Connecting to a New Server	5-40

Viewing Server Status Information	5-40
Server Status Information: Fields and Buttons	5-41
Server Status Information: Processes	5-41
Server Status Information: Pollers	5-41
Server Status Information: Tasks	5-42
Server Status Information: Clients	5-42
Using the Command Line Interface	5-43

CHAPTER 6

Managing Views 6-1

Overview	6-1
Initial View Selection	6-1
Custom View and Subviews	6-2
Viewing Basic Information for Custom Views	6-2
Right-Click Menu for Views	6-3
Views Summary List Table	6-3
Viewing Detailed Information for Views	6-4
Editing a View	6-5
Saving a View	6-5
Creating a New View	6-7
View Editor Window Menu	6-8
Objects In Current View	6-9
Right-Click Menu for a View	6-9
Right-Click Menu for a Subview	6-10
Right-Click Menu for an Object	6-10
View Objects Pane	6-10
Excluded/New Objects Pane	6-11
Excluded from View	6-11
New on the Network	6-11
Filter pane	6-12
View Editor Buttons	6-13
Closing the View Editor Window	6-13
Choosing a View	6-13
Loading the DEFAULT View	6-14
Loading a Client-Specific View	6-14

CHAPTER 7

Understanding Basic Object Functions 7-1

Displaying Object Windows	7-2
Right-Click Menu for All Objects	7-3

Alarms Table	7-4
Nodes Table	7-5
Signaling Points Table	7-9
Linksets Table	7-11
Links Table	7-14
Application Servers Table	7-15
Application Server Processes Table	7-17
Application Server Process Associations Table	7-19
Signaling Gateway Mated Pairs Table	7-21
Interfaces Table	7-23
Cards Table	7-25
RAN Backhauls Table	7-27
RAN Shorthauls Table	7-29
PWE3 Backhauls Table	7-31
PWE3 Virtual Circuits	7-33
Access Point Names Table	7-35
Software Versions Table	7-35
IP Addresses Table	7-36
Point Code Table	7-36
Editing Properties	7-37
Editing Properties for a RAN-O Backhaul	7-41
Attaching Notes	7-42
Viewing Notes	7-43
Deleting Objects	7-44
Deleting an Object from Your Network	7-44
Deleting an Object from the MWTM Database	7-44
Deleting a Node from the MWTM Discovery Dialog	7-46
Unmanaging and Managing Nodes or ITP Signaling Points	7-46
Excluding Nodes or ITP Signaling Points from a View	7-48
Ignoring and Unignoring Objects	7-48

CHAPTER 8

Understanding Detailed Object Functions 8-1

Viewing the Right-Click Menu for an Object	8-2
Deploying a File Associated with an ITP Node or Signaling Point	8-6
Viewing Management Interfaces and Physical Folders	8-7
Viewing Status Contributors	8-7
Viewing Details	8-9
Address Information	8-11

Advanced Details (Web)	8-11
Association Information	8-11
Bandwidth Information	8-12
Capability Point Code	8-12
Description	8-13
Descriptive Information	8-13
General Information	8-13
Interfaces	8-13
ITP Application Servers	8-14
ITP Linksets	8-15
Interface Information	8-15
IP Addresses for SNMP	8-16
IP Addresses Not for SNMP	8-16
Links Information	8-16
Local IP Address Information	8-17
Naming Information	8-17
Nodes	8-18
Cards	8-19
Interfaces	8-19
ITP Application Servers	8-20
ITP Application Server Processes	8-20
ITP Application Server Process Associations	8-20
ITP Links	8-20
ITP Linksets	8-21
ITP Signaling Gateway-Mated Pairs	8-21
ITP Signaling Points	8-21
Point Code	8-22
Polling Information	8-23
Protection Information	8-24
PWE3 Information	8-24
QoS Information	8-24
RAN Information	8-25
Remote IP Address Information	8-25
Uptime Information	8-26
Status Information	8-26
Nodes	8-26
Interfaces and Cards	8-27
ITP Application Servers	8-30
ITP Application Server Processes	8-32
ITP Application Server Process Associations	8-32

ITP Links	8-34
ITP Linksets	8-35
ITP Signaling Gateway Mated Pairs	8-36
ITP Signaling Points	8-37
Threshold Information (RAN-O Only)	8-38
Editing SNMP IP Addresses for a Node	8-39
Viewing Troubleshooting	8-40
Troubleshooting Menu and Toolbar	8-41
Commands That Require Additional User Input	8-42
Viewing Alarms and Recent Events	8-42
About Provisioning	8-43
Prerequisites for Using Provisioning	8-47
Setting Up the MWTM to Retrieve Running Configuration from the Object	8-47
Using the Provisioning Wizard	8-48
Polling Nodes	8-49
Polling from the Discovery Dialog	8-49
Performing a Normal Poll	8-50
Performing a Clean Poll	8-50
Allowing and Disallowing Trap Processing for a Node	8-52
Viewing Real-Time Data	8-52
Viewing the Syslog	8-53
Viewing CPU and Memory Performance	8-54
Viewing CPU Processes	8-55
Viewing CPU Utilization	8-55
Viewing Historical CPU Utilization	8-56
Viewing Memory Utilization	8-58
Viewing Historical Memory Utilization	8-59
Viewing Trap Settings	8-60
Viewing Data for Interfaces	8-62
Real-Time Interface Performance	8-63
Real-Time Interface Errors/Discards	8-64
Real-Time Interface Advanced Details	8-66
Viewing Data for ITP Objects	8-68
Charts: Application Servers and Application Server Process Associations	8-70
Charts: Links and Linksets	8-72
Interface Details	8-74
Poll Settings	8-76
Q.752 Measurements	8-77
Right-Click Menu	8-79

SCTP Association Configuration Details	8-79
SCTP Association Statistics Details	8-81
Statistics: Application Servers	8-82
Statistics: Application Server Process Associations	8-83
Statistics: Links and Linksets	8-85
Status Details	8-88
Viewing ITP MTP3 Errors	8-92
Viewing ITP MSU Rates	8-93
Right-click Menu	8-93
Viewing Non-Stop Operation	8-94
Viewing TDM Statistics	8-100
Line Configuration Pane	8-100
Line Status Information Pane	8-103
Performance and Error Information Pane	8-103
Viewing RAN-O Performance Data	8-104
Viewing Shorthaul Performance Data	8-105
Viewing Backhaul Performance Data	8-106
Viewing RAN-O Error Data	8-109
Viewing Shorthaul Errors	8-110
Viewing Backhaul Errors	8-114
Viewing PWE3 Statistics	8-114
Viewing ITP Linkset Access Lists	8-116
Viewing ITP Linkset Statistics	8-116
Viewing Data Specific for ITP Signaling Points	8-117
Viewing Route Detail	8-118
Viewing GTT MAP Status	8-119
Viewing GTT Statistics	8-120
Viewing the MTP3 Event Log	8-123
Viewing MLR Details	8-124
Viewing MLR Counters	8-124
Viewing MLR Trigger Config	8-126
Viewing MLR Trigger Results	8-130
Viewing HSRP details	8-133
Viewing RAN Shorthauls	8-136
Viewing Chassis View	8-136
Creating Virtual RAN Backhauls	8-137
Viewing APN-Specific Tables	8-138
Viewing APN Instances	8-139
Viewing GGSN Nodes	8-140

Using the APN Search Tool 8-141

CHAPTER 9

Managing Alarms and Events 9-1

Basic Concepts and Terms 9-1

Event Definition 9-1

Alarm Definition 9-2

Displaying Active Alarms and Event History 9-3

Toolbar Buttons 9-8

Right-click Menus 9-10

Right-Click Menu for All Alarms and Events 9-10

Right-Click Menu for a Specific Alarm or Event 9-10

Managing Filters for Alarms and Events 9-11

Setting Alarm or Event Filters 9-11

Alarm and Event Filter Buttons 9-12

Alarm and Event Filter Panes 9-12

Selected Objects Settings 9-15

Event Filter Example 9-18

Loading Existing Filters 9-18

Saving Filter Files 9-19

Viewing Properties for Alarms and Events 9-20

Attaching Notes to Alarms or Events 9-22

Viewing Archived Event Files on the Web 9-23

Changing the Way the MWTM Processes Events 9-23

Changing Event Limits 9-25

Specifying SNMP Servers for Trap Forwarding 9-29

Changing Event Categories 9-30

Configuring Trap, Status Alarm, or User Action Events 9-31

Forwarding Events as Traps to Other Hosts 9-35

Setting Sounds for Events at an MWTM Client 9-36

Listing Event Sound Filters 9-36

Creating New Event Sound Filters 9-37

Adding Sound Files to the MWTM 9-39

Changing an Existing Event Sound Filter 9-40

Deleting Event Sound Filters 9-40

Playing and Muting Event Sounds 9-40

Event Processing 9-41

Event Queue Congestion 9-41

Trap Rate Limits 9-41

Database Archiving	9-42
Event Archival Process	9-42
Alarm Archival Process	9-43
File-based Archiving	9-46

CHAPTER 10

Viewing Network Topology 10-1

Topology Menu	10-2
Topology Toolbar Buttons	10-3
Topology Panes	10-5
View Objects and Connections Panes	10-5
Topology Map	10-8
Topology Right-Click Menu: Map	10-13
Topology Right-Click Menu: Object	10-13
Topology Alarm Pane	10-14
Creating a Custom Layout	10-14
Finding an Object	10-14
Using the Selection Dialog	10-15
Centering the Topology Map on an Object	10-15
Displaying Detailed Information About a Topology Map Element	10-16
Printing the Topology Map	10-16
Saving the Topology Map as a JPEG File	10-16
Selecting a Directory for the JPEG File	10-17
Activating a Magnetic Grid on the Topology Map	10-18
Specifying a Color for the Magnetic Grid	10-19
Swatches Pane (Recommended)	10-19
HSB Pane	10-19
RGB Pane	10-20
Select Grid Color Field and Buttons	10-20
Specifying a Background Color for the Topology Map	10-20
Swatches Pane (Recommended)	10-21
HSB Pane	10-21
RGB Pane	10-21
Select Background Color Field and Buttons	10-21
Aligning Objects on the Topology Map	10-22
Hiding and Displaying Non-ITP Nodes and Linksets	10-23
Locking and Unlocking the Position of an Icon	10-23
Improving Topology Performance	10-23

Turning Off Antialiasing	10-23
Connecting Locally for Large Networks—Solaris Clients Only	10-24
Hiding and Redrawing Connections When Redrawing	10-24
Hiding and Showing Connections When Redrawing	10-24
Saving the Topology Map	10-24
Restoring the Topology Map	10-25

CHAPTER 11

Accessing Data from the Web Interface 11-1

Supported Browsers	11-1
Checking Your Browser	11-2
Accessing the MWTM Web Interface	11-2
Overview of the MWTM Web Interface	11-3
MWTM Web Interface Navigation Tree	11-3
MWTM Web Interface Content Area	11-5
Customizing Date Ranges	11-5
Using the Toolbar	11-6
Displaying the Home Page	11-11
Downloading the MWTM Client from the Web	11-12
Downloading the Solaris Client	11-12
Downloading the Windows Client	11-12
Downloading the Linux Client (Unsupported)	11-12
Accessing Software Updates and Additional Information	11-13
Viewing the MWTM Technical Documentation	11-13
Displaying Alarms and Events	11-14
Displaying Summary Lists	11-14
Displaying Software Versions	11-14
Displaying Status and Summary Reports	11-15
Viewing Report Status	11-15
Performance Summary Hourly Report	11-16
Performance Summary Daily Report	11-17
Viewing Historical Statistics Report Settings	11-18
Tools	11-19
Launch Tools	11-20
Event Sounds	11-20
Search Tools	11-20
Searching for Home Agent Subscribers	11-21
Searching for APN Subscribers	11-21
Understanding Groups	11-22

Creating Groups	11-22
Editing Groups	11-23
Viewing Group Summary Information	11-24
Displaying Group Details	11-24
Viewing Group Details	11-25
Batch Provisioning	11-25
MWTM: File Dialog	11-26
Viewing Statistics	11-26
Displaying RAN-O Statistics	11-27
Displaying Shorthaul Performance Statistics	11-28
Displaying Backhaul Performance Statistics	11-28
Displaying Error Statistics	11-30
Displaying Shorthaul Error Statistics	11-31
Displaying Backhaul Error Statistics	11-32
Generating RAN Data Export Files	11-32
Displaying CSG2 Real-Time Statistics	11-33
Global Statistics	11-33
Global Statistics	11-34
Load Statistics	11-34
BMA Statistics	11-36
Quota Server Statistics	11-37
User Database Statistics	11-38
CSG2 Protocol	11-38
Gx Global Statistics	11-39
Global Message Statistics	11-39
Global Message Error Statistics	11-40
Gx Policy Preload	11-41
Policy Preload Statistics	11-41
Policy Preload Error Statistics	11-41
Gx Policy Preload Ext	11-42
Gx PCRF Method List Message	11-44
Gx PCRF Method List Message Error	11-45
Displaying BWG Real-Time Statistics	11-46
Global	11-46
Status	11-46
Creation and Deletion Statistics	11-47
Miscellaneous Statistics	11-48
Signaling Packet Statistics	11-49
DHCP Packet Statistics	11-49

Handoff Statistics	11-50
Data Packet Statistics	11-51
Dropped Packet Statistics	11-52
Profile Statistics	11-53
Rejected Statistics	11-54
Paths	11-54
User Groups	11-55
Sessions and Flow Statistics	11-55
Traffic Statistics	11-56
Displaying HA Real-Time Statistics	11-57
Global	11-57
Registrations Processed by AAA	11-57
Registration Requests	11-58
Standby Synchronization	11-58
IP Local Pool Config	11-59
IP Local Pool Stats	11-59
Displaying GGSN Real-Time Statistics	11-60
Global	11-60
GTP Statistics	11-61
Charging Statistics	11-61
GTP Throughput Statistics Ext	11-61
PDP Context Statistics	11-62
AAA Authentication Statistics	11-64
AAA Accounting Statistics	11-64
IP and UDP Statistics	11-65
SGSN Throughput	11-65
APN	11-66
APN Instance Throughput	11-66
APN Instance Throughput Ext	11-67
APN Instance PDP	11-67
APN Instance PDP Ext	11-68
APN Instance Miscellaneous	11-69
IP Local Pool Config	11-70
IP Local Pool Stats	11-71
Displaying PDSN Real-Time Statistics	11-71
System Statistics	11-71
Session Statistics	11-72
Flow Statistics	11-73
Session Bandwidth Statistics	11-74

PCF Statistics	11-74
Traffic Statistics	11-75
Displaying SGW Real-Time Statistics	11-77
AAA	11-77
AAA Authentication Statistics	11-77
AAA Accounting Statistics	11-78
APN Instance Throughput	11-79
APN Instance Throughput Ext	11-79
APN Instance Bearer	11-80
EPC Buffering	11-81
Buffering Configuration	11-81
Buffering Status	11-81
Buffering Statistics	11-82
EPC Overload Protection	11-82
Status Information	11-83
Congestion Threshold Information	11-83
Statistics Information	11-83
Congestion Times	11-83
GTP Statistics	11-84
GTP Active Statistics	11-84
Charging Statistics	11-84
GTP Bearer Statistics	11-85
GTP Throughput Statistics	11-85
GTP Throughput Statistics Ext	11-86
GTP Error Statistics	11-86
GTPv2 Statistics	11-86
GTPv2 Bearer Statistics	11-87
GTPv2 Session Statistics	11-87
GTPv2 Path Bearer Statistics	11-87
GTPv2 Path Session Statistics	11-88
GTP Path Error Statistics	11-89
IP Local Pool Configuration	11-90
IP Local Pool Statistics	11-90
Displaying PDNGW Real time statistics	11-91
AAA	11-91
APN Instance Throughput	11-92
APN Instance Throughput Ext	11-92
APN Instance PDP/Bearer	11-92
APN Instance PDP/Bearer Ext	11-93
APN Instance Miscellaneous	11-94

EPC Buffering	11-94
EPC Overload Protection	11-94
GTP Statistics	11-94
GTP Active Statistics	11-95
Charging Statistics	11-95
GTP PDP/Bearer Statistics	11-95

INDEX

Preface

This preface describes the objectives, audience, organization, and conventions of the *User Guide for the Cisco Mobile Wireless Transport Manager 6.1.3*. It refers you to related publications and describes online sources of technical information.

The Cisco Mobile Wireless Transport Manager (MWTM) is a network management software product that enables you to discover, manage, and troubleshoot the following networks:

- IP Transfer Point (ITP)
- IP Radio Access Network (IPRAN), which includes:
 - Radio Access Network Optimization (RAN-O)
 - Pseudowire Emulation Edge to Edge (PWE3)
- Cisco Mobile Internet (MI) / mobile Services Exchange Framework (mSEF), which includes:
 - Cisco Gateway GPRS Support Node (GGSN)
 - Cisco Content Services Gateway (CSG)
 - Cisco Home Agent (HA)
 - Cisco Broadband Wireless Gateway (BWG)
 - Cisco Packet Data Node Gateway (PDNGW)
 - Cisco Serving Gateway (SGW)
 - Cisco Policy and Charging Rules Function (PCRF)
 - Cisco Packet Data Serving Node (PDSN)

For a more detailed description of the MWTM, see [Chapter 1, “Overview.”](#) For the latest MWTM information and software updates, go to <http://www.cisco.com/go/mwtm>.

This preface includes:

- [Document Objectives, page xxxvi](#)
- [Document Audience, page xxxvi](#)
- [Document Organization, page xxxvi](#)
- [Document Conventions, page xxxvii](#)
- [Related Documentation, page xxxviii](#)
- [Obtaining Documentation and Submitting a Service Request, page xl](#)

Document Objectives

This guide describes the architecture, supporting hardware and software, and management procedures for the MWTM. Using the information provided in this guide, you can complete the tasks that are necessary to use the MWTM in your ITP, IPRAN, and/or mSEF network.

Document Audience

This guide is for network administrators or operators who use the MWTM software to manage ITP, RAN-O, and/or mSEF networks. Network administrators or operators should have:

- Basic network management skills
- Basic Solaris system administrator skills
- Basic ITP, RAN-O, and/or mSEF knowledge

Document Organization

This guide is divided into the following chapters and appendixes:

- [“Overview”](#) provides brief descriptions of ITP, IPRAN, and mSEF, the MWTM, the MWTM’s client-server architecture, and an overview of how to use the MWTM to manage your network.
- [“Configuring Security”](#) provides information about configuring MWTM security and limiting access to the MWTM.
- [“Setting Up Your Server”](#) provides procedures to set up your MWTM server, which includes enabling traps, configuring a backup server, setting up TFTP, configuring SNMP settings and credentials, and creating new troubleshooting commands.
- [“Getting Started”](#) provides basic information and procedures for using the MWTM.
- [“Basic Operations”](#) provides information about basic operations you can perform using the MWTM, including navigating windows, exporting data, and performing basic server operations.
- [“Understanding Basic Object Functions”](#) provides information about basic object functions found within the Summary Lists section of the navigation tree.
- [“Managing Views”](#) provides information about using the MWTM to create, change, and load views and subviews, and view basic and detailed information for views and subviews.
- [“Understanding Detailed Object Functions”](#) provides information about more detailed object functions you can perform on specific types of objects.
- [“Managing Alarms and Events”](#) provides information about using the MWTM to view basic and detailed information for events, and change the way the MWTM processes events.
- [“Viewing Network Topology”](#) provides procedures for viewing the topology of your network, changing the way the MWTM shows the topology, and saving customized topology displays.
- [“Accessing Data from the Web Interface”](#) describes how to access MWTM data from the MWTM web interface.
- [“Managing Reports”](#) provides procedures for creating and viewing MWTM accounting and statistics reports for your ITP network.
- [“Editing an ITP Route Table File”](#) provides procedures for viewing and editing ITP route table files.

- “[Editing an ITP Global Title Translation Table](#)” provides procedures for viewing and editing ITP GTT files.
- “[Editing ITP MLR Address Table Files](#)” provides procedures for viewing and editing ITP MLR address table files.
- “[Client Object Map Reference](#)” provides an overview of the tabs available for each MWTM object within a view.
- “[Command Reference](#)” describes the commands used to set up and operate the MWTM.
- “[FAQs](#)” provides a list of frequently asked questions and troubleshooting tips for the MWTM.
- “[Troubleshooting the MWTM and the Network](#)” provides information for troubleshooting basic MWTM and network problems, including how to verify network discovery, clearing a locked-up MWTM display, and using the MWTM to diagnose typical network problems.
- “[Status Definitions](#)” defines the default status settings for all MWTM network objects.
- “[MIB Reference](#)” lists the MIBs used by the MWTM.
- “[Trap Reference](#)” lists and describes the traps that the MWTM supports.
- “[Configuring MWTM to Run with Various Networking Options](#)” describes communication between the MWTM client and the MWTM server in different networking environments, including Virtual Private Network (VPN), Network Address Translation (NAT), firewall, port-forwarding, and Secure Sockets Layer (SSL).
- “[MWTM Ports](#)” lists MWTM services ports, port type, and descriptions.

Document Conventions

This guide uses basic conventions to represent text and table information.

Command descriptions use the following conventions:

- Commands and keywords are in **boldface** font.
- Arguments for which you supply values are in *italic* font.
- Elements in square brackets ([]) are optional.
- Alternate but required keywords are grouped in braces ({ }) and separated by a vertical bar (|).

Examples use the following conventions:

- Terminal sessions and information that the system displays are printed in `screen` font.
- Information that you enter is in **boldface screen** font. Variables for which you enter actual data are printed in *italic screen* font.
- Nonprinting characters, such as passwords, are shown in angle brackets (< >).
- Information that the system displays is in `screen` font, with default responses in square brackets ([]).

This publication also uses the following conventions:

- Menu items and button names are in **boldface** font.
- Directories and filenames are in *italic* font.
- If items such as buttons or menu options are dimmed on application windows, it means that the items are not available either because you do not have the correct permissions or because the item is not applicable at this time.

**Note**

Means *reader take note*. Notes contain helpful suggestions or references to materials not contained in the manual.

**Caution**

Means *reader be careful*. You are capable of doing something that might result in equipment damage or loss of data.

**Tip**

Means *the following are useful tips*.

CHAPTER 1

Overview

This chapter describes the Cisco Mobile Wireless Transport Manager (MWTM) and contains:

- [What Is MWTM?, page 1-1](#)
- [What Is ITP?, page 1-6](#)
- [What Is CDT?, page 1-7](#)
- [What Is IPRAN?, page 1-7](#)
- [What Is PWE3?, page 1-8](#)
- [What Is RAN-O?, page 1-8](#)
- [What Is mSEF?, page 1-9](#)
- [How Do I Identify My Network Type?, page 1-10](#)
- [What Is Client/Server Architecture?, page 1-11](#)

What Is MWTM?

Using the MWTM, you can discover, manage, and troubleshoot objects in your ITP, IPRAN, and/or mSEF network. The MWTM provides:

- [Server and Network Features, page 1-2](#)
- [Graphical User Interface and Web Features, page 1-2](#)
- [Event Monitoring Features, page 1-3](#)
- [Performance Features, page 1-3](#)
- [Provisioning Features, page 1-3](#)
- [Security Features, page 1-4](#)
- [Topology Features, page 1-4](#)
- [Troubleshooting Features, page 1-5](#)
- [Customization Features, page 1-5](#)
- [Integration Features, page 1-5](#)

Server and Network Features

The MWTM:

- Uses client/server architecture. See [What Is Client/Server Architecture?](#), page 1-11 for more details.
- Supports Windows and Solaris clients and Solaris and Linux servers, and provides data access through a web browser.
- Supports large networks and is verified to work with a network containing up to 200 managed ITP nodes, or 10,000 managed IPRAN nodes, or 10,000 managed mSEF nodes, and 50 clients connected to the server. See the “Server System Requirements” section in the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#) for more information.
- Allows multiple MWTM servers to monitor the network simultaneously, providing data redundancy. Clients have server failure recognition and automatic failover capabilities. MWTM clients will automatically switch to a backup server when the primary server is not available (in network problems or hardware failures, for example).
- Discovers the entire Cisco ITP network and displays the ITP nodes, neighboring SS7 equipment, and linksets in tables and in a network topology drawing that you can customize.
- Discovers the entire Cisco IPRAN network. Displays the RAN-O network element, neighboring equipment, and physical and logical connections in a network topology drawing that you can customize.
- Discovers the mobile Services Exchange Framework (mSEF), including:
 - Cisco Gateway GPRS Support Node (GGSN)
 - Cisco Content Services Gateway (CSG)
 - Cisco Home Agent (HA)
 - Cisco Broadband Wireless Gateway (BWG)
 - Cisco Packet Data Serving Node (PDSN)
 - Cisco Packet Data Node Gateway (PDNGW)
 - Cisco Serving Gateway (SGW)
 - Cisco Policy and Charging Rules Function (PCRF)
- Lets you create custom views and subviews for grouping similar nodes together, where the state of the subview is the aggregation of the states of the contained nodes.
- Provides a command-line interface (CLI) on the server.
- Allows clients to connect to a server through the IP network; clients work across a Virtual Private Network (VPN) connection through a firewall that supports port forwarding or Network Address Translation (NAT), and through a Secure Sockets Layer (SSL) connection.
- (ITP only) Supports concurrent network indicators and variants; ANSI, China, ITU, NTT, and TTC point code variants; three- and four-octet point code formats; multiple secondary point codes; SS7 instance translation; and virtual linksets.

Graphical User Interface and Web Features

The MWTM:

- Provides a Java-based, easy-to-use GUI on the client with an easy-to-navigate *tree* display of all network objects as well as extensive web-based online help.

- Provides an extensive HTML-based web interface. Most of the primary GUI client features are also available on the web interface. See [Browser Questions, page C-6](#) for more information about the differences between the Java client and the web interface.

Event Monitoring Features

The MWTM:

- Displays a real-time event list that supports acknowledgement, annotation, customized filtering, and field viewing.
- Receives native traps from nodes in the Cisco IPRAN, Cisco mSEF and Cisco ITP solutions and uses SNMP polling to identify the status of each managed node, including interfaces, links, and circuits. The MWTM uses easy-to-recognize, color-coded icons to report the status.
- Monitors Cisco ITP nodes running Message Transfer Part Level 3 (MTP3) User Adaptation (M3UA) or Signaling Connection Control Part (SCCP) User Adaptation (SUA) application servers, as well as servers with multiple signaling points or variants acting as gateways.
- Provides web-based status monitoring, alarm viewing, sorting, filtering, archiving, online documentation, and client download.
- Provides external script execution on the server and sound playing on the client; both are triggered by events or alarms, and you can also customize them.

Performance Features

The MWTM:

- Provides extensive web-based accounting and network statistics reports for:
 - **Cisco RAN-O nodes**—Network and detailed interface-level statistics
 - **Cisco ITP nodes**—Network efficiency, detailed interface-level statistics, Q.752-based statistics reports, and point code inventory reports, including MTP3, GTT, M3UA/SUA, MSU, and multilayer routing reports
 - **mSEF**—See [Viewing Reports, page 13-3](#) for more information.
 - **PWE3**—See [Viewing Reports, page 13-3](#) for more information
- Displays real-time data rate and usage line graphs
- Supports options to configure collection intervals, record aging and statistics export via comma-separated values (CSV) format files

Provisioning Features

The MWTM provides provisioning for ITP, IPRAN, GGSN, CSG, and HA.

The MWTM:

- **ITP**—Assists in provisioning destination point code (DPC) route tables, global title translation (GTT) tables, multilayer routing (MLR) address tables, links and linksets by providing GUI-based editing; reduces errors by checking syntax and semantics before deploying the tables to the Cisco ITP node.

- ITP—Provides revision management and archiving of DPC route, GTT, and MLR address tables; can re-deploy a known good configuration in the event of a misconfiguration. Stores time of change, user ID, and comments for each change.
- ITP—Provides a deployment wizard that simplifies the process of transferring and activating GTT and DPC route-table configuration files onto Cisco ITP nodes. The wizard takes you through deployment step-by-step and learns along the way to speed up future deployments.
- IPRAN—Provides a deployment wizard for PWE3 circuits, ATM cell switching, and TDM drop and insert provisioning.
- GGSN—Provides a deployment wizard for APNs, interfaces, VLANs, and VRFs. These features are available for GGSN 8 and later software.
- CSG—Provides a deployment wizard for Maps, Content, Service, Billing, and Policies. These features are available for CSG2 R1 and later software.
- HA—Provides a deployment wizard for HA.

See [MWTM Provision Attributes](#) chapter of the *OSS Integration Guide for the Cisco Mobile Wireless Transport Manager 6.1.3* for more information on the attributes for MWTM 6.1.3 provision feature.

Security Features

The MWTM provides:

- Management of SSL certificates via the GUI
- Multi-level password-protected access for multiple users
- Multiple user authentication methods (OS-based and standalone)
- Passwords that users can change using the GUI
- Password enforcement policies (aging, minimum length, and lockouts)
- Audit trails of all user actions and all access via the web interface
- Security logs
- Optional access via VPN, Secure Shell (SSH), and SSL

Topology Features

The topology features are available for the ITP and RAN-O solutions.

The MWTM:

- Automatically discovers the network from any node, with links to unsupported nodes, and creates topological (graphical) and tabular (text) views of the network.
- Shows network objects as color-coded glyphs on a topology map, with right-click menus and layout, zoom, find, grid, hide, show, and save-as-JPEG functions. The topology map can be organized into one or more submaps, with a single object representing groups of network objects on the main topology map.
- Shows detailed data (including alarm and node data) in columns that can be resized, sorted, or hidden, depending on your preferences.

Troubleshooting Features

The MWTM provides:

- Troubleshooting tools that you can customize to help reduce the total time to resolution of network or node problems
- Integrated, online, context-sensitive help

Customization Features

The MWTM:

- Automatically saves your preferences, such as the size of specific windows or the order of columns in a window, and automatically applies those preferences whenever you launch the MWTM client.
- Polls the nodes on demand and at user-defined intervals, and reports the real-time status of all network objects and events, including the reason for any changes in status.
- Receives SNMP traps natively to drive alarms, and accurate and up-to-date status displays.

You can:

- Customize MWTM network(s) to show menus, options, and tools that are specific to the types of network that you are managing. You customize your network preferences during installation. You can change the network type later, if required, through the command line.
- Customize the GUI, topology, and tabular views to meet your specific needs. You can save customized views and subviews for future use and reference, and share them with other network users.
- Annotate network objects and events, attaching important information such as detailed descriptions, locations, service history, what triggered the event, and how often it has occurred.
- Customize the display category, severity, color, and message that you see with events. You can even have the MWTM play unique sounds for different types of events.
- Automate events, calling UNIX scripts to drive automatic paging, e-mail, and so on.
- Forward SNMP traps, and MWTM events in the form of SNMP traps, to other hosts, such as the Cisco Info Center (CIC) and the Micromuse Netcool suite of products.
- (ITP only) Load destination point code (DPC) route tables, GTT tables, and MLR address tables from files or from ITPs, configure the tables in the MWTM client, and deploy and activate the tables on ITPs. Supports GTT file format versions 3.1, 4.0, and 4.1. Supports cross-instance GTT files. Provides command-line verification of route tables and GTT tables.

Integration Features

The MWTM can integrate with:

- CiscoWorks LAN Management Solution (LMS) portal, which provides a suite of CiscoWorks products, including:
 - Resource Manager Essentials, which provides network management for Cisco ITP, RAN-O, and mSEF nodes.
 - CiscoView Element Manager, which provides dynamic status, monitoring, and configuration information for a broad range of Cisco internetworking products.

- CiscoView element manager and the CiscoWorks Device Center, which you can launch from the:
 - Main window when you right-click a node in the navigation tree.
 - Topology map for quick drill-down network analysis.
- The Cisco Transport Controller (CTC) on the Cisco Optical Networking System (ONS) 15454 for managing alarms and provisioning circuits on the SONET or SDH traffic cards. You can launch the CTC from a right-click menu in the MWTM client.

The MWTM:

- Receives SNMP traps and generates Cisco MWTM-specific traps for forwarding to external SNMP-based network management applications such as Cisco Info Center or IBM Tivoli/NetCool.
- Stores statistics in CSV format files for extracting performance and key performance indicators.
- Provides northbound Cisco ITP, mSEF, and IPRAN events, inventory, and provisioning XML/SOAP APIs, allowing 3rd-party OSSs to programmatically manage:

What Is ITP?

Events	• Retrieving all or filtered list of events (based on time, event ID, severity, category, message text) • Clearing event alarms • Changing event severity • Acknowledging events • Attaching text notes to events
Inventory	• Retrieving all inventory objects • Retrieving a specific inventory object • Walking the MWTM inventory tree • Attaching text notes to an inventory object
Provisioning (ITP only)	• Customizing the MWTM templates when necessary • Configuring: – linksets – links – application servers – application server processes

The Cisco hardware and software SS7-over-IP (SS7oIP) solution includes the ITP, which provides a reliable, cost-effective medium for migrating Signaling System 7 (SS7), the telecommunications network signaling technology, to the mobile wireless industry IP environment. The ITP off-loads SS7 traffic onto the IP network, replacing the mobile service provider's signaling network with a redundant IP cloud.

In the ITP, and in the MWTM, a *node* is a Cisco ITP or a legacy SS7 device (SSP, SCP, or STP).

A Cisco ITP node can have multiple *signaling points*. Signaling points are identified with unique addresses called *point codes*. Point codes are carried in signaling messages that are exchanged between signaling points to identify the source and destination of each message.

Signaling points and legacy SS7 nodes are connected by *links*, and multiple links are grouped in a *linkset*. Each link is assigned to a single linkset, but each linkset can have multiple links. Links within the same linkset must be parallel between the same signaling points or nodes.

In the MWTM, a linkset is a representation of *two* linksets that are associated with two signaling points or nodes, one for each side of a logical connection.

An *application server* is a logical entity serving a specific routing key.

The application server implements a set of one or more unique *application server processes*, of which one or more is normally actively processing traffic. An application server process is an IP-based instance of an application server, such as Call Agents, HLRs, SMSCs, and so on. An application server process can implement more than one application server.

An *application server process association* is the ITP virtual view of an application server process. The application server process association resides and is defined on the ITP.

A *signaling gateway-mated pair* is a pair of signaling gateways that exchange necessary state information by using the Signaling Gateway Mate Protocol (SGMP).

Collectively, nodes, signaling points, linksets, links, application servers, application server processes, application server process associations, and signaling gateway-mated pairs are known as *managed objects*.

For more information about ITP, including procedures for configuring ITP objects, see the *IP Transfer Point (ITP)* feature module for Cisco IOS software release 12.2(25)SW5 or later.

What Is CDT?

The Cisco Database for Telecommunications (CDT) is a per subscriber routing solution that supports SS7/C7 and IP-based addressing services. Alarming is provided by the master server (monitored by MWTM). An alarm event consists of a component (service or facility) name, class, and severity level, as well as detailed message information. System events include resource thresholds (throughput, database capacity, thread, etc.), network connectivity, user authentication, system availability, etc.

You can use the MWTM to discover CDT nodes and provide basic monitoring functions such as alarm status, polling information, and recent events. From the MWTM, you can launch the CDT login web page.

**Note**

MWTM 6.1.3 supports CDT 2.0. For SNMP traps to be handled properly CDT must be configured to use SNMPv2 traps.

What Is IPRAN?

The Cisco IP Radio Access Network (IPRAN) delivers standards-based end-to-end, IP connectivity for RAN transport. The Cisco solution converts RAN voice and data frames into IP packets at the cell site, and transports them seamlessly over a backhaul network. At the central site, the RAN frames are extracted from IP packets, and the ATM or TDM streams are rebuilt. The result is a transparent, radio vendor-agnostic, RAN IP transport solution.

The Cisco IPRAN solution is also known as Mobile Transport over Pseudowires, or MTOP. For more information about MTOP, see:

http://www.cisco.com/en/US/netsol/ns732/networking_solutions_solution.html

There are two families of pseudowire protocols used within the Cisco IPRAN: PWE3 and RAN-O.

What Is PWE3?

Pseudowire Emulation Edge to Edge, or PWE3, is the emulation of an ATM or TDM service over IP, MPLS, or L2TPv3 transport. The PWE3 protocol family is used to encapsulate RAN voice and data frames at the cell site for transport over a backhaul network.

Cisco nodes that support PWE3 and are managed by MWTM include:

- Cell Site Router (CSR):
 - Cisco MWR1941-DC-A and MWR 2941-DC routers
 - Cisco 3825 Integrated Services router
- Cisco 7600 router

What Is RAN-O?

Radio Access Network Optimization (RAN-O) delivers standard-based, end-to-end, IP connectivity for GSM and UMTS RAN transport. The solution Cisco offers frames RAN voice and data frames into IP packets at the cell-site, and transports them seamlessly over an optimized backhaul network. At the central site, the RAN frames are extracted from IP packets and the Abis or Iub data streams are rebuilt. The result is a transparent, radio vendor-agnostic, RAN IP transport and optimization solution that delivers nominal optimization efficiency of 50% without any impact on voice quality.

In RAN-O and in the MWTM, a *node* is a Cisco RAN-O device. A RAN node can be one of the following:

- Cell Site Router (CSR):
 - Cisco MWR 1941-DC-A and MWR 2941-DC routers
 - Cisco 3825 Integrated Services Router
- Cisco ONS 15454 SONET multiplexer
- RAN Service Module (card in the Cisco ONS 15454 SONET multiplexer)
- Unmanaged RAN node (BSC, RNC, BTS, or Node B)

Note

The MWTM does not manage BSC, BTS, RNC, or Node B objects but displays them in the topology window to help you visualize the network.

RAN interfaces that are available on the nodes interconnect nodes in a RAN-O network. A Cisco RAN-O node can have multiple *RAN interfaces*.

Cards are the modules that reside in the Cisco ONS 15454 SONET multiplexer.

IP backhauls are the trunks that transport optimized voice and data traffic between a remote cell-site RAN-O node and an aggregation RAN-O node at a central site.

RAN shorthauls are the interfaces that transport GSM or UMTS voice and data traffic between the Base Transceiver Station (BTS) or Node-B and the RAN-O node at the cell site. At the aggregation site, RAN shorthauls exist between the RAN-O node and the BSC or RNC.

RAN backhauls describe the end-to-end RAN connections between the BTS or Node-B at the cell site and the BSC or RNC at the aggregation site.

Collectively, nodes, interfaces, cards, and RAN backhauls and shorthauls are known as *managed objects*.

For more information about RAN-O objects, see:

- *Cisco MWR 1941-DC-A Mobile Wireless Edge Router Software Configuration Guide:*
http://www.cisco.com/en/US/products/hw/routers/ps4062/products_installation_and_configuration_guides_list.html
- *Cisco MWR 2941-DC Mobile Wireless Edge Router Software Configuration Guide*
http://www.cisco.com/en/US/products/ps9395/products_installation_and_configuration_guides_list.html
- *Cisco ONS 15454 RAN Service Module Software Configuration Guide:*
http://www.cisco.com/en/US/products/hw/optical/ps2006/products_installation_and_configuration_guides_list.html

What Is mSEF?

The Cisco Mobile Internet, also known as mobile Services Exchange Framework (mSEF), provides standards-based framework to enable the mobile Internet that links the RAN to IP networks and the services they provide. The mSEF provides:

- Access and service activation
- Easy mobility
- Packet inspection

The mSEF gateways that the MWTM manages include:

- Cisco Content Services Gateway (CSG)
 - CSG1 provides CSG features on the CSG card
 - CSG2 provides the latest CSG features on the Service and Application Module for IP (SAMI)
- Cisco Gateway GPRS Support Node (GGSN) on the SAMI and Multiprocessor WAN Application Module (MWAM)
- Cisco Home Agent (HA) on the SAMI and Cisco 7301
- Cisco Broadband Wireless Gateway (BWG) on the SAMI and Cisco 7301
- Cisco Packet Data Serving Node (PDSN) on the SAMI and Cisco 7613
- Cisco Packet Data Node Gateway (PDNGW)
- Cisco Serving Gateway (SGW)
- Cisco Policy and Charging Rules Function (PCRF)

For more information about mSEF, see:

http://www.cisco.com/en/US/netsol/ns706/networking_solutions_solution_category.html

What is LTE?

Long Term Evolution (LTE) is the next generation (4G) mobile wireless system expected to revolutionize mobile broadband usage. It is the next step beyond the current, 3G UMTS technology. LTE provides:

- All-IP flat network
- Higher throughput (up to 150 Mbps per user)
- Lower latency
- Higher spectral efficiency
- Seamless mobility between heterogeneous mobile technologies

Cisco is focused on developing the PDN Gateway (PDNGW), a Mobility Anchor gateway for inter-access technology mobility, and the Serving Gateway (SGW), a Mobility Anchor gateway for intra-3GPP mobility, for the LTE market.

The PDNGW provides connectivity to the UE to external packet data networks by being the point of exit and entry of traffic for the UE. The PDNGW performs authentication, IP address allocation, policy enforcement, packet filtering for each user, charging support, lawful interception, and packet screening.

The SGW is the gateway that terminates the interface towards the E-UTRAN (Enhanced Universal Terrestrial Radio Access Network) (S1). It acts as the local mobility anchor for inter-e Node B and inter-3GPP handovers (relaying traffic between 2G/3G networks and PDN GW).

The MWTM:

- Uses the existing device discovery infrastructure of the server to implement support for the PDNGW and SGW platforms.
- Uses the existing troubleshooting framework to add support for commands related to PDNGW and SGW troubleshooting.
- Uses the existing real time and historical statistics framework to poll for and displays real time and historical statistics for the PDNGW and SGW platforms.
- Uses existing event/alarm infrastructure of the MWTM server to generate events/alarms for the PDNGW and SGW platforms.

How Do I Identify My Network Type?

The MWTM can manage one or more types of networks. To determine the type of network that the MWTM is managing, launch the MWTM (by using either the MWTM client or web interface), and observe the network type or types in the title bar.

You can also click on a node in the left tree of the MWTM main window to view detailed information about the node in the right pane. The Node Type and other information provide enough details to determine the type of network you are managing.

If you are using the MWTM to manage multiple network types, you can uniquely identify node types by the DNS host names that you assign to them. For example, you can incorporate the string *itp* into the hostname of an ITP node (as in *itp-75*). Similarly, IPRAN nodes can employ a unique host naming scheme (for example, *rano-34*). In addition, you can segregate the nodes of different network types into different management subviews with, for example, one subview for ITP and another subview for IPRAN nodes. For more information about creating views and subviews, see [Chapter 6, “Managing Views.”](#)

What Is Client/Server Architecture?

The MWTM provides central services and database functions on an MWTM server, which communicates through a messaging interface with multiple MWTM clients.

The MWTM supports a maximum of 50 clients per MWTM server.

The MWTM comprises server and client software components that can be installed on the same workstation or on different workstations. The MWTM server is currently available on Solaris or Linux. The MWTM client is available on Solaris and Windows XP Professional.

Figure 1-1 *MWTM Client/Server Architecture*

Note

The MWTM client is also available on Linux, but is not a supported feature of the MWTM. Use it under advisement.

The client/server architecture is cross-platform compatible, with which you can run the client and server software in mixed operating system environments. For example, you can run the MWTM server on a Solaris or Linux workstation, and access it from an MWTM client running on Windows XP Professional.

The MWTM server software comprises a group of functional services that manage the data among the network, client workstations, and the centralized database. The MWTM server manages the exchange of data between the MWTM database and the network nodes. The MWTM process manager launches and manages all of the MWTM server processes, providing a robust and reliable launching platform for the MWTM.

The MWTM client software communicates with the MWTM server. You can install the MWTM client software on the same workstation as the MWTM server software, or on a different workstation on the same network as the MWTM server. After you install the MWTM server, you can download the MWTM client software from the web, for easy distribution to users and easier access to important information.

**Note**

For detailed information on installing the MWTM server and client software, see the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

CHAPTER 2

Configuring Security

Before you set up your server for discovering, monitoring, and configuring your Cisco network, you need to make some decisions about the level of security you desire in your network management. With the Cisco Mobile Wireless Transport Manager (MWTM), you can determine how you want users to authenticate, whether you want encrypted data between the application client and the server, and if you want to limit client access to specific IP addresses.

This chapter provides information about configuring MWTM security and limiting access to the MWTM. This chapter contains:

- [Configuring User Access, page 2-1](#)
- [Implementing SSL Support in the MWTM, page 2-21](#)
- [Limiting MWTM Client Access to the MWTM Server \(Server Only\), page 2-29](#)
- [Backing Up or Restoring MWTM Files \(Server Only\), page 2-30](#)
- [Removing MWTM Data from the MWTM Server, page 2-32](#)

Configuring User Access

You can use the MWTM to control who is allowed to do what in the MWTM, beyond simply specifying root and nonroot users. The MWTM calls this ability user-based access.

User-based access provides multilevel, password-protected access to MWTM features. Each user can have a unique username and password. You can also assign each user to one of five levels of access, which control the list of MWTM features accessible by that user.

To configure MWTM user access, perform the tasks in the following sections. Required and optional tasks are indicated:

Required:

- [Implementing Secure User Access \(Server Only\), page 2-2](#)
- [Creating Secure Passwords, page 2-7](#)
- [Configuring MWTM User Account Levels \(Server Only\), page 2-7](#)

Optional:

- [Automatically Disabling Users and Passwords \(Server Only\)](#), page 2-10
- [Manually Disabling Users and Passwords \(Server Only\)](#), page 2-12
- [Enabling and Changing Users and Passwords \(Server Only\)](#), page 2-13
- [Displaying a Message of the Day](#), page 2-15
- [Manually Synchronizing Local MWTM Passwords \(Server Only\)](#), page 2-16
- [Listing All Currently Defined Users \(Server Only\)](#), page 2-16
- [Displaying the Contents of the System Security Log \(Server Only\)](#), page 2-17
- [Restoring Security-Related MWTM Data \(Server Only\)](#), page 2-18
- [Disabling MWTM User-Based Access \(Server Only\)](#), page 2-18
- [Specifying a Super User \(Server Only\)](#), page 2-19

Implementing Secure User Access (Server Only)

Before you can access the full suite of security commands in the MWTM, you must enable MWTM user access, configure the type of security authentication you want, and add users to your user lists.

After you implement user access for the MWTM, users must log in to the system to access the:

- MWTM client interface
- MWTM web interface
- Event Editor
- Global Title Translation (GTT) Editor (ITP only)
- Address Table Editor (ITP only)

**Note**

After you implement MWTM user access, if a user logs in on one client, then logs in on a second client, the MWTM closes the first client and records the event in the system security log.

Security Authentication

Two types of security authentication are possible:

- *Local authentication:* You can create user accounts and passwords that are local to the MWTM system. When using this method, you can use MWTM user access commands to manage usernames, passwords, and access levels.
- *Solaris/Linux authentication:* Uses standard Solaris- or Linux-based user accounts and passwords, as specified in the `/etc/nsswitch.conf` file. You can provide authentication using the local `/etc/passwd` file; a distributed Network Information Services (NIS) system; or any other type of authentication tool (for details, see [Additional Authentication Tools](#), page 2-4). You can use all MWTM user access commands except:
 - `mwtm disablepass`
 - `mwtm passwordage`
 - `mwtm userpass`

In addition, if you have enabled Solaris/Linux authentication, you must be logged in as the root user, not as a superuser, to use:

- mwtm adduser
- mwtm updateuser
- mwtm authtype

PAM Setup to Check Library Version and JVM Versions

- To ensure Java Virtual Machine (JVM) version and available Pluggable Authentication Modules (PAM) library matches:
 - If your Operating System only has 32-bit version of the PAM library, then you need to make sure to use 32-bit JVM.
 - If your Operating System only has 64-bit version of the PAM library, then you need to make sure to use 64-bit JVM.
 - If your Operating System has both 32-bit and 64-bit versions of PAM libraries, then you can use either 32-bit or 64-bit JVM.

- To check the available PAM authentication module versions:

- To check PAM authentication module version on Solaris:

```
file /usr/lib/security/pam_radius_auth.so
file /usr/lib/security/sparcv9/pam_radius_auth.so
```

- To check PAM authentication module version on Linux:

```
file /lib/security/pam_radius_auth.so
file /lib64/security/pam_radius_auth.so
```

- To check JVM versions, go to:

```
/opt/CSCOsgm/j2re/jre/bin/java -version
```

- To change the JVM version on Solaris:

On Solaris, MWTM has both 32-bit and 64-bit JVM versions. By default, the MWTM 6.1.3 and above enables 64-bit JVM on Solaris. To change JVM to 32-bit version, enter the following commands:

```
% cd /opt/CSCOsgm/j2re/jre/bin
% mv java.sgm java.64
% mv java.32 java.sgm
% /opt/CSCOsgm/bin/mwtm restart
```

To check if the JVM version is changed successfully, go to:

```
/opt/CSCOsgm/j2re/jre/bin/java -version
```

- To check the JVM version on Linux:

For Linux, you cannot change JVM versions. MWTM installation program installs 64-bit JVM if the Linux runs 64-bit kernel. MWTM installation program installs 32-bit JVM if the Linux runs 32-bit kernel.

You need to ensure that proper version of PAM library is available on Linux that matches the kernel version.

Additional Authentication Tools

With the introduction of Pluggable Authentication Modules (PAM) in MWTM 6.1, you can use additional authentication tools, such as Remote Authentication Dial In User Service (RADIUS) or Terminal Access Controller Access-Control System (TACACS+).

For example, if you want to use RADIUS, follow these steps:

-
- Step 1** Ensure that you have:
- Selected Solaris or Linux authentication, either during installation or using the **mwtm authtype** command (see [mwtm authtype](#), page B-8)
 - Downloaded and compiled the PAM radius module from the internet
- Step 2** On the MWTM server, copy the PAM radius file (*pam_radius_auth.so*) you downloaded to the */usr/lib/security* directory.
- Step 3** For Solaris authentication:
- a. On the MWTM server, using a text editor, open this file:
`/etc/pam.conf`
 - b. Modify these lines:

```
mwtm-jpam auth required pam_unix_auth.so
mwtm-jpam account required pam_unix_account.so
```

to:

```
mwtm-jpam auth required pam_radius_auth.so
mwtm-jpam account required pam_radius_auth.so
```
- For Linux authentication:
- a. On the MWTM server, using a text editor, open this file:
`/etc/pam.d/mwtm-jpam`
 - b. Modify these lines (for 32 or 64-bit, respectively):

```
auth required /lib/security/pam_unix_auth.so
account required /lib/security/pam_unix_auth.so
or
auth required /lib64/security/pam_unix_auth.so
account required /lib64/security/pam_unix_auth.so
```

to:

```
auth required /lib/security/pam_radius_auth.so
account required /lib/security/pam_radius_auth.so
or
auth required /lib64/security/pam_radius_auth.so
account required /lib64/security/pam_radius_auth.so
```
- Step 4** Enter:
`cd /etc`
- Step 5** Create the following directory: *raddb*.
- Step 6** You should have a PAM configuration file named *pam_radius_auth.conf*. Copy this file as *server* in the */etc/raddb/* directory.
- Step 7** Configure the *server* file you just created with the actual Radius server, port number, and the secret password. For example:

```
172.16.24.60:1812 secret 3
```

**Note**

If a MWTM superuser is defined, user access is enabled with `authtype` set to `solaris` or `linux`, and user accounts for accessing MWTM are maintained locally on the host running the MWTM server, then `/etc/shadow` must be readable by the MWTM superuser account:

```
chown superuser /etc/shadow
```

where *superuser* is the name of the MWTM superuser account.

Configuring User Levels

You can configure one of seven account levels for each user. Valid levels are:

1. [Basic User \(Level 1\) Access](#)
2. [Power User \(Level 2\) Access](#)
3. [Network Operator \(Level 3\) Access](#)
4. [Network Administrator \(Level 4\) Access](#)
5. [System Administrator \(Level 5\) Access](#)
6. [Custom User Level 1 \(Level 11\) Access](#)
7. [Custom User Level 2 \(Level 12\) Access](#)

For more information about account levels, see [Configuring MWTM User Account Levels \(Server Only\)](#), page 2-7.

Configuring User Passwords

The method that you use for setting user passwords depends on the type of authentication that you configure on the MWTM system (local or solaris).

Local Authentication

If `mwtm authtype` is set to `local`, the MWTM prompts you to:

- Enter the user password. When setting the password, follow the rules and considerations in [Creating Secure Passwords](#), page 2-7.
- Force the user to change the password at the next login. The default is to not force the user to change the password.

Whenever a user must change a password, the MWTM issues an appropriate message, and prompts for the username and new password.

Solaris/Linux Authentication

If `mwtm authtype` is set to `solaris` or `linux`, users cannot change their passwords by using the MWTM client. Instead, they must manage their passwords on the external authentication servers by using Solaris or Linux commands, such as `passwd`.

All new passwords take effect the next time the MWTM automatically synchronizes local MWTM passwords with Solaris or Linux. You can manually synchronize passwords at any time by using the `mwtm syncusers` command. For more information, see [mwtm syncusers](#), page B-84.

Enabling Secure User Access

To enable secure user access for the MWTM:

Step 1 Log in to the MWTM server as the root user (see [Starting the MWTM Client, page 3-3.](#))

Step 2 To enable MWTM security, the following prerequisites must be met:

- User access must be enabled.
- The authentication type must be set.
- Users must be added.

The **mwtm useraccess** enable command takes you through all three stages, checking the status of:

1. **mwtm useraccess**—Enabled or disabled.
2. **mwtm authtype**—If you have not already set the mwtm authentication type, you must do so now.
3. **mwtm adduser**—If you have already assigned users, the MWTM asks if you want to use the same user database, or create a new one. If you have not assigned users, you must do so now.

Tip For details on the **mwtm useraccess**, **mwtm authtype**, and **mwtm adduser** commands, see [Appendix B, “Command Reference.”](#)

Run the mwtm useraccess enable command:

```
cd /opt/CSC0sgm/bin
./mwtm useraccess enable
~text elided~
```

Step 3 To activate your security changes on the MWTM client, restart the MWTM server with the mwtm restart command (see [mwtm restart, page B-57.](#)) To activate your security changes on the MWTM web interface, clear the browser cache and restart the browser.

Use the remaining procedures in this chapter to further customize your MWTM security system.

Creating Secure Passwords

When setting passwords in the MWTM, the:

- Password must be at least 6 characters, up to 15 characters.
- Password cannot be identical to the username.
- New password cannot be the same as the old password.
- MWTM does not allow users to switch back and forth between two passwords.
- Password cannot be a commonly used word. The MWTM server uses the system dictionary at */usr/share/lib/dict/words* (Solaris) or */usr/share/dict/words* (Linux) to determine whether a word is a commonly used word.

To use your own dictionary, add a line to the *System.properties* file:

- To disable the MWTM dictionary and allow common words, add:

```
DICTIONARY=/dev/null
```

- To use a custom dictionary, add:

```
DICTIONARY=/new-dictionary
```

where *new-dictionary* is the path and filename of the custom dictionary file, such as */users/usr11/words*. Each line in the custom dictionary must contain a single word, with no leading or trailing spaces.

Configuring MWTM User Account Levels (Server Only)

This section describes the user account levels, and the MWTM client and web interface actions that are available at each level:

- [Basic User \(Level 1\) Access, page 2-8](#)
- [Power User \(Level 2\) Access, page 2-8](#)
- [Network Operator \(Level 3\) Access, page 2-9](#)
- [Network Administrator \(Level 4\) Access, page 2-9](#)
- [System Administrator \(Level 5\) Access, page 2-9](#)
- [Custom User Level 1 \(Level 11\) Access, page 2-10](#)
- [Custom User Level 2 \(Level 12\) Access, page 2-10](#)

The account level that includes an action is the *lowest* level with access to that action. The action is also available to all higher account levels. For example, a System Administrator also has access to all Network Administrator actions.

Account levels are based on the action to be performed, not on the target network element. Therefore, if a user can perform an action on one MWTM network element (such as deleting a node), the user can perform the same action on all similar MWTM network elements (such as deleting an interface, signaling point, or linkset).

Note

Access to MWTM information and downloads on Cisco.com is already protected by Cisco.com, and is not protected by the MWTM.

To configure the account level for a user, use the **mwtm adduser** command, as described in [Implementing Secure User Access \(Server Only\)](#), page 2-2, or the **mwtm updateuser** or **mwtm newlevel** commands, as described in [Enabling and Changing Users and Passwords \(Server Only\)](#), page 2-13.

Basic User (Level 1) Access

Basic users can view MWTM data, load MWTM files, and use MWTM drill-down menus.

The following MWTM actions in the client and web interfaces are available to basic users:

MWTM Client Interface Actions	MWTM Web Interface Actions
- View the MWTM web interface homepage - Connect to a new server - Apply changes to views - Load the DEFAULT view and existing views, but cannot save them - View and edit preferences - View and manipulate the topology map, save it as a JPEG, but cannot save icon locations - View network elements, events, details, and notes - Load existing event filters, but cannot save them - Print MWTM windows - Launch CiscoWorks	- View the MWTM web interface homepage - View the following administrative pages: - System Information - System Status - View and edit web preferences - View reports

Power User (Level 2) Access

The following MWTM actions in the client and web interfaces are available to power users:

MWTM Client Interface Actions	MWTM Web Interface Actions
- Access all basic (Level 1) user client actions - Acknowledge events - View, change, and save event configurations, but cannot deploy changes - View real-time data and graphs - Edit network elements, events, and views - Unignore network elements and views - Save preferences files, event filters, and views	- Access all basic (Level 1) user web actions - Acknowledge events - View event configurations - View real-time statistics - Delete alarms - Modify alarm severity - Edit groups - Edit notes

Network Operator (Level 3) Access

The following MWTM actions in the client and web interfaces are available to network operators:

MWTM Client Interface Actions	MWTM Web Interface Actions
- Access all basic (Level 1) user and power (Level 2) user client actions - Access troubleshooting features - Ignore/Unignore network elements and views - Poll nodes - Access nodes through Telnet or SSH (ITP only) View route table files and GTT files, but cannot edit them	- Access all basic (Level 1) user and power (Level 2) user web actions - Access troubleshooting features - Access provisioning features - Access all features on Administrative pages

Network Administrator (Level 4) Access

The following MWTM actions in the client and web interfaces are available to network administrators:

MWTM Client Interface Actions	MWTM Web Interface Actions
- Accessing all basic (Level 1) user, power (Level 2) user, and network operator (Level 3) client actions - Modify and view SNMP configuration - Perform network discovery - Delete network elements - Unmanage nodes (ITP only) Edit and save route table files, GTT files, and address table files (ITP only) Use the deployment wizard	- Accessing all basic (Level 1) user, power (Level 2) user, and network operator (Level 3) web actions - Automatically log into SSH terminal in enable mode (if enable password is set)

System Administrator (Level 5) Access

The following MWTM actions in the client and web interfaces are available to system administrators:

MWTM Client Interface Actions	MWTM Web Interface Actions
- Accessing all basic (Level 1) user, power (Level 2) user, network operator (Level 3), and network administrator (Level 4) client actions - Access and modify trap settings - Manage/Unmanage nodes - Deploy saved event configuration changes	- Accessing all basic (Level 1) user, power (Level 2) user, network operator (Level 3), and network administrator (Level 4) web actions - Access and modify trap settings - Enable and disable reports (MSU Rates)

Custom User Level 1 (Level 11) Access

The following MWTM actions in the client and web interfaces are available for custom user level 1 users:

MWTM Client Interface Actions	MWTM Web Interface Actions
Customizing all basic (Level 1) user, power (Level 2) user, network operator (Level 3), network administrator (Level 4), and system administrator (Level 5) client actions.	Customizing all basic (Level 1) user, power (Level 2) user, network operator (Level 3), network administrator (Level 4), and system administrator web actions.

Custom User Level 2 (Level 12) Access

The following MWTM actions in the client and web interfaces are available for custom user level 2 users:

MWTM Client Interface Actions	MWTM Web Interface Actions
Customizing all basic (Level 1) user, power (Level 2) user, network operator (Level 3), network administrator (Level 4), and system administrator (Level 5) client actions.	Customizing all basic (Level 1) user, power (Level 2) user, network operator (Level 3), network administrator (Level 4), and system administrator (Level 5) web actions.

Automatically Disabling Users and Passwords (Server Only)

After you have implemented the basic MWTM security system, you can customize the system to automatically disable users and passwords when certain conditions are met (for example, a series of unsuccessful login attempts or a specified period of inactivity).

Tip

To view a list of current users and the status of user accounts, use the **mwtm listusers** command (see [mwtm listusers](#), page B-41).

To automatically disable users and passwords:

-
- Step 1** Log in to the MWTM server as the root or superuser:
- Root user—See [Becoming the Root User \(Server Only\)](#), page 3-2
 - Super user—See [Specifying a Super User \(Server Only\)](#), page 2-19
- Step 2** Enter the following command:
- ```
cd /opt/CSCOsgm/bin
```
- Step 3** (Optional) To configure the MWTM to generate an alarm after a specified number of unsuccessful login attempts by a user, enter:
- ```
./mwtm badloginalarm number-of-attempts
```
- where *number-of-attempts* is the number of unsuccessful login attempts allowed before the MWTM generates an alarm.
- The valid range is 1 unsuccessful attempt to an unlimited number of unsuccessful attempts. The default value is 5 unsuccessful attempts.

To disable this action (that is, to prevent the MWTM from automatically generating an alarm after unsuccessful login attempts), enter:

```
./mwtm badloginalarm clear
```

- Step 4** (Optional) To configure the MWTM to disable a user's account automatically after a specified number of unsuccessful login attempts, enter:

```
# ./mwtm badlogindisable number-of-attempts
```

where *number-of-attempts* is the number of unsuccessful login attempts allowed before the MWTM disables the user's account. The MWTM does not delete the user from the user list, the MWTM only disables the user's account.

The valid range is 1 unsuccessful attempt to an unlimited number of unsuccessful attempts. The default value is 10 unsuccessful attempts.

To re-enable the user's account, use the `mwtm enableuser` command.

To disable this action (that is, to prevent the MWTM from automatically disabling a user's account after unsuccessful login attempts), enter:

```
# ./mwtm badlogindisable clear
```

- Step 5** (Optional) The MWTM keeps track of the date and time each user last logged in. To configure the MWTM to disable a user's log in automatically after a specified number of days of inactivity, enter:

```
# ./mwtm inactiveuserdays number-of-days
```

where *number-of-days* is the number of days that a user can be inactive before the MWTM disables the user's account. The MWTM does not delete the user from the user list, the MWTM only disables the user's account.

The valid range is 1 day to an unlimited number of days. There is no default setting.

To re-enable the user's account, use the `mwtm enableuser` command.

This action is disabled by default. If you do not specify the `mwtm inactiveuserdays` command, user accounts are never disabled as a result of inactivity.

If you have enabled this action and you want to disable it (that is, to prevent the MWTM from automatically disabling user accounts as a result of inactivity), enter:

```
# ./mwtm inactiveuserdays clear
```

- Step 6** (Optional) If `mwtm authtype` is set to local, you can configure the MWTM to force users to change their passwords after a specified number of days.

To configure the MWTM to force users to change their passwords after a specified number of days, enter:

```
# ./mwtm passwordage number-of-days
```

where *number-of-days* is the number of days allowed before users must change their passwords.

Note You must have changed your password at least once for the `mwtm passwordage` command to properly age the password.

The valid range is 1 day to an unlimited number of days. There is no default setting.

Note The MWTM starts password aging at midnight on the day that you set the value. For example, if you use the **mwtm passwordage** command to set the password age to 1 day (24 hours), the password begins to age at midnight and expires 24 hours later.

This action is disabled by default. If you do not specify the **mwtm passwordage** command, users never need to change their passwords.

If you have enabled this action and you want to disable it (that is, prevent the MWTM from forcing users to change passwords), enter:

```
# ./mwtm passwordage clear
```

Note If **mwtm authtype** is set to **solaris** or **linux**, you cannot use the **mwtm passwordage** command. Instead, you must manage passwords on the external authentication servers.

Step 7 (Optional) To configure the MWTM to automatically disconnect a client (this includes the MWTM client, the GTT editor, and the address table editor) after a specified number of minutes of inactivity, enter:

```
# ./mwtm clitimeout number-of-minutes
```

where *number-of-minutes* is the number of minutes a client can be inactive before the MWTM disconnects the client.

The valid range is 1 minute to an unlimited number of minutes. There is no default value.

This action is disabled by default. If you do not specify the **mwtm clitimeout** command, clients are never disconnected as a result of inactivity.

If you have enabled this action and you want to disable it (that is, never disconnect a client as a result of inactivity), enter the following command:

```
# ./mwtm clitimeout clear
```

Manually Disabling Users and Passwords (Server Only)

As described in the [Automatically Disabling Users and Passwords \(Server Only\), page 2-10](#), you can customize the MWTM to automatically disable users and passwords when certain conditions are met. However, you can also manually disable MWTM users and passwords whenever you suspect a security breach has occurred.

To disable MWTM users and passwords:

Step 1 Log in to the MWTM server as the root or superuser:

- Root user—See [Starting the MWTM Client, page 3-3](#)
- Super user—See [Specifying a Super User \(Server Only\), page 2-19](#)

Step 2 Enter:

```
# cd /opt/CSCOsrgm/bin
```

Step 3 (Optional) To delete a user entirely from the MWTM user access account list, enter:

```
# ./mwtm deluser username
```

where *username* is the name of the user.

If you later decide to add the user back to the account list, you must use the **mwtm adduser** command.

Step 4 (Optional) If **mwtm authtype** is set to local, you can disable a user's password. To disable a user's password, enter:

```
# ./mwtm disablepass username
```

where *username* is the name of the user. The MWTM does not delete the user from the account list, the MWTM only disables the user's password.

Note If **mwtm authtype** is set to solaris or linux, you cannot use the **mwtm disablepass** command. Instead, you must manage passwords on the external authentication servers.

The user must change the password the next time he or she logs in.

You can also re-enable the user's account with the same password, or with a new password:

- To re-enable the user's account with the same password as before, use the **mwtm enableuser** command.
- To re-enable the user's account with a new password, use the **mwtm userpass** command.

Step 5 (Optional) To disable a user's account, but not the user's password, enter:

```
# ./mwtm disableuser username
```

where *username* is the name of the user.

Note If **mwtm authtype** is set to solaris or linux, you must be logged in as the root user, not as a superuser, to enter this command.

The MWTM does not delete the user from the account list; the MWTM only disables the user's account. The user cannot log in until you re-enable the user's account:

- To re-enable the user's account with the same password as before, use the **mwtm enableuser** command.
- To re-enable the user's account with a new password, use the **mwtm userpass** command.

Enabling and Changing Users and Passwords (Server Only)

Of course, the MWTM also enables you to re-enable users and passwords, and change user accounts. To enable and change users and passwords:

Step 1 Log in to the MWTM server as the root or superuser:

- Root user—See [Starting the MWTM Client, page 3-3](#)
- Super user—See [Specifying a Super User \(Server Only\), page 2-19](#)

Step 2 Enter the following command:

```
# cd /opt/CSCOsrgm/bin
```

Step 3 (Optional) To re-enable a user's account, which had been disabled either automatically by the MWTM or by a superuser, enter the following command:

```
# ./mwtm enableuser username
```

where *username* is the name of the user. The MWTM re-enables the user's account with the same password as before.

Note If **mwtm authtype** is set to solaris or linux, you must be logged in as the root user, not as a superuser, to enter this command.

Step 4 (Optional) If **mwtm authtype** is set to local, you can change a user's password, or re-enable the user's account with a new password, if the user's account had been disabled either automatically by the MWTM or by a superuser. To change a password or to re-enable a user's account with a new password, enter:

```
# ./mwtm userpass username
```

where *username* is the name of the user.

The MWTM prompts you for the new password. When setting the password, follow the rules and considerations in the [Creating Secure Passwords, page 2-7](#).

If the user's account has also been disabled, the MWTM re-enables the user's account with the new password.

Note If **mwtm authtype** is set to solaris or linux, you cannot use the **mwtm userpass** command. Instead, you must manage passwords on the external authentication servers.

Step 5 (Optional) To change a user's account level and password, enter the following command:

```
# ./mwtm updateuser username
```

where *username* is the name of the user.

Note If **mwtm authtype** is set to solaris or linux, you must be logged in as the root user, not as a superuser, to enter this command.

The MWTM prompts you for the new account level. Valid levels are described in [Configuring User Levels, page 2-5](#):

If **mwtm authtype** is set to local, the MWTM also prompts you for the user's new password. When setting the password, follow the rules and considerations in [Creating Secure Passwords, page 2-7](#).

Step 6 (Optional) To change a user's account level, but not the user's password, enter the following command:

```
# ./mwtm newlevel username
```

where *username* is the name of the user.

The MWTM prompts you for the new account level. Valid levels are described in [Configuring User Levels, page 2-5](#).

Displaying a Message of the Day

You can use the MWTM to display a user-specified MWTM system notice called the message of the day. You can use the message of the day to inform users of important changes or events in the MWTM system. The message of the day also gives users an opportunity to exit the MWTM client, Event Editor, GTT Editor (ITP only), or Address Table Editor (ITP only) before starting them.

If you enable the message of the day, it appears whenever a user attempts to launch a client. If the user accepts the message, the client launches. If the user declines the message, the client does not launch.

To display the Message of the Day dialog, use one of the following procedures:

- Launch a client. If there is a message of the day, the Message of the Day dialog appears.
- Launch MWTM web client. Choose **Administrative > System Information > Message of the Day**. This link appears only after enabling message of the day using the command `mwtm motd`.
- Choose **View > Message of the Day** from the MWTM main menu (in case of java client).
- Select the MWTM server name in the lower-right corner of the MWTM main window.

The Message of the Day dialog contains the following fields:

Field or Button	Description
Message of the Day Last Updated	Date and time the message of the day was last updated. If there is no message of the day, the MWTM displays Unknown.
Message Field	Text of the message of the day. If there is no message of the day, the MWTM displays <i>There is no message of the day.</i>
Accept	Closes the Message of the Day dialog and launches the client. If you do not click Accept, you cannot launch the client. This button is available when there is a message of the day and you launch a client.
Decline	Closes the Message of the Day dialog and exits the client. This button is available when there is a message of the day and you launch a client.
OK	Closes the Message of the Day dialog without exiting the client. This button is available if you displayed the Message of the Day dialog by choosing View > Message of the Day from the MWTM main menu. The OK button is not available in web client.

To configure the MWTM to display a message of the day:

-
- Step 1** Log in to the MWTM server as the root or superuser:
- Root user—See [Starting the MWTM Client, page 3-3](#)
 - Super user—See [Specifying a Super User \(Server Only\), page 2-19](#)

- Step 2** Enter the following commands:

```
cd /opt/CSCOsgm/bin
./mwtm motd enable
```

The MWTM displays:

Enter location of the message of the day file: [/opt/CSCOsgrm/etc/motd]

- Step 3** To accept the default value, press **Enter**; or type a different location and press **Enter**.

The MWTM displays:

```
Setting Message of the Day File to: [/opt/CSCOsgrm/etc/motd]
Message of the Day File set to: [/opt/CSCOsgrm/etc/motd]
MWTM server must be restarted for changes to take effect.
```

- Step 4** To create the message text (the first time) or edit the existing text, enter:

```
./mwtm motd edit
```

- Step 5** To display the contents of the message of the day file, enter:

```
./mwtm motd cat
```

- Step 6** To disable the message of the day file, enter:

```
./mwtm motd disable
```

Manually Synchronizing Local MWTM Passwords (Server Only)

If **mwtm authtype** is set to **solaris** or **linux**, the MWTM automatically synchronizes local MWTM passwords with the operating system at 1:30 a.m. each night (this setting can be changed using the root crontab). However, you can also manually synchronize passwords at any time.

To manually synchronize local MWTM passwords:

-
- Step 1** Log in to the MWTM server as the root or superuser:

- Root user—See [Starting the MWTM Client, page 3-3](#)
- Super user—See [Specifying a Super User \(Server Only\), page 2-19](#)

- Step 2** Change to the **/bin** directory:

```
cd /opt/CSCOsgrm/bin
```

- Step 3** Synchronize the MWTM passwords:

```
./mwtm syncusers
```

The MWTM synchronizes the passwords with Solaris.

Listing All Currently Defined Users (Server Only)

To list all currently defined users in the MWTM User-Based Access account list:

-
- Step 1** Log in to the MWTM server as the root or superuser:

- Root user—See [Starting the MWTM Client, page 3-3](#)
- Super user—See [Specifying a Super User \(Server Only\), page 2-19](#)

Step 2 Change to the */bin* directory:

```
cd /opt/CSCOsgrm/bin
```

Step 3 List all users:

```
./mwtm listusers
```

The MWTM displays the following information for each user:

- Username
- Last time the user logged in
- User's account access level
- User's current account status, such as Account Enabled or Password Disabled

Step 4 To list information for a specific user, enter:

```
./mwtm listusers username
```

where *username* is the name of the user.

Note You can also view user account information on the MWTM User Accounts web page.

Displaying the Contents of the System Security Log (Server Only)

To display the contents of the system security log with PAGER:

Step 1 Log in to the MWTM server as the root or superuser:

- Root user—See [Starting the MWTM Client, page 3-3](#)
- Super user—See [Specifying a Super User \(Server Only\), page 2-19](#)

Step 2 Change to the */bin* directory:

```
cd /opt/CSCOsgrm/bin
```

Step 3 Display the security log contents:

```
./mwtm seclog
```

The following security events are recorded in the log:

- All changes to system security, including adding users
- Login attempts, whether successful or unsuccessful, and logoffs
- Attempts to switch to another user's account, whether successful or unsuccessful
- Attempts to access files or resources of higher account level
- Access to all privileged files and processes
- Operating system configuration changes and program changes, at the Solaris level
- MWTM restarts
- Failures of computers, programs, communications, and operations, at the Solaris level

Step 4 To clear the log, enter:

```
./mwtm seclog clear
```

The default path and filename for the system security log file is */opt/CSCOs/gm/logs/sgmSecurityLog.txt*. If you installed the MWTM in a directory other than */opt*, then the system security log file is located in that directory.

**Note**

You can also view the system security log on the MWTM System Security Log web page. For more information, see [Viewing the Security Log, page 12-15](#).

Restoring Security-Related MWTM Data (Server Only)

If you inadvertently delete your user accounts, or make other unwanted changes to your MWTM security information, the MWTM can restore the security-related parts of the MWTM data files from the previous night's backup.

To restore the security-related MWTM data files:

Step 1 Log in as the root user (for details see [Starting the MWTM Client, page 3-3](#)).

Step 2 Change to the */bin* directory:

```
cd /opt/CSCOs/gm/bin
```

Step 3 Restore the security-related data:

```
./mwtm restore security
```

The MWTM restores the data.

Disabling MWTM User-Based Access (Server Only)

To completely disable MWTM User-Based Access:

Step 1 Log in to the MWTM server as the root or superuser:

- Root user—See [Starting the MWTM Client, page 3-3](#)
- Super user—See [Specifying a Super User \(Server Only\), page 2-19](#)

Step 2 Change to the */bin* directory:

```
cd /opt/CSCOs/gm/bin
```

Step 3 Disable user-based access:

```
./mwtm useraccess disable
```

The MWTM user access is disabled the next time you restart the MWTM server (using the `mwtm restart` command).

Specifying a Super User (Server Only)

You can use the MWTM to specify a *superuser*. A superuser can perform most actions that otherwise require the user to be logged in as the root user. (The root user can still perform those actions, too.) If you specify a superuser, the server also runs as the superuser and not as the root user.

Caution

As a superuser, you can adversely affect your operating environment if you are unaware of the effects of the commands that you use. If you are a relatively inexperienced UNIX user, limit your activities as a superuser to the tasks described in this document.

When you specify a superuser, remember that:

- The user must exist in the local `/etc/passwd` file. You cannot specify a user that is defined in a distributed Network Information Services (NIS) system.
- The superuser does not have access to all MWTM commands; you must still be logged in as the root user to enter certain commands. You must still be logged in as the root user to enter the following commands:
 - `mwtm authtype`
 - `mwtm backup`
 - `mwtm backupdir`
 - `mwtm browserpath`
 - `mwtm certgui`
 - `mwtm certtool`
 - `mwtm clean`
 - `mwtm cleanall`
 - `mwtm cleandb`
 - `mwtm cwsetup`
 - `mwtm evilstop`
 - `mwtm jspport`
 - `mwtm keytool`
 - `mwtm killclients`
 - `mwtm reboot`
 - `mwtm restore`
 - `mwtm restoreprops`
 - `mwtm setpath`, if you are specifying a *username*
 - `mwtm sounddir`
 - `mwtm ssl`

- mwtm stopclients
- mwtm superuser
- mwtm syncusers
- mwtm termproxy
- mwtm trapsetup
- mwtm uninstall
- mwtm webport
- mwtm xtermpath
- If the **mwtm authtype** is set to solaris or linux, you must still be logged in as the root user to enter the following commands:
 - mwtm adduser
 - mwtm disablepass
 - mwtm passwordage
 - mwtm updateuser
 - mwtm userpass
- If the SNMP trap port number on the MWTM server is less than 1024, you cannot use the **mwtm superuser** command. To correct this situation, you must specify a new SNMP trap port number that is greater than 1024:
 - To change the SNMP trap port number in the nodes in your network, use the `snmp-server host` command. By default, the MWTM listens for traps from trap multiplexing nodes and NMS applications on port 44750, so that is a good port number to choose. The SNMP trap port number must be the same on all nodes in your network.
 - For more information, see the description of the `snmp-server host` command in the “Node Requirements” section of the *Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3*.
 - Use the **mwtm trapsetup** command to change the SNMP trap port number in the MWTM server to match the port number in the nodes in your network. For more information, see [mwtm trapsetup](#), page B-88.

To specify a superuser on the MWTM server:

Step 1 Log in as the root user (see [Becoming the Root User \(Server Only\)](#), page 3-2).

Step 2 Change to the `/bin` directory:

```
cd /opt/CSCosgm/bin
```

Step 3 Specify the superuser:

```
./mwtm superuser username
```

where *username* is the name of the user.

Implementing SSL Support in the MWTM

Note

If you chose the Solaris or Linux authentication options (during installation or through the **mwtm authtype** command) you must enable SSL. For details on the **mwtm authtype** command, see [mwtm authtype](#), page B-8.

You can implement Secure Sockets Layer (SSL) support in your MWTM system. When you do, the MWTM uses secure sockets to encrypt all communication between the MWTM clients and server.

