CHAPTER 1

Introduction 1-1

1.1 Overview of Cisco Prime Optical 1-1

1.2 Prime Optical Integration with Prime Central 1-3

1.3 What's New in Prime Optical 9.6.3 1-4

1.4 Key Functionality 1-8

1.5 Key GUI Components 1-9

1.5.1 Dashboard 1-9

1.5.2 Domain Explorer 1-11

1.5.3 Subnetwork Explorer 1-24

1.5.4 Alarm Browser 1-27

1.5.5 Alarm Log 1-28

1.5.6 Network Map 1-28

1.5.7 NE Explorer 1-30

1.5.8 Control Panel 1-33

1.6 General Features of Prime Optical 1-35

1.6.1 Window Views 1-35

1.6.2 Table Views 1-36

1.6.3 Tree Views 1-38

1.6.4 Launching Context-Sensitive Information 1-38

1.6.5 Finding Data 1-38

1.6.6 Filtering Data 1-41

1.6.7 Exporting Data 1-41

1.6.8 Exporting Alarms and Events 1-42

1.6.9 Customizing Table Views 1-43

1.6.10 Refreshing Data 1-44

1.6.11 Pruning the Database 1-45

1.6.12 Using Mnemonics 1-45

1.6.13 Using the Online Help 1-46

1.6.14 Using the Pin Tool 1-46
1.6.15 Viewing System Details 1-46
1.6.16 Viewing Licensing (NE Audit) Information 1-47
1.6.17 Action Buttons 1-48
1.7 Related Documentation 1-48
1.7.1 Prime Optical Documentation Set 1-49
1.7.2 Related Cisco NE Documentation 1-50

CHAPTER 2 **Basic Concepts** 2-1
2.1 Prime Optical Interfaces 2-1
2.1.1 Southbound Interfaces with NEs 2-1
2.1.2 Northbound Interfaces with OSSs 2-3
2.2 Data Communications Network 2-4
2.2.1 Proxy Server/Firewall Configurations 2-4
2.3 What is FCPS? 2-5
2.4 Fault Management 2-5
2.5 Configuration Management 2-6
2.5.1 Explorers 2-6
2.5.2 Network Maps 2-7
2.5.3 Wizards 2-7
2.5.4 Inventory Management 2-7
2.5.5 Provisioning 2-8
2.5.6 Link Management 2-9
2.5.7 Circuit Management 2-10
2.5.8 NE Release Management 2-10
2.6 Performance Management 2-11
2.6.1 Selectable Collection of PM Data Parameters 2-12
2.6.2 PM Query and Graphs 2-12
2.6.3 Real-Time PM Reporting 2-13
2.7 Security Management 2-13
2.7.1 Login Advisory Message 2-14
2.7.2 Network Partitioning 2-14
2.7.3 User Management and Profiles 2-14
2.7.4 NE Access Control 2-15
2.7.5 Audit Log 2-16

CHAPTER 3 **Building the Network** 3-1
3.1 Overview 3-1

3.2 How Do I Build Groups? 3-2
3.2.1 Adding Groups 3-2
3.2.2 Copying Groups 3-2
3.2.3 Moving Groups 3-3
3.2.4 Deleting Groups 3-3
3.3 How Do I Build Network Partitions? 3-4
3.3.1 Adding Network Partitions 3-4
3.3.2 Modifying Network Partitions 3-5
3.3.3 Deleting Network Partitions 3-5
3.4 How Do I Build Subnetworks? 3-5
3.4.1 Adding Subnetworks 3-6
3.4.2 Moving Subnetworks 3-7
3.4.3 Deleting Subnetworks 3-7
3.5 How Do I Build NEs? 3-7
3.5.1 Prerequisites for Adding NEs 3-7
3.5.2 Adding NEs 3-13
3.5.3 Copying an NE from One Group to Another 3-21
3.5.4 Moving an NE from One Group to Another 3-22
3.5.5 Moving an NE from One Network Partition to Another 3-22
3.5.6 Automatically Grouping NEs in Subnetworks 3-23
3.5.7 Deleting NEs 3-24
3.5.8 Restoring a Deleted NE 3-28
3.5.9 Searching for an NE 3-28
3.6 How Do I Build Links? 3-28
3.6.1 Setting Up ONS 15530 and ONS 15540 NEs for Link Discovery 3-29
3.6.2 Overview of Supported Links 3-29
3.6.3 Viewing the Link Table 3-34
3.6.4 Filtering the Link Table 3-38
3.6.5 Creating Links 3-38
3.6.6 Modifying Links 3-44
3.6.7 Deleting Links 3-45
3.6.8 Viewing the Link Maintenance Report 3-46
3.6.9 Viewing Link Utilization 3-47
3.6.10 Filtering the Link Utilization Table 3-50
3.6.11 Setting OTS Link Capacity 3-51
3.6.12 Viewing OTS Link Utilization and Circuits 3-51
3.6.13 Exporting the OTS Link Utilization Report 3-52
3.7 How Do I Build Server Trails? 3-53
3.7.1 Creating Server Trails 3-53

3.7.2 Modifying Server Trails 3-54
3.7.3 Deleting Server Trails 3-55
3.8 How Do I Use Network Maps? 3-55
3.8.1 Customizing a Network Map 3-57
3.8.2 Viewing a Node on the Network Map 3-58
3.8.3 Adjusting the Zoom Level or Pan Position 3-58
3.8.4 Modifying a Map Background Image 3-59
3.8.5 Configuring the Network Map View 3-60
3.8.6 Saving Changes to the Network Map 3-62
3.8.7 Searching for Circuits 3-62
3.9 How Do I Discover the Network for Optical Devices? 3-63
3.9.1 Discovering CTC-Based NEs 3-63
3.9.2 Discovering ONS 155xx NEs 3-64
3.9.3 Rediscovering ONS 155xx NEs 3-65
3.9.4 Viewing Manually Discovered NEs 3-66
3.9.5 Resetting the Resync Interval 3-68
3.9.6 Discovering CRS-1 and CRS-3, NEs 3-68
3.10 How Do I Manually Discover NEs and Add Them to Specific Network Partitions? 3-69
3.10.1 Frequently Asked Questions 3-70
3.11 How Do I Test Connectivity for Optical and Routing Devices? 3-73
3.11.1 Pinging an NE 3-73
3.11.2 Testing NE Connectivity 3-73

CHAPTER 4 **Maintaining an Efficient Network** 4-1
4.1 Overview 4-1
4.2 How Do I Manage the Database? 4-2
4.2.1 Viewing and Modifying Database Properties 4-2
4.2.2 Changing the Prime Optical Database Password 4-7
4.2.3 Overview of Backing Up the Prime Optical Database 4-8
4.2.4 Backing Up the Prime Optical Database from the Prime Optical GUI 4-12
4.2.5 Exporting the Prime Optical Database from the Prime Optical GUI 4-13
4.2.6 Backing Up or Exporting the Prime Optical Database from the CLI 4-14
4.2.7 Restoring the Prime Optical Database from the Previous Backup 4-15
4.2.8 Pruning the Prime Optical Database 4-16
4.2.9 Using the SQL*PLUS Client to Manage the Database 4-23
4.2.10 Understanding Basic SQL Commands for Prime Optical Schema Objects 4-24
4.2.11 Using the Prime Optical Interactive Database Console to Manage the Database 4-25
4.2.12 Regenerating Statistics in the Database 4-27
4.2.13 Cleaning Up the Disk and Maintaining Disk Space on the Prime Optical Server 4-27

4.3 How Do I Manage the Network Software? 4-27
4.3.1 Transferring Images 4-27
4.3.2 Software Management 4-28
4.3.3 Scheduling Bulk Software Activation 4-35
4.3.4 Using the Flash File Table 4-36
4.3.5 Viewing Software Versions and Restarting the NE with a New Software Image 4-37
4.3.6 Activating a New NE Software Version on One or More ML-Series Cards 4-39
4.3.7 Delaying Software Activation on the ML-Series Cards 4-40
4.3.8 Adding a New NE Software Version to the Prime Optical Domain 4-40
4.3.9 Deleting an NE Software Version from the Prime Optical Domain 4-42
4.4 How Do I Modify the Network? 4-42
4.4.1 Changing IP Addresses for NEs 4-42
4.4.2 Changing the Internal Subnet Address—ONS 15600 SONET and ONS 15600 SDH 4-45
4.4.3 Viewing and Changing the Network Address—CTC-Based NEs 4-45
4.4.4 Configuring Proxy Server Settings—CTC-Based NEs 4-46
4.4.5 Changing the Operational State of an NE 4-53
4.4.6 Setting Date, Time, and Location on CTC-Based NEs 4-54
4.4.7 Configuring SNTP for Multiple NEs 4-55
4.4.8 Configuring Application-Specific Parameters 4-57
4.5 How Do I Manage Redundancy and Failover? 4-58
4.5.1 Backing Up NE Memory 4-58
4.5.2 Restoring NE Memory 4-63
4.5.3 Viewing and Modifying NE Service Properties 4-67
4.5.4 Viewing and Modifying Service Instance Properties 4-77
4.5.5 Backing Up Client Files 4-80
4.5.6 Restoring Server Configuration Files 4-80
4.5.7 Configuring Nodes for Database Restore—ONS 15600 4-81
4.5.8 Managing Protection Groups 4-82
4.5.9 Restoring NE Defaults 4-86
4.6 How Do I Monitor the Network? 4-87
4.6.1 Monitoring Scheduled Tasks 4-87
4.6.2 Monitoring Service Status 4-91
4.6.3 Monitoring Service Availability 4-92
4.6.4 Viewing the NE Discrepancy Table 4-94
4.6.5 Monitoring Prime Optical Client and Server Configuration Details 4-94
4.6.6 Viewing the Prime Optical Server Version 4-95
4.7 How Do I Manage CTC Operations? 4-96
4.7.1 Functionality Provided in CTC that Is Not Available in Prime Optical 4-96
4.7.2 Specifying CTC Partitions for CTC-Based NEs 4-97

CHAPTER 5 **Configuring Hardware** 5-1

5.1 Overview 5-1

5.2 Using the NE Explorer to Configure Optical NEs 5-2

5.3 Configuring Routing Protocols on Optical NEs 5-2

5.3.1 Specifying a Routing Protocol 5-3

5.3.2 Viewing Routing Tables for CTC-Based NEs 5-3

5.3.3 Creating Static Routes for CTC-Based NEs 5-3

5.3.4 Using OSPF with CTC-Based NEs 5-4

5.3.5 Using RIP 5-8

5.3.6 Creating and Modifying an SDCC, LDCC, or GCC Termination on Transponder Cards 5-10

5.3.7 Creating and Modifying an SDCC, LDCC, GCC, or OSC Termination on SONET or SDH Cards 5-12

5.3.8 Creating a DCC Tunnel Connection 5-15

5.3.9 Using SNMP 5-15

5.3.10 Configuring FTP Hosts for CTC-Based NEs 5-22

5.3.11 Specifying the Preferred Copy—ONS 15600 SONET or ONS 15600 SDH 5-24

5.3.12 Enabling Intermediate Path Performance Monitoring 5-25

5.3.13 Enabling Pointer Justification Count Monitoring for CTC-Based NEs 5-27

5.3.14 Changing the Power Monitoring Threshold for the ONS 15454 SONET and ONS 15454 SDH 5-27

5.3.15 Changing the Power Monitoring Threshold for the ONS 15600 SONET and ONS 15600 SDH 5-28

5.3.16 Creating an Ethernet Threshold 5-29

5.4 Synchronizing the Network 5-29

5.4.1 Synchronization Settings for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, and ONS 15600 SONET 5-30

5.4.2 Synchronization Settings for the ONS 15310 MA SDH, ONS 15454 SDH, and ONS 15600 SDH 5-34

5.5 Configuring the ONS 15216 5-39

5.6 Configuring the ONS 15305 Earlier than R3.0 5-39

5.7 Configuring the ONS 15305 R3.0, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH 5-39

5.7.1 Launching the Prime Optical NE Explorer 5-40

5.7.2 Launching CTC 5-40

5.7.3 Launching TL1 5-40

5.7.4 Provisioning an ONS 15305 R3.0, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Card Slot 5-40

5.7.5 Resetting a Card 5-41

5.7.6 Deleting a Card 5-41

5.7.7 Changing a Card 5-41

5.7.8 Inserting an AIS-V on an STS-1 SD-P 5-42
5.7.9 Changing Secure Config Mode—ONS 15454 SONET or ONS 15454 SDH 5-42
5.8 Configuring the ONS 15600 SONET and ONS 15600 SDH 5-44
5.8.1 Launching the Prime Optical NE Explorer 5-44
5.8.2 Launching CTC 5-45
5.8.3 Resetting a Card 5-45
5.8.4 Deleting a Card 5-45
5.8.5 Changing a Card 5-45

CHAPTER 6 **Provisioning Cards** 6-1
6.1 How Do I Provision Cards? 6-1
6.2 Common Cards 6-2
6.3 DWDM Cards 6-2
6.3.1 Provisioning Pluggable Entities on DWDM Cards 6-2
6.4 Electrical Cards 6-2
6.4.1 Converting DS1-14 Cards from 1:1 to 1:N Protection 6-2
6.4.2 Converting DS3-12 Cards from 1:1 to 1:N Protection 6-4
6.4.3 Converting E1-N-14 Cards from 1:1 to 1:N Protection 6-5
6.4.4 Converting DS3i-N-12 Cards from 1:1 to 1:N Protection 6-6
6.4.5 Resetting NE Thresholds to the Default Values 6-8
6.5 Ethernet Cards 6-8
6.5.1 Provisioning E-Series Ethernet Ports for VLAN Membership 6-8
6.5.2 Specifying the ML-Series Card Username and Password 6-9
6.5.3 Modifying Configuration Settings for the ML-Series Cards—ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH 6-10
6.5.4 Creating RMON Thresholds 6-11
6.5.5 Creating Segments 6-12
6.5.6 Editing Segments 6-13
6.5.7 Creating Configurations 6-14
6.5.8 Adding a Peer Card 6-17
6.5.9 Create, Edit, and Delete GCC 6-17
6.5.10 E-Series Spanning Tree Protocol (IEEE 802.1D) 6-19
6.6 FC_MR-4 Card 6-21
6.7 FMEC Cards 6-21
6.8 Multirate Cards 6-21
6.9 Optical Cards 6-21
6.9.1 Provisioning an OC-N Card for ONS 15454 SONET 6-22
6.9.2 Resetting NE Thresholds to the Default Values 6-22

CHAPTER 7 **Provisioning Services and Connections** 7-1

7.1 Overview 7-1

7.2 Managing Circuits 7-2

7.2.1 Circuit Table Launch Points 7-4

7.2.2 Viewing the Circuit Table 7-4

7.2.3 Creating Circuits Using the Circuit Wizard 7-11

7.2.4 Modifying Circuits on CTC-Based NEs 7-137

7.2.5 Modifying Circuits on ONS 15530 or ONS 15540 NEs 7-141

7.2.6 Summary of Edit Circuit Options 7-142

7.2.7 Updating Circuits 7-142

7.2.8 Merging Circuits 7-143

7.2.9 Reconfiguring Circuits 7-144

7.2.10 Repairing Circuits 7-144

7.2.11 Deleting Circuits 7-145

7.2.12 Viewing Circuit Spans 7-146

7.2.13 Viewing VLAN Information 7-147

7.2.14 Viewing the ONS 15530 and ONS 15540 Circuit Table 7-148

7.2.15 Viewing Circuits in the Circuit Path Table—ONS 15530 and ONS 15540 7-151

7.2.16 Viewing Circuits in the Circuit Path Span Table—ONS 15530 and ONS 15540 7-152

7.2.17 Viewing VCAT Member Circuits 7-153

7.2.18 Creating VCAT Member Circuits 7-155

7.2.19 Filtering the Circuit Table 7-157

7.2.20 Tracing Circuits 7-159

7.2.21 Modifying Traces 7-177

7.2.22 Managing Circuit Notes 7-177

7.2.23 Managing Circuit Rolls 7-178

7.2.24 Circuit Promotion of GMPLS Circuits 7-188

7.2.25 Validation of GMPLS Circuits 7-188

7.2.26 Reroute Wavelength of GMPLS Circuits 7-189

7.2.27 Restoration of GMPLS Circuits 7-190

7.2.28 Circuit Reports 7-192

7.3 Managing BLSRs 7-198

7.3.1 Viewing the BLSR Table 7-198

7.3.2 Creating a BLSR for an Individual Node 7-200

7.3.3 Creating BLSRs for Multiple Nodes Simultaneously 7-202

7.3.4 Viewing the BLSR Ring Map Table 7-203

7.3.5 Viewing the BLSR Squelch Table 7-203

7.3.6 Editing BLSRs 7-204

7.3.7 Switching BLSRs 7-204

7.3.8 Changing the BLSR Switch Interval 7-205
7.3.9 Using the BLSR Upgrade Table 7-205
7.3.10 Upgrading BLSRs 7-206
7.3.11 Filtering the BLSR Table 7-207
7.3.12 Deleting BLSRs 7-208
7.4 Managing MS-SPRings 7-208
7.4.1 Viewing the MS-SPRing Table 7-208
7.4.2 Creating an MS-SPRing for an Individual Node 7-210
7.4.3 Creating MS-SPRings for Multiple Nodes Simultaneously 7-211
7.4.4 Editing MS-SPRings 7-212
7.4.5 Using the MS-SPRing Upgrade Table 7-213
7.4.6 Upgrading MS-SPRings 7-213
7.4.7 Viewing the MS-SPRing Ring Map Table 7-214
7.4.8 Viewing the MS-SPRing Squelch Table 7-214
7.4.9 Switching MS-SPRings 7-215
7.4.10 Changing the MS-SPRing Switch Interval 7-216
7.4.11 Filtering the MS-SPRing Table 7-216
7.4.12 Deleting MS-SPRings 7-217
7.5 Managing VLANs for E-Series Cards 7-218
7.5.1 Creating VLANs 7-218
7.5.2 Tracing VLANs 7-219
7.5.3 Deleting VLANs 7-220
7.6 Managing VLANs (ML-Series Cards) 7-220
7.7 Managing SVLAN Profiles 7-221
7.8 Managing the SVLAN Database 7-222
7.9 Managing SVLANs 7-224
7.9.1 Viewing the SVLAN Table 7-225
7.9.2 Filtering the SVLAN Table 7-225
7.9.3 Creating an SVLAN 7-227
7.9.4 Modifying an SVLAN 7-233
7.9.5 Deleting an SVLAN 7-234
7.9.6 Adding an SVLAN Drop 7-234
7.9.7 Deleting an SVLAN Drop 7-235
7.9.8 Tracing an SVLAN 7-235
7.10 Provisioning Data Services 7-235
7.10.1 Initializing Layer 2 Cards 7-237
7.10.2 Backing Up and Restoring ML Configuration Files on Layer 2 Cards 7-238
7.10.3 Naming Convention for Discovered Layer 2 Topologies 7-239
7.10.4 Provisioning Layer 2 Topologies 7-239

7.10.5 Viewing the Layer 2 Topology Table 7-242
7.10.6 Creating Layer 2 Topologies 7-247
7.10.7 Deleting Layer 2 Topologies 7-266
7.10.8 Enabling Layer 2 Services 7-267
7.10.9 Modifying Layer 2 Topologies 7-270
7.10.10 Filtering the Layer 2 Topology Table 7-273
7.10.11 Modifying Ports in Layer 2 Topologies 7-274
7.10.12 Inserting or Deleting a Card on an RPR Topology 7-275
7.10.13 Layer 2 Service Management Tasks 7-286
7.10.14 Resynchronizing Layer 2 Topologies 7-312
7.10.15 Discovering Layer 2 Topologies 7-312
7.10.16 Changing the Framing Mode for ML-Series Cards 7-312
7.10.17 Provisioning ML-Series Cards to Receive SNMP Traps 7-315
7.10.18 Initializing ML-Series Cards 7-316
7.10.19 Managing Port Channel Link Aggregation on ML-Series Cards 7-318
7.11 Managing QoS Profiles 7-323
7.11.1 QoS Profile Management Tasks 7-324
7.11.2 Viewing the QoS Profile Table 7-324
7.11.3 Creating QoS Profiles 7-324
7.11.4 Modifying QoS Profiles 7-326
7.11.5 Duplicating QoS Profiles 7-328
7.11.6 Deleting QoS Profiles 7-329
7.11.7 Viewing the QoS Classes Table 7-329
7.12 Managing DWDM Nodes 7-330
7.12.1 Calculating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier 7-331
7.12.2 Calculating Internal Patchcord Connections—ONS 15454 SONET and ONS 15454 SDH R8.0 and R9.0 7-331
7.12.3 Creating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier 7-332
7.12.4 Creating Internal Patchcords—ONS 15454 SONET and ONS 15454 SDH R8.0 and Later 7-332
7.12.5 Deleting DWDM Connections or Internal Patchcords 7-334
7.12.6 Importing Cisco MetroPlanner Configuration Files—ONS 15454 SONET and ONS 15454 SDH R6.0 and Earlier 7-334
7.12.7 Provisioning DWDM Nodes Manually 7-335
7.12.8 Provisioning the Power Level of DWDM Nodes 7-337
7.12.9 Checking the Span Loss Between DWDM Nodes 7-337
7.12.10 Managing APC Domains 7-338
7.12.11 Configuring Automatic Node Setup 7-340