This section includes the following information:

- [Enabling SSL Support on the MWTM Server](#), page 2-21
- [Downloading the MWTM SSL Module for Windows Using the Web Interface](#), page 2-23
- [Downloading the Self-Signed SSL Certificate from the MWTM Server](#), page 2-23
- [Launching the MWTM Certificate Tool for SSL](#), page 2-24
- [Exporting an SSL Certificate](#), page 2-26
- [Viewing Detailed Information About a SSL Certificate](#), page 2-26
- [Managing SSL Support in the MWTM](#), page 2-27
- [Disabling SSL Support in the MWTM](#), page 2-28

Enabling SSL Support on the MWTM Server

To enable SSL support in the MWTM, perform the following:

- Step 1** Install an SSL key/certificate pair in the MWTM by using one of the following procedures:
- To install a new SSL key and a self-signed certificate, generate the key and certificate by logging in as the root user on the MWTM server and entering the **mwtm keytool genkey** command.
- The MWTM stops the MWTM server and these prompts appear:
- ```
Country Name (2 letter code) []:
State or Province Name (full name) []:
Locality Name (eg, city) []:
Organization Name (eg, company) []:
Organizational Unit Name (eg, section) []:
Common Name (your hostname) []:
Email Address []:
Certificate Validity (number of days)? [min: 30, default: 365]
```
- Enter the requested information.
- The MWTM generates the following files:
- `/opt/CSCOs/gm/etc/ssl/server.key` is the MWTM server's private key. Ensure that unauthorized personnel cannot access this key.
  - `/opt/CSCOs/gm/etc/ssl/server.crt` is the self-signed SSL certificate.
  - `/opt/CSCOs/gm/etc/ssl/server.csr` is a certificate signing request (CSR). It is not used if you are using a self-signed SSL certificate.

- To install a new SSL key and a certificate signed by a certificate authority (CA), generate the key and a CSR by logging in as the root user on the MWTM server and entering the **mwtm keytool genkey** command.

The MWTM stops the MWTM server and issues the following prompts:

```
Country Name (2 letter code) []:
State or Province Name (full name) []:
Locality Name (eg, city) []:
Organization Name (eg, company) []:
Organizational Unit Name (eg, section) []:
Common Name (your hostname) []:
Email Address []:
Certificate Validity (number of days)? [min: 30, default: 365]
```

Enter the requested information.

The MWTM generates the following files:

- `/opt/CSCOsgm/etc/ssl/server.key` is the MWTM server's private key. Ensure that unauthorized personnel cannot access this key.
- `/opt/CSCOsgm/etc/ssl/server.csr` is a CSR.
- `/opt/CSCOsgm/etc/ssl/server.crt` is the self-signed SSL certificate. It is not used if you are using a CA-signed SSL certificate; the CA-signed certificate overrides the self-signed certificate.

Print the CSR in X.509 format, by logging in as the root user on the MWTM server and entering the **mwtm keytool print\_csr** command.

Send the CSR to a CA to be signed.

After the CA signs the certificate, log in as the root user on the MWTM server and enter the following command:

```
./mwtm keytool import_cert cert_filename
```

where *cert\_filename* is the name of the signed certificate.

The MWTM stops the MWTM server and imports the certificate in X.509 format.

- To use an existing signed key/certificate pair, log in as the root user on the MWTM server and enter the following command:

```
./mwtm keytool import_key key_filename cert_filename
```

where *key\_filename* is the name of the existing SSL key and *cert\_filename* is the name of the existing signed certificate.

The MWTM stops the MWTM server and imports the SSL key in OpenSSL format and the signed SSL certificate in X.509 format.

**Step 2** Enable SSL support in the MWTM, by logging in as the root user on the MWTM server and entering the **mwtm ssl enable** command.

**Step 3** Restart the MWTM server.

**Step 4** Set up the MWTM client-side SSL certificate trust relationship by downloading and importing the self-signed or CA-signed certificate on every remote MWTM client, Windows as well as Solaris, that connects to the MWTM server.

- (Self-signed certificate only) Download the self-signed certificate (*server.crt*) by using the procedure in [Downloading the Self-Signed SSL Certificate from the MWTM Server, page 2-23](#).
- Import the self-signed or CA-signed certificate by using the procedure in [Launching the MWTM Certificate Tool for SSL, page 2-24](#).

**Step 5** Restart the MWTM client.

---

The MWTM clients can now connect to the MWTM server by using SSL. All communication between the server and clients is encrypted.

If an MWTM client, GTT editor (ITP only), or Address Table editor (ITP only) that is not SSL-enabled attempts to connect to an SSL-enabled MWTM server, the MWTM displays an appropriate warning message and opens the MWTM Client for Windows page. You can then download and install a new MWTM SSL module for the client to use to connect to that MWTM server.

If the client is SSL-enabled but does not have the correct certificate, the MWTM displays an appropriate warning message and opens the MWTM Server SSL Certificate page. You can then download the signed SSL certificate in X.509 format to the client.

## Downloading the MWTM SSL Module for Windows Using the Web Interface

To install the MWTM SSL module on a Windows system from the MWTM web interface:

---

**Step 1** From your browser, go to the URL for the MWTM Homepage:

`http://your_mwtm_server:1774`

where *your\_mwtm\_server* is the name or IP address of the MWTM server and *1774* is the web port being used by the MWTM (**1774** is the default port number.) If you do not know the name or web port of the MWTM server, contact the system administrator who installed the MWTM server software.

The MWTM web interface home page appears.

**Step 2** Click **Download Windows Client**. Ensure that your browser is pointed to an MWTM, SSL-enabled server.

**Step 3** Right-click **Download SSL Module for MWTM Client on Windows XP** and choose the **Save Link As** or **Save Target As** option.

**Note** If you are using Internet Explorer, change the *.zip* extension to *.jar* during the Save Target As option.

---

**Step 4** When queried, save the file under *<Installed Drive>\Program Files\Cisco Systems\MWTMClient\lib* where *<Installed Drive>* is the disk on which the MWTM client is installed.

**Step 5** You are prompted to launch the client, then download the self-signed SSL certificate (follow the subsequent procedures).

---

## Downloading the Self-Signed SSL Certificate from the MWTM Server

If you have implemented Secure Sockets Layer (SSL) support in your MWTM system, you can download the MWTM server's signed SSL certificate to all remote MWTM clients that connect to the server using SSL.

To download the certificate from the MWTM Server SSL Certificate page, use the following procedure on each remote MWTM client:

**Step 1** In a web browser, enter the following URL:

`https://server_name:1774`

where *server\_name* is the name or IP address of the server on which the MWTM server is running and *1774* is the Web port being using by the MWTM (1774 is the default port number.) If you do not know the name or Web port of the MWTM server, contact the system administrator who installed the MWTM server software.

The Server SSL Certificate page appears.

**Step 2** Right-click **Download Server SSL Certificate**.

**Step 3** Select **Save Link As** (or **Save Target As**) from the right-click menu.

**Step 4** Select a directory in which to save the certificate (*server.crt*), and click **Save**.

The MWTM downloads the *server.crt* file into the specified directory.

## Launching the MWTM Certificate Tool for SSL

If you have implemented Secure Sockets Layer (SSL) support in your MWTM system, you can launch the MWTM Certificate Tool for SSL. The MWTM Certificate Tool dialog box lists all SSL certificates that the MWTM client imported. In this dialog box, you specify whether to import, export, and display detailed information about SSL certificates.

To launch the MWTM SSL Certificate Tool, use one of the following procedures:

- In Solaris, log in as the root user and enter the following commands:

```
cd /opt/CSCosgm/bin
./mwtm certgui
```

For more information, see [mwtm certgui, page B-13](#).

- In Windows, choose **Start > Programs > Cisco MWTM Client > MWTM SSL Certificate Tool**.

The MWTM displays the MWTM Certificate Tool dialog box.

For each SSL certificate, the MWTM Certificate Tool dialog box displays:

| Field or Button | Description                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Issued to       | Hostname of the MWTM server to which the SSL certificate was issued.                                                                                                                         |
| Issued by       | Certificate authority (CA) that issued the SSL certificate.<br>Self-signed SSL certificates display the hostname of the MWTM server.                                                         |
| Expiration Date | Date on which the SSL certificate expires.                                                                                                                                                   |
| Import          | Displays the Open dialog box for an SSL certificate, which you use to import SSL certificates (for details, see <a href="#">Importing an SSL Certificate to an MWTM Client, page 2-25</a> ). |
| Export          | Displays the Save dialog box for an SSL certificate, which you use to export the selected SSL certificate.                                                                                   |
| Remove          | Removes the selected SSL certificate from the table.                                                                                                                                         |
| Details         | Displays the Certificate Information dialog box, which provides detailed information about the selected certificate.                                                                         |

| Field or Button | Description                                  |
|-----------------|----------------------------------------------|
| Exit            | Closes the MWTM Certificate Tool dialog box. |
| Help            | Displays online help for the current window. |

## Importing an SSL Certificate to an MWTM Client

If you have implemented Secure Sockets Layer (SSL) support in your MWTM system, you can import the MWTM server's self-signed SSL certificate, or a CA-signed SSL certificate, to all remote MWTM clients that connect to the server using SSL.

### Note

If you are using a Solaris client, you can import by using the MWTM SSL Certificate Tool as described in this section, or the CLI command **mwtm certtool** (for details, see [mwtm certtool](#), page B-14). If you are using a Windows client, you must use the MWTM SSL Certificate Tool.

To import an SSL certificate, launch the MWTM SSL Certificate Tool, as described in [Launching the MWTM Certificate Tool for SSL](#), page 2-24, then click **Import**. The MWTM displays the Open dialog box for SSL certificates.

Use the Open dialog box to locate the SSL certificate that you want to import. The Open dialog box contains:

| Field or Button                                                                                       | Description                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Look In                                                                                               | Click to select the directory in which you want to find the SSL certificate. Accept the default directory, or select a new directory from the drop-down list box.<br><br>For a self-signed certificate, locate the directory in which you downloaded the certificate. |
| File Name                                                                                             | Enter a name for the SSL certificate, or select a file from those listed in the “Open” field. The MWTM displays the name of the certificate in the “File Name” field.                                                                                                 |
| Files of Type                                                                                         | Specifies the type of file to display, and displays all files of that type in the selected directory. For SSL certificates, this field displays “All files,” which means files of all types appear in the table.                                                      |
|  Up One Level      | Displays the subfolders and files that are in the folder that is up one level from the currently visible folder.                                                                                                                                                      |
|  Desktop           | Displays the subfolders and files that are on your workstation desktop.                                                                                                                                                                                               |
|  Create New Folder | Creates a new subfolder in the visible folder.                                                                                                                                                                                                                        |
|  List              | Displays only icons for subfolders and files.                                                                                                                                                                                                                         |
|  Details           | Displays detailed information for subfolders and files, including their size, type, date they were last modified, and so on.                                                                                                                                          |
| Open                                                                                                  | Imports the file, closes the Open dialog box for an SSL certificate, and populates the MWTM Certificate Tool dialog box with the SSL certificate's information.                                                                                                       |
| Cancel                                                                                                | Closes the Open dialog box for an SSL certificate without importing the file.                                                                                                                                                                                         |

## Exporting an SSL Certificate

If you have implemented Secure Sockets Layer (SSL) support in your MWTM system, you can export SSL certificates that have been imported to the MWTM client.

To export a SSL certificate, launch the MWTM SSL Certificate Tool, as described in [Launching the MWTM Certificate Tool for SSL, page 2-24](#), select a certificate from the list, then click **Export**. The MWTM displays the Save dialog for SSL certificates.

Use the Save dialog box to export the SSL certificate to another directory. The Save dialog box contains:

| Field or Button                                                                                       | Description                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Save In                                                                                               | Click to select the directory in which you want to save the SSL certificate. Accept the default directory, or select a new directory from the drop-down list box.<br><br>For a self-signed certificate, locate the directory in which you downloaded the certificate. |
| File Name                                                                                             | Enter a name for the SSL certificate, or select a file from those listed in the “Save In” field. The MWTM displays the name of the certificate in the “File Name” field.                                                                                              |
| Files of Type                                                                                         | Specifies the type of file to save, and displays all files of that type in the selected directory. For SSL certificates, this field displays “All files,” which means files of all types.                                                                             |
|  Up One Level        | Displays the subfolders and files that are in the folder that is up one level from the currently visible folder.                                                                                                                                                      |
|  Desktop            | Displays the subfolders and files that are on your workstation desktop.                                                                                                                                                                                               |
|  Create New Folder | Creates a new subfolder in the visible folder.                                                                                                                                                                                                                        |
|  List              | Displays only icons for subfolders and files.                                                                                                                                                                                                                         |
|  Details           | Displays detailed information for subfolders and files, including their size, type, date they were last modified, and so on.                                                                                                                                          |
| Save                                                                                                  | Saves the file, closes the Save dialog box for an SSL certificate, and returns to the MWTM Certificate Tool dialog box. Click <b>Exit</b> to close the MWTM Certificate Tool dialog box and export the self-signed SSL certificate in X.509 format.                   |
| Cancel                                                                                                | Closes the Save dialog for an SSL certificate without saving the file.                                                                                                                                                                                                |

## Viewing Detailed Information About a SSL Certificate

If you implemented Secure Sockets Layer (SSL) support in your MWTM system, you can view detailed information about SSL certificates that were imported to the MWTM client.

To view detailed information about an SSL certificate, use one of the following procedures:

- Click the locked padlock icon in the lower-left corner of any MWTM window.

- Launch the MWTM SSL Certificate Tool, as described in [Launching the MWTM Certificate Tool for SSL, page 2-24](#), select an SSL certificate from the list and click **Details**.

The MWTM displays the Certificate Information dialog.

For the selected SSL, the Certificate Information dialog box displays:

| Field or Button     | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subject             | Node to which the SSL certificate was issued.<br><br>This field always includes the Common Name (CN) of the subject, which must match the fully qualified hostname of your MWTM server, such as <i>xxxx.company.com</i> .<br><br>This field might also contain other information, such as the Country (C), Organizational Unit (OU), or Organization (O) of the subject. |
| Issuer              | CA that issued the SSL certificate.<br><br>This field might include the Common Name (CN) of the issuer, as well as the Country (C), Organizational Unit (OU), or Organization (O) of the issuer.                                                                                                                                                                         |
| Version             | Version of the SSL certificate, such as “V1.”                                                                                                                                                                                                                                                                                                                            |
| Serial number       | Serial number associated with the SSL certificate.                                                                                                                                                                                                                                                                                                                       |
| Signature algorithm | Asymmetric algorithm ensures that the digital signature is secure, such as “MD5withRSA.”                                                                                                                                                                                                                                                                                 |
| Valid from          | Date and time on which the SSL certificate was created or became valid.                                                                                                                                                                                                                                                                                                  |
| Valid to            | Date and time on which the SSL certificate expires.                                                                                                                                                                                                                                                                                                                      |
| Public key          | Public key associated with the SSL certificate, used for encryption and for verifying signatures.                                                                                                                                                                                                                                                                        |
| OK                  | Closes the Certificate Information dialog box.<br><br>When you are ready to close the dialog box, click <b>OK</b> . The MWTM closes the Certificate Information dialog. If necessary, click <b>Exit</b> to close the MWTM Certificate Tool dialog.                                                                                                                       |

## Managing SSL Support in the MWTM

You use the MWTM to manage SSL support. To:

- Display the current status of SSL support in the MWTM, including whether SSL support is enabled or disabled and which SSL keys and certificates exist, use either the **mwtm ssl status** or **mwtm sslstatus** command.
- Print the MWTM server’s SSL certificate in X.509 format, use the **mwtm keytool print\_crt** command.
- List the SSL key/certificate pair on the MWTM server, use the **mwtm keytool list** command.
- List all SSL certificates on the MWTM client, launch the MWTM SSL Certificate Tool. The MWTM lists each imported certificate, including to whom the certificate was issued, who issued the certificate, and when the certificate expires.

For more information on the use of these commands, see [Appendix B, “Command Reference.”](#)

For more information on launching the MWTM SSL Certificate Tool, see [Exporting an SSL Certificate, page 2-26](#).

See [Enabling SSL for the Firefox Web Client, page 2-28](#) for information on using Firefox 3.

## Enabling SSL for the Firefox Web Client

If you are using Firefox 3 to connect to an MWTM server that has SSL enabled, you must add an exception to allow the connection to the server.

The first time you attempt to connect to an SSL-enabled MWTM server using Firefox 3, you get an error saying that you're speaking plain HTTP to an SSL-enabled server port. Follow these steps to add an exception to allow the connection:

- 
- Step 1** On the Server Connection Failed page, click the link at the bottom to add an exception.
- Step 2** In the Add Security Exception form, in the Location field, enter the MWTM server in the form of `https://<server_name>:1774/` where *server\_name* is the name or IP address of the server on which the MWTM server is running and 1774 is the Web port being using by the MWTM (1774 is the default port number.)
- Step 3** Click **Get Certificate**.
- Step 4** Click **Confirm Security Exception**.

You can now use Firefox 3 to connect to an SSL-enabled MWTM server.

---

## Disabling SSL Support in the MWTM

You use the MWTM to disable SSL support in the MWTM, and to remove SSL keys and certificates from the MWTM server and clients. To:

- Disable SSL support in the MWTM, use the **mwtm ssl disable** command.  
For more information, see [mwtm ssl, page B-74](#).
- Remove all SSL keys and certificates from the MWTM server, use the **mwtm keytool clear** command. The MWTM stops the MWTM server, if necessary, and removes the keys and certificates. Before restarting the server, you must generate new SSL keys by using the **mwtm keytool genkey** command, or you must completely disable SSL using the **mwtm ssl disable** command.  
For more information on the use of these commands, see [Appendix B, "Command Reference"](#).
- Remove an SSL certificate from the MWTM client, launch the MWTM SSL Certificate Tool. The MWTM lists each imported certificate. Select the certificate that you want to remove, and click **Remove**. The MWTM deletes the certificate from the list.

For more information on launching the MWTM SSL Certificate Tool, see [Exporting an SSL Certificate, page 2-26](#).

# Limiting MWTM Client Access to the MWTM Server (Server Only)

By default, when you first install the MWTM, all MWTM client IP addresses can connect to the MWTM server. However, you use the MWTM to limit client access to the server by creating and maintaining the *ipaccess.conf* file.

You can create the *ipaccess.conf* file and populate it with a list of MWTM client IP addresses that can connect to the MWTM server. The MWTM allows connections from only those clients, plus the local host. If the file exists but is empty, the MWTM allows connections only from the local host. (The MWTM always allows connections from the local host.)

When you first install the MWTM, the *ipaccess.conf* file does not exist and the MWTM allows all client IP addresses to connect to the MWTM server.

To create the *ipaccess.conf* file and work with the list of allowed client IP addresses:

- 
- Step 1** Log in to the MWTM server as the root or superuser:
- Root user—See [Becoming the Root User \(Server Only\)](#), page 3-2
  - Super user—See [Specifying a Super User \(Server Only\)](#), page 2-19

- Step 2** Change to the bin directory:

```
cd /opt/CSCOsgrm/bin
```

- Step 3** Create the *ipaccess.conf* file:

- To create the *ipaccess.conf* file and add a client IP address to the list, enter:  

```
./mwtm ipaccess add
```
- To create the *ipaccess.conf* file and open the file to edit it directly, enter:  

```
./mwtm ipaccess edit
```

The default directory for the file is located in the MWTM installation directory:

- If you installed the MWTM in the default directory, */opt*, then the default directory is */opt/CSCOsgrm/etc*.
- If you installed the MWTM in a different directory, then the default directory is located in that directory.

In the *ipaccess.conf* file, begin all comment lines with a pound sign (#).

All other lines in the file are MWTM client IP addresses, with one address per line.

Wildcards (\*) are allowed, as are ranges (for example, 1-100). For example, if you input the address \*.\*.\* then all clients can connect to the MWTM server.

- Step 4** After you create the *ipaccess.conf* file, you can use the full set of mwtm ipaccess keywords to work with the file:
- clear—Remove all client IP addresses from the *ipaccess.conf* file, and allow connections from any MWTM client IP address.
  - list—List all client IP addresses currently in the *ipaccess.conf* file. If no client IP addresses are listed (that is, the list is empty), connections from any MWTM client IP address are allowed.
  - rem—Remove the specified client IP address from the *ipaccess.conf* file.
  - sample—Print out a sample *ipaccess.conf* file.

For more information, see [mwtm ipaccess](#), page B-39.

---

Any changes you make to the *ipaccess.conf* file take effect when you restart the MWTM server.

You can also use the MWTM to limit the IP addresses that can send traps to the server by creating and maintaining the *trapaccess.conf* file. For more information, see the “[Limiting Traps by IP Address](#)” section on page 4-9.

## Backing Up or Restoring MWTM Files (Server Only)

The MWTM automatically backs up all MWTM data files to the MWTM installation directory daily at 1:30 a.m.

To change the time at which the MWTM automatically backs up files, log in as the root user and change the *root crontab* file:

- **crontab -l** lists cron jobs.
- **crontab -e** opens up an editor so you can make changes and save them.

### Note

The MWTM performs a database integrity check during the backup. If the check fails, the previous backup is not be overwritten, and the MWTM creates a new failed file (for example: *mwtm61-server-backup-failed.tar.Z*).

---

This section contains these topics:

- [Backing Up MWTM Data Files](#), page 2-30
- [Changing the Backup Directory](#), page 2-31
- [Setting the Number of Backup Days](#), page 2-31
- [Restoring MWTM Data Files](#), page 2-31

## Backing Up MWTM Data Files

To manually back up the MWTM data files at any time on a Solaris or Linux server:

---

**Step 1** Log in as the root user. See [Becoming the Root User \(Server Only\)](#), page 3-2.

**Step 2** Change to the bin directory:

```
cd /opt/CSCosgm/bin
```

**Step 3** Back up the MWTM files:

```
./mwtm backup
```

The MWTM backs up the data files in the installation directory.

If you installed the MWTM in the default directory, */opt*, then the default backup directory is also */opt*. If you installed the MWTM in a different directory, then the default backup directory is that directory.

---

## Changing the Backup Directory

To change the directory in which the MWTM stores its nightly backup files:

---

**Step 1** Log in as the root user. See [Becoming the Root User \(Server Only\)](#), page 3-2.

**Step 2** Change to the bin directory:

```
cd /opt/CSCOsgm/bin
```

**Step 3** Change the backup directory location:

```
./mwtm backupdir directory
```

where *directory* is the new backup directory.

If the new directory does not exist, the MWTM does not change the directory, but issues an appropriate warning message.

---

## Setting the Number of Backup Days

To set the number of days that the MWTM saves backup files:

---

**Step 1** Log in as the root user. See [Becoming the Root User \(Server Only\)](#), page 3-2.

**Step 2** Change to the bin directory:

```
cd /opt/CSCOsgm/bin
```

**Step 3** Change the number of backup days (default is 1):

```
./mwtm backupdays
```

```
Current value is: 1
```

```
Enter number of days to save backup files (1-30): [1]
```

**Step 4** Enter a value for the number of days from 1 to 30. For example:

```
Enter number of days to save backup files (1-30): [1] 5
```

```
Setting number of days to save backup files to 5 days.
```

The MWTM will save backup files for the number of days that you entered. In this example, the MWTM saves backup files for the last five days, and deletes backup files that are older than five days.

---

## Restoring MWTM Data Files

You can restore data files on the same Solaris or Linux server, or on a different Solaris or Linux server running the MWTM 6.1.3.

To restore the MWTM data files from a previous backup:

---

**Step 1** Log in as the root user. See [Becoming the Root User \(Server Only\)](#), page 3-2.

**Step 2** Change to the bin directory:

```
cd /opt/CSCosgm/bin
```

**Step 3** Restore the MWTM data files:

```
./mwtm restore
```

The MWTM restores the data files.

**Note**

If the number of backup days has been set to more than one day (see [Setting the Number of Backup Days](#), page 2-31), the MWTM will prompt you for a server or client backup file to restore from (because there would be more than one backup file to choose from).

**Warning**

**Do not interrupt this command. Doing so can corrupt your MWTM data files.**

The **mwtm restore** command provides optional keywords that you use to restore only selected MWTM data files, such as GTT files (ITP only), route table files (ITP only), log files, report files, or security files. For more information, see [mwtm restore](#), page B-58.

---

## Removing MWTM Data from the MWTM Server

If you ever want to remove all MWTM data from the MWTM server without uninstalling the product, you can do so in one of two ways. Both ways restore the MWTM server to a state that would exist after a new installation of the MWTM.

### Method 1

To remove all MWTM data from the MWTM server, *excluding* message log files, backup files, and report files:

---

**Step 1** Log in as the root user (see [Becoming the Root User \(Server Only\)](#), page 3-2).

**Step 2** Change to the bin directory:

```
cd /opt/CSCosgm/bin
```

**Step 3** Remove the MWTM data:

```
./mwtm clean
```

Data removed includes all MWTM data, notes, preferences, security settings, route files (ITP only), GTT files (ITP only), address table files (ITP only), seed files, event filters, report control files, and views, as well as any user-created files stored in the MWTM directories.

---

**Method 2**

To remove all MWTM data from the MWTM server, including all view files, notes that are associated with network elements, and event filters and preferences, excluding message log files, backup files, report files, configuration settings, and security settings:

---

**Step 1** Log in as the root user. See [Becoming the Root User \(Server Only\)](#), page 3-2.

**Step 2** Change to the bin directory:

```
cd /opt/CSCOsgrm/bin
```

**Step 3** Enter:

```
./mwtm cleandb
```

This command restores the MWTM server to a state that would exist after a new installation of the MWTM, except for the presence of the retained files. Data removed includes all MWTM data, notes, preferences, route files (ITP only), GTT files (ITP only), address table files (ITP only) and views, as well as any user-created files stored in the MWTM directories.

To remove all MWTM data from the MWTM server, **including** message log files, backup files, and report files, log in as the root user, as described in the [Becoming the Root User \(Server Only\)](#), page 3-2, then enter the following commands:

```
cd /opt/CSCOsgrm/bin
./mwtm cleanall
```

Data removed includes all MWTM data, notes, preferences, security settings, route files (ITP only), GTT files (ITP only), address table files (ITP only), seed files, event filters, report control files, views, message log files, backup files, and report files, as well as any user-created files stored in the MWTM directories.

---

# CHAPTER 3

## Getting Started

---

This chapter provides information about starting and stopping the Cisco Mobile Wireless Transport Manager (MWTM), and an overview of how to use the MWTM to manage your network.

This chapter contains:

- [Starting the MWTM Server, page 3-1](#)
- [Starting the MWTM Client, page 3-3](#)
- [Discovering Your Network, page 3-4](#)
- [Displaying the MWTM Main Window, page 3-14](#)
- [Using the MWTM Toolbar, page 3-23](#)
- [Using the MWTM Main Menu, page 3-18](#)
- [Accessing the MWTM Through a Web Browser, page 3-24](#)
- [Loading and Saving MWTM Files, page 3-25](#)
- [Using the Windows Start Menu, page 3-26](#)
- [Using the Windows Start Menu, page 3-26](#)
- [Locating Technology Specific Information, page 3-28](#)
- [Exiting the MWTM Client, page 3-30](#)

For detailed information about the MWTM-supported platforms, and hardware and software requirements, see the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

**Note**

The default directory for installing the MWTM is `/opt`. In commands that call for the default directory, if you installed the MWTM in a different directory, you must specify that directory instead of `/opt`.

## Starting the MWTM Server

Before starting an MWTM server, verify that:

- Each node uses a supported IOS image
- The MWTM server has IP connectivity to each node
- SNMP is enabled on each node
- (Optional, but recommended) Traps are enabled on each node

- (Optional, but recommended) A trap host is defined on each node

**Tip**

For a definition of MWTM nodes, see [What Is ITP?](#), page 1-6, [What Is IPRAN?](#), page 1-7, and [What Is mSEF?](#), page 1-9.

Because the MWTM application comprises a server component and a client component, you must start both components to run the application.

To start the MWTM server on a Solaris or Linux system:

**Step 1**

You must be logged in as the root user or as a superuser, or your login must have administrator privileges. To log in as the root user, see the [Becoming the Root User \(Server Only\)](#), page 3-2.

**Note**

For details on setting up administrator privileges, see [Specifying a Super User \(Server Only\)](#), page 2-19.

**Step 2**

Enter:

```
cd /opt/CSCosgm/bin
./mwtm start
```

**Note**

If the database has an exception during start up, the server will fail to start.

## Becoming the Root User (Server Only)

Some MWTM procedures require that you log in as the root user.

**Caution**

As the root user, you can adversely affect your operating environment if you are unaware of the effects of the commands that you use. If you are a relatively inexperienced UNIX user, limit your activities as the root user to the tasks described in this manual.

If you are not logged in, log in as the root user:

```
> login: root
> Password: root-password
```

If you are already logged in, but not as the root user, use the **su** command to change your login to root:

```
su
Password: root-password
```

# Starting the MWTM Client

This section contains:

- [Before Starting the MWTM Client, page 3-3](#)
- [Starting the MWTM Client on Solaris or Linux, page 3-3](#)
- [Access the Node, page 3-4](#)
- [Starting the MWTM Client on Windows, page 3-4](#)

## Before Starting the MWTM Client

When you start an MWTM client, the version and release of the client must match that of the MWTM server.

If there is a client-server mismatch, the MWTM displays a warning message when you try to start the client. If you have a web browser installed, the MWTM optionally opens a web page from which you can download an allowed, matching client. For more information about downloading the MWTM client, see [Downloading the MWTM Client from the Web, page 11-12](#).

## Setting the DISPLAY Variable for Solaris or Linux Clients

If you see the following message upon client startup, you must set the DISPLAY variable:

```
Could not launch client: Can't connect to X11 window server using <x> as the value of the DISPLAY variable.
```

The DISPLAY variable is set as part of your login environment on Solaris or Linux. However, if you use Telnet or SSH to access a workstation, you must set the DISPLAY variable to local display by using this command:

```
setenv DISPLAY local_ws:0.0
```

where *local\_ws* is your local workstation.

If your shell does not support the **setenv** command, enter:

```
export DISPLAY=local_ws:0.0
```

## Starting the MWTM Client on Solaris or Linux

To start the MWTM client on a Solaris or Linux system on which the MWTM server is installed, ensure that the MWTM server is running, then enter:

```
cd /opt/CSCosgm/bin
./mwtm client
```

To start the MWTM client on a Solaris or Linux system other than the one on which the MWTM server is installed, ensure that the MWTM server is running, then enter:

```
cd /opt/CSCosgmClient/bin
./mwtm client
```

To start the MWTM client on a Solaris or Linux system other than the one on which the MWTM server is installed, and connect to an MWTM server other than the default server, enter:

```
cd /opt/CSCOsgrmClient/bin
./mwtm client server_name_or_ip_address
```

where *server\_name\_or\_ip\_address* is the name or IP address of the Solaris or Linux system on which the MWTM server is running.

## Access the Node

You use the MWTM to link to the node by using the connection protocol (Telnet or SSH) that you set in the Node SNMP and Credentials dialog box (see [Credentials Fields, page 4-21](#)).

To access the node, right-click a node in a window, then choose **Node Connect** from the right-click menu.

**Note**

If your client workstation does not have network access to the IP address of the node (that is, if the node is behind a firewall or NAT device), you might be unable to access the node.

## Starting the MWTM Client on Windows

To start the MWTM client on a Windows system, choose **Start > Programs > Cisco MWTM Client > Launch MWTM Client**, or double-click the MWTM Client icon on the Windows desktop.

**Note**

You can change the amount of memory used by the Windows MWTM client, GTT Editor, and Address Table Editor by adding the following entries to the *C:\Program Files\Cisco Systems\MWTM Client\properties\System.properties* file:

```
JVM_CLIENT_HEAP=1200
JVM_ATBL_HEAP=1200
JVM_GTT_HEAP=1200
JVM_CLIENT_HEAP=1200
JVM_ATBL_HEAP=1200
JVM_GTT_HEAP=1200
```

This reserves 1,200 megabytes (MB) of memory for each application. The default is 768 MB.

## Discovering Your Network

This section provides details on using the MWTM to discover your networks. It includes:

- [Discovery Overview, page 3-5](#)
- [Launching the Discovery Dialog, page 3-6](#)
- [Loading Seed Nodes and Seed Files, page 3-7](#)
- [Running Discovery, page 3-12](#)
- [Verifying Discovery, page 3-14](#)

## Discovery Overview

The MWTM uses a Discovery process to populate the MWTM database, discovering the objects in your network.

You can run Discovery if MWTM User-Based Access is disabled; or, if it is enabled, and you are a Network Administrator or System Administrator. (For more information about user authorization levels in the MWTM, see [Configuring MWTM User Account Levels \(Server Only\)](#), page 2-7.)

To discover your network:

- 
- Step 1** Start the MWTM client, as described in [Starting the MWTM Client](#), page 3-3.
- Step 2** If you want to change SNMP settings, do so *before* running Discovery. See [Configuring SNMP Settings](#), page 4-15 for more information.
- Step 3** If you want to discover ONS nodes and did not choose the option to discover your network during installation, you must add the ONS nodes and set the credentials before running discovery (see [Adding Nodes](#), page 4-22 for more information.)
- Step 4** Choose **Network > Network Discovery** from the MWTM main menu. The MWTM displays the Discovery dialog box. See [Launching the Discovery Dialog](#), page 3-6 for more information.
- Step 5** Select the **Seed Settings** tab, if it is not already chosen. You use the Seed Settings tab to create, save, load, and delete MWTM seed files. Load one or more seed nodes, or an existing seed file, by using the procedures in [Loading Seed Nodes and Seed Files](#), page 3-7.
- Step 6** Select the **Discovery** tab, or click **Next**. You use the Discovery tab to discover the objects in your network. See [Running Discovery](#), page 3-12 for more information.
- To specify the extent of the network discovery, check the **Entire Network** check box. See the description of the Entire Network check box in [Running Discovery](#), page 3-12 for more information.
  - To specify whether the MWTM should keep or delete the existing database when discovering the network, check the **Delete Existing Data** check box. See the description of the Delete Existing Data check box in [Running Discovery](#), page 3-12 for more information.
  - To specify the maximum number of hops for discovering objects in your network, enter a value in the **Max. Hops** text box. For more information, see the description of the Max. Hops text box in the [Running Discovery](#), page 3-12.
- Step 7** Click the **Discover Network** button.

**Note**

Event processing in the MWTM might experience congestion when discovering very large networks. If the number of events exceeds the capacity of the event queue, the event congestion icon  appears in the lower left of the MWTM client and web windows. If the icon appears, the presentation of event information in the MWTM will lag behind the actual state of the network objects until the congestion clears. No user action is necessary.

- Step 8** Examine the Discovered Nodes table to verify that the MWTM discovered all of the nodes in the network. If you suspect that the MWTM did not discover all of the nodes, see [Verifying Discovery](#), page 3-14 for troubleshooting information. You might need to add more seed nodes and run discovery again.

- Step 9** When you are satisfied that the MWTM discovered all of the nodes in the network, save the list of seed nodes in a seed file. See [Saving a Seed File, page 3-8](#) for more information.

**Note**

(ITP only) You can run discovery multiple times to attempt to discover additional nodes based on the IP addresses defined in the Stream Control Transmission Protocol (SCTP) links. If you are using a separate management VLAN to manage your nodes, but private or unreachable IP addresses for your SCTP connectivity, uncheck the **Entire Network** check box in the Discovery dialog box. Otherwise, discovery attempts to reach those nodes continuously. Instead, enter all nodes to be discovered directly into the seed list and do a nonrecursive discovery.

**Related Topics**

- [Configuring SNMP Settings, page 4-15](#)
- [Backing Up or Restoring MWTM Files \(Server Only\), page 2-30](#)
- [Investigating Data Problems, page D-1](#)

## Launching the Discovery Dialog

To launch the Discovery dialog box and begin the Discovery process, choose **Network > Network Discovery** from the MWTM main menu. The MWTM displays the Discovery dialog box.

You use the Discovery dialog box to load and configure seed nodes, and use those seed nodes to discover the objects in your network.

If you start the MWTM client and the MWTM database is empty (including the very first time you start the MWTM client), the MWTM automatically opens the Discovery dialog box so you can run Discovery and populate the database.

The Discovery dialog box contains:

- [Discovery Dialog Menu, page 3-6](#)
- [Discovery Dialog Tabs, page 3-7](#)

## Discovery Dialog Menu

The menu on the Discovery dialog box contains:

| Menu Command               | Description                                                                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Load Seeds (Ctrl-L) | Opens the Load File Dialog: Seed File List, enabling you to load a seed file into the MWTM: <ul style="list-style-type: none"><li>• Enter the name of the seed file, and click <b>OK</b> to load it.</li><li>• Click <b>Cancel</b> to return to the Seed Settings tab without loading a seed file.</li></ul> |
| File > Save Seeds (Ctrl-S) | Opens the Save File Dialog: Seed File List, which you use to save changes you have made to the chosen seed file.                                                                                                                                                                                             |
| File > Save As             | Opens the Save File Dialog: Seed File List, which you use to save changes you have made to the chosen seed file with a new name, or overwrite an existing seed file.                                                                                                                                         |

| Menu Command                                          | Description                                                                                                                                                                                                           |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Close<br>(Ctrl-W)                              | Closes the current window.                                                                                                                                                                                            |
| Edit > Node SNMP and<br>Credentials Editor<br>(Alt-D) | Opens the Node SNMP and Credentials Editor dialog box.<br><br>If you have implemented MWTM User-Based Access, this option is available to users with authentication-level Network Administrator (level 4) and higher. |
| Help > Topics<br>(F1)                                 | Displays the table of contents for the MWTM online help.                                                                                                                                                              |
| Help > Window<br>(Shift-F1)                           | Displays online help for the current window.                                                                                                                                                                          |
| Help > About<br>(F3)                                  | Displays build date, version, SSL support, and copyright information about the MWTM application.                                                                                                                      |

## Discovery Dialog Tabs

The Discovery dialog box contains these tabs:

| Tab           | Description                                                 |
|---------------|-------------------------------------------------------------|
| Seed Settings | Displays the Seed Settings tab in the Discovery dialog box. |
| Discovery     | Displays the Discovery tab in the Discovery dialog box.     |

## Loading Seed Nodes and Seed Files

You use the MWTM to load one or more new seed nodes; or, to create, save, load, and delete existing MWTM seed files.

This section includes:

- [Loading a Seed Node, page 3-7](#)
- [Loading a Seed File, page 3-8](#)
- [Saving a Seed File, page 3-8](#)
- [Creating a New Seed File, page 3-10](#)
- [Creating a New Seed File, page 3-10](#)
- [Creating and Changing Seed Files Using a Text Editor, page 3-11](#)

## Loading a Seed Node

To load a seed node, enter the name or IP address of the seed node in the IP Address, Address range, Subnet, CIDR, or DNS Hostname field, and click **Add Node** (or press **Enter**).

### Note

Follow the guidelines for IP addresses in [SNMP Configuration Table, page 4-16](#).

The MWTM displays details of the SNMP settings for the seed nodes in the Seed Details pane. Continue adding seed nodes until you are certain that the MWTM will be able to discover the entire network.

## Loading a Seed File

If you have already created and saved one or more seed files, you can load a seed file, change the list of seed files, and select one seed file to be loaded automatically when the MWTM client is started or the Discovery dialog box is opened.

To load an existing seed file, choose **File > Load Seeds** from the Discovery Dialog menu. The MWTM displays the Load File Dialog: Seed File List dialog box.

The Load File Dialog: Seed File List contains:

| Field or Button                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                                               | Icon indicating whether the item in the table is a file or a folder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| OK                                                 | Loads the chosen seed file, saves any changes you made to the list of files, and closes the dialog box.<br><br>To load a seed file, double-click it in the list, select it in the list and click <b>OK</b> , or enter the name of the file and click <b>OK</b> .<br><br>The MWTM saves any changes you made to the list of files, closes the Load File Dialog: Seed File List dialog box, loads the seed file, and returns to the Discovery dialog box. The MWTM lists all of the seed nodes in the seed file in the Seed Nodes pane, and displays details of the SNMP settings for the seed nodes in the Seed Details pane. |
| Delete                                             | Deletes the chosen file from the seed file list. The MWTM issues an informational message containing the name and location of the deleted file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Cancel                                             | Closes the dialog box without loading a seed file or saving any changes to the seed file list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Help                                               | Displays online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Saving a Seed File

You use the MWTM to save a specific seed file, change the list of seed files, and select one seed file to be loaded automatically when the MWTM client is started or the Discovery dialog box is opened.

When you are satisfied that the MWTM has discovered all of the nodes in the network, save the list of seed nodes in a seed file by using one of these procedures:

- To save the changes you made to the seed file without changing the name of the file, choose **File > Save** from the Discovery Dialog menu.
- To save the changes you have made to the seed file with a new name, choose **File > Save As** from the Discovery Dialog menu. The MWTM displays the Save File Dialog: Seed File List dialog box.

The MWTM stores the seed file in the seed file directory on the MWTM server:

- If you installed the MWTM in the default directory, */opt*, then the MWTM seed file directory is */opt/CSCOsgm/seeds*.
- If you installed the MWTM in a different directory, then the MWTM seed file directory is located in that directory.

**Note**

If another user modifies and saves the seed file before you save your changes, the MWTM asks if you want to overwrite that user's changes. If you choose to do so, the other user's changes are overwritten and lost. If you choose not to do so, your changes are lost, unless you save the seed file to a different filename.

The Save File Dialog: Seed File List contains:

| Field or Button                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Creating a New Seed File

To create a new seed file in the MWTM, launch the Discovery dialog box, as described in [Launching the Discovery Dialog, page 3-6](#), then click the **Seed Settings** tab, if it is not already chosen.

You use the Seed Settings tab in the Discovery dialog box to create, save, load, and delete MWTM seed files.

The Seed Settings tab on the Discovery dialog box contains:

| Field or Button                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Seed Nodes                                               | Lists the seed nodes currently defined in the MWTM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IP Address Range or Hostname                             | IP address of the seed node. The default value is *.*.*.*.<br><b>Note</b> Follow the guidelines for IP addresses in <a href="#">SNMP Configuration Table, page 4-16</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Retries                                                  | Number of times the MWTM attempts to connect to the seed node. The valid range is 0 to 99. The default value is 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Timeout (sec)                                            | Time, in seconds, the MWTM waits for a response from the seed node. The valid range is 0 (no timeout) to 9999. The default value is 1 second.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Read Community                                           | SNMP community name for read access to the information maintained by the SNMP agent on the node. This value can be up to 32 characters in length. Do not include special characters such as the opening single quote ('), at symbol (@), dollar sign (\$), caret (^), closing single quote ('), double quote ("), ampersand (&), or pipe ( ). This value is usually set to <b>public</b> (the default).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Poll Interval (mins)                                     | Time, in minutes, between polls. The valid range is 0 to 9999. The default value is 15 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IP Address, Address range, Subnet, CIDR, or DNS Hostname | Address or name of the chosen seed node.<br>To create a new seed file, enter the name or address of a seed node in this field. Examples of acceptable input include: <ul style="list-style-type: none"> <li>IP Address: 1.2.3.4 (see the guidelines for IP addresses in <a href="#">SNMP Configuration Table, page 4-16</a>).</li> <li>Address Range: 1.2.3.2-15</li> <li>Subnet, CIDR: 1.2.3.0/24, 1.2.3.0/255.255.255.0</li> <li>DNS Hostname: mwtm.cisco.com</li> </ul> The MWTM displays details of the SNMP settings for the seed node in the Seed Details pane.<br>Continue to add as many seed nodes as necessary to discover your entire network.<br>When you are ready to save the list of seed nodes in a new seed file, choose <b>File &gt; Save As</b> from the Discovery Dialog menu. The MWTM displays the Save File Dialog: Seed File List dialog box. See <a href="#">Saving a Seed File, page 3-8</a> , for more information about saving seed files. |
| Add Node                                                 | Adds a new seed node to the MWTM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Field or Button | Description                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete          | Deletes the chosen seed node. The MWTM deletes the seed node without asking for confirmation.                                                                                                                                                                                         |
| Next            | Displays the Discovery tab in the Discovery dialog box.<br><br>If you enter a seed node IP address or name in the IP Address, Address range, Subnet, CIDR, or DNS Hostname field, then click <b>Next</b> , MWTM automatically adds the seed node before displaying the Discovery tab. |

## Changing an Existing Seed File

To modify an existing seed file in MWTM:

- 
- Step 1** Load the seed file as described in [Loading a Seed File, page 3-8](#).
  - Step 2** To add another seed node to the seed file, enter the name or IP address of the seed node in the IP Address, Address range, Subnet, CIDR, or DNS Hostname field, and click **Add Node**.
  - Step 3** To delete a seed node from the seed file, select the seed node and click **Delete Node**.
  - Step 4** To save the modified seed file, use the procedure described in [Saving a Seed File, page 3-8](#).
- 

## Creating and Changing Seed Files Using a Text Editor

A seed file is simply an unformatted list of seed node names. To create a seed file by using a text editor, simply create a file and list the seed node names, one on each line, with no other formatting:

```
new-york-a
new-york-b
chicago-c
```

When you save and name the seed file, remember:

- You can use any letters, numbers, or characters in the name that your operating system allows, except blanks.
- The MWTM saves the seed file with a *.see* file extension.
- The MWTM saves the seed file in the MWTM server's seed file directory, *seeds*:
  - If you installed the MWTM in the default directory, */opt*, then the seed file directory is */opt/CSCOs/gm/seeds/*.
  - If you installed the MWTM in a different directory, then the seed file directory resides in that directory.

When the MWTM loads the seed file, it verifies the syntax of the file, deleting blank lines and extraneous leading and trailing spaces as needed. The MWTM also verifies that each seed node name resolves to a valid IP address. If a name does not resolve to a valid IP address, the MWTM logs the erroneous entry and ignores it.

For example, given this seed file:

```
new-york-a<space>
<space>new-york-b
zzzzzzzzzzzz
<blank line>
<tab>chicago-c<tab>
```

The MWTM loads these entries:

```
new-york-a
new-york-b
chicago-c
```

## Running Discovery

Click the Discovery tab in the Discovery dialog box to discover the objects in your network.

To display the Discovery tab, launch the Discovery dialog box, as described in [Launching the Discovery Dialog, page 3-6](#), then select the **Discovery** tab in the Discovery dialog box, or click **Next** in the Seed Settings tab. (If you enter a seed node IP address or name in the IP Address, Address range, Subnet, CIDR, or DNS Hostname field, then click **Next**, MWTM automatically adds the seed node before displaying the Discovery tab.)

The Discovery tab comprises:

- [Discovery Settings, page 3-12](#)
- [Discovered Nodes, page 3-14](#)

## Discovery Settings

The Discovery Settings pane of the Discovery tab contains:

| Field or Button      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entire Network       | <p>Check box used to specify the extent of the network discovery:</p> <ul style="list-style-type: none"> <li>• To discover the entire network, check this check box. This is called <i>recursive discovery</i>, and it is the default setting.</li> </ul> <p>With this check box checked, the MWTM discovers all seed nodes and attempts to manage them; then attempts to discover and manage all nodes that are adjacent to those seed nodes (unless the nodes are connected by serial links only); then attempts to discover and manage all nodes that are adjacent to <i>those</i> nodes; and so on, until the Max Hops limit is reached.</p> <ul style="list-style-type: none"> <li>• To rediscover only seed nodes, uncheck this check box. This is called <i>nonrecursive discovery</i>.</li> </ul> <p>With this check box unchecked, the MWTM discovers all seed nodes and attempts to manage them, then labels all nodes that are adjacent to those seed nodes as Unmanaged.</p> |
| Delete Existing Data | <p>Check box used to keep or delete the existing MWTM database when discovering the network:</p> <ul style="list-style-type: none"> <li>• To keep all existing network data in the MWTM database before rediscovering the network, uncheck this check box. This is the default setting.</li> <li>• To delete all existing network data from the MWTM database before rediscovering the network, check this check box. Choose this option if you know that network elements have been deleted from your network since the last Discovery.</li> </ul> <p>If you discover the network with Delete Existing Data chosen, the MWTM stops any real-time polls that are running and issues appropriate messages.</p>                                                                                                                                                                                                                                                                            |

| Field or Button  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Hops         | The maximum number of hops from the seed node to search for other nodes to discover. Default is 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Discover Network | <p>Begins discovering the network.</p> <p>Click <b>Discover Network</b> to begin Discovery.</p> <p>If you have not defined at least one seed node in the Seed Settings tab, the MWTM prompts you to do so.</p> <p>When Discovery begins:</p> <ul style="list-style-type: none"> <li>• The <b>Discover Network</b> button changes to <b>Stop Discovery</b>.</li> <li>• The <i>Discovery In Progress</i> message appears in the title bar of all MWTM client windows.</li> </ul> <p>Discovery progresses in bursts. You might see a number of updates, followed by a pause, followed by more updates. The information that MWTM windows displays is not fully updated until Discovery is complete.</p> <p>By default, Discovery times out after 600 seconds (10 minutes). To change the Discovery timeout, change the value of the <code>DISCOVERY_TIMELIMIT</code> entry in the <i>Server.properties</i> file:</p> <ul style="list-style-type: none"> <li>• If you installed the MWTM in the default directory, <i>/opt</i>, then the location of the <i>Server.properties</i> file is <i>/opt/CSCOsgm/properties/Server.properties</i>.</li> <li>• If you installed the MWTM in a different directory, then the <i>Server.properties</i> file resides in that directory.</li> </ul> <p>Because the MWTM is an asynchronous system, with the MWTM server contacting clients one at a time, and because clients might run at different speeds, the information that MWTM clients display during Discovery might not always be synchronized.</p> <p>All other MWTM windows (Node, topology, and so on) are also populated with the newly discovered network data.</p> |
| Stop Discovery   | <p>Stops the Discovery process. For example, if you click Discover Network, then you realize that you loaded a seed node that you did not intend to load, you can click Stop Discovery to stop the Discovery process.</p> <p><b>Note</b> If you stop the Discovery process, the information in the MWTM database is incomplete and unreliable. To generate a new, complete, and reliable MWTM database, check the <b>Delete Existing Data</b> check box and run Discovery again.</p> <p>This button replaces the Discover Network button when the Discovery process begins, and changes back to the Discover Network button when the Discovery process ends.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

If you run Discovery with the Entire Network check box unchecked, and then you run Discovery with the Entire Network check box checked, any Unmanaged nodes in the first Discovery are not rediscovered by the second Discovery.

To recover from this situation and generate a new, complete, and reliable MWTM database, you must perform one of these procedures:

- Run Discovery again, with **Entire Network** and **Delete Existing Data** checked.
- Change the Unmanaged nodes to managed status. See [Unmanaging and Managing Nodes or ITP Signaling Points, page 7-46](#), for more information.
- Poll the nodes that were Unmanaged in the first Discovery. See [Polling Nodes, page 8-51](#), for more information.

## Discovered Nodes

The table in the Discovery tab lists all nodes that the MWTM discovered (all nodes, including new and excluded nodes, not just the nodes in the current view). By default, this table is sorted by Status.

- To see a tooltip for each column in the table, place the cursor over a column heading.
- If a cell is too small to show all of its data, place the cursor over the cell to see the full text in a tooltip.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Discovered Nodes section except Internal ID, Uptime, Reboot Reason, Process Traps, and Last Status Change.

- To display hidden columns, right-click in the table heading and select the check boxes for the columns that you want to display.
- To hide columns, right-click in the table heading and uncheck the check boxes for the columns that you want to hide.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

See [Nodes Table, page 7-5](#), for descriptions of the columns and check boxes of the discovered nodes table.

## Verifying Discovery

After you discover the network (see [Discovery Overview, page 3-5](#)), examine the Discovered Nodes table to verify that the MWTM discovered all of the nodes in the network. If you suspect that the MWTM did not discover all of the nodes, verify that:

- No nodes are excluded from your current view.
- The MWTM server can ping the nodes.
- The nodes are running images that are compatible with the MWTM server.
- SNMP is enabled on the nodes.
- The MWTM is configured with the correct SNMP community name. See [Launching the Discovery Dialog, page 3-6](#) for details.
- (ITP only) The missing nodes are connected to the seed nodes by SCTP connections, not just serial connections. If they are not connected by SCTP connections, you must add the missing nodes to the seed file as seed nodes. See [Changing an Existing Seed File, page 3-11](#) for more information.
- You chose Entire Network when you ran Discovery. If you suspect that you did not, run Discovery again with Entire Network chosen.

## Displaying the MWTM Main Window

The MWTM main window is the primary MWTM client window. It is the first window to appear when you launch the MWTM client.

The MWTM main window displays information about the events and objects that the MWTM discovers. The MWTM main window is divided into two primary areas: the navigation tree in the left pane and the content area in the right pane. When you select an item in the navigation tree, MWTM displays detailed information about the item in the content area in the right pane, such as configuration details and real-time data.

The MWTM main window contains:

| Element         | Description                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Title bar       | MWTM main window title bar that displays: MWTM main window <(networks)> - <server name>.                                              |
| Main menu       | Main menu on the MWTM main window. For details, see <a href="#">Using the MWTM Main Menu, page 3-18</a> .                             |
| Toolbar         | Toolbar options on the MWTM main window. For details, see <a href="#">Using the MWTM Toolbar, page 3-23</a> .                         |
| Navigation tree | Contains lists of objects and views. For details, see <a href="#">MWTM Client Navigation Tree, page 3-16</a> .                        |
| Content area    | Contains content for the object chosen in the navigation tree. For details, see <a href="#">MWTM Client Content Area, page 3-17</a> . |

When you start the MWTM for the first time, the MWTM displays the Discovery dialog box and the MWTM main window.

If you have already run Discovery, the events and objects that the MWTM discovered appear in the navigation tree and content area.

When you start the MWTM for the first time, if you did not configure the MWTM server to automatically discover your network the first time the server starts after installation, the Discovery dialog comes up automatically. Until you perform a discovery, the MWTM database contains no information, and the navigation tree and content area are blank. For details on the Discovery dialog, see [Discovering Your Network, page 3-4](#).

## Navigational Features

To help you keep track of which view you are currently using, as well as other important information, most MWTM windows display the name of the system on which the MWTM server is running in the title bar.

On the MWTM toolbar, there is a Location object that shows where you are currently in the MWTM navigation. For more information, see [Using the MWTM Toolbar, page 3-23](#).

At the bottom of the MWTM main window, the following information might appear:

| Information                                                                                                           | Description                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
|  Locked padlock icon               | Appears if the MWTM server has a security certificate. To see the certificate, click the symbol.                                          |
|  Unlocked padlock icon             | Appears if the MWTM server does not have a security certificate.                                                                          |
|  10037 Events<br>Number of objects | (Applicable for Active Alarms, Event History, and all Summary Lists) Shows the number of objects currently visible in the window, if any. |
|  1 File<br>Number of files         | (Only for load or save dialog boxes) Shows the number of files currently visible in the load or save files dialog box, if any.            |

| Information                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Check the message bar at the bottom of the window for information and assistance.</li> </ul> |
| <b>CHANGED</b><br>Changed                                | Appears if you have changed but not yet saved a view. You must save the view if you want to save your changes. For details, see <a href="#">Saving a View, page 6-5</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>NEW!</b> New icon                                     | <p>Appears if there is at least one newly discovered object in the network that has not been added to your current view. To add or exclude the object to your current view, see <a href="#">New on the Network, page 6-11</a>.</p> <p><b>Note</b> Clicking the <b>New</b> icon in the topology window opens the New Objects pane in the left pane. Clicking the <b>New</b> icon in any other window opens the Edit View tab of the View Editor window.</p>                                                                                                                                                                                                                                                                                                                  |
| <code>view: AutoInstanceView</code><br>View              | <p>Shows the name of the current view.</p> <p><b>Note</b> If your personal default view has been deleted, then the next time you launch the client, the MWTM informs you that your default view has been deleted and that your view has been reset to the DEFAULT view. To choose another view as your default view, use the Load Dialog: View List. For details, see <a href="#">Loading a Client-Specific View, page 6-14</a>.</p>                                                                                                                                                                                                                                                                                                                                        |
| <code>dhcp-64-102-82-102-cisco-com</code><br>Name        | Shows the name of the current user, or the name of the node the user is using.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>System Admin: n n n</code><br>Authentication level | If you have implemented MWTM user access security, the authentication level of the user appears.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## MWTM Client Navigation Tree

The MWTM client navigation tree displays objects in a variety of formats and views. The DEFAULT view, and other views that you can create, display a hierarchy of the objects that the MWTM manages. By default, the navigation tree is sorted by alarm severity, with objects having the most severe alarms appearing at the top of the tree.

### Note

To learn more about alarm severity, see [Chapter 9, “Managing Alarms and Events.”](#)

The client navigation tree contains:

| Object                       | Description                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active Alarms                | Displays a summary of all currently active alarms in your network, including the current status of the associated network object. For details, see <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                   |
| Event History                | Displays information about the events that the MWTM event logger and event processor deliver for all objects in the current network view. For details, see <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                           |
| Summary Lists                | Displays basic summary alarm information about all discovered network objects, including alarm severity and the total number of objects in each severity level. For details, see <a href="#">Displaying Summary Lists Alarms, page 3-17</a> . |
| DEFAULT View (or named view) | Displays the view name and all objects in that view. For details about views, see <a href="#">Chapter 6, “Managing Views.”</a>                                                                                                                |

**Note**

For additional features that appear only in the navigation tree of the web interface, see [MWTM Web Interface Navigation Tree, page 11-3](#).

## MWTM Client Content Area

The content area in the right pane displays detailed information about your network, such as configuration and historical data. To view detailed information for an object, click the object in the navigation tree. The content area in the right pane shows the details about the chosen object.

The content area formats the information in a way that is easy to interpret. Descriptive information is usually organized into subpanes. Tabs along the top of the content area organize more complex sets of information. Large amounts of information are organized into tables with labeled columns and multiple rows of data.

For additional features that appear only in the content area of the MWTM web interface, see [MWTM Web Interface Content Area, page 11-5](#).

## Displaying Summary Lists Alarms

Summary Lists provides basic summary alarm information about all discovered network objects, including alarm severity and the total number of objects for each severity level.

**Note**

If you click to expand the turner  beside Summary Lists, all discovered object types in your network appear. For detailed information, see [Displaying Object Windows, page 7-2](#).

To view the summary lists, click Summary Lists in the navigation tree in the MWTM main window. The Summary Lists table has two columns: Severity and Total. You can resize each column, or sort the table based on the information in one of the columns. By default, this table is sorted by Severity, with the highest severity (Critical) at the top. The Total column lists the total number of discovered objects for each severity level.

**Note**

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The summary list table contains:

| Column   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Severity | Alarm severity of the object. Possible values are:<br> Critical<br> Major<br> Minor<br> Warning<br> Informational<br> Indeterminate |
| Total    | Total number of network objects with the indicated severity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Note**

See [Chapter 9, “Managing Alarms and Events”](#) for information on alarm management.

## Right-Click Menu for the Summary Lists

To see the right-click menu for the summary lists, select Summary Lists or any of the objects under Summary Lists in the navigation tree and press the right mouse button. The menu provides:

| Menu Command              | Description                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------|
| Show In New Window        | Opens the current window in a new window.                                                                       |
| Back > List of Windows    | Navigates back to a window viewed in this session.<br>The MWTM maintains a list of up to 10 Back windows.       |
| Forward > List of Windows | Navigates forward to a window viewed in this session.<br>The MWTM maintains a list of up to 10 Forward windows. |

## Using the MWTM Main Menu

The MWTM main menu appears in the menu bar of most MWTM windows.

Some menu items do not appear on some windows. In addition, menu items that are dimmed are not available on that window.

For detailed information about the menu options provided by other windows, see the descriptions of those windows.

The MWTM main menu contains:

| Menu Command                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Load DEFAULT View (Ctrl-D)     | Loads the DEFAULT view, which is the view into which the MWTM places all discovered objects when discovering the network. The DEFAULT view is stored on the MWTM server and shared by all MWTM clients, but the clients cannot modify it.                                                                                                                                                                                                                                                           |
| File > Load View (Ctrl-L)             | <p>Loads an already existing view. The MWTM prompts you for the name of the view you want to load:</p> <ul style="list-style-type: none"> <li>Select the name of the view, or accept the default view name, then click <b>OK</b> to load the view.</li> <li>Click <b>Cancel</b> to close the prompt window without loading a view.</li> </ul>                                                                                                                                                       |
| File > Save View (Ctrl-S)             | <p>Saves the current view:</p> <ul style="list-style-type: none"> <li>If you have not already saved the current view, opens the Save File dialog box: View List, in which you enter or select a filename under which to save the current view.</li> <li>If you have already saved the current view, saves the view to that filename.</li> </ul> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.</p> |
| File > Save View As                   | <p>Opens the Save File Dialog: View List, which you use to enter or select a filename under which to save the current view.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.</p>                                                                                                                                                                                                                 |
| File > Connect to New Server (Ctrl-O) | <p>Connects to a new server. The MWTM prompts you for the new server's name or IP address, and UDP port number. The MWTM stops the MWTM client, then restarts the client connected to the new server.</p> <p>The MWTM stops the MWTM client, then restarts the client connected to the new server.</p>                                                                                                                                                                                              |
| File > Print (Ctrl-P)                 | <p>Opens the Print window where you can:</p> <ul style="list-style-type: none"> <li>Specify options for printing</li> <li>Print the current window</li> <li>Save the current window to a file</li> </ul> <p>The MWTM printing options require that you define a printer on your system. If you choose <b>File &gt; Print</b> and the Print window does not appear, ensure you have defined a printer on your system.</p>                                                                            |
| File > Exit (Ctrl-Q)                  | <p>Exits the MWTM application, after prompting you for confirmation.</p> <p>If you are working in a custom view (that is, not the DEFAULT view), the MWTM automatically saves any changes you made to the view.</p>                                                                                                                                                                                                                                                                                 |
| Edit > Views (Ctrl-M)                 | Opens the View Editor window to allow you to edit any views that you have created.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Edit > Clear All Events (Ctrl-E)      | <p>Deletes the event icon (orange triangle) from MWTM displays for all known objects. The actual events are not deleted from the MWTM, only the event icon for all known objects.</p> <p><b>Note</b> During Discovery, the MWTM might flag most objects with an event icon. If the event icons are too distracting, use the <b>Edit &gt; Clear All Events</b> menu option to remove them.</p>                                                                                                       |

| Menu Command                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit > Find<br>(Ctrl-F)                              | Opens the Find dialog box, in which you find a specific object, event, or text in the window.<br><br>If you select an object in the navigation tree in the MWTM main window, this option is dimmed and cannot be chosen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Edit > Delete<br>(Delete)                            | Deletes the currently chosen element or elements from the MWTM database. The MWTM displays the Confirm Deletion dialog box. To: <ul style="list-style-type: none"> <li>Delete the chosen elements, click <b>Yes</b>. The items are deleted from the MWTM database and the Confirm Deletion dialog box is closed.</li> <li>Retain the chosen elements, click <b>No</b>. The items are kept in the MWTM database and the Confirm Deletion dialog box closes.</li> <li>Prevent the MWTM from displaying the Confirm Deletion dialog box, select the <b>Do not show this again</b> check box.</li> </ul> <p><b>Note</b> If you select the <b>Do not show this again</b> check box, and you later decide you want the MWTM to begin displaying the Confirm Deletion dialog box again, you must select the Confirm Deletions check box in the General GUI settings in the Preferences window. For more information, see the description of the Confirm Deletions check box in <a href="#">Startup/Exit Settings, page 5-3</a>.</p> <p>To permanently delete all elements marked for deletion from the MWTM database, you can also run the <b>mwtm purgedb</b> command (see <a href="#">mwtm purgedb, page B-53</a>).</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.</p> |
| Edit > Preferences<br>(Ctrl-H)                       | Opens the Preferences window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Help > Topics<br>(F1)                            | Displays the table of contents for the MWTM online help.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Help > Window<br>(Shift-F1)                      | Displays online help for the current window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Help > About<br>(F3)                             | Displays build date, version, SSL support, and copyright information about the MWTM application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

1. In the UNIX environment (Solaris or Linux), this key combination can be mapped to a different function based on the Common Desktop Environment (CDE) that a user might have. For example, in Solaris CDE, Alt-Left Arrow and Alt-Right Arrow combinations are typically mapped to move back and forward through the different desktops. To remap the keys for use with the MWTM, see your UNIX Desktop Environment guide.

## Using the MWTM Toolbar

The MWTM toolbar appears under the menu bar in the MWTM client windows, and above the navigation tree in the MWTM web interface.

The MWTM toolbar contains:

| Element                                                                                                                       | Description                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <br>Sort tree by name                        | Sorts all content in the navigation tree alphabetically by name.                                                                                               |
| <br>Sort tree by status                      | Sorts all content in the navigation tree by status, from the highest alarms to the lowest.                                                                     |
| <br>Go back or forward one navigation change | (Only in MWTM client) Click to browse forward or backward in your navigation changes. In the MWTM web interface, click the browser's back and forward buttons. |
| <br>Location                                 | Shows your current location in MWTM. Some locations are clickable links to which you can navigate directly.                                                    |

## Accessing the MWTM Through a Web Browser

You can manage network nodes through one of two graphical user interfaces:

- **MWTM client interface**—The standard interface for accessing MWTM data. (This interface is described in [Displaying the MWTM Main Window, page 3-14.](#))
- **MWTM web interface**—A browser interface for accessing MWTM data. (This interface is introduced here and fully described in [Chapter 11, “Accessing Data from the Web Interface.”](#))

A comparison of the GUI features supported in each interface is shown in this matrix:

| GUI Features     | Web Interface | Client Interface | Notes                                                                                                                                                                                                               |
|------------------|---------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Main window      | X             | X                | Slight differences exist between the interfaces (in the navigation tree and content area displays).                                                                                                                 |
| Discovery window | X             | X                | Exists in both client and web interface.                                                                                                                                                                            |
| Historical Data  | X             |                  | You enter a start and stop time for the data you are interested in, and the MWTM retrieves the data from its database. You can access the web interface display from the right-click menus in the client interface. |
| Real-time Data   | X             | X                | The MWTM periodically polls the node for real-time data, and updates the graphs as new data is received.                                                                                                            |
| Topology         |               | X                | Client-only feature.                                                                                                                                                                                                |

| GUI Features       | Web Interface | Client Interface | Notes                                                                                                                                                                                                                 |
|--------------------|---------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| High-level editors |               | X                | These editors appear under the Tools menu of the MWTM main window: <ul style="list-style-type: none"> <li>Route Table Editor</li> <li>GTT Title Editor</li> <li>Address Table Editor</li> <li>Event Editor</li> </ul> |
| Provisioning       | X             |                  | Web-only feature for ITP, IP-RAN, CSG, GGSN, and HA objects. To launch web provisioning from the MWTM client, select the object in the navigation tree and click the Provision button in the web interface toolbar.   |

You access the web interface using one of two methods:

- Open a browser and enter `http://server_name:1774` in the Address field.
- From the MWTM client interface, choose **View > MWTM Web Links > Home**.

The web interface window opens in the browser window.

For detailed information about the MWTM web interface, see [Chapter 11, “Accessing Data from the Web Interface.”](#)

## Loading and Saving MWTM Files

You use the MWTM to quickly and easily load and save MWTM files. The files are on the MWTM server and you can load them on any connected MWTM client.

To display a Load File dialog box, use one of these procedures:

| Launched From                     | Choose                                     | Window Launched                           | Notes                                                                   |
|-----------------------------------|--------------------------------------------|-------------------------------------------|-------------------------------------------------------------------------|
| Address Table Editor (ITP only)   | <b>File &gt; Load &gt; Load from File</b>  | Load File Dialog: Address Table File List | See <a href="#">Loading an Existing Address Table File</a> , page 16-6. |
| Discovery dialog box              | <b>File &gt; Load Seeds</b>                | Load File Dialog: Seed File List          | See <a href="#">Loading Seed Nodes and Seed Files</a> , page 3-7.       |
| Event Filter dialog box           | <b>Load</b>                                | Load File Dialog: Load Filter             | See <a href="#">Loading Existing Filters</a> , page 9-18.               |
| GTT Editor (ITP only)             | <b>File &gt; Load</b>                      | Load File Dialog: GTT File List           | See <a href="#">Loading an Existing GTT File</a> , page 15-28.          |
| Preferences window                | <b>File &gt; Load System Default Prefs</b> | None                                      | See <a href="#">Displaying the Preferences Menu</a> , page 5-2.         |
| Route Table dialog box (ITP only) | <b>File &gt; Load</b>                      | Load File Dialog: Route Table File List   | See <a href="#">Loading an Existing Route Table File</a> , page 14-11.  |
| View Editor window                | <b>File &gt; Load</b>                      | Load File Dialog: View List               | See <a href="#">Loading a Client-Specific View</a> , page 6-14.         |

**Note**

To load the DEFAULT network view, choose **File > Load DEFAULT View** from the MWTM main menu. The MWTM loads the DEFAULT view.

To display a Save File dialog box, use one of these procedures:

| Launched From                     | Choose                   | Window Launched                           | Notes                                                           |
|-----------------------------------|--------------------------|-------------------------------------------|-----------------------------------------------------------------|
| Address Table Editor (ITP only)   | <b>File &gt; Save As</b> | Save File Dialog: Address Table File List | See <a href="#">Saving an Address Table File, page 16-17</a> .  |
| Discovery dialog box              | <b>File &gt; Save As</b> | Save File Dialog: Seed File List          | See <a href="#">Saving a Seed File, page 3-8</a> .              |
| Event Filter dialog box           | <b>File &gt; Save As</b> | Save File Dialog: Save Filter             | See <a href="#">Saving Filter Files, page 9-19</a> .            |
| GTT Editor (ITP only)             | <b>File &gt; Save As</b> | Save File Dialog: GTT File List           | See <a href="#">Saving a GTT File, page 15-37</a> .             |
| Route Table dialog box (ITP only) | <b>File &gt; Save As</b> | Save File Dialog: Route Table File List   | See <a href="#">Saving a Route Table File, page 14-12</a> .     |
| View Editor window                | <b>File &gt; Save As</b> | Save File Dialog: View List               | See <a href="#">Closing the View Editor Window, page 6-13</a> . |

## Using the Windows Start Menu

This section includes:

- [Changing the Default MWTM Server Name, page 3-26](#)
- [Launching the MWTM Client, page 3-27](#)
- [Launching the MWTM DOS Prompt, page 3-27](#)
- [Launching the MWTM Event Editor, page 3-27](#)
- [Launching the MWTM SSL Certificate Tool, page 3-27](#)
- [Displaying the MWTM README File, page 3-27](#)
- [Uninstalling the MWTM, page 3-28](#)

## Changing the Default MWTM Server Name

If the IP address or hostname to which your MWTM client is bound fails, you can change the default MWTM server name from the Windows Start menu.

To change the default MWTM server name:

- 
- Step 1** Close all open MWTM windows.
- Step 2** Choose **Start > Programs > Cisco MWTM Client > Modify Default MWTM Server Name**. The MWTM opens a DOS window, and asks you to enter the name of the new default MWTM server.

- Step 3** Enter the name of the new default MWTM server, and press **Enter**. The MWTM sets the default server to the new name that you entered.
- 

**Tip**

See [Connecting to a New Server, page 5-40](#) for more information about changing the default MWTM server name.

---

## Launching the MWTM Client

To launch the MWTM Client, choose **Start > Programs > Cisco MWTM Client > MWTM Client** from the Windows Start menu, or double-click the MWTM icon on the desktop. The MWTM launches the MWTM Client.

## Launching the MWTM DOS Prompt

To launch a DOS prompt for the MWTM from the Windows Start menu, choose **Start > Programs > Cisco MWTM Client > MWTM DOS Prompt**. The MWTM opens a DOS window, starting in the *\bin* directory:

- If you installed the MWTM client in the default directory, *C:\Program Files*, then the DOS prompt starts at *C:\Program Files\MWTMClient\bin*.
- If you installed the MWTM client in a different directory, then the *\bin* directory is located in that directory.

## Launching the MWTM Event Editor

To launch the MWTM Event Editor, choose **Start > Programs > Cisco MWTM Client > Launch MWTM Event Editor** from the Windows Start menu. The MWTM launches the MWTM Event Editor.

**Note**

The MWTM Event Editor is available to power users (level 2) and higher.

---

## Launching the MWTM SSL Certificate Tool

To launch the MWTM SSL Certificate Tool from the Windows Start menu, choose **Start > Programs > Cisco MWTM Client > MWTM SSL Certificate Tool**.

## Displaying the MWTM README File

The MWTM README file contains late-breaking information about the MWTM that might not be found in the other product documentation. To open the MWTM README file from the Windows Start menu, choose **Start > Programs > Cisco MWTM Client > Readme**.

## Uninstalling the MWTM

You can uninstall the MWTM from the Windows Start menu. For details, see the “Uninstalling the MWTM Client” section of the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

## Locating Technology Specific Information

To help you locate information specific to a technology, the following table lists where to find information based on the specified technology.

| Technology                             | Topic and Location                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Exiting the MWTM Client

When you are finished monitoring network performance statistics, you can exit the MWTM client:

- 
- Step 1** From the MWTM main menu, choose **File > Exit**. The Exit MWTM confirmation window appears.
- Step 2** Click **Yes** to close the MWTM client application.
-

# Importing SNMP Community Names from CiscoWorks (Solaris Only)

You can use the Cisco Mobile Wireless Transport Manager (MWTM) to store all SNMP community names in a single database in CiscoWorks Common Services (CS), and to export those names for use by the MWTM.

To export the database from CiscoWorks CS to the MWTM:

- 
- Step 1** Log in to CiscoWorks. From the Common Services tab, choose **Device and Credentials > Device Management**.
- Step 2** Click the **Export** button.
- Step 3** In the tree in the left pane, select the device(s) for export. To choose all devices, click the box next to CS@<your\_server\_name>. To choose an individual device:
- Expand the hierarchy
  - Drill-down to find an individual device
  - Click the box next to the corresponding device
- Step 4** In the fields in the right pane, enter:
- File Name = mwtm**  
**Format = CSV**

CiscoWorks creates the *mwtm* file in the default export directory, */opt/CSCOpX/objects/dmgt*. When you start the MWTM server, the MWTM looks for this file. If the file exists, the MWTM merges the file with its own community name database, and the exported SNMP community names will appear in the SNMP tab of the Node SNMP and Credentials dialog box (see [Configuring Nodes, page 4-14.](#))

---

**Tip**

For more information about SNMP, see “Configuring SNMP Support” in the Cisco IOS Release 12.2 *Configuration Fundamentals Configuration Guide*, Part 3, System Management.

---

## Changing MWTM Server Poller Settings

**Note**

For details on changing poller settings using the MWTM client or MWTM web interface, see [Changing Client and Web Preference Settings, page 5-1.](#)

---

The MWTM provides four pollers for use in the MWTM client GUI and web pages: a fast poller, a slow poller, a status refresh poller, and a memory poller. Using the MWTM, you can change the settings (such as minimum, maximum, and default) for each poller. However, the only setting you can modify for the memory poller is the timeout value.

To change server poller settings:

**Step 1** Edit the *Server.properties* file:

- If you installed the MWTM in the default directory, */opt*, then the location of the *Server.properties* file is */opt/CSCOsgm/properties/Server.properties*.
- If you installed the MWTM in a different directory, then the *Server.properties* file is located in that directory.

**Step 2** To change fast poller settings, change one or more of these lines in the file:

```
Fast poller default polling interval in seconds
FAST_POLLER_DEFAULT = 15

Fast poller minimum polling interval in seconds
FAST_POLLER_MIN = 5

Fast poller maximum polling interval in seconds
FAST_POLLER_MAX = 60
```

For example, to change the fast poller default to 30 seconds, change the `FAST_POLLER_DEFAULT` line to:

```
FAST_POLLER_DEFAULT = 30
```

**Step 3** To change slow poller settings, change one or more of these lines in the file:

```
Slow poller default polling interval in seconds
SLOW_POLLER_DEFAULT = 60

Slow poller minimum polling interval in seconds
SLOW_POLLER_MIN = 60

Slow poller maximum polling interval in seconds
SLOW_POLLER_MAX = 300
```

For example, to change the slow poller default to 180 seconds, change the `SLOW_POLLER_DEFAULT` line to:

```
SLOW_POLLER_DEFAULT = 180
```

**Step 4** To change status refresh poller settings, change one or more of these lines in the file:

```
Status refresh default interval in seconds
STATE_REFRESH_DEFAULT = 180

Status refresh minimum interval in seconds
STATE_REFRESH_MIN = 180

Status refresh maximum interval in seconds
STATE_REFRESH_MAX = 900
```

For example, to change the status refresh poller default to 300 seconds, change the `STATE_REFRESH_DEFAULT` line to:

```
STATE_REFRESH_DEFAULT = 300
```

**Step 5** To change memory poller settings, update the following value:

```
MEMORY_POLLER_TIMEOUT_INCREMENT = 5000
```

**Step 6** Save your changes and restart the MWTM server.

Any changes you make take effect when you restart the MWTM server, and are reflected throughout the MWTM client GUI and web pages at that time.

For each of these pollers, remember that, if you set the:

- Minimum interval for a poller to less than 0 seconds, the MWTM overrides that setting and resets the minimum interval to 0 seconds.
- Maximum interval for a poller to less than the minimum interval, the MWTM overrides that setting and resets the maximum interval to be equal to the minimum interval.
- Default interval for a poller to less than the minimum interval, the MWTM overrides that setting and resets the default interval to be equal to the minimum interval.
- Default interval for a poller to more than the maximum interval, the MWTM overrides that setting and resets the default interval to be equal to the maximum interval.

**Tip**

Due to potential timeouts during memory polling, we do not recommend that you set the memory timeout add-on value to anything less than the default of 5000 milliseconds. If the MWTM encounters memory timeouts during normal day-to-day operations, you can increment this value to alleviate the problem.

## Changing the Message Display

These sections contain information about changing the way the MWTM displays and stores messages:

- [Changing the Location of MWTM Message Log Files, page 4-4](#)
- [Changing the Size of the MWTM Message Log Files, page 4-4](#)
- [Changing the Time Mode for Dates in Log Files, page 4-5](#)
- [Changing the Age of the MWTM Message Log Files, page 4-5](#)

### Changing the Location of MWTM Message Log Files

By default, all MWTM system message log files are located on the MWTM server at */opt/CSCOsgm/logs*. To change the location of the system message log directory, use the **mwtm msglogdir** command. For more information, see [mwtm msglogdir, page B-48](#).

### Changing the Size of the MWTM Message Log Files

To change the size of the message log files, use the **mwtm logsize** command. For more information, see [mwtm logsize, page B-42](#).

## Changing the Time Mode for Dates in Log Files

To change the time mode for dates in log files, use the **mwtm logtimemode** command. For more information, see [mwtm logtimemode](#), page B-43.

## Changing the Age of the MWTM Message Log Files

To change the number of days the MWTM archives system message log files before deleting them from the MWTM server, use the **mwtm msglogage** command. For more information, see [mwtm msglogage](#), page B-48.

## Setting the ITP Point Code Format

You can use the MWTM to set a new point code format for an MWTM server. The MWTM server and all associated MWTM clients use the new point code format. Normally, you need to do this only once, after installation.

### Note

When setting the ITP Point Code Format, if a discovery has already occurred, some node and signaling point objects will have been named using the old format. These names will not be affected by the new format. To force the objects to be recreated using the new point code format, you must perform an **mwtm cleandb**.

After you perform the **mwtm cleandb**, the network will need to be discovered again to populate the device names based on the new signaling point format.

The point code format configuration is contained in the *PointCodeFormat.xml* file.

To set the new point code format, log in as the root user, as described in [Starting the MWTM Client](#), page 3-3, or as a superuser, as described in [Specifying a Super User \(Server Only\)](#), page 2-19. Then enter:

```
cd /opt/CSCosgm/bin
./mwtm pcformat [edit | list | master | restore]
```

Where:

- **edit**—Opens the *PointCodeFormat.xml* file for editing, using \$EDITOR environment variable if set, otherwise uses vi.
- **list**—Displays the current contents of the *PointCodeFormat.xml* file.
- **master**—Restores the *PointCodeFormat.xml* file to the default settings.
- **restore**—Restores the *PointCodeFormat.xml* file to the last saved copy.

The *PointCodeFormat.xml* file provides these default point code formats:

- **<Variant value="ANSI" format="8.8.8"/>**—Formats point codes using the 24-bit American National Standards Institute (ANSI) standard format, *xxx.yyy.zzz*, where:
  - *xxx* is the 8-bit network identification
  - *yyy* is the 8-bit network cluster
  - *zzz* is the 8-bit network cluster member

- `<Variant value="China" format="8.8.8"/>`—Formats point codes using the 24-bit China standard format, `xxx.yyy.zzz`, where:
  - `xxx` is the 8-bit network identification
  - `yyy` is the 8-bit network cluster
  - `zzz` is the 8-bit network cluster member
- `<Variant value="ITU" format="3.8.3"/>`—Formats point codes using the 14-bit International Telecommunication Union (ITU) standard format, `x.yyy.z`, where:
  - `x` is the 3-bit zone identification
  - `yyy` is the 8-bit region identification
  - `z` is the 3-bit signal-point
- `<Variant value="NTT" format="5.4.7" readBits="rightToLeft"/>`— Formats point codes using the 16-bit Nippon Telegraph and Telephone Corporation (NTT) standard format, `xx.yy.zzz`, where:
  - `xx` is the 5-bit zone identification
  - `yy` is the 4-bit area/network identification
  - `zzz` is the 7-bit identifier
- `<Variant value="TTC" format="5.4.7" readBits="rightToLeft"/>`— Formats point codes using the 16-bit Telecommunication Technology Committee (TTC) standard format, `xx.yy.zzz`, where:
  - `xx` is the 5-bit zone identification
  - `yy` is the 4-bit area/network identification
  - `zzz` is the 7-bit identifier

As shown previously, the standard point code format for each variant is three octets. (For example, 3.8.3 for ITU) However, you can also specify a four-octet format for any of the variants. (For example, 4.3.4.3 for ITU) The total number of bits must still equal 24 for ANSI and China, 14 for ITU, and 16 for NTT and TTC.

For information about customizing the point code formats, including setting a new three-octet or four-octet format, see the detailed instructions in the *PointCodeFormat.xml* file.

Any changes that you make take effect when you restart the MWTM server.

The MWTM preserves customized point code formats when you upgrade to a new version or release of the MWTM.

## Connecting a Single-Instance ITP to a Multiple-Instance ITP

You can configure the MWTM to recognize a single-instance ITP connecting to multiple instances on a multiple-instance ITP. In effect, the MWTM views the multiple networks as a single all-encompassing network.

To connect single-instance ITPs to multiple-instance ITPs:

**Step 1** Log in as the root user, as described in [Starting the MWTM Client, page 3-3](#), or as a superuser, as described in [Specifying a Super User \(Server Only\), page 2-19](#).

**Step 2** Enter:

```
cd /opt/CSCOsgm/bin
./mwtm pcf format edit
```

The `mwtm pcf format edit` command opens the *PointCodeFormat.xml* file for editing. For more information about using this command, see [Setting the ITP Point Code Format, page 4-5](#).

**Step 3** Add these lines to the *PointCodeFormat.xml* file:

```
<NetworkConfig>
 <Network value="Big-Network">
 <Include value="Network-1"/>
 <Include value="Network-2"/>
 <Include value="Network-3"/>
 </Network>
</NetworkConfig>
```

Where:

- *Network-1*, *Network-2*, and *Network-3* are the names of your subnetworks. (This example assumes that you are combining three subnetworks into one.)
- *Big-Network* is the name of the combined network that includes *Network-1*, *Network-2*, and *Network-3*.

In the MWTM, the signaling point Instance Name field displays the subnetwork name (for example, *Network-1*), and the Point Code field displays the name of the combined network (for example, *Big-Network*).

During Discovery, the MWTM assigns a default name to each discovered signaling point. The assigned default name consists of the point code and the combined network name (for example, 3.8.3:Big-Network).

**Step 4** Save your changes to the *PointCodeFormat.xml* file.

**Step 5** Restart the MWTM server. Any changes you made to the *PointCodeFormat.xml* file take effect when you restart the MWTM server.

---

The MWTM preserves the customized network configuration when you upgrade to a new version or release of the MWTM.

## Enabling SNMP Traps

By default, the MWTM cannot receive SNMP traps. To use SNMP traps with the MWTM, you must first configure the MWTM to receive traps.

To view the current trap reception configuration for the MWTM:

---

**Step 1** Log in as the root user, as described in [Starting the MWTM Client, page 3-3](#), or as a superuser, as described in [Specifying a Super User \(Server Only\), page 2-19](#).

**Step 2** Enter:

```
cd /opt/CSCosgm/bin
./mwtm trapstatus
```

The MWTM displays the current trap reception configuration for the MWTM, including:

- Whether receiving traps is enabled or disabled

- Which UDP port the MWTM trap receiver is listening on

To configure the MWTM to receive traps:

- 
- Step 1** Log in as the root user, as described in [Starting the MWTM Client, page 3-3](#), or as a superuser, as described in [Specifying a Super User \(Server Only\), page 2-19](#).
- Step 2** Enter:
- ```
# cd /opt/CSCOsgrm/bin
# ./mwtm trapsetup
```
- The MWTM displays:
- ```
The MWTM server must also be stopped to perform this operation.
Do you wish to continue? [n]
```
- Step 3** Type **y** and press **Enter**.
- The MWTM stops the MWTM Process Manager and all managed processes and displays:
- ```
Would you like to configure MWTM to receive SNMP traps? [yes]
```
- Step 4** Press **Enter**.
- The MWTM displays:
- ```
MWTM can receive traps natively on the standard UDP port number 162
or on any other UDP port chosen. If another application is already
bound to the SNMP standard trap reception port of 162, an alternate
port number for MWTM to receive traps must be specified.

UDP port number 44750 is the default alternate port.

Enter trap port number? [162]
```
- Step 5** By default, nodes send traps to port 162. To accept the default value, press **Enter**.
- Step 6** If your nodes have been configured to send traps to a different port, type that port number and press **Enter**.
- Step 7** By default, the MWTM listens for traps from trap-multiplexing nodes and NMS applications on port 44750. If you want the MWTM to monitor that port, and port 162 is not available on the MWTM server host, type **44750** and press **Enter**.
- Step 8** If trap multiplexing nodes and NMS applications in your network have been configured to send traps to a different port, type that port number and press **Enter**.
- Step 9** If you are a superuser, you must specify a port number that is greater than 1024, then press **Enter**.  
Do not enter a non numeric port number. If you do, you are prompted to enter a numeric port number.  
When you select an SNMP trap port number for the MWTM server, ensure your nodes use the same SNMP trap port number. See the description of the snmp-server host command in the “Preparing to Install the MWTM” chapter of the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#) for more information.
- Step 10** To accept the default value, press **Enter**; or, type a different location and press **Enter**.  
The MWTM confirms your choices and restarts the MWTM Process Manager and all managed processes.
-

You can change all aspects of MWTM event processing, including the size of the MWTM event database, the maximum length of time the MWTM is to retain events, and the default severity and color associated with each type of event. If a new trap becomes available that is of interest to the MWTM, you can add it to the MWTM event database, enabling the MWTM to recognize and process the new trap. For more information about changing MWTM event processing, see [Changing the Way the MWTM Processes Events, page 9-23](#).

[Integrating the MWTM with Other Products, page 5-36](#)

## Limiting Traps by IP Address

By default, when you first install the MWTM, all IP addresses are allowed to send traps to the MWTM server. However, you can use the MWTM to limit the IP addresses that can send traps to the server by creating and maintaining the *trapaccess.conf* file.

You can create the *trapaccess.conf* file and populate it with a list of IP addresses that can send traps to the MWTM server. The MWTM receives traps from only those IP addresses, plus the local host. If the file exists but is empty, the MWTM receives traps only from the local host. (The MWTM always receives traps from the local host.)

When you first install the MWTM, the *trapaccess.conf* file does not exist and the MWTM allows all IP addresses to send traps to the MWTM server.

To create the *trapaccess.conf* file and work with the list of allowed IP addresses:

---

**Step 1** Log in as the root user, as described in [Starting the MWTM Client, page 3-3](#), or as a superuser, as described in [Specifying a Super User \(Server Only\), page 2-19](#).

**Step 2** Enter:

```
cd /opt/CSCOs/gm/bin
```

**Step 3** Create the *trapaccess.conf* file:

- To create the *trapaccess.conf* file and add a client IP address to the list, enter:

```
./mwtm trapaccess add
```

```
Enter address to add: 1.2.3.4
```

```
IP Address 1.2.3.4 added.
```

```
MWTM server must be restarted for changes to take effect.
```

```
Use the following command to restart the server:
```

```
mwtm restart
```

- To create the *trapaccess.conf* file and open the file to edit it directly, enter:

```
./mwtm trapaccess edit
```

The default directory for the file is located in the MWTM installation directory. If you installed the MWTM:

- In the default directory, */opt*, then the default directory is */opt/CSCOs/gm/etc*.
- In a different directory, then the default directory resides in that directory.

In the *trapaccess.conf* file, begin all comment lines with a pound sign (#).

All other lines in the file are MWTM client IP addresses, with one address per line.

Wildcards (\*) are allowed, as are ranges (for example, 1-100). For example, the address \*.\*.\*.\* allows all clients to send traps to the MWTM server.

After you create the *trapaccess.conf* file, you can use the full set of mwtm trapaccess keywords to work with the file. For more details, see [mwtm trapaccess](#), page B-85.

---

Any changes that you make to the *trapaccess.conf* file take effect when you restart the MWTM server.

## Configuring a Backup MWTM Server

You can use the MWTM to configure a second MWTM server as a backup for the primary MWTM server. For best results, Cisco recommends that you configure the primary server and the backup server as backups for each other.

To configure a backup MWTM server:

---

**Step 1** Log in as the root user, as described in [Starting the MWTM Client](#), page 3-3, or as a superuser, as described in [Specifying a Super User \(Server Only\)](#), page 2-19.

**Step 2** Enter:

```
cd /opt/CSCOsgrm/bin
./mwtm secondaryserver hostname naming-port webport
```

where:

- *hostname* is the optional name of the host on which the backup MWTM server is installed.
- *naming-port* is the optional MWTM Naming Server port number for the backup MWTM server. The default port number is 44742.
- *webport* is the optional MWTM web port number for the backup MWTM server. The default port number is 1774.

---

**Note** If you use the **mwtm secondaryserver** command to configure a backup MWTM server, but the primary MWTM server fails before you launch the MWTM client, then the MWTM client has no knowledge of the backup server.

---

**Step 3** (Optional) To list the backup MWTM server that has been configured for this primary MWTM server, enter:

```
cd /opt/CSCOsgrm/bin
./mwtm secondaryserver list
```

**Step 4** (Optional) To configure whether or not a prompt appears on the client in the event of server failover, see [mwtm clientfailoverprompt](#), page B-19.

---

## Configuring an MWTM Client Connection Timer

You can use the MWTM to specify how long an MWTM client is to wait for the MWTM server before exiting.

To configure an MWTM client connection timer:

**Step 1** Log in as the root user, as described in [Starting the MWTM Client, page 3-3](#), or as a superuser, as described in [Specifying a Super User \(Server Only\), page 2-19](#).

**Step 2** Enter:

```
cd /opt/CSCOSgm/bin
./mwtm cliconntimer number-of-seconds
```

where *number-of-seconds* is the time the MWTM client is to wait for a message from the MWTM server before exiting. The valid range is 10 seconds to an unlimited number of seconds. The default value is 60 seconds.

If the timer expires, the client attempts to contact the server and takes one of these actions. If the server:

- Responds to the client, the client reconnects to the server.
- Does not respond to the client, but a backup server is configured, the client attempts to connect to the backup server.
- Does not respond to the client, and no backup server is configured, the client displays a dialog box with this message:

```
Connection to the server has timed out.
Client could not establish 2-way communications with the server.
If you are running through a VPN you may have entered the wrong client IP address.
```

Click **OK** to exit the client. The MWTM writes this message to the client console log:

- Solaris or Linux client—*/opt/CSCOSgmClient/logs/sgmConsoleLog.txt*
- Windows client—*C:\Program Files\Cisco Systems\MWTM Client\logs\consoleLog.txt*

The timer takes effect when you restart the MWTM server.

**Step 3** (Optional) To restore the default timeout of 60 seconds, enter:

```
./mwtm cliconntimer clear
```

The timer is reset to 60 seconds when you restart the MWTM server.

## Enabling the Terminal Server Proxy Service

The MWTM provides the capability to function through firewalls, where the server is located behind the firewall and the client is outside the firewall. To use this feature, enable the terminal proxy service by the **mwtm termproxy** command (see [mwtm termproxy, page B-85](#)).

# Setting Up TFTP on Your Server (ITP Only)

Before deploying or loading route table, GTT, or MLR address table files, the TFTP daemon must be running on the Solaris or Linux server.

**Tip**

For more information about questions regarding TFTP, see [When I try to deploy routes, GTT files, or address table files from the MWTM, why does TFTP fail or time out?](#), page C-15.

This section contains:

- [Setting Up TFTP on Solaris, page 4-12](#)
- [Setting Up TFTP on Linux, page 4-13](#)

## Setting Up TFTP on Solaris

To set up TFTP on your Solaris server:

**Step 1** Verify that the `tftp-server` package is installed:

```
pkginfo -l | grep tftp
```

If the `tftp-server` package is not installed, install it from your Solaris CD or distribution.

**Step 2** If you are not logged in, log in as the root user:

```
> login: root
> Password: root-password
```

If you are already logged in, but not as the root user, use the `su` command to change your login to root:

```
su
Password: root-password
```

**Caution**

As the root user, you can adversely affect your operating environment if you are unaware of the effects of the commands that you use. If you are a relatively inexperienced UNIX user, limit your activities as the root user to the tasks described in this manual.

**Step 3** Using a UNIX editor, open the `inetd.conf` file:

```
/etc/inetd.conf
```

**Step 4** In the `inetd.conf` file, ensure that this line appears:

```
tftp dgram udp6 wait root /usr/sbin/in.tftpd -s /tftpboot
```

If the line begins with a `#` sign, delete it, and save the changes.

**Step 5** Ensure that this directory exists:

```
/tftpboot
```

If not, then create this directory. Also ensure the directory has write permissions (777).

- Step 6** If you will be accessing more than one type of file (route, GTT, or MLR address table files,) you must create subdirectories, for example:

```
/tftpboot/route
/tftpboot/gtt
/tftpboot/atbl
```

- Step 7** Restart the inetd process:

- a. As the root user, enter:

```
ps -ef | grep inetd
```

Output should be similar to:

```
root 157 1 0 Oct 21 ? 0:00 /usr/sbin/inetd -s
```

- b. To find the process ID for inetd, enter:

```
ps -e -o pid,comm | grep inetd
```

Output should be similar to:

```
157 /usr/sbin/inetd
```

- c. To restart the inetd process, enter:

```
kill -HUP 157
```

Where 157 corresponds to the output integer returned in Step b.

- Step 8** Within the `/opt/CSCOs/gm/bin` directory, set the staging directory with these commands. For:

- Route table files, use the **mwtm routedir** command (see [mwtm routedir](#), page B-123).
- GTT files, use the **mwtm gttdir** command (see [mwtm gttdir](#), page B-109).
- MLR address table files, use the **mwtm atbldir** command (see [mwtm atbldir](#), page B-100).

## Setting Up TFTP on Linux

To set up TFTP on your Linux server:

- Step 1** Verify that the tftp-server package is installed:

```
rpm -q tftp-server
```

If the tftp-server package is not installed, install it from your RedHat Enterprise CD or distribution.

- Step 2** If you are not logged in, log in as the root user:

```
> login: root
> Password: root-password
```

If you are already logged in, but not as the root user, use the “su” command to change your login to root:

```
su
Password: root-password
```

**Caution**

As the root user, you can adversely affect your operating environment if you are unaware of the effects of the commands that you use. If you are a relatively inexperienced UNIX user, limit your activities as the root user to the tasks described in this manual.

**Step 3** Using a UNIX editor, open the *tftp* file:

```
/etc/xinetd.d/tftp
```

**Step 4** Edit the file:

a. Change the line:

```
user = nobody
```

to

```
user = root
```

b. Change the line:

```
disable = yes
```

to

```
disable = no
```

c. If you want to specify a different TFTP directory, replace */tftpboot* in the line *server\_args = -s /tftpboot* with the name of your directory.

**Step 5** Save the changes.

**Step 6** Enter:

```
/etc/init.d/xinetd restart
```

**Step 7** Set the staging directory:

- For route table files, use the **mwtm routedir** command (see [mwtm routedir](#), page B-123).
- For GTT files, use the **mwtm gttdir** command (see [mwtm gttdir](#), page B-109).
- For MLR address table files, use the **mwtm atbldir** command (see [mwtm atbldir](#), page B-100).

## Configuring Nodes

If MWTM User-Based Access is disabled, or if it is enabled and you are a Network Administrator or System Administrator, you can use the MWTM to view and change SNMP settings and configure login credentials.

For more information about user authorization levels in the MWTM, see [Configuring MWTM User Account Levels \(Server Only\)](#), page 2-7.

To access SNMP and credentials configuration, choose **Network > Node SNMP and Credentials Editor** from the MWTM main menu. The MWTM displays the Node SNMP and Credentials Editor dialog box.

The Node SNMP and Credentials Editor dialog box contains:

- [Node SNMP and Credentials Menu](#), page 4-15

- [Configuring SNMP Settings, page 4-15](#)
- [Configuring Login Credentials, page 4-20](#)

## Node SNMP and Credentials Menu

The menu on the Node SNMP and Credentials Editor dialog box contains:

| Menu Command                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Save<br>(Ctrl-S)     | Saves any SNMP configuration changes.<br><br>When you are satisfied with all of your changes to the SNMP settings, choose the <b>File &gt; Save</b> menu option. The MWTM saves the changes and updates the SNMP information on the MWTM server in real time.<br><br><b>Note</b> If another user modifies and saves the SNMP configuration before you save your changes, the MWTM asks if you want to overwrite that user's changes. If you choose to do so, the other user's changes are overwritten and lost. If you choose not to do so, your changes are lost. |
| File > Close<br>(Ctrl-W)    | Closes the current window. You may be prompted to save the current changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Help > Topics<br>(F1)       | Displays the table of contents for the MWTM online help.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Help > Window<br>(Shift-F1) | Displays online help for the current window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Help > About<br>(F3)        | Displays build date, version, SSL support, and copyright information about the MWTM application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Configuring SNMP Settings

### Note

If you want to change SNMP settings, do so *before* running discovery.

For more information about SNMP, see “Configuring SNMP Support” in the Cisco IOS Release 12.2 *Configuration Fundamentals Configuration Guide*, Part 3, System Management.

To change SNMP settings in the MWTM, start the MWTM client, as described in [Starting the MWTM Client, page 3-3](#), then choose:

- From the MWTM main window—**Network > Node SNMP and Credentials Editor** from the MWTM main menu.
- From the Discovery Dialog—**Edit > Node SNMP and Credentials Editor** from the menu bar.

### Note

(If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator [level 4] and higher).

The MWTM displays the SNMP tab.

The SNMP tab of the Node SNMP and Credentials Editor dialog box contains:

- [SNMP Settings Table, page 4-16](#)
- [SNMP Configuration Table, page 4-16](#)
- [SNMP Configuration Buttons, page 4-18](#)

The MWTM also provides a set of commands that you can use to configure SNMP settings (see [SNMP Configuration Commands, page 4-18](#)).

## SNMP Settings Table

The SNMP settings table displays current SNMP information for nodes in the MWTM. You can edit these fields in the [SNMP Configuration Table, page 4-16](#).

The SNMP configuration table contains:

| Column                       | Description                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------|
| IP Address Range or Hostname | IP address or DNS name of a node or range of nodes. An asterisk (*) indicates a wildcard value.                   |
| Read Community               | SNMP community name used by the node for read access to the information maintained by the SNMP agent on the node. |
| Timeout (secs)               | Time, in seconds, the MWTM waits for a response from the node.                                                    |
| Retries                      | Number of times the MWTM attempts to connect to the node.                                                         |
| Poll Interval (mins)         | Time, in minutes, between polls for the node.                                                                     |

## SNMP Configuration Table

In the SNMP configuration table, you can change SNMP settings for a node.

The SNMP configuration table contains:

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address Range or Hostname | <p>IP address or DNS name of a node.</p> <p>To change the IP address or DNS name of a node, select the node, enter the new address or name in the IP Address Range or Hostname field, then click <b>Update</b>.</p> <p>IP addresses use the format <i>x.x.x.x</i>, where each <i>x</i> has one of these values:</p> <ul style="list-style-type: none"> <li>• An integer in the range 0 through 255.</li> <li>• A range of integers separated by a hyphen (-), such as 10-60.</li> <li>• An asterisk (*), which is equivalent to specifying 0-255.</li> </ul> <p>The default value for this field is the IP address <i>*.*.*.*</i>, which the MWTM uses for all nodes not covered by other IP address ranges or names.</p> <p>When entering an IP address:</p> <ul style="list-style-type: none"> <li>• Use Class A, B, or C addressing: <ul style="list-style-type: none"> <li>– Class A—The first octet value is within the range of 1-126. A valid IP address is from 1.0.0.1 to 126.255.255.254.</li> <li>– Class B—The first octet value is within the range of 128-191. A valid IP address is from 128.1.0.1 to 191.254.255.254.</li> <li>– Class C—The first octet value is within the range of 192-223. A valid IP address is from 192.0.1.1 to 223.255.254.254.</li> </ul> </li> <li>• Do not use 0 or 255 for the last octet (<i>x.x.x.0</i> is reserved for subnet addresses or network addresses; <i>x.x.x.255</i> is reserved for subnet broadcast addresses).</li> <li>• Do not use IP addresses that fall within these ranges: 127.0.0.1-127.255.255.254, 128.0.0.1-128.0.255.254, 191.255.0.1-191.255.255.254, 223.255.255.1-223.255.255.254, and so on.</li> <li>• Do not use 0 for the first octet.</li> </ul> <p>Unlike IP addresses, you cannot specify a range of node names or use wildcards in node names. Each node name corresponds to a single node in the network.</p> |
| Read Community               | <p>SNMP community name to be used by the node for read access to the information maintained by the SNMP agent on the node.</p> <p>To change the SNMP community name for a node, select the node and enter the new name in the Read Community field, then click <b>Update</b>.</p> <p>This new SNMP community name must match the name used by the node. The default name is <i>public</i>.</p> <p>For information about exporting SNMP community names from CiscoWorks Resource Manager Essentials (RME), see <a href="#">Importing SNMP Community Names from CiscoWorks (Solaris Only)</a>, page 4-2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Timeout (secs)               | <p>Time, in seconds, the MWTM waits for a response from the node.</p> <p>If you determine that the MWTM waits too long for a response from a node, or does not wait long enough, you can change the timeout value. To change the time that the MWTM waits for a response from a node, select the node and enter the new timeout value in the Timeout (secs) field, then click <b>Update</b>.</p> <p>The valid range is 1 to 60 seconds. The default value is 3 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Field                | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retries              | <p>Number of times the MWTM attempts to connect to the node.</p> <p>If you determine that the MWTM retries a node too many times, or not enough times, you can change the number of retries. To change the number of times the MWTM attempts to connect to a node, select the node and enter the new number in the Retries field, then click <b>Update</b>.</p> <p>The valid range is 0 to 99. The default value is 2 retries.</p> |
| Poll Interval (mins) | <p>Time, in minutes, between polls for the node.</p> <p>If you determine that the MWTM polls a node too often, or not often enough, you can change the poll interval. To change the time, in minutes, between polls for a node, select the node and enter the new interval in the Poll Interval (mins) field, then click <b>Update</b>.</p> <p>The valid range is 5 to 1440. The default value is 15 minutes.</p>                  |

## SNMP Configuration Buttons

The SNMP tab of the Node SNMP and Credentials Editor dialog box contains:

| Button | Description                                                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Add    | <p>Adds the new SNMP settings to the MWTM database.</p> <p>To add a new node or range of nodes, enter the SNMP information in the appropriate fields and click <b>Add</b>. The new SNMP settings are added to the MWTM database.</p> |
| Update | Applies the values in the SNMP configuration fields to the selected node or range of nodes.                                                                                                                                          |
| Delete | <p>Deletes the selected node or range of nodes.</p> <p>To delete a node, select it and click <b>Delete</b>. The MWTM deletes the node without asking for confirmation.</p>                                                           |

## SNMP Configuration Commands

This section contains:

- [MWTM Commands for SNMP, page 4-19](#)
- [Required SNMP Configuration for RAN-O Nodes, page 4-19](#)

## MWTM Commands for SNMP

The MWTM provides these SNMP-related commands:

| Command                     | Description                                                                                        |
|-----------------------------|----------------------------------------------------------------------------------------------------|
| <b>mwtm addsnmpcomm</b>     | Adds an SNMP configuration.                                                                        |
| <b>mwtm deletesnmpcomm</b>  | Deletes an SNMP configuration.                                                                     |
| <b>mwtm modifiesnmpcomm</b> | Modifies an existing SNMP configuration.                                                           |
| <b>mwtm showsnmpcomm</b>    | Shows SNMP configuration(s).                                                                       |
| <b>mwtm snmpcomm</b>        | Sets a new default SNMP read community name.                                                       |
| <b>mwtm snmpconf</b>        | Changes the file used for SNMP parameters, such as community names, timeouts, and retries.         |
| <b>mwtm snmpget</b>         | Queries a host using an SNMP GET request.                                                          |
| <b>mwtm snmpnext</b>        | Queries a host using an SNMP GETNEXT request.                                                      |
| <b>mwtm snmpsetup</b>       | Sets up SNMP configuration(s).                                                                     |
| <b>mwtm snmpwalk</b>        | Queries a host using an SNMP GETNEXT request or an SNMP GETBULK request to “walk” through the MIB. |
| <b>mwtm snmpmaxrows</b>     | Sets the value of maximum rows for SNMP walk.                                                      |
| <b>mwtm snmphelp</b>        | Prints SNMP utilities usage information.                                                           |

**Tip**

For more information on the use of these commands, see [Appendix B, “Command Reference.”](#)

## Required SNMP Configuration for RAN-O Nodes

Configure these SNMP statements on the RAN-O nodes that you would like to manage by using the MWTM:

```
ipran-mib snmp-access <inBand | outOfBand>
ipran-mib location <cellSite | aggSite>
logging traps informational

snmp-server enable traps syslog
snmp-server community <SNMP_COMMUNITY_STRING> RO 1
snmp-server trap link ietf snmp-server queue-length 100
snmp-server enable traps snmp linkdown linkup coldstart warmstart
snmp-server enable traps ipran snmp-server enable traps cpu threshold
snmp-server host <SNMP_SERVER_HOST_IP_ADDRESS> version 2c v2c
```

**Tip**

For more information about these commands, see the *Cisco MWR 1941-DC-A Mobile Wireless Edge Router Software Configuration Guide* or the *Cisco MWR 2941-DC Mobile Wireless Edge Router Software Configuration Guide*.

## Configuring Login Credentials

This section contains:

- [Setting Up Login Credentials](#), page 4-20
- [Credentials Fields](#), page 4-21
- [Credentials Buttons](#), page 4-22
- [Adding Nodes](#), page 4-22
- [Credentials Commands](#), page 4-22

You can use the MWTM to set up log in credentials, which you can use for:

| Action                                        | Description                                                                                                                                                                                                                                                                                                                                               | Related Content                                                                                                                                                                            |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Troubleshooting                               | All networks                                                                                                                                                                                                                                                                                                                                              | <a href="#">Viewing Troubleshooting</a>                                                                                                                                                    |
| Discovery                                     | ONS nodes only<br><br><b>Note</b> Only ONS nodes require login credentials during discovery; all other node types only require an SNMP community string.                                                                                                                                                                                                  | <a href="#">Discovery Overview</a>                                                                                                                                                         |
| Deployment                                    | ITP only                                                                                                                                                                                                                                                                                                                                                  | <a href="#">Deploying ITP Files</a>                                                                                                                                                        |
| Provisioning                                  | All networks                                                                                                                                                                                                                                                                                                                                              | <a href="#">About Provisioning</a>                                                                                                                                                         |
| Launching an SSH terminal to a node           | All networks<br><br>In the MWTM client navigation tree, right-click on an object and choose <b>Node Connect</b> .                                                                                                                                                                                                                                         | <a href="#">Viewing the Right-Click Menu for an Object</a>                                                                                                                                 |
| Establishing a low-level connection to a node | ITP only<br><br>In the MWTM client, choose <b>Network &gt; Node File Management</b> , then choose <b>File &gt; Connect</b><br><br>or<br><br>In the Route Table Editor, choose <b>File &gt; Deploy</b><br><br>or<br><br>In the Global Title Translator Editor or Address Table Editor, choose <b>File &gt; Load from Node</b> or <b>File &gt; Deploy</b> . | <a href="#">Node File Management</a><br><a href="#">Deploying ITP Files</a><br><a href="#">Loading a GTT File from a Node</a><br><a href="#">Loading an Address Table File from a Node</a> |

## Setting Up Login Credentials

The MWTM enables a system administrator to configure the login credentials using the Node SNMP and Credentials Editor dialog box. Login credentials are stored in an encrypted file on the server, eliminating the need for users to login before running commands.

To set up login credentials in the MWTM, start the MWTM client, as described in [Starting the MWTM Client](#), page 3-3, then choose **Network > Node SNMP and Credentials Editor** from the MWTM main menu, and select the Credentials tab.

**Note**

If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.

For detailed information on the SNMP tab, see [Configuring SNMP Settings, page 4-15](#).

**Tip**

A check mark appears beside nodes or default credentials that are configured.

A system administrator can set up credentials:

- Globally on all nodes of all types—Click **Default** and complete the fields in the right pane.
- All nodes of a specific node type only—Under Default, click the node type and complete the fields in the right pane.

**Note**

Configuring default Cell Site Router (CSR) credentials applies to these CSRs: Cisco MWR and Cisco 3825.

- On a specific node—Under Nodes, click the node name and complete the fields in the right pane. Configuring credentials on a specific node overrides any Default credentials for that particular node.

The Credentials tab of the Node SNMP and Credentials dialog box contains:

- [Credentials Fields, page 4-21](#)
- [Credentials Buttons, page 4-22](#)

The MWTM also provides a set of commands that you can use to configure SNMP settings (for details, see the [Credentials Commands, page 4-22](#)).

## Credentials Fields

Under the Credentials tab of the Node SNMP and Credentials dialog box, you can configure these login credentials for node(s):

**Note**

Ensure that each user has sufficient privileges to run all commands.

| Field                      | Description                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------|
| IP Address or DNS Hostname | See <a href="#">Adding Nodes, page 4-22</a> .                                                                |
| User name                  | Enter the login username, if required.                                                                       |
| Password                   | Enter the login password, if required.                                                                       |
| Enable User name           | Enter the login enable username (not required for ONS nodes).                                                |
| Enable Password            | Enter the login enable password (not required for ONS nodes).                                                |
| Connection Protocol        | Choose the protocol to use when connecting to the node, either SSH or Telnet.                                |
|                            | <b>Note</b> The key size on the node must be configured to a minimum of 768 bits and a maximum of 2048 bits. |

**Note**

Username and password requirements vary according to your security configuration. For more information, see the *Cisco IOS Security Configuration Guide, Release 12.2*, Part 1 and Part 5.

## Credentials Buttons

The Credentials tab of the Node SNMP and Credentials dialog box contains:

| Button | Description                                                                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Apply  | Applies specified usernames and passwords to the selected node or Default credentials.                                                                                 |
| Clear  | Removes credentials. To clear usernames and passwords on a selected object, click <b>Clear</b> to remove the credentials, then click <b>Apply</b> .                    |
| Test   | You can test the credentials you have configured on the corresponding node or the default credentials against a selected node type (not available for all node types). |
| Add    | (Button only available when you click Nodes) Adds a specified node.                                                                                                    |

## Adding Nodes

In the Credentials tab, you can add a node. If you are working with ONS nodes, you must add the ONS node and set the credentials for the node before running discovery.

- 
- Step 1** Click **Nodes** in the navigation tree.
  - Step 2** Enter the IP address or DNS hostname.
  - Step 3** Add the username and password credentials.
  - Step 4** Specify the connection protocol (Telnet or SSH).
  - Step 5** Click **Add**.
- 

## Credentials Commands

The MWTM also provides credentials-related commands:

- To add credentials for a given IP address, or for the Default credentials, use the **mwtm addcreds** command.
- To show credentials for a given IP address, or for the Default credentials, use the **mwtm showcreds** command.
- To delete credentials for a given IP address, or for the Default credentials, use the **mwtm deletcreds** command.

**Tip**

For more information on the use of these commands, see [Appendix B, “Command Reference.”](#)

# Creating New Troubleshooting Categories and Commands

A system administrator can use the MWTM to create user-specific categories and commands:

**Step 1** On the server machine, if you are not logged in, log in as the root user:

```
> login: root
> Password: root-password
```

If you are already logged in, but not as the root user, use the “su” command to change your login to root:

```
su
Password: root-password
```

**Caution**

As the root user, you can adversely affect your operating environment if you are unaware of the effects of the commands that you use. If you are a relatively inexperienced UNIX user, limit your activities as the root user to the tasks described in this manual.

**Step 2** Using a UNIX editor, open the *UserCommands.ts* file:

```
/opt/CSC0sgm/etc/UserCommands.ts
```

**Step 3** Create new categories and commands, following the instructions in the *UserCommands.ts* file. Sample categories and commands are provided, which may be directly useful in your network.

**Step 4** Save changes. The new categories and commands now appear in the Troubleshooting tabs.

# CHAPTER 5

## Basic Operations

---

This chapter provides information about basic operations that you can perform in the Cisco Mobile Wireless Transport Manager (MWTM), and contains:

- [Changing Client and Web Preference Settings, page 5-1](#)
- [Viewing Online Help, page 5-21](#)
- [Finding Information in a Window, page 5-22](#)
- [Navigating Table Columns, page 5-23](#)
- [Printing Windows, page 5-24](#)
- [Managing and Deploying ITP Files, page 5-24](#)
- [Exporting Data, page 5-35](#)
- [Integrating the MWTM with Other Products, page 5-36](#)
- [Running Simultaneous Client Sessions, page 5-39](#)
- [Performing Basic Server Operations, page 5-39](#)
- [Using the Command Line Interface, page 5-43](#)

**Note**

The default directory for installing the MWTM is */opt*. In commands that call for the default directory, if you installed the MWTM in a different directory, you must specify that directory instead of */opt*.

---

## Changing Client and Web Preference Settings

This section contains this information:

- [Changing Client Preference Settings, page 5-2](#)
- [Changing Web Preference Settings, page 5-18](#)
- [Changing Real-Time Poller and Counter Settings, page 5-20](#)

## Changing Client Preference Settings

When a user changes some aspect of the MWTM client, such as the size of a window, or the order of columns in a window, the MWTM makes note of the user's preferences on the MWTM client and server. The MWTM saves the user's preferences to the MWTM server when the MWTM client exits.

Thereafter, whenever the user launches the MWTM client, the MWTM searches for the user's preferences. If the MWTM finds the user's preferences on the MWTM server, the MWTM launches the MWTM client with those preferences. Otherwise, the MWTM launches the MWTM client with the default preferences file.

In addition to the user preferences that the MWTM automatically saves, you use the MWTM to change many GUI, data, topology, and table settings that affect the way the MWTM presents its information.

**Note**

Anyone who uses the MWTM client can change its preference settings, and the changes affect all views running on this client.

To change overall MWTM preference settings, choose **Edit > Preferences** from the MWTM client main menu. The MWTM displays the Preferences window.

In the Preferences window, you can:

- [Displaying the Preferences Menu, page 5-2](#)
- [Changing General GUI Settings, page 5-3](#)
- [Changing Alarm and Event Settings, page 5-7](#)
- [Changing Charts Settings, page 5-11](#)
- [Changing Status Settings, page 5-11](#)
- [Changing CiscoWorks Server Settings, page 5-13](#)
- [Changing Topology Settings, page 5-13](#)
- [Changing Deploy Settings, page 5-15](#)
- [Customizing Colors, page 5-16](#)
- [Restoring Default Preference Settings, page 5-18](#)

## Displaying the Preferences Menu

The menu on the Preferences window contains:

| Option                           | Description                                                               |
|----------------------------------|---------------------------------------------------------------------------|
| File > Load System Default Prefs | Restores all preference settings to the original system default settings. |
| File > Save (Ctrl-S)             | Saves the preference changes.                                             |

| Option                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Close<br>(Ctrl-W)    | <p>Closes the Preferences window.</p> <p>To close the Preferences window at any time, choose <b>File &gt; Close</b>. If you have changed any preferences, the MWTM asks if you want to apply the changes before leaving the window:</p> <ul style="list-style-type: none"> <li>Click <b>Yes</b> to apply the changes and close the prompt window and the Preferences window.</li> <li>Click <b>No</b> to close the prompt window and the Preferences window without applying or saving any changes.</li> <li>Click <b>Cancel</b> to close the prompt window without applying any changes. The Preferences window remains open.</li> </ul> |
| Help > Topics<br>(F1)       | Displays the table of contents for the MWTM online help.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Help > Window<br>(Shift-F1) | Displays online help for the current window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Help > About<br>(F3)        | Displays build date, version, SSL support, and copyright information about the MWTM application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Changing General GUI Settings

You use the General GUI settings in the Preferences window to change general display settings for the MWTM, including which window to display first when starting the MWTM, and whether to display values in bits or bytes.

To display the General GUI settings, choose General GUI in the left pane of the Preferences window.

In the General GUI area you can change:

- [Startup/Exit Settings, page 5-3](#)
- [General Display Settings, page 5-4](#)
- [Node Name Settings, page 5-5](#)
- [Poller Settings, page 5-5](#)
- [Troubleshooting, page 5-6](#)
- [Connection Settings, page 5-6](#)
- [Repaint Priority, page 5-6](#)

### Startup/Exit Settings

Use the Startup/Exit Settings pane of the General GUI settings to specify whether you want to display the topology window when you launch the MWTM client, and whether you want the MWTM to prompt you for confirmation when you exit the MWTM client.

The Startup/Exit Settings pane contains:

| Check Box             | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MWTM: Topology Window | If checked, causes the topology window to appear when you start the MWTM. The default setting for this check box is unchecked.                                                                                                                                                                                                                                                           |
| Confirm Exit          | If checked, the MWTM prompts you for confirmation when you exit the MWTM client. The default setting for this check box is checked.                                                                                                                                                                                                                                                      |
| Confirm Deletions     | <p>If checked, the MWTM prompts you for confirmation when you delete an object. The default setting for this check box is checked.</p> <p><b>Note</b> If you check the Do not show this again check box in a Confirm Deletion dialog box, and you later decide that you do want the MWTM to display the Confirm Deletion dialog box, you must check the Confirm Deletions check box.</p> |
| Confirm In Band Polls | If checked, the MWTM prompts you for confirmation when you access a function that requires the MWTM to perform in-band polling of the object.                                                                                                                                                                                                                                            |

## General Display Settings

Use the General Display pane of the General GUI settings to specify whether the MWTM should:

- Display node domain names.
- Show details in bits instead of bytes.
- Show receive and send utilization as percentages.
- Show the point code mask in bits instead of dotted notation.

The General Display pane contains:

| Check Box                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show Node Domain Names                  | If checked, the MWTM shows node domain names in its displays. The default setting for this check box is unchecked (do not show node domain names).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Show Details in Bits Instead of Bytes   | <p>If checked, the MWTM displays data and data rates in bits instead of bytes:</p> <ul style="list-style-type: none"> <li>• Check if you want the MWTM to display data in bits, and data rates in bits per second. This is the default setting.</li> <li>• Uncheck if you want the MWTM to display data in bytes, and data rates in bytes per second.</li> </ul>                                                                                                                                                                                                                                                                                      |
| Show Utilization as Percentage          | <p>If checked, the MWTM displays receive and send for linksets and links as a percentage:</p> <ul style="list-style-type: none"> <li>• Check if you want the MWTM to display as a percentage. This is the default setting.</li> <li>• Uncheck if you want the MWTM to display in Erlangs.</li> </ul>                                                                                                                                                                                                                                                                                                                                                  |
| Show Point Code Mask in Bits (ITP only) | <p>If checked, the MWTM displays point code masks as a number of bits instead of dotted-decimal format. The MWTM applies this setting to all point code masks in the MWTM client, including those in the Route Table dialog box, in messages, and so on.</p> <ul style="list-style-type: none"> <li>• Uncheck if you want the MWTM to display point code masks in dotted-decimal format (octets separated by periods). This is the default setting.</li> <li>• Check if you want the MWTM to display point code masks as a number of bits.</li> </ul> <p>For more information about point code masks, see <a href="#">Route Table, page 14-7</a>.</p> |

## Node Name Settings

Use the Node Name pane of the General GUI settings to specify how the MWTM should display node names.

The Node Name pane contains these radio buttons:

| Radio Buttons                  | Description                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Show DNS or User Defined Names | Indicates whether the MWTM should identify nodes by their DNS or user-defined names. The default setting for this radio button is checked.          |
| Show IP Address in Name Field  | Radio button used to indicate whether the MWTM should identify nodes by their IP addresses. The default setting for this radio button is unchecked. |
| Show SysName                   | Indicates whether the MWTM should identify nodes by their System Name. The default setting for this radio button is unchecked.                      |

## Poller Settings

Use the Poller pane of the General GUI settings to change the MWTM poller and counter settings.

The Poller pane contains:

| Field or Radio Button          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fast Poller Default (secs)     | <p>Default interval, in seconds, for the fast poller. The valid range is 5 to 60 seconds. The default setting is 15 seconds.</p> <p>The fast poller appears in these MWTM client windows:</p> <ul style="list-style-type: none"> <li>• MWTM Real-Time Statistics: CPU Statistics window</li> <li>• (ITP only) Details window for an Application Server</li> <li>• (ITP only) Details window for a Linkset</li> <li>• (ITP only) Details window for a Signaling Gateway Mated Pair</li> </ul> <p>You can change the valid range and default setting in the <i>Server.properties</i> file. For more information, see <a href="#">Changing MWTM Server Poller Settings, page 4-2</a>.</p> |
| Slow Poller Default (secs)     | <p>Default interval, in seconds, for the slow poller. The valid range is 60 seconds to 300 seconds. The default setting is 60 seconds.</p> <p>The slow poller is used in all the MWTM client windows except those listed previously that use the fast poller.</p> <p><b>Note</b> You can change the valid range and default setting in the <i>Server.properties</i> file. For more information, see <a href="#">Changing MWTM Server Poller Settings, page 4-2</a>.</p>                                                                                                                                                                                                                |
| Show Counters Since Reboot     | Radio button used to configure the MWTM client to clear all counters in MWTM web pages whenever the node reboots. The default setting for this radio button is checked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Show Counters Since Last Poll  | Radio button used to configure the MWTM client to clear all counters whenever an MWTM web page is polled. The default setting for this radio button is unchecked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Show Counters Since User Reset | Radio button used to configure the MWTM client to clear all MWTM counters whenever the user resets the counters on an MWTM web page. The default setting for this radio button is unchecked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Troubleshooting

Use the Troubleshooting pane of the General GUI settings to specify whether the MWTM clears the display window upon command execution.

The Troubleshooting pane contains:

| Field                        | Description                                                |
|------------------------------|------------------------------------------------------------|
| Clear Display upon Execution | Clears the output display each time you execute a command. |

## Connection Settings

Use the Connection Settings pane of the General GUI settings to set the Telnet or SSH path and arguments for accessing nodes using one of these methods.

### Note

To connect to a node using SSH, the key size on the node must be configured to a minimum of 768 bits and a maximum of 2048 bits.

The Connection Settings pane contains:

| Field            | Description                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Telnet path      | Use to modify the default MWTM Telnet path to an executable file (for example, <i>putty.exe</i> ). Click <b>Find</b> to choose a Telnet path on your local machine.<br><b>Note</b> Choosing a non-GUI file might not yield the expected results. |
| Telnet arguments | Optional arguments that the MWTM passes to the Telnet executable when the MWTM invokes it. For example, to set the hostname and port number for the connection, specify <b>-telnet \$host \$port</b> . <sup>1</sup>                              |
| SSH path         | Use to modify the default MWTM SSH path to an executable file (for example, <i>putty.exe</i> ). Click <b>Find</b> to choose an SSH path on your local machine.<br><b>Note</b> Choosing a non-GUI file might not yield the expected results.      |
| SSH arguments    | Optional arguments that the MWTM passes to the SSH executable when the MWTM invokes it. For example, to set the hostname and port number for the connection, specify <b>-ssh \$host \$port</b> . <sup>1</sup>                                    |

1. When you right-click a node in the navigation tree and choose Connect To, the variables \$host and \$port are replaced with the hostname and port number of the node.

## Repaint Priority

Use the Repaint Priority pane of the General GUI settings to balance the responsiveness versus efficiency of the MWTM client. This setting controls how quickly the MWTM client repaints its displays.

The Repaint Priority pane contains a sliding control: 

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repaint Priority | <p>Balances the MWTM client's responsiveness versus efficiency. The valid range is 0 through 10, with 0 representing a high repaint priority (high responsiveness, low efficiency) and 10 representing a high communication priority (high efficiency, low responsiveness):</p> <ul style="list-style-type: none"><li>• To maximize repainting (responsiveness) over communication (efficiency), slide the selector toward High Repaint Priority.</li><li>• To maximize communication (efficiency) over repainting (responsiveness), slide the selector toward High Comm. Priority.</li><li>• The default setting is 2 (the third mark from the left).</li></ul> |

## Changing Alarm and Event Settings

Use the Alarms / Events settings in the Preferences window to:

- Change the default background color for each type of alarm or event
- Specify whether to display acknowledged alarms or events
- Specify the types of events the MWTM should display in the alarms and events tables, including the:
  - Category and severity
  - Whether the event is acknowledged
  - Other properties

To display the preference settings for alarms and events, select Alarms / Events in the left pane of the Preferences window.

In the right pane you can change:

- [Colors, page 5-8](#)
- [Alarm-specific Colors, page 5-8](#)
- [Time Format, page 5-8](#)
- [Date Format, page 5-8](#)
- [Categories, page 5-9](#)
- [Severities, page 5-9](#)
- [Other, page 5-10](#)

## Colors

The Alarm / Event Colors pane contains:

| Field         | Description                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Change Color  | Opens the Select Event Color dialog box from which you select a color for an alarm or event type. For more details, see <a href="#">Customizing Colors, page 5-16</a> . |
| Critical      | Indicates the background color for Critical alarms or events. The default is red.                                                                                       |
| Major         | Indicates the background color for Major alarms or events. The default is orange.                                                                                       |
| Minor         | Indicates the background color for Minor alarms or events. The default is yellow.                                                                                       |
| Warning       | Indicates the background color for Warning alarms or events. The default is blue.                                                                                       |
| Informational | Indicates the background color for Informational alarms or events. The default is white.                                                                                |
| Indeterminate | Indicates the background color for Indeterminate alarms or events. The default is cyan.                                                                                 |
| Normal        | Indicates the background color for Normal alarms or events. The default is light green.                                                                                 |

## Alarm-specific Colors

The Alarm-specific Colors pane contains:

| Field        | Description                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Change Color | Opens the Select Event Color dialog box from which you select a color for alarms and events of unmanaged objects. For more details, see <a href="#">Customizing Colors, page 5-16</a> . |
| Unmanaged    | Indicates the background color for unmanaged alarms or events. The default is gray.                                                                                                     |

## Time Format

The Time Format pane contains:

| Button  | Description                                                                                                    |
|---------|----------------------------------------------------------------------------------------------------------------|
| 12 Hour | Click this radio button to configure alarm or event time stamps to use 12-hour format (for example, 07:10:09). |
| 24 Hour | Click this radio button to configure alarm or event time stamps to use 24-hour format (for example, 19:10:09). |

## Date Format

The Date Format pane contains:

| Button      | Description                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------|
| Month-First | Click this radio button to configure alarm or event date stamps with the month appearing first (for example, 8/16/09). |
| Day-First   | Click this radio button to configure alarm or event date stamps with the day appearing first (for example, 16/8/09).   |

## Categories

In the Categories pane, you specify which event categories to display in the Event History window. The Categories pane contains:

| Field or Button | Description                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------|
| Status          | Indicates whether Status events should appear in the Event History window. The default is checked.         |
| Trap            | Indicates whether Trap events should appear in the Event History window. The default is checked.           |
| Create          | Indicates whether Create events should appear in the Event History window. The default is checked.         |
| Delete          | Indicates whether Delete events should appear in the Event History window. The default is checked.         |
| Discover        | Indicates whether Discover events should appear in the Event History window. The default is checked.       |
| Edit            | Indicates whether Edit events should appear in the Event History window. The default is checked.           |
| Ignore          | Indicates whether Ignore events should appear in the Event History window. The default is checked.         |
| Login           | Indicates whether Login events should appear in the Event History window. The default is checked.          |
| LoginDisable    | Indicates whether LoginDisable events should appear in the Event History window. The default is checked.   |
| LoginFail       | Indicates whether LoginFail events should appear in the Event History window. The default is checked.      |
| Logout          | Indicates whether Logout events should appear in the Event History window. The default is checked.         |
| OverWrite       | Indicates whether OverWrite events should appear in the Event History window. The default is checked.      |
| Poll            | Indicates whether Poll events should appear in the Event History window. The default is checked.           |
| Purge           | Indicates whether Purge events should appear in the Event History window. The default is checked.          |
| Provision       | Indicates whether Provision events should appear in the Event History window. The default is checked.      |
| LaunchTerminal  | Indicates whether LaunchTerminal events should appear in the Event History window. The default is checked. |
| Performance     | Indicates whether Performance events should appear in the Event History window. The default is checked.    |
| Select All      | Checks all event category check boxes.                                                                     |
| Deselect All    | Unchecks all event category check boxes.                                                                   |

### Note

The fields in the previous table are default categories; however, the MWTM system administrator might define additional categories. For information about custom categories, see [Changing Event Categories, page 9-30](#).

## Severities

In the Severities pane, you specify which alarm or event severities to display in the Event History and Active Alarms windows.

The Severities pane contains these default fields:

| Field         | Description                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------|
| Critical      | Indicates whether alarms and events of severity Critical should appear in the window. The default is checked.      |
| Major         | Indicates whether alarms and events of severity Major should appear in the window. The default is checked.         |
| Minor         | Indicates whether alarms and events of severity Minor should appear in the window. The default is checked.         |
| Warning       | Indicates whether alarms and events of severity Warning should appear in the window. The default is checked.       |
| Informational | Indicates whether alarms and events of severity Informational should appear in the window. The default is checked. |
| Indeterminate | Indicates whether alarms and events of severity Indeterminate should appear in the window. The default is checked. |
| Normal        | Indicates whether alarms and events of severity Normal should appear in the window. The default is checked.        |

## Other

Use the Other pane to further define the filter for the Event History and Active Alarms windows. These settings apply to all event displays in the current view.

The Other pane contains:

| Check Box or Field                  | Description                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Acknowledged                        | Indicates whether only acknowledged alarms and events should appear in the window. The default is checked.                                                                                                                                                                                                  |
| Unacknowledged                      | Indicates whether only unacknowledged alarms and events should appear in the window. The default is checked.                                                                                                                                                                                                |
| Time Before                         | Indicates whether only alarms and events that the MWTM logs prior to a specified date and time should appear in the window. The default is checked.                                                                                                                                                         |
| Time Before Field                   | Specifies the date and time prior to which alarms and events that the MWTM logs should appear in the window. This field is dimmed unless the Time Before check box is checked.                                                                                                                              |
| Time After                          | Indicates whether only alarms and events that the MWTM logs after a specified date and time should appear in the window. The default is checked.                                                                                                                                                            |
| Time After Field                    | Specifies the date and time after which alarms and events that the MWTM logs should appear in the window. This field is dimmed unless the Time After check box is checked.                                                                                                                                  |
| Message Contains                    | Indicates whether only alarms and events that contain the specified message text should appear in the window. The default is checked.                                                                                                                                                                       |
| Match Case                          | Indicates whether only alarms and events that match the case of the text in the Message Contains field should appear in the window. This field is dimmed unless the Message Contains check box is checked. If the Message Contains check box is checked, the default setting for this check box is checked. |
| Suppress Events for unmanaged nodes | Suppresses all alarms and events from nodes that are unmanaged. The default setting for this check box is unchecked.                                                                                                                                                                                        |

## Changing Charts Settings

Use the Charts pane in the Preferences window to change default settings for the elements in real-time data charts for application servers, application server process associations, links, and linksets.

To display the Charts pane, click **Charts** in the left pane of the Preferences window.

The Charts pane contains:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Series          | <p>Indicates the time series being defined. A time series is a set of data collected sequentially at a fixed interval of time.</p> <p>The default values for series are:</p> <ul style="list-style-type: none"> <li>Series 0: Dot, Solid, Red</li> <li>Series 1: Box, Solid, Green</li> <li>Series 2: Triangle, Solid, Blue</li> <li>Series 3: Diamond, Solid, Black</li> <li>Series 4: Star, Solid, Pink</li> <li>Series 5: Cross, Solid, Orange</li> <li>Series 6: Circle, Solid, Gray</li> <li>Series 7: Square, Solid, Light Green</li> <li>Series 8: Vertical Line, Solid, Red</li> <li>Series 9: Horizontal Line, Solid, Green</li> <li>Series 10: Dot, Solid, Blue</li> <li>Series 11: Box, Solid, Black</li> <li>Series 12: Triangle, Solid, Pink</li> <li>Series 13: Diamond, Solid, Orange</li> <li>Series 14: Star, Solid, Gray</li> <li>Series 15: Cross, Solid, Light Green</li> <li>Series 16: Circle, Solid, Red</li> </ul> |
| Symbol Style    | Drop-down list box used to define the symbol associated with a series. To change the symbol for a series, select a new value: Dot, Box, Triangle, Diamond, Star, Vertical Bar, Horizontal Line, Cross, or Circle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Line Style      | Drop-down list box that you use to define the style of line that connects data points in the chart. To change the line style for a series, select a new value: Solid, Long Dash, Long-Short-Long (LSL) Dash, Short Dash, Dash Dot, or None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Color           | Indicates the current color for the series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Change Color    | Opens the Select Series Color dialog box in which you select a color for a series. For more details, see <a href="#">Customizing Colors, page 5-16</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Changing Status Settings

You use the MWTM to customize the sort order for status settings, as well as the color of each status setting.

When you change the sort order or the color of a status setting, most MWTM client windows reflect the new sort order or color immediately. All other windows reflect the new sort order or color at the next poll.

When you change the color of a status, most MWTM client windows reflect the new color immediately. All other windows reflect the new color at the next poll.

To display the Status settings, click **Status** in the left pane of the Preferences window.

The Status pane contains:

| Field or Button   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status Sort Order | <p>Indicates the status setting being defined. The default status sort order and colors are:</p> <ul style="list-style-type: none"> <li>Unknown: Red</li> <li>Unavailable: Red</li> <li>Inactive: Red</li> <li>Failed: Red</li> <li>Down: Red</li> <li>Blocked: Red</li> <li>Pending: Red</li> <li>Warning: Yellow</li> <li>Shutdown: Blue</li> <li>Inhibited: Blue</li> <li>InhibitLoc: Blue</li> <li>InhibitRem: Blue</li> <li>Discovering: Cyan</li> <li>Polling: Cyan</li> <li>Waiting: Gray</li> <li>Unmanaged: Gray</li> <li>Active: Green</li> <li>NotPresent: Gray</li> </ul> |
| Move Up           | Moves the chosen status setting up in the Status Sort Order list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Change Color      | Opens the Select Status Color dialog box in which you select a color for a status. For more details, see <a href="#">Customizing Colors, page 5-16</a> .                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Move Down         | Moves the chosen status setting down in the Status Sort Order list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Reset Order       | Restores the status settings to the default sort order.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Reset Colors      | Restores the status settings to the default colors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Changing CiscoWorks Server Settings

You can configure the CiscoWorks server name and port numbers for all connected MWTM clients:

- During MWTM installation. See the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).
- After installation by running the **mwtm cwsetup** command. See [mwtm cwsetup](#), page B-22.

All clients connected to the MWTM server retain the CiscoWorks settings that were made during installation or the last time you ran the **mwtm cwsetup** command. However, you can overwrite the CiscoWorks settings for a particular client by using the preferences window.

To change the CiscoWorks server settings for a particular client:

**Step 1** From the main window, choose **Edit > Preferences > CiscoWorks**.

**Step 2** Click **CiscoWorks** in the left pane of the Preferences window.

The CiscoWorks server settings contain:

| Check Box or Field                       | Description                                                                                                                   |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| IP Address or DNS Host Name <sup>1</sup> | The IP address or the DNS hostname of the CiscoWorks server.                                                                  |
| Port <sup>1</sup>                        | The access port on the CiscoWorks server. The default setting is 1741.                                                        |
| Secure Port <sup>1</sup>                 | The port number on the CiscoWorks server that is used for secure access, for example, SSL access. The default setting is 443. |
| Secure Connection                        | Indicates if the connection to the CiscoWorks server is secure.                                                               |

1. Changing this setting affects only the MWTM client you are using. All other MWTM clients retain the CiscoWorks settings that were made during installation or the last time you ran the **mwtm cwsetup** command.

**Step 3** From the Preferences window menu bar, choose **File > Save**.

### Note

To do this procedure from the MWTM web interface, see [Changing Web Preference Settings](#), page 5-18.

## Changing Topology Settings

Use the Topology pane in the Preferences window to change default settings for the topology window.

To display the topology settings, select Topology in the left pane of the Preferences window.

The Topology pane contains:

| Check Box or Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spring Layout Spacing Factor (1-10)       | <p>Indicates how far to space nodes when the MWTM draws the Spring Layout topology map. Valid values are 1 through 10, with 1 being closer together and 10 being farther apart. The default spacing factor is 5.</p> <p>Even if you apply preferences and close the Preferences window, the topology map does not show the new spacing factor until you choose <b>Topology Tools &gt; Layout &gt; Spring</b>, or click the <b>Spring Layout</b> button.</p>                                                                                                                                                                                                                                                                                                                    |
| Show Mouse Overs                          | Specifies whether tooltips are enabled in topology maps. Checked is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Draw Connections When Dragging a Node     | <p>Specifies whether the MWTM draws connection lines in the topology map as you move nodes:</p> <ul style="list-style-type: none"> <li>• Check if you want the MWTM to draw the associated connection lines dynamically as you move a node.</li> <li>• Uncheck if you do not want the MWTM to draw the associated connection lines until after you have finished moving a node. Unchecked is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                           |
| Show Small SS7 Icons (ITP only)           | <p>Specifies the size of the SS7 icons in the topology map:</p> <ul style="list-style-type: none"> <li>• Uncheck if you want the MWTM to display large SS7 icons. Unchecked is the default.</li> <li>• Check if you want the MWTM to display small SS7 icons. This setting can save space in the topology map, making it easier to read.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Show Non-ITP Nodes (ITP only)             | <p>Specifies whether the MWTM should display non-ITP nodes and linksets in the topology map:</p> <ul style="list-style-type: none"> <li>• Check if you want the MWTM to display non-ITP nodes and linksets in the topology map. Checked is the default.</li> <li>• Uncheck if you want the MWTM to hide non-ITP nodes and linksets in the topology map. (The navigation tree still shows the hidden signaling points and linksets.)</li> </ul>                                                                                                                                                                                                                                                                                                                                 |
| Show Point Code and Node Name (ITP only)  | <p>Specifies whether the MWTM should display point codes as well as node names in the topology map:</p> <ul style="list-style-type: none"> <li>• Uncheck if you want the MWTM to display point codes but not node names. Unchecked is the default.</li> <li>• Check if you want the MWTM to display both point codes and node names.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| X Performance Enhancer (AntiAliasing Off) | <p>Specifies whether antialiasing is turned on in the topology map. Antialiasing, which is on by default, improves the appearance of the icons and connections in the map.</p> <p>However, antialiasing can impact the performance of the MWTM client on a remote workstation (that is, a Solaris or Linux workstation by using xhost, or a Windows workstation using an X-Window system emulator such as eXceed or Reflection X).</p> <ul style="list-style-type: none"> <li>• Uncheck if you want to turn on antialiasing in the topology map. Unchecked is the default.</li> <li>• Check if you want to turn off antialiasing.</li> </ul> <p>Remember that performance is always better if you access the MWTM by installing the MWTM client on the remote workstation.</p> |

## Changing Deploy Settings

### Note

Deploy settings are only for ITP networks. If you configure the MWTM to manage ITP networks, the deploy settings will appear in the Preferences window. You customize the MWTM to manage ITP networks during installation. You can also do this later by command (see [mwtm manage, page B-44](#)).

Use the Deploy settings to change the way the Deployment Wizard works.

To display the Deploy settings, select Deploy in the left pane of the Preferences window.

The Deploy settings contain:

| Check Box or Field                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Turn On Term Monitor During File Activation                                     | <p>Indicates whether the MWTM should turn on the terminal monitor before activating a route table file or GTT file on the ITP, and turn it off after activation (whether or not the activation was successful).</p> <p>If you turn on the terminal monitor during activation, detailed activation error messages appear in the connection log. These messages can be useful if activation fails. However, all node console logging messages also appear in the connection log; so, many nonactivation messages might also appear.</p> <p>The default is checked.</p>                                                                                                                                                                                                                                                                     |
| Turn Off All Debug Output Before Turning On Term Monitor                        | <p>Indicates whether debug messages should appear in the connection log. The default is checked.</p> <p>If you check the Turn On Term Monitor During File Activation check box, all node console logging messages appear, including all debug messages that are currently enabled on the node.</p> <p>You can then check the Turn Off All Debug Output Before Turning On Term Monitor check box to turn off all debug messages. This setting can reduce the number of nonactivation messages in the connection log. The default is checked.</p> <p><b>Note</b> The MWTM does not turn the debug messages back on after activation. Ensure that other users are not debugging on the node before checking this check box.</p> <p>This check box is dimmed unless you check the Turn On Term Monitor During File Activation check box.</p> |
| Synchronize Active and Standby Storage If Node Is Configured as Redundancy Mode | <p>Cisco 7507, 7513, and 7600 series routers support redundancy, which requires synchronization of the active and all standby storage devices.</p> <p>If you want the MWTM to use a node's <i>configured</i> redundancy mode to determine whether the MWTM should replicate storage operations (such as creating files, uploading, deleting, and so on) among the active and all standby storage devices, click this radio button.</p> <p><b>Note</b> This radio button is mutually exclusive with the Synchronize Active and Standby Storage If Node Is Operating in Redundancy Mode and Do Not Synchronize Active and Standby Storage radio buttons.</p>                                                                                                                                                                               |
| Synchronize Active and Standby Storage If Node Is Operating in Redundancy Mode  | <p>If you want the MWTM to use a node's <i>operating</i> redundancy mode to determine whether the MWTM should replicate storage operations (such as creating files, uploading, deleting, and so on) among the active and all standby storage devices, in the right pane click this radio button. The default is checked.</p> <p><b>Note</b> This radio button is mutually exclusive with the Synchronize Active and Standby Storage If Node Is Configured as Redundancy Mode and Do Not Synchronize Active and Standby Storage radio buttons.</p>                                                                                                                                                                                                                                                                                        |

| Check Box or Field                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Do Not Synchronize Active and Standby Storage                   | <p>If you want the MWTM to perform storage operations only on the active storage device (that is, no automatic synchronization of active and standby storage devices), click this radio button.</p> <p>Clicking this radio button requires you to manually synchronize the active and standby storage devices.</p> <p>This radio button is mutually exclusive with these radio buttons:</p> <ul style="list-style-type: none"> <li>Synchronize Active and Standby Storage If ITP Is Configured as Redundancy Mode</li> <li>Synchronize Active and Standby Storage If ITP Is Operating in Redundancy Mode</li> </ul>                                                                                                                                            |
| Enable Auto Refresh Node Storage In Node File Management Dialog | <p>Indicates whether the Node File Management dialog box should refresh storage device content automatically at user-defined intervals. Clicking this check box enables the Node File Management dialog box to detect any updates made to the file system.</p> <p>In addition, you can configure the node to disconnect idle connection sessions. If you check this check box, the MWTM automatically generates node operations at the user-defined interval, which prevents disconnection of the session by the node.</p> <p>The default is unchecked.</p> <p>To enable the automatic refresh, check this check box, then specify a Refresh Interval. The valid range is 1 seconds to an unlimited number of seconds. The default interval is 60 seconds.</p> |
| Always Overwrite Existing File In Deployment Wizard             | Indicates whether the Deployment Wizard should overwrite an existing file with the same filename automatically, without prompting the user. The default is unchecked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Always Skip Archive Comments                                    | <p>Indicates whether the Deployment Wizard should skip archive comments. The default is unchecked.</p> <p>This check box appears only if deploy comments are set to optional. For details, see <a href="#">mwtm deploycomments</a>, page B-105. If deploy comments are set to required, this check box does not appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Always Activate Deployed File In Deployment Wizard              | Indicates whether the Deployment Wizard should activate the deployed file automatically, without prompting the user. By default, this option is not selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Command Timeout in Seconds                                      | <p>Indicates how long, in seconds, an MWTM client with a session to a node should wait for a response from the node before closing the session.</p> <p>The valid range is 1 second to an unlimited number of seconds. The default is 90 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Customizing Colors

You use the MWTM to customize the colors for these settings:

| Setting                    | Menu Selection                                                                                                                               | Color Dialog        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| Alarm or event severity    | Click <b>Alarms / Events</b> in the left pane of the Preferences window, then click <b>Change Color</b> in the Alarm / Event Colors section. | Select Event Color  |
| Series in real-time charts | Click <b>Charts</b> in the left pane of the Preferences window then click <b>Change Color</b> in the Series Colors section.                  | Select Series Color |
| Status                     | Click <b>Status</b> in the left pane of the Preferences window, select a status setting, then click <b>Change Color</b> .                    | Select Status Color |

The Select Color dialog box contains:

- [Swatches Tab \(Recommended\)](#), page 5-17
- [HSB Tab](#), page 5-17
- [RGB Tab](#), page 5-17
- [Select Color Field and Buttons](#), page 5-18

#### Related Topics

- [Changing Alarm and Event Settings](#), page 5-7

### Swatches Tab (Recommended)

You use the Swatches tab of the Select Color dialog box to select a color from a set of color swatches. This is the recommended method for selecting a color.

To display the Swatches tab, click the **Swatches** tab in the Select Color dialog box.

To select a color, select a swatch. The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

### HSB Tab

You must also choose hue, saturation, and brightness (HSB) variables to select a color.

To display the HSB tab, click the **HSB** tab in the Select Color dialog box.

To select a color, you can either:

- Select a color range on the vertical color bar, then select a specific color by moving the cursor around on the color square.
- Enter specific values in the (hue), S (saturation), and B (brightness) fields.

The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

### RGB Tab

You then select the red, green, and blue (RGB) content of the color.

To display the RGB tab, click the **RGB** tab in the Select Color dialog box.

To select a color, select values for the Red, Green, and Blue fields. The chosen color appears in the Preview field. When you are satisfied with the color, click **OK**.

## Select Color Field and Buttons

The Select Color dialog box contains:

| Field or Button | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preview         | Displays a preview of the current chosen color.<br>Whichever method you choose to select a color, the chosen color appears in the Preview field. When you are satisfied with the color, click <b>OK</b> . |
| OK              | Sets the color as shown in the Preview field, and closes the Color dialog box.                                                                                                                            |
| Cancel          | Closes the Color dialog box without selecting a color.                                                                                                                                                    |
| Reset           | Resets the color to its initial setting.                                                                                                                                                                  |

## Restoring Default Preference Settings

If you decide you do not like your modified preference settings, you can use the MWTM to restore all preference settings to the original system default settings. To do so:

- 
- Step 1** Display the Preferences window, as described in [Changing Client Preference Settings, page 5-2](#).
- Step 2** Select the **File > Load System Default Prefs** menu option.  
The MWTM restores the default settings.
- 

## Changing Web Preference Settings

Access the web preference settings by clicking the Preferences link in the title bar of any web interface window. Web preferences include a subset of the preferences that are available in the client interface.

To change web preferences settings:

- 
- Step 1** Click **Preferences** in the title bar of any MWTM web page.
- Step 2** In the Preferences window, to display the:
- a. General GUI settings, click the **General GUI** tab.
  - b. CiscoWorks server settings, click the **CiscoWorks** tab.
- Step 3** Change the settings you want to modify (see the table following this procedure for descriptions of the settings).
- If you enter a new value in a text field, press **Enter** or **Tab** to activate the change.

### Note

For any user, common preferences between the web and client interfaces are shared. However, if the web and client interfaces are active at the same time, and you exit the client interface, any changes you made to the web preferences are overwritten by the client preferences.

You can now exit the web preferences window.

---

The Web Preferences window contains:

| Check Box, Radio Button, or Field     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Help                                  | Displays online help for the current window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>General GUI tab</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Show DNS or User-Defined Names        | Indicates whether the MWTM should identify nodes by their DNS or user-defined names. The default setting for this radio button is checked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Show IP Address in Name Field         | Indicates whether the MWTM should identify nodes by their IP addresses. The default setting for this radio button is unchecked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Show SysName                          | Indicates whether the MWTM should identify nodes by their System Name. The default setting for this radio button is unchecked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Show Node Domain Names                | If checked, the MWTM shows node domain names in its displays. The default setting for this check box is unchecked (do not show node domain names).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Show Details in Bits instead of Bytes | <p>If checked, the MWTM displays data and data rates in bits instead of bytes:</p> <ul style="list-style-type: none"> <li>Check if you want the MWTM to display data in bits, and data rates in bits per second. This is the default setting.</li> <li>Uncheck if you want the MWTM to display data in bytes, and data rates in bytes per second.</li> </ul>                                                                                                                                                                                                                                                                                      |
| Show Utilization as Percentage        | <p>If checked, the MWTM displays receive and send for linksets and links as a percentage:</p> <ul style="list-style-type: none"> <li>Check if you want the MWTM to display as a percentage. This is the default setting.</li> <li>Uncheck if you want the MWTM to display in Erlangs.</li> </ul>                                                                                                                                                                                                                                                                                                                                                  |
| Show Point Code Mask in Bits          | <p>If checked, the MWTM displays point code masks as a number of bits instead of dotted-decimal format. The MWTM applies this setting to all point code masks in the MWTM client, including those in the Route Table dialog box, in messages, and so on.</p> <ul style="list-style-type: none"> <li>Uncheck if you want the MWTM to display point code masks in dotted-decimal format (octets separated by periods). This is the default setting.</li> <li>Check if you want the MWTM to display point code masks as a number of bits.</li> </ul> <p>For more information about point code masks, see <a href="#">Route Table, page 14-7</a>.</p> |
| Clear Display upon Execution          | Clears the output display each time you execute a command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Fast Poller Interval (secs)           | <p>Default interval, in seconds, for the fast poller. The valid range is 5 seconds to 60 seconds. The default setting is 15 seconds.</p> <p><b>Note</b> You can change the valid range and default setting in the <i>Server.properties</i> file. For more information, see <a href="#">Changing MWTM Server Poller Settings, page 4-2</a>.</p>                                                                                                                                                                                                                                                                                                    |
| Slow Poller Interval (secs)           | <p>Default interval, in seconds, for the slow poller. The valid range is 60 seconds to 300 seconds. The default setting is 60 seconds.</p> <p><b>Note</b> You can change the valid range and default setting in the <i>Server.properties</i> file. For more information, see <a href="#">Changing MWTM Server Poller Settings, page 4-2</a>.</p>                                                                                                                                                                                                                                                                                                  |
| Status Refresh Interval (secs)        | <p>Specifies the default setting for how frequently the MWTM refreshes the web pages on the web interface.</p> <p>The valid range is 180 seconds to 900 seconds. The default setting is 180 seconds. (You can change the valid range and default setting in the <i>Server.properties</i> file. For more information, see <a href="#">Changing MWTM Server Poller Settings, page 4-2</a>.)</p>                                                                                                                                                                                                                                                     |
| <b>CiscoWorks tab<sup>1</sup></b>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Check Box, Radio Button, or Field | Description                                                                                                                   |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| IP Address or DNS Host Name       | The IP address or the DNS hostname of the CiscoWorks server.                                                                  |
| Port                              | The access port on the CiscoWorks server. The default setting is 1741.                                                        |
| Secure Port                       | The port number on the CiscoWorks server that is used for secure access, for example, SSL access. The default setting is 443. |
| Secure Connection                 | Indicates if the connection to the CiscoWorks server is secure.                                                               |

1. Changing these settings affects only the MWTM client you are using. All other MWTM clients retain the CiscoWorks settings that were made during installation or the last time you ran the `mwtm cwsetup` command.

## Changing Real-Time Poller and Counter Settings

The MWTM provides three pollers for use in the MWTM client GUI and web pages: a fast, a slow, and a status refresh. You use the MWTM to change settings for those pollers, and also to specify how you want to aggregate the visible counter values.

To change the MWTM poller refresh and counter display settings, use one of these methods:

- The *Server.properties* file specifies minimum, maximum, and default settings for the fast, slow, and status refresh pollers. To change those settings, see [Changing MWTM Server Poller Settings, page 4-2](#).
- To change the MWTM poller refresh and counter display settings for the GUI in the MWTM Preferences window, see [Poller Settings, page 5-5](#).
- To change the MWTM poller refresh and counter display settings for the MWTM web pages by using the MWTM Web Preferences web page, see [PDSN Reports, page 13-137](#).
- To change the MWTM counter display settings for the GUI from any Real-Time Data and Charts window in the GUI, click **Reset Counters** in any of these MWTM windows:
  - Poll Settings dialog box in any network object's MWTM Details window
  - Node Details: MTP3 Errors table
  - Signaling Point Details: GTT MAP Status table
  - Signaling Point Details: GTT Statistics table
  - Signaling Point Details: MLR Details table
  - Linkset: Statistics table
  - Link: Statistics tab and SCTP Assoc. Config Stats table
  - Interface: Interface Performance tab and Interface Errors table
  - SGMP: SCTP Assoc. Stats Details table

The MWTM displays the MWTM Reset Counters dialog box

The MWTM Reset Counters dialog box contains:

| Field or Button               | Description                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Show Counters Since Reboot    | Click to configure the MWTM client to clear all counters in MWTM web pages whenever the node reboots. The default is checked. |
| Show Counters Since Last Poll | Click to configure the MWTM client to clear all counters whenever an MWTM web page is polled. The default is unchecked.       |

| Field or Button                | Description                                                                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show Counters Since User Reset | Click to configure the MWTM client to clear all MWTM counters whenever the user resets the counters on an MWTM web page. The default setting for this radio button is unchecked. |
| Submit                         | Applies any changes you made to the counter settings, reflects the changes throughout the MWTM GUI, and closes the MWTM Reset Counters dialog box.                               |
| Cancel                         | Closes the MWTM Reset Counters dialog box.                                                                                                                                       |
| Help                           | Displays online help for the current window.                                                                                                                                     |

## Viewing Online Help

You can view web-based online help from either the MWTM client or the MWTM web interface. From the MWTM client, select the menu options described in the following table:

| Content                                                                | In the MWTM client, choose: |
|------------------------------------------------------------------------|-----------------------------|
| Table of contents                                                      | <b>Help &gt; Topics</b>     |
| Context-sensitive online help for the current window                   | <b>Help &gt; Window</b>     |
| MWTM information (build date, version, SSL support, copyright content) | <b>Help &gt; About</b>      |

From the MWTM web interface, click **Help**.

The MWTM online help is searchable and supports bookmarking of favorite topics:

| Feature   | In the MWTM web interface, choose:                                                   |
|-----------|--------------------------------------------------------------------------------------|
| Search    |  |
| Favorites |  |

# Finding Information in a Window

Sometimes, finding information, such as a node name or event text, in a long list can be difficult. You can use the MWTM client to search for a specific character string in windows that contain lots of information.

## Note

To find a specific object in the topology window, see [Finding an Object, page 10-14](#).

To find a character string, choose **Edit > Find** from the MWTM main menu. This menu option is available when you select from the navigation tree:

- Active Alarms
- Event History
- Any object under Summary Lists

The MWTM displays the Find dialog box.

## Note

The Find dialog box also appears when you choose **File > Find** from the Route Table Editor dialog box ([Chapter 14, “Editing an ITP Route Table File”](#)).