7.12.12 Creating Side Objects 7-343
7.12.13 Modifying Side Objects 7-344
7.12.14 Deleting Side Objects 7-344
7.12.15 Creating Alien Wavelength 7-344
7.12.16 Editing Alien Wavelength 7-345

CHAPTER 8 **Managing Security** 8-1

8.1 Overview 8-1
8.2 Login Advisory Message 8-2
8.3 User Security 8-2
8.3.1 Restricting User Access 8-2
8.3.2 User Privilege Profiles 8-3
8.3.3 Performing User Administration 8-3
8.3.4 Managing Prime Optical User Profiles 8-35
8.4 NE Security Management 8-41
8.4.1 Setting NE Authentication 8-41
8.4.2 Setting Up a Security Policy 8-43
8.4.3 Managing NE User Access 8-48
8.4.4 Managing CTC User Profiles 8-59
8.4.5 Managing Cisco IOS Users 8-62
8.4.6 Managing SNMPv3—CTC-Based Release 9.6 NEs 8-64
8.5 Audit Log 8-72
8.5.1 Viewing the Audit Log 8-73
8.5.2 Filtering Audit Log Data 8-74
8.6 Northbound Gateway Security 8-76

CHAPTER 9 **Managing Faults** 9-1

9.1 What Is Fault Management? 9-1
9.1.1 What the NE Provides 9-2
9.1.2 Fault Notification and Maintenance 9-2
9.1.3 Root Cause Analysis 9-3
9.2 Where Can I Get Information on Affected Services and Customers? 9-3
9.2.1 Viewing the Alarm Browser 9-4
9.2.2 Filtering Data in the Alarm Browser 9-6
9.2.3 Adding Alarm Notes 9-8
9.2.4 Viewing the Alarm Log 9-8
9.2.5 Filtering Data in the Alarm Log 9-10
9.2.6 Exporting All Data in the Alarm Log or Alarm Browser 9-13

9.3 What Fault Information Can I See? 9-14
9.3.1 How Are Alarms Displayed? 9-14
9.3.2 Suppressing Alarms 9-15
9.4 Is the Service Working? 9-15
9.4.1 Locating Alarms 9-16
9.4.2 Locating Affected Layer 2 Services 9-17
9.4.3 Viewing Affected Circuits 9-18
9.4.4 Setting Up and Viewing Alarm Configuration Parameters 9-18
9.4.5 Creating Alarm Profiles—CTC-Based NEs 9-22
9.4.6 Applying Alarm Profiles—CTC-Based NEs 9-23
9.4.7 Managing Alarm Profiles—CTC-Based NEs 9-24
9.4.8 Managing Custom Alarm Types—CTC-Based NEs 9-26
9.4.9 Using the Recovery Properties Pane 9-27
9.5 Where Is the Fault? 9-27
9.5.1 Sources of Information 9-27
9.5.2 Identifying and Monitoring Alarms 9-28
9.5.3 Using Visual and Audible Alarm Notifications 9-28
9.5.4 Sources of Events 9-29
9.5.5 Enabling Fault Synchronization—CTC-Based NEs 9-31
9.6 How Can I Find the Root Cause of the Fault? 9-32
9.6.1 Viewing the Error Log 9-32
9.6.2 Filtering Data in the Error Log 9-33
9.6.3 Managing the NE Audit Trail—CTC-Based NEs 9-34
9.6.4 Setting Debug Options 9-36
9.7 Who Is Responsible for Managing the Fault? 9-37
9.7.1 Acknowledging and Unacknowledging Alarms 9-38
9.7.2 Configuring Alarm Acknowledgement and Alarm Notes 9-38
9.8 How Can the Fault Be Fixed? 9-39
9.8.1 Clearing a Security Violation Alarm—ONS 15305 R3.0, ONS 15327, ONS 15454 SONET, ONS 15454 SDH 9-39
9.8.2 Performing a System Reset—ONS 15600 SONET and ONS 15600 SDH 9-39
9.8.3 Exporting Alarms and Events to a Text File 9-39
9.8.4 Configuring Server Logging Properties Using a Remote Debugger 9-40
9.8.5 Configuring Server Logging Properties Using the Properties File 9-40

CHAPTER 10 **Managing Performance** 10-1
10.1 What Is Performance Management? 10-1
10.2 What Performance Data Is Available? 10-2
10.3 How Is Performance Data Collected? 10-3

10.3.1 Viewing Performance Monitoring for an NE 10-4
10.3.2 Enabling Performance Monitoring 10-4
10.3.3 Understanding the PM Service Pane 10-4
10.3.4 Understanding the Individual PM Service Panes 10-5
10.3.5 Activating or Deactivating Performance Monitoring 10-12
10.3.6 Enabling or Disabling PM Data Collection on an Individual NE 10-12
10.3.7 Enabling or Disabling PM Data Collection by PM Category for CTC-Based NEs 10-13
10.3.8 Enabling PM Data Collection for the ONS 15530 and ONS 15540 10-14
10.3.9 Enabling or Disabling PM Retrieval Fail Alarms for CTC-Based NEs 10-14
10.3.10 Specifying the PM Data Display 10-15
10.3.11 Viewing the Robust PM Collection Queue 10-15
10.3.12 Using the Self Monitor Table 10-15
10.3.13 Filtering the Self Monitor Table 10-16
10.4 How Do I Query, View, Filter, and Graph PM Data? 10-17
10.4.1 Using the PM Table Query 10-17
10.4.2 Configuring PM Collection Settings 10-24
10.4.3 Launching the PM Table for Layer 3 Links from the Network Map 10-25
10.4.4 Managing Real-Time PM Data 10-26
10.4.5 Filtering PM Data 10-28
10.4.6 Using PM Data Graphs 10-28
10.4.7 Understanding How Prime Optical Displays the Interface Field 10-31

CHAPTER 11 **Managing Inventory** 11-1
11.1 Overview 11-1
11.2 Domain NE Table 11-2
11.2.1 Viewing the Domain NE Table 11-3
11.2.2 Filtering the Domain NE Table 11-5
11.2.3 Viewing NE Properties from the Domain NE Table 11-5
11.2.4 Viewing the ENE Devices Table 11-7
11.2.5 Viewing the TNE Devices Table 11-7
11.2.6 Filtering the TNE Devices Table 11-8
11.2.7 Opening a TL1 Tunnel 11-8
11.2.8 Closing a TL1 Tunnel 11-9
11.2.9 Modifying a TL1 Tunnel 11-10
11.3 Equipment Inventory Table 11-11
11.3.1 Viewing an Equipment Inventory Table 11-11
11.3.2 Exporting Equipment Inventory Table Data 11-18
11.3.3 Filtering the Equipment Inventory Table 11-19

CHAPTER 12 **Managing Southbound and Northbound Interfaces** 12-1

12.1 How Do I Manage Southbound Interfaces? 12-1
12.1.1 Southbound Port Details 12-1
12.1.2 Using a Static CORBA Listener Port on the Prime Optical Server 12-1
12.1.3 Client-Server Communication Protocols 12-2
12.1.4 Changing the Prime Optical Server Port 12-2
12.1.5 Changing the HTTP Server Port 12-2
12.2 How Do I Manage Northbound Interfaces? 12-3
12.2.1 Managing Prime Optical GateWay/SNMP 12-3
12.2.2 Managing Prime Optical GateWay/CORBA 12-11

CHAPTER 13 **Configuring MPLS-TP Using the CPT System** 13-1

13.1 Understanding Common Terms 13-2
13.1.1 What Is MPLS? 13-2
13.1.2 What Is MPLS-TP? 13-3
13.1.3 What Is the CPT System? 13-3
13.1.4 What Is Pseudowire? 13-4
13.1.5 What Is an EVC? 13-6
13.1.6 What Is CPT System QoS? 13-7
13.1.7 What Is an LSP? 13-7
13.1.8 What Is BFD? 13-8
13.1.9 What Is an EFP? 13-8
13.1.10 What Is a Bridge Domain? 13-9
13.1.11 What Is IGMP Snooping? 13-9
13.1.12 What Is MVR? 13-10
13.1.13 What Is LACP? 13-11
13.2 Understanding User Privileges and Tasks 13-11
13.3 Unsupported Features 13-14
13.4 MPLS-TP Tunnels 13-14
13.4.1 How Do I Create an MPLS-TP Tunnel? 13-14
13.4.2 Understanding the TP Tunnel Service Table 13-20
13.4.3 How Do I View or Modify an MPLS-TP Tunnel? 13-20
13.4.4 How Do I Delete an MPLS-TP Tunnel? 13-23
13.4.5 How Do I Trace an MPLS-TP Tunnel? 13-23
13.4.6 How Do I Launch the Pseudowire Service Table from the TP Tunnel Service Table? 13-24
13.5 Pseudowires 13-29
13.5.1 How Do I Create a Pseudowire? 13-29
13.5.2 Understanding the PW Service Table 13-34
13.5.3 How Do I View or Modify a Pseudowire? 13-35

13.5.4 How Do I Delete a Pseudowire? 13-37
13.5.5 How Do I Trace a Pseudowire? 13-37
13.6 EVCs 13-38
13.6.1 How Do I Create an EVC? 13-38
13.6.2 Understanding the EVC Service Table 13-42
13.6.3 How Do I View or Modify an EVC? 13-43
13.6.4 How Do I Delete an EVC? 13-47
13.6.5 How Do I Trace an EVC? 13-47
13.7 Understanding Advanced Troubleshooting Options 13-50
13.7.1 Understanding the MPLS-TP Tunnel Cross-Connections Table 13-51
13.7.2 Understanding the Pseudowire Cross-Connections Table 13-52
13.7.3 Understanding the EVC Cross-Connections Table 13-54
13.7.4 Understanding the Refresh L2 Service Data Discovery Option 13-55
13.8 CPT System QoS 13-55
13.8.1 How Do I Create and Manage QoS Objects? 13-55
13.8.2 How Do I Provision QoS Objects in the CPT System? 13-66
13.9 CPT System 13-68
13.9.1 Understanding CPT Cards 13-68
13.9.2 Overview of the CPT System Property Sheet 13-69
13.9.3 Understanding the CPT System Alarms 13-87

APPENDIX A **Icons and Menus Displayed in Prime Optical** A-1
A.1 Network Map, Domain Explorer, and Subnetwork Explorer Icons A-1
A.1.1 Alarm Icons A-3
A.1.2 Operational State Icons A-3
A.1.3 Communication State Icons A-4
A.2 Prime Optical Menu Bars A-4
A.2.1 File Menu A-4
A.2.2 Edit Menu A-8
A.2.3 Fault Menu A-14
A.2.4 Performance Menu A-15
A.2.5 Configuration Menu A-15
A.2.6 Administration Menu A-20
A.2.7 View Menu A-22
A.2.8 Window Menu A-23
A.2.9 Help Menu A-24

APPENDIX B **NE Explorer Information** B-1
B.1 ONS 15216 NE Explorer B-1

B.1.1 Active ONS 15216 NEs B-2
B.1.2 Passive ONS 15216 NEs B-4

APPENDIX C Slot Properties Pane Information—Common, DWDM, Electrical, and Ethernet Cards C-1
C.1 Common Cards C-1
C.1.1 Slot Properties—AIC C-2
C.1.2 Slot Properties—AIC-I C-5
C.1.3 Slot Properties—CTX-2500 C-9
C.1.4 Slot Properties—CTX-CL600 C-26
C.1.5 Slot Properties—FILLER C-59
C.1.6 Slot Properties—MIC-28-3-A and MIC-28-3-B C-59
C.1.7 Slot Properties—MMU (ONS 15454 SONET and ONS 15454 SDH) C-60
C.1.8 Slot Properties—OSCM (ONS 15454 SONET and ONS 15454 SDH) C-65
C.1.9 Slot Properties—SSXC C-70
C.1.10 Slot Properties—TCC+ C-71
C.1.11 Slot Properties—TCC-I C-72
C.1.12 Slot Properties—TCC2 C-73
C.1.13 Slot Properties—TCC2P C-75
C.1.14 Slot Properties—TCC3 C-77
C.1.15 Slot Properties—TNC and TNCE C-79
C.1.16 Slot Properties—TSC and TSCE C-90
C.1.17 Slot Properties—TSC (ONS 15600 SONET and ONS 15600 SDH) C-92
C.1.18 Slot Properties—Unprovisioned Slot (ONS 15327 and ONS 15454 SONET) C-93
C.1.19 Slot Properties—Unprovisioned Slot (ONS 15454 SDH) C-94
C.1.20 Slot Properties—XC C-94
C.1.21 Slot Properties—XC-VXL-10G C-95
C.1.22 Slot Properties—XC10G C-96
C.1.23 Slot Properties—XCVT C-98
C.1.24 Slot Properties—XCVXC C-100
C.1.25 Slot Properties—XTC (ONS 15305) C-101
C.1.26 Slot Properties—XTC (ONS 15327) C-102
C.2 DWDM Cards C-111
C.2.1 Slot Properties—2.5G_DM C-112
C.2.2 Slot Properties—2.5G_DMP C-126
C.2.3 Slot Properties—2.5G Multirate Transponder C-139

C.2.4 Slot Properties—32DMX C-159
C.2.5 Slot Properties—32DMX-L C-166
C.2.6 Slot Properties—32DMX_O C-173
C.2.7 Slot Properties—40-DMX-C C-177
C.2.8 Slot Properties—32MUX_O C-184
C.2.9 Slot Properties—40-MUX-C C-189
C.2.10 Slot Properties—32WSS C-196
C.2.11 Slot Properties—32WSS-L C-203
C.2.12 Slot Properties—40-WSS-C C-210
C.2.13 Slot Properties—40-WXC-C C-218
C.2.14 Slot Properties—80-WXC-C C-226
C.2.15 Slot Properties—40G-MXP-C C-238
C.2.16 Slot Properties—4MD_xx.x C-255
C.2.17 Slot Properties—AD_1B_xx.x C-259
C.2.18 Slot Properties—AD_1C_xx.x C-264
C.2.19 Slot Properties—AD_2C_xx.x C-269
C.2.20 Slot Properties—AD_4B_xx.x C-273
C.2.21 Slot Properties—AD_4C_xx.x C-278
C.2.22 Slot Properties—ADM-10G C-283
C.2.23 Slot Properties—GE_XP and 10GE_XP C-304
C.2.24 Slot Properties—MXP_2.5G_10E C-346
C.2.25 Slot Properties—MXP_2.5G_10G C-365
C.2.26 Slot Properties—MXP_MR_10DME C-378
C.2.27 Slot Properties—OPT-AMP-17-C and OPT-AMP-C C-399
C.2.28 Slot Properties—OPT-AMP-L C-408
C.2.29 Slot Properties—OPT-RAMP-C and OPT-RAMP-CE C-414
C.2.30 Slot Properties—OPT-BST C-423
C.2.31 Slot Properties—OPT-BST-E C-429
C.2.32 Slot Properties—OPT-BST-L C-435
C.2.33 Slot Properties—OPT-EDFA-17 and OPT-EDFA-24 C-442
C.2.34 Slot Properties—OPT-PRE C-448
C.2.35 Slot Properties—OSC-CSM C-453
C.2.36 Slot Properties—OTU2_XP C-458
C.2.37 Slot Properties—PSM C-484
C.2.38 Slot Properties—RAMAN-CTP and RAMAN-COP C-491
C.2.39 Slot Properties—SMR-C C-498
C.2.40 Slot Properties—T-DCU (TDC-CC and TDC-FC) C-511
C.2.41 Slot Properties—TXP_MR_10E C-515
C.2.42 Slot Properties—TXP_MR_10E_C C-542
C.2.43 Slot Properties—TXP_MR_10G C-563

C.2.44 Slot Properties—PTF_10GE_4 C-576
C.2.45 Slot Properties—AR_MXP, AR_XP and AR_XPE C-588
C.2.46 Slot Properties—10x10G_LC, 100G_LC_C, and CFP_LC C-621
C.3 Electrical Cards C-651
C.3.1 Slot Properties—DS-1-14 C-651
C.3.2 Slot Properties—DS1-28/DS3-EC1-3 C-658
C.3.3 Slot Properties—DS1-84/DS3-EC1-3 C-683
C.3.4 Slot Properties—DS-1N C-707
C.3.5 Slot Properties—DS-3-12 C-711
C.3.6 Slot Properties—DS-3E C-715
C.3.7 Slot Properties—DS-3i C-719
C.3.8 Slot Properties—DS-3i-N-12 C-724
C.3.9 Slot Properties—DS-3XM-6 C-729
C.3.10 Slot Properties—DS-N C-736
C.3.11 Slot Properties—DS1_E1_56 C-737
C.3.12 Slot Properties—DS3_EC1_48 C-746
C.3.13 Slot Properties—DS3XM-12 C-761
C.3.14 Slot Properties—E-1 C-774
C.3.15 Slot Properties—E1_21_E3_DS3_3 and E1_63_E3_DS3_3 C-778
C.3.16 Slot Properties—E1-42 C-801
C.3.17 Slot Properties—E1-63 (ONS 15305 CTC) C-808
C.3.18 Slot Properties—E1-8 (ONS 15305 CTC) C-810
C.3.19 Slot Properties—E1-N-14 C-812
C.3.20 Slot Properties—E3-12 C-820

C.4 Ethernet Cards C-832
C.4.1 Slot Properties—CE-100T-8 (ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH) C-833
C.4.2 Slot Properties—CE-100T-8 (ONS 15454 SONET) C-839
C.4.3 Slot Properties—CE-100T-8 (ONS 15454 SDH) C-846
C.4.4 Slot Properties—CE-1000-4 (ONS 15454 SDH and ONS 15454 SONET) C-853
C.4.5 Slot Properties—CE-MR-6 C-861
C.4.6 Slot Properties—CE-MR-10 C-870
C.4.7 Slot Properties—E10/100T-4 C-878
C.4.8 Slot Properties—E1000-2 C-882
C.4.9 Slot Properties—E1000-2-G C-885
C.4.10 Slot Properties—E100T-12 C-889
C.4.11 Slot Properties—E100T-G C-892

C.4.12 Slot Properties—E100-8 (ONS 15305 CTC) C-895
C.4.13 Slot Properties—E100-WAN-8 (ONS 15305 CTC) C-897
C.4.14 Slot Properties—ETH1000 C-900
C.4.15 Slot Properties—G1000-2 C-902
C.4.16 Slot Properties—G1000-4 C-906
C.4.17 Slot Properties—GE-2 (ONS 15305 CTC) C-911
C.4.18 Slot Properties—GigE-WAN-2 (ONS 15305 CTC) C-913
C.4.19 Slot Properties—ML-100T-8 C-916
C.4.20 Slot Properties—ML1000-2 C-922
C.4.21 Slot Properties—ML100T-12 C-932
C.4.22 Slot Properties—ML100X-8 C-942
C.4.23 Slot Properties—ML-MR-10 C-951
C.4.24 Slot Properties—MS-ISC-100T C-959
C.4.25 Slot Properties—RAN-SVC C-961
C.4.26 Slot Properties—PT_10GE_4 C-966
C.4.27 Slot Properties—PTSA_GE C-974

APPENDIX D **Slot Property Information—FC_MR-4, FMEC, Multirate, and Optical Cards** D-1

D.1 FC_MR-4 Card D-1
D.1.1 Slot Properties—FC_MR-4 D-1
D.2 FMEC Cards D-7
D.2.1 Slot Properties—FMEC-DS-1/E1 D-7
D.2.2 Slot Properties—FMEC-DS-3/E3 D-8
D.2.3 Slot Properties—FMEC-E1 D-9
D.2.4 Slot Properties—FMEC-E1-120NP D-11
D.2.5 Slot Properties—FMEC-STM1E 1:1 D-12
D.2.6 Slot Properties—MIC-A/P D-14
D.2.7 Slot Properties—MIC-C/T/P D-15
D.3 Multirate Cards D-16
D.3.1 Slot Properties—ASAP_4 D-16
D.3.2 Slot Properties—MRC-12 D-32
D.3.3 Slot Properties—MRC25G-4 D-56
D.3.4 Slot Properties—MRC25G-12 D-70
D.4 Optical Cards D-84
D.4.1 Slot Properties—OC12 IR/STM4 SH 1310 D-85
D.4.2 Slot Properties—OC12-4 IR/STM4 SH 1310 D-91
D.4.3 Slot Properties—OC192 LR/STM64 LH 1550 D-98
D.4.4 Slot Properties—OC192/STM64 XFR-Based D-105
D.4.5 Slot Properties—OC3 IR 4 1310 D-121

D.4.6 Slot Properties—OC3 IR/STM1 SH 1310-8 D-127
D.4.7 Slot Properties—OC48 D-134
D.4.8 Slot Properties—OC48 IR 1310 D-141
D.4.9 Slot Properties—OC48 LR 1550 D-148
D.4.10 Slot Properties—S1.1-2-LC (ONS 15305 CTC) D-155
D.4.11 Slot Properties—S1.1-8-LC (ONS 15305 CTC) D-157
D.4.12 Slot Properties—S16.1-1-LC (ONS 15305 CTC) D-159
D.4.13 Slot Properties—STM-1 D-161

GLOSSARY

INDEX

Preface

This section explains the objectives and intended audience of this publication and describes the conventions that convey instructions and other information.

Objectives

This guide explains how to use Cisco Prime Optical 9.6.3 to manage Cisco Optical Networking System (ONS) network elements (NEs).