The Find dialog box contains:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| What            | Character string for which the MWTM should search in the window. This can be any character string: all or part of a node name, event text, status, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Match Case      | Check box used to indicate whether the MWTM should search for only character strings that match the case of the text in the What field. To search with: <ul style="list-style-type: none"> <li>• Case-matching on, select this check box.</li> <li>• Case-matching off, clear this check box. This is the default setting.</li> </ul>                                                                                                                                                                                                                                                |
| Search Forward  | Indicates whether the MWTM should search forward (down and to the right) in the window. This radio button is mutually exclusive with the Search Backward button. The default is checked.                                                                                                                                                                                                                                                                                                                                                                                             |
| Search Backward | Indicates whether the MWTM should search backward (up and to the left) in the window. This radio button is mutually exclusive with the Search Forward button. The default is unchecked.                                                                                                                                                                                                                                                                                                                                                                                              |
| Find            | Launches the search. If: <ul style="list-style-type: none"> <li>• It finds a matching character string in the window, the MWTM highlights the first line that contains the string.<br/>To find the next occurrence of the string, click <b>Find</b> again.<br/>You can continue to click Find until you find no more matches in the window. At that time, the MWTM displays an appropriate message in the dialog box, such as:<br/>Bottom of table reached.</li> <li>• No matching character string is found, the MWTM displays an appropriate message in the dialog box.</li> </ul> |
| Close           | Closes the Find dialog box when you finish searching.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# Navigating Table Columns

You can resize, sort, or hide the columns in some tables in the MWTM to meet your specific needs. The MWTM client automatically saves your new settings and, thereafter, launches the client with the new settings.

## Note

Hiding table columns is possible in the MWTM client and web interfaces. Resizing table columns is possible only in the client interface. In the web interface, you can search for specific information and page through long tables by using its search and paging features (see [MWTM Web Interface Content Area, page 11-5](#)).

- To view a tooltip for each column in the table, place the cursor over a column heading. If a cell is too small to show all of its text, place the cursor over the cell to see the full text of the tooltip.
- To make a column wider or narrower in the MWTM client interface, click the column divider in the heading and move the divider to the right or left while holding down the left or right mouse button.

All Components or Recent Events tables in the MWTM main window reflect changes that you make to any object's Components or Recent events table. The Show in New window or Real-Time Data and Charts windows do not reflect the changes, however.

Depending on your system, as well as other factors, MWTM windows can sometimes appear so small that text is illegible, and columns and text entry fields too narrow to be usable. If this happens, resize the window and widen the individual columns until the information is again legible and the columns and text entry fields are usable.

- By default, the MWTM displays most of the columns in tables, but some columns may be hidden. To:
  - Display hidden columns, right-click in the table heading and select the check boxes for the columns you want to display. If you are using the web interface, click the **Apply** button.
  - Hide columns, right-click in the table heading and clear the check boxes for the columns you want to hide. If you are using the web interface, click the **Apply** button.

All Components or Recent Events tables in the MWTM main window reflect changes that you make to any object's Components or Recent events table. The Show in New window or Real-Time Data and Charts windows do not reflect the changes, however.

- To sort a table based on the data in a column, left-click in the column heading. The MWTM alpha-numerically sorts the table from top to bottom, based on the data in the chosen column. To sort the table in reverse order, left-click in the column heading a second time. If two entries in the chosen column are identical, the MWTM sorts those rows based on the data in the remaining table columns, moving left to right.
- The tables in the web interface display an icon in the column heading to indicate the column on which the table is sorted, and the direction of the sort. The icon displays a triangle (▲) if the sort order is ascending (1-9, A-Z), and an inverted triangle (▼) if the sort order is descending (Z-A, 9-1).
- If you sort a table in the web interface based on the Nodes column, the MWTM sorts the table based on the DNS names of the nodes, as the MWTM discovers nodes. However, if you modified your preferences to identify nodes by their user-defined names, then the MWTM sorts the table based on the user-defined names of the nodes. For more information, see [Node Name Settings, page 5-5](#).
- To customize the sort order for status settings in the Status column of tables, use the Status settings section of the Preferences window. For more information, see [Changing Status Settings, page 5-11](#).

- (ITP only) To sort a route table, click **Sort Table**. The MWTM sorts the entries in the route table field-by-field, beginning with Dest. Point Code, then Mask, Cost, Dest.Linkset, and finally QoS.

## Printing Windows

You can print most MWTM windows, as well as the topology map, for those times when you need hardcopy.

To print an MWTM window, choose **File > Print** from most MWTM windows (for example, the MWTM main window or topology window).

The MWTM displays the Print dialog box.

You use the Print dialog box to specify print settings, such as which printer to print to, whether to send output to a file (the default location for the print file is your home directory), and whether to print duplex.

### Note

You can send output to a file only in the file formats that your printer drivers support. Sending output to files can result in large file sizes that you will need to monitor and manage.

When you are satisfied with your print settings, click **Print**. The MWTM prints the window or map.

To exit the Print dialog box at any time without printing, click **Cancel**.

## Managing and Deploying ITP Files

You use the MWTM to manage GTT files, route table files, and MLR address table files. The MWTM provides a Node File Management dialog box and a Node Archive Management dialog box:

- [Node File Management, page 5-24](#)
- [Node Archive Management, page 5-31](#)
- [Deploying ITP Files, page 5-33](#)

## Node File Management

You use the Node File Management dialog box to:

- View:
  - GTT files
  - Route table files
  - MLR address table files
- Check these files for semantics and syntax
- Delete, rename, and upload the files to a remote node
- Activate the files

The Node File Management dialog box can handle GTT and route table files up to 512 KB in size (the maximum size supported by the MWTM and ITP) and up to 100,000 MLR address table entries.

To launch the Node File Management dialog box, choose **Network > Node File Management** from the MWTM main menu. The MWTM displays the Node File Management dialog box.

**Note**

If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.

The Node File Management dialog box contains:

- [Node File Management Menu, page 5-25](#)
- [Node File Management MWTM Pane, page 5-28](#)
- [Node File Management Node Pane, page 5-29](#)

## Node File Management Menu

The menu on the Node File Management dialog box contains:

| Command                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Connect<br>(Ctrl-N)    | <p>Opens the Pick Node dialog box in which you select a node and connect to that remote node.</p> <p><b>Note</b> The remote node might be configured to disconnect idle sessions. To prevent disconnection of sessions by the node, enable the MWTM to refresh storage device content automatically by selecting the <b>Enable Auto Refresh Node Storage In Node File Management Dialog</b> check box in the Deploy settings section of the Preferences window, then specify a Refresh Interval. For more information, see <a href="#">Changing Deploy Settings, page 5-15</a>.</p> <p>To avoid entering username and password information each time, you can set up credentials (see <a href="#">Configuring Login Credentials, page 4-20</a>).</p> |
| File > Disconnect<br>(Ctrl-D) | <p>Disconnects from the node.</p> <p>This option is dimmed if you are not connected to a remote node.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| File > Close<br>(Ctrl-W)      | Closes the Node File Management dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Local > Open File             | Opens the chosen route table file in the Route Table dialog box or the GTT file in the GTT Editor window or the MLR address table file in the Address Table Editor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Local > Check File            | Checks the semantics and syntax of the chosen file on the MWTM client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Local > Cut                   | Cuts the chosen local file from the MWTM client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Local > Copy                  | Copies the chosen local file from the MWTM client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Local > Paste                 | Pastes a cut or copied local file into the MWTM client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Local > Delete                | <p>Deletes the chosen file from the MWTM client.</p> <p><b>Note</b> If you try to delete a file, and you do not have permission to delete the file, the MWTM issues an appropriate error message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Local > Rename                | <p>Renames the chosen file on the MWTM client.</p> <p>You can use any letters, numbers, or characters in the new name that your operating system allows. However, if you include any spaces in the new name, the MWTM converts those spaces to dashes. For example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Local > Refresh          | <p>Refreshes the list of files in the MWTM pane.</p> <p>If you have added or modified route table files, GTT files, or MLR files on the MWTM client since you launched the Node File Management dialog box, the MWTM pane reflects those changes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Local > Go Up            | <p>Displays the subdirectories and files that are in the directory that is up one level from the currently visible directory on the MWTM client.</p> <p>This option is dimmed if this is the highest directory level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Local > Create Directory | Creates a new subdirectory in the directory that the MWTM client currently is displaying.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Remote > Activate        | <p>Activates the chosen route table file, GTT file, or MLR file on the remote node. That is, the MWTM replaces the currently running route table file, GTT file, or MLR file on the remote node with the chosen file.</p> <p><b>Note</b> You cannot activate the <i>MWTM-LAST-ACTIVE-filename.rou</i>, <i>MWTM-LAST-ACTIVE_filename.gtt</i>, <i>MWTM-LAST-ACTIVE-filename.mlr</i>, or <i>MWTM-LAST-ACTIVE-filename.sms</i> files. These are backup files. If you need to revert to one of these files, copy it, rename it, and upload and activate the renamed file on the remote node.</p> <p>This option is dimmed if you are not connected to a remote node.</p>                                                                                                                                                                                                                        |
| Remote > Cut             | Cuts the chosen remote file from the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Remote > Copy            | Copies the chosen remote file from the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Remote > Paste           | Pastes a cut or copied remote file into the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Remote > Delete          | <p>Deletes the chosen file from the remote node.</p> <p>If you try to delete a file, and you do not have permission to delete the file, the MWTM issues an appropriate error message.</p> <p>Some Cisco routers support redundancy, which requires synchronization of the active and all standby storage devices. If you delete a file in the node pane from an active storage device, and you then try to undelete the file before the standby storage devices have been synchronized, the file will have different IDs on the active and standby storage devices. If this occurs, the MWTM issues this error message and cancels the undelete:</p> <p>Invalid ID</p> <p>You must then undelete the file on the standby storage devices.</p> <p>This synchronization problem does not occur in the MWTM pane.</p> <p>This option is dimmed if you are not connected to a remote node.</p> |
| Remote > Rename          | <p>Renames the chosen file on the remote node.</p> <p><b>Note</b> You can rename files on the remote node for only Class C devices on the disk drives.</p> <p>You can use any letters, numbers, or characters in the new name that your operating system allows. However, if you include any spaces in the new name, the MWTM converts those spaces to dashes. For example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i>.</p> <p>This option is dimmed if you are not connected to a remote node.</p>                                                                                                                                                                                                                                                                                                                                                                                  |
| Remote > Undelete        | <p>Recovers the chosen file on the remote node.</p> <p>This option is dimmed if you are not connected to a remote node.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Command                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote > Refresh          | <p>Refreshes the list of files in the node pane.</p> <p>If route table files, GTT files, or MLR files have been added or modified on the remote node since you launched the Node File Management dialog box, those changes appear in the node pane.</p> <p>This option is dimmed if you are not connected to a remote node.</p>                                                                                                                                                             |
| Remote > Go Up            | <p>Displays the subdirectories and files that are in the directory that is up one level from the directory that is currently visible on the remote node.</p> <p>This option is dimmed if this is the highest directory level or if you are not connected to a remote node.</p>                                                                                                                                                                                                              |
| Remote > Create Directory | <p>Creates a new subdirectory in the directory that the remote node currently is displaying.</p> <p><b>Note</b> You can create folders on the remote node for only Class C devices on the disk drives.</p> <p>This option is dimmed if you are not connected to a remote node.</p>                                                                                                                                                                                                          |
| Remote > Squeeze Node     | <p>Optimizes Flash memory on the remote node so that the space used by the files marked as <i>deleted</i> or <i>error</i> can be reclaimed. For more information, see the description of the <b>squeeze</b> command in the Cisco IOS Release 12.2 <i>Configuration Fundamentals Command Reference</i>.</p> <p><b>Note</b> After performing the squeeze process you cannot recover deleted files using Undelete.</p> <p>This option is dimmed if you are not connected to a remote node.</p> |

| Help > About (F3)         | Displays build date, version, SSL support, and copyright information about the MWTM application.                                                                                                                                                                                                                                                                                                                                                                                            |

## Node File Management MWTM Pane

The MWTM pane on the left side of the Node File Management dialog box displays all of the files that the MWTM currently defines on the MWTM client. To populate the MWTM pane with all of the:

- Route table files currently defined on the MWTM client, select **Route Tables** from the drop-down list box.
- GTT files currently defined on the MWTM client, select **GTT Files** from the drop-down list box.
- MLR address table files currently defined on the MWTM client, select **MLR Address Tables** from the drop-down list box.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM sorts this table by Name, and displays all of the columns in the MWTM pane.

See [Navigating Table Columns, page 5-23](#) for more information about resizing, sorting, displaying, or hiding columns.

The MWTM pane contains:

| Column   | Description                                                 |
|----------|-------------------------------------------------------------|
| Type     | Indicates whether the chosen name is a directory or a file. |
| Name     | Name of the route table, GTT, or MLR file.                  |
| Size     | Size of the file in bytes.                                  |
| Modified | Date and time the file was last modified.                   |

The MWTM pane provides these right-click menu options for files:

| Command    | Description                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Open File  | Opens the chosen route table file in the Route Table dialog box or the chosen GTT file in the GTT Editor window or the chosen MLR address table file in the Address Table Editor window.                                                                                                                            |
| Check File | Checks the semantics and syntax of the chosen file on the MWTM client.                                                                                                                                                                                                                                              |
| Cut        | Cuts the chosen file from the MWTM client.                                                                                                                                                                                                                                                                          |
| Copy       | Copies the chosen file from the MWTM client.                                                                                                                                                                                                                                                                        |
| Paste      | Pastes a cut or copied file into the MWTM client.                                                                                                                                                                                                                                                                   |
| Delete     | Deletes the chosen file from the MWTM client.<br><br><b>Note</b> If you try to delete a file, and you do not have permission to delete the file, the MWTM issues an appropriate error message.                                                                                                                      |
| Rename     | Renames the chosen file on the MWTM client.<br><br>You can use any letters, numbers, or characters in the new name that your operating system allows. However, if you include any spaces in the new name, the MWTM converts those spaces to dashes. For example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i> . |
| Refresh    | Refreshes the list of files in the MWTM pane.<br><br>If you have added or modified route table, GTT, or MLR files on the MWTM client since you launched the Node File Management dialog box, the MWTM pane reflects those changes.                                                                                  |

| Command          | Description                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Go Up            | Displays the subdirectories and files that are in the directory that is up one level from the currently visible directory on the MWTM client.<br>This option is dimmed if this is the highest directory level.                                                        |
| Create Directory | Creates a new subdirectory in the currently visible directory on the MWTM client.                                                                                                                                                                                     |
| Upload           | Uploads the chosen file from the MWTM client to the remote node.<br>You can also upload a file by selecting it in the MWTM pane and clicking the arrow pointing to the node pane.<br>This option, and the arrow, is dimmed if you are not connected to a remote node. |

## Node File Management Node Pane

The node pane on the right side of the Node File Management dialog box displays all of the files that the MWTM currently defines on the remote node. To populate the node pane with all of the:

- Route table files currently defined on the remote node, select **Route Tables** from the drop-down list box.
- GTT files currently defined on the remote node, select **GTT Files** from the drop-down list box.
- MLR address table files currently defined on the remote node, select **MLR Address Tables** from the drop-down list box.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM sorts this table by Name, and displays all of the columns in the node pane.

See [Navigating Table Columns, page 5-23](#) for more information about resizing, sorting, displaying, or hiding columns.

The node pane contains:

| Column   | Description                                                 |
|----------|-------------------------------------------------------------|
| Type     | Indicates whether the chosen name is a directory or a file. |
| Name     | Name of the route table, GTT, or MLR file.                  |
| Size     | Size of the file in bytes.                                  |
| Modified | Date and time the file was last modified.                   |

The node pane provides these right-click menu options for files:

| Right-click Option | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Activate           | Activates the chosen route table file, GTT file, or MLR file on the remote node. That is, the MWTM replaces the currently running route table file, GTT file, or MLR file on the remote node with the chosen file.<br><br><b>Note</b> You cannot activate the <i>MWTM-LAST-ACTIVE-filename.rou</i> , <i>MWTM-LAST-ACTIVE_filename.gtt</i> , <i>MWTM-LAST-ACTIVE-filename.mlr</i> , or <i>MWTM-LAST-ACTIVE-filename.sms</i> files. These are backup files. If you need to revert to one of these files, copy it, rename it, and upload and activate the renamed file on the remote node.<br><br>This option is dimmed if you are not connected to a remote node. |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cut              | Cuts the chosen file from the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Copy             | Copies the chosen file from the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Paste            | Pastes a cut or copied file into the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Delete           | <p>Deletes the chosen file from the remote node.</p> <p>If you try to delete a file, and you do not have permission to delete the file, the MWTM issues an appropriate error message.</p> <p>Some Cisco routers support redundancy, which requires synchronization of the active and all standby storage devices. If you delete a file in the node pane from an active storage device, and you then try to undelete the file before the standby storage devices have been synchronized, the file will have different IDs on the active and standby storage devices. If this occurs, the MWTM issues the following error message and cancels the undelete:</p> <p>Invalid ID</p> <p>You must then undelete the file on the standby storage devices.</p> <p>This synchronization problem does not occur in the MWTM pane.</p> |
| Rename           | <p>Renames the chosen file on the remote node.</p> <p><b>Note</b> You can rename files on the remote node for only Class C devices on the disk drives.</p> <p>You can use any letters, numbers, or characters in the new name that your operating system allows. However, if you include any spaces in the new name, the MWTM converts those spaces to dashes. For example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| Undelete         | Recovers the chosen file on the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Refresh          | <p>Refreshes the list of files in the node pane.</p> <p>If route table files, GTT files, or MLR files have been added or modified on the remote node since you launched the Node File Management dialog box, those changes appear in the node pane.</p> <p>This option is dimmed if you are not connected to a remote ITP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Go Up            | <p>Displays the subdirectories and files that are in the directory that is up one level from the currently visible directory on the remote node.</p> <p>This option is dimmed if this is the highest directory level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Create Directory | <p>Creates a new subdirectory in the currently visible directory on the remote node.</p> <p><b>Note</b> You can create folders on the remote node for only Class C devices on the disk drives.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Squeeze Node     | <p>Optimizes Flash memory on the remote node so that the space used by the files marked as <i>deleted</i> or <i>error</i> can be reclaimed. For more information, see the description of the <b>squeeze</b> command in the Cisco IOS Release 12.2 <i>Configuration Fundamentals Command Reference</i>.</p> <p><b>Note</b> After performing the squeeze process you cannot recover deleted files using Undelete.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |
| Format Node      | Formats the Flash memory file system on the remote node. For more information, see the description of the <b>format</b> command in the Cisco IOS Release 12.2 <i>Configuration Fundamentals Command Reference</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Download         | <p>Downloads the chosen file from the remote node to the MWTM client.</p> <p>You can also download a file by selecting it in the node pane and clicking the arrow pointing to the MWTM pane.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Node Archive Management

You use the Archive Management dialog box to view the contents of the archive, open a version with its corresponding editor, and delete all versions of a file.

To launch the Archive Management dialog box, choose **Edit > Node Archive Management** from the MWTM main menu. The MWTM displays the Archive Management dialog box.

### Note

If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.

The Archive Management dialog box contains:

- [Node Archive Management Menu, page 5-31](#)
- [Node Archive Management Selector Pane, page 5-31](#)
- [Node Archive Management Display Pane, page 5-32](#)

## Node Archive Management Menu

The menu on the Archive Management dialog box contains:

| Command                  | Description                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Open File         | Opens the chosen route table file in the Route Table dialog box or the chosen GTT file in the GTT Editor window or the chosen MLR address table file in the Address Table Editor window.                   |
| File > Delete            | Deletes all versions of the chosen file from the MWTM client.<br><b>Note</b> If you try to delete a file, and you do not have permission to delete the file, the MWTM issues an appropriate error message. |
| File > Refresh           | Updates data for the currently visible entries.                                                                                                                                                            |
| File > Close (Ctrl-W)    | Closes the Archive Management dialog box.                                                                                                                                                                  |
| Help > Topics (F1)       | Displays the table of contents for the MWTM online help.                                                                                                                                                   |
| Help > Window (Shift-F1) | Displays online help for the current window.                                                                                                                                                               |
| Help > About (F3)        | Displays build date, version, SSL support, and copyright information about the MWTM application.                                                                                                           |

## Node Archive Management Selector Pane

The selector pane on the left side of the Archive Management dialog box displays all of the files that the MWTM currently defines on the MWTM client. To populate the selector pane with all of the:

- Route table files currently defined on the MWTM client, select **Route Tables** from the drop-down list box.
- GTT files currently defined on the MWTM client, select **GTT Files** from the drop-down list box.
- MLR address table files currently defined on the MWTM client, select **MLR Address Tables** from the drop-down list box.

To see the tooltip for each button in the selector pane, place the cursor over the button.

The selector pane contains:

| Button or Object      | Description                                                                                                                                                                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Open File for Editing | Opens the chosen route table file in the Route Table dialog box or the chosen GTT file in the GTT Editor window or the chosen MLR address table file in the Address Table Editor window.                                                                                                           |
| Delete                | Deletes all versions of the chosen file from the MWTM client.<br><b>Note</b> If you try to delete a file, and you do not have permission to delete the file, the MWTM issues an appropriate error message.                                                                                         |
| Refresh               | Updates data for the currently visible files.                                                                                                                                                                                                                                                      |
| Nodes                 | To see the nodes, signaling points, and archived files associated with a specific node, click the turner  beside the node or signaling point. Clicking on an archived file displays the file in the right pane. |
| Signaling Points      | To see the signaling points and archived files associated with a specific signaling point, click the turner  beside the signaling point. Clicking on an archived file displays the file in the right pane.        |

The selector pane provides these right-click menu options for files:

| Command   | Description                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Open File | Opens the chosen route table file in the Route Table dialog box or the chosen GTT file in the GTT Editor window or the chosen MLR address table file in the Address Table Editor window.                   |
| Delete    | Deletes all versions of the chosen file from the MWTM client.<br><b>Note</b> If you try to delete a file, and you do not have permission to delete the file, the MWTM issues an appropriate error message. |

## Node Archive Management Display Pane

The Archive Management pane displays all of the versions that currently exist on the chosen file in a table. To navigate to a chosen file, click the turner  beside Nodes or Signaling Points in the selector pane (in the left pane), and click on the file. All versions appear in the right pane.

If a cell is too small to show all of its comments, place the cursor over the cell to see the full text in a tooltip.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM sorts this table by Rev and displays all of the columns in the display pane.

See [Navigating Table Columns, page 5-23](#) for more information about resizing, sorting, displaying, or hiding columns.

The display pane contains:

| Column or Button | Description        |
|------------------|--------------------|
| Rev              | Revision number.   |
| Date             | Date of archival.  |
| Comments         | Archival comments. |

| Column or Button  | Description                                                                            |
|-------------------|----------------------------------------------------------------------------------------|
| Author            | User or client hostname or IP address from which the deployment or archiving occurred. |
| Adjust row height | You can adjust the row height to make comments readable.                               |

The display pane provides this right-click menu option for files:

| Command   | Description                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Open File | Opens the chosen route table file in the Route Table dialog box or the chosen GTT file in the GTT Editor window or the chosen MLR address table file in the Address Table Editor window. |

## Deploying ITP Files

### Tip

Before you can use the Deployment Wizard, you must set up TFTP (for details, see [Setting Up TFTP on Your Server \(ITP Only\)](#), page 4-12).

You use the Deployment Wizard to validate a route table file, GTT file, or MLR address table file, upload it to an ITP, archive the file, and activate it on the ITP. The Deployment Wizard can handle route table and GTT files up to 512 KB in size (the maximum size the MWTM and ITP support) and up to 100,000 MLR address table entries.

To launch the Deployment Wizard, choose **File > Deploy** from the route table menu, GTT menu, or Address Table Editor menu. The MWTM displays the Deployment Wizard for the currently visible file.

The left pane of the Deployment Wizard contains:

| Step           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select File    | Indicates that the file is chosen for deployment. The name of the file to deploy appears in the Deployment Wizard title bar.                                                                                                                                                                                                                                                                                                                                                             |
| Select Node/SP | <p>If you are deploying a GTT file or address table file, you use this option to select the signaling point to deploy the file. You can optionally check the Filter by Node check box, which limits signaling point selection to a specific node.</p> <p>Select a signaling point and node (optional) from the drop-down list boxes in the right pane, then click <b>Next &gt;</b>.</p> <p>If you are deploying a route table file, the MWTM proceeds directly to the Validate step.</p> |
| Validate       | Validates the file for deployment. Validation messages and error messages, if any, appear in the right pane.                                                                                                                                                                                                                                                                                                                                                                             |
| Login          | <p>You can log in to the signaling point. If required, enter the:</p> <ul style="list-style-type: none"> <li>• Login username, if required.</li> <li>• Login password, if required.</li> <li>• Enable username, if required.</li> <li>• Enable password, if required.</li> </ul> <p><b>Note</b> To avoid entering username and password information each time, you can set up credentials (see <a href="#">Configuring Login Credentials</a>, page 4-20).</p>                            |

| Step     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Upload   | <p>Uploads the file to the signaling point.</p> <p>If the file uploads with no errors, the MWTM proceeds to the Activate step.</p> <p>If the specified file already exists on the ITP, the MWTM displays the name of the duplicate file and the Overwrite and Always Overwrite check boxes. Check the:</p> <ul style="list-style-type: none"> <li>• <b>Overwrite</b> check box to overwrite the file on the ITP with the file being deployed. This is the default setting.</li> <li>• <b>Always Overwrite</b> check box if you want the MWTM to always overwrite the file on the ITP with the file being deployed, without prompting you for confirmation. The default setting for this check box is unchecked (prompt for confirmation).</li> </ul> <p>If you have set your preferences so that the MWTM client identifies nodes by their DNS names (the default setting) instead of by their IP addresses, then the ITP must be able to resolve the DNS names. Otherwise, the MWTM issues an appropriate error message and does not deploy the file.</p> <p>To enable the ITP to resolve DNS names, enter the <b>ip domain-lookup</b> command on the ITP. For more information about this command, see the <i>Cisco IOS IP Command Reference, Volume 1 of 4: Addressing and Services</i>, Release 12.3 or later.</p> <p>For more information about the Show DNS or User-Defined Names and Show IP Address in Name Field preference settings, see <a href="#">Node Name Settings, page 5-5</a>.</p> |
| Archive  | <p>You use to enter archive comments, if required. If archive comments are not required, the MWTM displays the Always Skip Archive Comments check box.</p> <p>For details on setting archive comments to required or optional, see <a href="#">mwtm deployarchive, page B-104</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Activate | <p>Activates the file on the signaling point (replaces the currently running route table file, GTT file, or address table file with the deployed file).</p> <p>The MWTM displays the Activate File and Always Activate File check boxes. You can:</p> <ul style="list-style-type: none"> <li>• Check the <b>Activate File</b> check box to activate the deployed file on the ITP. This is the default setting.</li> <li>• Uncheck the <b>Activate File</b> check box if you do not want to activate the deployed file on the ITP yet.</li> <li>• Check the <b>Always Activate File</b> check box if you want the MWTM to always activate the deployed file on the ITP, without prompting you for confirmation. The default setting for this check box is unchecked (prompt for confirmation).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Done     | Displays any status messages, such as errors or successful completion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

The bottom line of the Deployment Wizard contains:

| Field or Button   | Description                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Progress Bar      | Indicates that the MWTM is validating or uploading the file.                                                                                                  |
| Show Log/Hide Log | Displays or hides the log file for the Deployment Wizard.                                                                                                     |
| Next >            | Advances to the next step in the Deployment Wizard.                                                                                                           |
| Finish            | Closes the Deployment Wizard. The <b>Finish</b> button appears when deployment ends successfully, or when the MWTM encounters errors and cancels the process. |
| Cancel            | Closes the Deployment Wizard without deploying the file.                                                                                                      |
| Help              | Displays online help for the Deployment Wizard.                                                                                                               |

# Exporting Data

You use the MWTM to export its data for use by other products, such as CiscoWorks or Microsoft Excel. This section includes:

- [Exporting Current Data for Network Objects, page 5-35](#)
- [Exporting Current Node Names and SNMP Community Names, page 5-36](#)

## Exporting Current Data for Network Objects

You can use the MWTM CLI to export all MWTM data, or to export only chosen MWTM data.

To export all current MWTM data, with fields separated by vertical bars (|; this is the default setting), enter the **mwtm export all** command with the **-d bar** keywords:

**mwtm export all -d bar**

To export all MWTM data with fields separated by commas (,), specify the **-d comma** keywords:

**mwtm export all -d comma**

To export all MWTM data with fields separated by tabs, specify the **-d tab** keywords:

**mwtm export all -d tab**

To export only object-specific MWTM data, specify one of these keywords:

- **as**—(ITP only) Export only application server data.
- **asp**—(ITP only) Export only application server process data.
- **aspa**—(ITP only) Export only application server process association data.
- **links**—(ITP only) Export only link data.
- **linksets**—(ITP only) Export only linkset data.
- **nodes**—Export only node data.
- **sgmp**—(ITP only) Export only signaling gateway-mated pair data.
- **sps**—(ITP only) Export only signaling point data.

You can also specify the **-d comma** or **-d tab** keywords on any of these object-specific **mwtm export** commands.

Here is sample output for the **mwtm export nodes** command:

```
./mwtm export nodes
v6.1.0.15
t1168093931311|Sat Jan 06 09:32:11 EST 2009
#
Total 2 nodes

```

For more information about the use of the **mwtm export** command, see [mwtm export](#), page B-32.

## Exporting Current Node Names and SNMP Community Names

To export current MWTM node names and read and write SNMP community names, in CiscoWorks import format, with fields separated by commas (,), specify the **cw** keyword:

### **mwtm export cw**

You can export this data to a file, then use the file to import the nodes into the CiscoWorks database.

For more information about the use of the **mwtm export cw** command, see [mwtm export cw](#), page B-33.

## Integrating the MWTM with Other Products

The MWTM does not require CiscoWorks or the Cisco Info Center (CIC), but the MWTM does integrate with those products to provide added value. See these sections for more information:

- [Integrating the MWTM with CiscoWorks](#), page 5-36
- [Forwarding Traps to Other Hosts \(Server Only\)](#), page 5-38

## Integrating the MWTM with CiscoWorks

The MWTM can integrate with CiscoWorks during installation, registering with CiscoWorks as an installed application. In this scenario, CiscoWorks and MWTM are running on the same server. See the “Installing the MWTM on Solaris” and “Installing the MWTM on Windows” chapters of the [Installation Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#) for more information.

You can also integrate the MWTM with CiscoWorks after installation by using:

- Preference settings. See [Changing CiscoWorks Server Settings](#), page 5-13.
- The **mwtm cwsetup** command. See [mwtm cwsetup](#), page B-22, for more information.

### Note

If you are using CiscoWorks with the MWTM, do *not* install the CiscoWorks Device Fault Manager or CiscoWorks Campus Manager applications. These applications are not needed in service provider mobile wireless networks and cause contention for key ports (for example, the default SNMP trap port 162) in addition to consuming valuable CPU and memory resources on the server.

To uninstall the CiscoWorks Device Fault Manager and CiscoWorks Campus Manager applications, use the following commands:

```
/opt/CSCOpX/bin/uninstall.sh
```

then specify to uninstall the following applications:

- Campus Manager 5.1

- Device Fault Manager 3.1

Once you have integrated the MWTM with CiscoWorks, you can:

- [Launch CiscoWorks Applications from the MWTM Client, page 5-37](#)
- [Launch Integrated Applications from the MWTM Web Interface, page 5-38](#)
- [Launch the MWTM Web Interface from the CiscoWorks Dashboard, page 5-38](#)

## Launch CiscoWorks Applications from the MWTM Client

When you integrate the MWTM with CiscoWorks, you can launch, from the MWTM client **Launch** menu, the:

- CiscoView
- CiscoWorks LMS Portal
- CiscoWorks Device Center

To launch CiscoWorks applications from the MWTM client:

**Step 1** Ensure that CiscoWorks is installed in the network.

**Step 2** To launch the appropriate CiscoWorks application:

| CiscoWorks Application | Description                                                                                                                                                                                                                                                                                       | Steps to Launch from MWTM                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CiscoView              | Provides a real-time, color-coded, graphical representation of Cisco devices. You can use CiscoView to quickly identify an incorrect status on a port or interface. If you are running CiscoWorks on UNIX or Windows, you can access CiscoView through the link to the web version of CiscoWorks. | Choose <b>Launch &gt; CiscoView</b> from the MWTM main menu.<br><br>Or, right-click a node in the navigation tree and choose <b>Launch &gt; CiscoView</b> .         |
| CiscoWorks LMS Portal  | Provides a dashboard of CiscoWorks tools and utilities such as Resource Manager Essentials.                                                                                                                                                                                                       | Choose <b>Launch &gt; CiscoWorks LMS Portal</b> from the MWTM main menu.                                                                                            |
| Device Center          | Provides useful web-based device-monitoring functions, including reachability trends, response time trends, interface status, Syslog browsing, and a detailed inventory.                                                                                                                          | Choose <b>Launch &gt; Device Center</b> from the MWTM main menu.<br><br>Or, right-click a node in the navigation tree and choose <b>Launch &gt; Device Center</b> . |

**Step 3** At the prompt, enter a CiscoWorks user ID and password.

Depending on your selection in [Step 2](#), the MWTM links to the:

- Device Center dashboard, which displays information about the chosen node.
- CiscoView, which shows a graphical representation of the chosen node.

## Launch Integrated Applications from the MWTM Web Interface

To launch integrated applications from the MWTM web interface:

- Step 1** From the MWTM web interface, click the **Tools** link in the navigation tree (left pane).

**Note** If CiscoWorks does not appear in the navigation tree of the MWTM web interface, CiscoWorks is not integrated with the MWTM. Use the [mwtm cwsetup, page B-22](#), to integrate CiscoWorks with the MWTM.

- Step 2** In the right pane, in the Launch pane, click:

- CiscoView (*server\_name*)
- CiscoWorks LMS Portal (*server\_name*)
- Device Center (*server\_name*)

The chosen application launches.

## Launch the MWTM Web Interface from the CiscoWorks Dashboard

To launch the MWTM web interface from the CiscoWorks dashboard:

- Step 1** Log in to your CiscoWorks dashboard.

- Step 2** In the Mobile Wireless Transport Manager box, click the **MWTM Server Home Page** link.

**Note** If the Mobile Wireless Transport Manager box does not appear, CiscoWorks is not integrated with the MWTM. Use the [mwtm cwsetup, page B-22](#), to integrate CiscoWorks with the MWTM.

The MWTM web interface opens to the home page.

## Forwarding Traps to Other Hosts (Server Only)

You use the MWTM to forward SNMP traps to other SNMP servers, or hosts. The MWTM can then function as a trap multiplexer, integrating with high-level event- and alarm-monitoring systems such as the Cisco Info Center and IBM's Netcool/Tivoli suite of products. These systems can provide a single high-level view of all alarm monitoring in your network, making it easier to detect and resolve problems.

To enable the MWTM to forward SNMP traps to other hosts, specify the list of hosts in the *TrapForwarder.properties* file. The default file resides in the MWTM */properties* directory. If you installed the MWTM in:

- The default directory, */opt*, then the default file resides in */opt/CSCOsgm/properties/TrapForwarder.properties*.
- A different directory, then the default file resides in that directory.

In the *TrapForwarder.properties* file, begin all comment lines with a pound sign (#).

All other lines in the file are host definition lines using this format:

```
SERVERxx=dest-address[:portno]
```

where:

- *xx* is the user-defined server number.
- *dest-address* is the hostname, or the IP address in dotted-decimal format.
- *portno* is the optional port number. The default port number is 162.

For example, this host definition line:

```
SERVER02=64.102.86.104:162
```

enables the MWTM to forward traps to Server 02, with IP address 64.102.86.104, on port 162.

Any changes you make to the *TrapForwarder.properties* file take effect when you restart the MWTM server. Thereafter, the MWTM forwards all traps from the listed hosts except traps:

- That the MWTM cannot parse.
- From hosts listed in the *trapaccess.conf* file. For more information, see [Limiting Traps by IP Address, page 4-9](#).

The MWTM modifies Version 2c traps that do not have the agent IP address already specified in the varbind list by including the agent IP address in the varbind list.

You can also forward MWTM events to other hosts, in the form of SNMP traps. For more information, see [Forwarding Events as Traps to Other Hosts, page 9-35](#).

## Running Simultaneous Client Sessions

You can run multiple sessions of the MWTM client simultaneously because the MWTM uses a client-server architecture. The MWTM server provides central services and database functions and communicates with multiple MWTM clients. You can install the MWTM client software on the same system as the MWTM server, or on a different system on the same network as the MWTM server.

### Note

Running more than one MWTM client on the same workstation can degrade the workstation performance.

The MWTM recommends a maximum of 20 clients per MWTM server. If you connect more than 20 clients to a single server, the server requires additional memory and a more powerful CPU.

## Performing Basic Server Operations

This section contains this information:

- [Connecting to a New Server, page 5-40](#)
- [Viewing Server Status Information, page 5-40](#)

## Connecting to a New Server

You use the MWTM to connect the client to a new MWTM server. For example, you can monitor two or more networks from the same MWTM client, simply by switching servers. Or, if you have two MWTM servers monitoring the same network, and one server fails, the MWTM client automatically switches to the secondary server.

If you want to determine the default hostname before you connect to the new server, it appears in the SERVER\_NAME entry in the *System.properties* file. If you installed the MWTM in:

- The MWTM in the default directory, */opt*, then the location of the *System.properties* file is */opt/CSCOsgm/properties/System.properties*.
- A different directory, then the *System.properties* file resides in that directory.

To connect the client to a new server, choose **File > Connect to New Server** from the MWTM main menu. The MWTM displays the Connect to New Server dialog box.

The Connect to New Server dialog box contains:

| Field or Button           | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Name or IP Address | Name or IP address of the new server. Select the name of the new server, or its IP address from the Server Name or IP Address drop down list. You can also enter the server name or the IP address in this field manually.<br><br><b>Note</b> Server names get populated in the Server Name or IP Address drop down menu, only after adding the server names using <a href="#">mwtm servername</a> command.                         |
| Name Server Port          | UDP port number for the new server. Select the MWTM Naming Server UDP port number for the new server in the Name Server Port field. You can also enter the port number in this field manually.<br><br>The default value is 44742.<br><br><b>Note</b> On selection of Server Name or IP Address from the drop-down box, the configured port number for that selected Server Name or IP Address is displayed in the Port Number field |
| OK                        | Stops the MWTM client, then restarts the client connected to the specified server.<br><br>When you have entered the name of the new server, or its IP address, and its UDP port number, click <b>OK</b> . The MWTM stops the client, then restarts the client connected to the new server.                                                                                                                                          |
| Cancel                    | Closes the Connect to New Server dialog box without connecting to the new server.                                                                                                                                                                                                                                                                                                                                                   |
| Help                      | Displays online help for the Connect to New Server dialog box.                                                                                                                                                                                                                                                                                                                                                                      |

## Viewing Server Status Information

You use the MWTM to view detailed information about the processes, pollers, tasks, and clients for the server to which you are connected.

To display server status information, choose **View > MWTM Server > Status** in the MWTM main menu. The MWTM displays the Server Status Information window.

The Server Status Information window contains:

- [Server Status Information: Fields and Buttons, page 5-41](#)
- [Server Status Information: Processes, page 5-41](#)

- [Server Status Information: Pollers, page 5-41](#)
- [Server Status Information: Tasks, page 5-42](#)
- [Server Status Information: Clients, page 5-42](#)

## Server Status Information: Fields and Buttons

The Server Status Information window contains:

| Command       | Description                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Interval | Poll interval used to collect data for the table.                                                                                                                                                                   |
| Last Poll     | Time the last poll was run.<br><br>This field initially displays a message that the MWTM is polling the device. After the first polling cycle, the MWTM populates this field with the actual time of the last poll. |
| Update        | Forces an immediate poll, and refreshes the Server Status Information window with the latest data.                                                                                                                  |
| Close         | Closes the Server Status Information window.                                                                                                                                                                        |
| Help          | Accesses the online help for this window.                                                                                                                                                                           |

## Server Status Information: Processes

The Server Status Information: Processes section lists the processes that make up the MWTM server, and contains:

| Field      | Description                                                     |
|------------|-----------------------------------------------------------------|
| Name       | Name of the process, such as sgmNameServer.                     |
| Process ID | Number to uniquely identify the process.                        |
| Is Running | Indicates whether the process is running (true) or not (false). |

## Server Status Information: Pollers

The Server Status Information: Pollers table lists the detail and demand pollers that the MWTM server is currently processing, and contains:

| Field       | Description                                                                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poller ID   | Number to uniquely identify each MWTM detail poller that is currently active.<br><br>MWTM detail pollers collect detailed data (such as real-time data, statistics, route detail, and so on) that the regular MWTM poller did not collect. |
| Client Host | Name of the MWTM client that started the detail poller.                                                                                                                                                                                    |
| Interval    | Poll interval for the detail poller, in hours, minutes, and seconds.                                                                                                                                                                       |
| Iteration   | Number of times the detail poller should poll. If this field displays Forever, the detail poller will never stop polling, until the MWTM client requests that it stops.                                                                    |
| Next Poll   | Time until the next poll, in hours, minutes, and seconds.                                                                                                                                                                                  |

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time Limit  | Time remaining, in hours, minutes, and seconds, until the poller times out. When the poller times out, the MWTM automatically stops the poller to prevent unnecessary traffic on the network and sends an appropriate error message to the client.<br><br>By default, the MWTM allows pollers to run up to 8 hours. To change that setting, see the description of the <b>mwtm pollertimeout</b> command in <a href="#">mwtm pollertimeout</a> , page B-51. |
| Description | Description of the detail poller.                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Server Status Information: Tasks

The Server Status Information: Tasks table lists long-running services that the MWTM server performs, and contains:

| Field          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Task ID        | Number to uniquely identify the task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Interval       | Time between runs for the task, in hours, minutes, and seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Iteration      | Number of times the task should run. If this field displays Forever, the task will never stop polling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Next Execution | Time until the next run for the task, in hours, minutes, and seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| State          | Current state of the task. Valid values are: <ul style="list-style-type: none"><li>• <b>None</b>—Task is stopped.</li><li>• <b>Waiting</b>—Task is waiting to transition to Ready or Running state.</li><li>• <b>Ready</b>—Task is ready to execute but is not yet in Running state.</li><li>• <b>Running</b>—Task is started and is currently executing.</li><li>• <b>Pending</b>—Task was in Ready state when a user canceled it. The task is pending final removal from the scheduler.</li><li>• <b>Error</b>—Task encountered an error.</li><li>• <b>Dying</b>—Task was in Running state when it was canceled by a user. The task continues to run in Dying state until it ends. The server then removes the task from the scheduler.</li></ul> |
| Description    | Description of the task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Server Status Information: Clients

The Server Status Information: Clients table contains:

| Field        | Description                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process Name | Name of an MWTM client that is currently connected to the server.                                                                                                                                                                                                                       |
| User Name    | If you have implemented MWTM User-Based Access, this field displays the name of an MWTM client user who is currently logged in and connected to the server.<br><br>If you have not implemented MWTM User-Based Access, this field displays the name of the node that the user is using. |
| Message Mask | Mask that indicates which messages can be sent to the client.                                                                                                                                                                                                                           |

| Field      | Description                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sleeping?  | Indicates whether the thread that is responsible for delivering messages is sleeping (yes) or not (no). The normal setting for this field is no.                                         |
| Sleep Time | Time in seconds the thread that is responsible for delivering messages has been sleeping. The normal setting for this field is 0.                                                        |
| Queue Size | Number of messages waiting to be sent to the MWTM client. The normal setting for this field is 0, but it could be higher if the MWTM server or client is very busy, as during Discovery. |

## Using the Command Line Interface

The MWTM provides a command line interface that you use to interact with the MWTM and with the Cisco IOS software operating system by entering commands and optional arguments. For more information, see [Appendix B, “Command Reference.”](#)

# CHAPTER 6

## Managing Views

### Note

The web interface does not support the views feature. You can create customized views only in the Cisco Mobile Wireless Transport Manager (MWTM) client interface.

This chapter contains:

- [Overview, page 6-1](#)
- [Viewing Basic Information for Custom Views, page 6-2](#)
- [Viewing Detailed Information for Views, page 6-4](#)
- [Editing a View, page 6-5](#)
- [Saving a View, page 6-5](#)
- [Creating a New View, page 6-7](#)
- [Loading the DEFAULT View, page 6-14](#)
- [Loading a Client-Specific View, page 6-14](#)

## Overview

This chapter describes how to create and manage multiple views of your network from the MWTM client. Before creating or managing a view, you must understand the basic concepts of a default view, a custom view (and its associated subviews), and the navigational features available in each view:

- [Initial View Selection, page 6-1](#)
- [Custom View and Subviews, page 6-2](#)
- [Viewing Basic Information for Custom Views, page 6-2](#)

## Initial View Selection

Initially at client start-up, a new dialog ‘Initial View Selection’ is displayed which gives the user the ability to select different view options. ‘Use Default View’ loads the DEFAULT view. When the Cisco Mobile Wireless Transport Manager (MWTM) discovers your network, all discovered objects are placed in a DEFAULT view, which is stored on the MWTM server and shared by all MWTM clients. Clients cannot modify the DEFAULT view that is stored on the MWTM server. This view is always available for users who need to view the entire network.

‘Create an Empty View’ option used to start the client when there is a large number of nodes discovered on the server. ‘Open Existing View’ option lists all the existing views. ‘Open Last Used View’ option opens the view which was used last.

You can use the MWTM to create your own, client-specific views and subviews, which are subsets of the DEFAULT view, to meet your individual needs.

## Custom View and Subviews

You can choose the nodes you are interested in managing, exclude all other nodes from your view, and change the layout of the topology map in the topology window. You can save all of this customized information in a custom view and set that view as the new *default* view for the MWTM client.

You can use the MWTM client from then on to manage only the part of the network you are interested in, with the settings you prefer. When you modify the DEFAULT view in any way (except for modifying the layout of the topology map in the topology window), the MWTM prompts you to name the new, custom view.

You can also create many different views and subviews on a given MWTM client, with each view devoted to a different aspect of the network. You can then load a different view to manage a different part of the network, or switch to the DEFAULT view to see the entire network. For details on creating views, see [Creating a New View, page 6-7](#).

If more than one person uses a certain MWTM, each user can create a personal view.

Also, you can create subviews in any custom view. The custom view becomes the parent view of one or more subviews. When you load a custom view that has subviews, the MWTM displays the Views label under Summary Lists in the navigation tree. When you click Views, the Views table appears in the right pane and lists all subviews of the custom (parent) view (see [Views Summary List Table, page 6-3](#)).

**Note**

You cannot create subviews for the DEFAULT view. Subviews are valid only for custom views.

## Viewing Basic Information for Custom Views

To see all subviews currently configured in a custom view:

- 
- Step 1** Load a custom view by choosing **File > Load View**.
  - Step 2** Choose a custom view from the View List in the Load File dialog box and click **OK**.  
If the chosen custom view has associated subviews, the Views label appears under Summary Lists in the navigation tree.
  - Step 3** Click the turner  beside **Summary Lists**, then click **Views**.  
The View Summary List window appears.
- 

The View Summary List window provides information about all subviews that have been defined for this custom view, including their status and other important information.

The View Summary List window contains these sections:

- [Right-Click Menu for Views, page 6-3](#)

- [Views Summary List Table, page 6-3](#)

**Related Topics**

- [Viewing Detailed Information for Views, page 6-4](#)
- [Navigating Table Columns, page 5-23](#)

## Right-Click Menu for Views

To see the right-click menu for views, under Summary Lists, select **Views** and right-click the mouse. For details on menu options, see [Viewing the Right-Click Menu for an Object, page 8-2](#).

**Note**

If the Views label does not appear under Summary Lists, you have loaded the DEFAULT view or a custom view that has no subviews.

## Views Summary List Table

The views table shows information about the subviews that have been defined for a custom view. If a custom view has no subviews, this option is not available.

You can resize each column, or sort the table based on the information in one of the columns. By default, this table is sorted by Parent View, and the MWTM shows all of the columns in the view table except Internal ID.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The view table contains:

| Column      | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID | Internal ID of the view. The internal ID is a unique ID for every object, assigned by the MWTM for its own internal use. It can also be useful when the TAC is debugging problems.                                                                                                                                                                                               |
| Name        | Name of the subview that belongs to the custom (parent) view.                                                                                                                                                                                                                                                                                                                    |
| Parent View | Name of the custom or parent view to which the subview belongs.                                                                                                                                                                                                                                                                                                                  |
| Ignored     | Indicates whether the subview should be included when aggregating and displaying MWTM status information: <ul style="list-style-type: none"><li>• Check the check box to ignore the subview.</li><li>• Uncheck the check box to include the subview. This is the default setting.</li></ul> Users with authentication level Power User (level 2) and higher can edit this field. |
| Notes       | Indicates whether a note is associated with the subview.                                                                                                                                                                                                                                                                                                                         |

| Column             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Events             | <p>Indicates whether a recent event associated with a network object in the subview. (Even if the server purges all of the events associated with objects in the subview, the MWTM continues to display the event icon in this field.) To delete the event icon (orange triangle) from MWTM displays for:</p> <ul style="list-style-type: none"> <li>A specific subview, select the subview and click the icon.</li> <li>All subviews, choose <b>Edit &gt; Clear All Events</b> from the MWTM main menu.</li> </ul> <p><b>Note</b> During Discovery, the MWTM might flag most views with an event icon. If the event icons are too distracting, use the <b>Edit &gt; Clear All Events</b> menu option to remove them.</p> <p>Changing a view (for example, by ignoring it or attaching a note to it) does not generate an event, and therefore does not cause an event icon to appear in this field.</p> <p>Deleting an application server process, node, or signaling point with the Delete menu option does not generate an event, and therefore does not cause an event icon to appear in this field. However, if the MWTM rediscovers a deleted application server process, node, or signaling point, events are generated and logged for the deletion and the rediscovery, and the event icon appears in this field.</p>                                         |
| Last Status Change | Date and time that the status of the subview last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Severity           | This is the worst severity of the network objects in the view or any subview.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status             | <p>Current status of the subview. Possible values are:</p> <ul style="list-style-type: none"> <li>Active</li> <li>Unmanaged</li> <li>Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status Reason      | <p>Reason for the current status of the subview.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>The default directory, <i>/opt</i>, then the file resides at <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>A different directory, then the help directory and file reside in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

## Viewing Detailed Information for Views

The MWTM can display detailed information about a chosen view, including its associated objects, status, and other information.

Updates for the view that are received from the MWTM server are reflected automatically in this window.

To display the Details tab for a view, click the name of the view in the MWTM main window navigation tree. For example, to see detailed information for the DEFAULT view in the right pane, click DEFAULT View in the navigation tree.

The View Details window contains:

| Function or Tab                     | For More Information                                                  |
|-------------------------------------|-----------------------------------------------------------------------|
| Right-click menu (MWTM client only) | <a href="#">Viewing the Right-Click Menu for an Object, page 8-2.</a> |
| Status Contributors                 | <a href="#">Viewing Status Contributors, page 8-7</a>                 |
| Details                             | <a href="#">Viewing Details, page 8-9</a>                             |
| Notes (MWTM client only)            | <a href="#">Viewing Notes, page 7-43</a>                              |
| Recent Events                       | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>           |
| Alarms                              | <a href="#">Viewing Alarms and Recent Events, page 8-42</a>           |

## Editing a View

For details on editing a view, see [Editing Properties, page 7-37](#).

## Saving a View

You use the MWTM to save a specific view, change the list of views, and select one view to be loaded automatically when the associated preferences file is saved.

When you are satisfied with the changes you made to a view, use one of these procedures to save the view:

- To save the changes you made to the view without changing the name of the file, choose **File > Save** from the View Editor window menu.

**Note** You cannot save changes to the DEFAULT view. If you are currently using the DEFAULT view and you choose **File > Save**, the MWTM shows the Save File Dialog: View List dialog box.

- To save the changes you made to the view with a new name, choose **File > Save As** from the Discovery Dialog menu. The MWTM shows the Save File Dialog: View List dialog box.

The MWTM stores the view in the view file directory on the MWTM server:

- If you installed the MWTM in the default directory, */opt*, then the MWTM view file directory is */opt/CSCOsgm/views*.
- If you installed the MWTM in a different directory, then the MWTM view file directory resides in that directory.

**Note**

If another user modifies and saves the view before you save your changes, the MWTM asks if you want to overwrite that user's changes. If you choose to do so, the other user's changes are overwritten and lost. If you choose not to do so, your changes are lost, unless you save the view to a different filename.

The Save File Dialog: View List contains:

| Field or Button                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Creating a New View

You use the MWTM to specify the nodes and objects you want to see in MWTM displays. This view is called a client-specific network view. All changes you make are reflected in topology tables and maps as soon as you make the changes.

Before creating a client-specific network view, ensure that Discovery has been run at least once, and data appears in the server's MWTM database. See [Discovery Overview, page 3-5](#), for details.

To create a client-specific network view, choose **Edit > Views** from the MWTM main menu. The Create New View window appears. Enter a name for the new view in the 'Enter name for new view' text box and then click **OK**. The View Editor window appears. Click **Cancel** to close the window.

You use the View Editor window also to move objects into and out of the current view. All changes that you make in this window are reflected in the MWTM client, and in the topology tables and maps as soon as you make the changes.

The View Editor window contains:

- [View Editor Window Menu, page 6-8](#)
- [Objects In Current View, page 6-9](#)
- [View Objects Pane, page 6-10](#)
- [Excluded/New Objects Pane, page 6-11](#)
- [Filter pane, page 6-12](#)
- [View Editor Buttons, page 6-13](#)
- [Closing the View Editor Window, page 6-13](#)

| File > Load<br>(Ctrl-L)                             | <p>Loads an already existing view.</p> <p>If you have already saved a view and you want to change it, choose the <b>File &gt; Load</b> menu option. The MWTM prompts you for the name of the view you want to load:</p> <ul style="list-style-type: none"> <li>• Select the name of the view, or accept the default view name, then click <b>OK</b> to load the view.</li> <li>• Click <b>Cancel</b> to close the prompt window without loading a view.</li> </ul>                                                |
| File > Create Views by SP Instances<br>(Ctrl-P)     | Creates views based on signaling point's network names. A confirmation window is displayed asking for the confirmation of replacement of current set of views.                                                                                                                                                                                                                                                                                                                                                    |
| File > Create Views by Aggregation Node<br>(Ctrl-P) | Creates views based on aggregation nodes. A confirmation window is displayed asking for the confirmation of replacement of current set of views.                                                                                                                                                                                                                                                                                                                                                                  |
| File > Save<br>(Ctrl-S)                             | <p>Saves the current view. If you have:</p> <ul style="list-style-type: none"> <li>• Not already saved the current view, opens the Save File Dialog: View List, which you use to enter or select a filename under which to save the current view.</li> <li>• Already saved the current view, saves the view to that filename.</li> </ul> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.</p>                      |
| File > Save As                                      | <p>Opens the Save File Dialog: View List, which you use to save changes you made to the chosen view with a new name, or overwrite an existing seed file. The view is updated immediately in the MWTM client.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.</p>                                                                                                                                              |
| File > Close<br>(Ctrl-W)                            | <p>Closes the View Editor window.</p> <p>If you have modified the view, the MWTM asks if you want to save your changes. Click:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b> to save your changes to the current view.</li> <li>• <b>No</b> to keep the current view as-is, without applying any changes. The MWTM closes the View Editor window.</li> <li>• <b>Cancel</b> to close the prompt window and return to the View Editor window without applying any changes to the current view.</li> </ul> |
| Edit > Create Subview<br>(Ctrl-N)                   | Creates a new subview for the chosen view or subview. Enter a name for the new subview.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Edit > Rename View<br>(Ctrl-R)                      | Renames the chosen view. The new name can be from 1 to 30 characters, and can contain any letters, numbers, or special characters.                                                                                                                                                                                                                                                                                                                                                                                |
| Edit > Include In View<br>(Ctrl-I)                  | Includes the chosen object in the view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Menu Command                     | Description                                                                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit > Exclude From View (Alt-X) | Excludes the chosen object from the view. The MWTM also excludes the object and associated objects from the topology map.<br>If you exclude all of the objects associated with a node, the node is excluded, too. |
| Edit > Delete View (Ctrl-D)      | Deletes the chosen view.                                                                                                                                                                                          |
| Help > Topics (F1)               | Shows the table of contents for the MWTM online help.                                                                                                                                                             |
| Help > Window (Shift-F1)         | Shows online help for the current window.                                                                                                                                                                         |
| Help > About (F3)                | Shows build date, version, SSL support, and copyright information about the MWTM application.                                                                                                                     |

## Objects In Current View

The navigation tree in the left pane of the View Editor window lists nodes that the current view contains. To see the objects that are associated with a node, and that are in the current view, click the turner  beside the node.

To exclude any of these objects from the current view, select them in the navigation tree, then choose **Edit > Exclude From View** from the View Editor window to move them to the Excluded From View pane of the View Editor window.

### Note

If you are using an MWTM client with the DEFAULT view set, the MWTM automatically adds all newly discovered objects to the navigation tree as soon as they are discovered.

If you delete an object, the MWTM removes it from the navigation tree. If the MWTM then discovers the object, the MWTM places it in the New on the Network pane. To see this object again in your current view, you must move it into the navigation tree using Edit > Include In View from the View Editor window.

The navigation tree in the View Editor window provides these right-click menus:

- [Right-Click Menu for a View, page 6-9](#)
- [Right-Click Menu for a Subview, page 6-10](#)
- [Right-Click Menu for an Object, page 6-10](#)

## Right-Click Menu for a View

The right-click menu for a view in the navigation tree of the View Editor window provides these options:

| Menu Command   | Description                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| Create Subview | Creates a new subview for the chosen view. Enter a name for the new subview.                                                       |
| Rename View    | Renames the chosen view. The new name can be from 1 to 30 characters, and can contain any letters, numbers, or special characters. |

## Right-Click Menu for a Subview

The right-click menu for a subview in the navigation tree of the View Editor window contains:

| Menu Command   | Description                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Create Subview | Creates a new subview for the chosen subview. Enter a name for the new subview.                                                       |
| Rename Subview | Renames the chosen subview. The new name can be from 1 to 30 characters, and can contain any letters, numbers, or special characters. |
| Open Subview   | Opens the chosen subview.                                                                                                             |
| Delete Subview | Deletes the chosen subview.                                                                                                           |

## Right-Click Menu for an Object

The right-click menu for an object in the navigation tree of the View Editor window provides this option:

| Menu Command      | Description                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Exclude From View | Excludes the chosen object, and any lower-level associated objects, from the view or subview. This action also excludes the object from the topology map. |

## View Objects Pane

The View Objects pane lists the nodes that the current view contains. To exclude any of these objects from the current view, right click the object, then choose **Exclude From View** in the right click menu or chose **Edit > Exclude From View** from the menu.

The View Objects pane provides:

| Field       | Description                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| View Object | Lists the objects that the current view contains.                                                                                                                                                                                                    |
| View Parent | Lists the parent objects of the entries in the View Object column.                                                                                                                                                                                   |
| Severity    | Indicates the alarm severity for the chosen signaling point. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information. |
| View Type   | Type of the object listed in the View Object column.                                                                                                                                                                                                 |

The right-click menu for an object in the View Objects pane provides this option:

| Menu Command      | Description                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Exclude From View | Excludes the chosen object, and any lower-level associated objects, from the view or subview. This action also excludes the object from the topology map. |

## Excluded/New Objects Pane

The Excluded/New Objects pane contains the following tabs:

- [Excluded from View, page 6-11](#)
- [New on the Network, page 6-11](#)

### Excluded from View

The Excluded from View tab lists the objects that have been excluded from the current view. To add these objects to the current view, select them from the table under Excluded from View tab, then choose **Edit > Include In View** from the MWTM main menu or right click on them and choose **Include In View** from the right click menu.

The Excluded from View tab contains:

| Field       | Description                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| View Object | Lists the objects that are excluded from the view.                                                                                                                                                                                                   |
| View Parent | Parent objects of the entries in the View Object column of the Excluded from View tab.                                                                                                                                                               |
| Severity    | Indicates the alarm severity for the chosen signaling point. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information. |
| View Type   | Type of the object listed in the View Object column of the Excluded from View tab.                                                                                                                                                                   |

The Excluded from View tab provides this right-click option for an object:

| Menu Command    | Description                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------|
| Include In View | Includes the chosen object, and any lower-level associated objects, in the chosen view or subview. |

### New on the Network

The New on the Network tab shows newly discovered objects, based on these criteria. If you are using an MWTM client with:

- The DEFAULT view set, this table never contains any objects. In the DEFAULT view, the MWTM adds all newly discovered objects to the navigation tree in the View Editor window as soon as they are discovered.
- A custom view set, this table contains all objects discovered since the View Editor window was opened in this session that have *not* been excluded in the Excluded from View pane or that are not in the current view.

When the MWTM discovers one or more new objects in the network, the MWTM also:

- Broadcasts the discovery of the new objects to all MWTM clients.

- Shows a **New** icon in the bottom of most MWTM windows. Clicking the **New** icon in the topology window opens the New Objects pane in the left pane. Clicking the **New** icon in any other window opens the Edit View tab of the View Editor window.
- Adds graphical elements for the newly discovered objects to the New Objects pane in the left pane of the topology window. For more information, see [Printing the Topology Map, page 10-16](#).

To add a newly discovered object to the current view, select one or more objects in the table under New on the Network tab, then choose **Edit > Include In View** from the MWTM main menu or right click on them and choose **Include In View** from the right click menu.

To exclude a newly discovered object from the current view, select one or more objects in the New on the Network pane, then choose **Edit > Exclude From View** from the MWTM main menu or right click on them and choose **Include In View** from the right click menu.

The New on the Network tab provides:

| Field       | Description                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| New Object  | Lists the objects that are newly added to the current view.                                                                                                                                                                                          |
| View Parent | Parent objects of the entries in the New Object column of the New on the Network tab.                                                                                                                                                                |
| Severity    | Indicates the alarm severity for the chosen signaling point. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information. |
| View Type   | Type of the object listed in the New Object column of the New on the Network tab.                                                                                                                                                                    |

The New on the Network tab provides these right-click options for an object:

| Menu Command      | Description                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Include In View   | Includes the chosen object, and any lower-level associated objects, in the chosen view or subview.                                                    |
| Exclude From View | Excludes the chosen object, and any lower-level associated objects, from the view or subview. The MWTM also removes the object from the topology map. |

## Filter pane

The Filter pane provides an option to filter the list of objects which are necessary when there are thousands of items in the editor. The Filter pane contains this text field:

| Field                       | Description                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name or Parent Name or Type | Enter the name or the parent name or the type of the object in this text box. Based on your entry in this field, the content of the View Editor window gets filtered. |

## View Editor Buttons

The View Editor window provides the following buttons:

| Field  | Description                                                                   |
|--------|-------------------------------------------------------------------------------|
| OK     | Applies the changes you made to the editor and closes the View Editor window. |
| Cancel | Closes the View Editor window without saving the changes.                     |

## Closing the View Editor Window

To close the View Editor window at any time, click **File > Close**. If you have modified the view, the MWTM asks if you want to apply the changes before leaving the window. Click:

- **Yes** to apply the changes to the current view. The MWTM applies the changes to all MWTM windows immediately. The MWTM then asks if you want to make this the default view. Click:
  - **Yes** to make this view the new default view. In the future, when this client is started, this will be the default view.
  - **No** to retain your old default view.

The MWTM closes the View Editor window.

- **No** to keep the current view unchanged, without applying any changes. The MWTM closes the View Editor window.
- **Cancel** to close the prompt window and return to the View Editor window without applying any changes to the current view.

If you are working in a custom view (that is, not in the DEFAULT view) and you exit the MWTM client, the MWTM automatically saves any changes you made to the view.

## Choosing a View

If you are performing an action and have multiple views from which to choose, the Choose a View dialog box appears. Use it to choose the view you wish to apply.

The Choose a View dialog box contains:

| Field or Button | Description                                      |
|-----------------|--------------------------------------------------|
| View List       | Shows a list of views available for this action. |
| OK              | Confirms the view you have chosen.               |
| Cancel          | Cancels the dialog without choosing a view.      |
| Help            | Shows help for this dialog box.                  |

## Loading the DEFAULT View

To load the DEFAULT network view, choose **File > Load DEFAULT View** from the MWTM main menu. You might be prompted to save the view in which you currently are. Once you have chosen whether to save your current view, the MWTM loads the DEFAULT view.

### Note

Any custom views are saved in the View Editor window (Import Views tab) under the Edit > Views option in the MWTM main window.

## Loading a Client-Specific View

You use the MWTM to load a specific view, change the list of views, and select one view to be loaded automatically when the associated preferences file is loaded.

To load a client-specific network view, choose **File > Load View** or choose **Edit > Views** from the MWTM main menu. The View Editor window appears. Then choose **File > Load** from the View Editor window menu. The MWTM shows the Load File Dialog: View List dialog box.

The Load File Dialog: View List contains:

| Field or Button                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Go Up One Folder | Click this icon to go up one folder in the directory structure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Type                                                                                                | Icon indicating whether the item in the table is a file or a folder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Name                                                                                                | Name of the view file or folder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Last Modified                                                                                       | Date and time the view file or folder was last modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Size (bytes)                                                                                        | Size of the view file or folder, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Make this my preferred start option                                                                 | Specifies whether the chosen view should be loaded automatically whenever the associated preferences file is loaded. To load the: <ul style="list-style-type: none"> <li>Chosen view, select the view, then check this check box.</li> <li>Last-used view, uncheck the check box. This is the default setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                      |
| Number of Files (visible in bottom left corner)                                                     | Total number of view files and folders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OK                                                                                                  | Loads the chosen view, saves any changes you made to the list of views, closes the dialog box, and returns to the View Editor window.<br><br>To load a view, double-click it in the list, select it in the list and click <b>OK</b> , or enter the name of the view and click <b>OK</b> .<br><br><b>Note</b> If the network elements belonging to a client-specific view have been removed from the network, a message appears when you load the view. The message warns you that the network elements have been removed from the view. To prevent the warning from being issued the next time you load the view, save the view using the same name (File > Save from the View Editor window). |
| Delete                                                                                              | Deletes the chosen file from the view list. The MWTM issues an informational message containing the name and location of the deleted file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Field or Button | Description                                                                          |
|-----------------|--------------------------------------------------------------------------------------|
| Cancel          | Closes the dialog box without loading a view or saving any changes to the view list. |
| Help            | Shows online help for the dialog box.                                                |

# CHAPTER 7

## Understanding Basic Object Functions

You can use the Cisco Mobile Wireless Transport Manager (MWTM) to view basic information about any discovered MWTM object, including its associated objects, status, and other important information.

To view basic information for an object, click **Summary Lists** in the navigation tree of the MWTM main window, then select one of these objects:

### Note

Objects only appear if your network contains that particular object type.

| Summary List                                                                                                                                                                                    | Applicable Network Type |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Alarms                                                                                                                                                                                          | All networks            |
| Nodes                                                                                                                                                                                           | All networks            |
| Signaling Points                                                                                                                                                                                | ITP only                |
| <b>Note</b> In a multi-instance network, the signaling point name has the format <i>pointcode:instanceName</i> .                                                                                |                         |
| In a multi-instance network, the MWTM does not display signaling points that are only partly configured (that is, the variant and network name are configured, but not the primary point code). |                         |
| Linksets                                                                                                                                                                                        |                         |
| Links                                                                                                                                                                                           |                         |
| Application Servers                                                                                                                                                                             |                         |
| Application Server Processes                                                                                                                                                                    |                         |
| Application Server Process Associations                                                                                                                                                         |                         |
| Signaling Gateway Mated Pairs                                                                                                                                                                   |                         |
| Interfaces                                                                                                                                                                                      | All networks            |

| Summary List          | Applicable Network Type |
|-----------------------|-------------------------|
| Cards                 | RAN-O only              |
| RAN Backhauls         |                         |
| RAN Shorthauls        |                         |
| PWE3 Backhauls        |                         |
| PWE3 Virtual Circuits |                         |
| Access Point Names    | mSEF and GGSN only      |
| Software Versions     | All networks            |
| Point Code            | ITP only                |
| IP Addresses          | All networks            |

This chapter contains:

## Displaying Object Windows

To display an object window, in the MWTM main window, under Summary Lists in the navigation tree, click the object type. The object window appears in the right pane.

### Example:

To display the nodes table, choose **Summary Lists > Nodes**. The nodes table appears.

- The table lists all objects of the object type that you chose in the navigation tree. To see the fully qualified domain name (FQDN) of any object in the table, hover over the object with the mouse. A tooltip lists the FQDN for the object.
- Some table columns may be hidden by default. To see a list all columns, right-click on any column, and check the box for the columns that you want to expose.
- Tables are sorted based on the column that is highlighted. To sort by a different column, simply click the desired column.

**Tip**

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

Object windows provide information about all objects of a specific type that the MWTM has discovered and can contain:

- [Right-Click Menu for All Objects, page 7-3](#)

- [Alarms Table, page 7-4](#)
- [Nodes Table, page 7-5](#)
- [Signaling Points Table, page 7-9](#)
- [Linksets Table, page 7-11](#)
- [Links Table, page 7-14](#)
- [Application Servers Table, page 7-15](#)
- [Application Server Processes Table, page 7-17](#)
- [Application Server Process Associations Table, page 7-19](#)
- [Signaling Gateway Mated Pairs Table, page 7-21](#)
- [Interfaces Table, page 7-23](#)
- [Cards Table, page 7-25](#)
- [RAN Backhauls Table, page 7-27](#)
- [RAN Shorthauls Table, page 7-29](#)
- [PWE3 Backhauls Table, page 7-31](#)
- [PWE3 Virtual Circuits, page 7-33](#)
- [Access Point Names Table, page 7-35](#)
- [Software Versions Table, page 7-35](#)
- [IP Addresses Table, page 7-36](#)
- [Point Code Table, page 7-36](#)

## Right-Click Menu for All Objects

To see the right-click menu for all objects, in the MWTM main window, under Summary Lists in the navigation tree, select the object type and right-click it. The right-click menu contains:

| Menu Command              | Description                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------|
| Show in New Window        | Opens the object window in a new window.                                                                        |
| Back > List of Windows    | Navigates back to a window viewed in this session.<br>The MWTM maintains a list of up to 10 Back windows.       |
| Forward > List of Windows | Navigates forward to a window viewed in this session.<br>The MWTM maintains a list of up to 10 Forward windows. |

### Note

The right-click menu, available by clicking on a specific object in the right pane, is described in [Viewing the Right-Click Menu for an Object, page 8-2](#).

## Alarms Table

The alarms table displays a count of alarms by node and severity. To display the alarms table, choose **Summary Lists > Alarms**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The alarms table contains:

| Column        | Description                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID   | Internal ID of the node. The internal ID is a unique ID for every object, which the MWTM assigns for its own internal use. This ID can also be useful when the TAC is debugging problems. |
| Node          | Name of the node.                                                                                                                                                                         |
| Feature       | The feature name of the node.                                                                                                                                                             |
| Total         | Total number of alarms for the node.                                                                                                                                                      |
| Critical      | Total number of critical alarms for the node.                                                                                                                                             |
| Major         | Total number of major alarms for the node.                                                                                                                                                |
| Minor         | Total number of minor alarms for the node.                                                                                                                                                |
| Warning       | Total number of warning alarms for the node.                                                                                                                                              |
| Informational | Total number of informational alarms for the node.                                                                                                                                        |
| Indeterminate | Total number of indeterminate alarms for the node.                                                                                                                                        |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Nodes Table

The nodes table displays information about nodes that the MWTM has discovered. To display the nodes table, choose **Summary Lists > Nodes**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The nodes table contains:

| Column               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID          | Internal ID of the node. The internal ID is a unique ID for every object, which the MWTM assigns for its own internal use. This ID can also be useful when the TAC is debugging problems.                                                                                                                                                                                                                                                                           |
| Name                 | Name of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Primary SNMP Address | IP address of the node, which SNMP uses to poll the node. (There might be other IP addresses on the node that are not the primary SNMP address.)                                                                                                                                                                                                                                                                                                                    |
| CLLI Code (ITP only) | Common Language Location Identification code for the node. A CLLI code is a standardized 11-character identifier that uniquely identifies the geographic location of the node. If the node has no CLLI code configured, this field is blank.                                                                                                                                                                                                                        |

| Avg. MWTM Poll Response (secs) | Average response time for the device to respond to poll from the MWTM server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Serial Number                  | Serial number of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Uptime                         | Time the node has been up, in days, hours, minutes, and seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Reboot Reason                  | Reason for the last reboot of the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Ignored                        | <p>Indicates whether to include the node when aggregating and displaying MWTM status information:</p> <ul style="list-style-type: none"> <li>• Check the check box to include the node. This is the default setting.</li> <li>• Uncheck the check box to exclude the node.</li> </ul> <p><b>Note</b> Not applicable for unmanaged nodes.</p> <p>Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Process Traps                  | Indicates whether the MWTM should process traps from this node. This field is read-only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Column                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trap Polling                 | <p>Indicates whether or not trap polling is enabled for this node. By default, trap polling is enabled for all nodes except for IP-RAN nodes. This field is read only.</p> <p>For IP-RAN nodes, you can modify this setting by using the following commands:</p> <ul style="list-style-type: none"> <li>• To enable trap polling for this node, set <code>ipran-mib snmp-access</code> to <code>inBand</code> on the node.</li> <li>• To disable trap polling for this node, set <code>ipran-mib snmp-access</code> to <code>outOfBand</code> on the node.</li> </ul> <p><b>Note</b> For information about in-band and out-of-band management, see <a href="#">IP-RAN Specific FAQs, page C-20</a>.</p> |
| Report Polling               | <p>Indicates whether or not report polling is enabled for this node. This field is read-only for the web client, but editable in the java client for ITP nodes.</p> <p>For IP-RAN nodes, you can modify this setting by using the following commands:</p> <ul style="list-style-type: none"> <li>• To enable report polling for this node, set <code>ipran-mib location</code> to <code>aggSite</code> on the node.</li> <li>• To disable report polling for this node, set <code>ipran-mib location</code> to <code>cellSite</code> on the node.</li> </ul> <p>For all other nodes, this field is not editable.</p>                                                                                    |
| Notes                        | Indicates whether a note is associated with the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Events<br>(MWTM client only) | Indicates whether the node has received any events. If the node has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Last Status Change           | Date and time that the status of the node last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Severity                     | Indicates the alarm severity for the chosen node. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Status        | <p>Current status of the node. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Discovering</li> <li>• Polling</li> <li>• Unknown</li> <li>• Unmanaged</li> <li>• Waiting</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Status Reason | <p>Reason for the current status of the node.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOSgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons appear in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Signaling Points Table

The signaling points table displays information about the signaling points that the MWTM has discovered. To display the signaling points table, choose **Summary Lists > Signaling Points**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The signaling points table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID               | Internal ID of the signaling point. The internal ID is a unique ID for every object, which the MWTM assigns for its own internal use. It can also be useful when the TAC is debugging problems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Name                      | Name of the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Node                      | Name of the node associated with this signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Instance Number           | Number of the instance associated with the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Network Name              | Name of the instance associated with the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Point Code                | Primary point code of the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Variant                   | SS7 protocol variant. Valid variants are: <ul style="list-style-type: none"> <li>• ANSI</li> <li>• China</li> <li>• ITU</li> <li>• NTT</li> <li>• TTC</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Network Indicator         | Determines the type of call that is being placed. Valid values are: <ul style="list-style-type: none"> <li>• <b>National</b>—National-bound call. The MWTM routes national calls through the national network.</li> <li>• <b>NationalSpare</b>—National-bound call, used in countries in which more than one carrier can share a point code. In those countries, the Network Indicator differentiates the networks.</li> <li>• <b>International</b>—International-bound call. The MWTM forwards international-bound calls to an STP pair that acts as an international gateway.</li> <li>• <b>InternationalSpare</b>—International-bound call; used in countries in which more than one carrier can share a point code. In those countries, the Network Indicator differentiates the networks.</li> </ul> |
| Ignored                   | Indicates whether to include the signaling point when aggregating and displaying MWTM status information: <ul style="list-style-type: none"> <li>• Uncheck the check box to include the signaling point. This is the default setting.</li> <li>• Check the check box to exclude the signaling point.</li> </ul> Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.                                                                                                                                                                                                                                                                                                   |
| Notes                     | Indicates whether a note is associated with the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Events (MWTM client only) | Indicates whether the signaling point has received any events. If the signaling point has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Last Status Change        | Date and time that the status of the signaling point last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Severity                  | Indicates the alarm severity for the chosen signaling point. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status        | <p>Current status of the signaling point. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Unknown</li> <li>• Unmanaged</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Status Reason | <p>Reason for the current status of the signaling point.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file resides at <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file reside in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full status reason in a mouse over help popup.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Linksets Table

The linksets table displays information about the linksets that the MWTM has discovered. To display the linksets table, choose **Summary Lists > Linksets**.

**Tip**

Linksets that are associated with nodes that are excluded from the current view are not visible in the linksets table. See [Creating a New View, page 6-7](#), for more information about excluding nodes.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The linksets table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID               | Internal ID of the linkset. The internal ID is a unique ID for every object, which the MWTM assigns for its own internal use. It can also be useful when the TAC is debugging problems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Name                      | Name of the linkset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Node                      | Node associated with the linkset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Signaling Point           | Signaling point associated with the linkset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Local Point Code          | Point code of the primary signaling point for the linkset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Adj Point Code            | Point code of the adjacent signaling point for the linkset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Linkset Type              | <p>Type of linkset, which the MWTM determines by examining the links defined in the linkset. Possible linkset types are:</p> <ul style="list-style-type: none"> <li>• <b>HSL</b>—The links in this linkset use the SS7-over-ATM high-speed protocol.</li> <li>• <b>SCTPIP</b>—The links in this linkset use the Stream Control TCP/IP transport protocol.</li> <li>• <b>Serial</b>—The links in this linkset use the serial SS7 signaling protocol.</li> <li>• <b>Mixed</b>—The links in this linkset are of two or more types. (This configuration is not recommended.)</li> <li>• <b>Virtual</b>—The links in this linkset are virtual links, which connect signaling point instances running on the same node. The MWTM does not poll virtual linksets, nor does it display real-time data or accounting statistics for virtual linksets.</li> </ul> <p><b>Note</b> Prior to IOS release 12.2(23)SW1, the user manually created virtual linksets on multi-instance nodes. In and after that release, users can now automatically create virtual linksets.</p> <ul style="list-style-type: none"> <li>• <b>Other</b>—No links have been defined for this linkset.</li> </ul> |
| Links                     | Total number of links in the linkset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Active Links              | Number of links in the linkset that are <i>Active</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Congested Links           | Number of links in the linkset that are <i>Congested</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Status        | <p>Current status of the linkset. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Shutdown</li> <li>• Unavailable</li> <li>• Unknown</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Status Reason | <p>Reason for the current status of the signaling gateway-mated pair.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Links Table

The links table displays information about the links that the MWTM has discovered. To display the links table, choose **Summary Lists > Links**.

### Note

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The links table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID               | Internal ID of the link. The internal ID is a unique ID for every object, which the MWTM assigns for its own internal use. This ID can also be useful when the TAC is debugging problems.                                                                                                                                                                                                                                                                                                                                                                              |
| Node                      | Name of the node associated with the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Signaling Point           | Name of the signaling point associated with the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Linkset                   | Name of the linkset associated with the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SLC                       | Signaling link code (SLC) ID for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Type                      | Type of link. Possible link types are: <ul style="list-style-type: none"> <li>• <b>HSL</b>—The link uses the SS7-over-ATM high-speed protocol.</li> <li>• <b>SCTPIP</b>—The link uses the Stream Control TCP/IP transport protocol.</li> <li>• <b>Serial</b>—The link uses the serial SS7 signaling protocol.</li> <li>• <b>Virtual</b>—The link is a virtual link, which connects signaling point instances running on the same node. The MWTM does not poll virtual links, nor does it display real-time data or accounting statistics for virtual links.</li> </ul> |
| Congestion Level          | Indicates the level of congestion on the link. A link is congested if it has too many packets waiting to be sent. This condition could result from the failure of an element in your network.<br><br>Possible values for the Congestion Level field are <code>None</code> , indicating no congestion, and 1 to 3, indicating levels of congestion from very light (1) to very heavy (3).                                                                                                                                                                               |
| Ignored                   | Indicates whether to include the link when aggregating and displaying MWTM status information: <ul style="list-style-type: none"> <li>• Uncheck the check box to include the link. This is the default setting.</li> <li>• Check the check box to exclude the link.</li> </ul> Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.                                                                                                 |
| Notes                     | Indicates whether a note is associated with the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Events (MWTM client only) | Indicates whether the link has received any events. If the link has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the link.                                                                                                                                                                                                                                                                                                                                                      |
| Last Status Change        | Date and time that the status of the link last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Severity                  | Indicates the alarm severity for the chosen link. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                                                                                              |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status        | <p>Current status of the link. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Blocked</li> <li>• Failed</li> <li>• InhibitLoc</li> <li>• InhibitRem</li> <li>• Shutdown</li> <li>• Unknown</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Status Reason | <p>Reason for the current status of the signaling gateway-mated pair.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons appear in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Application Servers Table

The application servers table displays information about the application servers that the MWTM has discovered. To display the application servers table, choose **Summary Lists > App. Servers**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The application servers table contains:

| Column                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID                             | Internal ID of the application server. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. This ID can also be useful when the TAC is debugging problems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Name                                    | Name of the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Node                                    | Name of the node associated with the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Signaling Point                         | Name of the signaling point associated with the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Protocol                                | Protocol associated with the application server. Possible values are: <ul style="list-style-type: none"> <li>• <b>M3UA</b>—MTP3-User Adaptation.</li> <li>• <b>SUA</b>—SCCP-User Adaptation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Routing Key                             | Routing key associated with the application server. The application server bases its routing decisions on the routing key value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Traffic Mode                            | Method by which the application server forwards requests to its active application server processes. Possible values are: <ul style="list-style-type: none"> <li>• <b>overRide</b>—One application server process takes over all traffic for the application server, possibly overriding any currently active application server process in the application server.</li> <li>• <b>broadcast</b>—Every active application server process receives the same message.</li> <li>• <b>loadBind</b>—Each application server process shares in the traffic distribution with every other currently active application server process, based on application server process bindings.</li> <li>• <b>loadRndRobin</b>—Each application server process shares in the traffic distribution with every other currently active application server process, using a round-robin algorithm.</li> <li>• <b>undefined</b>—The traffic mode is not defined. The first application server process that becomes active defines the traffic mode.</li> </ul> |
| Application Server Process Associations | Total number of application server processes associated with the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Active ASP Associations                 | Number of currently active application server processes associated with the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Ignored                                 | Indicates whether to include the application server when aggregating and displaying MWTM status information: <ul style="list-style-type: none"> <li>• Uncheck the check box to include the application server. This is the default setting.</li> <li>• Check the check box to exclude the application server.</li> </ul> <p>Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Notes                                   | Indicates whether a note is associated with the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Events (MWTM client only)               | Indicates whether the application server has received any events. If the application server has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Last Status Change                      | Date and time that the status of the application server last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Severity      | Indicates the alarm severity for the chosen application server. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Status        | <p>Current status of the application server. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Down</li> <li>• Inactive</li> <li>• Pending</li> <li>• Shutdown</li> <li>• Unknown</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Status Reason | <p>Reason for the current status of the signaling gateway-mated pair.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Application Server Processes Table

The application server processes table displays information about the application server processes that the MWTM has discovered. To display the application server processes table, choose **Summary Lists > App. Server Processes**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The application server processes table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID               | Internal ID of the application server process. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. This ID can also be useful when the TAC is debugging problems.                                                                                                                                                                                                                                                                                                                                         |
| Name                      | Name of the application server process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Node                      | Name of the node associated with the application server process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Local IP Address          | Local IP address that the application server process is currently using.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Local Port                | Local port number that the application server process is currently using.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Ignored                   | <p>Indicates whether to include the application server process when aggregating and displaying MWTM status information:</p> <ul style="list-style-type: none"> <li>• Uncheck the check box to include the application server process. This is the default setting.</li> <li>• Check the check box to exclude the application server process.</li> </ul> <p>Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.</p> |
| Notes                     | Indicates whether a note is associated with the application server process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Events (MWTM client only) | Indicates whether the application server process has received any events. If the application server process has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the application server process.                                                                                                                                                                                                                                                                    |
| Last Status Change        | Date and time that the status of the application server process last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Severity                  | Indicates the alarm severity for the chosen application server process. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                                                        |
| Status                    | <p>Current status of the application server process. Possible values are:</p> <ul style="list-style-type: none"> <li>• Unknown</li> <li>• Unmanaged</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                   |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status Reason | <p>Reason for the current status of the application server process.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Application Server Process Associations Table

The application server process associations table displays information about the application server process associations that the MWTM has discovered. To display the application server process associations table, choose **Summary Lists > App. Server Proc. Assoc.**

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The application server process associations table contains:

| Column             | Description                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID        | Internal ID of the application server process association. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems.    |
| Name               | Name of the application server process association.                                                                                                                                                                            |
| Node               | Name of the node associated with the application server process association.                                                                                                                                                   |
| Signaling Point    | Name of the signaling point associated with the application server process association.                                                                                                                                        |
| Application Server | Name of the application server associated with the application server process association.                                                                                                                                     |
| Protocol           | <p>Protocol associated with the application server process association. Possible values are:</p> <ul style="list-style-type: none"> <li><b>M3UA</b>—MTP3-User Adaptation.</li> <li><b>SUA</b>—SCCP-User Adaptation.</li> </ul> |

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Congestion Level          | <p>Indicates the level of congestion of an application server process association. An application server process association is congested if it has too many packets waiting to be sent. This condition could result from the failure of an element in your network.</p> <p>Possible values for the Congestion Level field are <code>None</code>, indicating no congestion, and 1 to 7, indicating levels of congestion from very light (1) to very heavy (7).</p>                                                                                                                         |
| Ignored                   | <p>Indicates whether to include the application server process association when aggregating and displaying MWTM status information:</p> <ul style="list-style-type: none"> <li>• Uncheck the check box to include the application server process association. This is the default setting.</li> <li>• Check the check box to exclude the application server process association.</li> </ul> <p>Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.</p> |
| Notes                     | Indicates whether a note is associated with the application server process association.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Events (MWTM client only) | Indicates whether the application server process association has received any events. If the application server process association has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the application server process association.                                                                                                                                                                                                                                                                    |
| Last Status Change        | Date and time that the status of the application server process association last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Severity                  | Indicates the alarm severity for the chosen application server process association. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                                                                                |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status        | <p>Current status of the application server process association. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Blocked</li> <li>• Down</li> <li>• Inactive</li> <li>• Pending</li> <li>• Shutdown</li> <li>• Unknown</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status Reason | <p>Reason for the current status of the application server process association.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

## Signaling Gateway Mated Pairs Table

The signaling gateway-mated pairs table displays information about the signaling gateway-mated pairs that the MWTM has discovered. To display the signaling gateway-mated pairs table, choose **Summary Lists > Signaling Gateway Mated Pairs**.

### Note

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The signaling gateway-mated pairs table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID               | Internal ID of the signaling gateway-mated pair. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems.                                                                                                                                                                                                                                                                                                                                            |
| Name                      | Name of the signaling gateway-mated pair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Mate                      | Name of the node associated with the mate of the signaling gateway-mated pair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Node                      | Name of the node associated with the signaling gateway-mated pair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Congestion Level          | <p>Indicates the congestion level of a signaling gateway-mated pair. A signaling gateway-mated pair is congested if it has too many packets waiting to be sent. This condition could result from the failure of an element in your network.</p> <p>Possible values for the Congestion Level field are <code>None</code>, indicating no congestion, and 1 to 7, indicating levels of congestion from very light (1) to very heavy (7).</p>                                                                                                                    |
| Ignored                   | <p>Indicates whether to include the signaling gateway-mated pair when aggregating and displaying MWTM status information:</p> <ul style="list-style-type: none"> <li>• Uncheck the check box to include the signaling gateway-mated pair. This is the default setting.</li> <li>• Check the check box to exclude the signaling gateway-mated pair.</li> </ul> <p>Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.</p> |
| Notes                     | Indicates whether a note is associated with the signaling gateway-mated pair.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Events (MWTM client only) | Indicates whether the signaling gateway-mated pair has received any events. If the signaling gateway-mated pair has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the signaling gateway-mated pair.                                                                                                                                                                                                                                                                    |
| Last Status Change        | Date and time that the status of the signaling gateway-mated pair last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Severity                  | Indicates the alarm severity for the chosen signaling gateway-mated pair. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                                                            |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Status        | <p>Current status of the signaling gateway-mated pair. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Down</li> <li>• Inactive</li> <li>• Shutdown</li> <li>• Unknown</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Status Reason | <p>Reason for the current status of the signaling gateway-mated pair.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Interfaces Table

The interfaces table displays information about the ITP or RAN interfaces that the MWTM has discovered. To display the interfaces table, choose **Summary Lists > Interfaces**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The interfaces table contains:

| Column      | Description                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID | Internal ID of the interface. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems. |
| Name        | Name of the interface. The node specifies the name of the interface.                                                                                                                           |

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                      | Name of the node with the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Interface Type            | Type of interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Send Speed                | Interface send speed in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Receive Speed             | Interface receive speed in bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Interface Index           | Unique numeric identifier of the interface. This identifier appears in the interface table (ifTable).                                                                                                                                                                                                                                                                                                                                                                                               |
| Maximum Packet Size       | The maximum packet size that traverses the interface in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Physical Address          | The physical address of the interface. If a physical address does not apply to the interface, N/A appears in the table cell.                                                                                                                                                                                                                                                                                                                                                                        |
| Ignored                   | <p>Indicates whether to include the interface when aggregating and displaying MWTM status information:</p> <ul style="list-style-type: none"> <li>• Uncheck the check box to include the interface. This is the default setting.</li> <li>• Check the check box to exclude the interface.</li> </ul> <p>Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.</p> |
| Notes                     | Indicates whether a note is associated with the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Events (MWTM client only) | Indicates whether the interface has received any events. If the interface has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the interface.                                                                                                                                                                                                                                                                    |
| Last Status Change        | Date and time that the status of the interface last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Severity                  | Indicates the alarm severity for the chosen interface. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                      |
| Status                    | <p>Current status of the interface. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Down</li> <li>• Inactive</li> <li>• Shutdown</li> <li>• Unknown</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                         |
| Admin Status              | <p>Desired state of the interface:</p> <ul style="list-style-type: none"> <li>• Up</li> <li>• Down</li> <li>• Testing</li> <li>• Shutdown</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                          |

| Column             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Operational Status | <p>Current operational state of the interface:</p> <ul style="list-style-type: none"> <li>• Up</li> <li>• Down</li> <li>• Testing</li> <li>• Unknown</li> <li>• Dormant</li> <li>• Not present</li> <li>• Lower layer down</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Status Reason      | <p>Reason for the current status of the interface.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOs/gm/apache/share/html/docs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Cards Table

The cards table displays information about the cards in the ONS 15454 IPRAN node that the MWTM has discovered. To display the cards table, choose **Summary Lists > Cards**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The cards table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID               | Internal ID of the card. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems.                                                                                                                                                                                                                                                                              |
| Name                      | Name of the card. The node specifies the name of the card.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Node                      | Name of the node in which the card resides.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Card Type                 | Type of the card in the node.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Model Name                | Model name of the card (can include the part number).                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Description               | Description of the card.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Slot Number               | The slot number of the card in the node.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Ignored                   | Indicates whether to include the card when aggregating and displaying MWTM status information: <ul style="list-style-type: none"> <li>• Uncheck the check box to include the card. This is the default setting.</li> <li>• Check the check box to exclude the card.</li> </ul> Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field. |
| Notes                     | Indicates whether a note is associated with the card.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Events (MWTM client only) | Indicates whether the card has received any events. If the card has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the card.                                                                                                                                                                                                                                                      |
| Last Status Change        | Date and time that the status of the card last changed.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Severity                  | Indicates the alarm severity for the chosen card. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                              |
| Status                    | Current status of the card. Possible values are: <ul style="list-style-type: none"> <li>• Active</li> <li>• Down</li> <li>• Inactive</li> <li>• Shutdown</li> <li>• Unknown</li> <li>• Warning</li> </ul> For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a>                                                                                                                                                               |

| Column           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status Reason    | <p>Reason for the current status of the card.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |
| Hardware Version | Hardware version of the card.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Firmware Version | Firmware version of the card.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Software Version | Software version of the card.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## RAN Backhauls Table

The RAN backhauls table displays information about the RAN backhauls that the MWTM has discovered. To display the RAN backhauls table, choose **Summary Lists > RAN Backhauls**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The RAN backhauls table contains:

| Column      | Description                                                                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID | Internal ID of the RAN backhaul. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems. |
| Name        | Name of the RAN backhaul.                                                                                                                                                                         |
| Node        | Name of the node on which this RAN backhaul resides.                                                                                                                                              |
| Location    | Location of the node (either at the cell site or the aggregation node site).                                                                                                                      |
| Peer Name   | Name of the object's peer.                                                                                                                                                                        |
| Peer Node   | Name of the node to which the peer object belongs.                                                                                                                                                |

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Type                      | Indicates whether the RAN backhaul is a normal backhaul or a virtual backhaul (see <a href="#">Creating Virtual RAN Backhauls, page 8-138</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| User Send Bandwidth       | The bandwidth that the user specified for the backhaul. Values for send and receive bandwidths will be different if the interface is asymmetrical. To change this value, see <a href="#">Editing Properties for a RAN-O Backhaul, page 7-41</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| User Receive Bandwidth    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| System Send Bandwidth     | The bandwidth that the system specifies for the backhaul. Values for send and receive bandwidths will be different if the interface is asymmetrical.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| System Receive Bandwidth  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Notes                     | Indicates whether a note is associated with the RAN backhaul.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Events (MWTM client only) | Indicates whether the RAN backhaul has received any events. If the RAN backhaul has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the RAN backhaul.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Last Status Change        | Date and time that the status of the RAN backhaul last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Severity                  | Indicates the alarm severity for the chosen RAN backhaul. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Status                    | <p>Current status of the RAN backhaul. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Failed</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Status Reason             | <p>Reason for the current status of the RAN backhaul.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

| Column                          | Description                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accept Threshold <sup>1</sup>   | The percentage threshold setting below which the backhaul is considered acceptable.                                                                                              |
| Warning Threshold <sup>1</sup>  | The percentage threshold setting beyond which the backhaul issues a warning. Subsequent warnings are issued only if the value goes below the Acceptable Threshold.               |
| Overload Threshold <sup>1</sup> | The percentage threshold setting beyond which the backhaul is considered overloaded. Subsequent overload messages are issued only if the value goes below the Warning Threshold. |

1. To change the default setting, see [Editing Properties for a RAN-O Backhaul, page 7-41](#).

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## RAN Shorthauls Table

The RAN shorthauls table displays information about the RAN shorthauls that the MWTM has discovered. To display the RAN shorthauls table, choose **Summary Lists > RAN Shorthauls**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The RAN shorthauls table contains:

| Column                      | Description                                                                                                                                                                                        |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID                 | Internal ID of the RAN shorthaul. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems. |
| Name                        | Name of the RAN shorthaul.                                                                                                                                                                         |
| Node                        | Name of the node to which the RAN shorthaul is connected.                                                                                                                                          |
| Type                        | Type of shorthaul, either GSM or UMTS.                                                                                                                                                             |
| Optimized                   | Whether or not the traffic is optimized.                                                                                                                                                           |
| Location                    | Location of the node (either at the cell site or the aggregation node site).                                                                                                                       |
| Peer Name                   | Name of the object's peer.                                                                                                                                                                         |
| Peer Node                   | Name of the node to which the peer object belongs.                                                                                                                                                 |
| Interface Type              | Type of interface (for example, a point-to-point interface or an ATM interface).                                                                                                                   |
| Send Speed                  | Send speed of the interface in bits per second (for example, 1.98M).                                                                                                                               |
| Receive Speed               | Receive Speed of the interface in bits per second (for example, 1.98M).                                                                                                                            |
| Interface Index             | Unique numeric identifier of the interface. This identifier appears in the interface table (ifTable).                                                                                              |
| Maximum Packet Size (bytes) | Maximum packet size on the interface in bytes.                                                                                                                                                     |
| Physical Address            | Physical address, if applicable, of the interface.                                                                                                                                                 |

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ignored                   | <p>Indicates whether to include the RAN shorthaul when aggregating and displaying MWTM status information:</p> <ul style="list-style-type: none"> <li>• Uncheck the check box to include the RAN shorthaul. This is the default setting.</li> <li>• Check the check box to exclude the RAN shorthaul.</li> </ul> <p>Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field.</p> |
| Notes                     | Indicates whether a note is associated with the RAN shorthaul.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Events (MWTM client only) | Indicates whether the RAN shorthaul has received any events. If the RAN shorthaul has received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the RAN shorthaul.                                                                                                                                                                                                                                                                    |
| Last Status Change        | Date and time that the status of the RAN shorthaul last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Severity                  | Indicates the alarm severity for the chosen RAN shorthaul. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                              |
| Last Status Change        | Date and time that the status of the shorthaul last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status Reason | <p>Reason for the current status of the RAN shorthaul.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## PWE3 Backhauls Table

The PWE3 backhauls table displays information about the PWE3 backhauls that the MWTM has discovered. A PWE3 backhaul is an object created for the logical grouping of PWE3 virtual circuits on a given node that have the same remote peer.

To display the PWE3 backhauls table, choose **Summary Lists > PWE3 Backhauls**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The PWE3 backhauls table contains:

| Column      | Description                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID | Internal ID of the PWE3 backhaul. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems. |
| Name        | Name of the PWE3 backhaul.                                                                                                                                                                         |
| Node        | Name of the node on which this PWE3 backhaul resides.                                                                                                                                              |
| Peer Name   | Name of the object's peer.                                                                                                                                                                         |
| Peer Node   | Name of the node to which the peer object belongs.                                                                                                                                                 |

| Column                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Status Reason                | <p>Reason for the current status of the PWE3 backhaul.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## PWE3 Virtual Circuits

The PWE3 virtual circuits table displays information about the PWE3 virtual circuits that the MWTM has discovered. To display the PWE3 virtual circuits table, choose **Summary Lists > PWE3 Virtual Circuits**.

### Note

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The PWE3 virtual circuits table contains:

| Column                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID               | Internal ID of the PWE3 virtual circuit. The internal ID is a unique ID for every object, that the MWTM assigns for its own internal use.                                                                                                                                                                                                                                                                                                                                                                             |
| Name                      | Name of the PWE3 virtual circuits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Node                      | Name of the node on which this PWE3 virtual circuits resides.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Peer Name                 | Name of the object's peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Peer Node                 | Name of the node to which the peer object belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Type                      | Indicates the service to be carried over this virtual circuit type.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PSN Type                  | Packet Switched Network (PSN) type on which this virtual circuit is carried.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ID                        | Virtual circuit identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Primary                   | Indicates whether the virtual circuit is primary. A virtual circuit that services traffic is considered primary. A virtual circuit that provides redundancy is not primary.                                                                                                                                                                                                                                                                                                                                           |
| Remote Interface String   | If provided by the protocol, displays the interface description of the remote side of the virtual circuit.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description               | Each virtual circuit is associated to an interface in the ifTable of the node as part of the service configuration. If specified, this field displays the description of the interface.                                                                                                                                                                                                                                                                                                                               |
| Ignored                   | Indicates whether to include the PWE3 virtual circuits when aggregating and displaying MWTM status information: <ul style="list-style-type: none"> <li>Uncheck the check box to include the PWE3 virtual circuits. This is the default setting.</li> <li>Check the check box to exclude the PWE3 virtual circuits.</li> </ul> Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field. |
| Notes                     | Indicates whether a note is associated with the PWE3 virtual circuits.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Events (MWTM client only) | Indicates whether the PWE3 virtual circuits have received any events. If the PWE3 virtual circuits have received an event, an icon appears in the table cell. Clicking the icon clears the event and takes you to the Recent Events tab for the PWE3 virtual circuits.                                                                                                                                                                                                                                                |
| Severity                  | Indicates the alarm severity for the chosen PWE3 virtual circuits. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                                                            |
| Last Status Change        | Date and time that the status of the virtual circuit last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Column               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Oper Status          | <p>Indicates the actual combined operational status of this virtual circuit. Oper Status is <i>up</i> if both Inbound Oper Status and Outbound Oper Status are in the <i>up</i> state.</p> <ul style="list-style-type: none"> <li>• Up</li> <li>• Down</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Inbound Oper Status  | Indicates the actual operational status of this virtual circuit in the inbound direction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Outbound Oper Status | Indicates the actual operational status of this virtual circuit in the outbound direction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Status Reason        | <p>Reason for the current status of the virtual circuits.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If you installed the MWTM in:</p> <ul style="list-style-type: none"> <li>• The default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• A different directory, then the help directory and file are located in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a></p> |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Access Point Names Table

The Access Point Names (APN) table displays information about the APNs the MWTM has discovered. To display the Access Point Names table, choose **Summary Lists > Access Point Names**.

**Note**

Some table columns are hidden by default. Right-click on the web table header to see all columns.

The APN table contains:

| Column      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID | Not shown by default, the Internal ID of the APN is a unique ID for every object the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems.                                                                                                                                                                                                                                                                      |
| Name        | Name of the APN node.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Index       | The Index assigned to the access point.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Ignored     | Indicates whether to include the APN when aggregating and displaying MWTM status information: <ul style="list-style-type: none"><li>• Uncheck the check box to include the APN. This is the default setting.</li><li>• Check the check box to exclude the APN.</li></ul> Users with authentication level Network Operator (level 3) and higher can edit this field. Users with authentication level Power User (level 2) and higher can edit the Unignore field. |
| Notes       | Indicates whether a note is associated with the APN.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Severity    | Indicates the alarm severity for the chosen APN. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Managing Alarms and Events, page 9-1</a> for more information.                                                                                                                                                                                                                         |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Software Versions Table

The Software Versions table lists the software versions for each node the MWTM manages. This option is Web-only and does not appear in the MWTM client. To display the Software Versions table, choose **Summary Lists > Software Versions**.

For details on the Software Versions table, see [Displaying Software Versions, page 11-14](#).

## IP Addresses Table

You can view a report of IP addresses of the nodes that the MWTM manages. You can also export this report to a CSV file. To display the IP Address report table, choose **Summary Lists > IP Addresses**. The IP Addresses report contains:

| Field or Column <sup>1</sup> | Description                                                                                                                                                             |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                         | Indicates whether the IP address displayed is the primary or secondary IP address for the device.                                                                       |
| Node                         | Name or IP address of the node.<br>To see more information for the node, click the node name.<br><b>Note</b> Each node can be associated with one or more IP addresses. |
| IP Address                   | IP address of the node.                                                                                                                                                 |
| Last Regular Poll Interval   | The last time this node was polled.                                                                                                                                     |
| SNMP Pollable                | Whether the node can be polled by SNMP (yes or no).                                                                                                                     |

1. To sort the column in descending order, click the column heading. Click again to sort the list in ascending order.

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Point Code Table

You can view current point code inventory reports using the MWTM. You can also export the reports.

### Current Point Code Inventory

The Point Codes Report page shows all point codes that are currently being used by all nodes that the MWTM detected. To display the Point Codes Report table, choose **Summary Lists > Point Code**.

The Point Codes Report table is sorted based on the information in the Node column. However, you can sort the table based on the information in any of the columns (see [Navigating Table Columns, page 5-23](#)).

| Field or Column | Description                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signaling Point | Signaling point that is currently being used by a node.<br>To sort the point codes by signaling point in descending order, click the <b>Signaling Points</b> heading.<br>Click again to sort the point codes in ascending order.               |
| Point Code      | Point code that is currently being used by a node.<br>To sort the point codes by point code in ascending order, click the <b>Point Codes</b> heading. This is the default display.<br>Click again to sort the point codes in descending order. |

| Field or Column | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Node            | Name or IP address of the node.<br>To see more information for the node, click the node name.<br>To sort the point codes by node in descending order, click the <b>Node</b> heading.<br>Click again to sort the point codes in ascending order.                                                                                                                                                                                                                                                       |
| Point Code Type | Type of point code: <ul style="list-style-type: none"><li>• <b>Primary</b>—Main point code used by a node.</li><li>• <b>Secondary</b>—Alternate or backup point code used by a node.</li><li>• <b>Capability</b>—Shared by more than one node, each of which is also assigned a real point code. Also called an alias point code.</li></ul> To sort the point codes by type in ascending order, click the <b>Point Code Type</b> heading.<br>Click again to sort the point codes in descending order. |

**Note**

For toolbar details, see [Using the Toolbar, page 11-6](#).

## Editing Properties

In the Edit Properties dialog box you can change the basic properties associated with these objects:

- Views
- Nodes
- Signaling Points (ITP only)
- Application Server Processes (ITP only)
- Backhauls (RAN-O only), (see [Editing Properties for a RAN-O Backhaul, page 7-41](#))

To edit a node's properties, right-click the node in the Node table in the right pane or in a view in the navigation tree, and choose **Edit > Properties** in the right-click menu. The MWTM displays the Edit Properties dialog box, which contains:

| Field or Button                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                            | <p>Name of the object.</p> <ul style="list-style-type: none"> <li>• <b>For application server processes only</b>—This field cannot be edited.</li> <li>• <b>For nodes only</b>—By default, this field displays the node's DNS name, which the MWTM discovered. However, if you modified your preferences to identify nodes by their IP addresses, then that is how the node is identified in this field. For more information, see <a href="#">Node Name Settings, page 5-5</a>.</li> <li>• <b>For signaling points only</b>—By default, this field displays the signaling point's point code and network name, which the MWTM discovered (for example, <b>1.22.0:net0</b>).</li> </ul> <p>You can also use this field to specify a new, more meaningful name for the node or ITP signaling point. Remember that:</p> <ul style="list-style-type: none"> <li>• You can change an object's name to a new name or IP address.</li> <li>• A new name can be from 1 to 30 characters, and can contain any letters (upper- or lowercase) and any numbers, as well as blank spaces ( ), hyphens (-), and underscores (_), but no periods (.). If you enter a name that is longer than 30 characters, or if you enter any other special characters or periods, the MWTM beeps and retains the current name.</li> <li>• If you enter a name that includes a period (.), the MWTM assumes that you are entering a new IP address. A new IP address must use the <i>x.x.x.x</i> format, where <i>x</i> is between 0 and 255, and must contain only numbers and periods (.), but no letters or special characters. If you enter an IP address that contains any letters or special characters, the MWTM beeps and retains the current IP address.</li> <li>• If you edit an object whose current name already contains invalid characters, the MWTM beeps and replaces the name with blanks. Enter a new name that uses only valid characters, or click <b>Cancel</b> to keep the existing name. If you click <b>Cancel</b>, the MWTM exits the Edit Properties dialog box without saving any changes to the Name, Connect Address, or Icon Name field.</li> <li>• If you leave the Name field blank, the MWTM reverts to the object's default name (dependent upon network type).</li> <li>• The new object's name <i>is</i> used when launching context-based applications, such as CiscoWorks. Therefore, if the new name that you enter is not the object's DNS name, and the application knows the object by its DNS name, context links into the application for that object might not work.</li> </ul> <p>When you click Save, all MWTM windows are updated automatically to reflect the new name.</p> |
| Connect Address<br>(Nodes only) | <p>Connect IP address to pass to the Telnet or SSH command.</p> <p>A new Telnet or SSH IP address must use the <i>x.x.x.x</i> format, where <i>x</i> is between 0 and 255, and must contain only numbers and periods, but no letters or special characters. If you enter a Telnet or SSH IP address that contains any letters or special characters, the MWTM beeps and retains the current IP address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Icon Name       | <p>Drop-down menu of graphic icons to assign to this object in topology maps. The MWTM automatically assigns an appropriate icon to each discovered node and to Unknown nodes; but, you can use this field to assign a different icon (for example, if you know that a given Unknown node is a mobile switching center).</p> <p><b>Note</b> Additional icon types appear in the list for user customization.</p> <p>When the MWTM discovers a single-instance node, it assigns the icon that corresponds to the node. When the MWTM discovers a multi-instance node, it assigns a separate icon for each unique instance.</p> <p>Icon names include the following:</p> <ul style="list-style-type: none"> <li>• ASP—Application server process</li> <li>• BSC—Base Station Controller <sup>1</sup></li> <li>• BTS—Base Transceiver Station <sup>1</sup></li> <li>• Building—Icon representing a collection of network objects in a building.</li> <li>• Cisco2600—Cisco 2650, Cisco 2650XM, Cisco 2651, Cisco 2651XM</li> <li>• Cisco2800</li> <li>• Cisco3845</li> <li>• Cisco7202, Cisco7204 (Cisco 7204, Cisco 7204VXR), Cisco7206 (Cisco 7206, Cisco 7206VXR)</li> <li>• Cisco7301, Cisco7304</li> <li>• Cisco7505, Cisco7507 (Cisco 7507, Cisco 7507mx, Cisco 7507z), Cisco7513 (Cisco 7513, Cisco 7513mx, Cisco 7513z)</li> </ul> |

| Field or Button          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Interface Structure | <p>Drop-down menu to configure the way the MWTM displays the physical interfaces of a node (excluding the ONS node). Choices include:</p> <ul style="list-style-type: none"> <li>Default—Restores the interface structure to the default setting for the node. For example, if the default structure is hierarchical, choosing this option restores the parent-child hierarchy in the Physical folder.</li> </ul> <p><b>Note</b> In cases where the MWTM cannot determine the interface hierarchy of a node, the MWTM sets its default structure to be flat (that is, all interfaces appear at the same level).</p> <ul style="list-style-type: none"> <li>Force Flat—Forces the interface structure of a node to be flat (that is, no hierarchy). All interfaces in the Physical folder appear at the same level.</li> <li>Force Hierarchical—Forces the interface structure of a node to be hierarchical (that is, to display parent-child relationships among interfaces).</li> </ul> <p>When you choose a different setting, the MWTM opens a popup with this message:</p> <p>A clean poll will be triggered if this value is changed.</p> <p>Click <b>OK</b> to close the popup. Click <b>Save</b> to activate your changes. You can view your changes in the MWTM client and web interfaces.</p> |
| Save                | Button to save the changes that you make to the object information. Updates all MWTM windows to reflect your changes, and exits the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Restore             | Button to restore changes that you make to the Name and Icon Name fields of the Edit Properties dialog box and leave the dialog box open.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Cancel              | Button to exit the dialog box without saving any changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Help                | Button to display online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

1. The MWTM does not manage BSC, BTS, RNC, or Node B objects but displays them in the topology window to help you visualize the network.

## Editing Properties for a RAN-O Backhaul

To edit the properties of a backhaul or virtual backhaul interface, right-click the backhaul object in the navigation tree or right pane, and choose **Edit > Properties** in the right-click menu.

The MWTM displays the Edit RAN Backhaul Properties dialog box, which contains:

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | <p>Name of the backhaul.</p> <p>You can use this field to specify a new, more meaningful name for the backhaul.</p> <p>Remember that:</p> <ul style="list-style-type: none"> <li>You can change a backhaul's name to a new name. A new name can contain: <ul style="list-style-type: none"> <li>From 1 to 30 characters</li> <li>Any letters (upper- or lowercase)</li> <li>Any numbers, as well as blank spaces ( ), dashes (-), underscores (_), or periods (.)</li> </ul> </li> </ul> <p>If you enter a name that is longer than 30 characters, or if you enter any other special characters, the MWTM beeps and retains the current name.</p> |

| Field or Button       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                       | <ul style="list-style-type: none"> <li>If you edit an object whose current name already contains invalid characters, the MWTM beeps and replaces the name with blanks. Enter a new name that uses only valid characters, or click <b>Cancel</b> to keep the existing name. If you click <b>Cancel</b>, the MWTM exits the Edit RAN Backhaul Properties dialog box without saving any changes to the Name, Connect Address, or Icon Name field.</li> </ul> <p>When you click Save, all MWTM windows are updated automatically to reflect the new name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Threshold Information | Displays slider bars for controlling the Acceptable, Warning, and Overloaded threshold settings. Left-click the slider and drag it to the desired setting for each threshold. See <a href="#">Threshold Information (RAN-O Only)</a> , page 8-38, for descriptions of these thresholds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Bandwidth Information | <p>Displays:</p> <ul style="list-style-type: none"> <li>User Send Bandwidth (bits or bytes)/sec</li> <li>User Receive Bandwidth (bits or bytes)/sec</li> </ul> <p>The user bandwidth is the value that you (the user) specify for the backhaul. Send and receive values will differ if the interface is asymmetrical.</p> <p>The backhaul appears in the backhaul real-time chart as a percentage of the User Bandwidth. The preset value for the User Bandwidth is the same as the System Bandwidth.</p> <p>When you change the User Bandwidth, you are changing the scale of the Y axis of the backhaul real-time chart in the Performance tab (see <a href="#">Displaying Backhaul Performance Statistics</a>, page 11-29). The X and Y values of the data do not change. The threshold ranges resize because they are percentages of User Bandwidth.</p> <p>The User Bandwidth represents 100%. Data points that are higher than the User Bandwidth will exceed 100%. The Y axis dynamically increases to display all data points. (See <a href="#">Why does my backhaul graph show greater than 100% for transmit traffic?</a>, page C-25.)</p> <ul style="list-style-type: none"> <li>System Send Bandwidth (bits/sec)</li> <li>System Receive Bandwidth (bits/sec)</li> </ul> <p>The system bandwidth is the value that the system specifies for the backhaul. Send and receive values will differ if the interface is asymmetrical. You cannot edit this field.</p> |
| Save                  | Saves changes that you make to the object information, updates all MWTM windows to reflect your changes, and exits the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Restore               | Restores changes that you make to the Name, and sets the Threshold Information, and Bandwidth Information fields to the system defaults. The dialog box is left open.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Cancel                | Exits the dialog box without saving any changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Help                  | Displays online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Attaching Notes

### Tip

Users with East Asian Languages configured on Windows are supported.

You use the MWTM to annotate an object, attaching a descriptive string to it. To attach a note to an object, in the:

- MWTM client, right-click the object in the navigation tree, then choose **Edit > Notes**. The Edit Notes dialog box appears.

- Web interface, left-click the object in the navigation tree, click the Notes tab, then click **Edit**. The text area becomes active.

**Note**

You can add a note to a node by using either the MWTM client or the web interface. You can also view the note from either interface.

The Edit Notes dialog contains:

| Field or Button   | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | Name of the object. You cannot edit this field.                                                                                                                                                                                                                                                                                                                               |
| Note Last Updated | Date and time the Notes field for this object was last updated. If no note is currently associated with this object, this field displays the value <code>Not Set</code> .<br>You cannot edit this field.                                                                                                                                                                      |
| Notes             | Notes to associate with this object. In this field, you can enter any important information about the object, such as a detailed description, location, service history, and so on.                                                                                                                                                                                           |
| Edit              | (Web interface only) Enables you to edit or add a note in the content area.                                                                                                                                                                                                                                                                                                   |
| Save              | Saves changes that you make to the object's notes, updates all MWTM windows to reflect your changes, and closes the dialog box.<br><br>When you annotate an object, the MWTM displays a note icon in the Notes column of all object tables for the annotated object, and the topology map in the topology window displays a note icon in the upper-left corner of the object. |
| Cancel            | Cancels the operation without saving any changes.                                                                                                                                                                                                                                                                                                                             |
| Help              | Displays online help for the dialog box.                                                                                                                                                                                                                                                                                                                                      |

**Related Topic**

- [Viewing Notes, page 7-43](#)

## Viewing Notes

You use the MWTM to view any notes that are associated with an object. To view a note:

- Select an object in the navigation tree, then click the Notes tab.
- Right-click an object in a window, then choose **View > Notes**. (The Notes option is dimmed if no note is associated with the chosen object.)

The MWTM displays the Notes tab for the chosen object, which shows:

- Notes associated with the object.
- The date and time the notes associated with the object were last updated, or the message `Not Set` if no notes are associated with the object.
- The message `No Notes` if no notes are associated with the object.

**Note**

The Notes tab is not supported on the DEFAULT View in the web interface.

For example, to view a note for a node, right-click the node in the Node table in the right pane or in a view in the navigation tree, then choose **View > Notes** in the right-click menu.

## Deleting Objects

After discovery, the objects in your network are known to the MWTM and added to the MWTM database. Physically deleting objects from your network is not the same as deleting them from the MWTM database. These sections describe the differences between deleting objects from your network, the MWTM database, and the MWTM discovery database, and the procedures for doing so:

- [Deleting an Object from Your Network, page 7-44](#)
- [Deleting an Object from the MWTM Database, page 7-44](#)

### Deleting an Object from Your Network

If you physically delete a known object from your network (for example, by powering down a node), it remains in the MWTM database, the MWTM labels it Unknown, and the system administrator is responsible for deleting it from the MWTM database, if you choose to do so.

#### Note

For nodes, the MWTM also labels all associated network objects Unknown because the MWTM attempts to poll the node and gets no response. For details on polling nodes, see [Polling Nodes, page 8-51](#).

### Deleting an Object from the MWTM Database

Typically, you delete an object from the MWTM database for one of these reasons:

- You physically deleted the object from your network. This is the most common reason for deleting a object from the MWTM database.
- The object state is one of these:

| Object    | States             | Applicable To          |
|-----------|--------------------|------------------------|
| Node      | Unknown, Unmanaged | ITP and IPRAN networks |
| Interface | Unknown            |                        |

| Object                                 | States             | Applicable To     |
|----------------------------------------|--------------------|-------------------|
| Signaling Point                        | Unknown, Unmanaged | ITP networks only |
| Linkset                                | Unknown            |                   |
| Link                                   | Unknown            |                   |
| Application Server                     | Unknown            |                   |
| Application Server Process             | Unknown            |                   |
| Application Server Process Association | Unknown            |                   |
| Signaling Gateway Mated Pair           | Unknown            |                   |

You are aware of the reason for the state, and you no longer want to see the object in the MWTM displays. For example, the object might be a test lab device, or it could be associated with an object that was removed from the network.

**Note** If an object has at least one adjacent object in Active, Discovering, Waiting, or Warning state, you cannot delete the object. If you try, the MWTM cancels the deletion.

- If you delete all associated connections to an Unmanaged object, the MWTM does not automatically delete the object. Instead, you must manually delete the object.

If you have physically deleted a known object from your network, and you then delete it from the MWTM, it is no longer in the MWTM database, it does not appear in MWTM windows, and it is not discovered when you run discovery.

If you have *not* physically deleted a known object from your network, and you delete it from the MWTM, any associated objects are also automatically deleted from the MWTM database (if applicable). However, at the next poll the MWTM finds the object (and any associated objects) and adds it back to the MWTM database, setting the status appropriately. If this happens, do not delete the object again. Instead, set it to Ignored. See [Ignoring and Unignoring Objects, page 7-48](#), for more information.

To delete an object from the MWTM database, use one of these procedures:

**Note**

If you delete an object from the MWTM database, the object is deleted for all MWTM clients and views that are connected to that MWTM server.

- Select one or more objects in a window, then choose **Edit > Delete** from the MWTM main menu.
- Right-click the object in a window, then select **Delete** from the right-click menu. (You cannot delete more than one object at a time from the right-click menu.)

The MWTM asks you to confirm the deletion. Click:

- **Yes** to delete the chosen objects. The MWTM deletes the objects from the MWTM database.
- **No** to return to the window without deleting any objects from the MWTM database.

You can also enter the **mwtm delete** commands from the command line interface to delete one or more objects from the MWTM database. See [mwtm delete, page B-24](#), for more information on the use of this command.

## Deleting a Node from the MWTM Discovery Dialog

If you want to completely eliminate a given node from the MWTM database, you can delete it from the MWTM Discovery dialog box, ensuring that the MWTM never even discovers it.

**Note**

If you delete a node from the MWTM Discovery dialog box, the node is deleted for *all* MWTM clients and views connected to that MWTM server.

To delete a node from the MWTM Discovery dialog box:

- Step 1** Choose **Network > Network Discovery** from the MWTM main menu. The Discovery dialog box appears.
- Step 2** Click the **Discovery** tab.
- Step 3** In the Discovered Nodes table, select the node that you want to delete.
- Step 4** Click **Delete Node**.

The MWTM deletes the nodes from the MWTM database, without asking for confirmation. The MWTM will no longer discover the nodes.

## Unmanaging and Managing Nodes or ITP Signaling Points

You use the MWTM to change a node or any associated signaling point to the Unmanaged state. You can also remove the Unmanaged state from these objects.

In some situations, you might not want a node or signaling point to appear in MWTM windows. However, you might be unable to delete the object from the MWTM database. For example, if:

- You have not physically deleted a known node or signaling point from your network, and you delete it from the MWTM, the object is removed from the poll list. However, at the next poll, the MWTM returns the object to the DEFAULT view. If you are using a custom view, the MWTM labels the object as new.
- A node has at least one adjacent node in Active, Discovering, Waiting, or Warning state; or, if a signaling point has at least one adjacent signaling point in Active or Warning state, you cannot delete the node or signaling point. If you try, the MWTM cancels the deletion.

In these situations, you can label the object as Unmanaged. When you set a node or signaling point to the Unmanaged state, the MWTM removes the object from the poll list.

**Note**

Users with authentication level Network Administrator (level 4) and higher can only Unmanage nodes or ITP signaling points.

Users with authentication level System Administrator (level 5) can Manage nodes or ITP signaling points.

**Note**

If you change a node or signaling point to the Unmanaged state, the object is Unmanaged for all MWTM clients and views connected to that MWTM server.

To label a node or signaling point Unmanaged:

**Step 1**

Choose the node or signaling point in a window.

**Note**

You cannot label a node Unmanaged if it has a Node Type of Unknown. If you select a node with a Node Type of Unknown, this menu option is dimmed and cannot be chosen. If you select more than one node, and at least one of them has a Node Type of Unknown, this menu option is grayed-out and cannot be chosen.

**Step 2**

Select **Unmanage** from the right-click menu. The MWTM labels the chosen node and any associated signaling point(s) Unmanaged and removes them from the poll list.

**Note**

When you set a node or signaling point to the Unmanaged state, the events for the object will continue to appear in the Events window. If you want to suppress events for unmanaged objects, see [Setting Alarm or Event Filters, page 9-11](#)).

You can also remove the Unmanaged status from a node or signaling point, when you are ready to return them to the MWTM poll list. To remove the Unmanaged status from an object:

**Step 1**

Select the node or signaling point in a window.

**Note**

You cannot remove the Unmanaged status from a node with a Node Type of Unknown. If you select a node with a Node Type of Unknown, then this menu option is dimmed and cannot be chosen. If you select more than one node, and at least one of them has a Node Type of Unknown, then this menu option is grayed-out and cannot be chosen.

**Step 2**

Select **Manage** from the right-click menu. The MWTM removes the Unmanaged status from the chosen node, returns it to the poll list, and polls it immediately.

**Note**

(ITP only) You can also remove the Unmanaged status from a signaling point, when you are ready to return the signaling point to the MWTM poll list. To remove the Unmanaged status from a signaling point, right-click a signaling point in a window, then select **Manage Node** from the right-click menu. The MWTM removes the Unmanaged status from the chosen signaling point, the node associated with the signaling point, and all other signaling points associated with that node. The MWTM then returns these objects to the poll list, and polls them immediately.

## Excluding Nodes or ITP Signaling Points from a View

To exclude a node or signaling point from the current view, right-click the node or signaling point in a window, then select **Exclude from View** in the right-click menu. The MWTM excludes the node or signaling point from the current view. See [Creating a New View, page 6-7](#), for more information about excluding objects from views.

## Ignoring and Unignoring Objects

You can instruct the MWTM to ignore an object when it aggregates and displays network data. Setting objects to Ignored prevents known problems from affecting MWTM displays for associated network objects. In effect, you are preventing a known problem from distracting you from other, more urgent network problems.

### Example:

You can set a node to Ignored before shutting down the node for maintenance.

### Note

If you set an object to Ignored, the object is ignored for all MWTM clients and views connected to that MWTM server.

Also, if you set an object to Ignored, make a note of the change, and remember to reset the object when the problem is corrected or the maintenance is complete.

- To set an object to Ignored:  
Right-click the object, then select **Ignore** from the menu  
or  
In the object window in the right pane, check the **Ignored** check box.
- To display all objects that are ignored in the object window, click the Ignored column heading. The MWTM displays all ignored objects at the top of the table.
- To set an object to ignore in the topology window, select an object in the topology map, then, in the left pane, select the **Ignored** check box for the object you want to ignore.
- To unignore an object, right-click the object, then select **Unignore** from the menu.

## CHAPTER 8

# Understanding Detailed Object Functions

---

You can use the Cisco Mobile Wireless Transport Manager (MWTM) to view detailed information about any discovered MWTM object, including its associated objects, status, notes, alarms and events, and so on.

To display detailed information for an object:

- 
- Step 1** In the navigation tree of the MWTM main window, click the turner  beside a view.
- Step 2** Click a node. The Details tab appears in the content pane (see [Viewing Details, page 8-9](#)).
- 

This chapter contains:

- [Viewing the Right-Click Menu for an Object, page 8-2](#)
- [Deploying a File Associated with an ITP Node or Signaling Point, page 8-6](#)
- [Viewing Management Interfaces and Physical Folders, page 8-7](#)
- [Viewing Status Contributors, page 8-7](#)
- [Viewing Details, page 8-9](#)
- [Editing SNMP IP Addresses for a Node, page 8-39](#)
- [Viewing Troubleshooting, page 8-40](#)
- [Viewing Alarms and Recent Events, page 8-42](#)
- [About Provisioning, page 8-43](#)
- [Polling Nodes, page 8-51](#)
- [Allowing and Disallowing Trap Processing for a Node, page 8-53](#)
- [Viewing Real-Time Data, page 8-54](#)
- [Viewing ITP Linkset Access Lists, page 8-117](#)
- [Viewing Data Specific for ITP Signaling Points, page 8-118](#)
- [Viewing RAN Shorthauls, page 8-137](#)
- [Viewing Chassis View, page 8-137](#)
- [Creating Virtual RAN Backhauls, page 8-138](#)
- [Viewing APN-Specific Tables, page 8-139](#)

**Note**

For details on viewing notes, see [Viewing Notes, page 6-43](#).

The MWTM displays detailed tabular information in the content area for the chosen object. Tabs will vary depending on the chosen object.

**Note**

The tabs automatically reflect updates for the object from the MWTM server.

## Viewing the Right-Click Menu for an Object

From the MWTM client, you can right-click on any object in an MWTM view, summary list, or topology map to view numerous menu options.

**Example:**

To see the right-click menu for a node, from the MWTM client, select a node in the navigation tree and right-click the mouse button.

These right-click menu options might be available on a given MWTM object:

| Menu Command                                      | Description                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show In New Window                                | Opens the Details window for the chosen object in a new window.                                                                                                                                                                                                                                                                                                                     |
| Edit > Properties                                 | Opens the Edit Properties dialog box for the chosen node or ITP signaling point.<br>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.                                                                                                                                                    |
| Edit > Notes                                      | Opens the Edit Notes dialog box for the chosen object.<br>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.                                                                                                                                                                              |
| Edit > SNMP IP Addresses                          | Opens the Edit SNMP IP Addresses dialog box for the chosen node.<br>This option is dimmed if the chosen node has no associated SNMP IP addresses.<br>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.                                                                        |
| Edit > Route Table<br>(ITP signaling points only) | Opens the Route Table dialog box, using a route table from the signaling point.<br>This option is not available if the node associated with chosen signaling point is in Unknown or Unmanaged status.<br>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.                    |
| Clear Event Icon                                  | Deletes the event icon  from MWTM displays for the chosen object, for this MWTM client only. The MWTM does not delete the actual events, but deletes only the event icon for the chosen object for this MWTM client.<br>This option is dimmed if the chosen object has no associated event icon. |

| Menu Command                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| View > Center in Topo            | Opens the topology window and displays the object in the center of the topology map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| View > Advanced Details (Web)    | Opens the MWTM web client to display the Statistics tab for the selected object. This option appears only for those objects that have advanced details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Menu Command                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Archived Events > Status Changes                             | Displays the archived status changes in a web browser.                                                                                                                                                                                                                                                                                                                                              |
| Archived Events > SNMP Traps                                 | Displays the archived SNMP traps in a web browser.                                                                                                                                                                                                                                                                                                                                                  |
| Archived Events > Status Changes and SNMP Traps              | Displays both the archived status changes and archived SNMP traps in a web browser.                                                                                                                                                                                                                                                                                                                 |
| Ignore                                                       | <p>Ignores the chosen object at the next polling cycle.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.</p>                                                                                                                                                                               |
| Unignore                                                     | <p>Stops ignoring the chosen object at the next polling cycle.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.</p>                                                                                                                                                                              |
| Performance History<br>(RAN-O backhauls and shorthauls only) | Displays historical performance charts for the chosen RAN-O backhaul or shorthaul in a web browser.                                                                                                                                                                                                                                                                                                 |
| Error History<br>(RAN-O backhauls and shorthauls only)       | Displays historical error charts for the chosen RAN-O backhaul or shorthaul in a web browser.                                                                                                                                                                                                                                                                                                       |
| Create Virtual RAN Backhaul<br>(RAN-O backhauls only)        | Opens the Virtual RAN Backhaul Editor. For details, see <a href="#">Creating Virtual RAN Backhauls, page 8-138</a> .                                                                                                                                                                                                                                                                                |
| Drill-Down > <i>List of windows</i>                          | <p>Opens a specific tab for the chosen object. Tabs listed start a poller.</p> <p>This option is not available if the node is in Unknown or Unmanaged status.</p>                                                                                                                                                                                                                                   |
| Latest Reports                                               | <p>Opens the latest reports for the object in a web browser. This option launches the web client's Report tab for object types of ITP and non-ITP nodes. For details on reports, see <a href="#">Chapter 13, "Managing Reports."</a></p> <p>This option is not available if the node is in Unknown or Unmanaged status.</p>                                                                         |
| Provision                                                    | Opens the web interface to the Provision tab of the chosen object (see <a href="#">Using the Provisioning Wizard, page 8-49</a> ).                                                                                                                                                                                                                                                                  |
| Launch                                                       | <p>Use it to launch:</p> <ul style="list-style-type: none"> <li>• CiscoView</li> <li>• CiscoWorks LMS Portal</li> <li>• Device Center</li> <li>• Node Home Page (This option is displayed based on the CiscoWorks user configuration)</li> </ul> <p><b>Note</b> You must first integrate these applications with the MWTM. See <a href="#">Integrating the MWTM with CiscoWorks, page 5-36</a>.</p> |
| Node Connect > Web Home Page                                 | <p>Displays the home page of the node in a new web browser window.</p> <p>This option does not appear in the right-click menu for Cisco Optical Networking System (ONS) nodes or nodes that are unknown.</p> <p>For a Cisco Data for Telecommunications (CDT) node, this option launches the CDT login web page.</p>                                                                                |

| Menu Command                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Connect > CLI via Telnet/SSH          | <p>Links to the node via Telnet or SSH.</p> <p>This option is dimmed if the chosen node has no IP addresses.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.</p>                                                                                                                                                                                                                                                                                                            |
| Node Connect > Launch CTC (ONS nodes only) | <p>Launches the Cisco Transport Controller (CTC) for managing ONS nodes. For more information about using the CTC, see the <i>CTC Launcher Application Guide</i> (<a href="http://www.cisco.com/en/US/products/hw/optical/ps2006/products_installation_and_configuration_guides_list.html">http://www.cisco.com/en/US/products/hw/optical/ps2006/products_installation_and_configuration_guides_list.html</a>).</p> <p>This option appears only for ONS nodes.</p>                                                                                                                    |
| Poll Node > Normal Poll                    | <p>Polls all chosen nodes or ITP signaling points, retaining all currently known objects.</p> <p>Normal Poll retains all objects associated with polled nodes or signaling points, even objects that have been deleted and are, therefore, in Unknown status.</p> <p>This option is dimmed if the chosen node has no IP addresses.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.</p> <p>See <a href="#">Performing a Normal Poll, page 8-51</a> for more information.</p> |
| Poll Node > Clean Poll                     | <p>Polls all chosen nodes or ITP signaling points and removes any Unknown network objects after the completion of the poll.</p> <p>Clean Poll removes all network objects from the node or signaling point at the completion of the poll.</p> <p>This option is dimmed if the chosen node has no IP addresses.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.</p> <p>See <a href="#">Performing a Clean Poll, page 8-52</a> for more information.</p>                      |
| Allow Trap Processing                      | <p>Enables the MWTM to process traps from the chosen node. This is the default setting.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 4) and higher.</p> <p>See <a href="#">Allowing and Disallowing Trap Processing for a Node, page 8-53</a> for more information.</p>                                                                                                                                                                                                                       |
| Disallow Trap Processing                   | <p>Prevents the MWTM from processing traps from the chosen node.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 4) and higher.</p> <p>See <a href="#">Allowing and Disallowing Trap Processing for a Node, page 8-53</a> for more information.</p>                                                                                                                                                                                                                                              |

| Menu Command                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unmanage                                       | <p>Labels the chosen node or signaling point Unmanaged.</p> <p><b>Note</b> If you change a node to the Unmanaged status, the MWTM removes adjacent legacy nodes from the topology map.</p> <p>You cannot label a node or signaling point Unmanaged if it has a Node Type of Unknown. If you select a node or signaling point with a Node Type of Unknown, then this menu option is dimmed and cannot be chosen.</p> <p>This option is dimmed if the chosen node has no IP addresses.</p> <p>Events for unmanaged objects will continue to appear in the Events window. To suppress events for unmanaged objects, set this option using an event filter (<a href="#">Setting Alarm or Event Filters, page 9-11</a>).</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.</p> |
| Manage                                         | <p>Removes the Unmanaged status from the chosen node or signaling point.</p> <p><b>Note</b> If you change a node to the Managed status, the MWTM adds adjacent legacy nodes back to the topology map.</p> <p>You cannot remove the Unmanaged status from a node with a Node Type of Unknown. If you select a node with a Node Type of Unknown, then this menu option is dimmed.</p> <p>This option is dimmed if the chosen node has no IP addresses.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level System Administrator (level 5).</p>                                                                                                                                                                                                                                                                            |
| Exclude from View                              | Excludes the chosen node or signaling point from the current view. See <a href="#">Creating a New View, page 7-7</a> for more information about excluding objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Deploy <i>Object</i> > From Archive (ITP only) | Launches the Deployment Wizard for the chosen node or ITP signaling point. See <a href="#">Deploying a File Associated with an ITP Node or Signaling Point, page 8-6</a> for more information about deploying to nodes or ITP signaling points.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Deploy <i>Object</i> > From File (ITP only)    | Launches the Deployment Wizard for the chosen node or ITP signaling point. See <a href="#">Deploying a File Associated with an ITP Node or Signaling Point, page 8-6</a> for more information about deploying to nodes or ITP signaling points.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Deploying a File Associated with an ITP Node or Signaling Point

You use the MWTM to deploy a GTT file or route table file associated with an ITP node or signaling point. To do so, right-click the ITP node or signaling point in a window, then choose **Deploy Object > From Archive** or **From File** in the right-click menu. The MWTM launches the Deployment Wizard for the chosen ITP node or signaling point. See [Deploying a Route Table File, page 14-12](#) and [Deploying a GTT File, page 15-33](#) for more information.

# Viewing Management Interfaces and Physical Folders

ITP, IPRAN, and mSEF nodes can contain:

- **Management Interfaces**—A folder that contains a list of interfaces that the MWTM uses to manage the node.
- **Physical**—A folder that contains a list of the physical interfaces and ONS cards that belong to the node. Slot numbers precede ONS card objects (for example, *15 - RAN\_SVC* or *02 - E1-42*).

All objects in the Physical folder are ignored *unless* they also appear outside of the Physical folder. The status of Physical folder-only objects do not contribute to the status of the parent node. These objects also do not appear in the Active Alarms list, but they do appear in the Event History. You can un-ignore the Physical folder, then re-ignore the objects you do not want to monitor. For more information, see [Why are objects in the Physical folder ignored?, page C-8](#)).

## Viewing Status Contributors

The Status Contributors section displays information about conditions that contribute to the overall status of the chosen object. To view the Status Contributors section, select an object in the navigation tree and click the Status Contributors tab in the right pane.

The content pane lists all objects contributing to the status of the object you have chosen in the navigation tree. A tooltip in the content pane lists the fully qualified domain name (FQDN) for the object.

To see which object types pertain to the Status Contributors tab, see [Appendix A, “Client Object Map Reference.”](#) If the object does not have any associated objects, the Status Contributors tab will not appear.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns except Internal ID.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Status Contributors table contains:

| Column      | Description                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID | Internal ID of the object. The internal ID is a unique ID for every object, assigned by the MWTM for its own internal use. It can also be useful when the TAC is debugging problems.                                                                                                                                                                                                   |
| Name        | Name of the object.                                                                                                                                                                                                                                                                                                                                                                    |
| Object Type | Type of network object.                                                                                                                                                                                                                                                                                                                                                                |
| Ignored     | Indicates whether the object should be included when aggregating and displaying MWTM status information: <ul style="list-style-type: none"><li>• Uncheck the check box to include the object. This is the default setting.</li><li>• Check the check box to exclude the object.</li></ul> This field can be edited by users with authentication level Power User (level 2) and higher. |
| Notes       | Indicates whether a note is associated with the object.                                                                                                                                                                                                                                                                                                                                |

| Column             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Events             | <p>Indicates whether the object has an associated recent event. (Even if the server purges all of the events associated with the object, the MWTM continues to display the event icon in this field.) To:</p> <ul style="list-style-type: none"> <li>Delete the event icon (orange triangle) from MWTM displays for a specific object, select the object and click the icon.</li> <li>Delete the event icon from MWTM displays for all objects, choose <b>Edit &gt; Clear All Events</b> from the MWTM main menu.</li> </ul> <p><b>Note</b> During Discovery, the MWTM might flag objects with an event icon. If the event icons are too distracting, use the <b>Edit &gt; Clear All Events</b> menu option to remove them.</p> |
| Last Status Change | Date and time that the status of the object last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Alarm Severity     | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Status Reason      | <p>Reason for the current status of the object.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If:</p> <ul style="list-style-type: none"> <li>• You installed the MWTM in the default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reasons, place the cursor over the cell to see the full text in a tooltip.</p> <p>The MWTM lists status reasons in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |

## Viewing Details

The Details section displays information such as naming and status details for the chosen object.

To view the Details section, select a view in the navigation tree, select an object, then click the Details tab in the right pane.

### Note

If the chosen object is a link, linkset, signaling gateway-mated pair, RAN-O backhaul or shorthaul, PWE3 backhaul, or PWE3 Virtual Circuit, the Details tab displays both peers of the chosen object in adjacent panes for easy comparison.

The Details tab contains these sections (in alphabetical order):

| Section                                                                                  | Applicable Object(s)                                                                                        | Applicable Network Type(s)       |

| <a href="#">Status Information</a>                                                       | All objects                                                                                                 | All networks                     |
| <a href="#">Threshold Information (RAN-O Only)</a>                                       | Backhauls, Nodes                                                                                            | RAN-O only                       |
| <a href="#">Uptime Information</a>                                                       | Nodes                                                                                                       | All networks                     |

**Tip**

If the pair of a link, linkset, or signaling gateway-mated pair is Unknown, and if the peer of a backhaul or shorthaul is Unknown, `Unknown` appears for the pair or peer fields in the Details tab.

## Address Information

The Address Information section for interfaces contains:

| Field       | Description                                              |
|-------------|----------------------------------------------------------|
| IP Address  | List of IP addresses that are assigned to the interface. |
| Subnet Mask | Subnet mask information of the interface.                |

## Advanced Details (Web)

The Advanced Details (Web) link appears in the MWTM client and launches the MWTM web interface to display the Statistics tab for the selected node. The Advanced Details (Web) link enables you to access advanced statistics that are available only for these nodes:

- CSG2 (see [Displaying CSG2 Real-Time Statistics, page 11-34](#))
- BWG (see [Displaying BWG Real-Time Statistics, page 11-48](#))
- HA (see [Displaying HA Real-Time Statistics, page 11-59](#))
- GGSN on a SAMI card (see [Displaying GGSN Real-Time Statistics, page 11-62](#))
- APN (see [APN, page 11-68](#))

## Association Information

The Association Information section for ITP application servers contains:

| Field                  | Description                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------|
| Number of ASPAs        | Number of application server process associations associated with this application server.        |
| Number of Active ASPAs | Number of active application server process associations associated with this application server. |

## Bandwidth Information

The Bandwidth Information section for RAN-O backhauls (and virtual backhauls) contains:

| Field                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Send Bandwidth (bits or bytes/sec)<br>User Receive Bandwidth (bits or bytes/sec)     | Bandwidth that the user specifies for the backhaul. Send and receive bandwidth values will be different if the interface is asymmetrical. By default, the user bandwidth is the same as the system bandwidth.<br><br><b>Note</b> When you change the User Bandwidth (see <a href="#">Editing Properties for a RAN-O Backhaul, page 6-41</a> ), you are changing the scale of the Y axis of the backhaul real-time chart in the Performance tab (see <a href="#">Displaying Backhaul Performance Statistics, page 11-29</a> ). The X and Y values of the data do not change. The threshold ranges resize because they are percentages of User Bandwidth. |
| System Send Bandwidth (bits or bytes/sec)<br>System Receive Bandwidth (bits or bytes/sec) | Bandwidth that the system specifies (as defined on the node) for the backhaul. Send and receive bandwidth values will be different if the interface is asymmetrical. You cannot edit this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Capability Point Code

The Capability Point Code section for ITP signaling points contains:

| Column            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Point Code        | Capability point code of the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Variant           | SS7 protocol variant. Valid variants are: <ul style="list-style-type: none"> <li>• ANSI</li> <li>• China</li> <li>• ITU</li> <li>• NTT</li> <li>• TTC</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Network Indicator | Determines the type of call. Valid values are: <ul style="list-style-type: none"> <li>• <b>National</b>—National-bound call. The MWTM routes national calls through the national network.</li> <li>• <b>NationalSpare</b>—National-bound call, used in countries in which more than one carrier can share a point code. In those countries, the <b>Network Indicator</b> differentiates networks.</li> <li>• <b>International</b>—International-bound call. The MWTM forwards international-bound calls to an STP pair that acts as an international gateway.</li> <li>• <b>InternationalSpare</b>—International-bound call, used in countries in which more than one carrier can share a point code. In those countries, the <b>Network Indicator</b> differentiates networks.</li> </ul> |
| Network Name      | Name of the network associated with the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Description

The Description section contains a description of the ITP signaling point or linkset. If the signaling point or linkset has no description, this section is blank. If the linkset is unknown, Unknown appears in the Description section.

## Descriptive Information

The Descriptive Information section for nodes and ONS cards contains:

| Field                | Description                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------|
| Software Description | Comprehensive information about the software that is installed on the node.                      |
| Software Version     | Version of software (for example, the ONS package or IOS version) that is installed on the node. |
| Description          | Full description of the ONS card (for example, RAN_SVC_LINE_CARD).                               |
| Hardware Version     | Version of the hardware of the ONS card (for example, VID=000, HwRev=29).                        |
| Firmware Version     | Version of the firmware on the ONS card, if applicable (for example, 12.2(24)St).                |

## General Information

The General Information section applies to these objects:

- [Interfaces, page 8-13](#)
- [ITP Application Servers, page 8-14](#)
- [ITP Linksets, page 8-15](#)

## Interfaces

The General Information section for interfaces contains:

| Field                                              | Description                                    |
|----------------------------------------------------|------------------------------------------------|
| Maximum Packet Size                                | Maximum packet size on the interface in bytes. |
| Send Speed (bits/bytes per second) <sup>1</sup>    | Interface send speed in bits per second.       |
| Receive Speed (bits/bytes per second) <sup>2</sup> | Interface receive speed in bits per second.    |

## ITP Application Servers

The General Information section for ITP application servers contains:

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol     | Protocol associated with the application server. Possible values are: <ul style="list-style-type: none"> <li>• <b>M3UA</b>—MTP3-User Adaptation.</li> <li>• <b>SUA</b>—SCCP-User Adaptation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| QoS          | Quality of service (QoS) class of the application server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Routing Key  | Routing key associated with the application server. The routing key is the value that determines the routing decisions that the application server makes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Traffic Mode | Method by which the application server forwards requests to its active application server processes. Possible values are: <ul style="list-style-type: none"> <li>• <b>overRide</b>—One application server process takes over all traffic for the application server, possibly overriding any currently active application server process in the application server.</li> <li>• <b>broadcast</b>—Every active application server process receives the same message.</li> <li>• <b>loadBind</b>—Each application server process shares in the traffic distribution with every other currently active application server process, based on application server process bindings.</li> <li>• <b>loadRndRobin</b>—Each application server process shares in the traffic distribution with every other currently active application server process, using a round-robin algorithm.</li> <li>• <b>undefined</b>—The traffic mode is not defined. The first application server process that becomes active defines the traffic mode.</li> </ul> |

## ITP Linksets

The General Information section for ITP linksets contains:

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Linkset Type | <p>Type of linkset, which the MWTM determines by examining the links defined in the linkset. Possible linkset types are:</p> <ul style="list-style-type: none"> <li>• <b>HSL</b>—The links in this linkset use the SS7-over-ATM (Asynchronous Transfer Mode) high-speed protocol.</li> <li>• <b>SCTPIP</b>—The links in this linkset use the Stream Control Transmission Protocol (SCTP) IP transport protocol.</li> <li>• <b>Serial</b>—The links in this linkset use the serial SS7 signaling protocol.</li> <li>• <b>Mixed</b>—The links in this linkset are of two or more types. (This configuration is not recommended.)</li> <li>• <b>Virtual</b>—The links in this linkset are virtual links, which connect signaling point instances running on the same node. The MWTM does not poll virtual linksets, nor does it display real-time data or accounting statistics for virtual linksets.</li> </ul> <p><b>Note</b> Prior to IOS release 12.2(23)SW1, the user manually created virtual linksets on multi-instance nodes. In and after that release, the system automatically creates virtual linksets.</p> <ul style="list-style-type: none"> <li>• <b>Other</b>—No links have been defined for this linkset.</li> </ul> |
| Inbound ACL  | <p>Inbound IP access control list (ACL) number for the linkset.</p> <p>If no inbound ACL exists for the linkset, this field displays <b>0</b>.</p> <p>If the linkset is a Virtual linkset, this field displays N/A.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Outbound ACL | <p>Outbound ACL number for the linkset.</p> <p>If no outbound ACL exists for the linkset, this field displays <b>0</b>.</p> <p>If the linkset is a Virtual linkset, this field displays N/A.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Interface Information

The Interface Information section for ITP links and application server process associations contains:

| Field                  | Description                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name         | (HSL, Serial, and Virtual links only) Name of the interface.                                                                       |
| Interface Index        | (HSL, Serial, and Virtual links only) Index into the SNMP interface table.                                                         |
| QoS                    | (SCTP links only) Quality of service (QoS) class of the link.                                                                      |
| Configured Local Port  | (SCTP links only) Local port for which the link was configured.                                                                    |
| Local Port             | (SCTP links only) If the link is active, local port that the link is currently using. If the link is not active, <b>0</b> appears. |
| Configured Remote Port | (SCTP links only) Remote port for which the link was configured.                                                                   |

| Field              | Description                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Actual Remote Port | (SCTP links only) If the link is active, remote port that the link is currently using. If the link is not active, <b>0</b> appears.                                                                                     |
| Protocol           | Protocol associated with the application server process association. Possible values are: <ul style="list-style-type: none"> <li><b>M3UA</b>—MTP3-User Adaptation.</li> <li><b>SUA</b>—SCCP-User Adaptation.</li> </ul> |

## IP Addresses for SNMP

The IP Addresses for SNMP section for nodes contains:

| Field                  | Description                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address             | IP addresses associated with this node, including the primary SNMP address and all backup IP addresses, that are intended for SNMP.                        |
| Last Regular Poll Time | Date and time of the last full poll of the node.<br>If the IP address has never been polled, the MWTM displays the description <code>Never Polled</code> . |
| SNMP Pollable          | Whether or not the IP address is used for SNMP polling.                                                                                                    |

If there are no IP addresses defined for the node that are intended for SNMP, this field displays the description:

`There are no other IP addresses defined for this node.`

## IP Addresses Not for SNMP

The IP Addresses Not for SNMP section for nodes contains:

| Field      | Description                                                                   |
|------------|-------------------------------------------------------------------------------|
| IP Address | IP addresses associated with this node that are <i>not</i> intended for SNMP. |

If no IP addresses are defined for the node that are not intended for SNMP, this field displays the description:

`There are no other IP addresses defined for this node.`

## Links Information

The Links Information section for ITP linksets contains:

| Field | Description                           |
|-------|---------------------------------------|
| Links | Total number of links in the linkset. |

| Field           | Description                                        |
|-----------------|----------------------------------------------------|
| Active Links    | Number of links in the linkset that are Active.    |
| Congested Links | Number of links in the linkset that are Congested. |

## Local IP Address Information

The Local IP Address Information section for ITP application server processes, application server process associations, SCTP links, and signaling gateway mated pairs contains:

| Field          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address     | <p>Local IP address that the object is using, or the primary IP address that is configured for the object, or both.</p> <p>The primary IP address is the first CS7 local IP address you configure in the node. For example, if you configure these IP addresses in the node:</p> <pre>cs7 local-peer 4180   local-ip 128.3.0.77   local-ip 128.3.0.254</pre> <p>then the MWTM uses 128.3.0.77 as the primary IP address. If someone deletes this IP address from the node configuration, or adds a new IP address to the beginning of the list, the MWTM detects the change and automatically updates this field to reflect the new primary IP address.</p> |
| Interface Name | Name of the interface to which the IP address is assigned. If the object has no interface name, this field is blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Status         | <p>Current status of the IP address. Possible values are:</p> <ul style="list-style-type: none"> <li> <b>Active</b>—The IP address is currently fully functional.</li> <li> <b>Inactive</b>—The IP address is not currently functional.</li> </ul>                                                                                                                                                                                                                                    |
| Cfg            | <p>Indicates whether this local IP address was configured for the object. Possible values are:</p> <ul style="list-style-type: none"> <li><b>Yes</b>—This is the configured local IP address, and the object is currently using it.</li> <li><b>(blank)</b>—This is not the configured local IP address.</li> </ul>                                                                                                                                                                                                                                                                                                                                         |
| Actual         | <p>Indicates whether this local IP address is currently being used by the object. Possible values are:</p> <ul style="list-style-type: none"> <li><b>Yes</b>—The object is currently using this IP address.</li> <li><b>(blank)</b>—The object is not using this IP address.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                     |

## Naming Information

The Naming Information section applies to these objects:

- [Nodes, page 8-18](#)
- [Cards, page 8-19](#)
- [Interfaces, page 8-19](#) (including RAN backhauls and shorthauls)
- [ITP Application Servers, page 8-20](#)
- [ITP Application Server Processes, page 8-20](#)

- [ITP Application Server Process Associations, page 8-20](#)
- [ITP Links, page 8-20](#)
- [ITP Linksets, page 8-21](#)
- [ITP Signaling Gateway-Mated Pairs, page 8-21](#)
- [ITP Signaling Points, page 8-21](#)

## Nodes

The Naming Information section for nodes contains:

| Field                      | Description                                                                                                                                                                                                                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Display Name               | Name of the node.                                                                                                                                                                                                                                                                                             |
| IP Address or DNS Hostname | IP address or DNS name of the node, as the MWTM discovered it. However, if you modified your preferences to identify nodes by their IP addresses, then this is method of node identification in this field. For more information, see <a href="#">Node Name Settings, page 5-5</a> .                          |
| Node Type                  | Type of node. See <a href="#">Nodes Table, page 6-5</a> , for a list of the available node types.                                                                                                                                                                                                             |
| Feature                    | Primary function performed by the node type. See <a href="#">Nodes Table, page 6-5</a> , for a list of the available features.                                                                                                                                                                                |
| Chassis Type (ONS only)    | Description of the chassis hardware type (for example, ONS 15454 SDH ETSI).<br><b>Note</b> This field appears only for the ONS chassis.                                                                                                                                                                       |
| Serial Number              | Serial number of the node.                                                                                                                                                                                                                                                                                    |
| CLLI Code (ITP only)       | COMMON LANGUAGE Location Identification Code for the node. A CLLI code is a standardized 11-character identifier that uniquely identifies the geographic location of the node. If the node has no CLLI code configured, this field is blank.                                                                  |
| SNMP Access (IP-RAN only)  | Indicates the type of SNMP access: <ul style="list-style-type: none"> <li>• <b>In-band</b>—Access is through the backhaul interface (cell site).</li> <li>• <b>Out of band</b>—Access is external to the backhaul interface (aggregation site).</li> <li>• <b>Undefined</b>—Access is not defined.</li> </ul> |
| Location (RAN-O only)      | The location of the SNMP settings, whether at the cell site (BSC) or the aggregation node site (BTS). <sup>1</sup>                                                                                                                                                                                            |

## Cards

The Naming Information section for ONS cards contains:

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                   | Name of the card.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Card Type <sup>1</sup> | Type of card. Card types for ONS include: <ul style="list-style-type: none"> <li>• <b>TCC</b>—Control</li> <li>• <b>E1</b>—Ethernet</li> <li>• <b>STM1</b>—Synchronous Transport Module</li> <li>• <b>DS1</b>—Digital Signal</li> <li>• <b>OC3</b>—Optical</li> <li>• <b>XC</b>—Cross-connect</li> <li>• <b>RAN_SVC</b>—RAN Service</li> <li>• <b>ALM_PWR</b>—Alarm and Power</li> <li>• <b>CRFT_TMG</b>—Craft Terminal</li> <li>• <b>AICI</b>—Alarm Interface Controller</li> </ul> |
| Model Name             | Model name of the card (for example, PartNum=800-26651-01).                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Slot Number            | Slot number of the card in the ONS chassis.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Serial Number          | Serial number of the card.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Interfaces

The Naming Information section for interfaces (which includes RAN backhaul and shorthaul interfaces) contains:

| Field                | Description                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                 | Name of the interface.                                                                                                                                                                                            |
| Node                 | Name of the node to which the interface belongs.                                                                                                                                                                  |
| Physical Address     | Physical address of the interface.                                                                                                                                                                                |
| Interface Index      | Interface index number.                                                                                                                                                                                           |
| Interface Type       | Interface type.                                                                                                                                                                                                   |
| RAN Connection To    | RAN connection that is associated with the interface.<br><b>Note</b> Not visible for RAN backhauls.                                                                                                               |
| Virtual RAN Backhaul | Whether the RAN backhaul is a virtual backhaul. For more information about virtual RAN backhauls, see <a href="#">Creating Virtual RAN Backhauls, page 8-138</a> .<br><b>Note</b> Visible only for RAN backhauls. |

## ITP Application Servers

The Naming Information section for ITP application servers contains:

| Field           | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| Name            | Name of the application server.                                     |
| Node            | Name of the node associated with the application server.            |
| Signaling Point | Name of the signaling point associated with the application server. |

## ITP Application Server Processes

The Naming Information section for ITP application server processes contains:

| Field      | Description                                                               |
|------------|---------------------------------------------------------------------------|
| Name       | Name of the application server process.                                   |
| Node       | Name of the node associated with the application server process.          |
| Local Port | Local port number that the application server process is currently using. |

## ITP Application Server Process Associations

The Naming Information section for ITP application server process associations contains:

| Field                      | Description                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------|
| Name                       | Name of the application server process association.                                                |
| Node                       | Name of the node associated with the application server process association.                       |
| Signaling Point            | Name of the signaling point associated with the application server process association.            |
| Application Server         | Name of the application server associated with the application server process association.         |
| Application Server Process | Name of the application server process associated with the application server process association. |

## ITP Links

The Naming Information section for ITP links contains:

| Field           | Description                                           |
|-----------------|-------------------------------------------------------|
| Node            | Name of the node associated with the link.            |
| Signaling Point | Name of the signaling point associated with the link. |
| Linkset         | Name of the linkset associated with the link.         |

| Field | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLC   | Signaling link code (SLC) ID for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Type  | Type of link. Possible link types are: <ul style="list-style-type: none"> <li>• <b>HSL</b>—The link uses the SS7-over-ATM (Asynchronous Transfer Mode) high-speed protocol.</li> <li>• <b>SCTPIP</b>—The link uses the Stream Control Transmission Protocol (SCTP) IP transport protocol.</li> <li>• <b>Serial</b>—The link uses the serial SS7 signaling protocol.</li> <li>• <b>Virtual</b>—The link is a virtual link, which connects signaling point instances running on the same node. The MWTM does not poll virtual links, nor does it display real-time data or accounting statistics for virtual links.</li> </ul> |

## ITP Linksets

The Naming Information section for ITP linksets contains:

| Field            | Description                                                 |
|------------------|-------------------------------------------------------------|
| Name             | Name of the linkset.                                        |
| Node             | Node associated with the linkset.                           |
| Signaling Point  | Signaling point associated with the linkset.                |
| Local Point Code | Point code of the primary signaling point for the linkset.  |
| Adj Point Code   | Point code of the adjacent signaling point for the linkset. |

## ITP Signaling Gateway-Mated Pairs

The Naming Information section for ITP signaling gateway-mated pairs contains:

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name       | Name of the signaling gateway-mated pair.                                                                                                                                                                                                                                                                                                                                  |
| Node       | Name of the node associated with the signaling gateway-mated pair.                                                                                                                                                                                                                                                                                                         |
| Is Passive | Indicates whether the signaling gateway-mated pair can initiate the connection to the mate: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The signaling gateway-mated pair is passive, and cannot initiate the connection to the mate.</li> <li>• <b>No</b>—The signaling gateway-mated pair is not passive, and can initiate the connection to the mate.</li> </ul> |

## ITP Signaling Points

The Naming Information section for ITP signaling points contains:

| Column | Description                                           |
|--------|-------------------------------------------------------|
| Name   | Name of the signaling point.                          |
| Node   | Name of the node associated with the signaling point. |

| Column          | Description                                                 |
|-----------------|-------------------------------------------------------------|
| Network Name    | Name of the network associated with the signaling point.    |
| Instance Number | Number of the instance associated with the signaling point. |

## Point Code

The Point Code section for ITP signaling points contains:

| Column            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Point Code        | Primary and secondary point codes of the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Variant           | SS7 protocol variant. Valid variants are: <ul style="list-style-type: none"> <li>• ANSI</li> <li>• China</li> <li>• ITU</li> <li>• NTT</li> <li>• TTC</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Network Indicator | Determines the type of call. Valid values are: <ul style="list-style-type: none"> <li>• <b>National</b>—National-bound call. The MWTM routes national calls through the national network.</li> <li>• <b>NationalSpare</b>—National-bound call, used in countries in which more than one carrier can share a point code. In those countries, the Network Indicator differentiates networks.</li> <li>• <b>International</b>—International-bound call. The MWTM forwards international-bound calls to an STP pair that acts as an international gateway.</li> <li>• <b>InternationalSpare</b>—International-bound call, used in countries in which more than one carrier can share a point code. In those countries, the Network Indicator differentiates networks</li> </ul> |
| Network Name      | Name of the network associated with the signaling point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Polling Information

The Polling Information section for nodes contains:

| Field                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process Traps                  | Indicates whether traps are processed. To change this setting, check or uncheck the check box in the Process Traps column of the Nodes table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Trap Polling                   | <p>Indicates whether or not trap polling is enabled for this node. By default, trap polling is enabled for all nodes except for IP-RAN nodes. This field is read only.</p> <p>For IP-RAN nodes, you can modify this setting by using the following commands:</p> <ul style="list-style-type: none"> <li>To enable trap polling for this node, set ipran-mib snmp-access to inBand on the node.</li> <li>To disable trap polling for this node, set ipran-mib snmp-access to outOfBand on the node.</li> </ul> <p><b>Note</b> For information about in-band and out-of-band management, see <a href="#">IP-RAN Specific FAQs, page C-20</a>.</p> |
| Report Polling                 | <p>Indicates whether or not report polling is enabled for this node. This field is read-only for the web client, but editable in the java client for ITP nodes.</p> <p>For IP-RAN nodes, you can modify this setting by using the following commands:</p> <ul style="list-style-type: none"> <li>To enable report polling for this node, set ipran-mib location to aggSite on the node.</li> <li>To disable report polling for this node, set ipran-mib location to cellSite on the node.</li> </ul> <p>For all other nodes, this field is not editable.</p>                                                                                    |
| First Discovered               | Date and time that the MWTM first discovered the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Last Poll IP Address           | <p>Last IP address that was polled for this node.</p> <p>For an unmanaged node, this field is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Last Full Poll Time            | <p>Date and time of the last full poll of the node for node-related MIBs (as opposed to a demand poll for just one associated object's data).</p> <p>For a node that is not an ITP, IPRAN, or mSEF node, this field is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |
| Last MWTM Poll Response (secs) | <p>Time, in seconds, taken by this node to respond to the last MWTM poll request.</p> <p>For a node that is not an ITP, IPRAN, or mSEF node, this field is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Avg. MWTM Poll Response (secs) | <p>Average time, in seconds, taken by this node to respond to MWTM poll requests.</p> <p>For a node that is not an ITP, IPRAN, or mSEF node, this field is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Protection Information

The Protection Information section for ONS nodes and cards contains:

| Column           | Description                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------|
| Card Type        | The type of card.<br>This column appears only when you select the ONS node in the navigation tree.                       |
| Protected Slot   | Slot number of the protected card, which is configured for protection. <sup>1</sup>                                      |
| Protecting Slot  | Slot number of the card that is protecting one or more cards.                                                            |
| Configured State | The configured state of the chosen card: Working or Protecting. The card is working normally or protecting another card. |
| Current State    | The current state of the chosen card: Active or Standby.                                                                 |

1. See the *Cisco ONS 15454 Product Overview* for information about protection schemes for ONS cards:

## PWE3 Information

The PWE3 Information section for PWE3 virtual circuits contains:

| Column                        | Description                                          |
|-------------------------------|------------------------------------------------------|
| Type                          | Type of service card carried over.                   |
| PSN Type                      | PSN type on which the virtual circuit is carried.    |
| Virtual Circuit ID Is Primary | The virtual circuit identifier.                      |
| Is Primary                    | Indicates whether the object is a primary or backup. |
| Remote Interface String       | Remote interface string for the virtual circuit ID   |
| Description                   | Description of the virtual circuit                   |

## QoS Information

The QoS Information section for ITP signaling points contains:

| Column | Description                                                                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QoS    | Quality of service (QoS) class of the signaling point. Valid QoS classes range from <b>1</b> through <b>7</b> . ALL indicates that the signaling point accepts all QoS classes. |
| ToS    | Type of service (ToS) of the signaling point.                                                                                                                                   |
| DSCP   | IP differentiated-services-code-point (DSCP) of the signaling point.                                                                                                            |

## RAN Information

**Note**

This subsection appears only for configured RAN interfaces (GSM Abis and UMTS Iub interfaces).