Use this guide to learn about:

- Cisco Prime Optical, an element management system (EMS)
- Prime Optical GateWay, an EMS-to-network management system (NMS) interface architectural component

Audience

The primary audience for this guide includes network operations personnel and system administrators. This guide assumes that you are familiar with the following products and topics:

- Basic internetworking terminology and concepts
- Network topology and protocols
- Microsoft Windows Vista, Windows 2000 Professional, Windows XP Professional, and Windows Server 2003 Terminal Server
- Sun Microsystems Solaris administration
- Oracle database administration
- Telecommunication Management Network (TMN) architecture model

Conventions

This document uses the following conventions:

Item	Convention
Commands and keywords	**boldface** font
Displayed session and system information	`screen` font
Information that the user must enter	**`boldface screen`** font
Variables that the user must supply	*`italic screen`* font
Menu items and button names	**boldface** font
Selecting a menu item	**Option > Network Preferences**

Caution Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Note Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

Timesaver Means *the described action saves time*. You can save time by performing the action described in the paragraph.

Tip Means *the following information will help you solve a problem.*

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see *What's New in Cisco Product Documentation* at: http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html.

Subscribe to *What's New in Cisco Product Documentation*, which lists all new and revised Cisco technical documentation, as an RSS feed and deliver content directly to your desktop using a reader application. The RSS feeds are a free service.

Introduction

Cisco Prime Optical (formerly Cisco Transport Manager) is a carrier-class, multitechnology management system that integrates the end-to-end management of traditional transport networks and new carrier packet transport networks. It can help maintain the integrity of existing services, plus deliver interactive, content-based services and high-bandwidth applications.

Cisco Prime Optical manages the entire Cisco optical portfolio, including:

- Metro core
- Metro dense wavelength-division multiplexing (DWDM)
- Metro edge and access products
- New Carrier Packet Transport (CPT) System products

Prime Optical also serves as a foundation for integration into a larger overall Operations Support System (OSS) environment by providing northbound gateway interfaces to higher-layer management systems.

For Cisco network element (NE) documentation, see 1.7.2 Related Cisco NE Documentation, page 1-50.

This chapter contains the following sections:

- 1.1 Overview of Cisco Prime Optical, page 1-1
- 1.2 Prime Optical Integration with Prime Central, page 1-3
- 1.3 What's New in Prime Optical 9.6.3, page 1-4
- 1.4 Key Functionality, page 1-8
- 1.5 Key GUI Components, page 1-9
- 1.6 General Features of Prime Optical, page 1-35
- 1.7 Related Documentation, page 1-48

1.1 Overview of Cisco Prime Optical

This section provides a high-level overview of how Prime Optical fits into the network.

Prime Optical provides advanced capabilities in fault, configuration, performance, and security management across the element and network management layers of the Telecommunication Management Network (TMN) reference architecture.

Prime Optical manages the following optical NEs:

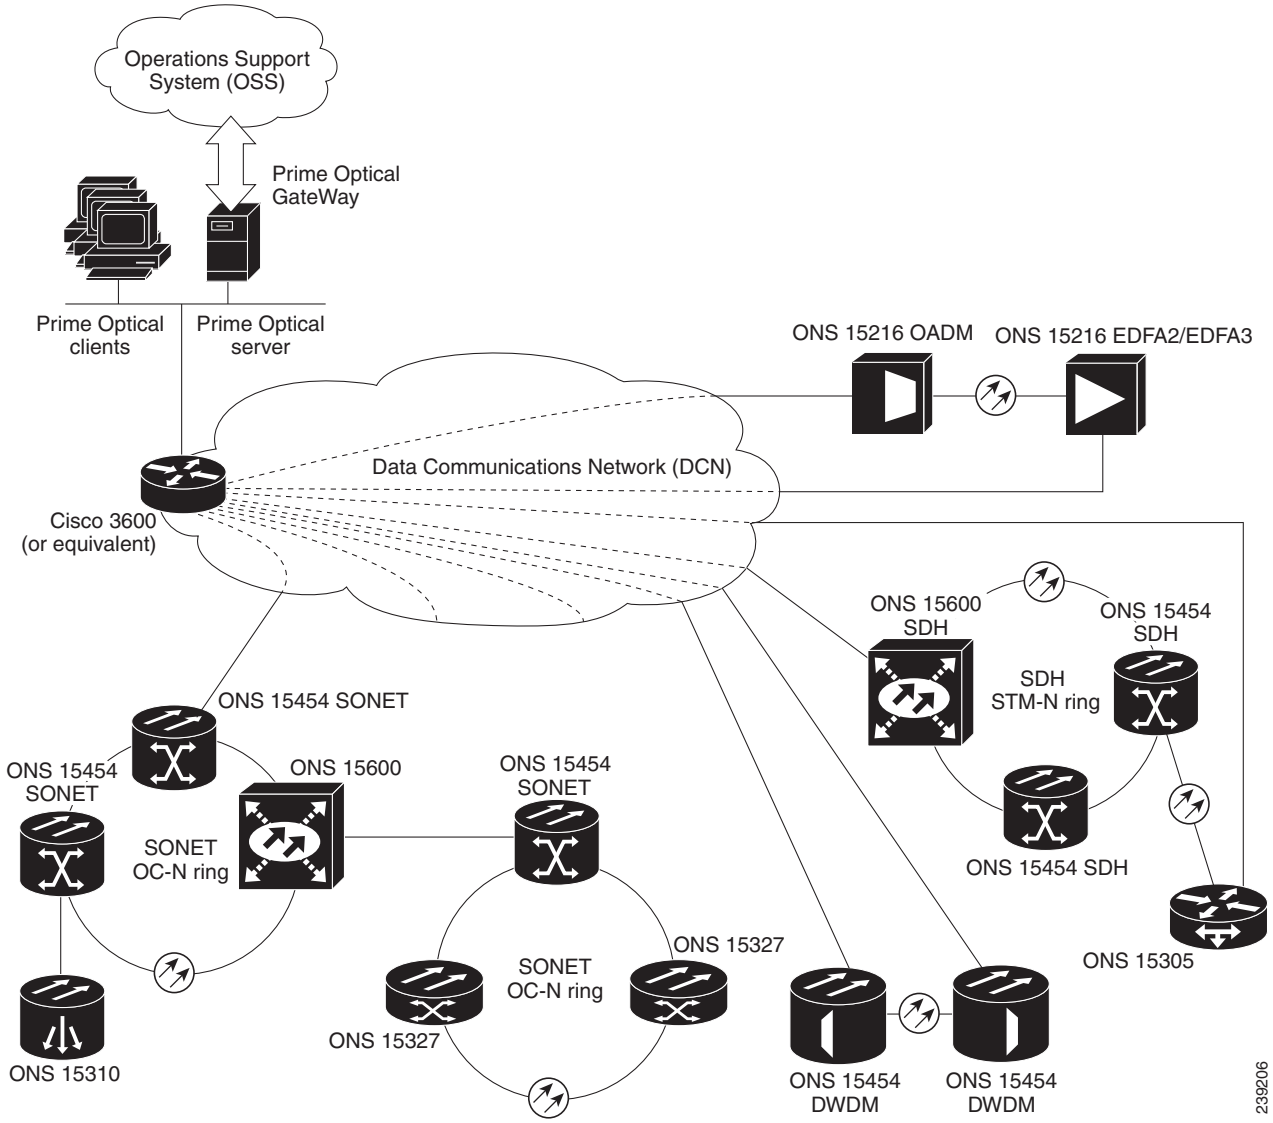
- Cisco Transport Controller (CTC)-based NEs:
  - Cisco ONS 15305 R3.0 and later
  - Cisco ONS 15310 CL
  - Cisco ONS 15310 MA SDH
  - Cisco ONS 15310 MA SONET
  - Cisco ONS 15327
  - Cisco ONS 15454 SDH
  - Cisco ONS 15454 SONET
  - Cisco ONS 15454-M6
  - Cisco ONS 15454-M2
  - Cisco ONS 15600 SDH
  - Cisco ONS 15600 SONET
- Cisco ONS 15216
- Cisco ONS 15305 R2.0.x
- Cisco ONS 15530
- Cisco ONS 15540 ESP and ESPx
- Carrier Packet Transport 200
- Carrier Packet Transport 200 SDH
- Carrier Packet Transport 600
- Carrier Packet Transport 600 SDH
- Unmanaged NEs or nodes from other vendors

Prime Optical GateWay is an architectural component that provides northbound element management system-to-network management system (EMS-to-NMS) interface mediation. Prime Optical GateWay enables service providers to integrate Prime Optical with their OSSs by using open, standard interfaces. Prime Optical offers Simple Network Management Protocol (SNMP) and Common Object Request Broker Architecture (CORBA) interface options.

Note The Prime Optical GateWay/CORBA functionality is sold separately.

Prime Optical provides a comprehensive management solution as illustrated in the following figure.

Figure 1-1 Prime Optical Comprehensive Management Solution



1.2 Prime Optical Integration with Prime Central

Prime Optical can be used as a standalone product or as part of Cisco Prime Central. When it is installed as part of a suite, you can launch Prime Optical from the Prime Central portal. For more information about Prime Central, see the documentation for Cisco Prime Central.

When Prime Optical and Cisco Prime Network are installed as part of the suite, you can view additional device details from Prime Network for Carrier Packet Transport (CPT) NE.

To launch Prime Network from these NEs:

Step 1 From the Domain Explorer, right-click the **CPT NE**.

Step 2 Select **Network > Device Details**. You should now be able to view additional device details using Prime Network.

1.3 What's New in Prime Optical 9.6.3

The following table describes changes and enhancements in Prime Optical 9.6.3.

Table 1-1 New Features in Prime Optical 9.6.3

Feature Update	Description	For More Information, See...
Installation Enhancements		
Installation Procedure	The procedure to install Prime Optical has been streamlined.	Cisco Prime Optical 9.6.3 Installation Guide
Ability to uninstall unsuccessful installations	You can uninstall Prime Optical even if your previous installation was unsuccessful or incomplete. The uninstaller will remove all changes made to the system.	Cisco Prime Optical 9.6.3 Installation Guide
Third-party tools	The following third-party tools have been upgraded for Prime Optical R9.6.3: • Apache 2.2.23 • Java 7	Cisco Prime Optical 9.6.3 Installation Guide
Ability to install Prime Optical on RHEL 6.2	You can install and run the Prime Optical server and client on the Red Hat Linux 6.2, 64-bit operating system.	Cisco Prime Optical 9.6.3 Installation Guide
Ability to install Prime Optical 9.6.3 on your home directory	You can install Prime Optical 9.6.3 on your home directory.	—
Server/Client Platform Enhancements		
Added support for external authentication on TACACS+ servers	Prime Optical 9.6.3 supports external authentication on TACACS+ servers.	Cisco Prime Optical 9.6.3 Basic External Authentication
Optical Enhancements		
Ability to manage the AR_XPE card	The AR_XPE card is an enhanced version of the AR_XP card. New functionality includes the following features: • Support for new ODU0 multiplexing for 1GE and 1GFC payloads. • Support for new ODU0 payload mapping during OCHCC circuit creation. • Addition of RMON thresholds for 10GE and 4GFC payloads. • Bandwidth utilization panel to show ODU0 slices. • Support for new ODUK port mapping.	• C.2.45 Slot Properties—AR_MXP, AR_XP and AR_XPE, page C-588 • 7.2.3.8 Creating a DWDM OCHCC—ONS 15454 MSTP, page 7-72 • Appendix E, "Performance Data"

Table 1-1 New Features in Prime Optical 9.6.3 (continued)

Feature Update	Description	For More Information, See...
Support for 100G_LC_C, 10x10G_LC, and CFP_LC cards	Prime Optical includes the following new functionality for the 100G_LC_C, 10x10G_LC, and CFP_LC cards: • GCC communication channel support. • Payload support for 10x10G_LC. • OTU4 payload support for 100G_LC_C. • Physical PM support on 100G_LC_C. • FAN-OUT and LOW-LATENCY operating mode for 10x10G_LC. • The following protection mechanism for the cards: – Y-Cable protection for 1x100G and 2x40G clients for CFP_LC. – Y-Cable protection for all supported payloads in 10x10G Muxponder and TXP_10G Transponder mode for 10x10G_LC. • Proactive Protection Regen tab for 100G_LC_C card.	• C.2.46 Slot Properties—10x10G_LC, 100G_LC_C, and CFP_LC, page C-621 • 6.5.9 Create, Edit, and Delete GCC, page 6-17
	Supports the operating mode setting. You can perform the following operations: • Create or delete an operating mode. • Add or remove a peer card.	• 6.5.7 Creating Configurations, page 6-14 • 6.5.8 Adding a Peer Card, page 6-17

Table 1-1 New Features in Prime Optical 9.6.3 (continued)

Feature Update	Description	For More Information, See...
GUI and Prime Optical GateWay/CORBA support for 15216-FBGDCU-XXX and 15216-MD-48 modules	Prime Optical provides the following new functionality: • GUI and Prime Optical GateWay/CORBA support for internal patch cord and link management for the 15216-FBGDCU-XXX modules. The passive units are: – 15216-FBGDCU-165-XXX – 15216-FBGDCU-331-XXX – 15216-FBGDCU-496-XXX – 15216-FBGDCU-661-XXX – 15216-FBGDCU-826-XXX – 15216-FBGDCU-992-XXX – 15216-FBGDCU-1157-XXX – 15216-FBGDCU-1322-XXX – 15216-FBGDCU-1653-XXX – 15216-FBGDCU-1983-XXX • Prime Optical GateWay/CORBA support for new card management on 15216-MD-48 modules. The passive units are: – 15216-MD-48-ODD – 15216-MD-48-EVEN – 15216-MD-48-CM	Appendix B, "NE Explorer Information"
New Side Monitoring tab	A new Side Monitoring tab under the Provisioning tab of the node properties pane is shown for the following NEs: • ONS 15454 SONET NE Explorer • ONS 15454 SDH NE Explorer	Appendix B, "NE Explorer Information"
Support for GMPLS restoration	Prime Optical supports the following new functionality for GMPLS circuits: • Ability to provision the Restoration and Revert operations during WSON circuit creation. • Ability to modify the Restoration and Revert operations after WSON circuit creation. • Ability to manage the Restoration and Revert operations on created WSON circuits.	• 7.2.27 Restoration of GMPLS Circuits, page 7-190 • 7.2.3.7 Creating a DWDM OCHNC—ONS 15454 MSTP, page 7-67 • 7.2.3.8 Creating a DWDM OCHCC—ONS 15454 MSTP, page 7-72 • 7.2.3.9 Creating a DWDM OCH Trail Circuit—ONS 15454 MSTP, page 7-76 • 7.2.2 Viewing the Circuit Table, page 7-4

Table 1-1 New Features in Prime Optical 9.6.3 (continued)

Feature Update	Description	For More Information, See...
New WSON tab	A new WSON tab has been added to the **NE Explorer** > **Provisioning** > **DWDM** node properties pane, for ONS15454 NEs to manage alarms that caused GMPLS circuit restoration. You can do the following: • Proceed to affected circuits • Perform alarms acknowledgement	Appendix B, "NE Explorer Information"
Support for multiple deletions in the RMON Thresholds tab	You can perform multiple deletions of the RMON thresholds for the 100G_LC, 10x10G_LC, AR_XP, and AR_MXP cards.	• C.2.46 Slot Properties—10x10G_LC, 100G_LC_C, and CFP_LC, page C-621 • C.2.45 Slot Properties—AR_MXP, AR_XP and AR_XPE, page C-588
Ability to support Ingress Rate Limit to the CVLAN profile	Prime Optical 9.6.3 supports Ingress Rate Limit to the CVLAN profile for the 10GE_XP card.	7.7 Managing SVLAN Profiles, page 7-221
Support for Protection Operations	Prime Optical supports the new Link Maintenance Report, including the following new functionality on the OCHCC, OCHNC, and OCH Trail circuits: • Display the list of protected circuits • Display the active path on the link • Perform protection switch operations	• 7.2.3.8 Creating a DWDM OCHCC—ONS 15454 MSTP, page 7-72 • 7.2.3.9 Creating a DWDM OCH Trail Circuit—ONS 15454 MSTP, page 7-76 • 7.2.3.7 Creating a DWDM OCHNC—ONS 15454 MSTP, page 7-67 • 3.6.8 Viewing the Link Maintenance Report, page 3-46
New Alarm Conditions tab	A new Alarm Conditions tab under the Provisioning tab of the node properties pane is shown for the NEs.	Appendix B, "NE Explorer Information"
CRS-1/3 platform managed as a CRS NE	In Prime Optical 9.6.3, the CRS-1/3 platform is managed as a CRS NE.	Appendix B, "NE Explorer Information"
Ability to search for circuits	You can perform a global or contextual search for circuits in Prime Optical 9.6.3.	• 3.8.7 Searching for Circuits • 7.2.28 Circuit Reports
Ability to highlight circuits	Prime Optical 9.6.3 allows you to highlight NEs, links, and groups that are connected by a particular circuit.	3.8.7 Searching for Circuits
New Circuit Report	The new circuit report allows you to view the source and destination termination points of a circuit.	7.2.28 Circuit Reports
Link Attributes	Prime Optical 9.6.3 allows you to: • View the DWDM side of a link on the network map. • Set the refresh interval for links.	3.8.5 Configuring the Network Map View

Table 1-1 New Features in Prime Optical 9.6.3 (continued)

Feature Update	Description	For More Information, See...
Spans Report	You can view and export data from a dockable Spans report for a circuit.	7.2.28.6 Viewing the Spans Report
New NE Domain table	You can view the new NE domain table and do the following: • Change NE state • Open NE Explorer • Open Domain Explorer • Open Equipment Inventory Table • Set (Robust) PM Collection State	11.2 Domain NE Table
Features Removed		
Tabs in the Logging Properties pane	The following tabs have been removed from **Control Panel** > **Logging Properties** pane: • Logging Properties tab and all of its subtabs: – General tab – SNMP Trap Service Debug tab – Basic Service Debug tab • Net Service Debug tab and NE Service subtab • Debug tab and PM Service subtab	—
Cisco Aggregation Services Router 9000 (ASR 9K) NE	Prime Optical 9.6.3 does not support ASR 9K NE.	

1.4 Key Functionality

Prime Optical provides the following key functionality:

- Integrated IP, SONET, SDH, Ethernet, and DWDM management in a single scalable platform.
- An intuitive Java-based GUI that provides a native “look-and-feel” on both Microsoft Windows and Sun Solaris client platforms.
- User-defined domain explorer network views with “bubble-up” alarm severity propagation and drill-down capabilities to isolate fault conditions and service-delivery impact.
- Geographic network maps and explorer views that reflect the physical layout and configuration of the network.
- Alarm Browser and Alarm Log views that provide a robust listing of all current and historical alarms and events.
- A desktop-resident dashboard that provides alarm status for the Prime Optical user’s entire span of control with quick access to the Domain Explorer and the Alarm Browser.
- Real-time network surveillance with configurable popup alarm and event notifications.
- Real-time shelf views with full alarm and operational status indicators.

- Automated configuration backup with manual restore capabilities, plus remote software download capability across the entire network domain.
- GUI-based NE configuration.
- Integrated A-to-Z circuit provisioning.
- Integrated Layer 2 (L2) topology and service provisioning.
- Extensive performance monitoring (PM) statistics collected across the SONET/SDH, DS-1/E1, DWDM, Ethernet, and Cisco IOS interfaces available for display or export.
- Custom profiles that can be used to grant separate permissions for each Prime Optical operation.
- Comprehensive security management that provides flexible user access.
- Northbound EMS-to-NMS interface mediation through Prime Optical GateWay/CORBA and Prime Optical GateWay/SNMP. Prime Optical GateWay allows service providers to integrate Prime Optical with their OSSs by using open, standard interfaces.
- CORBA fault and inventory integration with Cisco Info Center.
- Extensive, intuitive online help.

1.5 Key GUI Components

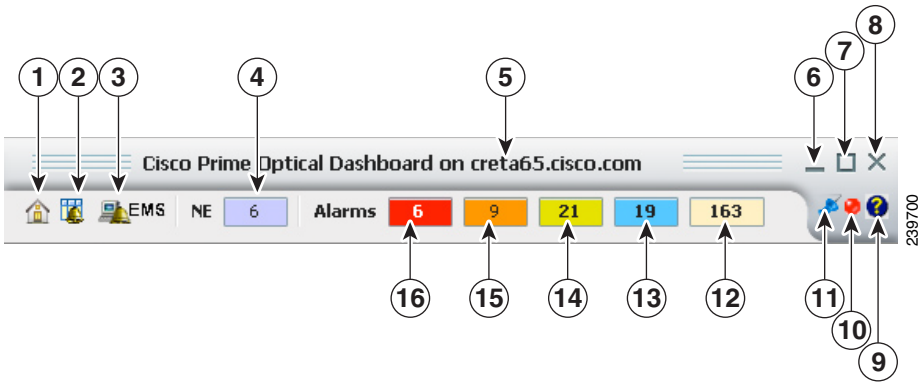
This section describes the following key components in the Prime Optical GUI:

- 1.5.1 Dashboard, page 1-9
- 1.5.2 Domain Explorer, page 1-11
- 1.5.3 Subnetwork Explorer, page 1-24
- 1.5.4 Alarm Browser, page 1-27
- 1.5.5 Alarm Log, page 1-28
- 1.5.6 Network Map, page 1-28
- 1.5.7 NE Explorer, page 1-30
- 1.5.8 Control Panel, page 1-33

1.5.1 Dashboard

The Dashboard shows useful alarm and NE information in one easily accessible location.

Figure 1-2 Prime Optical Dashboard



1	Layers the Domain Explorer window as the top active window. The Domain Explorer is the Prime Optical home window.
2	Opens the Alarm Browser window; this highlights NE-specific critical, major, minor, and warning alarms.
3	Opens the Alarm Browser window, filtered to show all EMS alarms in the domain. This toolbar icon is enabled only if you have read/write permission for the Show EMS Alarms/Events operation.
4	Lists the total number of NEs in the domain. Click the counter to open the Domain NE table, which provides an inventory of NEs within the selected management domain.
5	Displays the server name. If the server name string contains fewer than 16 characters, the entire name is displayed. If the server name is longer than 16 characters, the first 14 characters display, followed by an ellipsis (...). The tooltip displays the full server name, regardless of length, and the IP address.
6	Minimizes all Prime Optical windows, except for the Dashboard window itself.
7	Restores all minimized Prime Optical windows.
8	Closes the Dashboard.
9	Displays online help for the Dashboard.
10	Indicates a change in Prime Optical status, including: • New alarms have occurred on NEs in the domain • New NEs have been added to the domain • Connectivity status has changed When a change in Prime Optical status occurs, the font changes from plain to **bold** in the affected alarm count boxes. Click the Status has Changed tool to acknowledge the status change. The tooltip toggles to No Change in Status and the font returns to plain, which indicates that you acknowledged the status change.
11	If you click the pin icon, the Dashboard window is *pinned down*, meaning that it is not brought to the foreground by default. If you click the pin icon again, the Dashboard window is *pinned up*, meaning that it is brought to the foreground each time an update occurs (alarm counts change, NE count changes, and so on).
12	Lists the number of unacknowledged alarms in the domain. The alarm count includes unacknowledged alarms on NEs and on the EMS. Click the counter to open the Alarm Browser window, filtered to show all unacknowledged alarms.
13	Lists the number of warning alarms in the domain. The alarm count includes warning alarms on NEs and on the EMS. Click the counter to open the Alarm Browser window, filtered to show all warning alarms.

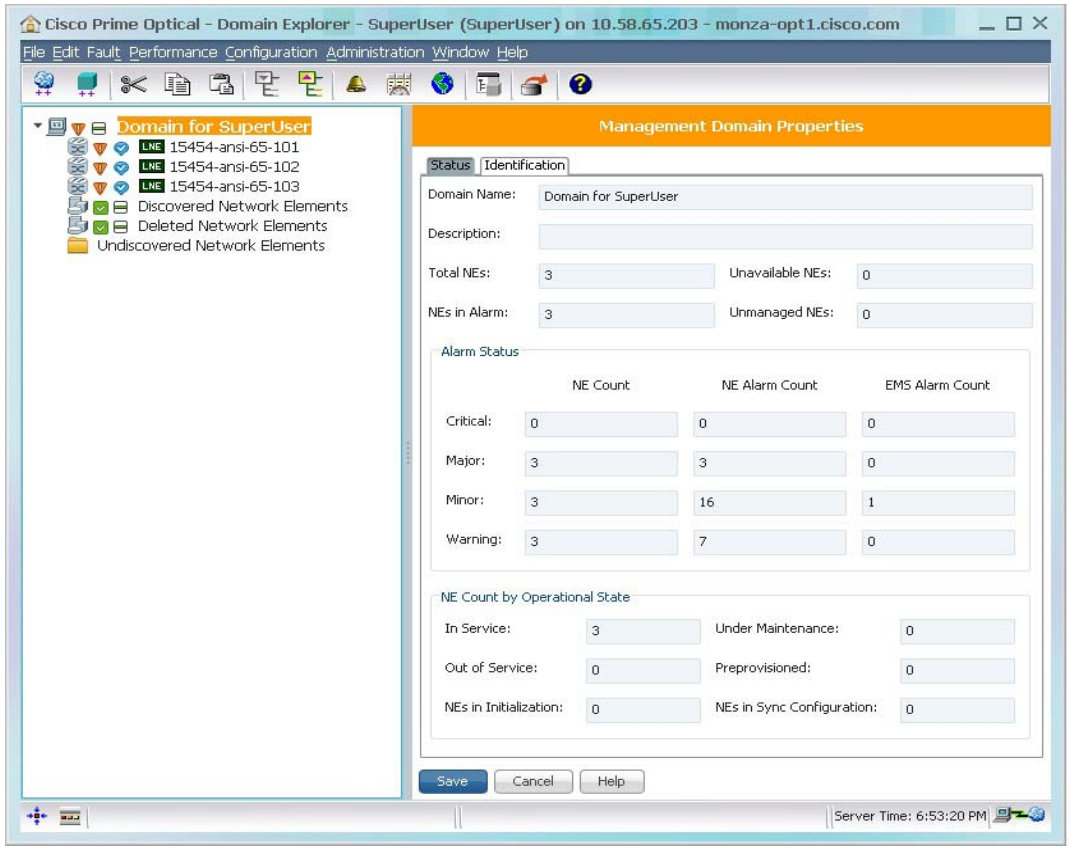
14	Lists the number of minor alarms in the domain. The alarm count includes minor alarms on NEs and on the EMS. Click the counter to open the Alarm Browser window, filtered to show all minor alarms.
15	Lists the number of major alarms in the domain. The alarm count includes major alarms on NEs and on the EMS. Click the counter to open the Alarm Browser window, filtered to show all major alarms.
16	Lists the number of critical alarms in the domain. The alarm count includes critical alarms on NEs and on the EMS. Click the counter to open the Alarm Browser window, filtered to show all critical alarms.

Note A single mouse click is all that is required for Dashboard operations. If you double-click an object, Prime Optical launches two instances of the object. For example, if you double-click the Open Alarm Browser icon, Prime Optical opens two Alarm Browser windows.

1.5.2 Domain Explorer

The Domain Explorer window opens when you log into Prime Optical. The Domain Explorer is the Prime Optical home window and provides a logical view of the network plus alarm, connectivity, and operational status. To log out of Prime Optical, choose **File > Exit** from the Domain Explorer window.

Figure 1-3 Domain Explorer



The Domain Explorer window is divided into two sections: the topology tree and the properties pane. The topology tree on the left side of the window consists of a management domain, groups, and NEs, which are displayed in a hierarchical format. You can drag and drop NEs to reposition them in the topology tree. The properties pane on the right side of the window shows detailed information about the object that is selected in the topology tree.

Tip See Appendix A, "Icons and Menus Displayed in Prime Optical" for an explanation of the Domain Explorer legend and icons.

By default, the Domain Explorer contains the following groups that are visible to SuperUser and NetworkAdmin users only:

- Discovered Network Elements—Contains NEs that have been automatically discovered by the Prime Optical server. Autodiscovered NEs are added to the Discovered Network Elements group by default, and Prime Optical starts managing them automatically. See 3.9 How Do I Discover the Network for Optical Devices?, page 3-63 for more information on Prime Optical's discovery process.
- Deleted Network Elements—Contains NEs that have been deleted. An NE appears in this group only when the last instance of that NE has been deleted.
- Undiscovered Network Elements—Contains basic data about NEs that have been manually discovered but are not currently managed. Undiscovered NEs are connected to NEs that are managed by a network service.

Note
- The Discovered Network Elements, Deleted Network Elements, and Undiscovered Network Elements groups cannot be deleted or renamed.
- The server time is displayed on the lower-right side of the Domain Explorer window. The server name is displayed in the Domain Explorer title bar.

For information about populating the Domain Explorer with new groups, gateway NEs (GNEs), or NEs, see Chapter 3, "Building the Network."

The Domain Explorer has three properties panes: Management Domain Properties, Group Properties, and Network Element Properties.

1.5.2.1 Management Domain Properties

The Management Domain Properties pane displays information about the management domain that is currently selected in the Domain Explorer or Subnetwork Explorer tree. The Prime Optical management domain consists of all the NEs managed by the Prime Optical server where the Prime Optical client connects.

The management domain can also contain groups or subnetworks that give you the flexibility to subdivide the domain you are monitoring. For example, a group or subnetwork can represent all NEs within a geographical location.

To display all first-level nodes under the management domain, click the expand icon next to the management domain name in the topology tree. If any of the groups, subnetworks, or NEs have an alarm condition, an icon representing that condition is displayed next to the management domain name.

The Management Domain Properties pane has two tabs: Status and Identification.

1.5.2.1.1 Status Tab

The following table describes the Status tab fields.

Table 1-2 Field Descriptions for the Status Tab

Field	Description
Domain Name	User-defined name of the management domain.
Description	User-defined description of the management domain.
Total NEs	Total number of NEs within the management domain.
Unavailable NEs	Number of NEs within the management domain that Prime Optical cannot currently connect to.
NEs in Alarm	Total number of NEs within the management domain that have an active alarm.
Unmanaged NEs	Total number of unmanaged NEs within the management domain.
Alarm Status	Total number of NE and EMS alarms by severity. In addition, this field lists how many of the total NEs with active alarms are experiencing a critical, major, minor, or warning alarm. **Note** If the same NE is experiencing more than one type of alarm simultaneously, that NE is counted for each severity level.
NE Count by Operational State	Total number of NEs within the management domain according to operational state: • In Service: The NE is currently deployed and requires monitoring. • Out of Service: The NE has been marked Out of Service and does not require monitoring. • NEs In Initialization: The NE is initializing, and you can do the following: – Open the NE Explorer in display-only mode if the NE has been discovered at least once – Open the Alarm Browser and Alarm Log – Open the PM tables You cannot provision circuits or links. The NE is not listed in the available NEs as the source or destination of a circuit. • Under Maintenance: The NE is temporarily under maintenance but requires monitoring. • Preprovisioned: The NE has been added to the database for provisioning but is not yet in service. • NEs in Sync Configuration: The NE is in Sync Configuration state, and you can do the following: – Provision circuits and links – Open the Alarm Browser and Alarm Log – Open the PM tables You cannot open the NE Explorer, but the discovery process of the NE is prioritized over the other NEs.

1.5.2.1.2 Identification Tab

The following table describes the Identification tab fields.

Table 1-3 Field Descriptions for the Identification Tab

Field	Description
Domain Name	Name of the management domain.
Description	Description of the management domain.
EMS ID	EMS ID.
Server	Name or IP address of the Prime Optical server to which the user is connected.
Vendor Name	Vendor name.
Software Version	Prime Optical release that is running.

Note See Table 1-22 for the descriptions of the actions that you can perform using the buttons at the bottom of the window.

1.5.2.2 Group Properties and Network Partition Properties

The Group Properties pane or Network Partition Properties pane displays information about the group or network partition that is currently selected in the topology tree. The Group Properties pane is part of the Domain Explorer; the Network Partition Properties pane is part of the Subnetwork Explorer.

A group consists of other groups or NEs. Groups give you the flexibility of subdividing the management domain you are monitoring. For example, a group can represent all NEs within a geographical location.

A network partition is a group of subnetworks or a group of NEs that is managed by the same NE service. Different network partitions mean different NE services. For information about NE services, see 4.5.3 Viewing and Modifying NE Service Properties, page 4-67.

Click the expand icon next to a group or network partition in the topology tree to view the objects that are assigned to that group or network partition. The same group or network partition can have multiple instances in the topology tree. The contents of all instances of a group or network partition are always the same. Any changes to one instance of a group or network partition will be reflected in all instances of that group or network partition.

You can add and delete groups or network partitions; however, the option to delete a group or network partition is not available until all objects are removed from the group or network partition. If the group or network partition has multiple instances in the topology tree, you can delete all but the last instance of the group or network partition.

The Group Properties or Network Partition Properties pane has two tabs: Status and Identification.

1.5.2.2.1 Status Tab

The following table describes the Status tab fields.

Table 1-4 Field Descriptions for the Status Tab

Field	Description
Group ID/Network Partition ID	User-defined name of the selected group or network partition.
Description	User-defined description of the selected group or network partition.
Total NEs	Total number of NEs within the selected group or network partition.
Unavailable NEs	Number of NEs within the selected group or network partition that the Prime Optical server cannot currently reach.
NEs in Alarm	Total number of NEs within the selected group or network partition that currently have an active alarm.
Unmanaged NEs	Number of NEs within the selected group or network partition that are currently unmanaged.
Alarm Status	Total number of alarms within the selected group or network partition, by severity. In addition, this field lists how many of the total NE alarms have a critical, major, minor, or warning status. If the same NE experiences more than one type of alarm simultaneously, that NE is included in the count for each severity level.
NE Count by Operational State	Total number of NEs within the selected group or network partition according to operational state. There are four states: • In Service • Under Maintenance • Out of Service • Preprovisioned Also shows the number of NEs within the selected group or network partition that are initializing or synchronizing their configuration.

1.5.2.2.2 Identification Tab

The following table describes the Identification tab fields. Only users with the appropriate user access profile can edit these fields.

Table 1-5 Field Descriptions for the Identification Tab

Field	Description
Group ID/Network Partition ID	Unique user-defined name of the selected group or network partition.
Description	User-defined description of the selected group or network partition.
Location Name (*not applicable to network partitions*)	User-defined geographic location of the selected group.

Note See Table 1-22 for the descriptions of the actions that you can perform using the buttons at the bottom of the window.

1.5.2.3 Network Element Properties

The Network Element Properties pane displays information about the NE that is currently selected in the tree. An NE represents a Cisco ONS 15216, ONS 15305, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15454-M2, ONS 15454-M6, ONS 15530, ONS 15540, ONS 15600 SONET, ONS 15600 SDH, or unmanaged/other vendor node.

The same NE can have multiple instances in the tree. The contents of all instances of the same NE are always the same. Any changes to one NE instance are reflected in all instances of that NE. Regardless of the number of instances an NE has in the tree, you can delete one or all instances of that NE. When the final instance of an NE is deleted, the deleted NE moves to the Deleted Network Elements group.

The Network Element Properties panes for most NEs have the following tabs: Status, Identification, Address, NE Authentication, and TL1 Tunnel. The NE Properties pane for passive NEs has only one tab: Identification.

1.5.2.3.1 Status Tab

The following table describes the fields in the Status tab. Display-only fields have a gray background.

Table 1-6 Field Descriptions for the Status Tab

Field	Description
NE ID	Name of the selected NE.
Description	Information that a user entered to describe the NE.
NE Model	Model of the selected NE.
Alarm Status	Total number of critical, major, minor, and warning alarms currently existing on the selected NE.
Communication State	Current communication state of the selected NE. Communication states can be one of the following: • Available • Unavailable • Not Applicable • Initialization Failed
Operational State	Current operational state of the selected NE. You can change the operational state.

Table 1-6 Field Descriptions for the Status Tab (continued)

Field	Description
PM Collection (*not applicable to the ONS 15216*)	15 Min/1 Day: Check the **15 Min** check box to enable 15-minute PM data collection. Check the **1 Day** check box to enable 1-day PM data collection. By default, PM data collection is disabled for both 15-minute and 1-day options.
	15 Min Robust/1 Day Robust: If the 15 Min check box is checked and the NE supports robust PM collection, you can check the **15 Min Robust** check box to enable robust PM collection. If the 1 Day check box is checked and the NE supports robust PM collection, you can check the **1 Day Robust** check box to enable robust PM collection. Robust PM collection is performed according to the selected PM collection state when the NE or server is available. **Note** You cannot collect robust PM data until at least one 15-minute or one 1-day interval has been collected in normal operation. Robust PM data collection applies only to CTC-based NEs[1] and to the ONS 15305, ONS 15530[2], ONS 15540 ESP[3], and ONS 15540 ESPx[2] NEs. Robust PM data collection is not supported for the ONS 15216.
Audit Trail State (*applicable to CTC-based NEs*)	Whether the audit trail collection is enabled or disabled. You can change the setting. Audit trail collection is disabled by default. **Note** The CTC-based ONS 15305 R3.0 does not support audit trails.

1. For CTC-based NEs, you can collect up to 8 hours of 15-minute robust PM data and up to the previous day's 1-day robust PM data.
2. For ONS 15530 and ONS 15540 ESPx NEs, you can collect up to 24 hours (96 previous missed intervals) of 15-minute robust PM data and up to the previous day's 1-day robust PM data.
3. For ONS 15540 ESP NEs, you can collect up to 24 hours (96 previous missed intervals) of 15-minute robust PM data.

1.5.2.3.2 Identification Tab

The following table describes the fields in the Identification tab. Display-only fields have a gray background. Fields displayed vary by NE type.

Table 1-7 Field Descriptions for the Identification Tab

Field	Description
NE ID	Name of the selected NE.
Alias	Alias name of the selected NE.
Description	Information that a user entered to describe the NE.
NE Model	Model of the selected NE.
NE Type	Type of NE.
Vendor Name	Vendor name.
Software Version	Software version that is running on the NE.

Table 1-7 Field Descriptions for the Identification Tab (continued)

Field	Description
Version Name	String name tag that identifies the NE and the associated software version. The version name that is displayed is dependent on the software version. If the software version is: • Unsupported—The value displayed is "**Unsupported**." • Supported: – Version manually added—The value displayed is the version name used by Prime Optical to manage the NE. This value is available in the Supported NE table that is specific to the custom version name. – Version not manually added—The value displayed is the version name as available in the NE Supported table. For more information see, Table 4-13.
Location Name	Geographic location of the selected NE.

1.5.2.3.3 Address Tab

The following table describes the fields in the Address tab.

Table 1-8 Field Descriptions for the Address Tab

Field	Description
NE ID	Name of the selected NE.
Description	Information a user entered to describe the NE.
NE Model	Model of the selected NE.
Active IP Address	IP address of the GNE. If the node is a GNE or LAN-connected network element (LNE), the active IP address is the IP address that Prime Optical is currently using to connect to the NE. GNEs have an IPv6 active IP address only if Prime Optical connects to them using an IPv6 protocol. All end network elements (ENEs) have an IPv6 active IP address if their GNE is connected to Prime Optical with IPv6. This information is calculated on a theoretical projection, which does not necessarily equate to a real network situation. For tunnel NEs (TNEs)—NEs reachable through a TL1 connection—this field displays the IP address of the non-Cisco GNE. Prime Optical can connect to a TNE that belongs to an Open System Interconnection (OSI) network behind a non-Cisco GNE.
NE IPv4 Address	IPv4 address of the NE. Prime Optical tries to connect to the NE using an IPv4 address. If the IPv4 address is unreachable, Prime Optical tries to connect to the NE using its IPv6 address, if configured and reachable. **Note** The NE IPv4 Address field is dimmed when the NE is in service. If the node is a TNE, this field displays the IP address of the TNE in the network that connects the TNE with its ENEs. You cannot edit the NE IP address for TNEs, even if the TNE is marked as Out of Service.

Table 1-8 Field Descriptions for the Address Tab (continued)

Field	Description
NE IPv6 Address	IPv6 address of the NE. If the IPv6 address is unreachable, Prime Optical tries to connect to the NE using its IPv4 address. **Note** If IPv6 is not configured on the NE, the IP address 0:0:0:0:0:0:0:0 is shown. The NE IPv6 Address field is dimmed when the NE is in service.
SNMP Community String (*not available for all NEs*)	Community string name used in SNMP messages. You must provide the community string name to give the user SNMP read access to the device. **Note** This field is displayed only for ENE devices. This field is unavailable or not displayed if it does not apply to the selected NE. For ONS 155xx NEs, you specify the community string in the SNMP Community String table (**Administration > Community String Table**). The ONS 15216 EDFA2 uses the community string "private." Automatic addition of an entry in the SNMP Trap Destination table requires read/write access (RWA).
GNE ID	*Display only.* ID for the GNE. **Note** The GNE/ENE association is determined automatically by the Prime Optical server. If an ENE references a GNE and that GNE is reconfigured to no longer proxy for the ENE, the GNE ID for that ENE is left blank.
Subnetwork ID	Subnetwork ID for the selected NE.
Network Partition ID	Network partition ID for the selected NE. **Note** SONET and SDH NEs cannot be added to the same network partition.

1.5.2.3.4 NE Authentication Tab

The NE Authentication tab allows you to specify usernames and passwords for the Prime Optical server and command-line interface (CLI) connections to the selected NE. The following table describes the fields in the NE Authentication tab. Fields shown depend on the type of NE selected; the field is unavailable or not displayed if it does not apply to the selected NE.

Table 1-9 Field Descriptions for the NE Authentication Tab

Field	Description
Server - SNMP Connection	
SNMP Protocol	Specify the SNMP protocol from the drop-down list. Values are: • Default—When selected, Prime Optical uses the global defaults set in the Control Panel > Security Properties pane for SNMPv3. • SNMPv1/v2—Select this option to use SNMP version 1 or version 2. • SNMPv3—Select this option to use SNMP version 3.
Username	Username of a Prime Optical user enabled for SNMPv3 communication. When you add the NE, use the wizard to set parameters for the SNMPv3 user.
Authentication Protocol	Choose the authentication protocol to use for authenticating the user. Values are None, MD5 (the default), or SHA.