The RAN Information section contains:

| Field             | Description                                       |
|-------------------|---------------------------------------------------|
| Protocol          | Protocol of the interface (GSM-Abis or UMTS-Iub). |
| Local IP Address  | IP address of the local node.                     |
| Local Port        | Local port that the interface uses.               |
| Remote IP Address | IP address of the remote (peer) node.             |
| Remote Port       | Remote port that the interface uses.              |

## Remote IP Address Information

The Remote IP Address Information section for ITP application server process associations, SCTP links, and signaling gateway mated pairs contains:

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | Remote IP address associated with the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Type       | Indicates whether this designated primary IP address is for the object (Primary), or is the IP address currently being used by the object (Effective), or both (Primary and Effective).<br><br>Usually, the same IP address is Primary and Effective. However, if the primary IP address is down for some reason, the object uses a different IP address and is labeled Effective.                                                                                                                                              |
| Status     | Current status of the IP address. Possible values are: <ul style="list-style-type: none"><li>• <b>Active</b>—The IP address is currently fully functional.</li><li>• <b>Inactive</b>—The IP address is not currently functional.</li></ul>                                                                                                                                                                                                                                                                                      |
| Cfg        | (12.2(4)MB10 and later) Indicates whether this remote IP address was configured for the object. Possible values are: <ul style="list-style-type: none"><li>• <b>Yes</b>—This is the configured remote IP address, and the object is currently using it.</li><li>• <b>(blank)</b>—This is not the configured remote IP address.</li><li>• <b>N/A</b>—The MWTM cannot determine whether this is the configured remote IP address.</li></ul> For Cisco IOS software releases prior to 12.2(4)MB10, this field always displays N/A. |
| Actual     | Indicates whether the object is currently using this remote IP address. Possible values are: <ul style="list-style-type: none"><li>• <b>Yes</b>—The object is using the IP address.</li><li>• <b>(blank)</b>—The object is not using the IP address.</li></ul>                                                                                                                                                                                                                                                                  |

## Uptime Information

The Uptime Information section for nodes contains:

| Field         | Description                                                |
|---------------|------------------------------------------------------------|
| Uptime        | Time the node is up, in days, hours, minutes, and seconds. |
| Reboot Reason | Reason for the last reboot of the node.                    |

## Status Information

The Status Information section applies to these objects:

- [Nodes, page 8-26](#)
- [Interfaces and Cards, page 8-27](#) (includes RAN backhauls and shorthauls)
- [ITP Application Servers, page 8-30](#)
- [ITP Application Server Processes, page 8-32](#)
- [ITP Application Server Process Associations, page 8-32](#)
- [ITP Links, page 8-34](#)
- [ITP Linksets, page 8-35](#)
- [ITP Signaling Gateway Mated Pairs, page 8-36](#)
- [ITP Signaling Points, page 8-37](#)

## Nodes

The Status Information section for nodes contains:

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is Ignored              | Indicates whether the node is Ignored (that is, whether to include the node when aggregating and displaying MWTM status information).                                                                                                                                                                                                                                                               |
| Alarm Severity          | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                                                                                                                                                                                                            |
| MTP3 Offload (ITP only) | Indicates whether MTP3 offload is configured for the node. Possible values are: <ul style="list-style-type: none"> <li>• <b>Main</b>—The MTP3 management function operates only on the main processor.</li> <li>• <b>Offload</b>—The MTP3 management function operates on the main processor and on other available processors.</li> <li>• <b>N/A</b>—MTP3 offload cannot be determined.</li> </ul> |

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NSO Status (ITP only) | <p>Current NSO status of the node, with a color-coded background. Possible values are:</p> <p> <b>Local</b>—NSO is configured and the secondary peer is in the appropriate status for failover support.</p> <p> <b>Local</b>—NSO is configured, but the secondary peer is <i>not</i> in the appropriate status for failover support.</p> <p> <b>None</b>—The node and MIB support NSO, but NSO is not configured on the ITP.</p> <p> <b>N/A</b>—The node and MIB do not support NSO, or the MWTM cannot determine the NSO status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Status                | <p>Current status of the node. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Discovering</li> <li>• Polling</li> <li>• Unknown</li> <li>• Unmanaged</li> <li>• Waiting</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Last Status Change    | Date and time that the status of the node last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Status Reason         | <p>Reason for the current status of the signaling gateway-mated pair.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If:</p> <ul style="list-style-type: none"> <li>• You installed the MWTM in the default directory, <i>/opt</i>, then the file is in the <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |

## Interfaces and Cards

The Status Information section for interfaces (including RAN backhaul and shorthaul interfaces) and cards contains:

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Is Ignored                      | Indicates whether the interface or card is Ignored (that is, whether the interface or card should be included when aggregating and displaying MWTM status information).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Alarm Severity                  | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Admin Status                    | Displays the administrative status of the interface. Status can be: <ul style="list-style-type: none"> <li> Unknown—Unknown administrative status.</li> <li> Up—Administratively up.</li> <li> Shutdown—Administratively down.</li> <li> Testing—Administrator is testing the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Operational Status              | Displays the operational status of the interface. Status can be: <ul style="list-style-type: none"> <li> Unknown—Unknown operational status.</li> <li> Up—Interface is up.</li> <li> Down—Interface is down.</li> <li> Testing—Interface is in test mode.</li> <li> Dormant—Interface is dormant.</li> <li> Not Present—An interface component is missing.</li> <li> Lower Layer Down—An interface is down because of a lower-layer interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Connect State<br>(for GSM Abis) | Displays the connection state of a GSM interface. States can be: <ul style="list-style-type: none"> <li> Connected—The node is monitoring local and remote alarm status.</li> <li> Disconnected—The system ignores the local alarm status. The local transmitter on the shorthaul is disabled. Capability messages are transmitted to the remote describing the provisioning. The system stays disconnected until the remote capabilities are known and the peer state is transitioning to connected.</li> <li> Send Connect—One or more attempts have been made to connect to remote peer.</li> <li> Receive Connect—The local-peer has received a connect request from the remote-peer.</li> <li> Connect Rejected—Connection was rejected.</li> <li> ACK Connect—The initial connect request was sent and acknowledged by remote-peer. The local-peer is now waiting for a connect request from the remote-peer.</li> <li> Check Connect—The local peer has reason to believe its remote peer has failed. Additional tests are being processed to verify peer's state.</li> </ul> |

| Field                                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Last Status Change | Date and time of last change to status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Status Reason      | <p>Reason for the current status of the interface or card.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If:</p> <ul style="list-style-type: none"> <li>• You installed the MWTM in the default directory, <i>/opt</i>, then the file is in the <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |

## ITP Application Servers

The Status Information section for ITP application servers contains:

| Field          | Description                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is Ignored     | Indicates whether the application server is Ignored (that is, whether the application server should be included when aggregating and displaying MWTM status information). |
| Alarm Severity | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                  |

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Is Ignored         | Indicates whether the application server process is Ignored (that is, whether to include the application server process when aggregating and displaying MWTM status information).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Alarm Severity     | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Last Status Change | Date and time that the status of the application server process last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Status             | <p>Current status of the application server process. Possible values are:</p> <ul style="list-style-type: none"> <li>Unknown</li> <li>Unmanaged</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Status Reason      | <p>Reason for the current status of the signaling gateway-mated pair.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. To:</p> <ul style="list-style-type: none"> <li>You installed the MWTM in the default directory, <i>/opt</i>, then the file is in the <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |

## ITP Application Server Process Associations

The Status Information section for ITP application server process associations contains:

| Field          | Description                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is Ignored     | Indicates whether the application server process association is Ignored (that is, whether the application server process association should be included when aggregating and displaying MWTM status information). |
| Alarm Severity | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                          |

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Congestion Level   | <p>Indicates the level of congestion on the application server process association. An application server process association is congested if it has too many packets waiting to be sent. This condition could be caused by the failure of an element in your network.</p> <p>Possible values for the Congestion Level field are None, indicating no congestion, and <b>1</b> to <b>7</b>, indicating levels of congestion from very light (<b>1</b>) to very heavy (<b>7</b>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Instance Status    | <p>Current status of the protocol associated with the application server process, with a color-coded background. Possible values are:</p> <ul style="list-style-type: none"> <li> Active—The protocol is available.</li> <li> Shutdown—An administrator has forced the protocol to an unavailable state.</li> <li> Unknown—The MWTM cannot determine the current status of the protocol.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Is Ignored         | Indicates whether the link is Ignored (that is, whether the link should be included when aggregating and displaying MWTM status information).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Alarm Severity     | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Last Status Change | Date and time that the status of the link last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Status             | <p>Current status of the link. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Blocked</li> <li>• Failed</li> <li>• InhibitLoc</li> <li>• InhibitRem</li> <li>• Shutdown</li> <li>• Unknown</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Status Reason      | <p>Reason for the current status of the link.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. To:</p> <ul style="list-style-type: none"> <li>• You installed the MWTM in the default directory, <i>/opt</i>, then the file is in the <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |
| Congestion Level   | <p>Indicates the level of congestion on the link. A link is congested if it has too many packets waiting to be sent. This condition could be caused by the failure of an element in your network.</p> <p>Possible values for the Congestion Level field are None, indicating no congestion, and <b>1</b> to <b>7</b>, indicating levels of congestion from very light (<b>1</b>) to very heavy (<b>7</b>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Field               | Description                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Receive Utilization | Indicates whether, on average, the link is under its configured receive utilization threshold (UnderThreshold) or over the threshold (OverThreshold). |
| Send Utilization    | Indicates whether, on average, the link is under its configured send utilization threshold (UnderThreshold) or over the threshold (OverThreshold).    |

## ITP Linksets

The Status Information section for ITP linksets contains:

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is Ignored         | Indicates whether the linkset is ignored (that is, whether the linkset should be included when aggregating and displaying MWTM status information).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Alarm Severity     | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Last Status Change | Date and time that the status of the linkset last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status             | <p>Current status of the linkset. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Shutdown</li> <li>• Unavailable</li> <li>• Unknown</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Status Reason      | <p>Reason for the current status of the signaling gateway-mated pair.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. To:</p> <ul style="list-style-type: none"> <li>• You installed the MWTM in the default directory, <i>/opt</i>, then the file is in the <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons appear(s) in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |

## ITP Signaling Gateway Mated Pairs

The Status Information section for ITP signaling gateway mated pairs contains:

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is Ignored       | Indicates whether the signaling gateway-mated pair is Ignored (that is, whether the signaling gateway-mated pair should be included when aggregating and displaying MWTM status information).                                                                                                                                                                                                                                                                                                                                                                                              |
| Alarm Severity   | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Congestion Level | Indicates the level of congestion on the signaling gateway-mated pair. A signaling gateway-mated pair is congested if it has too many packets waiting to be sent. This condition could be caused by the failure of an element in your network.<br><br>Possible values for the Congestion Level field are None, indicating no congestion, and <b>1</b> to <b>7</b> , indicating levels of congestion from very light ( <b>1</b> ) to very heavy ( <b>7</b> ).                                                                                                                               |
| Instance Status  | Current status of the protocol associated with the signaling gateway-mated pair, with a color-coded background. Possible values are:<br><br> Active—The protocol is available.<br> Shutdown—An administrator has forced the protocol to an unavailable state.<br> Unknown—The MWTM cannot determine the current status of the protocol. |
| Status           | Current status of the signaling gateway-mated pair. Possible values are: <ul style="list-style-type: none"> <li>Active</li> <li>Blocked</li> <li>Down</li> <li>Inactive</li> <li>Pending</li> <li>Shutdown</li> <li>Unknown</li> <li>Warning</li> </ul> For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a>                                                                                                                                                                                                                                     |

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Status Change | Date and time that the status of the signaling gateway-mated pair last changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Status Reason      | <p>Reason for the current status of the signaling gateway-mated pair.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. To:</p> <ul style="list-style-type: none"> <li>You installed the MWTM in the default directory, <i>/opt</i>, then the file is in the <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |

## ITP Signaling Points

The Status Information section for ITP signaling points contains:

| Column             | Description                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Is Ignored         | Indicates whether the signaling point is Ignored (that is, whether the signaling point should be included when aggregating and displaying MWTM status information). |
| Alarm Severity     | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                            |
| Last Status Change | Date and time that the status of the signaling point last changed.                                                                                                  |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status        | <p>Current status of the signaling point. Possible values are:</p> <ul style="list-style-type: none"> <li>• Active</li> <li>• Unknown</li> <li>• Unmanaged</li> <li>• Warning</li> </ul> <p>For detailed definitions of each status, see <a href="#">Appendix E, “Status Definitions.”</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status Reason | <p>Reason for the current status of the signaling point.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. To:</p> <ul style="list-style-type: none"> <li>• You installed the MWTM in the default directory, <i>/opt</i>, then the file is in the <i>/opt/CSCOsgm/apache/share/htdocs/eventHelp</i> directory.</li> <li>• You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The status reasons are listed in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |

## Threshold Information (RAN-O Only)

The Threshold Information section for RAN-O nodes contains:

| Field      | Description                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Acceptable | The percentage threshold setting below which the backhaul utilization is considered acceptable. The default Acceptable threshold is 60 percent. <sup>1</sup>                                                                                                        |
| Warning    | The percentage threshold setting beyond which the backhaul utilization issues a warning. Subsequent warnings are issued only if the utilization falls below the Acceptable threshold. The default Warning threshold is 70 percent. <sup>1</sup>                     |
| Overloaded | The percentage threshold setting beyond which the backhaul utilization is considered overloaded. Subsequent overload messages are issued only if the utilization falls below the Acceptable threshold. The default Overloaded threshold is 80 percent. <sup>1</sup> |

1. To change the default setting, see [Editing Properties for a RAN-O Backhaul, page 6-41](#).

## Editing SNMP IP Addresses for a Node

You use the MWTM to determine which IP addresses to use for SNMP polling.

To edit a node's SNMP IP addresses, right-click a node in a window, choose **Edit > SNMP IP Addresses** in the right-click menu. The MWTM displays the Edit SNMP IP Addresses dialog box.

The Edit SNMP IP Addresses dialog box contains:

| Field or Button        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available IP Addresses | <p>List of all IP addresses associated with this node that users could not or do not want the MWTM to use for SNMP polling. The MWTM does not send SNMP queries to IP addresses in this list.</p> <p>This option appears only for ITP, IPRAN, or mSEF nodes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IP Addresses for SNMP  | <p>List of all IP addresses associated with this node that the MWTM can use for SNMP polling:</p> <ul style="list-style-type: none"> <li>By default, the MWTM places all discovered IP addresses in this list, in the order in which they are discovered. The MWTM uses the IP address at the top of the list as the primary SNMP address for the node.</li> </ul> <p>During SNMP polling of the node (status polling and demand polling), the MWTM first tries the primary SNMP address. If the primary is unavailable, the MWTM tries the other IP addresses, one-by-one, in descending order.</p> <ul style="list-style-type: none"> <li>To assign a new primary SNMP address, or to change the order of the secondary IP addresses, click the <b>Raise Priority</b> and <b>Lower Priority</b> buttons to move the IP addresses up and down in the list.</li> <li>You can also select IP addresses that you do not want the MWTM to use for SNMP polling. This feature is useful, for example, to separate management traffic from SMS traffic. To remove an IP address from the list, click <b>Remove</b>. The MWTM removes the IP address from the IP Addresses for SNMP list, places it in the Available IP Addresses list, and no longer uses it for SNMP polling.</li> </ul> <p>To enable an IP address for SNMP polling again, select the address in the Available IP Addresses list and click <b>Add</b>. The IP address moves back into the IP Addresses for SNMP list and is again available for SNMP polling.</p> <p>If you remove all IP addresses from the IP Addresses for SNMP list, you remove the node from the network, and the MWTM automatically labels the node Unmanaged in all MWTM windows.</p> <p>When you click <b>Save</b>, all MWTM windows are updated automatically to reflect the changes.</p> <p>This option appears only for ITP, IPRAN, or mSEF nodes.</p> |
| Add                    | Enables one or more chosen IP addresses for SNMP polling. All chosen IP addresses in the Available IP Addresses list are moved to the IP Addresses for SNMP list where the MWTM uses them again for SNMP polling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Remove                 | Disables one or more chosen IP addresses for SNMP polling. All chosen IP addresses in the IP Addresses for SNMP list are moved to the Available IP Addresses list, and are no longer used by the MWTM for SNMP polling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Raise Priority         | Moves the chosen IP addresses up in the IP Addresses for SNMP list. If you move an IP address to the top of the list, the MWTM uses that IP address as the new primary SNMP address for the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Lower Priority         | Moves the chosen IP addresses down in the IP Addresses for SNMP list. If you remove an IP address from the top of the list, the MWTM no longer uses that IP address as the primary SNMP address for the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Save                   | <p>Saves changes that you made to the node information and exits the dialog box.</p> <p>When you are satisfied with your changes, click <b>Save</b>. The MWTM saves your changes and updates all MWTM windows to reflect your changes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Field or Button | Description                                                                                                                                     |

| Cancel          | Exits the dialog box without saving any changes.<br>At any time, you can click <b>Cancel</b> to exit the dialog box without saving any changes. |
| Help            | Displays online help for the dialog box.                                                                                                        |

## Viewing Troubleshooting

### Note

If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.

### Tip

For more information about troubleshooting, see the [OSS Integration Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

You can run commands and view output in the Troubleshooting section available from the MWTM client or MWTM Web interface.

To view the Troubleshooting section, in a view in the navigation tree, select an object, then click on the Troubleshooting tab in the right pane.

### Note

To see which object types pertain to this tab, see [Appendix A, “Client Object Map Reference.”](#)

### Tip

To save the output of all executed commands to a log file, see [mwtm tshootlog, page B-89](#).

Before you can run commands and view output, you must properly configure credentials. You can configure credentials by using the CLI command (see [mwtm addcreds, page B-6](#)) or through the MWTM client (see [Configuring Login Credentials, page 4-20](#)). If credentials are not configured, the output pane displays this message:

```
No credentials are available for this node
```

## Troubleshooting Menu and Toolbar

The Troubleshooting section displays these menus and toolbar buttons for the chosen object:

| Menu or Toolbar Button                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                                                                             | <p>A grouping of related commands. The MWTM provides default categories that you cannot modify. Additional categories are user-defined. You can execute all commands in a category at once by using the Execute Category button.</p> <p><b>Note</b> To define additional categories and create new commands in categories, see <a href="#">Creating New Troubleshooting Categories and Commands, page 4-23</a></p>                                                                                                             |
| Command                                                                                              | <p>A command or task within the chosen category. The MWTM provides commands for default categories that you cannot modify. You can execute a chosen command by using the Execute Command button.</p>                                                                                                                                                                                                                                                                                                                           |
| Suffix                                                                                               | <p>Filters the output of troubleshooting commands. For example:</p> <ul style="list-style-type: none"> <li>•   include—Includes the lines matching the specified regular expression</li> <li>•   exclude—Excludes the lines matching the specified regular expression</li> <li>•   begin—Starts the printout at the line matching a regular expression</li> <li>•   section—Outputs only the matching sections of the printout</li> </ul> <p><b>Note</b> The suffixes allowed here are those supported by the IOS version.</p> |
|  Execute Command   | <p>Executes the chosen command only.</p> <p><b>Note</b> If you are using Microsoft Internet Explorer, the scroll bar may change position.</p>                                                                                                                                                                                                                                                                                                                                                                                  |
|  Execute Category | <p>Executes all commands in the chosen category.</p> <p><b>Note</b> If you are using Microsoft Internet Explorer, the scroll bar may change position.</p>                                                                                                                                                                                                                                                                                                                                                                      |
|  Cancel Execution | <p>Stops any execution process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|  Save Output      | <p>Saves output on screen to a file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|  Copy Output      | <p>Copies output on screen to the clipboard.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|  Print Output     | <p>Prints output on screen.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|  Clear Output     | <p>Clears all output from the screen.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Output Pane                                                                                          | <p>Pane where command output appears.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Commands That Require Additional User Input

After you click the Execute Command or Execute Category button, some commands prompt you for additional input. Commands that prompt you for additional input have an ellipsis (...) at the end of the command. You must enter valid data, which appears in green as you type. Invalid data appears in red. The MWTM will not execute a command with invalid data. Once you have entered the additional input, you must click one of these buttons:

| Button | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OK     | <p>Executes the chosen command or category of commands.</p> <p><b>Note</b> If you do not provide input but leave the fields blank, and then click OK, the MWTM skips the command or commands and this message appears:</p> <p style="margin-left: 40px;">Skipping command.</p> <p>The MWTM lists the commands that you skipped, but executes other commands for which you provided input.</p> |
| Clear  | Removes entered data from all input fields.                                                                                                                                                                                                                                                                                                                                                   |
| Cancel | Removes the input fields from the right pane.                                                                                                                                                                                                                                                                                                                                                 |

**Note**

Save, Copy, Print, and Output options are available in the MWTM client interface only.

## Viewing Alarms and Recent Events

To view alarms for an object, in the navigation tree, select the object (for example, a node), then click the Alarms tab in the content area.

To view recent events for an object, in the navigation tree, select the object (for example, an interface), then click the Recent Events tab in the content area.

The table in the content pane displays information about the alarms or recent events associated with the chosen object. The content pane also provides tools to perform tasks, such as setting filters and acknowledging alarms or events.

**Note**

For managed objects that have peers (RAN backhauls and shorthauls, ITP links and linksets, and signaling-gateway mated pairs), the MWTM displays subtabs to distinguish alarms and recent events for each peer object.

- For descriptions of the table columns, see [Right-click Menus, page 9-10](#).

- For descriptions of alarms and events tools, see [Toolbar Buttons, page 9-7](#).
- To understand the difference between alarms and events, see [Basic Concepts and Terms, page 9-1](#).

## About Provisioning

When you select and right-click an object from the navigation tree of the MWTM client and select **Provision**, the MWTM web interface appears. This section describes how to provision objects using the MWTM web interface and provides examples.

For further information, see the *OSS Integration Guide for the Cisco Mobile Wireless Transport Manager 6.1.3*.

[http://www.cisco.com/en/US/docs/net\\_mgmt/mobile\\_wireless\\_transport\\_manager/6.1.3/developer/guide/mwtm613ossig.html](http://www.cisco.com/en/US/docs/net_mgmt/mobile_wireless_transport_manager/6.1.3/developer/guide/mwtm613ossig.html)

Using provisioning through the MWTM Web interface, you can add, modify, and/or delete ITP, PWE3, CSG2, GGSN, or HA objects, as follows:

| Personality | Objects                                                        | Add | Modify | Delete |
|-------------|----------------------------------------------------------------|-----|--------|--------|
| ITP         | Linksets                                                       | Yes | Yes    | Yes    |
|             | SCTP Links                                                     | Yes | Yes    | Yes    |
|             | MTP2 Links                                                     | Yes | Yes    | Yes    |
|             | HSMTP2 Links                                                   | Yes | Yes    | Yes    |
|             | HSL Links                                                      | Yes | Yes    | Yes    |
|             | Application servers, including m3ua and sua                    | Yes | Yes    | Yes    |
|             | Application server processes, including m3ua and sua           | Yes | Yes    | Yes    |
|             | Local peer objects                                             | Yes | Yes    | Yes    |
|             | m3ua objects                                                   | Yes | Yes    | Yes    |
|             | sua objects                                                    | Yes | Yes    | Yes    |
|             | Channelized serial interfaces (under T1/E1 controllers)        | Yes | Yes    | Yes    |
|             | Physical serial interfaces                                     | No  | Yes    | No     |
|             | Physical T1/E1 controllers                                     | No  | Yes    | No     |
|             | Physical ATM interfaces                                        | No  | Yes    | No     |
|             | Physical Ethernet, FastEthernet, or GigabitEthernet interfaces | No  | Yes    | No     |
|             | DCS                                                            | Yes | Yes    | Yes    |

1. Not all options and/or subcommands are supported.
2. Not all options and/or subcommands are supported.
3. See bug about VTP Mode Transparent

**Note**

If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Operator (level 3) and higher.

This section contains:

- [Prerequisites for Using Provisioning, page 8-48](#)
- [Using the Provisioning Wizard, page 8-49](#)

## Prerequisites for Using Provisioning

Before you can provision an object:

- You must set up:
  - Basic IP connectivity
  - SNMP community strings
  - Credentials
  - Telnet or SSH access allowed
  - (*ITP only*) Basic signaling points configured

**Note**

For provisioning to work correctly, the format of the point code in MWTM must match the point code format on the router.

- (GGSN only) The GPRS service must be enabled in IOS
- MWTM must be able to successfully:
  - Discover the object
  - Retrieve running configuration from the object

## Setting Up the MWTM to Retrieve Running Configuration from the Object

Before you can use the MWTM to provision objects, you must set up the MWTM to retrieve the running configuration from the object.

The MWTM inventory has two types of attributes:

- **Monitor attributes**—Attributes obtained from SNMP polling and/or status monitoring
- **Configuration attributes**—Attributes obtained from IOS running configuration.

Setting up the MWTM to retrieve running configuration is a two-step process. You must:

1. Supply credentials for the target node(s). For details, see [Configuring Login Credentials, page 4-20](#).
2. Ensure that the MWTM is getting the IOS running configuration successfully from the object. There are two approaches you can use:
  - **Automatic configuration synchronization**—This is the default option. You can verify that the option in the *System.properties* file—look for the `AUTO_SYNC_CONFIG` field, which should be set to true. If you enable this option, the MWTM automatically retrieves the running configuration from the object after the MWTM processes a provisioning operation (from the GUI or NBAPI). During every status poll, the MWTM checks whether the running configuration has changed on the object. If the configuration has changed, the MWTM retrieves it.
  - **Manual configuration synchronization**—In certain situations, you may choose to turn off automatic configuration synchronization and manage configuration synchronization manually. You can request manual configuration synchronization using the NBAPI or the CLI. For details, see the [OSS Integration Guide for the Cisco Mobile Wireless Transport Manager 6.1.3](#).

## Using the Provisioning Wizard

**Note**

Throughout the wizard, you can click **Next** to continue, **Previous** to go back, **Cancel** to exit the wizard without saving changes, **Refresh** to reload the current window, or **Submit** to complete the provisioning

The provisioning wizards supports characters A-Z, a-z, 0-9, underscore (\_), dash (-), and the “at” sign (@). The provisioning wizard might allow you to enter unsupported characters in text fields, but they might cause unexpected results in the provisioning wizard.

Note the following conditions when using special characters in the provisioning wizard:

- Do not enter # or % in any text fields in the provisioning wizard.

- If you use a special character (for example, +, a period (.), or a space) in any text field in the provisioning wizard, when you click **Next**, the MWTM GUI briefly flashes the encoded value of the special character. For example, + briefly displays as %2B. After refreshing, the MWTM GUI displays the correct value.

To start provisioning by using the MWTM provisioning wizard:

---

**Step 1** Launch the Provisioning wizard using one of the following options:

- If you are using the MWTM client, right-click a node in the navigation tree and choose **Provision**.
- If you are using the MWTM web interface, click a node in the navigation tree then, in the top of the Details tab, choose **Actions > Provision**.

---

**Note** The Provision menu item or button is not displayed if the node is not managed.

---

**Step 2** Select a **Type** (and **SubType**, if applicable).

**Step 3** Click **New** to create a new item of the chosen Type or select an item in the Provisioned Items list, then click **Edit** or **Delete**.

The provisioning wizard appears. The wizard stages are: Basic, Features, and Summary.

---

**Note** If you do not initiate activity on an active wizard window, your session will time out after 60 seconds, and the MWTM returns to the Provision Choices window.

---

**Step 4** Enter the relevant information at the Basic stage and click **Next** to continue.

**Step 5** (Optional) Make your selections at the Features stage. Notice that as you enable features, they appear in the Wizard Steps pane under Features. Click **Next** to continue.

**Step 6** (Optional) If you have added features, you can choose to configure aspects of each feature. Click **Next** to continue, or click the wizard stage in the left pane to jump between stages.

**Step 7** The Summary stage appears, showing which IOS commands the MWTM will send to the object. You can optionally check the box **Write to IOS startup-config**, which saves your configuration changes permanently to the startup configuration on the object. This process can take time.

**Step 8** In the **Add to batch file** pulldown menu, you can select configuration commands to add to a batch file. You can create a new batch file by entering a filename that does not already exist.

**Step 9** Click **Submit** to send the provisioning to the object.

---

The provisioning wizard provides colored status balls in the Wizard Steps pane, which indicate:

- **White**—The stage you are in currently
- **Red**—A problem in the stage
- **Yellow**—Stage is not yet configured
- **Green**—Stage is configured successfully

# Polling Nodes

The MWTM automatically polls nodes at specified intervals. However, you can also request an immediate poll for a node. This section describes:

- [Polling from the Discovery Dialog, page 8-51](#)
- [Performing a Normal Poll, page 8-51](#)
- [Performing a Clean Poll, page 8-52](#)

## Polling from the Discovery Dialog

To poll a node from the Discovery dialog box:

---

**Step 1** Choose **Network > Network Discovery** from the MWTM main menu.

The MWTM displays the Discovery dialog box.

**Step 2** Select the Discovery tab.

The MWTM displays the Discovery pane. The Discovered Nodes section of the Discovery pane lists all discovered nodes (all nodes, including new and excluded nodes, not just the nodes in the current view).

**Step 3** Select one or more nodes.

**Note**

You cannot poll a node with a Primary SNMP Address of N/A. If you select a node with a Primary SNMP Address of N/A, then the Poll Node button is dimmed and cannot be chosen. If you select more than one node, and even one of them has a Primary SNMP Address of N/A, then the Poll Node button is dimmed and cannot be clicked.

---

**Step 4** Click **Poll Node**.

The MWTM begins a poll of the chosen nodes. During polling, the Poll Node button is dimmed, the *Selected nodes are being polled* message appears at the bottom of the Discovery dialog box, and individual nodes might display the polling status.

**Note**

If the node has only one IP address for the MWTM to poll, and the poll fails or times out, the MWTM issues an error message. If the node has more than one IP address for the MWTM to poll, and the polls of one or more IP addresses fail or time out, the MWTM issues warning messages. If all polls fail or time out, the MWTM issues an error message.

---

When the *Selected nodes are being polled* message disappears and no nodes are in polling status, polling is complete. The MWTM database immediately reflects any new or changed data for the chosen nodes.

---

## Performing a Normal Poll

A normal poll retains all objects associated with polled nodes, even objects that have been deleted and are therefore in Unknown status.

To poll one or more nodes, retaining all associated components in the MWTM database, use one of these procedures:

#### From a View in the Main Window

- 
- Step 1** Select a view in the navigation tree.
  - Step 2** Select one or more nodes in the navigation tree.
  - Step 3** Choose **Network > Poll Nodes > Normal Poll**.
- The MWTM polls all chosen objects.
- 

#### From Summary Lists

- 
- Step 1** Click **Nodes** under Summary Lists in the navigation tree.
  - Step 2** Select a node or adjacent node in the node table in the right pane.
  - Step 3** Choose **Network > Poll Nodes > Normal Poll**.
- The MWTM polls that node.
- 

#### From Right-click Menu in a View

- 
- Step 1** Select a view in the navigation tree.
  - Step 2** Right-click a node in the navigation tree.
  - Step 3** Choose **Poll Node > Normal Poll** from the right-click menu.
- The MWTM polls the node.
- 

## Performing a Clean Poll

A clean poll removes all network objects in an unknown or unconfigured state from the node at the completion of the poll.

To poll one or more nodes, removing and then rediscovering all associated components, use one of these procedures:

#### From a View in the Main Window

- 
- Step 1** Select a view in the navigation tree.
  - Step 2** Select one or more nodes in the navigation tree.
  - Step 3** Choose **Network > Poll Nodes > Clean Poll**.
- The MWTM polls all chosen nodes.
-

---

**From Summary Lists**

---

- Step 1** Click **Nodes** under Summary Lists in the navigation tree.
- Step 2** Select a node or adjacent node in the node table in the right pane.
- Step 3** Choose **Network > Poll Nodes > Clean Poll**.  
The MWTM polls that node.
- 

---

**From Right-click Menu in a View**

---

- Step 1** Select a view in the navigation tree.
- Step 2** Right-click a node in the navigation tree.
- Step 3** Choose **Poll Node > Clean Poll** from the right-click menu.  
The MWTM polls the node.
- 

---

**Clean Node for ITP Objects**

---

- Step 1** Select a view in the navigation tree.
- Step 2** Select an application server, application server process, link, or linkset in the navigation tree or in the Summary Lists tables.
- Step 3** Choose **Network > Poll Nodes > Clean Poll**.  
The MWTM polls all ITP nodes and adjacent nodes associated with the object.
- 

## Allowing and Disallowing Trap Processing for a Node

By default, the MWTM processes traps from all discovered nodes. However, you can prevent the MWTM from processing traps from one or more nodes. For example, if a node is experiencing many link changes and generating too many traps, you can disallow traps from that node until the situation stabilizes.

**Note**

If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 4) and higher.

---

**Note**

If you prevent the MWTM from processing traps from a node, all MWTM clients and views connected to that MWTM server are prevented from processing traps from that node.

Also, if you prevent the MWTM from processing traps from a node, make a note of the change, and remember to reset the node when the problem is corrected or the maintenance is complete.

---

To prevent the MWTM from processing traps from a node, use one of these procedures:

- Uncheck the **Process Traps** check box for the node in the Node table.

**Note** By default, the Process Traps column is hidden. To display the Process Traps column, right-click in the table heading and select the **Process Traps** check box.

- Right-click the node in the navigation tree, then choose **Disallow Trap Processing**.

To allow the MWTM to process traps from a node, use one of these procedures:

- Check the **Process Traps** check box for the node in the Node table.
- Right-click the node in the navigation tree, then choose **Allow Trap Processing**.

## Viewing Real-Time Data

You can use the MWTM to view real-time data for chosen objects in the navigation tree. The real-time statistics for some objects (CSG2, BWG, HA, GGSN, PDNGW, and SGWs on SAMI cards) appear only in the MWTM web interface (see [Chapter 11, “Accessing Data from the Web Interface”](#) to view these statistics).

**Note**

In the MWTM client, the real-time icon  appears in some tabs in the right pane. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window when you no longer need to see it.

For more information on viewing real-time data, see:

- [Viewing the Syslog, page 8-55](#)
- [Viewing CPU and Memory Performance, page 8-56](#)

## Viewing the Syslog

The Syslog section displays all messages in the system log for the chosen node.

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window when you no longer need to refer to it.

To view the Syslog section, in a view in the navigation tree, select a node, then click the Syslog tab in the content area.

The Syslog section displays these fields for the chosen node:

| GUI Element                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                                                    |
| Poll Interval                                                                             | Poll interval used to collect data for the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Last Poll                                                                                 | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                                                                                                                                                                                                                                                                                     |
| Timestamp                                                                                 | Date and time of the syslog message from the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Severity                                                                                  | Severity of the syslog message. Possible values are: <ul style="list-style-type: none"> <li>• <b>Alert</b>—Conditions that require immediate action.</li> <li>• <b>Critical</b>—Critical conditions.</li> <li>• <b>Debug</b>—Debug conditions, log FTP commands, and WWW URLs.</li> <li>• <b>Emergency</b>—System unusable conditions.</li> <li>• <b>Error</b>—Error conditions.</li> <li>• <b>Info</b>—Information conditions.</li> <li>• <b>Notice</b>—Normal but significant conditions.</li> <li>• <b>Warning</b>—Warning conditions.</li> </ul> |
| Facility                                                                                  | Name of the facility that generated the syslog message, such as SYS, SNMP, CS7MTP3, or CS7PING.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Name                                                                                      | Short text identifier for the message type. A facility name in conjunction with a message name uniquely identifies a syslog message type.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Message                                                                                   | Text of the syslog message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Viewing CPU and Memory Performance

The Performance tab provides real-time chart and table statistics about:

- [Viewing CPU Processes, page 8-56](#)
- [Viewing CPU Utilization, page 8-57](#)
- [Viewing Historical CPU Utilization, page 8-58](#)
- [Viewing Memory Utilization, page 8-59](#)
- [Viewing Historical Memory Utilization, page 8-61](#)

### Note

In the MWTM client and web interface, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window when you no longer need to refer to it.

To view real-time CPU performance statistics, in a view in the navigation tree, select a node, then click the Performance tab in the content area.

### Note

In some cases, users can notice a difference in the number of CPUs reported by the CPU Utilization, CPU Processes, and Memory Utilization selections. The CPU MIBs do not report statistics for cards that are in standby mode (for example, supervisor cards). However, the memory MIB does report memory utilization for standby cards. Because of this difference, the Memory Utilization selection can display a greater number of CPUs than the CPU Utilization and CPU Processes selections.

Also, because the information for memory and CPU statistics comes from different MIBs, the CPU descriptions can vary. Users can correlate the information by comparing the descriptions available among the CPU Utilization, CPU Processes, and Memory Utilization selections. Devices that support the CISCO-MEMORY-POOL-MIB show only the description of the main processor.

## Viewing CPU Processes

To view real-time CPU processes, select a node from the navigation tree, click the Performance tab, then from the View menu, select **CPU Processes**.

The MWTM displays information about CPU processes in a table with slot- and CPU-specific tabs. When you click the tabs for a specific slot and CPU, the MWTM shows CPU process information for the selected CPU. If only a single CPU exists, no tabs for slots or CPUs appear. The MWTM displays information for the CPU in the right pane.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

Each table contains:

| Field or Column                                                                             | Description                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                            |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval. |

| Field or Column | Description                                                                                                                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Interval   | Poll interval used to collect data for the table.                                                                                                                                                                |
| Last Poll       | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll. |
| PID             | Process identifier.                                                                                                                                                                                              |
| Name            | Name of the process.                                                                                                                                                                                             |
| Time Created    | Total time since the process was created.                                                                                                                                                                        |
| Total Runtime   | CPU time the process has used.                                                                                                                                                                                   |
| Times Invoked   | Number of times the process was invoked.                                                                                                                                                                         |
| Average Runtime | Average CPU time for each process invocation.                                                                                                                                                                    |
| 5 Sec %         | Average CPU utilization percentage for the node over the last 5 seconds.                                                                                                                                         |
| 1 Min %         | Average CPU utilization percentage for the node over the last minute.                                                                                                                                            |
| 5 Min %         | Average CPU utilization percentage for the node over the last 5 minutes.                                                                                                                                         |
| Priority        | Process queue priority. Possible values are: <ul style="list-style-type: none"> <li>• Low</li> <li>• Normal</li> <li>• High</li> <li>• Critical</li> </ul>                                                       |

## Viewing CPU Utilization

To view real-time CPU utilization, select a node from the navigation tree, click the Performance tab, then from the View menu, select **CPU Utilization**.

The MWTM displays a CPU utilization chart with:

- A Summary tab that shows the combined utilization of all CPUs on the node
- Slot- and CPU-specific tabs that show utilization for a selected CPU

### Note

The MWTM web interface displays this data in tabular, instead of chart, format.

The CPU summary chart displays a vertical band whenever at least one its CPUs is above the normal threshold. Status balls on the CPU-specific tabs indicate the highest threshold status of all data series for the CPU for the last polling interval.

The CPU-specific charts display horizontal bands to show overloaded, warning, and acceptable thresholds; you must configure the CPU rising and falling thresholds on the device to display these bands in the MWTM. The falling threshold corresponds to the boundary between the acceptable and warning bands. The rising threshold corresponds to the boundary between the warning and overloaded bands. For multi-CPU devices, these thresholds apply only to the main CPU.

| GUI Elements                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Change Poller                                                                             | Button that opens the Poller Settings dialog box. See <a href="#">Change Poller, page 8-106</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Poll Interval                                                                             | Label that shows the current poll interval in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Percentage                                                                                | Y-axis label that shows percentage of CPU utilization over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Time                                                                                      | X-axis label that displays a real-time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Legend                                                                                    | <p>Identifies the data series currently showing in the chart.</p> <ul style="list-style-type: none"> <li>5 sec—Average CPU utilization percentage for the node over the last 5 seconds.</li> <li>1 min—Average CPU utilization percentage for the node over the last minute.</li> <li>5 min—Average CPU utilization percentage for the node over the last 5 minutes.</li> <li>No Data—Color-coded value that indicates no data is available to display.</li> <li>CPU Threshold Crossed—In the Summary-tab chart, color-coded value that indicates when CPU utilization is above normal.</li> <li>Overloaded—In a CPU-tab chart, color-coded value that indicates when CPU utilization is in the overloaded zone.</li> <li>Warning—In a CPU-tab chart, color-coded value that indicates when CPU utilization is in the warning zone.</li> <li>Acceptable—In a CPU-tab chart, color-coded value that indicates when CPU utilization is in the acceptable zone.</li> </ul> |

## Viewing Historical CPU Utilization

### Note

This option is available in the MWTM web client only.

To view historical CPU utilization, select a node from the navigation tree, click the Performance tab, then from the View menu, select **Historical CPU Utilization**.

A summary table displays the following information:

| Field                                 | Description                                                                |
|---------------------------------------|----------------------------------------------------------------------------|
| Data Type                             | Data type, which can be either Average Utilization or Maximum Utilization. |
| Average Utilization                   | Average of the data across the chosen time range.                          |
| Maximum Utilization                   | Maximum utilization during the chosen time range.                          |
| Maximum Timestamp ( <i>timezone</i> ) | Timestamp for when the maximum utilization value occurred.                 |
| Warning Threshold                     | Threshold setting beyond which a warning is issued.                        |
| Overload Threshold                    | Threshold setting beyond which is considered overloaded.                   |

When you run the report, the following information is displayed:

| GUI Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Toolbar</i>         | Provides functions to select a report type, duration, output type. See <a href="#">Using the Toolbar, page 11-6</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Type                   | A comprehensive summary of average and maximum CPU utilization statistics. You can choose from 15-minute, hourly, or daily capacity summary reports, or choose a custom range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>Graph</i>           | If you select <b>Graph</b> from the Output menu, the graph shows the average utilization and the maximum utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>Table</i>           | <p>If you select <b>Table</b> from the Output menu, the table contains:</p> <ul style="list-style-type: none"> <li>• Timestamp (<i>timezone</i>)—Timestamp for when the maximum utilization value occurred.</li> <li>• Average Utilization—Average of the data across the specified time range.</li> <li>• Maximum Utilization—Maximum utilization during the specified time range.</li> <li>• Minimum Utilization—Minimum utilization during the specified time range.</li> <li>• Warning Threshold—Threshold setting beyond which a warning is issued.</li> <li>• Overload Threshold—Threshold setting beyond which is considered overloaded.</li> </ul>                                  |
| Expand to Full Screen  | If Output Type is Graph, displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Percentage Utilization | If Output Type is Graph, the Y-axis label shows percentage of CPU utilization over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Time                   | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>Legend</i>          | <p>If Output Type is Graph, a color-coded legend shows labels for utilization:</p> <ul style="list-style-type: none"> <li>• Average Utilization—Average of the data across the chosen time range.</li> <li>• Maximum Utilization—Maximum value across the chosen time range.</li> <li>• No Data—Color-coded value that indicates no data is available to display.</li> <li>• Overloaded—Color-coded value that indicates when CPU utilization is in the overloaded zone.</li> <li>• Warning—Color-coded value that indicates when CPU utilization is in the warning zone.</li> <li>• Acceptable—Color-coded value that indicates when CPU utilization is in the acceptable zone.</li> </ul> |

## Viewing Memory Utilization

To view CPU memory utilization for the node, click the View drop-down menu in the MWTM client or MWTM web interface, and select **Memory Utilization**.

The MWTM displays memory utilization in a table with:

- A Summary tab that shows the combined memory utilization of all CPUs on the node
- Slot- and CPU-specific tabs that show memory utilization for a selected CPU

### Note

Depending on the device, memory utilization statistics may not be available from the management information base (MIB). Devices that support the CISCO-ENHANCED-MEMORY-POOL-MIB have detailed memory information for each CPU. Devices that support the CISCO-MEMORY-POOL-MIB

have memory information only for the CPU of the main processor. For these devices, the memory utilization table shows only one entry even though these devices can have multiple CPUs. In these cases, the CPU Description column indicates *CPU of main processor*.

## Summary Tab

The Summary tab displays a tabular overview of all CPUs in the chosen node to enable users to easily observe problem areas.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Summary table.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Summary table contains:

| Field or Column                                                                           | Description                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                           |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                |
| Poll Interval                                                                             | Poll interval used to collect data for the table.                                                                                                                                                                |
| Last Poll                                                                                 | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll. |
| CPU                                                                                       | Slot number (if known) and CPU number.                                                                                                                                                                           |
| CPU Description                                                                           | Type of CPU.                                                                                                                                                                                                     |
| Processor Memory                                                                          | Percentage of available processor memory in use.                                                                                                                                                                 |
| I/O Memory                                                                                | Percentage of available I/O memory in use.                                                                                                                                                                       |

## CPU-specific Tabs

The CPU-specific tabs display tabular information for the selected slot and CPU. If only a single CPU exists, no slot or CPU tabs appear and the MWTM displays the information for the CPU in the right pane.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

Each CPU-specific table contains:

| Field or Column                                                                             | Description                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                            |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval. |

| Field or Column           | Description                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Interval             | Poll interval used to collect data for the table.<br><br><b>Note</b> Polling for memory statistics takes longer than for CPU statistics. If excessive timeouts occur for memory polling, you can increase the number of milliseconds for the timeout by changing the <code>MEMORY_POLLER_TIMEOUT_INCREMENT</code> in the <i>Server.properties</i> file. |
| Last Poll                 | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                                                                                        |
| Memory Type               | The type of memory, either processor memory or I/O memory.                                                                                                                                                                                                                                                                                              |
| Utilization               | Percentage of utilization for each type of memory.                                                                                                                                                                                                                                                                                                      |
| Total                     | Total amount of memory for each memory type.                                                                                                                                                                                                                                                                                                            |
| Used                      | Amount of memory that is used for each memory type.                                                                                                                                                                                                                                                                                                     |
| Free                      | Amount of free (unused) memory for each memory type.                                                                                                                                                                                                                                                                                                    |
| Largest Free <sup>1</sup> | The largest available memory unit.                                                                                                                                                                                                                                                                                                                      |
| Valid <sup>1</sup>        | Whether or not the memory is valid for use.                                                                                                                                                                                                                                                                                                             |

1. This column is hidden by default. Right-click in the column header and check the check box next to the heading label to display it.

## Viewing Historical Memory Utilization

### Note

This option is available in the MWTM web client only.

To view historical memory utilization, select a node from the navigation tree, click the Performance tab, then from the View menu, select **Historical Memory Utilization**.

If you select **Graph** from the Output menu, the following information displayed:

| GUI Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Toolbar     | Provides functions to select a report type, duration, output type. See <a href="#">Using the Toolbar, page 11-6</a> .                                                                                                                                                                                                                                                                                                          |
| Type        | A comprehensive summary of average and maximum memory utilization statistics. You can choose from the following types: <ul style="list-style-type: none"> <li>Memory Peak Utilization 15 Minutes</li> <li>Memory Average Utilization 15 Minutes</li> <li>Memory Peak Utilization Hourly</li> <li>Memory Average Utilization Hourly</li> <li>Memory Peak Utilization Daily</li> <li>Memory Average Utilization Daily</li> </ul> |
| Graph       | If you select <b>Graph</b> from the Output menu, the graph shows the average utilization and the maximum utilization.                                                                                                                                                                                                                                                                                                          |

| GUI Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Table</i>           | <p>If you select <b>Table</b> from the Output menu, the table contains:</p> <ul style="list-style-type: none"> <li>• Timestamp (<i>timezone</i>)—Timestamp for when the maximum utilization value occurred.</li> <li>• Memory Type—Type of memory.</li> <li>• Average Utilization—Average utilization for each type of memory.</li> <li>• Maximum Utilization—Maximum utilization during the specified time range.</li> <li>• Minimum Utilization—Minimum utilization during the specified time range.</li> <li>• Total—Total utilization for all types of memory.</li> <li>• Average Used—Average memory used.</li> <li>• Average Free—Average memory available.</li> </ul> |
| Expand to Full Screen  | If Output Type is Graph, this text link displays the graph in a new, full-screen window for easier viewing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Percentage Utilization | If Output Type is Graph, the Y-axis label shows percentage of memory utilization over time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Time                   | If Output Type is Graph, the X-axis label shows a historical time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>Legend</i>          | If Output Type is Graph, a color-coded legend shows labels for utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Viewing Trap Settings

The Trap Settings section displays all trap settings for the chosen node, as well as all hosts and port numbers to which the node sends traps.

If you have implemented MWTM User-Based Access, this option is available to users with authentication level 5 (System Administrator).

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window when you no longer need to refer to it.

To view the Trap Settings section, in a view in the navigation tree, select a node, then click on the Trap Settings tab in the content area.

The Trap Settings section displays these fields for the chosen node:

| GUI Element                                                                                 | Description                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                 |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                      |
| Poll Interval                                                                               | Poll interval used to collect data for the table.                                                                                                                                                                      |
| Last Poll                                                                                   | <p>Time the last poll was run.</p> <p>This field initially displays the description <code>Polling node</code>. After the first polling cycle, the MWTM populates this field with the actual time of the last poll.</p> |

| GUI Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Local IP Address                   | IP address of a local host to which the node sends traps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| GUI Element      | Description                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------|
| Port             | Port to which the node sends traps.                                                                               |
| Trap Version     | Trap version sent to this IP address and port.                                                                    |
| Community String | SNMP community name used by the node for read access to the information maintained by the SNMP agent on the node. |

## Viewing Data for Interfaces

### Note

The MWTM client provides charts and tables to display the performance and error information for the chosen interface. The MWTM web interface displays the same information in a tabular format.

For most interfaces, the MWTM displays interface performance and error information in separate tabs in the right pane. However, depending on variables such as node type, card type, interface type, IOS software image, and the running configuration on the node itself, performance and error statistics may not be available for the chosen interface.

### Note

- Interface performance and error statistics are not available for T1, E1, Synchronous Digital Hierarchy (SDH), or RAN-O shorthaul interfaces.
- Statistics are also unavailable for these ATM interface types: ATM subinterface and ATM layer.

For the chosen interface, you can view:

- [Real-Time Interface Performance, page 8-64](#)
- [Real-Time Interface Errors/Discards, page 8-65](#)
- [Real-Time Interface Advanced Details, page 8-67](#)

## Real-Time Interface Performance

To view real-time interface performance, select the interface in the navigation tree, then click the Interface Performance tab.

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

You may be prompted to start an in-band poller if polling cannot be done out of band.

The Interface Performance tab contains:

| GUI Element <sup>1</sup>                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

1. The MWTM web interface displays the same information in tabular, not chart, format.

## Real-Time Interface Errors/Discards

To view real-time interface errors/discards, select the interface in the navigation tree, then click the Interface Errors/Discards tab.

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

You may be prompted to start an in-band poller if polling cannot be done out of band.

The Interface Errors/Discards tab contains:

| GUI Element                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Poll Interval                                                                             | Label that shows the current poll interval in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Last Poll                                                                                 | Label that identifies when the last poll occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Congestion                                                                                | Output Queue Size—The length of the output packet queue (in packets).<br><br>When a router receives a packet, it typically forwards it to another interface. The packet enters a queue on the output interface before it is actually sent. The interface typically has a buffer that can hold a fixed number of packets in the queue. When the output queue overflows, the router begins to discard packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Interface Errors/Discards                                                                 | Table that shows this information for the chosen interface: <ul style="list-style-type: none"> <li>Data Type:               <ul style="list-style-type: none"> <li>Receive Errors—Incoming (receive) errors.</li> <li>Send Errors—Outgoing (transmit) errors.</li> <li>Receive Discards—Incoming, discarded packets.</li> <li>Send Discards—Outgoing, discarded packets.</li> <li>Unknown Protocol Packets Received—For packet-oriented interfaces, the number of received packets that were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing, the number of received transmission units that were discarded because of an unknown or unsupported protocol. For interfaces that do not support protocol multiplexing, the count will always be 0.</li> </ul> </li> <li>Counts—Error counts since the last reboot.</li> <li>Rates (per sec)—Error rates since the last reboot.</li> <li>Percent Of Packets</li> </ul> |

| GUI Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Interface Detailed Errors | <p>Table that shows this information for the chosen interface:</p> <ul style="list-style-type: none"> <li>• Data Type: <ul style="list-style-type: none"> <li>– Receive Runts—Number of packets input on a particular physical interface which were dropped as they were smaller than the minimum allowable physical media limit.</li> <li>– Receive Framing Errors—Number of input packets on a physical interface which were misaligned or had framing errors.</li> <li>– Receive Aborts—Number of input packets which were dropped because the receiver aborted.</li> <li>– Receive Queue Drops—Number of input packets which were dropped.</li> <li>– Receive Giants—Number of input packets on a particular physical interface which were dropped as they were larger than the largest permitted size of a packet which can be sent/received on an interface.</li> <li>– Receive Ignored—Number of input packets which were simply ignored by this physical interface due to insufficient resources to handle the incoming packets.</li> <li>– Receive Overruns—Number of input packets which arrived on a particular physical interface which were too quick for the hardware to receive and hence the receiver ran out of buffers.</li> <li>– Send Queue Drops—Number of output packets dropped by the interface even though no error had been detected to prevent them being transmitted.</li> </ul> </li> <li>• Counts—Packet counts since the last reboot.</li> <li>• Rates (per sec)—Packet rates since the last reboot.</li> <li>• Percent Of Packets</li> </ul> |
| Interface Errors / Sec    | <p>Chart that shows interface errors per second for the chosen interface. The Y axis shows errors per second. The X axis shows a real-time scale and the server time zone. A legend provides color-coded descriptions of the error types for the incoming and outgoing traffic.</p> <p><b>Note</b> This chart is only available in the MWTM client interface. The MWTM web interface shows the same data in tabular format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Real-Time Interface Advanced Details

To view real-time interface advanced details, select the interface in the navigation tree, then click the Interface Advanced Details tab.

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data. You might be prompted to start an in-band poller if polling cannot be done out of band.

The Interface Advanced Details tab contains:

| GUI Element                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Viewing Data for ITP Objects

You use the MWTM to view detailed statistics for any of these ITP objects:

- Application Servers
- Application Server Process Associations
- Links
- Linksets
- Signaling Gateway Mated Pairs

To display detailed statistics for an object:

- In the MWTM client—In a view in the navigation tree, right-click an object, then choose **View > Real-Time Data and Charts**. The MWTM displays the Statistics Details window for the object.

### Note

The MWTM server automatically reflects updates for the objects received in this window.

Changes you make in this window might not be reflected throughout the MWTM until the next poll (by default, every 15 seconds). For information about changing the poll interval, see [Poll Settings, page 8-77](#).

- In the web interface—Click on the relevant object (Application Server, Linkset, and so on) in the navigation tree and choose the relevant tab in the content pane.

The Statistics Details window in the MWTM client has a navigation tree, which contains:

| Component        | Applicable To | Content Links                    |
|------------------|---------------|----------------------------------|
| Poll Settings    | All objects   | <a href="#">Poll Settings</a>    |
| Right-click menu | Links         | <a href="#">Right-Click Menu</a> |

The Statistics Details window and the MWTM web interface may contain these tabs in the content pane:

| Tab                                    | Applicable To                                                                                                                                                                                            | Content Links                                                                                                                                                            |

## Charts: Application Servers and Application Server Process Associations

You use the MWTM to view real-time MTP3 and ASP packet rate information for the chosen application server or application server process association. To do so, click the Charts tab in the Statistics Details window for an application server or application server process association, then click the relevant tab and the chosen chart appears.

The Statistics Details: Charts section for application servers and application server process associations contains:

| Tab                    | Description                                                                                                                                                             | Applicable To                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| MTP3 Packet Rate       | Displays MTP3 packet rate information for a chosen application server.                                                                                                  | Application servers                                             |
| ASP Packet Rate        | Displays real-time application server process packet rate information for a chosen application server.                                                                  | Application servers                                             |
| Packets From ASP Rate  | Displays real-time rate information for packets received by the application server process for the chosen application server or application server process association. | Application servers and application server process associations |
| Packets To ASP Rate    | Displays real-time rate information for packets sent to the application server process by the chosen application server or application server process association.      | Application servers and application server process associations |
| Packets From MTP3 Rate | Displays real-time rate information for packets received by the chosen application server or application server process association, from the MTP3 layer.               | Application servers and application server process associations |
| Packets To MTP3 Rate   | Displays real-time rate information for packets sent to the MTP3 layer from the chosen application server or application server process association.                    | Application servers and application server process associations |

The tabs in the Statistics Details: Charts section for application servers and application server process associations contain:

| Field or Button    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Time window (mins) | <p>Drop-down list box used to specify the length of time appear in the chosen chart.</p> <p>Valid selections are 1, 2, 5, 10, 20, 40, or 60 minutes. The default selection is 5 minutes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <Type> Rate Chart  | <p>Displays one of these rate charts for the chosen application server or application server process association as a function of time:</p> <ul style="list-style-type: none"> <li>• MTP3 Packet Rate Chart</li> <li>• ASP Packet Rate Chart</li> <li>• Packets From ASP Rate Chart</li> <li>• Packets To ASP Rate Chart</li> <li>• Packets From MTP3 Rate Chart</li> <li>• Packets To MTP3 Rate Chart</li> </ul> <p>To see the exact time and data coordinates for a data point, left-click the data point. The coordinates appear in the format (<i>hh:mm:ss, dd.dd</i>), where:</p> <ul style="list-style-type: none"> <li>• <i>hh:mm:ss</i> is the time for that data point in hours, minutes, and seconds.</li> <li>• <i>dd.dd</i> is the MTP3 packet rate for that data point.</li> </ul> <p>The Time window (mins) field specifies the total visible time in the chart.</p> <p>New data points are added to the right side of the chart. When the chart reaches the end of the time window (for example, after 5 minutes, if the Time window (mins) field is set to 5), new data points continue to be added to the right side of the chart, while old data points drop off the left side of the chart.</p> <p>If a poll is missed (for example, as a result of an SNMP timeout), the MWTM ignores the missing data point, stops drawing the line, and waits for the next valid data point to begin drawing the line again.</p> <p>To scroll left, right, up, or down in the chart, drag the cursor while holding down <b>Ctrl</b> and the left mouse button.</p> <p>To zoom in on a section of the chart, drag the cursor while pressing <b>Shift</b> and the left mouse button.</p> <p>To reset the chart to the default view and scaling, click <b>Reset</b>.</p> |
| AS or ASPA         | <p>Displays color-coded icons for the application server process associations associated with the application server, or for the application server process association.</p> <p>To add the data for an application server process association to the chart, click the icon in this field. To remove the data from the chart, click the icon again.</p> <p>You use the MWTM to customize the symbols, line styles, and colors assigned to data points in real-time data charts. For more information, see <a href="#">Changing Charts Settings, page 5-11</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Reset              | If you scrolled or zoomed the chart, resets the chart to the default view and scaling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Grid On            | Superimposes a graphic grid on the chart. The grid can make the data easier to read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Grid Off           | Removes the graphic grid from the chart.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Help               | Displays online help for the current window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Charts: Links and Linksets

You use the MWTM to view real-time received, sent, and dropped information for the chosen link or linkset. To do so, click the Charts tab in the Statistics Details window for a link or linkset, then click the relevant tab and the chosen chart appears.

The Statistics Details: Charts section for links and linksets contains:

| Tab                               | Description                                                                                                                                                                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ReceivedUtilization               | Displays real-time Received Utilization information for the chosen link or linkset.                                                                                                                                                |
| SendUtilization                   | Displays real-time SendUtilization information for the chosen link or linkset.                                                                                                                                                     |
| PktsRcvdPerSec                    | Displays real-time packets-received-per-second information for the chosen link or linkset.                                                                                                                                         |
| PktsSentPerSec                    | Displays real-time packets-sent-per-second information for the chosen link or linkset.                                                                                                                                             |
| BitsRcvdPerSec or BytesRcvdPerSec | Displays real-time bits-received-per-second information for the chosen link or linkset (or bytes-received-per-second information, if you unchecked the Show Details in Bits Instead of Bytes check box in the Preferences window). |
| BitsSentPerSec or BytesSentPerSec | Displays real-time bits-sent-per-second information for the chosen link or linkset (or bytes-sent-per-second information, if you unchecked the Show Details in Bits Instead of Bytes check box in the Preferences window).         |
| Drops                             | Displays drops information for the chosen link or linkset.                                                                                                                                                                         |

The tabs in the Statistics Details: Charts section for links and linksets contain:

| Field or Button    | Description                                                                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Linkset            | Drop-down list box used to select the linkset from whose perspective data should be visible.<br>By default, data appears from the perspective of the chosen linkset. To display data from the perspective of the adjacent linkset, select it in this list box. |
| Time window (mins) | Drop-down list box used to specify the length of time visible in the chosen chart.<br>Valid selections are 1, 2, 5, 10, 20, 40, or 60 minutes. The default selection is 5 minutes.                                                                             |

| Field or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <Type> Chart    | <p>Displays one of these charts for the chosen link (and all links on the linkset) or linkset (up to 16 links) as a function of time:</p> <ul style="list-style-type: none"> <li>• Received Utilization Chart</li> <li>• Send Utilization Chart</li> <li>• Packets Received Chart</li> <li>• Packets Sent Chart</li> <li>• Bits or Bytes Received Chart</li> <li>• Bits or Bytes Sent Chart</li> <li>• Drops Chart</li> </ul> <p>To see the exact time and data coordinates for a data point, left-click the data point. The coordinates are visible in the format (<i>hh:mm:ss, dd.dd</i>), where:</p> <ul style="list-style-type: none"> <li>• <i>hh:mm:ss</i> is the time for that data point in hours, minutes, and seconds.</li> <li>• <i>dd.dd</i> is the receive utilization percentage for that data point.</li> </ul> <p><b>Note</b> (For ReceivedUtilization and SendUtilization only) For serial and HSL links on Cisco 7507 and 7513 series routers, the visible utilization data can vary by up to 5% from the actual utilization—the MWTM might even display utilization data of more than 100%. This variance results from the synchronization of Layer 2 counters between the Versatile Interface Processor (VIP) CPU and the Route Switch Processor (RSP) CPU on 7500 series routers. This variance does not occur for links on Cisco 2600, 7200, or 7300 series routers.</p> <p>If more than one link appears in the SLC field, you can compare the visible data to that of one or more of the other links by clicking the color-coded icons. To remove the data for the additional links, click the icons again.</p> <p>The Time window (mins) field specifies the total visible time in the chart.</p> <p>New data points are added to the right side of the chart. When the chart reaches the end of the time window (for example, after 5 minutes, if the Time window (mins) field is set to 5), new data points continue to be added to the right side of the chart, while old data points “drop off” the left side of the chart.</p> <p>If a poll is missed (for example, as a result of an SNMP timeout), the MWTM ignores the missing data point, stops drawing the line, and waits for the next valid data point to begin drawing the line again.</p> <p>To scroll left, right, up, or down in the chart, drag the cursor while holding down <b>Ctrl</b> and the left mouse button.</p> <p>To zoom in on a section of the chart, drag the cursor while pressing <b>Shift</b> and the left mouse button.</p> <p>To reset the chart to the default view and scaling, click <b>Reset</b>.</p> |
| SLC             | <p>Displays up to 17 color-coded icons. One for:</p> <ul style="list-style-type: none"> <li>• Each link (SLC) in the chosen chart, up to 16 total links.</li> <li>• The average of all SLCs.</li> </ul> <p>To add the data for a link or for the average to the chart, click the icon in this field. To remove the data from the chart, click the icon again.</p> <p>You use the MWTM to customize the symbols, line styles, and colors assigned to data points in real-time data charts. For more information, see <a href="#">Changing Charts Settings, page 5-11</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Field or Button                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show threshold line for (Linksets only, ReceivedUtilization or SendUtilization) | Draws a horizontal line on the chosen utilization chart, indicating the receive and send threshold for the chosen link.<br>If you do not want to draw a threshold line, select None. This is the default setting.                                                                                                                                                                                                           |
| Scale to threshold (Linksets only, ReceivedUtilization or SendUtilization)      | Scales the chosen utilization chart in order to draw the threshold chosen in the Show threshold line for field. To: <ul style="list-style-type: none"> <li>Scale the chart, check this check box.</li> <li>Remove the scaling from the chart, uncheck this check box. This is the default setting.</li> </ul> The Scale to threshold check box is not available if the <b>Show threshold line for</b> field is set to None. |
| Reset                                                                           | If you scrolled or zoomed the chart, resets the chart to the default view and scaling.                                                                                                                                                                                                                                                                                                                                      |
| Grid On                                                                         | Superimposes a graphic grid on the chart. The grid can make the data easier to read.                                                                                                                                                                                                                                                                                                                                        |
| Grid Off                                                                        | Removes the graphic grid from the chart.                                                                                                                                                                                                                                                                                                                                                                                    |
| Help                                                                            | Displays online help for the current window.                                                                                                                                                                                                                                                                                                                                                                                |

## Interface Details

You use the MWTM to view real-time interface details for the chosen application server process association, link, or signaling gateway-mated pair.

The Statistics Details: Interface Details section contains:

| Section                                   | Description                                                                                                            |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Configuration Information</a> | Interface type, speed, and MTU. For SCTP links, this section also provides the IP address, mask, and physical address. |
| <a href="#">Status Information</a>        | Length of time the interface is up, administrative and operational status, and status of the line protocol.            |
| <a href="#">Statistics Information</a>    | Number of bytes and packets that have been received and transmitted on the interface.                                  |
| <a href="#">Errors Information</a>        | Number of packet errors and discarded packets.                                                                         |

### Configuration Information

The Configuration Information subsection in the Statistics Details: Interface Details section for application server process associations, links, and signaling gateway mated pairs contains:

| Field            | Description                                                                                                                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type             | Type of interface, such as Ethernet.                                                                                                                                                                 |
| MTU              | Size, in bytes, of the largest datagram that can send or receive on the interface.                                                                                                                   |
| Speed (Bits/Sec) | Estimate, in bits per second, of the interface's current bandwidth. If the interface does not vary in bandwidth; or, if no accurate estimate can be made, this field displays the nominal bandwidth. |
| IP Address       | (SCTP links only) IP address corresponding to the media-dependent physical address. If the interface does not have such an address (for example, a serial line), this field displays N/A.            |

| Field            | Description                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Mask          | (SCTP links only) Subnet mask corresponding to the media-dependent physical address. If the interface does not have such an address (for example, a serial line), this field displays N/A.                                        |
| Physical Address | (SCTP links only) Address of the interface at the protocol layer immediately below the network layer in the protocol stack. If the interface does not have such an address (for example, a serial line), this field displays N/A. |

**Note**

This section does not appear if the application server process association, link, or signaling gateway mated pair has been offloaded to a Service and Application Module for IP () card.

**Status Information**

The Status Information subsection in the Statistics Details: Interface Details section for application server process associations, links, and signaling gateway mated pairs contains:

| Field                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Uptime               | Time the interface is up, in days, hours, minutes, and seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Admin Status         | State of the interface. Possible values are: <ul style="list-style-type: none"> <li>Up</li> <li>Down</li> <li>Testing</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Operational Status   | Current operational state of the interface. Possible values are: <ul style="list-style-type: none"> <li>Up</li> <li>Down</li> <li>Testing</li> <li>Unknown</li> <li>Dormant</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Line Protocol Status | Current state of the line protocol. Possible values are: <ul style="list-style-type: none"> <li><b>Up</b>—Software processes that handle the line protocol consider the line to be usable (that is, keepalives are successful).</li> <li><b>Down</b>—Software processes that handle the line protocol consider the line to be unusable.</li> </ul> <p>You can use the Line Protocol together with Operational Status to troubleshoot interface connection problems. For example, if Operational Status is Up, but Line Protocol is Down, the interface has detected a carrier on the physical layer, but clocking or framing problems might occur.</p> |

## Statistics Information

The Statistics Information subsection in the Statistics Details: Interface Details section for application server process associations, links, and signaling gateway mated pairs contains:

| Field               | Description                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bytes In per Sec    | Number of bytes received on the interface per second, including framing characters.                                                                  |
| Bytes Out per Sec   | Number of bytes sent on the interface per second, including framing characters.                                                                      |
| Packets In per Sec  | Number of packets delivered per second to a higher-layer protocol.                                                                                   |
| Packets Out per Sec | Total number of packets that higher-level protocols requested to be sent to the network per second, including those that were discarded or not sent. |

## Errors Information

The Errors Information subsection in the Statistics Details: Interface Details section for application server process associations, links, and signaling gateway mated pairs contains:

| Field        | Description                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In Discards  | Number of inbound packets that were discarded, even though no errors were detected to prevent their delivery to a higher-layer protocol. For example, a packet might be discarded to free buffer space.  |
| Out Discards | Number of outbound packets that were discarded, even though no errors were detected to prevent their delivery to a higher-layer protocol. For example, a packet might be discarded to free buffer space. |
| In Errors    | Number of inbound packets that contained errors that prevented their delivery to a higher-layer protocol.                                                                                                |
| Out Errors   | Number of outbound packets that were not sent because of errors.                                                                                                                                         |

## Poll Settings

To view or change poll settings for the object's Statistics Details window in the MWTM client interface, click **Poll Settings** in the left pane. The MWTM displays the Poll Settings pane in the right pane.

The Poll Settings pane contains:

| Field                    | Description                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Interval (secs)     | New poll interval for the object's Statistics Details window, in seconds.<br><br>Enter the new poll interval in this field. The valid range is 15 seconds to an unlimited number of seconds. The default value is 15 seconds. |
| Current Poll Interval    | Current poll interval for the object's Statistics Details window, in seconds.                                                                                                                                                 |
| Number of Polls Received | Total number of polls received since polling began for the object's Statistics Details window.                                                                                                                                |
| Running Time             | Total elapsed time since polling began for the object's Statistics Details window.                                                                                                                                            |
| Last Message             | Date and time of the last poll for the object's Statistics Details window.                                                                                                                                                    |

| Field             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Counter Mode | Displays the current mode for poll counters, and the date and time that counters were last reset. Possible modes are: <ul style="list-style-type: none"> <li>• <b>Since Reboot</b>—Counters display values aggregated since the last reboot of the node, or since the node last reset the counters.</li> <li>• <b>Since Last Poll</b>—Counters display values aggregated since the last poll.</li> <li>• <b>Since User Reset</b>—Counters display values aggregated since the last time they were reset by the user.</li> </ul> |
| Reset Counters    | Opens the MWTM Reset Counters dialog box, which you use to change MWTM poller and counter settings. For more information, see <a href="#">Changing Real-Time Poller and Counter Settings, page 5-20</a> .                                                                                                                                                                                                                                                                                                                       |

## Q.752 Measurements

The Statistics Details: Q.752 Measurements section for links contains:

- [Error Information, page 8-78](#)
- [Inhibited Information, page 8-78](#)
- [Retransmitted Information, page 8-79](#)
- [Congested Information, page 8-79](#)

Statistics for links associated with the chosen linkset are visible in the left column, and for links associated with the adjacent linkset in the right column.

### Error Information

The Error Information subsection contains:

| Field                       | Description                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Link Failure Count          | Number of times the link was unavailable for signaling.                                                                       |
| Alignment Error Count       | Number of errors detected during link alignment. Link alignment occurs at start up, or when trying to bring up a failed link. |
| Negative ACKs Count         | Number of errors detected during link acknowledgement.                                                                        |
| Status Indicator Busy Count | Number of times the Status Indicator Busy was received.                                                                       |

### Inhibited Information

The Inhibited Information subsection contains:

| Field                    | Description                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Local Inhibit Onset      | Number of times a local ITP administrator has inhibited the link (that is, set the link to prevent traffic from flowing). |
| Local Inhibit Duration % | Percentage of time the link is locally inhibited since the last reboot of the ITP, or since ITP last reset the counters.  |

| Field                     | Description                                                                                                               |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Remote Inhibit Onset      | Number of times a remote ITP administrator has inhibited the link.                                                        |
| Remote Inhibit Duration % | Percentage of time the link is remotely inhibited since the last reboot of the ITP, or since ITP last reset the counters. |

### Retransmitted Information

The Retransmitted Information subsection contains:

| Field                             | Description                                                  |
|-----------------------------------|--------------------------------------------------------------|
| Packets Retransmitted per Sec     | Number of packets that the link transmits, per second.       |
| Bytes Retransmitted per Sec       | Number of bytes that the link transmits, per second.         |
| Local Automatic Change Over Count | Number of <i>local automatic changeover</i> events detected. |
| Local Automatic Change Back Count | Number of <i>local automatic changeback</i> events detected. |

### Congested Information

The Congested Information subsection contains:

| Field or Column                 | Description                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------|
| Congestion Occurrences          | Number of times congestion has occurred on the link.                                                             |
| Congestion Duration %           | Percentage of time the link is congested since the last reboot of the ITP, or since ITP last reset the counters. |
| Congestion Level                | Level of congestion: 1, 2, or 3.                                                                                 |
| Packets Lost                    | Number of packets lost by the link as a result of congestion at each level.                                      |
| Packets Lost per Sec            | Number of packets per second that the link loses, as a result of congestion at each level.                       |
| Times At Level With Packet Loss | Number of times the link is congested and has lost packets at each level.                                        |

## Right-Click Menu

The Statistics Details window for a link in the MWTM client interface provides a right-click menu. To see this menu, right-click a link in the navigation tree of the Statistics Details window. The menu displays:

| Menu Command  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete Item   | <p>Deletes the currently chosen link from the MWTM database. The MWTM displays the Confirm Deletion dialog box, To:</p> <ul style="list-style-type: none"> <li>Delete the chosen link, click <b>Yes</b>. The MWTM deletes the link from the MWTM database and closes the Confirm Deletion dialog box.</li> <li>Retain the chosen link, click <b>No</b>. The MWTM retains the link in the MWTM database and closes the Confirm Deletion dialog box.</li> <li>Prevent the MWTM from displaying the Confirm Deletion dialog box, check the <b>Do not show this again</b> check box.</li> </ul> <p><b>Note</b> If you check the <b>Do not show this again</b> check box, and you later decide you want the MWTM to begin displaying the Confirm Deletion dialog box again, you must check the Confirm Deletions check box in the General GUI settings in the Preferences window. For more information, see the description of the Confirm Deletions check box in <a href="#">Startup/Exit Settings, page 5-3</a>.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Network Administrator (level 4) and higher.</p> |
| Ignore Item   | <p>Ignores the link that you click at the next polling cycle.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Unignore Item | <p>Stops ignoring the chosen link at the next polling cycle.</p> <p>If you have implemented MWTM User-Based Access, this option is available to users with authentication level Power User (level 2) and higher.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## SCTP Association Configuration Details

You use the MWTM to view Stream Control Transmission Protocol (SCTP) association configuration details for the chosen application server process association, link, or signaling gateway-mated pair.