Table 1-9 Field Descriptions for the NE Authentication Tab (continued)

Field	Description
Authentication Password	Enter the password that the OSS client uses to log into the Prime Optical server. The password must contain: • From 1 to 12 characters • At least one special character other than an apostrophe (') • At least two letters (A-Z, a-z), including at least one uppercase letter • At least one number (0-9) **Note** Regardless of the actual length of the password, the Password and Confirm Password fields display only a fixed-length string of 15 asterisks (*).
Confirm Authentication Password	Re-enter the password to confirm it.
Privacy Protocol	Specify the protocol to use for communicating the value of the SHA or DES fields. Select the privacy protocol for the NBI user. You can choose one of the following: • NONE—No privacy protocol for the user. • DES—Use Data Encryption Standard (DES) for encryption.
Privacy Password	Enter the password used to decrypt the message payload. Use this password if the Prime Optical user encryption mode for communication is NONE or DES.
Confirm Privacy Password	Re-enter the privacy password to confirm it.
Server - NE Connection[1]	
Username	Username that the Prime Optical server uses to connect to NEs.
Password	Password to use for Prime Optical server-to-NE connections.
Confirm Password	Re-enter the password to confirm it.
CLI Connection[2]	
Username	Username to use for CLI-to-NE connections.
Password	Password to use for CLI-to-NE connections.
Confirm Password	Re-enter the password to confirm it.

1. This field applies to NEs that have a TL1 interface and are provisioned through TL1 (for example, the ONS 15216 EDFA2, EDFA3, and OADM).
2. This field applies to NEs that have a CLI and are provisioned through CLI.

1.5.2.3.5 TL1 Tunnel Tab

The TL1 Tunnel tab is available only for TNEs (NEs reachable through a TL1 connection) and allows you to specify TNE settings. Prime Optical can connect to a TNE that belongs to an OSI network behind a non-Cisco GNE. The following NE models support TL1 tunnels: ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH.

The following table describes the fields in the TL1 Tunnel tab. All fields are dimmed (with a gray background) when the TL1 tunnel is open, and when the NE is marked as In Service or Under Maintenance.

Table 1-10 Field Descriptions for the TL1 Tunnel Tab

Field	Description
TL1 Encoding Mode	TL1 encoding mode: • LV + Base64 Payload—(Default) If selected, TL1 port 3081 is used. • LV + Binary Payload—If selected, TL1 port 3081 is used. • Raw—If selected, TL1 port 3082 is used.
Port	Port number used to support the TL1 tunnel.
GNE Connection Area	
GNE Login Required	• If checked, a GNE login is attempted whenever the TL1 tunnel is opened. The login uses the specified GNE TID, username, and password. • If unchecked, the GNE TID, Username, Password, and Confirm Password fields are dimmed (but their contents are not cleared); no login is attempted to the GNE.
GNE TID	Value that must be entered if a GNE login is required.
Username	Username that the Prime Optical server uses to connect to TNEs.
Password	Password to use for Prime Optical server-to-TNE connections.
Confirm Password	Re-enter the password to confirm it.
Gateway TL1 Port	Port that the TL1 gateway uses to connect to the non-Cisco GNE. The port depends on the type of NE that is being used as the non-Cisco GNE. You can edit the port number.

Note Regardless of the actual length of the password, the Password and Confirm Password fields display only a fixed-length string of 15 asterisks (*).

Note See Table 1-22 for the descriptions of the actions that you can perform using the buttons at the bottom of the window.

1.5.2.4 Undiscovered Network Elements

The Undiscovered Network Elements pane displays information about NEs that are not yet managed by a network service. These NEs are discovered using Manual discovery mode. You can get details for undiscovered NEs through the managed NEs to which they are connected. Details are limited by the type of links that exist between the NEs.

Table 1-11 Field Descriptions for the Undiscovered Network Elements Pane

Field	Description
Discovery State Area	

Discovery State	Displays the current state of the undiscovered NEs. Values are:
	• Idle—No discovery has been initiated on the NEs.
	• In progress—The discovery is in progress. The values within parentheses indicate the start date and time of the discovery process.
	• Completed—The discovery process is complete. The values within parentheses indicate the date and time of the completion of the discovery process.
	• Partially completed—The discovery process is incomplete for some NEs.
	• Canceled—The discovery operation has been canceled.
	• Failed—The discovery operation failed.
	To initiate a new discovery session, click the **Start Discovery** button. The Select Network Partitions dialog box opens. The dialog box displays the available network partitions, the number of NEs present, and the threshold. Select one or more network partitions from the list. You must have at least one network partition (in manual mode) to be able to start the discovery process. To launch the Select Network Partitions dialog box, you need at least two network partitions, both in manual mode. You will receive the following message if you do not have at least two partitions:
	`There are no network partitions available to run the discovery.`
	The Start Discovery button is disabled if a discovery session is already in progress. The following message is displayed if the another discovery, initiated through a different session, is in progress:
	`Another discovery is running. Try again later.`
	To add the undiscovered NEs to a specific network partition, click **Add Undiscovered Network Elements**. The Add Undiscovered NEs wizard opens. You can also add undiscovered NEs by doing one of the following:
	• Right-click **Undiscovered Network Elements** in the left pane; then, click **Add Undiscovered Network Elements**.
	• Choose **Administration > Add Undiscovered NEs**.

Discovery Overview Area	
SONET NEs	Displays the number of SONET NEs that are unmanaged.
SDH NEs	Displays the number of SDH NEs that are unmanaged.
Undefined NEs	If Prime Optical has only the IP address of the discovered NE, it cannot classify the NE as SONET or SDH. In such cases, the NE is marked as Undefined. This display-only field shows the number of undefined NEs that are unmanaged.

1.5.2.5 Add Undiscovered NEs Wizard

The Add Undiscovered NEs wizard allows you to add the manually discovered NEs to network partitions. Using the wizard, you can filter NEs based on various parameters and add them to the network partition. The wizard is divided into three sections: a pane displaying the undiscovered NEs, the Selected NEs pane, and a pane with the details of an NE selected in the undiscovered NEs pane.

Undiscovered NEs Pane

The right pane displays the list of undiscovered NEs, along with the following details:

- IP address
- NE model
- NE role

To view the details of an NE, select the NE. The details are displayed in the table.

Note IPv6 Connection Type is available only if IPv6 connectivity is present between Prime Optical and the NE. Otherwise, the connection type is marked as Unknown.

Selected NEs Pane

The Selected NEs pane displays the undiscovered NEs that have been selected to be added to a network partition. To add NEs to the list, click the right arrow (**>**). To move the NEs back to the undiscovered NEs pane, click the left arrow (**<**).

Filtering NEs

You can filter the displayed NEs by choosing one of the following options from the toolbar:

- IP Address—Click the filter icon to specify an IP address. The Undiscovered NE Filter dialog box opens. Enter an IP address or an asterisk (*) as a wildcard; then, click **Apply**. The filter changes to green when IP address filtering begins. Alternatively, choose **File > Filter** and enter the IP address.
- IP Version—Select IPv4 or IPv6.
- NE Model—Select an NE model. The NE model is unknown if you filtered by IP address only. The following message appears if you try to add an NE of an unknown model type to the Selected NEs list:

  ```
  Make sure that the selected entries refer to the same model type.
  ```

- Family Type—Select a family from the available list. The family type NE model is unknown if you filtered by IP address only.

The following message appears if you try to change a filtering parameter when nodes are present in the Selected NEs list:

```
This will clear the current selection. Click OK to apply the change. Click Cancel to
retain the selection.
```

The status bar at the bottom of the window shows the number of NEs currently displayed out of the total available NEs.

You can also do the following:

- Export Data—The Export dialog box allows you to export data as comma-separated values (CSVs) or tab-separated values (TSVs). To export data, choose **File > Export**. For more information, see 1.6.7 Exporting Data, page 1-41.

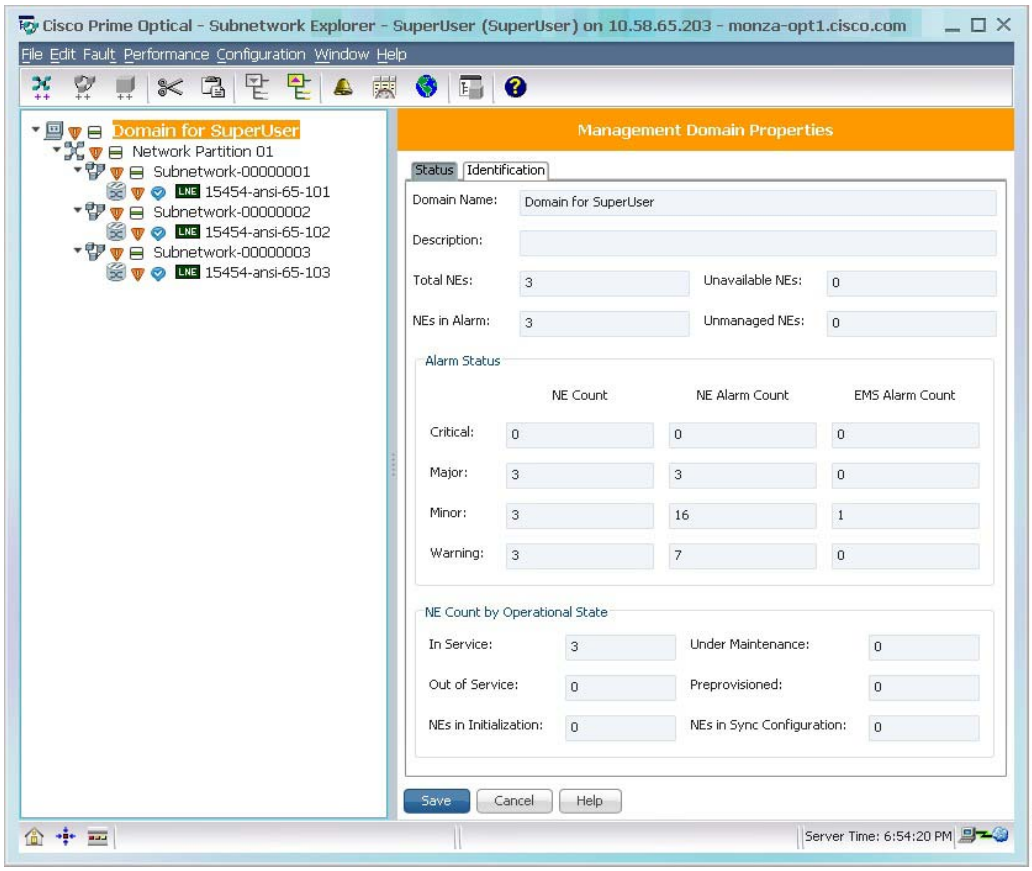
- Create HTML Report—Allows you to generate an HTML report based on the data in the table. Choose **File > HTML Report**. You can generate a report for selected rows or for all rows. After you make your selection, the browser window appears with the HTML report. Use your browser's Print option to print the HTML report.
- Debug Problems—Gives you information to investigate, diagnose, and fix a problem. For more information, see 9.6.4 Setting Debug Options, page 9-36.

To add the selected NEs to a network partition, click **Next**. The Add Network Elements window appears, showing that the selected NEs have been added to the Added NEs list. For more information, see 3.5.2 Adding NEs, page 3-13. To remove the NE that you do not want to be added, select the NE and click **Remove**.

1.5.3 Subnetwork Explorer

The Subnetwork Explorer window displays a hierarchical view of all the network partitions, subnetworks, and NEs currently being monitored by Prime Optical. The alarm status is also indicated.

Figure 1-4 Subnetwork Explorer



The Subnetwork Explorer window is divided into two sections: the explorer tree and the properties pane. The explorer tree consists of a management domain, network partitions, subnetworks, and NEs, which are displayed in a hierarchical format. You can drag and drop NEs to reposition them in the tree. The properties pane on the right side of the window shows detailed information about the object that is selected in the tree.

The Subnetwork Explorer allows you to:

- View the alarm, connectivity, and operational status of network partitions, subnetworks, and NEs
- Add network partitions
- Modify network partition properties
- Delete empty network partitions
- Add subnetworks and associate the new subnetwork to new or existing network partitions
- Add NEs to a subnetwork and associate the new NEs with the network partitions of that subnetwork

The Subnetwork Explorer has two modes: automatic and manual. In automatic mode, all topologically connected NEs are grouped automatically into subnetworks. You cannot associate NEs to subnetworks in this mode. In manual mode, you can associate NEs to subnetworks. To change the subnetwork mode, choose **Administration > Control Panel > UI Properties** and check or uncheck the **Automatically Group NEs in Subnetworks** check box.

In the transition period during which this option is being changed, any current operations (such as dropping an NE in a subnetwork) are completed.

The server time is displayed on the lower right side of the Subnetwork Explorer window. The server name is displayed in the window's title bar.

The Subnetwork Explorer has four properties panes: Management Domain Properties, Network Partition Properties, Subnetwork Properties, and Network Element Properties.

1.5.3.1 Management Domain Properties

See 1.5.2.1 Management Domain Properties, page 1-12.

1.5.3.2 Network Partition Properties

See 1.5.2.2 Group Properties and Network Partition Properties, page 1-14.

1.5.3.3 Subnetwork Properties

The Subnetwork Properties pane displays information about the subnetwork that is currently selected in the explorer tree. Click the expand icon next to a subnetwork in the tree to view the NEs that have been assigned to that subnetwork.

The Subnetwork Properties pane has two tabs: Status and Identification.

1.5.3.3.1 Status Tab

The following table describes the Status tab fields.

Table 1-12 Field Descriptions for the Status Tab

Field	Description
Subnetwork ID	User-defined or default name of the selected subnetwork.
Description	User-defined description of the selected subnetwork.
Total NEs	Total number of NEs within the selected subnetwork.
Unavailable NEs	Number of NEs within the selected subnetwork that the Prime Optical server cannot currently reach.
NEs in Alarm	Total number of NEs within the selected subnetwork that are currently experiencing an alarm.
Unmanaged NEs	Number of NEs within the selected subnetwork that are currently unmanaged.
Alarm Status	Total number of alarms within the selected subnetwork, by severity. In addition, this field lists the number of alarmed NEs that are experiencing a critical, major, minor, or warning alarm. If the same NE experiences more than one type of alarm simultaneously, that NE is included in the count for each severity level.
NE Count by Operational State	Total number of NEs within the selected subnetwork according to operational state. There are four states: • In Service • Under Maintenance • Out of Service • Preprovisioned Also shows the number of NEs within the selected subnetwork that are initializing or synchronizing their configuration.

1.5.3.3.2 Identification Tab

The following table describes the fields in the Identification tab.

Note Only users with the appropriate user access profile can edit these fields.

Table 1-13 Field Descriptions for the Identification Tab

Field	Description
Subnetwork ID	Unique user-defined name of the selected subnetwork.
Description	User-defined description of the selected subnetwork.
Subnetwork Type	Subnetwork type (SONET, SDH, Other, or Unknown).
Subnetwork Topology	Type of topology to which the selected subnetwork belongs.
Network Partition ID	Network partition ID to which the subnetwork belongs.

Note See Table 1-22 for the descriptions of the actions that you can perform using the buttons at the bottom of the window.

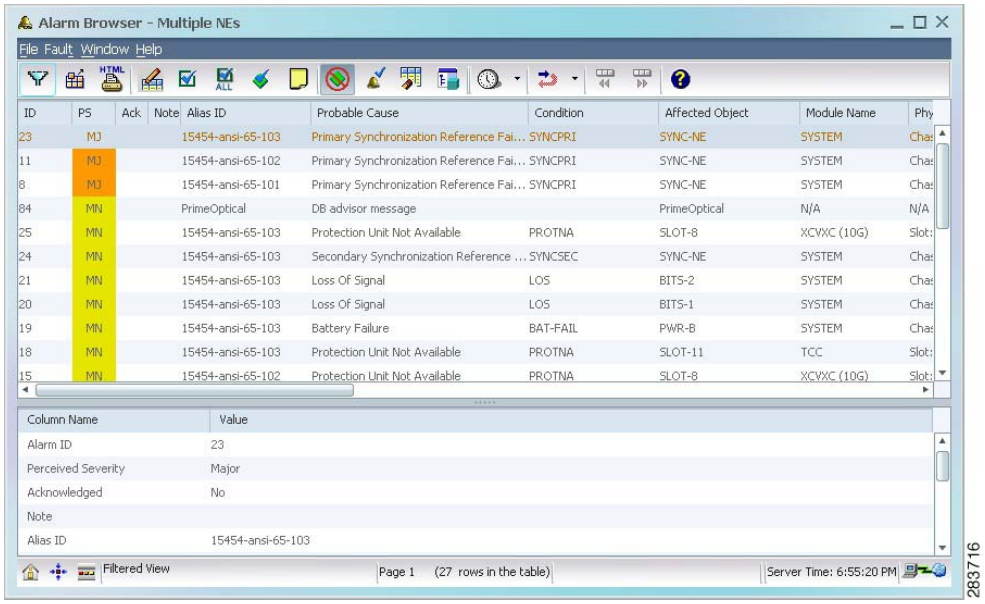
1.5.3.4 Network Element Properties

See 1.5.2.3 Network Element Properties, page 1-16.

1.5.4 Alarm Browser

The Alarm Browser displays standing alarms and conditions in the managed domain that are assigned a severity level of critical, major, minor, or warning. It also shows cleared alarms that are not acknowledged.

Figure 1-5 Alarm Browser



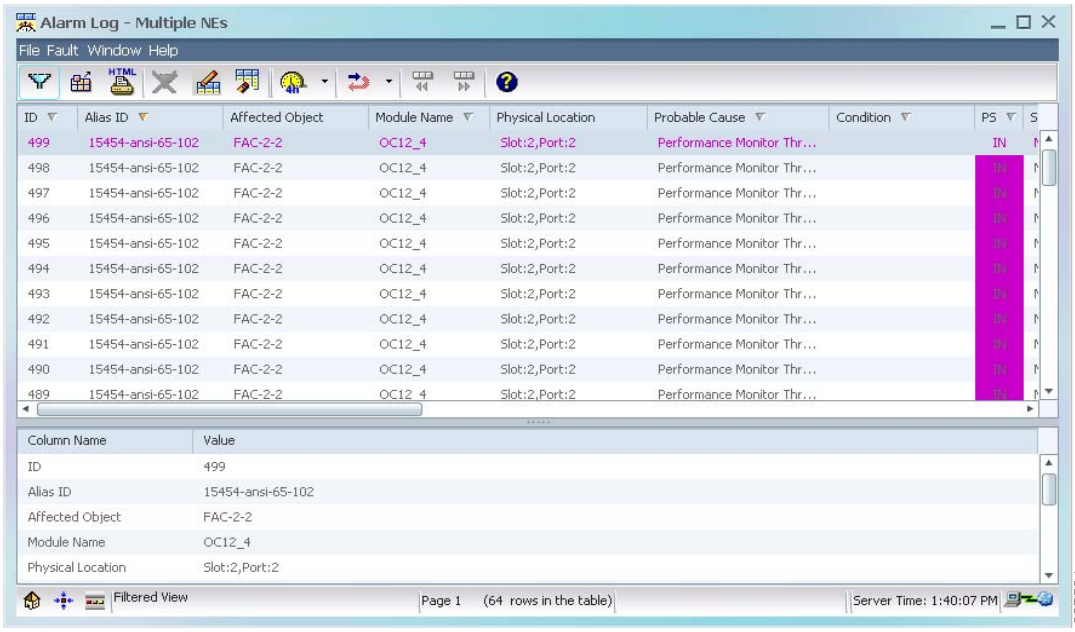
Tip For detailed information about the Alarm Browser, see Chapter 9, "Managing Faults."

Note Refer to the appropriate NE documentation for a list of alarms supported on each NE. See 1.7.2 Related Cisco NE Documentation.

1.5.5 Alarm Log

The Alarm Log window contains alarms that have transitioned from the Alarm Browser. Cleared alarms are transitioned when you acknowledge them or when automatic acknowledgment has been enabled (in the Control Panel > UI Properties pane). In addition, the Alarm Log shows a history of cleared and acknowledged alarms and all transient conditions (also known as events or autonomous nonalarmed messages), as well as threshold crossing alerts (TCAs).

Figure 1-6 Alarm Log

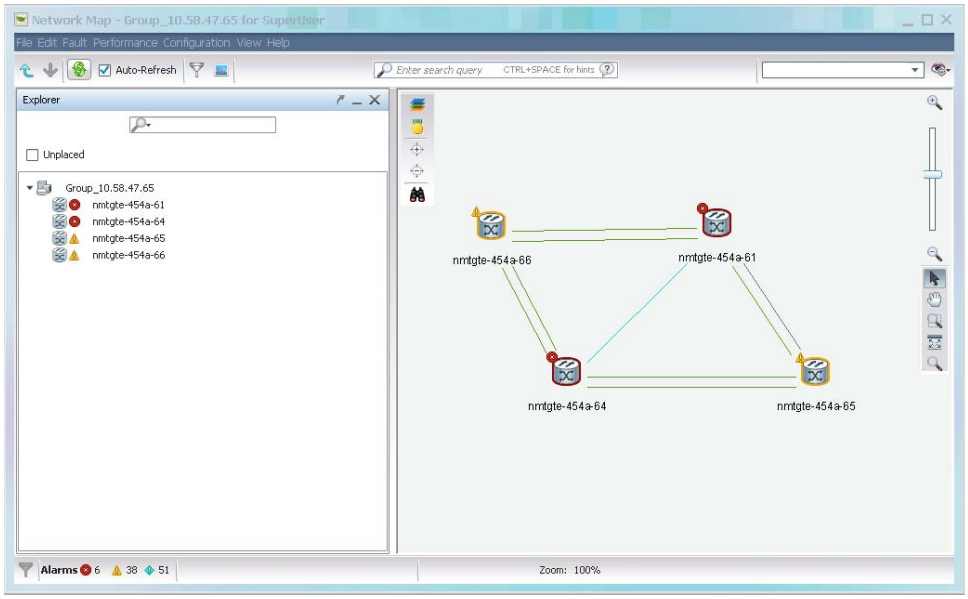


Tip For detailed information about the Alarm Log, see Chapter 9, "Managing Faults."