The Statistics Details: SCTP Assoc. Config Details section contains:

| Section                                                | Description                                                                                                                             |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Configuration Information</a>              | Status information, length of time the link is up, remote and local numbers, and IP address information.                                |
| <a href="#">Local IP Address Information</a>           | Local IP addresses associated with the link and the length of time each address is up.                                                  |
| <a href="#">Remote IP Address Information</a>          | Remote IP addresses associated with the link, the length of time each address is up, and SCTP retry information.                        |
| <a href="#">Transmission Configuration Information</a> | The MTU, number of inbound and outbound streams, retry timeouts, local and remote receive window sizes, and chunk bundling information. |

## Configuration Information

The Configuration Information subsection in the Statistics Details: SCTP Assoc. Config Details section for application server process associations, SCTP links, and signaling gateway mated pairs contains:

| Field                | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status               | <p>Current status of the SCTP association. Possible values are:</p> <ul style="list-style-type: none"> <li>• Closed</li> <li>• CookieWait</li> <li>• CookieEchoed</li> <li>• DeleteTCB</li> <li>• Established</li> <li>• ShutdownAckSent</li> <li>• ShutdownPending</li> <li>• ShutdownReceived</li> <li>• ShutdownSent</li> </ul> <p>For detailed information about each status, see RFC 2960, Stream Control Transmission Protocol.</p> |
| Uptime               | Time the link is up, in days, hours, minutes, and seconds.                                                                                                                                                                                                                                                                                                                                                                                |
| Remote Port          | Remote port number for the SCTP association.                                                                                                                                                                                                                                                                                                                                                                                              |
| Local Port           | Local port number for the SCTP association.                                                                                                                                                                                                                                                                                                                                                                                               |
| Primary IP Address   | Designated primary IP address for the SCTP association.                                                                                                                                                                                                                                                                                                                                                                                   |
| Effective IP Address | IP address that the SCTP association uses.                                                                                                                                                                                                                                                                                                                                                                                                |

## Local IP Address Information

The Local IP Address Information subsection in the Statistics Details: SCTP Assoc. Config Details section for application server process associations, SCTP links, and signaling gateway mated pairs contains:

| Field      | Description                                                                                      |
|------------|--------------------------------------------------------------------------------------------------|
| IP Address | Local IP addresses associated with the link.                                                     |
| Uptime     | Time each local IP address associated with the link is up, in days, hours, minutes, and seconds. |

## Remote IP Address Information

The Remote IP Address Information subsection in the Statistics Details: SCTP Assoc. Config Details section for application server process associations, SCTP links, and signaling gateway mated pairs contains:

| Field      | Description                                                                                       |
|------------|---------------------------------------------------------------------------------------------------|
| IP Address | Remote IP addresses associated with the link.                                                     |
| Uptime     | Time each remote IP address associated with the link is up, in days, hours, minutes, and seconds. |

| Field                 | Description                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------|
| Retry Timeout (msecs) | Current SCTP Retransmission Timeout (T3-rtx timer).                                        |
| Maximum Retries       | Maximum allowable number of retransmissions before this IP address is considered inactive. |
| Retries               | Current retransmission count.                                                              |

### Transmission Configuration Information

The Transmission Configuration Information subsection contains:

| Field                         | Description                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MTU                           | Maximum transmission unit (MTU) size that this SCTP association uses. Out of the IP addresses that the SCTP association uses, the smallest size that is supported.                                                                                           |
| In Streams                    | Inbound streams as negotiated when the SCTP association was started.                                                                                                                                                                                         |
| Out Streams                   | Outbound streams as negotiated when the SCTP association was started.                                                                                                                                                                                        |
| Maximum Retries               | Maximum number of data retransmissions in the SCTP association context.                                                                                                                                                                                      |
| Local Receive window Size     | Current local receive window size for this SCTP association.                                                                                                                                                                                                 |
| Remote Receive window Size    | Current local send window size for this SCTP association.                                                                                                                                                                                                    |
| Initial Retry Timeout (msecs) | Initial timeout value, in milliseconds, that the SCTP implementation permits for the retry timeout.                                                                                                                                                          |
| Minimum Retry Timeout (msecs) | Minimum timeout value, in milliseconds, that the SCTP implementation permits for the retry timeout.                                                                                                                                                          |
| Maximum Retry Timeout (msecs) | Maximum timeout value, in milliseconds, that the SCTP implementation permits for the retry timeout.                                                                                                                                                          |
| Bundle Chunks                 | Indicates whether the SCTP protocol allows chunks to be bundled into a single datagram as follows. Valid values are: <ul style="list-style-type: none"> <li><b>true (1)</b>—Chunks are bundled.</li> <li><b>false (2)</b>—Chunks are not bundled.</li> </ul> |
| Bundle Timeout (msecs)        | Time, in milliseconds, to wait to allow data chunks to accumulate so that they can be transmitted in the same datagram.                                                                                                                                      |

### SCTP Association Statistics Details

You use the MWTM to view Stream Control Transmission Protocol (SCTP) association statistics details for the chosen application server process association, link, or signaling gateway-mated pair.

The Statistics Details: SCTP Assoc. Stats Details section contains:

| Section                                                | Description                                                                          |
|--------------------------------------------------------|--------------------------------------------------------------------------------------|
| <a href="#">Remote IP Address Information</a>          | IP addresses, round-trip times, failure counts, and IP address status and heartbeat. |
| <a href="#">Statistics Information (per sec) Rates</a> | Sent and received counts for packets and chunks.                                     |

## Remote IP Address Information

The Remote IP Address Information subsection in the Statistics Details: SCTP Assoc. Stats Details section for application server process associations, SCTP links, and signaling gateway mated pairs contains:

| Field                            | Description                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------|
| IP Address                       | Remote IP addresses associated with the link.                                                                |
| Smoothed Round Trip Time (msecs) | Average, in milliseconds, of all round-trip times between the local and remote systems on an IP network.     |
| Failure Count                    | Number of times the remote IP address was marked as failed.                                                  |
| Heartbeat Status                 | Current status of the heartbeat associated with the remote IP address. Valid values are Active and Inactive. |
| IP Status                        | Current status of the remote IP address. Valid values are Active and Inactive.                               |

## Statistics Information (per sec) Rates

The Statistics Information (per sec) Rates subsection in the Statistics Details: SCTP Assoc. Stats Details section for application server process associations, SCTP links, and signaling gateway mated pairs contains:

| Field                     | Description                                                                |
|---------------------------|----------------------------------------------------------------------------|
| Packets Sent              | Number of IP datagrams that this SCTP association sends per second.        |
| Packets Received          | Number of IP datagrams that this SCTP association receives per second.     |
| Control Chunks Sent       | Number of control chunks that this SCTP association sends per second.      |
| Control Chunks Rec        | Number of control chunks that this SCTP association receives per second.   |
| Ordered Chunks Sent       | Number of ordered chunks that this SCTP association sends per second.      |
| Ordered Chunks Rec        | Number of ordered chunks that this SCTP association receives per second.   |
| Unordered Chunks Sent     | Number of unordered chunks that this SCTP association sends per second.    |
| Unordered Chunks Rec      | Number of unordered chunks that this SCTP association receives per second. |
| Retransmitted Chunks      | Number of chunks that this SCTP association retransmits per second.        |
| Retransmitted Fast Chunks | Number of fast chunks that this SCTP association retransmits per second.   |

## Statistics: Application Servers

You use the MWTM to view statistics for a chosen application server.

The Statistics Details: Statistics tab contains:

| Field                      | Description                                                                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active Duration            | Total time the application server is in service since the last reboot of the ITP, or since ITP last reset the counters.                                                                                                                                                  |
| MTP3 Packet Rate (per sec) | Number of MTP3 packets that the application server receives per second.<br>This field initially displays the description <code>Waiting for second poll</code> . After two polling cycles, the MWTM populates this field with actual calculated rates.                    |
| ASP Packet Rate (per sec)  | Number of application server process packets that the application server sends per second.<br>This field initially displays the description <code>Waiting for second poll</code> . After two polling cycles, the MWTM populates this field with actual calculated rates. |

## Statistics: Application Server Process Associations

You use the MWTM to view statistics for a chosen application server process association.

The Statistics Details: Statistics tab contains:

- [Packets Per Second Information, page 8-84](#)
- [Error Information, page 8-84](#)
- [ASP Initialization Counters, page 8-85](#)
- [Signaling Congestion Counters, page 8-85](#)
- [Destination Counters, page 8-86](#)

### Packets Per Second Information

The Packets Per Second Information section in the Statistics Details: Statistics tab for application server process associations contains:

| Field             | Description                                                        |
|-------------------|--------------------------------------------------------------------|
| Packets From ASP  | Number of packets that the application server receives per second. |
| Packets To ASP    | Number of packets that the application server sends per second.    |
| Packets From MTP3 | Number of packets that the MTP3 layer receives per second.         |
| Packets To MTP3   | Number of packets that the MTP3 layer sends per second.            |

### Error Information

The Error Information section in the Statistics Details: Statistics tab for application server process associations contains:

| Field           | Description                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------|
| Errors Received | Total number of error (ERR) messages that the application server process association receives. |
| Errors Sent     | Total number of error (ERR) messages that the application server process association sends.    |

## ASP Initialization Counters

The ASP Initialization Counters section in the Statistics Details: Statistics tab for application server process associations contains:

| Field                        | Description                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Up Messages Received         | Total number of application server process up (ASPUP) messages that the application server process association receives.                  |
| Up ACK Messages Sent         | Total number of application server process up acknowledgement (UPACK) messages that the application server process association sends.     |
| Down Messages Received       | Total number of application server process down (ASPDN) messages that the application server process receives.                            |
| Down ACK Messages Sent       | Total number of application server process down acknowledgement (DOWNACK) messages that the application server process association sends. |
| Activation Messages Received | Total number of application server process active messages that the application server process association receives.                      |
| Activation ACK Messages Sent | Total number of application server process active acknowledgement messages that the application server process association sends.         |
| Inactive Messages Received   | Total number of application server process inactive messages that the application server process association receives.                    |
| Inactive ACK Messages Sent   | Total number of application server process inactive acknowledgement messages that the application server process association sends.       |

## Signaling Congestion Counters

The Signaling Congestion Counters section in the Statistics Details: Statistics tab for application server process associations contains:

| Field                     | Description                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------------------------|
| Level 0 Messages Received | Total number of signaling congestion level 0 (SCON0) messages that the application server process receives. |
| Level 1 Messages Received | Total number of signaling congestion level 1 (SCON1) messages that the application server process receives. |
| Level 2 Messages Received | Total number of signaling congestion level 2 (SCON2) messages that the application server process receives. |
| Level 3 Messages Received | Total number of signaling congestion level 3 (SCON3) messages that the application server process receives. |
| Level 0 Messages Sent     | Total number of signaling congestion level 0 (SCON0) messages that the application server process sends.    |
| Level 1 Messages Sent     | Total number of signaling congestion level 1 (SCON1) messages that the application server process sends.    |
| Level 2 Messages Sent     | Total number of signaling congestion level 2 (SCON2) messages that the application server process sends.    |
| Level 3 Messages Sent     | Total number of signaling congestion level 3 (SCON3) messages that the application server process sends.    |

## Destination Counters

The Destination Counters section in the Statistics Details: Statistics tab for application server process associations contains:

| Field                                   | Description                                                                                                                 |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Unavailable Messages Received           | Total number of destination unavailable (DUNA) messages that the application server process association receives.           |
| Unavailable Messages Sent               | Total number of destination unavailable (DUNA) messages that the application server process association sends.              |
| Available Messages Received             | Total number of destination available (DAVA) messages that the application server process association receives.             |
| Available Messages Sent                 | Total number of destination available (DAVA) messages that the application server process association sends.                |
| User Part Unavailable Messages Received | Total number of destination user part unavailable (DUPU) messages that the application server process association receives. |
| User Part Unavailable Messages Sent     | Total number of destination user part unavailable (DUPU) messages that the application server process association sends.    |
| State Audit Messages Received           | Total number of destination state audit (DAUD) messages that the application server process association receives.           |
| State Audit Messages Sent               | Total number of destination state audit (DAUD) messages that the application server process association sends.              |

## Statistics: Links and Linksets

You use the MWTM to view statistics for a chosen link or linkset.

The Statistics Details: Statistics tab contains:

- [Packet Information, page 8-87](#)
- [Bit Information or Byte Information, page 8-87](#)
- [LSSU Information \(Links Only\), page 8-88](#)
- [Utilization Information, page 8-88](#)
- [Service Information, page 8-89](#)

Statistics for links associated with the chosen linkset are visible in the left column, and for links associated with the adjacent linkset in the right column.

## Packet Information

The Packet Information section in the Statistics Details: Statistics tab for links and linksets contains:

| Field                                  | Description                                                                                                                                                                                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sent Per Sec                           | Number of packets that the link or linkset sends per second.<br><br>This field initially displays the description <code>Waiting for second poll</code> . After two polling cycles, the MWTM populates this field with actual calculated rates.    |
| Received Per Sec                       | Number of packets that the link or linkset receives per second.<br><br>This field initially displays the description <code>Waiting for second poll</code> . After two polling cycles, the MWTM populates this field with actual calculated rates. |
| Drops                                  | Total number of packets that have been dropped by the link or linkset.                                                                                                                                                                            |
| Transmit Queue Depth (links only)      | Number of packets waiting to be sent on by the link.                                                                                                                                                                                              |
| Transmit Queue High Depth (links only) | Highest level reached by the transmit queue since the last reboot of the ITP, or since ITP last reset the averages as a result of bad data.                                                                                                       |
| Transmit Queue High Reset (links only) | Level at which the link is to reset the transmit queue. If the link is never to reset the transmit queue, this field displays <code>Never</code> .                                                                                                |
| Signal Link Test (links only)          | Indicates whether test packets are being sent on the link. Valid values are: <ul style="list-style-type: none"> <li>• <b>true (1)</b>—Test packets are being sent.</li> <li>• <b>false (2)</b>—Test packets are not being sent.</li> </ul>        |

## Bit Information or Byte Information

The Bit Information section (or Byte Information section, if you unchecked the Show Details in Bits Instead of Bytes check box in the Preferences window) in the Statistics Details: Statistics tab for links and linksets contains these fields:

| Field            | Description                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sent Per Sec     | Number of bits or bytes (as set in the Preferences window) that the link or linkset sends per second.<br><br>This field initially displays the description <code>Waiting for second poll</code> . After two polling cycles, the MWTM populates this field with actual calculated rates.    |
| Received Per Sec | Number of bits or bytes (as set in the Preferences window) that the link or linkset receives per second.<br><br>This field initially displays the description <code>Waiting for second poll</code> . After two polling cycles, the MWTM populates this field with actual calculated rates. |

## LSSU Information (Links Only)

The Links Status Signal Unit (LSSU) section in the Statistics Details: Statistics tab for links contains:

| Field                 | Description                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------|
| LSSU Packets Sent     | Total number of LSSU packets that the link sends.                                             |
| LSSU Packets Received | Total number of SS7 Message Transfer Part Layer 2 (MTP2) LSSU packets that the link receives. |

## Utilization Information

The Utilization Information section in the Statistics Details: Statistics tab for links and linksets contains:

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send Plan Capacity            | Planned capacity of the link or linkset to send, in bits per second. For a link or linkset of type: <ul style="list-style-type: none"> <li>Serial or HSL, available bandwidth for the link/linkset.</li> <li>SCTPIP (or Mixed for linksets), set on the ITP by using the plan-capacity CS7 link or linkset configuration command.</li> </ul> <p>If Send Plan Capacity is not set on the ITP for this link or linkset, this field displays the value <b>0</b>.</p> <ul style="list-style-type: none"> <li>Other, this field always displays the value <b>0</b>.</li> </ul>                                                                                                                                                                                                                                                                                   |
| %                             | Amount of the link or linkset's send capacity being used, as a percentage or in Erlangs (E) as set in the Preferences window, calculated by using this formula:<br>$\text{Send Utilization} = (\text{Bits Sent Per Sec}) / \text{Planned Capacity}$ <p>This field initially displays the description <code>Waiting for second poll</code>. After two polling cycles, the MWTM populates this field with actual calculated rates. For a link or linkset of type:</p> <ul style="list-style-type: none"> <li>SCTPIP (or Mixed for linksets), if Send Plan Capacity is not set on the ITP for this link, or for one or more of the links associated with this linkset, this field displays the description <code>Set Plan Capacity on ITP</code>.</li> <li>Other, this field always displays the description <code>Set Plan Capacity on ITP</code>.</li> </ul> |
| Send Threshold % (links only) | Indicates when to generate the MWTM a <code>clTpSpLinkSentUtilChange</code> for the link, as a percent of its total send capacity. For example, if Send Plan Capacity is 64,000 bits per second, and Send Threshold % is <b>50</b> , then the MWTM generates a <code>clTpSpLinkSentUtilChange</code> notification when the link reaches 50% of 64,000, or 32,000 bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Receive Plan Capacity         | Planned capacity of the link or linkset to receive, in bits per second. For a link or linkset of type: <ul style="list-style-type: none"> <li>Serial or HSL, available bandwidth for the link.</li> <li>SCTPIP (or Mixed for linksets), set on the ITP using the plan-capacity CS7 link/linkset configuration command.</li> </ul> <p>If Receive Plan Capacity is not set on the ITP for this link or linkset, this field displays the value <b>0</b>.</p> <ul style="list-style-type: none"> <li>Other, this field always displays the value <b>0</b>.</li> </ul>                                                                                                                                                                                                                                                                                           |

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Receive Utilization %            | <p>Amount of the link or linksets receive capacity being used, as a percentage or in Erlangs (E) as set in the Preferences window, calculated by using this formula:</p> $\text{Receive Utilization} = (\text{Bits Received Per Sec}) / \text{Receive Plan Capacity}$ <p>This field initially displays the description <code>Waiting for second poll</code>. After two polling cycles, the MWTM populates this field with actual calculated rates. For a link or linkset of type:</p> <ul style="list-style-type: none"> <li>SCTPIP (or Mixed for linksets), if Receive Plan Capacity is not set on the ITP for this link, or for one or more of the links associated with this linkset, this field displays the description <code>Set Plan Capacity on ITP</code>.</li> <li>Other, this field always displays the description <code>Set Plan Capacity on ITP</code>.</li> </ul> |
| Receive Threshold % (links only) | <p>Indicates when to generate the MWTM a <code>cltpSpLinkRcvdUtilChange</code> for the link, as a percent of its total receive capacity. For example, if Receive Plan Capacity is 64,000 bits per second, and Receive Threshold % is <b>50</b>, then the MWTM generates a <code>cltpSpLinkRcvdUtilChange</code> notification when the link reaches 50% of 64,000, or 32,000 bits per second.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Service Information

The Service Information section in the Statistics Details: Statistics tab for links and linksets contains:

| Field                                   | Description                                                                                                                                                                                                                                                     |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Duration In Service %                   | Percentage of time the link or linkset is in service since the last reboot of the ITP, or since ITP last reset the counters.                                                                                                                                    |
| Duration Out Of Service %               | Percentage of time the link or linkset is out of service since the last reboot of the ITP, or since ITP last reset the counters.                                                                                                                                |
| MTP3 Accounting Enabled (linksets only) | <p>Indicates whether the collection of MTP3 accounting statistics is enabled for the linkset.</p> <p>If the linkset is a Virtual linkset, this field displays N/A.</p>                                                                                          |
| GTT Accounting Enabled (linksets only)  | <p>Indicates whether the collection of GTT accounting statistics is enabled for the linkset.</p> <p>For Cisco IOS software releases prior to 12.2(4)MB10, this field displays Unknown.</p> <p>If the linkset is a Virtual linkset, this field displays N/A.</p> |

### Status Details

You use the MWTM to view status details for a chosen link.

The Statistics Details: Status Details tab contains:

| Column                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol State Details | <p>Detailed information about the state of the protocol for this link. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>Changeback control (TCBC)</b>—Changeback control is buffering data on this link.</li> <li>• <b>Changeover control (TCOC)</b>—Changeover control is buffering data on this link.</li> <li>• <b>Link availability control (TLAC)</b>—Adjacent Signalling point is restarting.</li> <li>• <b>Link availability control (TLAC)</b>—Emergency changeover is in progress on this link.</li> <li>• <b>Link availability control (TLAC)</b>—Changeback is in progress on this link.</li> <li>• <b>Link availability control (TLAC)</b>—Changeover is in progress on this link.</li> <li>• <b>Link availability control (TLAC)</b>—The last changeover operation failed on this link.</li> <li>• <b>Link availability control (TLAC)</b>—Inhibit command will be retried.</li> <li>• <b>Link availability control (TLAC)</b>—Management request in progress for this link.</li> <li>• <b>Link availability control (TLAC)</b>—Signalling point is in the process of a restart.</li> <li>• <b>Signalling routing control (TSRC)</b>—Changeover request is complete.</li> <li>• <b>Signalling routing control (TSRC)</b>—Adjacent Signalling Point is restarting.</li> <li>• <b>Link availability control (TLAC)</b>—Link is inhibited by a local management operation.</li> <li>• <b>Link availability control (TLAC)</b>—Link is inhibited by a remote management operation.</li> <li>• <b>Link availability control (TLAC)</b>—Link is blocked because of a local processor outage.</li> <li>• <b>Link availability control (TLAC)</b>—Link is blocked because of a remote processor outage.</li> </ul>                                   |
| Link Test Results      | <p>Indicates the results of the link test. Possible results are:</p> <ul style="list-style-type: none"> <li>• <b>No Errors</b>—The link did not detect any errors.</li> <li>• <b>Undefined OPC (Origination Point Code)</b>—A signaling link test message arrived with an undefined OPC. This scenario can occur when a serial link connects incorrectly, or when you configure an SCTP link incorrectly. This scenario differs from Incorrect OPC because the signaling point is unaware of the point code in question. The point code is not defined for any linkset on this ITP.</li> <li>• <b>Incorrect OPC</b>—A signaling link test message arrived with an incorrect OPC. This scenario can occur when a serial link connects incorrectly, or when you configure an SCTP link incorrectly. This scenario differs from <b>Undefined OPC</b> because the signaling point is aware of the point code in question, and the point code is defined for a linkset on this ITP, but the point code is not correct for the current linkset.</li> <li>• <b>Undefined SLC (Signaling Link Code)</b>—A signaling link test message arrived with an undefined SLC. This scenario can occur when a serial link connects incorrectly, or when you configure an SCTP link incorrectly. The link connects to the correct linkset, but the linkset does not have a definition for the SLC in question.</li> <li>• <b>Incorrect SLC</b>—A signaling link test message arrived with an incorrect SLC. This scenario can occur when a serial link connects incorrectly, or when you configure an SCTP link incorrectly. The link connects to the correct linkset, but to the wrong link in that linkset. That is, the signaling test receives the test packet on the wrong link.</li> </ul> |

| Column                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link Test Results<br>(continued) | <ul style="list-style-type: none"> <li>• <b>Incorrect NI (Network Indicator)</b>—A signaling link test message arrived with an incorrect NI. This scenario can occur when links connect to the correct linkset and link, but the NIs of the two adjacent point codes are not the same.</li> <li>• <b>Bad Pattern</b>—A signaling link test message arrived with an incorrect test pattern. This error occurs because the test pattern is corrupt. This scenario usually indicates a hardware or configuration issue related to the physical format of the data on the links, caused by a variant mismatch or incorrect definitions on the physical link.</li> <li>• <b>Non Adjacent</b>—Received a signaling link test message from a nonadjacent node.</li> <li>• <b>Failed</b>—Unable to run the test, or no response arrived in the specified interval.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Link Fail Reason                 | <p>If the link failed the link test, indicates the reason for the failure. Possible reasons are:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—No additional reason available.</li> <li>• <b>Changeover in progress</b>—Changeover is in progress. This message diverts traffic away from a failed link.</li> <li>• <b>Management disconnect request</b>—An MTP3 sent a request to stop the link.</li> <li>• <b>Link alignment lost</b>—Link alignment is lost.</li> </ul> <p>A link is in alignment when signal units are received in sequence, and with the proper number of octets. The signal unit must be a total length of eight-bit multiples. If the signal unit is not of eight-bit multiples, or if the signaling information field (SIF) exceeds the 272-octet capacity, the signaling unit is considered to be in error. If excessive errors are encountered on a link, it is considered to be out of alignment.</p> <p>For M2PA links, this state reason is generated when the M2PA alignment timer T1 expires. This could indicate that the remote link is shutdown, or that intermittent IP connectivity problems exist.</p> <ul style="list-style-type: none"> <li>• <b>Link connection lost</b>—Link connection is lost.</li> <li>• <b>Local Disconnect</b>—A request to disconnect the link is received, but the link is already disconnected.</li> <li>• <b>Remote Disconnect</b>—A remote disconnect request is received.</li> <li>• <b>Signal unit error rate monitor failure</b>—The signal unit error rate monitor has failed.</li> <li>• <b>T1 timeout no FISU received</b>—A T1 timeout no FISU is received. This timer avoids message mis-sequencing during changeover.</li> <li>• <b>T2 timeout no SIO received</b>—A T2 timeout no SIO is received. This timer waits for a changeover acknowledgment.</li> </ul> |

| Column                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link Fail Reason<br>(continued) | <ul style="list-style-type: none"> <li>• <b>T3 timeout no SIN received</b>—A T3 timeout no SIN is received. This timer controls diversion-delay to avoid mis-sequencing on changeback.</li> <li>• <b>T6 timeout excessive congestion</b>—A T6 timeout excessive congestion is received. This timer avoids message mis-sequencing on controlled rerouting.</li> <li>• <b>T7 timeout excessive acknowledgement delay</b>—A T7 timeout excessive acknowledgement delay is received. The T7 timer prevents a signaling point from waiting too long for a positive or negative acknowledgment. Usually, an acknowledgment is sent when a signaling point becomes idle and does not have any more traffic to transmit. When congestion occurs at a signaling point, or an extreme amount of traffic is present, the T7 could possibly time out and force retransmission of messages.</li> <li>• <b>Link proving failure</b>—A link proving failure occurred.</li> <li>• <b>Abnormal BSN received</b>—An abnormal Backward Sequence Number (BSN) is received.</li> <li>• <b>Abnormal FIB received</b>—An abnormal Forward Indicator Bit (FIB) is received.</li> <li>• <b>Abnormal SIB received</b>—An abnormal Status Indicator Busy (SIB) is received.</li> <li>• <b>Abnormal LSSU received</b>—An abnormal Link Status Signal Unit (LSSU) is received.</li> <li>• <b>Peer not ready</b>—An MTP3 tried to bring up a link that is still cleaning up after being stopped. In some cases, the MTP3 does not change over after a link failure, so the M2PA or SCTP waits for an event that will not occur. When an MTP3 tries to bring up the link again, the previous control structures must first be cleaned up. If M2PA gets a start request from an MTP3, and the previous structures are still being held, M2PA cleans them up and sends a PEER NOT READY to the MTP3 layer. A subsequent request to start the link from the MTP3 layer will then cause the link to come up.</li> <li>• <b>Communication lost</b>—M2PA or SCTP has determined that the remote end signaling point is no longer reachable. Possible reasons include: <ul style="list-style-type: none"> <li>– The maximum number of consecutive retries of a packet is reached.</li> <li>– In the absence of data, the MWTM failed to receive heartbeat ACKs in response to heartbeats, for the maximum number of retries.</li> </ul> </li> <li>• <b>No Listen posted</b>—An MTP3 tried to start a link, but the local-peer port associated with the link is not available, probably because of a bad configuration.</li> <li>• <b>Unable to allocate buffer</b>—M2PA or SCTP cannot get buffers for sending or receiving packets. Buffer problems can be temporary or permanent. Temporary buffer problems will generally clear with little side effects. Permanent buffer problems can lead to failed linksets or links.</li> </ul> |

| Column                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Viewing ITP MTP3 Errors

The ITP MTP3 Errors table displays all MTP3 error information for the chosen ITP node.

If you have implemented MWTM User-Based Access, this option is available to users with authentication level System Administrator (level 5).

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

The MTP3 Errors section displays these columns for the chosen node:

| Column                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                                |
| Reset Counters                                                                              | Opens the MWTM Reset Counters dialog box, which you use to change MWTM poller and counter settings. For more information, see <a href="#">Changing Real-Time Poller and Counter Settings, page 5-20</a> .                                                                                                                                                                                                                                                                                                                        |
| Poll Counter Mode                                                                           | <p>Displays the current mode for poll counters, and the date and time that counters were last reset. Possible modes are:</p> <ul style="list-style-type: none"> <li>• <b>Since Reboot</b>—Counters display values aggregated since the last reboot of the ITP, or since ITP last reset the counters.</li> <li>• <b>Since Last Poll</b>—Counters display values aggregated since the last poll.</li> <li>• <b>Since User Reset</b>—Counters display values aggregated since the last time they were reset by the user.</li> </ul> |

| Column            | Description                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Interval     | Poll interval used to collect data for the table.                                                                                                                                                                |
| Last Poll         | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll. |
| Count             | Number of times the indicated MTP3 error type was detected.                                                                                                                                                      |
| Error Description | Description of the MTP3 error type.                                                                                                                                                                              |

## Viewing ITP MSU Rates

The ITP MSU Rates table displays all MSU rate information in charts for the chosen ITP node.

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

The MSU Rates tab contains a Summary sub-tab, showing totals for all MSU rates. Each additional sub-tab shows MSU rates for a specific CPU (for example, 0/0 shows CPU 0 located in slot 0). The status ball on the sub-tab indicates the current threshold level of the CPU.

| GUI Elements                                                                                | Description                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                              |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                   |
| Change Poller                                                                               | Button that opens the Poller Settings dialog box. See <a href="#">Change Poller, page 8-106</a> .                                                                                                                                                                                   |
| Poll Interval                                                                               | Label that shows the current poll interval in seconds.                                                                                                                                                                                                                              |
| Last Poll                                                                                   | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                    |
| MSUs / sec                                                                                  | Y-axis label that displays traffic rate in MSUs per second.                                                                                                                                                                                                                         |
| Time                                                                                        | X-axis label that displays a real-time scale.                                                                                                                                                                                                                                       |
| Legend                                                                                      | Identifies the data series currently showing in the chart. <ul style="list-style-type: none"> <li><b>No Data</b>—Data is not available. A vertical bar appears in the chart.</li> <li><b>CPU Threshold Crossed</b>—One or more CPUs have crossed a processing threshold.</li> </ul> |

## Right-click Menu

A right-click context menu provides options to modify how the chart appears:

| Menu options        | Description                                                                                                                                                                               |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hide > <i>field</i> | Hides the currently shown data series.                                                                                                                                                    |
| Show > <i>field</i> | Shows the currently shown data series.                                                                                                                                                    |
| Reset Zoom          | If you have zoomed into a specific area of the chart, resets the zoom.<br><b>Note</b> To zoom into a specific area of the chart, use the left mouse button to drag a box around the area. |
| Grid On             | Displays a grid on the chart.                                                                                                                                                             |
| Grid Off            | Removes the grid from the chart.                                                                                                                                                          |
| Shapes On           | Displays individual data points as shapes on the rate lines and the chart legend.                                                                                                         |
| Shapes Off          | Removes shapes from the rate lines and the chart legend.                                                                                                                                  |

## Viewing Non-Stop Operation

Non-Stop Operation (NSO) is an implementation of redundant data elements and software functionality that enables networks to approach 99.999% availability. The Non-Stop Operation table displays detailed information about all NSO settings associated with the chosen node.

To view the Non-Stop Operation section, in a view in the navigation tree, select an ITP node or any of the mSEF node (HA, BWG, GGSN, CSG2, PDNGW, SGW, and PDSN), then click on the Non-Stop Operation tab in the content area.

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

The Non-Stop Operation table displays these fields for the chosen node:

| GUI Element                                                                                 | Description                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                           |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                |
| Poll Interval                                                                               | Poll interval used to collect data for the table.                                                                                                                                                                |

| Current Status: Peer Unit State          | <p>Current RF status for this unit's peer unit. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—Active and is processing calls.</li> <li>• <b>Active Drain</b>—Performing client cleanup.</li> <li>• <b>Active Extra Load</b>—Active and is processing calls for all feature boards in the system.</li> <li>• <b>Active Fast</b>—Performing call maintenance during a SWACT notification.</li> <li>• <b>Active Handback</b>—Active, is processing calls, and is handing off some resources to the other RF unit.</li> <li>• <b>Active Preconfiguration</b>—Active but has not yet read its configuration.</li> <li>• <b>Active Postconfiguration</b>—Active and is processing its configuration.</li> <li>• <b>Disabled</b>—RF is not currently operating on the peer unit.</li> <li>• <b>Hot Standby</b>—Ready to become the active unit.</li> <li>• <b>Initialization</b>—Establishing necessary system services.</li> <li>• <b>Negotiation</b>—Discovering and negotiating with this unit.</li> <li>• <b>Cold Standby</b>—Running the client RF notification.</li> <li>• <b>Cold Standby Bulk</b>—Synchronizing its client data with this (active) unit.</li> <li>• <b>Cold Standby Configuring</b>—Synchronizing its configuration with this (active) unit.</li> <li>• <b>Cold Standby File System</b>—Synchronizing its file system with this (active) unit.</li> <li>• <b>Unknown</b>—The current RF state of the peer unit is not known.</li> </ul> |
| Current Status: Primary Mode             | <p>Indicates whether this unit is the primary or secondary.</p> <p>The primary unit has a higher priority than the secondary unit. In a race situation (for example, during initialization), or in any situation in which the units cannot successfully negotiate activity between themselves, the primary unit becomes the active unit and the secondary unit becomes the standby unit. Only one redundant unit can be the primary unit at any given time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Current Status: Last Failover Time          | Date and time when the primary redundant unit became the active unit. If no failover has occurred, this field displays <code>No Failover Has Occurred</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Current Status: Standby Available At Time   | Date and time when the peer redundant unit entered the Hot Standby state. If a failover occurs, this field displays <code>System Initialization</code> for a brief period until the system is back up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Redundancy Mode Capability: Capability Mode | List of redundancy modes that the unit can support. Possible values are: <ul style="list-style-type: none"> <li>• <b>Cold Standby Redundant</b>—This unit is configured for redundancy, but the redundant peer unit is not fully initialized and cannot retain established calls.</li> <li>• <b>Dynamic Load Share NonRedundant</b>—This unit is not configured for redundancy, but it is load-sharing. The load-sharing is based on the operational load (that is, it is based on the number of calls, or some other factor).</li> <li>• <b>Static Load Share Redundant</b>—This unit is configured for redundancy, and it is load-sharing. The load-sharing is based on the operational load.</li> <li>• <b>NonRedundant</b>—Redundancy is not configured on this unit, and it is not load-sharing.</li> <li>• <b>Static Load Share NonRedundant</b>—This unit is not configured for redundancy, but it is load-sharing. The load-sharing is not based on the operational load.</li> <li>• <b>Static Load Share Redundant</b>—This unit is configured for redundancy, and it is load-sharing. The load-sharing is not based on the operational load.</li> <li>• <b>Warm Standby Redundant</b>—This unit is configured for redundancy, and the redundant peer unit can immediately handle new calls, but it cannot retain established calls.</li> <li>• <b>Hot Standby Redundant</b>—This unit is configured for redundancy, the redundant peer unit can immediately handle new calls, and it can <i>instantaneously</i> retain established calls.</li> </ul> |
| Redundancy Mode Capability: Description     | The Description column contains additional clarification or description of the Capability Mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Switchover History: Index                   | Number identifying the entry in the Switchover History table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Switchover History: Prev. ID                | Unit ID of the active unit that failed or was removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Switchover History: Curr. ID                | Unit ID of the standby unit that became the new active unit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Viewing TDM Statistics

You can view real-time TDM statistics for T1 and E1 interfaces. To view TDM statistics for one of these interfaces, launch the MWTM client or MWTM web interface (<http://server name:1774>), select the T1 or E1 interface in the navigation tree (in the Physical folder), then click the TDM Statistics tab.

**Note**

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

The TDM Statistics tab contains:

| GUI Element                                                                                 | Description                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                            |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval. |
| Change Poller                                                                               | Button that opens the Poller Settings dialog box. See <a href="#">Change Poller, page 8-106</a> . This button appears only in the MWTM client.                                                    |
| Poll Interval                                                                               | Label that shows the current poll interval in seconds.                                                                                                                                            |
| Last Poll                                                                                   | Label that identifies when the last poll occurred.                                                                                                                                                |
| Line Configuration                                                                          | Pane that lists the line configuration parameters of the chosen T1 or E1 interface. See <a href="#">Line Configuration Pane, page 8-101</a> .                                                     |
| Line Status Information <sup>1</sup>                                                        | Pane that provides line status information for the chosen T1 or E1 interface. See <a href="#">Line Status Information Pane, page 8-104</a> .                                                      |
| Performance / Error Information <sup>1</sup>                                                | Pane that provides performance and error information for the chosen T1 or E1 interface. See <a href="#">Performance and Error Information Pane, page 8-104</a> .                                  |

1. To run basic troubleshooting commands on T1 and E1 interfaces, click the Troubleshooting tab, and select the Layer 2 Cross Connection category. See [Viewing Troubleshooting, page 8-40](#).

## Line Configuration Pane

The Line Configuration pane contains:

| Parameter          | Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name     | Name of the interface (for example, T1 0/0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Line Type          | <p>Indicates the type of DS1 line that implements this circuit. The type of circuit affects the number of bits per second that the circuit can reasonably carry, as well as the interpretation of the usage and error statistics. Values include:</p> <ul style="list-style-type: none"> <li>• ESF—Extended Super Frame DS1.</li> <li>• D4—AT&amp;T D4 format DS1.</li> <li>• E1—CCITT recommendation G.704 (Table 4a).</li> <li>• E1-CRC—CCITT recommendation G.704 (Table 4b).</li> <li>• E1-MF—G.704 (Table 4a) with TS16 multiframing enabled.</li> <li>• E1-CRC-MF—G.704 (Table 4b) with TS16 multiframing enabled.</li> <li>• Other—Line type that is other than those described by this parameter.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Line Code          | <p>Indicates the type of zero code suppression used on the line, which affects a number of its characteristics. Values include:</p> <ul style="list-style-type: none"> <li>• JBZS—Jammed Bit Zero Suppression. A technique in which the AT&amp;T specification of at least one pulse every 8-bit period is literally implemented by forcing a pulse in bit 8 of each channel. Therefore, only seven bits per channel, or 1.344 Mbps, is available for data.</li> <li>• B8ZS—Bipolar with 8 Zeros Substitution. A specified pattern of normal bits and bipolar violations replace a sequence of eight zero bits.</li> <li>• ZBTISI—Zero Byte Time Slot Interchange. A technique applied to a DS1 frame to ensure pulse density requirements are met. ANSI clear channels use ZBTISI.</li> <li>• AMI—Alternate Mark Inversion. A technique in which no zero code suppression is present and the line encoding does not directly solve the problem. In this application, the higher layer must provide data which meets or exceeds the pulse density requirements. E1 links, with or without CRC, use this code or the HDB3 code.</li> <li>• HDB3—High Density Bipolar of order 3. A line code based on AMI.</li> <li>• Other—Line code that is other than those described by this parameter.</li> </ul> |
| Send Code          | <p>Indicates what type of code is sent across the DS1 interface by the device. Values include:</p> <ul style="list-style-type: none"> <li>• Send No Code—Sending looped or normal data.</li> <li>• Send Line Code—Sending a request for a line loopback.</li> <li>• Send Payload Code—Sending a request for a payload loopback.</li> <li>• Send Reset Code—Sending a loopback termination request.</li> <li>• Send QRS—Sending a quasi-random signal (QRS) test pattern.</li> <li>• Send 511 Pattern—Sending a 511 bit fixed test pattern.</li> <li>• Send 3-in-24 Pattern—Sending a fixed test pattern of 3 bits set in 24.</li> <li>• Send Other Test Pattern—Sending a test pattern other than those described by this parameter.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Circuit Identifier | Contains the transmission vendor's circuit identifier, for the purpose of facilitating troubleshooting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter            | Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Loopback Config      | <p>Identifies the loopback configuration of the DS1 interface. Agents supporting read/write access should return badValue in response to a requested loopback state that the interface does not support. Values include:</p> <ul style="list-style-type: none"> <li>• No Loop—Not in the loopback state. A device that is not capable of performing a loopback on the interface always returns this value.</li> <li>• Payload Loop—The received signal at this interface is looped through the device. Typically the received signal is looped back for retransmission after it has passed through the device's framing function.</li> <li>• Line Loop—The received signal at this interface does not go through the device (minimum penetration) but is looped back out.</li> <li>• Other Loop—Loopbacks that are not defined by this parameter.</li> </ul> |
| Signal Mode          | <p>Identifies the signal mode of the interface. Values include:</p> <ul style="list-style-type: none"> <li>• None—Indicates that no bits are reserved for signaling on this channel.</li> <li>• Robbed Bit—Indicates that T1 robbed bit signaling is in use.</li> <li>• Bit Oriented—Indicates that E1 channel associated signaling is in use.</li> <li>• Message Oriented—Indicates that common channel signaling is in use either on channel 16 of an E1 link or channel 24 of a T1.</li> </ul>                                                                                                                                                                                                                                                                                                                                                            |
| Clock Source         | <p>Indicates the source of the transmit clock. Values include:</p> <ul style="list-style-type: none"> <li>• Loop Timing—Indicates that the recovered receive clock is used as the transmit clock.</li> <li>• Local Timing—Indicates that a local clock source is used.</li> <li>• Through Timing—Indicates that a recovered receive clock from another interface is used as the transmit clock.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Facilities Data Link | <p>Describes the use of the facilities data link, and is the sum of the capabilities:</p> <ul style="list-style-type: none"> <li>• ANSI T1 403—Refers to the facilities data link (FDL) exchange recommended by ANSI.</li> <li>• AT&amp;T 54016—Refers to ESF FDL exchanges.</li> <li>• FDL None—Indicates that the device does not use the FDL.</li> <li>• Other—Indicates use of a protocol other than those described by this parameter.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                       |

## Line Status Information Pane

The Line Status Information pane contains:

| Parameter                                  | Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Line Status                                | <p>Indicates the line status of the interface. It contains loopback, failure, received alarm, and transmitted alarm information. Values include:</p> <ul style="list-style-type: none"> <li>No Alarm—No alarm is present on the line.</li> <li>Receive Far End LOF—Far end loss of frame (LOF). This notification is also known as a yellow alarm.</li> <li>Transmit Far End LOF—Near end is sending LOF indication.</li> <li>Receive AIS—Far end is sending alarm indication signal (AIS).</li> <li>Transmit AIS—Near end is sending AIS.</li> <li>Loss of Frame—Near end LOF (red alarm).</li> <li>Loss of Signal—Near end loss of signal (LOS).</li> <li>Loopback State—Near end is looped.</li> <li>T16 AIS—E1 T16 alarm indication signal.</li> <li>Receive Far End LOMF—Far end is sending T16 loss of multiframe (LOMF).</li> <li>Transmit Far End LOMF—Near end is sending T16 LOMF alignment.</li> <li>Receive Test Code—Near end is detecting a test code.</li> <li>Other Failure—Any line status not defined by this parameter.</li> </ul> |
| Loss of Frame Count <sup>1</sup>           | Real-time count for loss of frame.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Loss of Signal Count <sup>1</sup>          | Real-time count for loss of signal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Remote Alarm Indication Count <sup>1</sup> | Real-time count for remote alarm indication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Alarm Indication Signal Count <sup>1</sup> | Real-time count for alarm indication signal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

1. Not available for T1 or E1 controllers for ITP 12.2 releases.

## Performance and Error Information Pane

The Performance and Error Information pane contains:

| Parameter                    | Value                                                                                                                     |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Time Elapsed within Interval | Number of minutes and seconds that have elapsed since the beginning of the current error-measurement period.              |
| Line Code Violations         | Number of line code violations (LCVs) encountered by the interface in the current 15-minute interval.                     |
| Path Coding Violations       | Number of path coding violations encountered by the interface in one of the previous 96, individual 15-minute, intervals. |

| Parameter                         | Value                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------|
| Slip Duration                     | Number of slip seconds encountered by the interface in the current 15-minute interval.                     |
| Severely Errored Framing Duration | Number of severely errored framing seconds encountered by the interface in the current 15-minute interval. |
| Line Error Duration               | Number of line errored seconds encountered by the interface in the current 15-minute interval.             |
| Degraded Duration                 | Number of degraded seconds encountered by the interface in the current 15-minute interval.                 |
| Errored Duration                  | Number of errored seconds encountered by the interface in the current 15-minute interval.                  |
| Bursty Error Duration             | Number of bursty errored seconds encountered by the interface in the current 15-minute interval.           |
| Severely Errored Duration         | Number of severely errored seconds encountered by the interface in the current 15-minute interval.         |
| Unavailable Duration              | Number of unavailable seconds encountered by a DS1 interface in the current 15 minute interval.            |

## Viewing RAN-O Performance Data

### Note

The web interface provides historical (not real-time) charts depicting performance information over user-specified time ranges. You can use historical statistics for capacity planning and trend analysis. See [Displaying RAN-O Historical Statistics, page 11-35](#).

The web interface provides historical (not real-time) charts depicting performance information over user-specified time ranges. You can use historical statistics for capacity planning and trend analysis. See [Displaying RAN-O Historical Statistics, page 11-35](#).

The MWTM client interface provides access to RAN-O real-time performance statistics that you can use to troubleshoot problems that occur in real time. The zoom and navigation features quickly enable isolating and focusing on a problem area.

You use real-time charts in the MWTM client to view performance information on shorthaul and backhaul interfaces. To view performance data for a shorthaul or backhaul interface, select the interface in the navigation tree of the DEFAULT view (or any custom view), then click the Backhaul or Shorthaul Performance tab in the right pane.

The Backhaul or Shorthaul Performance tab displays one or more charts depending on whether you selected a shorthaul or a backhaul interface. These charts depict send and receive rates of optimized IP traffic over time. The charts display the traffic from 0 to the maximum speed on the interface. You can set the client preferences to display this data in bits or bytes per second. The default polling interval is 15 seconds, but you can change the frequency in the Poller Settings dialog box, which you launch by clicking the Change Poller button.

The Backhaul or Shorthaul Performance tab also shows total send and receive errors when you select a backhaul interface.

This section provides information about:

- [Viewing Shorthaul Performance Data, page 8-106](#)
- [Viewing Backhaul Performance Data, page 8-107](#)

## Viewing Shorthaul Performance Data

The Shorthaul Performance tab displays a single chart that shows:

- The send rate plotted in one color and the receive rate plotted in a different color.
- A vertical band when the congestion mechanism is active (see the [Cisco MWR 1941-DC-A Mobile Wireless Edge Router Software Configuration Guide](#) for congestion management information).
- A different colored vertical band when no data exists.

### Content Pane

The content (right) pane contains:

| GUI Elements                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Change Poller                                                                             | Button that opens the Poller Settings dialog box. See <a href="#">Right-click Menu, page 8-107</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Poll Interval                                                                             | Label that shows the current poll interval in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Bits or Bytes/Sec                                                                         | Y-axis label that displays traffic rate in bits or bytes per second. The default is bits per second. The Y axis automatically scales to the interface speed. To change the charts to show bytes per second, uncheck the Show Details in Bits instead of Bytes check box in the Preferences window ( <a href="#">General Display Settings, page 5-4</a> ).                                                                                                                                                                                                                                                                                                                                                        |
| Time                                                                                      | X-axis label that displays a real-time scale and the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Legend                                                                                    | Identifies the data series currently showing in the chart. <ul style="list-style-type: none"> <li>• <b>No Data</b>—Data is not available. A vertical bar appears in the chart.</li> <li>• <b>Congestion Active</b>—Shows when the shorthaul is in a congested state. A vertical bar appears in the chart.</li> </ul> <p><b>Note</b> You can configure the congestion mechanism for low-latency GSM and UMTS traffic. Other traffic (for example, SNMP or file transfer) can be discarded without entering the congestion mechanism. For detailed information about GSM and UMTS congestion management, see the <a href="#">Cisco MWR 1941-DC-A Mobile Wireless Edge Router Software Configuration Guide</a>.</p> |

### Change Poller

To change the poll interval, click the **Change Poller** button. The MWTM displays the Poller Settings dialog box. The Poller Settings window displays these labels and buttons for the chosen interface:

| Label/Button                                                                                | Description                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                            |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval. |

| Label/Button             | Description                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Interval (secs)     | The poll interval, in seconds, for the chosen node.<br>To set a new poll interval, click in the Poll Interval (secs) text box and enter a new value. The default value is 15 seconds. Valid values are between 5 and 60. |
| Current Poll Interval    | Value of the poll interval currently in use.                                                                                                                                                                             |
| Number of Polls Received | Number of polls received by the chosen node.                                                                                                                                                                             |
| Running Time             | Time in hours, minutes, and seconds that the poller is running.                                                                                                                                                          |
| Change                   | Changes the poll interval from the current setting to the value you have entered in the Poll Interval (secs) text box.                                                                                                   |
| Close                    | Closes the Poller Settings window.                                                                                                                                                                                       |
| Help                     | Displays online help for the current window.                                                                                                                                                                             |

### Right-click Menu

A right-click context menu provides options to navigate to the backhauls that are associated with the chosen shorthaul interface. You can also modify how the chart appears. The right-click menu contains:

| Menu options               | Description                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Go to > <i>backhaul</i>    | Opens the Backhaul Performance tab for the backhaul interface associated with the chosen shorthaul interface.                                           |
| Show/hide right-click menu | Provides options to show or hide one or more parts of a data series. See <a href="#">Right-click Menu, page 8-94</a> , for descriptions of the options. |

## Viewing Backhaul Performance Data

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

The Backhaul Performance tab displays multiple charts in a split pane. The top pane displays send rate statistics, and the bottom pane displays receive rate statistics. You can maximize either pane to full screen size by using the split-pane control bar.

Each pane contains the following charts that share the same time domain:

- **Top chart**—Displays total GSM traffic, total UMTS traffic, and total traffic (a summation of total GSM and total UMTS) in bits or bytes per second (left Y axis). The right Y axis displays the backhaul utilization as a percentage of the user bandwidth. You can change the scale of the Y axis by changing the User Bandwidth (see [Editing Properties for a RAN-O Backhaul, page 6-41](#)). The Y axis automatically scales to the User Bandwidth.

The top chart overlays the traffic display on top of threshold ranges (acceptable, warning, and overloaded) that are represented by color-coded, horizontal bands.

- **Middle chart**—Displays the traffic rates in bits or bytes per second for each shorthaul interface that is associated with the backhaul interface.

- **Bottom chart**—Displays total send-and-receive errors per second over time for all of the shorthaul interfaces included in the backhaul interface.

## Content Pane

The content (right) pane contains:

| GUI Elements                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|  Refresh                        | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|  Pause                          | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Change Poller                                                                                                    | Button that opens the Poller Settings dialog box. See <a href="#">Right-click Menu, page 8-107</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Poll Interval                                                                                                    | Label that shows the current poll interval in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SH or BH<br>Bits or Bytes/Sec                                                                                    | Left Y-axis label that displays shorthaul (SH) or backhaul (BH) traffic rate in bits or bytes per second. The default is bits per second. This label appears for only the top and middle charts of both panes. The Y axis automatically scales to the User Bandwidth.<br><br>To change the charts to show bytes per second, uncheck the Show Details in Bits instead of Bytes check box in the Preferences window ( <a href="#">General Display Settings, page 5-4</a> ).                                                                                                                                                                                                                                                                                                                                                                                         |
| % Utilization                                                                                                    | Y-axis label on the right side of the chart. The right-side axis displays the backhaul utilization as a percentage of the User Bandwidth.<br><br>The chart background is color-coded to indicate these thresholds: <ul style="list-style-type: none"> <li>• <b>Overloaded</b>—Top portion of chart background</li> <li>• <b>Warning</b>—Middle portion of chart background</li> <li>• <b>Acceptable</b>—Bottom portion of chart background</li> </ul> For definitions of these thresholds, see <a href="#">Threshold Information (RAN-O Only), page 8-38</a> .<br>To change threshold settings, including the User Bandwidth, see <a href="#">Editing Properties for a RAN-O Backhaul, page 6-41</a> .<br><b>Note</b> If the % Utilization exceeds 100%, see <a href="#">Why does my backhaul graph show greater than 100% for transmit traffic?, page C-25</a> . |
| Errors/Sec                                                                                                       | Y-axis label that displays the total number of errors per second for send and receive traffic. This label appears only for the bottom chart of both panes.<br><br><b>Note</b> The same Errors/Sec chart appears in each pane.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Time                                                                                                             | X-axis label that displays real-time scales for all the charts in the pane. The chart also shows the server time zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>Split-pane Control</i><br> | Pane sizing feature that separates the top and bottom panes. To fully expand the: <ul style="list-style-type: none"> <li>• Bottom pane, click the noninverted triangle on the control bar.</li> <li>• Top pane, click the inverted triangle on the control bar.</li> </ul> To partially expand a pane, left-click the control bar and drag it up or down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>Legend</i>                                                                                                    | Color-coded legend to the right of the charts that describes the information that appears in all charts of the pane.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Right-click Menu

A right-click context menu provides options to navigate to the shorthauls that are associated with the chosen backhaul interface. You can also modify how the chart appears.

The right-click menu contains:

| Menu options             | Description                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Go to > <i>shorthaul</i> | Opens the Shorthaul Performance tab for the shorthaul interface associated with the chosen backhaul interface.                                           |
| Display Series           | Opens the Display Series dialog box, which allows you to select data series to show or hide. See <a href="#">Display Series Dialog Box, page 8-109</a> . |
| Reset Zoom, Grid, Shapes | See <a href="#">Right-click Menu, page 8-94</a> , for descriptions of these options.                                                                     |

## Display Series Dialog Box

The Display Series dialog box allows you to select data series to show or hide. This dialog box is available when you select the report output as *Graph*. Most network-level reports contain more than 12 series.

The Display Series dialog box contains:

| Column or Buttons       | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Selected Series</b>  | Displays the FQDN IDs for the data that is used to create the report.                                                                                                                                                                                                                                                                                                                                        |
| <b>Available Series</b> | <p>Displays the list of available objects for this report.</p> <p><b>Note</b> If there are many objects in the report, the objects in the Available Series column span multiple pages and not all objects are shown on one page. See <a href="#">Using the Toolbar, page 11-6</a> for more information on using the paging features. To view all selected objects, sort the table by the Display column.</p> |

| Column or Buttons                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Viewing RAN-O Error Data

The MWTM client interface provides access to RAN-O real-time error statistics that you can use to troubleshoot problems that occur in real time. The zoom and navigation features quickly enable isolating and focusing on a problem area.

You use real-time charts in the MWTM client to troubleshoot errors that occur on shorthaul and backhaul interfaces. To view error data for a shorthaul or backhaul interface, select it in the navigation tree of the DEFAULT view (or any custom view), and click the Shorthaul or Backhaul Errors tab in the right pane.

The Shorthaul or Backhaul Errors tab shows errors for the chosen interface.

**Note**

If the CISCO-IP-RAN-BACKHAUL-MIB on the node is not compliant with the MWTM, the MWTM issues the message:

```
MIB not compliant for reports
```

Install a version of IOS software on the node that is compatible with the MWTM. For a list of compatible IOS software, from the MWTM:

- Web interface, choose **Administrative > IPRAN OS README**.
- Client interface, choose **View > MWTM Web Links > Administrative**; then click **IPRAN OS README**.

## Viewing Shorthaul Errors

**Note**

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

When you select a GSM Abis shorthaul interface in the navigation tree in the DEFAULT view (or any custom view), the MWTM displays protocol, missed packet, and miscellaneous errors in the right pane. When you select a UMTS Iub shorthaul interface, the MWTM displays optimization and miscellaneous errors.

This window also includes a graph that displays the total number of errors per second. The graph has a right-click menu with options similar to those of the right-click menu of the Performance window.

You can use the split pane control bar to resize or maximize the error tables or the error graph.

### Content Pane

The content (right) pane contains:

| GUI Elements                                                                                | Description                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                            |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval. |
| Change Poller                                                                               | Button that opens the Poller Settings dialog box. See <a href="#">Right-click Menu, page 8-107</a> .                                                                                              |
| Reset Counters                                                                              | Opens the Reset Counters dialog box to configure the method of polling. See <a href="#">Changing Real-Time Poller and Counter Settings, page 5-20</a> .                                           |
| Poller Counter Mode                                                                         | Label that displays the polling mode that you configure in the Reset Counters dialog box.                                                                                                         |

| GUI Elements                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Interval                                                                                               | Label that shows the current poll interval in seconds.                                                                                                                                                                                                                                                                                                              |
| Optimization Failures                                                                                       | Pane that displays optimization failures for the chosen GSM Abis or UMTS Iub shorthaul interface. See <a href="#">Missed Packets, page 8-114</a> .                                                                                                                                                                                                                  |
| Miscellaneous                                                                                               | <p>Pane that displays miscellaneous errors on the chosen shorthaul interface. See <a href="#">Viewing PWE3 Statistics, page 8-115</a>.</p> <p><b>Note</b> This pane appears for both GSM Abis and UMTS Iub shorthaul interfaces but with some differences in the types of errors shown.</p>                                                                         |
| Missed Packets                                                                                              | <p>Pane that displays missed packet errors on the chosen GSM Abis shorthaul interface. See <a href="#">Viewing PWE3 Statistics, page 8-115</a>.</p> <p><b>Note</b> This pane appears only for GSM Abis shorthaul interfaces.</p>                                                                                                                                    |
| Split-pane Control Bar<br> | <p>Pane sizing feature that separates the top and bottom panes. To fully expand the:</p> <ul style="list-style-type: none"> <li>Bottom pane, click the noninverted triangle on the control bar.</li> <li>Top pane, click the inverted triangle on the control bar.</li> </ul> <p>To partially expand a pane, left-click the control bar and drag it up or down.</p> |
| Total Errors / Second                                                                                       | Chart that displays the total number of errors per second on the shorthaul interface. See <a href="#">Total Errors per Second, page 8-115</a> .                                                                                                                                                                                                                     |

## Protocol Failures

The Protocol Failures pane has a table that contains:

| GUI Elements                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Columns</i>                   | <p>Table columns that list:</p> <ul style="list-style-type: none"> <li><i>Type of error</i>—Type of protocol failure on the GSM Abis or UMTS Iub</li> <li><b>Counts</b>—Number of errors of a particular type</li> <li><b>Rates (per sec)</b>—Error rate for a particular type of error</li> </ul>                                                                                                                                                                            |
| Total                            | Total number of protocol failures encountered during the compression and decompression of the GSM-Abis or UMTS-Iub traffic.                                                                                                                                                                                                                                                                                                                                                   |
| Packet Unavailable               | Number of times compression failed because a packet was unavailable.                                                                                                                                                                                                                                                                                                                                                                                                          |
| Reconstruction Failures          | Number of times information in a packet could not be decompressed.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Encapsulation Errors             | Number of times compression failed because of encapsulation errors.                                                                                                                                                                                                                                                                                                                                                                                                           |
| QoS Drops                        | Number of times compression failed because of quality of service errors or traffic load.                                                                                                                                                                                                                                                                                                                                                                                      |
| Peer Route Unavailable           | Number of times compression failed because a route to the peer was not available.                                                                                                                                                                                                                                                                                                                                                                                             |
| Interface Down                   | Number of times compression failed because an interface was down.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Congestion Drops (GSM Abis only) | <p>Number of dropped GSM packets or UMTS cells because of traffic congestion.</p> <p><b>Note</b> You can configure the congestion mechanism for low-latency GSM and UMTS traffic. Other traffic (for example, SNMP or file transfer) can be discarded without entering the congestion mechanism. For detailed information about GSM and UMTS congestion management, see the <a href="#">Cisco MWR 1941-DC-A Mobile Wireless Edge Router Software Configuration Guide</a>.</p> |

## Miscellaneous

The Miscellaneous pane has a table that contains:

### Note

The error types in the table apply to UMTS Iub and GSM Abis shorthaul interfaces unless otherwise noted.

| GUI Elements                                  | Description                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Columns</i>                                | Table columns that list: <ul style="list-style-type: none"> <li><i>Type of error</i>—Type of miscellaneous error on the GSM Abis or UMTS Iub shorthaul.</li> <li><b>Counts</b>—Number of errors of a particular type.</li> <li><b>Rates (per sec)</b>—Error rate for a particular type of error.</li> </ul> |
| Total                                         | Total number of miscellaneous failures encountered during the compression and decompression of the GSM-Abis or UMTS-Iub traffic.                                                                                                                                                                            |
| Peer Not Ready                                | The count of packets dropped on the backhaul because the peer was not ready.                                                                                                                                                                                                                                |
| Peer Not Active (GSM Abis only)               | The count of packets dropped on the backhaul because the peer was reachable but not in an active state.                                                                                                                                                                                                     |
| Invalid Packets                               | Number of backhaul packets that were received and dropped because they contained invalid information.                                                                                                                                                                                                       |
| Packet Allocation (UMTS Iub only)             | Number of times a packet could not be allocated to send data on the UMTS Iub shorthaul interface.                                                                                                                                                                                                           |
| Protocol Encapsulation Errors (UMTS Iub only) | Number of times compression failed because of encapsulation errors.                                                                                                                                                                                                                                         |
| Local PVC Unavailable (UMTS Iub only)         | Number of packets dropped because a local PVC was unavailable.                                                                                                                                                                                                                                              |
| Remote PVC Unavailable (UMTS Iub only)        | Number of packets dropped because a remote PVC was unavailable.                                                                                                                                                                                                                                             |
| Backhaul Drops (UMTS Iub only)                | Number of packets dropped on the backhaul.                                                                                                                                                                                                                                                                  |
| Lost Received Packets (GSM Abis only)         | Number of backhaul packets expected to be received but that never arrived.                                                                                                                                                                                                                                  |
| Lost Sent Packets (GSM Abis only)             | Number of backhaul packets sent but the peer never received.                                                                                                                                                                                                                                                |
| Fast Send Failures (GSM Abis only)            | Number of fast send failures on the shorthaul interface.                                                                                                                                                                                                                                                    |
| Transmit Failures (GSM Abis only)             | Number of packet transmit failures on the shorthaul interface.                                                                                                                                                                                                                                              |
| Interrupt Failures (GSM Abis only)            | Number of packets lost due to interrupt failures.                                                                                                                                                                                                                                                           |

| GUI Elements                   | Description                                                       |
|--------------------------------|-------------------------------------------------------------------|
| Late Arrivals (GSM Abis only)  | Number of GSM packets that arrived later than the allowed time.   |
| Early Arrivals (GSM Abis only) | Number of GSM packets that arrived earlier than the allowed time. |

### Missed Packets

The Missed Packets pane appears only for GSM Abis shorthaul interfaces and has a table that contains:

| GUI Elements                                | Description                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Columns</i>                              | Table columns that list: <ul style="list-style-type: none"> <li>• <i>Type of error</i>—Type of missed packet error on the GSM Abis shorthaul interface.</li> <li>• <b>Counts</b>—Number of errors of a particular type.</li> <li>• <b>Rates (per sec)</b>—Error rate for a particular type of error.</li> </ul> |
| Total                                       | Total number of missed packet errors encountered during the compression and decompression of the GSM-Abis shorthaul interface.                                                                                                                                                                                  |
| Late Packets                                | Number of packets missed on the backhaul because they arrived past the allowed time frame                                                                                                                                                                                                                       |
| Lost Packets                                | Number of packets missed because they were lost on the backhaul                                                                                                                                                                                                                                                 |
| Overruns (GSM Abis only)                    | Number of packets missed due to the jitter buffer running out of available space.                                                                                                                                                                                                                               |
| Transmit Interface Resets (GSM Abis only)   | Number of transmission interface resets.                                                                                                                                                                                                                                                                        |
| Transmit Buffer Unavailable (GSM Abis only) | Number of times that the system is unable to allocate buffer for transmission.                                                                                                                                                                                                                                  |
| Reset Event                                 | Number of packets missed on the backhaul because of a reset event                                                                                                                                                                                                                                               |
| Insufficient Memory                         | Number of packets missed on the backhaul for lack of available memory to allocate the packet                                                                                                                                                                                                                    |

## Total Errors per Second

The Total Errors per Second pane displays a chart that contains:

| GUI Elements                    | Description                                                                                                          |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Total Errors/Second (shorthaul) | Chart title that lists the chosen shorthaul.                                                                         |
| Errors/Sec                      | Y-axis label that displays errors per second for the chosen shorthaul.                                               |
| Time                            | X-axis label that displays a real-time scale for the chosen shorthaul. The chart also displays the server time zone. |

## Viewing Backhaul Errors

### Note

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

When you select a backhaul interface in the navigation tree, the MWTM displays a chart in the right pane. The charts shows GSM and UMTS errors per second for each shorthaul interface included in the backhaul.

The content (right) pane contains:

| GUI Elements               | Description                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------|
| Change Poller              | Button that opens the Poller Settings dialog box. See <a href="#">Right-click Menu, page 8-107</a> . |
| Poll Interval              | Label that shows the current poll interval in seconds.                                               |
| Last Poll                  | Label that displays the date and time of the last poll.                                              |
| GSM and UMTS Errors/Second | Chart title for GSM and UMTS errors.                                                                 |
| Errors/Sec                 | Y-axis label that displays errors per second.                                                        |
| Time                       | X-axis label that displays a real-time scale and the server time zone.                               |
| <i>Legend</i>              | Color-coded legend for the shorthaul interfaces included in the chosen backhaul.                     |

A right-click menu provides navigational and chart control options. See [Display Series Dialog Box, page 8-109](#).

## Viewing PWE3 Statistics

You can view real-time Pseudowire Emulation Edge-to-Edge (PWE3) statistics for cell-site routers that have the PWE3 capability. To view real-time PWE3 statistics for one of these nodes, select the node in the navigation tree, then click the PWE3 Statistics tab. You can view real-time PWE3 statistics in the MWTM client and web interfaces (there are minor differences in layout and appearance).

**Note**

In the MWTM client, the real-time icon  appears in the tab. This icon indicates that polling will periodically occur while this window is open. To prevent unnecessary traffic on your network, close this window (for example, by clicking a different tab) when you no longer need to view the real-time data.

The PWE3 Statistics tab contains:

| GUI Element                                                                               | Description                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                           |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                |
| Change Poller                                                                             | Button that opens the Poller Settings dialog box. See <a href="#">Right-click Menu, page 8-107</a> .                                                                                                             |
| Reset Counters                                                                            | Button that opens the Reset Counters dialog box to configure the method of polling. See <a href="#">Changing Real-Time Poller and Counter Settings, page 5-20</a> .                                              |
| Poll Counter Mode                                                                         | Label that displays the polling mode that you configure in the Reset Counters dialog box.                                                                                                                        |
| Poll Interval                                                                             | Label that shows the current poll interval in seconds.                                                                                                                                                           |
| Last Poll                                                                                 | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll. |
| ID                                                                                        | Table column label that lists the ID of the virtual circuit.                                                                                                                                                     |
| Type                                                                                      | Type of service that carries the virtual circuit.                                                                                                                                                                |
| PSN Type                                                                                  | Type of packet-switched network (PSN) that carries the virtual circuit. For example, MPLS.                                                                                                                       |
| Name                                                                                      | Name of the virtual circuit.                                                                                                                                                                                     |
| Description                                                                               | Description of the virtual circuit.                                                                                                                                                                              |
| Peer Address                                                                              | IP address of the peer node.                                                                                                                                                                                     |
| Create Time <sup>1</sup>                                                                  | Time when the virtual circuit was created.                                                                                                                                                                       |
| Up Time <sup>1</sup>                                                                      | Length of time the virtual circuit has been operational.                                                                                                                                                         |
| Admin Status <sup>1</sup>                                                                 | The administrative status of the virtual circuit.                                                                                                                                                                |
| Oper Status <sup>1</sup>                                                                  | The operational status of the virtual circuit.                                                                                                                                                                   |
| Oper Status Inbound <sup>1</sup>                                                          | The operational status of the virtual circuit in the inbound direction.                                                                                                                                          |
| Oper Status Outbound <sup>1</sup>                                                         | The operational status of the virtual circuit in the outbound direction.                                                                                                                                         |
| Time Elapsed <sup>1</sup>                                                                 | Time in seconds since the beginning of the measurement period.                                                                                                                                                   |
| Valid Intervals <sup>1</sup>                                                              | Number of valid intervals for which data was collected.                                                                                                                                                          |
| Received Packets Rate                                                                     | Number of packets that the virtual circuit received each second from the packet-switched network.                                                                                                                |
| Received Packets Count <sup>1</sup>                                                       | Total number of packets that the virtual circuit received from the packet-switched network.                                                                                                                      |
| Received Bits Rate                                                                        | Number of bytes that the virtual circuit received each second from the packet-switched network.                                                                                                                  |
| Received Bits Count <sup>1</sup>                                                          | Total number of bytes that the virtual circuit received from the packet-switched network.                                                                                                                        |
| Sent Packets Rate                                                                         | Number of packets that the virtual circuit forwarded each second to the packet-switched network.                                                                                                                 |
| Sent Packets Count <sup>1</sup>                                                           | Total number of packets that the virtual circuit forwarded to the packet-switched network.                                                                                                                       |

| GUI Element                  | Description                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------|
| Sent Bits Rate               | Number of bytes that the virtual circuit forwarded each second to the packet-switched network. |
| Sent Bits Count <sup>1</sup> | Total number of bytes that the virtual circuit forwarded to the packet-switched network.       |

## Viewing ITP Linkset Access Lists

The Linkset Access Lists section displays information about the access lists associated with the chosen linkset and its adjacent linkset.

To view the Linkset Access List section, in a view in the navigation tree, select an ITP linkset, then click on the Linkset Access Lists tab in the content area.

### Note

This window polls your network periodically. To prevent unnecessary traffic on your network, close this window when you no longer need it.

This window is not available if the linkset is a Virtual linkset.

For each linkset, the Linkset Access Lists section displays these columns:

| Column        | Description                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refresh       | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                           |
| Pause         | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                |
| Poll Interval | Used to collect data for the table.                                                                                                                                                                              |
| Last Poll     | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll. |
| Linkset       | Name of the linkset for which access lists appear.                                                                                                                                                               |
| In            | Inbound access lists for the linkset. If the linkset has no inbound access lists, this field displays <code>None</code> .                                                                                        |
| Out           | Outbound access lists for the linkset. If the linkset has no outbound access lists, this field displays <code>None</code> .                                                                                      |
| List #        | Access list number configured on the node and applied to the linkset. ITP uses access list numbers 2700 through 2799.                                                                                            |
| Access List   | List of commands in the access list.                                                                                                                                                                             |

## Viewing ITP Linkset Statistics

The Linkset Statistics section displays information about the access lists associated with the chosen linkset and its adjacent linkset.

To view the Linkset Statistics section, in a view in the navigation tree, select an ITP linkset, then click on the Statistics tab in the content area.

**Note**

This window polls your network periodically. To prevent unnecessary traffic on your network, close this window when you no longer need it.

This window is not available if the linkset is a Virtual linkset.

The Linkset Statistics table displays these fields for the chosen signaling point:

| GUI Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refresh                 | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Pause                   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                         |
| Reset Counters          | Opens the MWTM Reset Counters dialog box, which you use to change MWTM poller and counter settings. For more information, see <a href="#">Changing Real-Time Poller and Counter Settings, page 5-20</a> .                                                                                                                                                                                                                                                                                                                 |
| Poll Counter Mode       | Displays the current mode for poll counters, and the date and time that counters were last reset. Possible modes are: <ul style="list-style-type: none"> <li>• <b>Since Reboot</b>—Counters display values aggregated since the last reboot of the ITP, or since ITP last reset the counters.</li> <li>• <b>Since Last Poll</b>—Counters display values aggregated since the last poll.</li> <li>• <b>Since User Reset</b>—Counters display values aggregated since the last time they were reset by the user.</li> </ul> |
| Poll Interval           | Poll interval used to collect data for the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Last Poll               | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                                                                                                                                                                                                                                                          |
| Packet Information      | Packets sent and received and drops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Bit Information         | Bits sent and received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Utilization Information | Send and receive plan capacity and utilization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Service Information     | MTP3 and GTT accounting settings and in service and out of service information.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Viewing Data Specific for ITP Signaling Points

These sections are specific only to ITP signaling points:

- [Viewing Route Detail, page 8-119](#)
- [Viewing GTT MAP Status, page 8-120](#)
- [Viewing GTT Statistics, page 8-121](#)
- [Viewing the MTP3 Event Log, page 8-124](#)
- [Viewing MLR Details, page 8-125](#)

## Viewing Route Detail

The Route Detail table displays detailed information about routes associated with the chosen signaling point, including dynamic and shadow routes. The Route Detail table automatically eliminates duplicate data in successive rows.

To view the Route Detail section, in a view in the navigation tree, select an ITP signaling point, then click on the Route Detail tab in the content area.

### Note

This window polls your network periodically. To prevent unnecessary traffic on your network, close this window when you no longer need to refer to it.

The Route Detail table displays these fields for the chosen signaling point:

| GUI Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refresh                | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                 |
| Pause                  | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                      |
| Poll Interval          | Poll interval used to collect data for the table.                                                                                                                                                                                                                                                                                                                                                                      |
| Last Poll              | Time the last poll was run.<br><br>This field initially displays the description Polling node. After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                                                                                                                                                                     |
| Destination Point Code | Destination point code for packets on the chosen signaling point. The destination point code is the point code to which a given packet is routed.                                                                                                                                                                                                                                                                      |
| Mask                   | Mask length for packets on the chosen signaling point. The mask length is the number of significant leading bits in the point code. The mask length is always 14 for ITU and 24 for ANSI.                                                                                                                                                                                                                              |
| Access                 | Status of the destination. Possible values are: <ul style="list-style-type: none"> <li>• Accessible</li> <li>• Inaccessible</li> <li>• Restricted</li> <li>• Unknown</li> </ul>                                                                                                                                                                                                                                        |
| Congestion Level       | Indicates the level of congestion on the route. A route is congested if it has too many packets waiting to be sent. This condition could be caused by the failure of an element in your network.<br><br>Possible values for the Congestion Level field are <i>None</i> , indicating no congestion, and <b>1</b> to <b>7</b> , indicating levels of congestion from very light ( <b>1</b> ) to very heavy ( <b>7</b> ). |
| Number of Routes       | Number of routes to the chosen destination route set (Destination Point Code plus Mask).                                                                                                                                                                                                                                                                                                                               |
| Cost                   | Cost of the route to the destination, relative to other routes. The valid costs range from <b>1</b> (lowest cost and highest priority) through <b>9</b> (highest cost and lowest priority).                                                                                                                                                                                                                            |
| Destination Linkset    | Destination linkset associated with the destination point code. The destination linkset is also called the output linkset.                                                                                                                                                                                                                                                                                             |
| QoS                    | Quality of service (QoS) class of the route, as configured by the network administrator. Valid QoS classes range from <b>1</b> through <b>7</b> ; ALL indicates that the route accepts all QoS classes.                                                                                                                                                                                                                |

| GUI Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Management Status | <p>Accessibility of the destination from the adjacent point code at the remote end of the signaling point. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>Allowed</b>—Traffic is allowed on the route without restriction.</li> <li>• <b>Prohibited</b>—Traffic is prohibited on the route.</li> <li>• <b>Restricted</b>—Traffic is restricted on the route.</li> <li>• <b>Unknown</b>—Accessibility cannot be determined.</li> </ul> |
| Route Status      | <p>Status of the route. Possible values are:</p> <ul style="list-style-type: none"> <li>• Available</li> <li>• Restricted</li> <li>• Unavailable</li> </ul>                                                                                                                                                                                                                                                                                                 |

## Viewing GTT MAP Status

The GTT MAP Status table displays detailed information about all GTT MAPs associated with the chosen signaling point. The GTT MAP Detail table automatically eliminates duplicate data in successive rows.

To view the GTT MAP Status section, in a view in the navigation tree, select an ITP signaling point, then click on the GTT MAP Status tab in the content area.

### Note

This window polls your network periodically. To prevent unnecessary traffic on your network, close this window when you no longer need to refer to it.