1.5.6 Network Map

The Network Map window allows you to graphically display how the network is partitioned.

The Network Map is organized into a multilevel hierarchy that corresponds to the structure of the Domain Explorer tree. The Network Map hierarchy consists of management domains, groups, and NEs, which are displayed graphically.



Note See Appendix A, "Icons and Menus Displayed in Prime Optical" for an explanation of the Network Map icons.

When you launch the Network Map from the Prime Optical domain, it displays a map with individual groups, NEs, and link icons. The network map has four main components: a center pane displaying the map image, Explorer pane, Properties pane, and Overview pane. From the Explorer pane, you can perform a search for NEs based on certain parameters. Prime Optical also allows you to filter network maps by NEs, groups, or links. For details, see 3.8 How Do I Use Network Maps?, page 3-55.

Clicking the **Open Parent Map tool** returns you to the parent map. Clicking the **Open Child Map tool** opens the child map for the selected NE.When you launch the Network Map from a particular group in the Domain Explorer, the Network Map opens with the contents of the group displayed.

Note Double-clicking a group on the map opens the child map. Double-clicking a node on the map opens the NE Explorer.

After you zoom in on a region on the map, the pan tool at the right side of the screen allows you to pan the view to a different region. All groups are shown on a single map, and the zoom level and pan position determine which groups are visible at any time. You can open multiple map windows to compare different views.

All groups, NEs, links, and labels are zoomed when you zoom in or zoom out. Prime Optical allows you to save the zoom level and framing of the map.

With the Auto-Refresh check box selected in the Network Map window, a refreshed map is automatically displayed when:

- A node is deleted
- The alarm counts change
- The node connectivity state changes
- The node admin state changes

- The node name changes
- The node data properties change
- The discovery state changes
- The link is modified

When the Auto-Refresh check box is unchecked, a notification bar appears at the top of the network map window stating that attributes of elements in the map have changed, and you can click the Refresh tool to reload the map.

You can export a Network Map as an image in PNG format using the Export tool in the Network Map window.

You can also search for circuits from the Network Map. For details, see 3.8 How Do I Use Network Maps?, page 3-55.

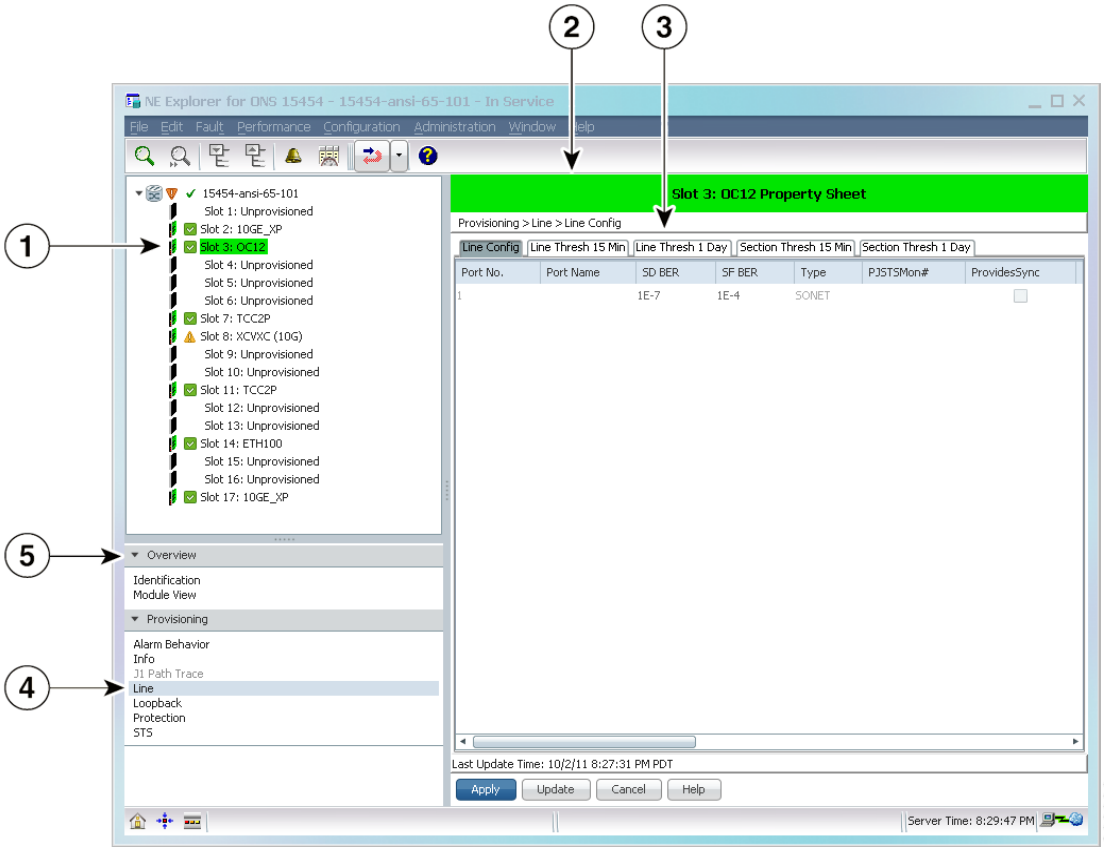
1.5.7 NE Explorer

The NE Explorer window shows service and equipment provisioning information about the selected NE. The configuration information is retrieved through the CLI, CORBA, SNMP, and TL1. The actual protocol used depends on the NE type.

Use one of the following methods to open the NE Explorer:

- Select an NE; then, choose **Configuration > NE Explorer** in the Domain Explorer or Subnetwork Explorer.
- Double-click an NE icon in the Domain Explorer tree, Subnetwork Explorer tree, or Network Map.
- In the Domain Explorer tree, Subnetwork Explorer tree, or Network Map, right-click an NE icon and choose **NE Explorer** from the shortcut menu.
- Click the **Open NE Explorer** tool in the Domain Explorer, Subnetwork Explorer, or Network Map toolbar.
- In the Alarm Browser, choose **Fault > Locate Alarm/Event** (or click the **Locate Alarm/Event Through NE Explorer** tool).
- Double-click a row in the Alarm Browser.

Figure 1-7 NE Explorer



Number	Element Name	Description
1	NE Explorer Tree	Lists all installed cards for a selected management domain.
2	Properties Pane	Displays detailed property information.
3	Tab	Groups related information within the properties pane. **Note** If many tabs are displayed in the properties pane, select the arrow or Show List icons to view all available tabs.
4	Node or Slot Properties	Displays information about the selected object property in the properties pane.
5	Drawer	Groups node and slot properties that have related attributes. • Overview Drawer—Contains a list of informational properties. • Provisioning Drawer—Contains a list of configurable properties.

To display all the slots under the node, click the expand icon (+) next to the node in the topology tree. To view properties, select the node or slot and click the down arrow next to the Overview and Provisioning drawers. Unavailable properties are dimmed.

When you change the data in the property sheet and try to navigate to a different node or slot property without saving, the following message appears.

```
Property sheet has been changed. Do you really want to discard changes?
```

The following table lists the NEs supported in Prime Optical and describes the NE Explorer for each NE. Not all NEs have an associated NE Explorer.

Table 1-14 NE Explorer and Node Property Information

NE	Description	See
Unmanaged NE/Other Vendor Node	The node properties pane for the Unmanaged NE/Other Vendor Node displays information about unmanaged NEs or nodes from other vendors.	B.18 Unmanaged NE/Other Vendor Node Properties Pane, page B-474
ONS 15216	For the ONS 15216, the NE Explorer consists of a properties pane that displays information about the NE. ONS 15216 NEs are grouped as active NEs or passive NEs.	B.1 ONS 15216 NE Explorer, page B-1
ONS 15305 (CEC-based)	The NE Explorer is not available for the ONS 15305. Equivalent functionality is provided by launching Cisco Edge Craft (CEC) from Prime Optical. CEC is the local craft application used to manage ONS 15305 NEs. From the Domain Explorer, choose **Configuration > ONS 15305 > Launch Cisco Edge Craft**.	B.2 ONS 15305, page B-25
ONS 15305 (CTC-based)	For the CTC-based ONS 15305, the NE Explorer consists of a tree on the left side of the window and a properties pane on the right. The tree displays all interfaces for the selected NE, including card name, slot number, and number of alarms present on the card. It also displays unprovisioned or unequipped slots. The properties pane displays detailed information about the entity that is selected in the tree view.	B.3 ONS 15305 CTC NE Explorer, page B-26
ONS 15310 CL	For the ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH, the NE Explorer consists of a tree on the left side of the window and a properties pane on the right. The tree displays all interfaces for the selected NE, including card name, slot number, and number of alarms present on the card. It also displays unprovisioned or unequipped slots. The properties pane displays detailed information about the entity that is selected in the tree view.	B.4 ONS 15310 CL NE Explorer, page B-32
ONS 15310 MA SONET		B.5 ONS 15310 MA SONET NE Explorer, page B-59
ONS 15310 MA SDH		B.6 ONS 15310 MA SDH NE Explorer, page B-89
ONS 15327	For the ONS 15327, the NE Explorer consists of a tree on the left side of the window and a properties pane on the right. The tree displays all interfaces for the selected NE, including card name, slot number, and number of alarms present on the card. It also displays unprovisioned or unequipped slots. The properties pane displays detailed information about the entity that is selected in the tree view.	B.7 ONS 15327 NE Explorer, page B-120
ONS 15454 SONET	For the ONS 15454 SONET and ONS 15454 SDH, the NE Explorer consists of a tree on the left side of the window and a properties pane on the right. The tree displays all interfaces for the selected NE, including card name, slot number, and number of alarms present on the card. It also displays unprovisioned or unequipped slots. The properties pane displays detailed information about the entity that is selected in the tree view.	B.9 ONS 15454 SONET NE Explorer, page B-188
ONS 15454 SDH		B.10 ONS 15454 SDH NE Explorer, page B-232
ONS 15454-M6		B.11 ONS 15454-M6 NE Explorer, page B-280
ONS 15454-M2		B.12 ONS 15454-M2 NE Explorer, page B-319

Table 1-14 NE Explorer and Node Property Information (continued)

NE	Description	See
ONS 15600 SONET	For the ONS 15600 SONET and ONS 15600 SDH, the NE Explorer consists of a tree on the left side of the window and a properties pane on the right. The tree displays all interfaces for the selected NE, including card name, slot number, and number of alarms present on the card. It also displays unprovisioned or unequipped slots. The properties pane displays detailed information about the entity that is selected in the tree view.	B.13 ONS 15600 SONET NE Explorer, page B-356
ONS 15600 SDH		B.14 ONS 15600 SDH NE Explorer, page B-384

Usage Notes:

- When you click the Create button in an NE Explorer tab and use the Create dialog box to add information, the information is committed directly on the NE. You do not have to click the Apply button at the bottom of the properties pane.

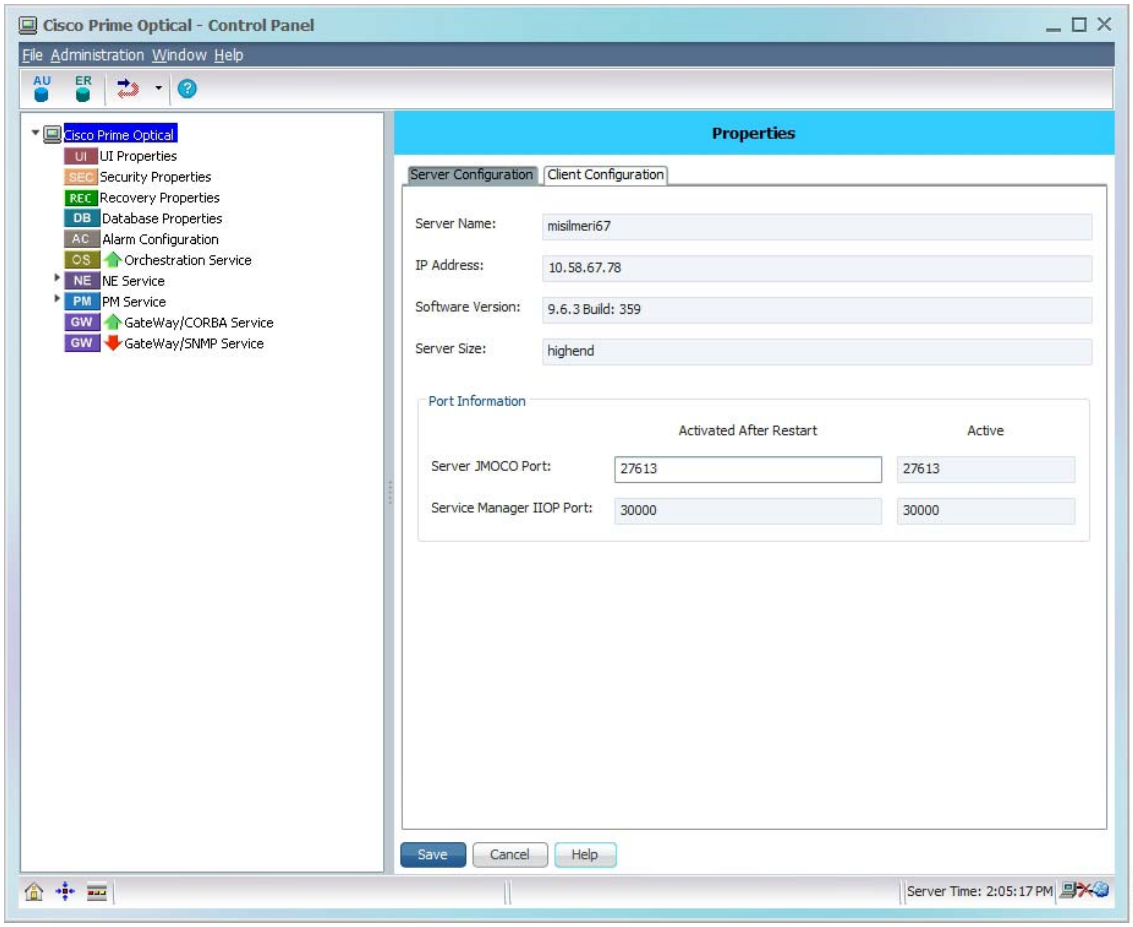
  Also, if you use the Create button to commit information on the NE, any changes to the value governed by the Apply button will be lost if they have not already been applied. For example, if you check the Allow SNMP Set check box on the SNMP tab, then create a trap destination host before clicking the Apply button, the check box will revert back to unchecked after the create operation is completed and the screen refreshes with the new trap destination in the table.
- You must click the Update button to retrieve the latest NE defaults, alarm profile, and VLAN list.
- See Table 1-22 for descriptions of actions that you can perform using the buttons at the bottom of the window.
- If nothing has been configured on the selected NE, the NE Explorer properties pane appears blank and system defaults apply.

1.5.8 Control Panel

The Control Panel allows you to view and modify certain client and server configuration parameters. Certain modifications take effect immediately and change the active server configuration. Other changes take effect when the server is restarted.

The left side of the window displays the tree, which contains the different Prime Optical functions and services. The right side of the window displays the properties pane that corresponds to the selected client or server component.

Figure 1-8 Control Panel



Click the expand icon next to the Prime Optical functions and services in the tree structure to display the services contained within. For example, expand NE Service to display the individual services.

The following table describes the panes in the Control Panel.

Table 1-15 Panes in the Control Panel

Pane	Description	For More Information, See
Prime Optical Properties	View the current server and client configuration.	Table 4-44 on page 4-95
UI Properties	Configure application-specific parameters.	Table 4-23 on page 4-57
Security Properties	Configure Prime Optical security parameters and specify usernames and passwords for NEs.	Table 8-10 on page 8-30
Recovery Properties	View a list of servers that clients will log into if access to the primary server is disrupted and view a list of critical services that the server monitors.	Table 9-10 on page 9-27
Database Properties	View database and backup configuration, pruning time periods, and information that the server uses to log into the Oracle database.	Table 4-1 on page 4-2
Alarm Configuration	View threshold and nonthreshold EMS alarm parameters.	Table 9-8 on page 9-19

Table 1-15 Panes in the Control Panel (continued)

Pane	Description	For More Information, See
Orchestration Service	View status of the discovery service and configure properties for discovery of undiscovered NEs.	Table 3-21 on page 3-66
NE Service	Select an NE type and view and update server configuration, which includes port information, timing parameters, and NE backup parameters. You can also stop or start an individual network service instance.	Table 4-27 on page 4-68
PM Service	Select an NE type and view and modify performance-related settings for that NE. You can also stop or start an individual PM service instance.	Table 10-1 on page 10-4
GateWay/CORBA Service	Stop, start, or configure parameters for the Prime Optical GateWay/CORBA service.	Table 12-5 on page 12-13
GateWay/SNMP Service	Stop, start, or configure parameters for the Prime Optical GateWay/SNMP service.	Table 12-1 on page 12-6

1.6 General Features of Prime Optical

This section describes some of the general Prime Optical features.

Note Prime Optical users are subject to user privileges. Depending on your user profile, you might not see certain windows or have access to certain functions. For more information about user privileges, see 8.3.2 User Privilege Profiles, page 8-3.

1.6.1 Window Views

All Prime Optical window views have a menu bar, toolbar, and status bar as described in the following table.

Table 1-16 Prime Optical Window Views

Item	Icon	Description
Menu bar	—	Some of the window menus are context-sensitive. All windows have a Window menu and a Help menu.
Toolbar	—	Each window has a toolbar with context-sensitive tools. All windows have a Help tool.
		For a detailed description of a particular window, click the **Help** tool (or choose **Help > Current Window**) to launch the online help.

Table 1-16 Prime Optical Window Views (continued)

Item	Icon	Description
Status bar	All windows have a status bar (located in the lower-left of the window) that reports the server time and contains the following icons:	
		Click the **Return to Domain Explorer** status bar icon to return to the Domain Explorer window. (The Domain Explorer window itself does not have this status bar icon.)
		Click the **Open Dashboard** status bar icon to open the Dashboard.
		Click the **Reset to Default Window Size** status bar icon to reset the window to its default size.
		This NE connectivity icon indicates that Prime Optical is currently connected to all NEs.
		This NE connectivity icon indicates that Prime Optical has lost connectivity to one or more NEs.

Note When you switch to a different program and then return to Prime Optical, the Prime Optical dialog boxes might be hidden behind another Prime Optical window or dialog box. The Prime Optical client might appear frozen because the hidden dialog box requires user action. On a Windows workstation, press **Alt-Tab** to display all running processes. Continue to press **Tab** (while keeping **Alt** depressed) to select the icon for the Java process. This will position the Prime Optical dialog box as the top active window. On a Solaris workstation, minimize the open windows until the Prime Optical dialog box is visible.

1.6.2 Table Views

All Prime Optical table views share common characteristics, as described in the following table.

Table 1-17 Prime Optical Table Views

Item	Tool	Description
Page Back and Page Forward		Some tables return large numbers of rows. To support large tables, Prime Optical provides a paging feature. If more than 1000 rows of data are returned, data is grouped in pages of up to 1000 rows. You can page forward and page back to view the entire set of data. • Page Back—Moves the table backward by one page. • Page Forward—Moves the table forward by one page.
Split-Pane View	—	Table views have two panes: a top pane and a bottom pane. The top pane displays the rows in the table. The bottom pane displays a detailed description of the selected row in the top pane. The bottom pane improves the readability of row attributes that might be truncated in the top pane. You can resize these panes by dragging the splitter bar up or down. **Note** The resized panes will return to their default sizes the next time you open the table.
Rearrange and Resize Columns	—	To rearrange columns in any table, select and drag the column title. To resize columns, drag the column separator line to the left or the right. **Note** The rearranged or resized columns will return to their default positions and sizes the next time you open the table.

Table 1-17 Prime Optical Table Views (continued)

Item	Tool	Description
Customize View		You can customize the way tables are displayed by selecting the columns to be displayed, and the order in which to display them. Prime Optical allows you to save your customized table view so that the next time you open the table, it is displayed in the same manner in which it was saved. See 1.6.9 Customizing Table Views, page 1-43 for more information.
Sort	—	You can sort columns using the up or down arrows. The up arrow represents ascending order; the down arrow represents descending order. The orange-colored arrow identifies the column that is the primary key in the current sort. To sort the data, simply click the column title. **Note** You can only sort one column at a time.
Group	—	You can group items in a column that have the same value using the square icons located in the column title. To group column items, simply click the column title. The color of the square icon turns orange, indicating that the column is grouped. **Note** You can only group one column at a time.
Filter	 	Click the **Filter** tool to filter the data according to criteria that you select, and then display the results in a table. Some tables have a time-based Filter tool that allows you to filter data for the past 4 hours, past 8 hours, past 12 hours, past day, or past week. **Note** Clicking Refresh Data resets the time-based filter. The filter retrieves data for the specified interval, beginning when the Refresh Data tool is clicked. For example, if the specified interval is Past Hour and Refresh Data is clicked at 3:02 p.m., the filter retrieves data that occurred between 2:02 p.m. and 3:02 p.m. If the specified interval is From Now Onward at 8:00 p.m., data is retrieved beginning at 8:00 p.m. and the time is reset only after From Now Onward is clicked again.
Export		Click the **Export Data to File** tool to export the tabular data to a file. **Note** You can export only data that the current table tool has cached (which might be larger than what is visible if there is a vertical scroll bar on the view), and not the entire data set available in the database.
HTML Report		Click the **Generate HTML Report** tool to generate an HTML report based on the data in the table. You can generate a report for selected rows or for all rows in the current page. A maximum of 1000 rows per page can be exported. After making your selection, click **OK**; the browser window appears with the HTML report. The report is saved automatically on the client system. (The default directory is C:\Cisco\TransportManagerClient*version-number*\reports or /opt/CiscoTransportManagerClient*version-number*/reports.) Use your browser's Print option to print the report.

1.6.3 Tree Views

All Prime Optical tree views share common characteristics, as described in the following table.

Table 1-18 Prime Optical Tree Views

Item	Tool	Description
Split-Pane View	—	Tree views have two panes: a left pane and a right pane. The left pane represents the topology tree; the right pane shows the properties of the entity selected in the tree.
Expand		Click the **Expand** tool (or choose **Edit > Expand**) to expand the selected tree node.
Collapse		Click the **Collapse** tool (or choose **Edit > Collapse**) to collapse the selected tree node.
Right-Click Options	—	Every selectable object has right-click options. Right-click a selectable object to view a shortcut menu that allows you to access more detailed information about the object.

1.6.4 Launching Context-Sensitive Information

Many Prime Optical views have a specific selection context, meaning that the same window will have a different look depending on where it was launched.

For example, if you launch the Alarm Browser from the management domain node, the browser shows all NE and EMS alarms (if you have permission to see EMS alarms). If you launch the Alarm Browser from a subnetwork, group, or NE node, the browser shows only NE alarms. If you launch the Alarm Browser from the Dashboard, the browser shows all NE alarms for the Prime Optical domain.

As another example, for circuit creation, the context of the launch point determines the choice of nodes that can be selected as source and destination nodes.

1.6.5 Finding Data

Prime Optical has a Find feature that you can use to locate specific data.

1.6.5.1 Finding Data in the Domain Explorer

In the Domain Explorer, you can use the Find dialog box to search for circuits, L2 topologies, NEs, or groups.

Step 1 In the Domain Explorer window, choose **Edit > Find**. The Find dialog box opens.

Step 2 From the Object Type drop-down list, choose one of the following options:

- SONET Circuits
- SDH Circuits
- L2 Topologies

- Network Element/Group
- Metro DWDM Circuits

Note The Metro DWDM Circuits option applies only to ONS 15530 and ONS 15540 NEs. For other NE types—such as the ONS 15454—the Metro DWDM Circuits option returns no results. To filter circuits on ONS 15454 NEs, use the Circuit table filter. See 7.2.19 Filtering the Circuit Table, page 7-157.

Step 3 To search for SONET, SDH, or metro DWDM circuits, specify the following information in the Object Properties area, in any combination:

- Circuit name
- Circuit alias (not applicable to metro DWDM circuits)
- Description
- Customer ID (not applicable to metro DWDM circuits)
- Service ID (not applicable to metro DWDM circuits)
- NE ID
- Circuit type
- Circuit size
- Number of VLANs (not applicable to metro DWDM circuits)

Tip In the Circuit Name, Description, Customer ID, Service ID, and NE ID fields, you can enter a percentage character (%) as a wildcard. You can search for a partial string inserted between percentage characters, such as *%CMP%*.

Step 4 To search for a particular L2 topology and view the results in the Layer 2 Topology table, specify the following information in the Object Properties area:

- Topology name
- NE ID
- NE type—Choose All, SONET, or SDH.
- Topology type—Choose All, Point to Point, Resilient Packet Ring, or 802.17 Resilient Packet Ring.

Tip In the L2 Topology Name and NE ID fields, you can enter an asterisk (*) as a wildcard.

Step 5 To search for a particular NE or group, enter the following information in the Object Properties area:

- NE or group name
- Alias
- IP address (in IPv4 or IPv6 format)
- Description

Tip To make the search noncase-sensitive, check the **Ignore Case** check box. The search always starts from the root node and returns to the root node after reaching the last node.

Tip In the Name, IP Address, and Description fields, you can enter a percentage character (%) as a wildcard. You can search for a partial string inserted between percentage characters. For example, in the IP Address field, you can enter ***%1.2%*** to search for all IP addresses that contain *1.2* as octets. If you do not enter wildcard characters, the search returns only exact matches.

Step 6 Click **OK**.

Step 7 To search for the next instance of the specified search object, choose **Edit > Find Next** in the Domain Explorer window.

1.6.5.2 Finding Data in the NE Explorer

In the NE Explorer window, you can use the Find dialog box to search for a particular node or card by specifying the node or card name.

Step 1 In the Domain Explorer window, select an NE node and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the NE Explorer window, choose **Edit > Find** (or click the **Find** tool). The Find dialog box opens.

Step 3 In the Find text field, enter the search text. The drop-down list displays a list of the search text you entered; your most recent entry appears at the top of the list.

Tip To make the search case-sensitive, check the **Match Case** check box. The search always starts from the root node and returns to the root node after reaching the last node.

Step 4 Click **OK**.

Note The Match Case check box setting is not saved. When you initiate a search, the case sensitivity of the search depends on the current setting in the Match Case check box. If you select a previously specified search string from the drop-down list, the search does not remember the Match Case check box setting that you specified in the previous search string.

Step 5 To search for the next instance of the specified search object, choose **Edit > Find Next** (or click the **Find Next** tool) in the NE Explorer window.

1.6.5.3 Finding NEs or Groups in the Network Map

In the Network Map window, you can use the Find on Map dialog box to search for a particular NE or group. The Find on Map dialog box allows you to search for an NE or group by providing the full or partial identifier of the NE or group. The Find on Map dialog box searches for a matching NE or group in the map and, if one is found, selects it automatically.

For a group, the identifier is always the name. For an NE, the identifier is the name or the alias, depending on which of the two attributes is currently displayed in the map.

Step 1 In the Domain Explorer window, choose **File > Network Map**.

Step 2 In the Network Map window, choose **Edit > Find**. The Find on Map dialog box opens.

Step 3 In the Name text field, enter the search text.

Tip You can enter a percentage character (%) as a wildcard. You can search for a partial string inserted between percentage characters, such as *%CMP%*.

Step 4 Click **OK**. The first NE or group matching the name is selected in the map.

Step 5 Choose **Find Next** in the Find on Map dialog box to search for the next instance of the specified search object.

Step 6 Click **Close** to close the Find on Map dialog box.

Tip After closing the Find on Map dialog box, you can find the next instance of the specified search object by choosing **Edit > Find Next** in the Network Map window.

1.6.6 Filtering Data

Filter dialog boxes filter user-specified data. Many tables have Filter dialog boxes that enable you to filter data in different ways and display the results in a table. If the filter supports wildcards, you can enter a percentage character (%) as a wildcard character to support broader searches.

1.6.7 Exporting Data

Most tables support an export function to export the table contents to a flat file. The Export dialog box allows you to export data as comma-separated values (CSVs) or tab-separated values (TSVs), which are formats commonly used to import data into spreadsheet and database applications for further analysis and manipulation. You can also select a user-specified character as a separator.

To open the Export dialog box, click the **Export Data to File** tool (or choose **File > Export**) in a table. The following table describes the fields in the Export dialog box. After making your selections, click **OK**.

Table 1-19 Field Descriptions for the Export Dialog Box

Field	Description
Field Separator	
Comma separated	If selected, the data is exported as comma-separated values.
Tab separated	If selected, the data is exported as tab-separated values.
Other	If selected, the data is exported with the separator that you specify in the Other text field. **Note** If you specify a character as a separator and your data contains the same character, the character in the data is automatically enclosed in double quotes. This allows the spreadsheet or database application to understand that the character is part of your data. Regardless of whether you select Comma separated, Tab separated, or Other, Prime Optical automatically encloses text in double quotes if it has a separator.
Export	
Selected row(s)	If selected, only the selected rows in the current page are exported.
All rows in current page	If selected, all rows in the current page are exported.
Entire table	If selected, exports the entire contents of the selected table to a text file. A progress bar tracks the export progress. The entire-table export writes the data to a user-specified text file and retains the user-selected table customizations. For example, if you customized the table to make a column invisible, that column does not appear in the exported file. In the User Preferences dialog box, you can enable or disable the ability to export the entire Alarm Browser or Alarm Log. (You cannot enable or disable the ability to export the entire contents of the selected PM or inventory table.) **Note** To enable you to export all data in the Alarm Browser or Alarm Log, the window cannot be in automatic refresh mode. (This restriction does not apply to PM or inventory tables; you can export all data in the selected PM or inventory table when automatic refresh mode is enabled.)
Export Data to File	
Export Data to File	By default, exported data is stored in the C:\Cisco\TransportManagerClient*version-number*\exports or /opt/CiscoTransportManagerClient*version-number*/exports directory under the name that you provide in the Export Data to File text box. Click **Browse** to change the file location.

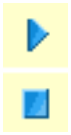
1.6.8 Exporting Alarms and Events

In addition to exporting directly from the Alarm Browser or the Alarm Log, Prime Optical provides an Event Export Manager window (**Fault > Event Export Manager**) that allows you to export alarms and events, as they occur, to the file of your choice. You can also set various parameters to refine the export. You can choose to export events continuously or to export a specific number of events:

- To export events continuously, click the **Start Export** tool. The Event Export Manager exports events continuously until you click the **Stop Export** tool, or until the current Prime Optical session ends, whichever occurs first.

- To export a specific number of events, check the **Stop export when** check box, enter a number of records, and click the **Start Export** tool. The export will stop after logging the specified number of events.

Figure 1-9 Start and Stop Export Tools



The following table describes the fields in the Event Export Manager window.

Table 1-20 Field Descriptions for the Event Export Manager

Field	Description
Network Elements	Allows you to export alarms (NE alarms and Prime Optical-specific EMS alarms) and events for selected NEs. Choose from the list of available NEs and add them to the Selected list. If you have the appropriate user permission and you want to export EMS alarms and events, check the **Export Prime Optical EMS Alarms/Events** check box.
Severity	Allows you to export events that have a severity of Critical, Major, Minor, Warning, Indeterminate, and/or Cleared.
Export To	Allows you to export the file to a given destination. Click **Browse** to browse for a particular destination. You can also overwrite or append the file.
Export Options	Allows you to specify the field separator type. Types include Comma, Tab, Semicolon, or Other, an option you use to specify a different separator. You can also check the **Stop export when** check box and enter a number of records to instruct the Event Export Manager to stop exporting after logging the specified number of records.

1.6.9 Customizing Table Views

Most tables support a customized view function that allows you to select the columns to be displayed, and the order in which to display them. Prime Optical allows you to save your customized table view so that the next time you open the table, it is displayed in the same manner in which it was saved.

Step 1 Open the table to customize.

Step 2 Click the **Customize View** tool (or choose **File > Customize View**) to open the Customize View dialog box. The following table provides descriptions.

Step 3 Make your customizations as required.

Step 4 Click **Apply** to apply your customizations. The changes are applied to the table but are not saved.

Note When you apply any changes, an asterisk (*) appears after the table name. The asterisk indicates that you have made changes but have not saved them.

Step 5 Choose **File > Save Customized View** to save your customizations. The asterisk disappears from after the table name.

After you save the custom view:

- Changes are applied immediately to the table you are working on.
- Changes are not applied to other instances of the same table that are currently open. Tables must be closed and then reopened for the changes to take effect.
- Changes are displayed when the same user launches a new instance of the table; this applies to all Prime Optical sessions for that user.

Table 1-21 Field Descriptions for the Customize View Dialog Box

Field	Description
Show/Hide Selection	
Add >	Select a column to display and click **Add** to move the column to the list of displayed columns.
< Remove	Select a column to hide and click **Remove** to move the column to the list of hidden columns.
Up/Down	Select a column from the list of columns to be displayed (at the right side). Click **Up** to reposition the selected column one place at a time to the left of the table, or click **Down** to reposition the selected column one place at a time to the right of the table. **Tip** The column displayed at the top of the list will be displayed as the left-most column.
Apply	Click **Apply** to apply your customizations to the current session.
Cancel	Click **Cancel** to close the Customize View dialog box without applying any changes.
Help	Click **Help** to launch the online help.

1.6.10 Refreshing Data

Many windows have a Refresh Data toolbar icon that refreshes all data being displayed by Prime Optical. There are two versions of the Refresh Data tools, and both refresh data from either the server or the database:

- The Refresh Data tool shown in the top figure flashes when updates are available. This tool has two modes: manual refresh and autorefresh.
- The Refresh Data tool shown in the bottom figure does not notify you that updates are available. You must click the tool to retrieve updated data.

Figure 1-10 Refresh Data Tool

Note Clicking **Refresh Data** in the Domain Explorer window refreshes all data for the entire Prime Optical client and closes all open windows (except the Domain Explorer window). Depending on the number of NEs in your network, you might experience a delay while the data refreshes. After the Domain Explorer refreshes, the status bar shows "Refresh Data Complete."

Note
- It takes longer to refresh data from the NE than from the server.
- When a chassis contains cards that have many interfaces (such as the DS1_E1_56, DS3_EC3_48, or DS3XM_12 cards), it might take 4 minutes or longer for the NE Explorer to refresh data from the NE.

1.6.11 Pruning the Database

Prime Optical automatically prunes various categories of data that tend to accumulate over time and would otherwise exhaust the available disk space. You can configure the following categories of data for automatic pruning:

- PM data
- FM data
- Audit log data
- Error log data
- NE audit trail data
- Self-monitor data
- Job monitor data

The following options are provided to control the pruning for each category of data:

- Enable/disable
- Retention period (1 to 1000 days)
- Time of day at which to perform the pruning

1.6.12 Using Mnemonics

All menus and menu options have a uniquely assigned mnemonic to support keyboard access to menu items in addition to access through the mouse. The underlined letter within a menu item indicates the mnemonic keystroke. For example, to exit the Prime Optical application, enter **Alt+f** (for the File menu); then, enter **x** (Exit).

1.6.13 Using the Online Help

The online help provides a detailed explanation of each Prime Optical GUI window and dialog box.

To view the online help for any window, you have two options:

- Choose **Help > Current Window**
- Click the **Help** tool

Figure 1-11 Help Tool

To view the online help for any dialog box, click the **Help** button within the dialog box.

Tip Use your browser's Print option to print the selected page.

1.6.14 Using the Pin Tool

The Dashboard has a pin tool. When you click it, the window is *pinned down*, meaning that it is not brought to the foreground by default. If you click the pin tool again, the Dashboard window is *pinned up*, meaning that it is brought to the foreground each time an update occurs (alarm counts change, NE count changes, and so on).

1.6.15 Viewing System Details

To view the system details, complete the following steps:

Step 1 In the Prime Optical Home page, place your cursor near the View System Details option available at the top right.

Step 2 Click the icon *next to* View System Details. The following system details appear:

- Host
- Version
- Oracle RDBMS Version
- System Name
- Operating System
- Total Memory Size
- Total Swap Space Size
- Architecture

1.6.16 Viewing Licensing (NE Audit) Information

Prime Optical allows you to view Licensing (NE Audit) information such as version summary and details grouped by device type, number of devices, and so on. Users with the appropriate role can generate, view, and export reports.

To view and export NE Audit information, complete the following steps:

Step 1 In the Prime Optical Home page, choose **Administration > Summary**.

The device software version summary and the device type count report information are displayed.

- Software Version—Version of the software that is running on the selected device.
- Device Type—Type of the device.
- Total—Number of NEs of a specific software version.
- Number of Devices—Number of devices.
- Sum of Shelves—Total number of shelves.

Step 2 In the Prime Optical Home page, choose **Administration > All Devices**

The list of all devices is displayed with the following fields:

- Device Name—Name of the device.
- IP Address—IP address of the device.
- Device Type—Type of the device.
- Software Version—Software version of the device type.
- Operational State—Operational state of an NE. The operational states are:
  - Preprovisioned
  - Under Maintenance
  - In Service
  - Out of Service
  - In Service–Initializing
  - In Service–Synch Configuration
- Multishelf—Specifies whether the device belongs to a multishelf node.
- Shelves—Device shelf number.
- Vendor Name—Device vendor name.

Step 3 To export the report in CSV format, click the **Excel** icon; to export the report in PDF format, click the **PDF** icon.

1.6.17 Action Buttons

The following table describes the actions that you can perform using the buttons at the bottom of Prime Optical windows and dialog boxes.

Table 1-22 Action Buttons

Button	Description
Add >	Click to select one or more available options; then, click **Add >** to add the selected option(s) to the list of selected options. **Note** Hold down the Shift key to select more than one option sequentially, or hold down the Ctrl key to select more than one option nonsequentially.
Apply	Commits any changes to user-defined fields to the Prime Optical database and applies the changes to the NE.
Back	Returns to the previous screen. (In the first screen, Back is not available.)
Cancel	Replaces any changes to user-defined fields with the previous values. If the current window is a wizard, the wizard closes when you click the Cancel button.
Close	Closes the window.
Finish	Creates the service and closes the wizard.
Help	Launches the online help for the window.
Maximize	Click the Maximize button to expand the window. After you expand the window, the Maximize button changes to a Reset Size button.
Next	Temporarily saves the current information and displays the next screen. (In the last screen, Next is replaced by Finish.)
OK	Commits the selections made in the window and closes the window.
< Remove	Click to select one or more options; then, click **< Remove** to remove the selected option(s) and return them to the Available list. **Note** Hold down the Shift key to select more than one option sequentially, or hold down the Ctrl key to select more than one option nonsequentially.
Reset	Resets the values displayed in the window to the default values.
Reset Size	Click the Reset Size button to return the window to its original size.
Save	Commits any changes to user-defined fields to the Prime Optical database and saves the changes to the NE.
Unlock	Unlocks the Prime Optical session and displays the Domain Explorer.
Update	Retrieves all current configuration settings for the selected NE. The time stamp Last Update Time: *date time* indicates the last time the configuration settings were retrieved for the NE. Any changes to user-defined fields that have not been applied are not updated with the fields' current configuration settings for the selected NE.

1.7 Related Documentation

This section summarizes the Prime Optical documentation and related documentation.

1.7.1 Prime Optical Documentation Set

Note You can access the most current Prime Optical documentation online at http://www.cisco.com/en/US/products/ps11670/tsd_products_support_series_home.html.

The Prime Optical documentation set comprises the following guides:

- *Release Notes for Cisco Prime Optical 9.6.3*—Describes the caveats for Prime Optical.
- *Cisco Prime Optical 9.6.3 Installation Guide*—Explains how to install Prime Optical and how to upgrade from previous releases.
- *Cisco Prime Optical 9.6.3 User Guide*—Describes how to use the Prime Optical software, which consists of user applications and tools for network discovery, network configuration, connection management, fault management, system administration, and security management.
- *Cisco Prime Optical 9.6.3 GateWay/CORBA User Guide and Programmer Manual*—This guide.
- *Cisco Prime Optical 9.6.3 Database Schema*—Describes the database schema that Prime Optical uses to store information in a Structured Query Language (SQL) database such as the Oracle database. The document is designed for users who need to create their own reports without using Prime Optical.
- *Cisco Prime Optical 9.6.3 High Availability Installation Guide*—Explains how to install Prime Optical in a high availability (HA) environment.

  Note To obtain the *Cisco Prime Optical 9.6.3 High Availability Installation Guide*, contact your Cisco account representative.

- *Cisco Prime Optical 9.6.3 Basic External Authentication*—Describes how Prime Optical supports basic external authentication.
- *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*—Describes the methodology that Prime Optical uses to provision ML-series cards.
- *Migration Matrix for Cisco Prime Optical and Cisco Transport Manager Service Pack Releases*—Describes the migration matrix for service pack releases.

1.7.2 Related Cisco NE Documentation

Basic Concepts

This chapter introduces some basic Cisco Prime Optical and networking concepts, including:

- 2.1 Prime Optical Interfaces, page 2-1
- 2.2 Data Communications Network, page 2-4
- 2.3 What is FCPS?, page 2-5
- 2.4 Fault Management, page 2-5
- 2.5 Configuration Management, page 2-6
- 2.6 Performance Management, page 2-11
- 2.7 Security Management, page 2-13

2.1 Prime Optical Interfaces

This section describes the southbound interfaces that Prime Optical uses to communicate with NEs and the northbound interfaces that Prime Optical uses to communicate with Operations Support Systems (OSSs).

2.1.1 Southbound Interfaces with NEs

The Prime Optical server communicates with NEs through the data communications network (DCN) by using several protocols (CORBA, HTTP, SNMP, TL1, and so on).