The GTT MAP Status table displays these columns for the chosen signaling point:

| Column                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                                |
| Reset Counters                                                                              | Opens the MWTM Reset Counters dialog box, which you use to change MWTM poller and counter settings. For more information, see <a href="#">Changing Real-Time Poller and Counter Settings, page 5-20</a> .                                                                                                                                                                                                                                                                                                                        |
| Poll Counter Mode                                                                           | <p>Displays the current mode for poll counters, and the date and time that counters were last reset. Possible modes are:</p> <ul style="list-style-type: none"> <li>• <b>Since Reboot</b>—Counters display values aggregated since the last reboot of the ITP, or since ITP last reset the counters.</li> <li>• <b>Since Last Poll</b>—Counters display values aggregated since the last poll.</li> <li>• <b>Since User Reset</b>—Counters display values aggregated since the last time they were reset by the user.</li> </ul> |
| Poll Interval                                                                               | Poll interval used to collect data for the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Column                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Poll              | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                                                                                                                                                                                                                                                                                                                          |
| Point Code             | Primary point code for the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Point Code Status      | Status of the primary point code. Possible values are: <ul style="list-style-type: none"> <li>• <b>Allowed</b></li> <li>• <b>Prohibited</b>—Either the point code cannot be reached, or the point code is labeled Prohibited by the SCCP protocol.</li> </ul>                                                                                                                                                                                                                                                                                                                             |
| Congestion Level       | MTP3 congestion level for the primary point code. Possible values are: <ul style="list-style-type: none"> <li>• <b>No congestion</b>—Corresponds to None. The link is not congested.</li> <li>• <b>Congestion level 1</b>—Corresponds to Low. The link is slightly congested.</li> <li>• <b>Congestion level 2</b>—Corresponds to High. The link is congested.</li> <li>• <b>Congestion level 3</b>—Corresponds to Very High. The link is very congested.</li> </ul> Low, High, and Very High correspond roughly to equivalent ANSI, China standard, ITU, NTT, and TTC congestion levels. |
| Point Code Congested   | Number of times a point code was congested at the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Point Code Unavailable | Number of times a point code was unavailable at the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SCCP Unavailable       | Number of times an SCCP was unavailable at the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MTP3 Failures          | Number of times the MTP3 layer failed at the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Number of Subsystems   | Number of subsystems for the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Subsystem Number       | Primary subsystem number (SSN) for the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Subsystem Status       | Status of the primary SSN. Possible values are: <ul style="list-style-type: none"> <li>• Allowed</li> <li>• Prohibited—Either the remote subsystem cannot be reached, or the SCCP protocol labels the subsystem Prohibited.</li> </ul>                                                                                                                                                                                                                                                                                                                                                    |
| Subsystem Unavailable  | Number of times a subsystem was unavailable at the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Subsystem Congested    | Number of times a subsystem was congested at the GTT MAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Viewing GTT Statistics

The GTT Statistics table displays detailed statistical information about all GTTs that are associated with the chosen signaling point. The GTT Statistics table automatically eliminates duplicate data in successive rows.

To view the GTT Statistics section, in a view in the navigation tree, select an ITP signaling point, then click on the GTT Statistics tab in the content area.

**Note**

This window polls your network periodically. To prevent unnecessary traffic on your network, close this window when you no longer need to refer to it.

The GTT Statistics table displays these columns for the chosen signaling point:

| GUI Element                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                         |
| Reset Counters                                                                            | Opens the MWTM Reset Counters dialog box, which you use to change MWTM poller and counter settings. For more information, see <a href="#">Changing Real-Time Poller and Counter Settings, page 5-20</a> .                                                                                                                                                                                                                                                                                                                 |
| Poll Counter Mode                                                                         | Displays the current mode for poll counters, and the date and time that counters were last reset. Possible modes are: <ul style="list-style-type: none"> <li>• <b>Since Reboot</b>—Counters display values aggregated since the last reboot of the ITP, or since ITP last reset the counters.</li> <li>• <b>Since Last Poll</b>—Counters display values aggregated since the last poll.</li> <li>• <b>Since User Reset</b>—Counters display values aggregated since the last time they were reset by the user.</li> </ul> |
| Poll Interval                                                                             | Poll interval used to collect data for the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Last Poll                                                                                 | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                                                                                                                                                                                                                                                          |

| GTT Messages:<br>RSR Received From MTP  | Number of Reset Request (RSR) messages that GTT received from the MTP.                                                                                        |
| GTT Messages: Counts                    | Number of GTT messages of the specified category since MWTM polling began for the linkset, or since the MWTM last reset the averages as a result of bad data. |
| GTT Messages: Rate (per sec)            | Number of errors messages handled by GTT, per second.                                                                                                         |

## Viewing the MTP3 Event Log

The MTP3 Event Log table displays the most recent MTP3 events associated with the chosen signaling point.

To view the MTP3 Event Log section, in a view in the navigation tree, select an ITP signaling point, then click on the MTP3 Event Log tab in the content area.

### Note

This window polls your network periodically. To prevent unnecessary traffic on your network, close this window when you no longer need to refer to it.

The MTP3 Event Log table displays these fields for the chosen signaling point:

| GUI Element                                                                                 | Description                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                           |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                |
| Poll Interval                                                                               | Poll interval used to collect data for the table.                                                                                                                                                                |
| Last Poll                                                                                   | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll. |
| Logged Events                                                                               | Total number of MTP3 events that have been logged for this signaling point.                                                                                                                                      |
| Dropped Events                                                                              | Total number of MTP3 events that have been dropped for this signaling point.                                                                                                                                     |
| Max Events                                                                                  | Maximum number of events that the event history can contain. When event history table is full, the oldest entries are deleted as new entries are added.                                                          |
| Allowed Events                                                                              | ITP parameter that specifies the absolute maximum for the Max Events field. That is, for this node, the Max Events field can range from 0 to the value specified by the Allowed Events field.                    |

| GUI Element | Description                        |
|-------------|------------------------------------|
| Index       | Event number that the ITP assigns. |
| Message     | Message text for the event.        |

## Viewing MLR Details

The MLR Details tab displays the MLR counters, trigger configuration, and trigger results associated with the chosen signaling point.

To view the MLR Details section, in a view in the navigation tree, select an ITP signaling point, then click on the MLR Details tab in the content area.

### Note

This window polls your network periodically. To prevent unnecessary traffic on your network, close this window when you no longer need to refer to it.

The MLR Details tab displays these fields for the chosen signaling point:

| GUI Element                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                            |
|  Pause | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                                                                                                                                                                 |
| Reset Counters                                                                            | Opens the MWTM Reset Counters dialog box, which you use to change MWTM poller and counter settings. For more information, see <a href="#">Changing Real-Time Poller and Counter Settings, page 5-20</a> .                                                                                                                                                                                                                                                                                                         |
| Poll Counter Mode                                                                         | Displays the current mode for poll counters, and the date and time that counters were last reset. Possible modes are: <ul style="list-style-type: none"> <li>• <b>Since Reboot</b>—Counters display values aggregated since the last reboot of the ITP, or since ITP last reset the counters.</li> <li>• <b>Since Last Poll</b>—Counters display values aggregated since the last poll.</li> <li>• <b>Since User Reset</b>—Counters display values aggregated since the last time the user reset them.</li> </ul> |
| Poll Interval                                                                             | Poll interval used to collect data for the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Last Poll                                                                                 | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                                                                                                                                                                                                                                                  |
| MLR Counters                                                                              | Displays the MLR Counters table. For more information, see <a href="#">Viewing MLR Counters, page 8-125</a> .                                                                                                                                                                                                                                                                                                                                                                                                     |
| MLR Trigger Config                                                                        | Displays the MLR Trigger Configuration table. For more information, see <a href="#">Viewing MLR Trigger Config, page 8-127</a> .                                                                                                                                                                                                                                                                                                                                                                                  |
| MLR Trigger Results                                                                       | Displays the MLR Trigger Results table. For more information, see <a href="#">Viewing MLR Trigger Results, page 8-131</a> .                                                                                                                                                                                                                                                                                                                                                                                       |

## Viewing MLR Counters

The MLR Counters table displays MLR counters associated with the chosen signaling point.

You can resize each column, or sort tables based on the information in one of the columns. By default, the MWTM displays all of the columns in the MLR Counters table.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The MLR Counters table displays these columns for the chosen signaling point:

| Column                                | Description                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Processed: Routed                     | Total number of packets routed by MLR, and the packet routing rate in packets per second.                                                              |
| Processed: MAP SMS-MO                 | Number of MSUs of type GSM-MAP SMS-MO processed by MLR, and the GSM-MAP SMS-MO MSU processing rate in packets per second.                              |
| Processed: MAP SMS-MT                 | Number of MSUs of type GSM-MAP SMS-MT processed by MLR, and the GSM-MAP SMS-MT MSU processing rate in packets per second.                              |
| Processed: MAP SRI-SM                 | Number of MSUs of type GSM-MAP SRI-SM processed by MLR, and the GSM-MAP SRI-SM MSU processing rate in packets per second.                              |
| Processed: MAP AlertSc                | Number of MSUs of type GSM-MAP AlertSc processed by MLR, and the GSM-MAP AlertSc MSU processing rate in packets per second.                            |
| Processed: ANSI-41 SMD-PP             | Number of MSUs of type ANSI-41 SMD-PP processed by MLR, and the ANSI-41 SMD-PP MSU processing rate in packets per second.                              |
| Processed: ANSI-41 SMS Requests       | Number of MSUs of type ANSI-41 SMSRequest processed by MLR, and the ANSI-41 SMSRequest MSU processing rate in packets per second.                      |
| Processed: ANSI-41 SMS Notifys        | Number of MSUs of type ANSI-41 SMSNotify processed by MLR, and the ANSI-41 SMSNotify MSU processing rate in packets per second.                        |
| Aborts: Total Aborted                 | Total number of MSUs aborted by MLR, and the MSU abort rate in packets per second.                                                                     |
| Aborts: No Resources                  | Number of MSUs aborted by MLR because of a shortage of resources, and the No Resources MSU abort rate in packets per second.                           |
| Aborts: Results Blocked               | Number of MSUs aborted by MLR with a result of block, and the Results Blocked MSU abort rate in packets per second.                                    |
| Aborts: GTI Mismatches                | Number of MSUs aborted by MLR because of mismatched GTIs, and the GTI Mismatches MSU abort rate in packets per second.                                 |
| Aborts: Address Conversion Failures   | Number of MSUs aborted by MLR because of a failed GTA address conversion, and the Address Conversion Failures MSU abort rate in packets per second.    |
| Aborts: Destination Unavailables      | Number of MSUs aborted by MLR because the destination was unavailable, and the Destination Unavailables MSU abort rate in packets per second.          |
| Aborts: No Server Aborted             | Number of MSUs aborted by MLR because no server was available, and the No Server Aborted MSU abort rate in packets per second.                         |
| Continues: Total Continued            | Total number of MSUs returned to SCCP by MLR with a result of continue, and the MSU return rate in packets per second.                                 |
| Continues: Failed Triggers            | Number of MSUs returned to SCCP by MLR because of no trigger match, and the Failed Triggers MSU return rate in packets per second.                     |
| Continues: Result Continueds          | Number of MSUs returned to SCCP by MLR with a result of continue, and the Result Continueds MSU return rate in packets per second.                     |
| Continues: Result GTTs                | Number of MSUs returned to SCCP by MLR with a result of GTT, and the Result GTTs MSU return rate in packets per second.                                |
| Continues: Unsupported SCCP Msg Types | Number of MSUs returned to SCCP by MLR because of unsupported message types, and the Unsupported SCCP Msg Types MSU return rate in packets per second. |

| Column                                     | Description                                                                                                                                           |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Continues: Unsupported Segmented SCCP Msgs | Number of MSUs returned to SCCP by MLR because of unsupported segments, and the Unsupported Segmented SCCP Msg MSU return rate in packets per second. |
| Continues: Unsupported Messages            | Number of MSUs returned to SCCP by MLR because of parse failures, and the Unsupported Messages MSU return rate in packets per second.                 |
| Continues: Parse Errors                    | Number of MSUs returned to SCCP by MLR because of parse errors, and the Parse Errors MSU return rate in packets per second.                           |
| Continues: No Results                      | Number of MSUs returned to SCCP by MLR with no results, and the No Results MSU return rate in packets per second.                                     |
| Continues: No Server Continueds            | Number of MSUs returned to SCCP by MLR because no server was available, and the No Server Continueds MSU return rate in packets per second.           |

## Viewing MLR Trigger Config

The MLR Trigger Config table displays the MLR trigger configuration associated with the chosen signaling point, divided into these subtables:

- [Triggers, page 8-127](#)
- [SubTriggers, page 8-128](#)
- [Ruleset, page 8-128](#)
- [Rules, page 8-129](#)
- [Addresses, page 8-129](#)
- [Results, page 8-130](#)

## Triggers

The Triggers subtable displays MLR trigger information associated with the chosen signaling point.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Triggers subtable except Set Name, Start Date, End Date, and Status.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Triggers subtable displays these columns for the chosen signaling point:

| Column                           | Description                                                                                                                     |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Entries<br>(in subtable heading) | Total number of entries in the subtable.                                                                                        |
| Set Name                         | Set name associated with the trigger.                                                                                           |
| Index                            | Index number associated with the trigger.                                                                                       |
| SubTriggers                      | Number of subtriggers associated with the chosen trigger.                                                                       |
| Start Date                       | Date and time on which this trigger should begin filtering traffic.<br>If no Start Date is configured, this field displays N/A. |
| End Date                         | Date and time on which this trigger should stop filtering traffic.<br>If no End Date is configured, this field displays N/A.    |

| Column        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status        | Current status of the trigger. Possible values are: <ul style="list-style-type: none"> <li>• <b>Active</b>—A corresponding GTT table entry for the trigger or, if this is an MTP3 trigger, an available route to the appropriate point code exists.</li> <li>• <b>Inactive</b>—No corresponding GTT table entry or available route to the appropriate point code for the trigger. The trigger will never match and a configuration error is likely.</li> </ul> |
| Action        | Action taken by the trigger.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Prematches    | Preliminary count of trigger matches.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Prematch Rate | Number of Prematches per second for the trigger.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Matches       | Number of trigger matches with result <code>Action Performed</code> .                                                                                                                                                                                                                                                                                                                                                                                          |
| Match Rate    | Number of Matches per second for the trigger.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Parameters    | Parameters that control the behavior of the trigger.                                                                                                                                                                                                                                                                                                                                                                                                           |

## SubTriggers

The SubTriggers subtable displays MLR subtrigger information associated with the chosen signaling point and trigger.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the SubTriggers subtable.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The SubTriggers subtable displays these columns for the chosen signaling point:

| Column                           | Description                                                                    |
|----------------------------------|--------------------------------------------------------------------------------|
| Trigger<br>(in subtable heading) | Set name of the parent trigger with which the chosen subtrigger is associated. |
| Entries<br>(in subtable heading) | Total number of entries in the subtable.                                       |
| Set Name                         | Set name associated with the subtrigger.                                       |
| Index                            | Index number associated with the subtrigger.                                   |
| Action                           | Action taken by the subtrigger.                                                |
| Matches                          | Number of subtrigger matches with result <code>Action Performed</code> .       |
| Match Rate                       | Number of Matches per second for the subtrigger.                               |
| Parameters                       | Parameters that control the behavior of the subtrigger.                        |

## Ruleset

The Ruleset subtable displays MLR ruleset information associated with the chosen signaling point and trigger or subtrigger.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Ruleset subtable except Start Date and End Date.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Ruleset subtable displays these columns for the chosen signaling point:

| Column                           | Description                                                       |
|----------------------------------|-------------------------------------------------------------------|
| Entries<br>(in subtable heading) | Total number of entries in the subtable.                          |
| Set Name                         | Set name associated with the ruleset.                             |
| Start Date                       | Starting date and time for this ruleset to become active.         |
| End Date                         | Ending date and time for this ruleset to become active.           |
| Segmented                        | Indicates whether this ruleset should process segmented messages. |
| Protocol                         | Default protocol for rules in this ruleset.                       |
| Search Type                      | Search type that this ruleset should perform.                     |

## Rules

The Rules subtable displays MLR rules information associated with the chosen signaling point and ruleset.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Rules subtable except Set Name.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Rules subtable displays these columns for the chosen signaling point:

| Column                           | Description                                                                   |
|----------------------------------|-------------------------------------------------------------------------------|
| Entries<br>(in subtable heading) | Total number of entries in the subtable.                                      |
| Set Name                         | Set name associated with the rule.                                            |
| Index                            | Index number associated with the rule.                                        |
| Operation Type                   | Types of messages on which this rule matches.                                 |
| Protocol                         | Protocol used for matching by this rule.                                      |
| Matches                          | Number of rule matches with result <code>Action Performed</code> .            |
| Match Rate                       | Number of Matches per second for the rule.                                    |
| Rule Parameters                  | Parameters that control the behavior of the rule.                             |
| Result Parameters                | Parameters that control the behavior of the result associated with this rule. |

## Addresses

The Addresses subtable displays MLR address information associated with the chosen signaling point and rule.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Addresses subtable except Set Name.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Addresses subtable displays these columns for the chosen signaling point:

| Column                           | Description                                                                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entries<br>(in subtable heading) | Total number of entries in the subtable.                                                                                                                                                                                            |
| Set Name                         | Set name associated with the address.                                                                                                                                                                                               |
| Address Type                     | Type of address. The MWTM 6.1 supports these types of addresses: <ul style="list-style-type: none"> <li>• <b>bch</b>—Binary-coded hexadecimal</li> <li>• <b>gsmDa</b>—Groupe Special Mobile (GSM) 7-bit default alphabet</li> </ul> |
| Address Digits                   | Address digits to be matched.                                                                                                                                                                                                       |
| Exact Match                      | Indicates whether an exact match to the Address Digits is required.                                                                                                                                                                 |
| Matches                          | Number of address matches with result <i>Action Performed</i> .                                                                                                                                                                     |
| Match Rate                       | Number of Matches per second for the address.                                                                                                                                                                                       |
| Result Parameters                | Parameters that control the behavior of the result associated with this address.                                                                                                                                                    |

## Results

The Results subtable displays MLR results information associated with the chosen signaling point and rule or address.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Results subtable except Index.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Results subtable displays these columns for the chosen signaling point:

| Column                                                 | Description                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ruleset<br>(in subtable heading)                       | Ruleset associated with the results.                                                                                                                                                                                                                                                    |
| No Server Available<br>Action<br>(in subtable heading) | Default behavior if no result is available. Possible actions are: <ul style="list-style-type: none"> <li>• <b>Discard</b>—Discard the packet without forwarding it.</li> <li>• <b>Resume</b>—Return the unmodified packet to the higher level protocols for default routing.</li> </ul> |
| Entries<br>(in subtable heading)                       | Total number of entries in the subtable.                                                                                                                                                                                                                                                |
| Set Name                                               | Set name associated with the results.                                                                                                                                                                                                                                                   |
| Index                                                  | Index number associated with the results.                                                                                                                                                                                                                                               |
| Type                                                   | Type of result. Possible values are: <ul style="list-style-type: none"> <li>• <b>PC</b>—Point code</li> <li>• <b>ASName</b>—Application server name</li> </ul>                                                                                                                          |
| Result                                                 | Destination point code or name of the result.                                                                                                                                                                                                                                           |
| Weight                                                 | Weight for this result in its set of results.                                                                                                                                                                                                                                           |

| Column     | Description                                            |
|------------|--------------------------------------------------------|
| Count      | Number of times this result is encountered.            |
| Count Rate | Number of times per second this result is encountered. |

## Viewing MLR Trigger Results

The MLR Trigger Results table displays the MLR results associated with the chosen signaling point. You can use this subtable to determine which triggers, subtriggers, rules, and addresses are causing a particular result to execute.

The MLR Trigger Results table contains:

- [Results, page 8-131](#)
- [Addresses, page 8-131](#)
- [Rules, page 8-132](#)
- [Ruleset, page 8-133](#)
- [SubTriggers, page 8-133](#)
- [Triggers, page 8-134](#)

## Results

The Results subtable displays all MLR results information associated with the chosen signaling point. You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Results subtable except Index.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Results subtable displays these columns for the chosen signaling point:

| Column                           | Description                                                                                                                                                    |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entries<br>(in subtable heading) | Total number of entries in the subtable.                                                                                                                       |
| Set Name                         | Set name associated with the results.                                                                                                                          |
| Index                            | Index number associated with the results.                                                                                                                      |
| Type                             | Type of result. Possible values are: <ul style="list-style-type: none"> <li>• <b>PC</b>—Point code</li> <li>• <b>ASName</b>—Application server name</li> </ul> |
| Result                           | Destination point code or name of the result.                                                                                                                  |
| Weight                           | Weight for this result in its set of results.                                                                                                                  |
| Count                            | Number of times this result is encountered.                                                                                                                    |
| Count Rate                       | Number of times per second this result is encountered.                                                                                                         |

## Addresses

The Addresses subtable displays MLR address information associated with the chosen result.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Addresses subtable except Set Name.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Addresses subtable displays these columns for the chosen signaling point:

| Column                             | Description                                                                                                                                                                                                                     |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ResultSet<br>(in subtable heading) | Set of results associated with the addresses.                                                                                                                                                                                   |
| Entries<br>(in subtable heading)   | Total number of entries in the subtable.                                                                                                                                                                                        |
| Set Name                           | Set name associated with the address.                                                                                                                                                                                           |
| Address Type                       | Type of address. The MWTM 6.1 supports these types of addresses: <ul style="list-style-type: none"> <li><b>bch</b>—Binary-coded hexadecimal</li> <li><b>gsmDa</b>—Groupe Special Mobile (GSM) 7-bit default alphabet</li> </ul> |
| Address Digits                     | Address digits to be matched.                                                                                                                                                                                                   |
| Exact Match                        | Indicates whether an exact match to the Address Digits is required.                                                                                                                                                             |
| Matches                            | Number of address matches with result <i>Action Performed</i> .                                                                                                                                                                 |
| Match Rate                         | Number of Matches per second for the address.                                                                                                                                                                                   |
| Result Parameters                  | Parameters that control the behavior of the result associated with this address.                                                                                                                                                |

## Rules

The Rules subtable displays MLR rules information associated with the chosen result.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Rules subtable except Set Name.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Rules subtable displays these columns for the chosen signaling point:

| Column                             | Description                                                  |
|------------------------------------|--------------------------------------------------------------|
| ResultSet<br>(in subtable heading) | Set of results associated with the rules.                    |
| Entries<br>(in subtable heading)   | Total number of entries in the subtable.                     |
| Set Name                           | Set name associated with the rule.                           |
| Index                              | Index number associated with the rule.                       |
| Operation Type                     | Types of messages on which this rule matches.                |
| Protocol                           | Protocol used for matching by this rule.                     |
| Matches                            | Number of rule matches with result <i>Action Performed</i> . |
| Match Rate                         | Number of Matches per second for the rule.                   |

| Column            | Description                                                                   |
|-------------------|-------------------------------------------------------------------------------|
| Rule Parameters   | Parameters that control the behavior of the rule.                             |
| Result Parameters | Parameters that control the behavior of the result associated with this rule. |

## Ruleset

The Ruleset subtable displays MLR ruleset information associated with the chosen result.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Ruleset subtable except Start Date and End Date.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Ruleset subtable displays these columns for the chosen signaling point:

| Column                               | Description                                                       |
|--------------------------------------|-------------------------------------------------------------------|
| Rule Number<br>(in subtable heading) | Index number of the rule with which this ruleset is associated.   |
| Entries<br>(in subtable heading)     | Total number of entries in the subtable.                          |
| Set Name                             | Set name associated with the ruleset.                             |
| Start Date                           | Starting date and time for this ruleset to become active.         |
| End Date                             | Ending date and time for this ruleset to become active.           |
| Segmented                            | Indicates whether this ruleset should process segmented messages. |
| Protocol                             | Default protocol for rules in this ruleset.                       |
| Search Type                          | Search type that this ruleset should perform.                     |

## SubTriggers

The SubTriggers subtable displays MLR subtrigger information associated with the chosen result.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the SubTriggers subtable.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The SubTriggers subtable displays these columns for the chosen signaling point:

| Column                           | Description                                                |
|----------------------------------|------------------------------------------------------------|
| Entries<br>(in subtable heading) | Total number of entries in the subtable.                   |
| Set Name                         | Set name associated with the subtrigger.                   |
| Index                            | Index number associated with the subtrigger.               |
| Action                           | Action taken by the subtrigger.                            |
| Matches                          | Number of subtrigger matches with result Action Performed. |
| Match Rate                       | Number of Matches per second for the subtrigger.           |
| Parameters                       | Parameters that control the behavior of the subtrigger.    |

## Triggers

The Triggers subtable displays MLR trigger information associated with the chosen result.

You can resize each column, or sort the table based on the information in one of the columns. By default, the MWTM displays all of the columns in the Triggers subtable except Set Name, Start Date, End Date, and Status.

For detailed information on working in tables, see [Navigating Table Columns, page 5-23](#).

The Triggers subtable displays these columns for the chosen signaling point:

| Column                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ruleset<br>(in subtable heading) | Ruleset with which this trigger is associated.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Entries<br>(in subtable heading) | Total number of entries in the subtable.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Set Name                         | Set name associated with the trigger.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Index                            | Index number associated with the trigger.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SubTriggers                      | Number of subtriggers associated with the chosen trigger.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Start Date                       | Date and time on which this trigger should begin filtering traffic.<br>If no Start Date is configured, this field displays N/A.                                                                                                                                                                                                                                                                                                                                                       |
| End Date                         | Date and time on which this trigger should stop filtering traffic.<br>If no End Date is configured, this field displays N/A.                                                                                                                                                                                                                                                                                                                                                          |
| Status                           | Current status of the trigger. Possible values are: <ul style="list-style-type: none"> <li><b>Active</b>—Either there is a corresponding GTT table entry for the trigger or, if this is an MTP3 trigger, there is an available route to the appropriate point code.</li> <li><b>Inactive</b>—There is no corresponding GTT table entry or available route to the appropriate point code for the trigger. The trigger will never match and a configuration error is likely.</li> </ul> |
| Action                           | Action that the trigger takes.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Prematches                       | Preliminary count of trigger matches.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Prematch Rate                    | Number of Prematches per second for the trigger.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Matches                          | Number of trigger matches with result <code>Action Performed</code> .                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Match Rate                       | Number of Matches per second for the trigger.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Parameters                       | Parameters that control the behavior of the trigger.                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Viewing HSRP details

The HSRP tab is displayed for the mSEF devices including 7600 chassis and the SAMI cards running HA, BWG, GGSN, CSG2, PDNGW, SGW, and PDSN. Select the mSEF object in the navigation tree in the left pane and click the HSRP tab in the right pane.

**Note**

On selection of the group in the Configured Interfaces table, the corresponding details are updated in the Detailed Information, Tracked Interfaces, and Secondary IP Addresses for Group panes.

The HSRP tab contains the following fields:

| GUI Element                                                                               | Description                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                           |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                |
| Poll Interval                                                                             | Poll interval used to collect data for the table.                                                                                                                                                                |
| Last Poll                                                                                 | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll. |
| Configured Interfaces: Interface                                                          | Name of the interface.                                                                                                                                                                                           |
| Configured Interfaces: Group Number                                                       | Group number is unique within the scope of an interface and can be reused across interfaces. The combination of Interface and group number is what identifies a discreet set of HSRP information.                |
| Configured Interfaces: State                                                              | The status of the interface. The possible values are: <ul style="list-style-type: none"> <li>• Initial</li> <li>• Learn</li> <li>• Listen</li> <li>• Speak</li> <li>• Standby</li> <li>• Active</li> </ul>       |
| Configured Interfaces: Virtual IP Address                                                 | Primary virtual address for this group.                                                                                                                                                                          |
| Configured Interfaces: Priority                                                           | Priority of the interface.                                                                                                                                                                                       |
| Detailed Information: Interface                                                           | Name of the interface.                                                                                                                                                                                           |
| Detailed Information: Group Number                                                        | Group number is unique within the scope of an interface and can be reused across interfaces. The combination of Interface and group number is what identifies a discreet set of HSRP information.                |

| GUI Element                                              | Description                                                                                                                                                                                                |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Detailed Information: State                              | The status of the interface. The possible values are: <ul style="list-style-type: none"> <li>• Initial</li> <li>• Learn</li> <li>• Listen</li> <li>• Speak</li> <li>• Standby</li> <li>• Active</li> </ul> |
| Detailed Information: Active IP Address                  | IP address of the current active router for this group.                                                                                                                                                    |
| Detailed Information: Standby IP Address                 | IP address of the current standby router for this group                                                                                                                                                    |
| Detailed Information: Virtual IP Address                 | Primary virtual IP address for this group.                                                                                                                                                                 |
| Detailed Information: Virtual MAC Address                | Virtual MAC Address used.                                                                                                                                                                                  |
| Detailed Information: Use Configured Timers              | HSRP routers learn a group's Hello time or Hold time from hello messages. The possible values are: Yes or No                                                                                               |
| Detailed Information: Configured Hello Time (secs)       | Interval between successive HSRP Hello messages from a given router (when the value of Use Configured Timers is Yes).                                                                                      |
| Detailed Information: Configured Hold Time (secs)        | Interval between the receipt of a Hello message and the presumption that the sending router has failed (when the value of Use Configured Timers is Yes).                                                   |
| Detailed Information: Learned Hello Time (secs)          | Interval between successive HSRP Hello messages from a given router when the value of Use Configured Timers is No                                                                                          |
| Detailed Information: Learned hold Time (secs)           | Interval between the receipt of a Hello message and the presumption that the sending router has failed (when the value of Use Configured Timers is No).                                                    |
| Detailed Information: Preempt                            | The valid values are True or False.                                                                                                                                                                        |
| Detailed Information: Preempt Delay                      | Time difference between a router power up and the time it can actually start preempting the currently active router.                                                                                       |
| Tracked Interfaces: Interface Name                       | Name of the tracked interface.                                                                                                                                                                             |
| Tracked Interfaces: Priority                             | Priority of the tracked interface for the corresponding pair.                                                                                                                                              |
| Secondary IP Addresses for Group: Secondary IP Addresses | Secondary virtual IP addresses defined for the group.                                                                                                                                                      |

## Viewing RAN Shorthauls

To view RAN shorthauls that are associated with a RAN-O backhaul, select the backhaul object in the navigation tree in the left pane, and click the RAN Shorthauls tab in the right pane. The right pane displays a tabular list of RAN shorthauls that are associated with the chosen backhaul.

To view descriptions of the columns of the RAN shorthauls table, see [RAN Shorthauls Table, page 6-29](#).

## Viewing Chassis View

The Chassis View tab is displayed only for mSEF and SAMI nodes. Select the mSEF or the SAMI node in the navigation tree in the left pane and click the Chassis View tab in the right pane.

The Chassis View tab contains:

| GUI Element                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Refresh | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                        |
|  Pause   | Pauses the page refresh feature. Click Pause to disable the page refresh that would normally occur after the Status Refresh Interval. Click Pause again to re-enable the Status Refresh Interval.                                                                                                                                                                             |
| Status Refresh Interval                                                                   | Allows you change the default refresh interval of 180 seconds. Enter a value between 180 and 900 seconds.<br><br><b>Note</b> Changes you make are temporary to the current page. Navigating away from the page sets the status refresh interval back to the default setting. To change the default setting, see <a href="#">Changing Web Preference Settings, page 5-18</a> . |
| Last Poll                                                                                 | Time the last poll was run.<br><br>This field initially displays the description <code>Polling node</code> . After the first polling cycle, the MWTM populates this field with the actual time of the last poll.                                                                                                                                                              |
| Chassis Node Name Information: Display Name                                               | Name of the node.                                                                                                                                                                                                                                                                                                                                                             |
| Chassis Node Name Information: IP Address or DNS Hostname                                 | IP Address or DNS host name of the CiscoWorks server.                                                                                                                                                                                                                                                                                                                         |
| Chassis Node Name Information: Node Type                                                  | Type of node. See <a href="#">Nodes Table, page 6-5</a> , for a list of the available node types.                                                                                                                                                                                                                                                                             |
| Chassis Node Name Information: Feature                                                    | Feature associated with the node.                                                                                                                                                                                                                                                                                                                                             |

| Chassis View: Description                                     | Description of the node.             |

## Creating Virtual RAN Backhauls

You use the MWTM to create a virtual RAN backhaul by grouping real backhauls. A virtual backhaul is useful if you have configured several RAN backhauls for the same interface. To view the utilization for that interface, create a virtual RAN backhaul that contains all the real backhauls that you have configured for the interface.

### Note

When creating virtual RAN backhauls, observe the following restrictions:

- You cannot add a real backhaul to more than one virtual backhaul.
- To add a real backhaul to a virtual backhaul, you must first enable report polling on the node that is associated with the real backhaul. If you add a real backhaul to a virtual backhaul, and then disable report polling on the associated node, historical reporting for the virtual backhaul will not work! To restore historical reporting for the virtual backhaul, you must enable report polling on the associated node or remove the real backhaul from the virtual backhaul. To enable report polling on a node, you must access the node by using its command line interface.

To create a virtual RAN backhaul, right-click a RAN backhaul, then choose **Create Virtual RAN Backhaul**. The MWTM displays the Virtual RAN Backhaul Editor.

The Virtual RAN Backhaul Editor contains:

| Field or Button     | Description                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                | Name of the virtual RAN backhaul.                                                                                                                                                                                                  |
| Available Backhauls | Pane that contains the Available Backhauls table, which contains these columns: <ul style="list-style-type: none"> <li><b>Name</b>—Name of the RAN backhaul</li> <li><b>Node</b>—Node to which the RAN backhaul belongs</li> </ul> |
| Included Backhauls  | Pane that contains the Included Backhauls table, which contains these columns: <ul style="list-style-type: none"> <li><b>Name</b>—Name of the RAN backhaul</li> <li><b>Node</b>—Node to which the RAN backhaul belongs</li> </ul>  |
| Add                 | Adds the chosen backhaul to the Included Backhauls table.                                                                                                                                                                          |
| Remove              | Removes the chosen backhaul from the Included Backhauls table.                                                                                                                                                                     |
| Save                | Saves the virtual RAN backhaul and closes the Virtual RAN Backhaul Editor.                                                                                                                                                         |
| Cancel              | Cancels the current operation and closes the Virtual RAN Backhaul Editor.                                                                                                                                                          |
| Help                | Opens the Help window for this feature.                                                                                                                                                                                            |

To create a virtual RAN backhaul:

- Step 1** Enable report polling on the nodes associated with the backhauls that you plan to add to the virtual backhaul.
- Step 2** Right-click a backhaul in the RAN Backhauls table or in a view in the navigation tree.
- Step 3** Choose **Create Virtual RAN Backhaul** in the right-click menu.  
The Virtual RAN Backhaul Editor appears.
- Step 4** In the Available Backhauls pane, choose a backhaul from the table.
- Step 5** Click **Add** to add the chosen backhaul to the Included Backhauls table.
- Step 6** Repeat [Step 5](#) for each additional backhaul you want to include in the virtual backhaul.
- Step 7** To remove a backhaul from the Included Backhauls table, choose a backhaul from the table and click **Remove**.
- Step 8** In the Name field at the top of the dialog box, enter a name for the virtual backhaul.
- Step 9** Click **Save** to create the virtual RAN backhaul and close the dialog box.

## Viewing APN-Specific Tables

This section describes the APN-specific tabs displayed on the APN node window.

- [Viewing APN Instances, page 8-140](#)
- [Viewing GGSN Nodes, page 8-141](#)
- [Using the APN Search Tool, page 8-142](#)

## Viewing APN Instances

The APN Instances window displays each APN instance for the selected APN and provides identity and status information about the APN instance.

The APN Instances table contains the following fields:

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Internal ID           | Not shown by default, the Internal ID of the APN is a unique ID for every object the MWTM assigns for its own internal use. The ID can also be useful to TAC when troubleshooting problems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Node                  | Name of the APN node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Name                  | Name of the APN Instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Index                 | Number assigned to the APN instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| VRF Name              | Name of the virtual routing and forwarding (VRF) over which communication with BMA occurs. If no VRF is specified, the global routing table is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| IP Pool Name          | IP address pool providing IP addresses for this APN instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| AAA Server Group Name | The AAA Radius server group providing authentication for this APN instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Primary DNS           | The address of the primary DNS that is provided to the mobile station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Secondary DNS         | The address of the secondary DNS that is provided to the mobile station.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Service Mode          | The operational state of the APN. It is either in service or in maintenance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Ignored               | Indicates whether the object should be included when aggregating and displaying MWTM status information: <ul style="list-style-type: none"> <li>Uncheck the check box to include the object. This is the default setting.</li> <li>Check the check box to exclude the object.</li> </ul> This field can be edited by users with authentication level Power User (level 2) and higher.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Notes                 | Indicates whether a note is associated with the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Severity              | Indicates the alarm severity for the chosen APN. The severity can be Critical, Major, Minor, Warning, Informational, Indeterminate, Unmanaged, or Normal. See <a href="#">Chapter 9, “Managing Alarms and Events”</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Last Status Change    | Date and time the status of the APN last change.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status                | Current status of the APN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Status Reason         | For a full list of possible reasons, see the <b>stateReasons.html</b> file. If you installed the MWTM in the default directory, <b>/opt</b> , the file is located at the <b>/opt/CSCOsgm/apache/share/htdocs/eventHelp</b> directory.<br><br>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip. The status reasons appear in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears first.<br><br>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see <a href="#">Appendix B, “Command Reference.”</a> |

## Viewing GGSN Nodes

This window lists the GGSN nodes associated with APN you selected. The fields of this window provide information about the GGSN node.

The following table describes the fields of the GGSN node window.

| Field                | Description                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                 | Name of the GGSN node                                                                                                                                                                                                                                                                                                                                                                  |
| Primary SNMP Address | IP addresses associated with this node, including the primary SNMP address and all backup IP addresses, that are intended for SNMP.                                                                                                                                                                                                                                                    |
| Node Type            | Type of node. See <a href="#">Nodes Table, page 6-5</a> , for a list of the available node types.                                                                                                                                                                                                                                                                                      |
| Feature              | Feature associated with this GGSN node.                                                                                                                                                                                                                                                                                                                                                |
| Software Version     | Version of software (for example, the ONS package or IOS version) that is installed on the node.                                                                                                                                                                                                                                                                                       |
| Ignored              | Indicates whether the object should be included when aggregating and displaying MWTM status information: <ul style="list-style-type: none"><li>• Uncheck the check box to include the object. This is the default setting.</li><li>• Check the check box to exclude the object.</li></ul> This field can be edited by users with authentication level Power User (level 2) and higher. |
| Trap Polling         | Indicates whether trap polling is enabled or not.                                                                                                                                                                                                                                                                                                                                      |
| Report Polling       | Indicates whether report polling is enabled or not.                                                                                                                                                                                                                                                                                                                                    |
| Notes                | Indicates whether a note is associated with the object.                                                                                                                                                                                                                                                                                                                                |
| Severity             | Indicates the alarm severity of the object. See <a href="#">Chapter 9, “Managing Alarms and Events.”</a>                                                                                                                                                                                                                                                                               |

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status        | <p>Current status of the object. Possible values are:</p> <ul style="list-style-type: none"> <li>Active</li> <li>Blocked</li> <li>Discovering</li> <li>Down</li> <li>Failed</li> <li>Inactive</li> <li>Inhibited</li> <li>InhibitLoc</li> <li>InhibitRem</li> <li>None</li> <li>Not Present</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status Reason | <p>Reason for the current status of the object.</p> <p>For a full list of possible reasons, see the <i>stateReasons.html</i> file. If:</p> <ul style="list-style-type: none"> <li>You installed the MWTM in the default directory, <i>/opt</i>, then the file is located at <i>/opt/CSCOs/gm/apache/share/htdocs/eventHelp</i> directory.</li> <li>You installed the MWTM in a different directory, then the help directory and file are in that directory.</li> </ul> <p>If the cell is too small to show all of the status reason, place the cursor over the cell to see the full text in a tooltip.</p> <p>The MWTM lists status reasons in order of decreasing magnitude. If two or more reasons apply, the reason of greatest magnitude appears.</p> <p>If the status reason is Unsupported Configuration, correct the configuration and enter the <b>mwtm cleandiscover</b> command to delete all current network data and begin a discovery of the network. If the status reason remains Unsupported Configuration, enter the <b>mwtm clean</b> command to restore the MWTM server to a state that would exist after a new installation of the MWTM, excluding the log files, which the MWTM retains. To also remove the log files, enter the <b>mwtm cleanall</b> command. For more information on the use of these commands, see the <a href="#">Command Reference, page B-1</a>.</p> |

## Using the APN Search Tool

The APN Node Tools tab provides a subscriber search tool that enables you to find a subscriber by Mobile Station ISDN (MSISDN) number. The tool searches all of the GGSNs associated with the APN. If the subscriber is found it enables troubleshooting subscriber information on the corresponding GGSN.

- 
- Step 1** Click the Tools tab.
- Step 2** Enter a subscriber's number in MSISDN field.
- Step 3** Check all GGSN nodes to search among those listed under Select GGSN Nodes to Search.
- Step 4** Click **Search**.
-

# CHAPTER 9

## Managing Alarms and Events

---

You can use the Cisco Mobile Wireless Transport Manager (MWTM) to view information about alarms and events, including their associated network objects and related information.

This chapter contains:

- [Basic Concepts and Terms, page 9-1](#)
- [Displaying Active Alarms and Event History, page 9-3](#)
- [Managing Filters for Alarms and Events, page 9-11](#)
- [Viewing Properties for Alarms and Events, page 9-20](#)
- [Attaching Notes to Alarms or Events, page 9-22](#)
- [Viewing Archived Event Files on the Web, page 9-23](#)
- [Changing the Way the MWTM Processes Events, page 9-23](#)
- [Forwarding Events as Traps to Other Hosts, page 9-35](#)
- [Setting Sounds for Events at an MWTM Client, page 9-36](#)
- [Event Processing, page 9-41](#)

## Basic Concepts and Terms

This section contains these topics:

- [Event Definition, page 9-1](#)
- [Alarm Definition, page 9-2](#)

## Event Definition

Events are created when the status of a device changes and when a user performs certain actions. MWTM detects device status changes by receiving notifications from devices and by periodically polling the devices. Examples of events include:

- An interface status changes.
- A node is unreachable by MWTM.
- A user deletes a node from the MWTM inventory.

The MWTM writes events to the MWTM database once, and they never change. By definition, an event is a historical instance in time, and the MWTM does not modify any information about the event. It is important to understand that an event, once it occurs, does not change its status even when the conditions that triggered the event are no longer present.

To view a list of recent events, click **Event History** in the navigation tree of the client or web interface. To view archived events, click **Archived** in the web interface toolbar.

## Alarm Definition

An alarm is a sequence of events, each representing a specific occurrence in the alarm lifecycle.

An alarm represents a series of correlated events that describe a fault occurring in the network or management system. An alarm describes the complete fault life cycle, from the time that the alarm is raised (when the fault is first detected) until the alarm is cleared. Examples of alarms include:

- An interface is operationally down.
- A node is unreachable by MWTM.
- There is a device fan failure.

Figure 9-1 shows an example of a sequence of correlated events that describe the lifecycle of one alarm.

**Figure 9-1** Example of Alarm

The MWTM constructs alarms from a sequence of correlated events. A complete event sequence for an alarm includes a minimum of two events:

- Alarm open (for example, a link-down event raises an alarm).
- Alarm clear (for example, a link-up event clears the alarm).

The lifecycle of an alarm can include any number of correlated events that are triggered by changes in severity, updates to services, and so on. When a new related event occurs, the MWTM correlates it to the alarm and updates the alarm severity and message text based on the new event. If you manually clear the alarm, the alarm severity changes to normal. You can still view the events that formed this alarm in the Event History table.

### Tip

Remember that an alarm can change over time as new correlated events occur; but events, by definition, can never change. Events are historical instances in time.

To view all alarms, click **Active Alarms** in the navigation tree. By default, the navigation tree is sorted by alarm severity, with objects having the most severe alarms appearing at the top of the tree.

**Note**

While some events correlate to a single alarm, there are events that do not raise alarms at all.

## Displaying Active Alarms and Event History

You use the MWTM to view a network summary of active alarms and historical events. The contents of the Active Alarms window and the Event History window are very similar in appearance (the Active Alarms table shows fewer entries than the Event History table because multiple events are associated with a single alarm.)

Here are a few helpful facts about alarms and events:

- The MWTM displays the number of alarms or events in the message area (lower left area of the GUI).
- Not all events raise alarms.
- Alarms can be manually or automatically cleared and removed from the MWTM; events cannot be cleared, but they can be manually or automatically deleted.

To see a summary of all active alarms, in the MWTM client or web interface, click **Active Alarms** in the navigation tree. The MWTM shows the Active Alarms window in the right pane.

The Active Alarms window provides basic information about all active alarms in your network that are not excluded from your current view. The MWTM updates the information in the window at least once every minute. For more information about the Active Alarms window, see:

- [Toolbar Buttons, page 9-8](#)
- [Right-click Menus, page 9-10](#)

To see a summary of all the recent events, in the MWTM client or web interface, click **Event History** in the navigation tree. The MWTM shows the Event History window in the right pane.

For more information about the Event History window, see:

- [Toolbar Buttons, page 9-8](#)
- [Right-click Menus, page 9-10](#)

**Note**

You can view multiple Event History windows at the same time, with different event filtering in each window or dialog box.

If you select a specific object in the navigation tree and click the Alarms tab or Recent Events tab, the MWTM shows information about the alarms or events for that object only.

You can resize each column (except when using the web interface), or sort the table based on the information in one of the columns.

**Note**

For more information about resizing, sorting, displaying, or hiding columns, see [Navigating Table Columns, page 5-23](#).

To see detailed information about an alarm or event, in the:

- MWTM client interface, right-click the event in a window, then select **Alarm and Event Properties** in the right-click menu.

- Web interface, select the alarm or event by checking its check box, then click the **Alarm and Event Properties** icon  in the toolbar.

**Note**

When using the web interface to select an alarm or event in the table, you check the check box for the row. You can select multiple rows. To clear the selection, click Clear Selection in the toolbar. In the client interface, use the Shift key to select multiple rows. To clear the selection, left-click anywhere in the table.

The table columns of the Active Alarms, Alarms tab, Event History, and Recent Events tabs include:

| Column       | Description                                                                                                                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID  | Internal ID of the alarm or event. The internal ID is a unique ID that the MWTM assigns for its own internal use. This ID can also be useful when the Cisco Technical Assistance Center (TAC) is debugging problems.<br><br>This column is hidden by default.                                               |
| Ack          | Indicates whether the alarm or event has been acknowledged. To: <ul style="list-style-type: none"> <li>• Acknowledge an unacknowledged alarm or event, use the Acknowledge toolbar button.</li> <li>• Make a previously acknowledged event unacknowledged, use the Unacknowledge toolbar button.</li> </ul> |
| Name         | Name of the alarm or event.                                                                                                                                                                                                                                                                                 |
| Alarm Nature | Nature of the alarm.<br><br>This column is present in Active Alarms and Alarms tab.                                                                                                                                                                                                                         |
| Element Name | Network element name associated with the event.<br><br>This column is hidden by default.                                                                                                                                                                                                                    |

| AS (ITP only)               | Name of the application server associated with the alarm or event. If no application server is associated with the alarm or event, None appears.<br>This column is hidden by default.                                         |
| ASPA (ITP only)             | Name of the application server process association associated with the alarm or event. If no application server process association is associated with the alarm or event, None appears.<br>This column is hidden by default. |
| Interface                   | Interface associated with this alarm or event.<br>This column is hidden by default.                                                                                                                                           |
| RAN Backhaul (RAN-O only)   | RAN backhaul associated with this alarm or event.<br>This column is hidden by default.                                                                                                                                        |
| Message                     | The message associated with the alarm or event.                                                                                                                                                                               |

## Toolbar Buttons

The Active Alarms and Event History windows in the client and the web interfaces provide these toolbar buttons:

| Button                                                                                                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Set Filter<br>or<br>Modify Filter                                                                                 | Opens the Alarm and Event Filter dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|  Apply Filter<br>or<br>Remove Filter                                                                               | Activates and deactivates the event filter specified in the Event Filter dialog box. If: <ul style="list-style-type: none"> <li>The filter is activated, the MWTM shows only those alarms or events that pass the filter.</li> <li>The filter is deactivated, the MWTM shows all alarms or events.</li> <li>You activate a filter in an object's Recent Events table in the MWTM main window, the filter is activated in all Recent Events tables in the MWTM main window for all other objects. The filter is not activated in Recent Events tables in Show In New Window windows or Real-Time Data and Charts windows.</li> </ul>                                                |
| <br><br>Show only Archived Events<br>or<br>Show only Archived Alarms<br>(Client interface only)                    | In the Active Alarms page, the Show only Archived Alarms button takes you to the Archived Alarms page in the web.<br><br>In the Event History page, the Show only Archived Events button takes you to the Archived Events page in the web.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Archived<br>(web interface only)                                                                                                                                                                    | This option appears in the tool bar when you are viewing the Event History table or the Active Alarms table. Click the Archived button to display a table of archived events or alarms. Click the Archived button again to switch back and forth.<br><br><div>  <b>Caution</b> In the <i>Server.properties</i> file, you can limit the number of rows in the archived events table with the MAX_ARCHIVED_EVENT_DB_ROWS property. The default value is 200,000. Increasing this value can have severe impact on server performance and can cause the server to run out of memory.         </div> |
|  Refresh<br>(web interface only)                                                                                 | Forces a refresh of the current web page. Click this icon to refresh the current page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <br>Pause<br>or<br><br>Resume | Pauses or resumes the table.<br><br>While the table is paused, the MWTM does not display new alarms or events in the table (unless you apply a filter or edit your preferences). When the table is resumed, all new alarms or events since the table was paused are added to the display.<br><br>If alarms or events are deleted while the table is paused, they are not removed from the table. Instead, they are dimmed and cannot be acknowledged or edited. Deleted alarms or events are removed from the table when you resume the table.                                                                                                                                     |
|  Acknowledge                                                                                                     | Makes the chosen alarms or events acknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Button                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Unacknowledge<br>Makes the chosen alarms or events unacknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|    | Clear<br>Clears the chosen alarms in the Active Alarms table. When you clear an alarm, the alarm no longer affects the severity of the object (its severity changes to normal), but the alarm remains visible in the Active Alarms table.<br><br>This option is not available for events.                                                                                                                                                                                                                                         |
|    | Delete<br>Deletes the chosen alarms or events. When you delete an alarm or event, you remove it from the table, and the MWTM archives the alarm or event in its database. Also, the alarm or event no longer affects the severity of the object.                                                                                                                                                                                                                                                                                  |
|    | Clear and Delete<br>Clears the chosen alarms and also deletes them from the Active Alarms table. Use the Clear and Delete button if you need to designate an alarm as manually cleared before deleting it.<br><br>When you use the Clear and Delete button, the MWTM changes the alarm severity of the object to normal, sends an alarm log message to <code>/opt/CSCOs/gm/logs/messageLog.txt</code> , and sends a trap to a northbound host to indicate that the alarm cleared.<br><br>This option is not available for events. |
|    | Event Properties<br>Opens the Alarm and Event Properties window, Properties tab.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|   | Events for Alarm<br>Launches a dialog that shows a table of events that are associated with the selected alarm. (This button is only available in alarm tables.)                                                                                                                                                                                                                                                                                                                                                                  |
|  | Edit Notes<br>Opens the Alarm and Event Properties window, Notes tab.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|  | Time Difference<br>Shows the time difference in days, minutes, hours, and seconds between two alarms or events. In the client interface, use the Ctrl key to select two alarms or events. In the web interface, check the check boxes of two alarms or events. Then click the Time Difference button.                                                                                                                                                                                                                             |
|  | Find<br>(Client interface only)<br>Finds specified text in the Active Alarms or Event History table.                                                                                                                                                                                                                                                                                                                                                                                                                              |
|  | Create Sound Filter<br>(Client interface only)<br>Opens the Event Sound Filters dialog box, with fields populated based on the chosen event.                                                                                                                                                                                                                                                                                                                                                                                      |
|  | Adjust Row Height<br>(Client interface only)<br>Adjusts the table row height and wraps the message text. Click:<br><ul style="list-style-type: none"> <li>Once to double the row height and wrap the message text.</li> <li>Again to triple the row height and wrap the message text.</li> <li>Again for single row height and no message text wrapping. This is the default setting.</li> </ul> This setting is saved automatically with your preferences.                                                                       |

| Button                                                                                                                                    | Description                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Export the report as a CSV file<br>(Web interface only) | Exports the alarms and events related table data to a report with comma-separated values (CSV file). You can save this file to disk or open it with an application that you choose (for example, Microsoft Excel). |
|  Help for Event                                          | Shows context-sensitive help for the chosen alarm or event in a separate browser window.                                                                                                                           |

## Right-click Menus

In the MWTM client interface navigation tree, to display the right-click menu for all:

- Alarms, right-click Active Alarms (see [Right-Click Menu for All Alarms and Events, page 9-10](#)).
- Events, right-click Event History (see [Right-Click Menu for All Alarms and Events, page 9-10](#)).

In the MWTM client interface, to display the right-click menu for a specific alarm or event, right-click the alarm or event in the right pane (see [Right-Click Menu for a Specific Alarm or Event, page 9-10](#)).

### Note

Right-click menus are available only in the MWTM client interface.

## Right-Click Menu for All Alarms and Events

To see the right-click menu for all active alarms, in the MWTM client interface, select Active Alarms or Event History in the navigation tree and right-click the mouse button.

| Menu Command                     | Description                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Show In New Window               | Opens the Active Alarms or Event History window in a new window.                                                |
| Back > <i>List of Windows</i>    | Navigates back to a window viewed in this session.<br>The MWTM maintains a list of up to 10 Back windows.       |
| Forward > <i>List of Windows</i> | Navigates forward to a window viewed in this session.<br>The MWTM maintains a list of up to 10 Forward windows. |

## Right-Click Menu for a Specific Alarm or Event

To see this menu, in the MWTM client interface, select an alarm or event and right-click the mouse button.

The right-click menu provides these options:

| Menu Command          | Description                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit Notes            | Opens the Edit Alarm and Event Notes dialog for the chosen alarm or event.                                                                                    |
| Go To > <i>Object</i> | Shows the window for the object associated with the chosen alarm or event.<br>If no object is associated with the alarm or event, this option is not visible. |

| Menu Command        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Change Severity     | Changes the alarm severity to critical, major, minor, warning, informational, indeterminate, or normal.<br><b>Note</b> This right-click menu option appears only in the Active Alarms window.                                                                                                                                                                                                                                                                                                                                                                                            |
| Acknowledge         | Makes the chosen alarms or events acknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Unacknowledge       | Makes the chosen alarms or events unacknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Clear               | Clears the chosen alarm in the Active Alarms table. When you clear an alarm, the alarm no longer affects the severity of the object (its severity changes to normal). The alarm remains visible in the Active Alarms table for 24 hours. After 24 hours, the MWTM archives the alarm in its database.<br>This option is not available for events.<br><b>Note</b> This right-click menu option appears only in the Active Alarms window.                                                                                                                                                  |
| Delete              | Deletes the chosen alarm or event. When you delete an alarm or event, you remove it from the table, and the MWTM archives the alarm or event in its database. Also, the alarm or event no longer affects the severity of the object.                                                                                                                                                                                                                                                                                                                                                     |
| Clear and Delete    | Clears the chosen alarm and also deletes it from the Active Alarms table. Use the Clear and Delete button if you need to designate an alarm as manually cleared before deleting it.<br>When you use the Clear and Delete button, the MWTM changes the alarm severity of the object to normal, sends an alarm log message to <code>/opt/CSCOs/gm/logs/messageLog.txt</code> , and sends a trap to a northbound host to indicate that the alarm cleared.<br>This option is not available for events.<br><b>Note</b> This right-click menu option appears only in the Active Alarms window. |
| Properties          | Opens the Alarm and Event Properties dialog.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Create Sound Filter | Opens the Event Sound Filters dialog box, with fields populated based on the chosen event.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Help for Event      | Shows context-sensitive help for the chosen event in a separate browser window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Managing Filters for Alarms and Events

You can use the MWTM to create filters to customize the information visible for events and alarms.

- [Setting Alarm or Event Filters, page 9-11](#)
- [Loading Existing Filters, page 9-18](#)
- [Saving Filter Files, page 9-19](#)

## Setting Alarm or Event Filters

You can use the MWTM Alarm and Event Filter dialog box to change the way alarm or event information appears.

### Note

You can access the Alarm and Event Filter dialog box through the client interface or the web interface. Minor differences that exist are noted in this section.

To change the way the MWTM presents event information, click **Event History** in the navigation tree, then click the Modify event filter tool  at the top of the Event History window. The Alarm and Event Filter dialog box appears (in the client interface, the window appears with the Properties tab chosen).

**Note**

The Selected Objects tab is available only in the client interface.

For more information about the Alarm and Event Filter dialog box, see these sections:

- [Alarm and Event Filter Buttons, page 9-12](#)
- [Alarm and Event Filter Panes, page 9-12](#)
- [Selected Objects Settings, page 9-15](#)
- [Event Filter Example, page 9-18](#)

**Related Topics**

## Alarm and Event Filter Buttons

The Alarm and Event Filter dialog box contains:

| Button       | Description                                                                                                                                                                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select All   | Checks all check boxes in the section.                                                                                                                                                                                                                    |
| Deselect All | Unchecks all check boxes in the section.                                                                                                                                                                                                                  |
| OK           | Applies any changes you made to the filter and closes the Alarm and Event Filter dialog box.                                                                                                                                                              |
| Load         | Opens the Load File Dialog, which you use to load an already existing filter file.<br>If you are viewing events for a specific object in the navigation tree of the MWTM main window, this button is not available.                                       |
| Save         | Opens the Save File Dialog, which you use to save the filter file with a new name, or overwrite an existing filter file.<br>If you are viewing events for a specific object in the navigation tree of the MWTM main window, this button is not available. |
| Cancel       | Closes the Alarm and Event Filter dialog box without applying any changes to the filter.                                                                                                                                                                  |
| Help         | Shows online help for the current dialog box.                                                                                                                                                                                                             |

## Alarm and Event Filter Panes

You use the Alarm and Event Filter panes in the Alarm and Event Filter dialog box to specify the types of alarms or events the MWTM should display in the Active Alarms or Event History window, including the category, feature, and severity of the alarm or event.

The Alarm and Event Filter dialog box contains these panes:

- [Categories, page 9-13](#)

- [Severities, page 9-13](#)
- [Features, page 9-14](#)
- [Other, page 9-14](#)

## Categories

Use the Categories pane of the Alarm and Event Filter dialog box to specify which event categories you want to display in the Active Alarms or Event History window.

The following categories are available:

- Status
- Trap
- Create
- Delete
- Discover
- Edit
- Ignore
- Login
- LoginDisable
- LoginFail
- Logout
- OverWrite
- Poll
- Purge
- Provision
- LaunchTerminal
- Performance

All categories are checked by default. You can click Deselect All, or Select All.

### Note

These are the default categories; there might be additional categories that the MWTM system administrator defines. For information about custom categories, see [Changing Event Categories, page 9-30](#).

## Severities

Use the Severities pane of the Alarm and Event Filter dialog box to specify which alarm/event severities you want to display in the Active Alarms or Event History window.

The Severities pane contains these default fields:

| Check box     | Description                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Informational | Indicates whether events of the specified severity appear in the Active Alarms/Event History window.<br><br>Check boxes are checked by default. |
| Normal        |                                                                                                                                                 |
| Indeterminate |                                                                                                                                                 |
| Warning       |                                                                                                                                                 |
| Critical      |                                                                                                                                                 |
| Minor         |                                                                                                                                                 |
| Major         |                                                                                                                                                 |

## Features

Use the Features pane of the Alarm and Event Filter dialog box to specify which event features you want to display in the Active Alarms or Event History window.

The following features are available:

- Unknown
- ITP
- CSR
- ONS
- RAN\_SVC
- GGSN
- CSG1
- CSG2
- CDT
- BWG
- HA
- mSEF
- IP-RAN
- MetroE-Switch
- Generic
- PDSN
- PDNGW
- SGW
- PCRF

All categories are checked by default. You can click Deselect All, or Select All.

## Other

Use the Other pane of the Alarm and Event Filter dialog box to further define the filter for the Active Alarms or Event History window. These settings are applied to all alarm/event displays in the current view.

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Acknowledged                 | Check box indicating whether only acknowledged alarms/events appear in the Active Alarms/Event History window. This check box is unchecked by default.                                                                                                                                                                                                                                                                                                                                                                                      |
| Unacknowledged               | Check box indicating whether only unacknowledged alarms/events appear in the Active Alarms/Event History window. This check box is checked by default.                                                                                                                                                                                                                                                                                                                                                                                      |
| Time Before                  | Check box indicating whether only alarms/events that the MWTM logs prior to a specified date and time appear in the Active Alarms/Event History window. This check box is unchecked by default.                                                                                                                                                                                                                                                                                                                                             |
| Time Before                  | Specifies the date and time prior to which alarms/events that the MWTM logs appear in the Active Alarms/Event History window. This field is dimmed unless the Time Before check box is checked.                                                                                                                                                                                                                                                                                                                                             |
| Time After                   | Check box indicating whether only alarms/events that the MWTM logs after a specified date and time appear in the Active Alarms/Event History window. This check box is unchecked by default.                                                                                                                                                                                                                                                                                                                                                |
| Time After                   | Specifies the date and time after which alarms/events that the MWTM logs appear in the Active Alarms/Event History window. This field is dimmed unless the Time After check box is checked.                                                                                                                                                                                                                                                                                                                                                 |
| Message Contains             | Check box indicating whether only alarms/events that contain the specified message text appear in the Active Alarms/Event History window. This check box is unchecked by default.                                                                                                                                                                                                                                                                                                                                                           |
| Match Case                   | Check box indicating whether only alarms/events that match the case of the text in the Message Contains field appear in the Active Alarms/Event History window. This field is dimmed unless the Message Contains check box is checked. If the Message Contains check box is checked, the default setting for this check box is unchecked.                                                                                                                                                                                                   |
| Suppress for unmanaged nodes | <p>Check box for suppressing alarms/events for any objects that have been set to the unmanaged state (see <a href="#">Unmanaging and Managing Nodes or ITP Signaling Points, page 6-46</a>, for steps to set an object to the unmanaged state). To suppress alarms/events for unmanaged objects, check the check box. To retain alarms/events for unmanaged objects, uncheck the check box.</p> <p>If you are viewing alarms/events for a specific object in the navigation tree of the MWTM main window, this button is not available.</p> |

## Selected Objects Settings

### Note

The Selected Objects tab is not available in the Events dialog box if you are viewing events:

- For a specific object in the navigation tree of the MWTM main window.
- Using the web interface.

To specify an object for which the MWTM should display alarms or events in the Active Alarms/Event History window:

- Step 1** Click **Active Alarms** or **Event History** or in the navigation tree.  
The Active Alarms or Event History window appears in the right pane.
- Step 2** Click the Set Filter tool  at the top of the window.  
The Alarm and Event Filter dialog box appears with the Properties tab chosen.
- Step 3** Click the **Selected Objects** tab.

The Alarm and Event Filter dialog box appears with the Selected Objects tab highlighted.

The Selected Objects settings contains:

| Field or Button                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node                                 | Drop-down list box of all nodes that the MWTM has discovered. If you: <ul style="list-style-type: none"> <li>Want to filter alarms/events based on a node, select a node from the drop-down list box.</li> <li>Do not want to filter alarms/events based on a node, select None. The MWTM grays-out the other object fields. This is the default setting.</li> </ul>                                                              |
| ApplicationServerProcess (ITP only)  | Drop-down list box of all application server processes associated with the chosen node: <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on an application server process, select an application server process from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on an application server process, select None. This is the default setting.</li> </ul>     |
| SignalingGatewayMatedPair (ITP only) | Drop-down list box of all signaling gateway-mated pairs associated with the chosen node: <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on a signaling gateway-mated pair, select a signaling gateway-mated pair from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on a signaling gateway-mated pair, select None. This is the default setting.</li> </ul> |
| SignalingPoint (ITP only)            | Drop-down list box of all signaling points associated with the chosen node: <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on a signaling point, select a signaling point from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on a signaling point, select None. This is the default setting.</li> </ul>                                                     |
| Linkset (ITP only)                   | Drop-down list box of all linksets associated with the chosen signaling point: <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on a linkset, select a linkset from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on a linkset, select None. This is the default setting.</li> </ul>                                                                          |
| Link (ITP only)                      | Drop-down list box of all links associated with the chosen linkset: <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on a link, select a link from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on a link, select None. This is the default setting.</li> </ul>                                                                                              |
| ApplicationServer (ITP only)         | Drop-down list box of all application servers associated with the chosen signaling point: <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on an application server, select an application server from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on an application server, select None. This is the default setting.</li> </ul>                           |

| Field or Button                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ApplicationServerProcess Association (ITP only) | <p>Drop-down list box of all application server process associations associated with the chosen application server:</p> <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on an application server process association, select an application server process association from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on an application server process association, select None. This is the default setting.</li> </ul> |
| Card (RAN-O only)                               | <p>Drop-down list box of all cards associated with the chosen node:</p> <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on a card, select a card from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on a card, select None. This is the default setting.</li> </ul>                                                                                                                                                          |

This is the default setting.</li> </ul>                                                                                                 |
| Backhaul (RAN-O only)                           | <p>Drop-down list box of all RAN backhauls associated with the chosen node or card:</p> <ul style="list-style-type: none"> <li>If you want to filter alarms/events based on an interface, select an interface from the drop-down list box.</li> <li>If you do not want to filter alarms/events based on an interface, select None. This is the default setting.</li> </ul>                                                                                                                        |
| Selected Objects: Object Type                   | Indicates the type of object, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Selected Objects: AS (ITP only)                 | Indicates the application server, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Selected Objects: ASP (ITP only)                | Indicates the application server process, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Selected Objects: ASPA (ITP only)               | Indicates the application server process application, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Selected Objects: Link (ITP only)               | Indicates the link, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Selected Objects: Linkset (ITP only)            | Indicates the linkset, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Selected Objects: Node                          | Indicates the node, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Selected Objects: SGMP (ITP only)               | Indicates the signaling gateway-mated pair, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Selected Objects: SP (ITP only)                 | Indicates the signaling point, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Selected Objects: Card (RAN-O only)             | Indicates the card, if any, on which the filter is based.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Field or Button                         | Description                                                                    |
|-----------------------------------------|--------------------------------------------------------------------------------|
| Selected Objects: Interface             | Indicates the interface or subinterface, if any, on which the filter is based. |
| Selected Objects: Backhaul (RAN-O only) | Indicates the RAN backhaul, if any, on which the filter is based.              |

## Event Filter Example

This example shows how to set an event filter to display trap messages for warning events for a specific node. You perform this procedure by using the MWTM client interface.

- 
- Step 1** Choose **Event History** in the navigation tree of the MWTM main window of the client interface.
- Step 2** Click the Event Filter tool  at the top of the Event History window.  
The Event Filter dialog box appears with the Properties tab chosen.
- Step 3** In the Categories pane, uncheck all check boxes except for the Trap check box.
- Step 4** In the Severities pane, uncheck all check boxes except for the Warning check box.
- Step 5** Click the Selected Objects tab.
- Step 6** In the drop-down list box, choose a node from the list of discovered nodes.
- Step 7** To activate the event filter and close the Event Filter dialog box, click **OK**.
- Step 8** To save the event filter for future use:
- In the Event Filter dialog box, click **Save**. This action opens the Save Filter dialog box.
  - In the Save Filter dialog box, enter a meaningful name in the Filename text box (for example, Node109-WarningTraps).
  - Click **OK** to close the Save Filter dialog box.
  - Click **OK** to close the Event Filter dialog box.
- In the future, to view traps for warning events for Node109, click **Load** in the Event Filter dialog box, choose the Node109-WarningTraps filter, then click **OK**. The Events window will only display warning traps for Node109 until you load a different event filter or change the current one.
- 

## Loading Existing Filters

You use the MWTM client interface to load a specific filter file and change the list of filter files.

To load an existing filter, click **Load** in the Alarm and Event Filter dialog box. The Load File Dialog: Load Filter dialog box appears.

The Load File Dialog: Load Filter contains:

| Field or Button or Icon | Description                                                          |
|-------------------------|----------------------------------------------------------------------|
| Type                    | Icon indicating whether the item in the table is a file or a folder. |
| Name                    | Name of the filter file or folder.                                   |
| Last Modified           | Date and time the filter file or folder was last modified.           |

| Field or Button or Icon                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Size (bytes)                                      | Size of the filter file or folder, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Number of Files<br>(appears in lower left corner) | Total number of filter files and folders.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| OK                                                | <p>Loads the chosen filter, saves any changes you made to the list of files, and closes the dialog box.</p> <p>To load an filter file, double-click it in the list, select it in the list and click <b>OK</b>, or enter the name of the file and click <b>OK</b>. The MWTM loads the filter file, saves any changes you made to the list of files, closes the Load File Dialog: Load Filter dialog box, and returns to the Alarm and Event Filter dialog box.</p> |
| Delete                                            | Deletes the chosen file from the filter file list. The MWTM issues an informational message containing the name and location of the deleted file.                                                                                                                                                                                                                                                                                                                 |
| Cancel                                            | Closes the dialog box without loading an filter file or saving any changes to the filter file list.                                                                                                                                                                                                                                                                                                                                                               |
| Help                                              | Shows online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Saving Filter Files

You use the MWTM client interface to save a specific filter file and change the list of filter files.

When you are satisfied with the filter settings, click **Save** in the Alarm and Event Filter dialog box. The Save File Dialog: Save Filter dialog box appears.

The Save File Dialog: Save Filter contains:

| Field or Button or Icon                            | Description                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                                               | Icon indicating whether the item in the table is a file or a folder.                                                                                                                                                                                                                                                                                                   |
| Name                                               | Name of the filter file or folder.                                                                                                                                                                                                                                                                                                                                     |
| Last Modified                                      | Date and time the filter file or folder was last modified.                                                                                                                                                                                                                                                                                                             |
| Size (bytes)                                       | Size of the filter file or folder, in bytes.                                                                                                                                                                                                                                                                                                                           |
| Filename                                           | <p>Name by which you want to save the filter file.</p> <p>If you create a new filter filename, you can use any letters, numbers, or characters in the name that are allowed by your operating system. However, if you include any spaces in the new name, the MWTM converts those spaces to dashes. For example, the MWTM saves file <i>a b c</i> as <i>a-b-c</i>.</p> |
| Number of Files<br>(visible in bottom left corner) | Total number of filter files and folders.                                                                                                                                                                                                                                                                                                                              |

| Field or Button or Icon | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OK                      | Saves any changes you made to the current filter file and closes the dialog box.<br>To save the filter file with a new name, use one of these procedures. To save the file with: <ul style="list-style-type: none"> <li>A completely new name, enter the new name and click <b>OK</b>.</li> <li>An existing name, overwriting an old filter file, select the name in the list and click <b>OK</b>.</li> </ul> The MWTM saves the filter file with the new name, saves any changes you made to the list of files, closes the Save File Dialog: Save Filter dialog box, and returns to the Alarm and Event Filter dialog box. |
| Delete                  | Deletes the chosen file from the filter file list. The MWTM issues an informational message containing the name and location of the deleted file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Cancel                  | Closes the dialog box without saving the filter file or saving any changes to the filter file list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Help                    | Shows online help for the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Viewing Properties for Alarms and Events

You use the MWTM to view detailed information about a chosen alarm or event, including its associated object, status, and other information.

To view detailed information about an alarm or event, in the:

- MWTM client interface, right-click the alarm or event in a window, then select **Event Properties** in the right-click menu.
- Web interface, select an alarm or event by checking its check box, then click the **Event Properties** icon  in the toolbar.

The Event Properties dialog box appears. The Event Properties dialog box contains:

| Tab, Field, or Button | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message               | Message text for the alarm or event.<br>You can customize this field (see <a href="#">Changing the Way the MWTM Processes Events, page 9-23</a> ).                                                                                                                                                                                                                            |
| Properties            | Tab that shows detailed information about the chosen alarm or event.                                                                                                                                                                                                                                                                                                          |
| Notes                 | Tab that shows notes associated with this alarm or event. If no note is currently associated with this alarm or event, this field shows the value <i>No Notes</i> .<br>In the Notes tab, the date and time the Notes field for this alarm or event was last updated. If no note is currently associated with this alarm or event, this field shows the value <i>Not Set</i> . |
| Details               | Tab that shows specific alarm or event attributes.                                                                                                                                                                                                                                                                                                                            |
| Events for Alarm      | Tab that shows a table of events that are associated with the selected alarm.<br>This tab does not appear in the Event Properties dialog box selected via Event History link.                                                                                                                                                                                                 |

| Tab, Field, or Button | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Acknowledged          | Indicates whether the alarm or event has been acknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Acknowledged By       | Name of the node that last acknowledged the alarm or event. If no one has acknowledged the alarm or event, this field is not shown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Acknowledge Time      | The time at which the event was acknowledged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Cleared By User ID    | The user who cleared the event.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Cleared Time          | The time at which the event was cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Tab, Field, or Button             | Description                                                                                                                                                                                                                                                                                                |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Internal ID                       | An internal identification that the MWTM uses for the alarm or event.                                                                                                                                                                                                                                      |
| Name                              | The name for the alarm or event, for example, InterfaceState.                                                                                                                                                                                                                                              |
| Alarm Nature                      | Nature of the alarm.                                                                                                                                                                                                                                                                                       |
| Count                             | Number of times this alarm occurred.<br><b>Note</b> This field is important only for alarms because an event count will always be 1.                                                                                                                                                                       |
| Element Name                      | Name of the managed element, for example, the node name.                                                                                                                                                                                                                                                   |
| <i>object name</i>                | Name of the object associated with the alarm or event. The object can be: <ul style="list-style-type: none"> <li>• Node or Interface</li> <li>• ITP objects: SP, Linkset, Link, AS, ASP, ASPA, SGMP</li> <li>• RAN-O objects: RAN Backhaul, Card</li> <li>• APN objects are applicable for GGSN</li> </ul> |
| <i>Node</i>                       | Name of the node associated with the alarm or event.                                                                                                                                                                                                                                                       |
| Create Time (Node Time Zone)      | The node time zone at which the event was received.                                                                                                                                                                                                                                                        |
| Change Time (Node Time Zone)      | The node time zone at which the event was updated.                                                                                                                                                                                                                                                         |
| Acknowledge Time (Node Time Zone) | The node time zone at which the event was acknowledged.                                                                                                                                                                                                                                                    |
| Clear Time (Node Time Zone)       | The node time zone at which the event was cleared.                                                                                                                                                                                                                                                         |

## Attaching Notes to Alarms or Events

You use the MWTM to annotate an alarm or event, attaching a descriptive string to it.

To annotate an alarm or event in the:

- MWTM client, right-click an alarm or event in the Event History window, then select **Edit Notes** in the right-click menu. The Edit Event dialog box appears.
- Web interface, select an alarm or event in the Event History window by checking its check box, then click the **Edit Notes** icon . The Event Properties dialog box appears, with the Notes tab chosen.

### Note

You can add a note to an alarm or event by using either the MWTM client or the web interface. You can also view the note from either interface.

The Edit Event Dialog contains:

| Field or Button | Description                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | Message text of the alarm or event.                                                                                                                                                                                                   |
| Last Update     | Date and time the Notes field for this alarm or event was last updated. If no note is currently associated with this alarm or event, this field shows the value <i>Not Set</i> .<br><br>You cannot edit this field.                   |
| Notes           | Notes to associate with this alarm or event. In this field, you can enter any important information about the alarm or event, such as its associated object, what triggered the alarm or event, how often it has occurred, and so on. |
| Edit            | Enables you to edit or add a note.                                                                                                                                                                                                    |
| Save            | Saves changes you have made to the alarm or event information.                                                                                                                                                                        |
| Cancel          | Cancels the operation without saving any changes.                                                                                                                                                                                     |
| Help            | Shows online help for the current window.                                                                                                                                                                                             |

[Viewing Properties for Alarms and Events, page 9-20](#)

## Viewing Archived Event Files on the Web

The All Network Event Archived Files page provides access to archived alarm and event files for the server to which you are connected.

To access archived event files:

- Step 1** In a web browser, navigate to the MWTM web interface (for details, see [Accessing the MWTM Web Interface, page 11-2](#)).
- Step 2** Choose **File Archive > Events** from the web navigation tree.  
In the Last Modified Date column, choose the day you want to view archived event files for.
- Step 3** Adjacent to the date you have chosen, click the **Status Changes and SNMP Traps** link under **View**. The Network Status Archive page appears, showing a list of the status and trap messages in the archive.

## Changing the Way the MWTM Processes Events

The types of MWTM events are:

- **Trap events**—Incoming events that the MWTM does not solicit
- **Status events**—Status changes that the MWTM detects
- **User Action events**—Events that user actions trigger

In those broad types, there occur subordinate types of events, each with a default category, severity, color, message text, and event help file. You use the MWTM to change the default characteristics of each type of event, tailoring them to meet your needs.

**Note**

Changes you make to the MWTM event processing can adversely affect your operating environment. In most environments, the MWTM recommends that you use the default event-processing settings without modification.

To change the MWTM event processing, use one of these procedures:

- Choose **Tools > Event Editor** from the MWTM main menu of the client interface
- Choose **Start > Programs > Cisco MWTM Client > MWTM Event Editor** in Windows.
- Enter the **mwtm eventeditor** command (see [mwtm eventeditor](#), page B-29).

The MWTM launches the MWTM Event Editor in the client interface. The Event Editor is not available in the web interface.

**Note**

To use the Event Editor, you must be a power user (level 2) or higher.

You use the Event Editor to customize the visible category, severity, color, and message associated with events; and load, save, and deploy customized event configurations. You can also specify a list of SNMP servers to which the MWTM should forward events in the form of traps.

The high-level MWTM event processing settings appear in the navigation tree in the left pane in the MWTM Event Editor window. The detailed settings for each high-level setting appear in the content area in the right pane.

The MWTM Event Editor menu provides these options:

| Menu Command               | Description                                                                                                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File > Load Draft          | Loads the local copy of the event configuration that you saved.                                                                                                                                                                                                                                                  |
| File > Save Draft (Ctrl-S) | Saves a local copy of the event configuration, including any changes you made by using the Event Editor. You can save only one local copy of the event configuration. You cannot specify a filename for the local copy.                                                                                          |
| File > Load Default        | Loads the default event configuration on this MWTM client.<br><br>The default event configuration is the standard event configuration that the MWTM uses when it is first installed. The default event configuration stored on the MWTM server and shared by all MWTM clients, but the clients cannot modify it. |
| File > Load Running        | Loads the event configuration that is currently running on the MWTM server.                                                                                                                                                                                                                                      |
| File > Load Backup         | Loads the backup event configuration from the MWTM server.<br><br>The MWTM creates a backup event configuration every time the event configuration on the MWTM server is overwritten.                                                                                                                            |
| File > Revert              | Reverts to the last event configuration that was loaded on the MWTM client. This could be the draft, default, running, or backup event configuration.                                                                                                                                                            |

| Menu Command             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Changing Event Limits

To change limits for the MWTM event database, click the turner  beside Event Configuration, then click **Limits**. The Limits Configuration window appears in the right pane.