2.1.1.1 ONS 15216

The ONS 15216 product family consists of the following classes of products:

- DWDM filters or multiplexer/demultiplexer units
- Optical add/drop multiplexers (OADMs)
- Optical amplifiers (OAs), which are also referred to as erbium-doped fiber amplifiers (EDFAs)
- Dispersion compensation, including the Optical Supervisory Channel (OSC) and Dispersion Compensation Unit (DCU)

The ONS 15216 NEs are referred to as *active* or *passive*. Active NEs support a management interface; passive NEs do not. There is no communication between passive NEs and Prime Optical; rather, all of the information is user-defined. You can use the Domain Explorer to manually add inventory information

for passive NEs. You can use the NE Explorer to manually add specific information such as serial number. For passive ONS 15216 NEs with multiple slots (such as the DCU), you can use the NE Explorer to specify the content of each slot. All of the information that you define is maintained in the Prime Optical database and propagated to an external OSS through Prime Optical GateWay/CORBA.

The following table summarizes the management protocol support available for the ONS 15216 product family. It also identifies each NE type as active or passive.

Table 2-1 ONS 15216 Management Protocols

ONS 15216 Product	Active or Passive NE?	Management Protocol
ONS 15216 100-GHz OADM1/2/4	Active	TL1[1]
ONS 15216 EDFA2	Active	SNMPv2c[1], TL1
ONS 15216 EDFA3	Active	SNMPv2c[1], TL1
ONS 15216 100-GHz Red/Blue Filters	Passive	—
ONS 15216 200-GHz Red/Blue Filters	Passive	—
ONS 15216 200-GHz OADM1/2	Passive	—
ONS 15216 EDFA1	Passive	—
ONS 15216 OSC	Passive	—
ONS 15216 DCU	Passive	—
ONS 15216 FlexLayer	Passive	—

1. Protocol that Prime Optical uses to manage the NE.

2.1.1.2 ONS 15305

Prime Optical uses SNMP as the primary management interface for the ONS 15305. Prime Optical supports the use of Cisco Edge Craft to configure the ONS 1530x. Cisco Edge Craft is the local craft application used to manage ONS 15305 NEs.

2.1.1.3 ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, and ONS 15600 SDH

The ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, and ONS 15600 SDH support TL1 and SNMP interfaces, as well as a CORBA interface for Cisco Transport Controller (CTC) and Prime Optical management. The CORBA interface is a proprietary Cisco interface and is not published for use by customers or third parties.

Note TL1 support is not available for ONS 15305 CTC, ONS 15454 SDH releases earlier than R5.0, or ONS 15600 SDH releases earlier than R8.0.

The ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, and ONS 15600 SDH also support a Cisco proprietary HTTP interface for bulk collection of performance management (PM) data. This interface is not published for customer or third-party use.

Note The ONS 15305 R3.0 does not support the Cisco proprietary HTTP interface for bulk collection of PM data. Instead, the ONS 1530x PM Service collects PM data by using the SNMP protocol.

Note In general, any updates from CTC for ONS 15600-specific screens can take up to several minutes. This delay affects Prime Optical screens that are specific to the ONS 15600 SONET and ONS 15600 SDH.

2.1.1.4 ONS 155xx

Prime Optical uses SNMP to manage the ONS 15530 and ONS 15540 NEs. For the ONS 15530 and ONS 15540, Prime Optical also provides access to the Cisco IOS command-line interface (CLI) through Telnet.

2.1.2 Northbound Interfaces with OSSs

Prime Optical supports three gateway modules that provide northbound EMS-to-NMS interface mediation. Not all NE types are supported by each module. The following table shows the NE types supported by each gateway module.

Table 2-2 Prime Optical GateWay/CORBA and SNMP Coverage

NE Type	GateWay/CORBA Support?	GateWay/SNMP Support?
ONS 15216 EDFA2	Yes	Yes
ONS 15216 EDFA3	Yes	Yes
ONS 15216 100-GHz OADM	No	No
ONS 15216 100-GHz Red/Blue Filters	Yes[1]	No
ONS 15216 200-GHz Red/Blue Filters	Yes	No
ONS 15216 200-GHz OADM1/2	Yes	No
ONS 15216 EDFA1	Yes	No
ONS 15216 OSC	Yes	No
ONS 15216 DCU	Yes	No
ONS 15216 FlexLayer	Yes	No
ONS 15305 2.0.x	Yes	Yes
ONS 15305 CTC	Yes	Yes
ONS 15310 CL	Yes	Yes
ONS 15310 MA SONET	Yes	Yes
ONS 15310 MA SDH	Yes	Yes
ONS 15327	Yes	Yes
ONS 15454 SONET	Yes	Yes
ONS 15454 SDH	Yes	Yes
ONS 15530	Yes	Yes

Table 2-2 Prime Optical GateWay/CORBA and SNMP Coverage (continued)

NE Type	GateWay/CORBA Support?	GateWay/SNMP Support?
ONS 15540 ESP, ESPx	Yes	Yes
ONS 15600 SONET	Yes	Yes
ONS 15600 SDH	Yes	Yes
Not Managed/Other Vendor NEs	Yes	No

1. Prime Optical GateWay/CORBA supports only inventory management for the passive ONS 15216 NEs and Not Managed/Other Vendor NEs.

See Chapter 12, "Managing Southbound and Northbound Interfaces" for detailed information about Prime Optical GateWay/SNMP. See also *Cisco Prime Optical 9.6.3 GateWay/CORBA User Guide and Programmer Manual* for detailed information about Prime Optical GateWay/CORBA.

2.2 Data Communications Network

A DCN, also known as an Operations Support Network (OSN), is the management network that provides connectivity between a service provider's operations support center applications and the NEs that they support. The DCN supports operations, administration, management, and provisioning (OAM&P) functions such as network surveillance, provisioning, service restoration, and so on. NEs that make up the provisioned services infrastructure used to deliver services to customers include SDH, SONET, add-drop multiplexers (ADMs), optical repeaters, voice switches, digital cross-connect systems, frame relay, asynchronous transfer mode (ATM) switches, digital subscriber line access multiplexers (DSLAMs), digital loop transmission systems, and so on.

The DCN establishes the link between Prime Optical and the EMS. The DCN is important to service providers because it is a vital element in getting fast, reliable management information about the network. Service providers design the DCN as a carrier-class management solution where a single failure does not jeopardize the ability to manage the network.

2.2.1 Proxy Server/Firewall Configurations

The ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, and ONS 15600 SDH support a proxy server configuration that allows networking ONS NEs in environments where visibility and accessibility between NEs must be restricted. In a proxy server environment, NEs are designated as gateway NEs (GNEs) or end NEs (ENEs). The GNE is LAN-connected to the DCN, while the ENEs are accessed through the proxy server feature on the GNE over the section data communications channel (SDCC). The ENEs are not directly accessible by IP address; in fact, the ENE IP addresses can be in a separate, private IP address space because they are not visible on the larger DCN. The GNE must have an IP address that is valid for the DCN LAN.

2.3 What is FCPS?

Prime Optical's strategy is to provide a common, carrier-class fault, configuration, performance, and security (FCPS) EMS.

FCPS refers to the different types of information handled by management systems. A fifth area, accounting, is often included, making the acronym *FCAPS*. However, Prime Optical does not support accounting management.

2.4 Fault Management

Fault management (FM) detects, isolates, and reports faults for the network and service. Fault management tracks the correlation of related services; for example, reliability, availability, survivability, quality assurance, alarm surveillance, alarm management, fault localization, fault correction, testing, and trouble administration. Fault management also maximizes the availability of the network for service delivery.

The Alarm Browser, Alarm Log, and Dashboard provide information on fault management. Fault management tools are described in the following table.

Table 2-3 Fault Management Tools

Name	Description
Alarm Management	Identifies network problems and failures. For more information, see Chapter 9, "Managing Faults."
Alarm Browser	Displays standing alarms and conditions in the managed domain. The Alarm Browser window lists the conditions that are assigned a severity level of critical, major, minor, or warning. It also shows cleared alarms that are not acknowledged. For more information, see Chapter 9, "Managing Faults."
Alarm Log	The Alarm Log window contains alarms that have transitioned from the Alarm Browser. Cleared alarms are transitioned when you acknowledge them or when automatic acknowledgment has been enabled (in the **Control Panel > UI Properties** pane). In addition, the Alarm Log shows a history of cleared and acknowledged alarms and all transient conditions (also known as events or autonomous nonalarmed messages). For more information, see Chapter 9, "Managing Faults."
Dashboard	The Dashboard shows useful alarm and NE information in one easily accessible location. See Figure 1-2 on page 1-10.

The FM function is responsible for the discovery and localization of malfunctions on managed NEs. Prime Optical supports consolidated FM by way of the following functions:

- Alarm collection
  - Alarm and event acquisition and storage
  - EMS alarms for loss of communication, software download failure, memory backup failure, login security violation, server monitor thresholds, and free remaining disk space
  - Fault synchronization after connection loss
  - Maintenance mode state for suppression of alarms, events, and PM collection
- Alarm display

  - Quick-view Dashboard window for display of alarm count and unacknowledged alarm count, and launch of EMS alarm view
  - Alarm indication and propagation
  - Color and shape coding of severity for critical, major, minor, and warning alarms
- Alarm acknowledgement
  - Flexible alarm acknowledgment—single, multiple, all, automatic
  - Editable notes per alarm record
- Historic alarm retrieval
- Alarm sorting and filtering
- Visible and audible notification of alarm reporting
- Reports and exporting facilities

2.5 Configuration Management

With configuration management, you set and control NEs, identify resources, collect information about a resource, and manage connections between NEs. Configuration management deals not only with the state of NEs, but also with the provisioning of resources and services. Generally, configuration management involves network planning, installation, service planning and negotiation, service provisioning, equipment provisioning, status and control, and network topology. Configuration management allows you to prepare the network to deliver services.

Examples of configuration management include:

- Discovering the inventory of what is installed in the network
- Configuring chassis slots for cards based on desired services
- Managing intra-chassis connections between NEs
- Configuring cards in protected or unprotected relationships
- Configuring physical (PTP) or logical (CTP) ports to support service profiles
- Creating, modifying, viewing, and deleting network topologies and connections
- Downloading and activating NE software
- Backing up and restoring the NE configuration

Prime Optical provides different graphical views to support configuration management. All views can be classified into three main groups: explorers, network maps, and wizards.

2.5.1 Explorers

Explorer windows are divided into two sections: a tree and a pane. The tree organizes the resources (domain, groups, nodes, network partitions, subnetworks, and modules), which are displayed in a hierarchical format. You can access information about each resource by browsing the tree section. The pane provides specific information about the selected object. There are three types of explorers:

- Domain Explorer
- Subnetwork Explorer
- NE Explorer

2.5.2 Network Maps

Network Map windows display how the network is partitioned graphically. The Network Map is organized into a multilevel hierarchy that corresponds with the structure of Domain Explorer and Subnetwork Explorer trees. Users with the appropriate privileges can organize their own map display.

For more information, see 1.5.6 Network Map, page 1-28.

2.5.3 Wizards

Wizards are used to simplify involved configuration management tasks such as:

- A-to-Z circuit provisioning
- NE user access administration
- Layer 2 service provisioning
- VLAN and SVLAN provisioning
- Software download
- Native equipment/facility provisioning
- Topology/link management
- Automatic NE memory backup, on-demand restoration
- General operation on multiple NEs

2.5.4 Inventory Management

Inventory information is another component of configuration management. Prime Optical provides two levels of inventory reports:

- Domain NE table—A complete list of all the NEs that belong to a specific group or to the entire domain
- Equipment Inventory table—A detailed list of cards and modules installed on a specific NE

Note For detailed information about inventory reports, see Chapter 11, "Managing Inventory."

2.5.4.1 Adding New NEs to the Prime Optical Domain

The Add New NE wizard allows you to add a new NE, or to add several new NEs at once. The wizard allows you to enter multiple NE IP addresses one at a time, or enter a beginning and ending IP address and automatically add a range of NEs. See 3.5.2 Adding NEs, page 3-13.

2.5.4.2 NE Connectivity and Operational States

The operational state of an NE can have the following values:

- Preprovisioned—The NE has been added to the database for provisioning but is not yet in service. Prime Optical does not manage preprovisioned NEs.

- Under Maintenance—The NE is temporarily under maintenance but requires monitoring. This state is the same as In Service except that Prime Optical does not report alarms or events for under-maintenance NEs.
- In Service—The NE is currently deployed and requires monitoring. Prime Optical collects polling, FM, configuration management, and PM data from in-service NEs and stores the data in the database.
- Out of Service—The NE has been marked Out of Service by a network administrator and does not require monitoring. The Prime Optical database records the last known state of the NE when it was in service.
- In Service–Initializing—The NE is marked as In Service–Initializing when Prime Optical connects to the NE (Communication State is marked as Available) and the discovery process starts. The initialization process is completed when fault and inventory have been synchronized. The operational state changes from In Service–Initializing to In Service–Synch Configuration.
- In Service–Synch Configuration—The NE is marked as In Service–Synch Configuration when Prime Optical uploads a configuration for that NE. You can change the operational state of an NE from In Service–Synch Configuration to Out of Service.

The communication state of an NE can have the following values:

- Not Applicable—The NE is Preprovisioned or Out of Service. The connection to the NE has not been established or has been dropped.
- Available—The NE is In Service or Under Maintenance and Prime Optical is connected to the NE. The NE is declared Available when it is reachable and supported by Prime Optical (as defined in **Administration > Supported NE Table**).
- Unavailable—The NE is In Service or Under Maintenance but Prime Optical cannot establish a connection to the NE. When Prime Optical loses the connection to the NE, an EMS alarm with a probable cause of *Connection loss* is generated.
- Initialization Failed—The NE software version is not listed in the Supported NE table.

2.5.5 Provisioning

Prime Optical supports provisioning through:

- NE Explorer—Shows service-provisioning information about the selected NE.
- Craft interface—Depending on the NE model, Prime Optical provides access to NE craft interfaces such as CTC, Cisco Edge Craft, web browsers, and the CLI.

Note A CLI session might not have a scroll bar depending on the operating system you are using. To enable the scroll bar on Solaris, hold down the Ctrl key, click the middle button of your mouse, and select enable scroll bar.

The following table lists the available craft interfaces by NE model.

Table 2-4 Craft Interface by NE Model

NE Model	Craft Interfaces Available from Prime Optical
ONS 15216 EDFA2	TL1 interface
	CLI

Table 2-4 Craft Interface by NE Model (continued)

NE Model	Craft Interfaces Available from Prime Optical
ONS 15216 EDFA3	TL1 interface
ONS 15216 100-GHz OADM	TL1 interface
ONS 15305	CLI
	CTC (available only for the ONS 15305 R3.0)
	Cisco Edge Craft
ONS 15310 CL	CTC
	TL1 interface
ONS 15310 MA SONET	CTC
	TL1 interface
ONS 15310 MA SDH	CTC
	TL1 interface
ONS 15327	CTC
	TL1 interface
ONS 15454 SONET	CTC
	TL1 interface
ONS 15454 SDH	CTC
	TL1 interface
ONS 15530	Cisco IOS CLI
	TL1 interface
ONS 15540 ESP, ESPx	Cisco IOS CLI
	TL1 interface
ONS 15600 SONET	CTC
	TL1 interface
ONS 15600 SDH	CTC
	TL1 interface

2.5.6 Link Management

A link is a connection between two termination points (TPs). Prime Optical represents the physical connectivity between NEs in the domain by defining the physical links between NEs. Prime Optical allows you to view, create, modify, and delete links. Prime Optical also supports a Link Utilization table, which displays utilization information and overall consumption of bandwidth for the selected links.

Note For all NEs that support links, you can add manually provisioned links. For example, you can define manual and patchcord links for the ONS 15454. For detailed information, see 3.6 How Do I Build Links?, page 3-28.

2.5.7 Circuit Management

A circuit represents an end-to-end connection between two or more connection termination points (CTPs). A circuit consists of an alternating series of cross-connections and link connections. In its simplest form, a circuit consists of a single cross-connection (if the circuit is defined between two CTPs on the same NE). A circuit can be bidirectional or unidirectional, point-to-point or point-to-multipoint, and protected or unprotected.

Prime Optical supports the following circuit management operations:

- Find circuits
- View circuits and circuit spans
- Create circuits
- Modify circuits
- Delete circuits
- Trace circuits
- Display associated VLANs
- Upgrade circuits
- Repair circuits
- Update circuits
- Roll circuits
- Merge circuits
- Reconfigure circuits

Note See Chapter 7, "Provisioning Services and Connections" for detailed information about circuit provisioning.

2.5.8 NE Release Management

An NE added to the Prime Optical domain is discovered and managed by Prime Optical only if the NE software version is defined in the Supported NE table.

Note See *Release Notes for Cisco Prime Optical 9.6.3* for the NE software versions that are supported in Prime Optical 9.3.1.

Caution Before updating the software image on an NE, check the Prime Optical release notes to verify whether the NE software version is supported in this Prime Optical release.

The following NE administration features are available for ONS 15216 EDFA, ONS 15305, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 155xx, ONS 15600 SONET, and ONS 15600 SDH NEs:

- Software download (not available for the ONS 15305 R3.0)
- Memory backup and restore (not available for the ONS 15305)

- Job monitoring
- NE Software table (used to commit or revert software images)

2.5.8.1 Software Download Wizard

Use the Software Download wizard to download software to NEs. After the download is complete you can use the NE Software table to activate the software. The downloaded software becomes the active version, and the active version becomes the standby version. Prime Optical stores two software versions: active and standby.

2.5.8.2 Memory Backup Dialog Box

Use the Memory Backup dialog box to back up configuration and provisioning information that resides in the flash memory of an NE. By default, the local Prime Optical server automatically backs up the memory of NEs once a day for seven days and stores the backup files on the Prime Optical server. After seven days, the oldest backup file is replaced by the current backup.

2.5.8.3 Memory Restore Dialog Box

Use the Memory Restore dialog box to restore provisioning and configuration information stored in the flash memory of an NE.

2.5.8.4 Job Monitor Table

The Job Monitor table provides information about scheduled administrative tasks such as task type, task owner, task status, task start and end time, and so on.

2.5.8.5 NE Software Table

The NE Software table displays the active and standby software versions for the NE. From this table, you can activate new software or revert software on NEs.

2.6 Performance Management

Performance management (PM) involves gathering and reporting information on the behavior of NEs, networks, and services, including quality assurance, monitoring, management control, and analysis. It also involves the system's ability to collect and store massive amounts of statistical data for network activity.

Performance management ensures that the network delivers services with the promised quality. PM data is useful for fine-tuning the performance of the device and proactively monitoring for catastrophic failures before they occur. The NEs accumulate PM statistics in 15-minute and 1-day intervals.

Note See Chapter 10, "Managing Performance" for more information.

Examples of performance management include:

- Collecting, storing, and forwarding data to characterize the integrity of transmission

- Determining when connections fail to meet committed integrity thresholds

2.6.1 Selectable Collection of PM Data Parameters

There are two steps to setting PM collection:

1. Enable PM collection for a given NE model (in the **Control Panel > PM Service** pane)
2. Enable PM collection for specific NEs (in the Domain Explorer or **Subnetwork Explorer > NE Properties** pane > **Status** tab > **PM Collection** area)

PM data cannot be collected unless the PM Service process is running. If PM data collection is enabled on an NE but the PM Service is not running, Prime Optical displays a warning message.

For certain NEs, you can also enable robust PM data collection at the NE level. With robust collection, Prime Optical attempts to recover from any data collection gaps that might occur due to an outage or an extended communication failure. If Prime Optical detects a data gap, it attempts to retrieve the missing PM data from the historical registers available on the NE.

For the ONS 15530 and ONS 15540, you can use the Cisco IOS CLI to enable performance monitoring on each NE and module.

Note See 10.3.6 Enabling or Disabling PM Data Collection on an Individual NE, page 10-12 and 10.3.7 Enabling or Disabling PM Data Collection by PM Category for CTC-Based NEs, page 10-13 for information on enabling and disabling PM data collection.

2.6.2 PM Query and Graphs

Prime Optical offers two PM query wizards to view PM reports:

- Query by NE Model—Allows you to filter PM data by non-CTC-based NE models
- Query by PM Category—Allows you to filter PM data by PM category, which can span multiple NE models

The PM Query by NE Model wizard allows you to specify:

- Non-CTC-based NE model (ONS 15530, ONS 15305, and so on)
- PM type (SONET Section, SONET Line, and so on)
- 15-minute, 1-day, or real-time collection
- Near-end or far-end collection
- Time period
- Module type (valid only for real-time PM data collection)
- Physical location, where applicable

The PM Query by Category wizard allows you to specify:

- PM category (SONET, SDH, DWDM, and so on)
- PM type (SONET Section, SONET Line, and so on)
- 15-minute, 1-day, or real-time collection

- Near-end or far-end collection
- Time period
- Module type (valid only for real-time PM data collection)
- Physical location, where applicable

Note Performance management is not supported for the ONS 15216.

All PM tables contain a Plot tab that you can use to plot the data in a graphical view that is stored in the Prime Optical database. Prime Optical plots up to three parameters in one graph for comparison. The Y axis represents the selected parameter(s); the X axis shows the time.

2.6.3 Real-Time PM Reporting

Prime Optical supports the ability to launch a real-time PM report from the PM Query wizard or from a single row in a PM table. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. You can view and modify the polling interval for the real-time PM reporting session. You can end a real-time PM session at any time and export the data. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Note Real-time PM reporting applies only to CTC-based NEs.

2.7 Security Management

Security management prevents and detects any improper use of network resources and services. Aspects of security management include prevention, detection, containment, and recovery.

Security management protects the revenue-generating assets in the network. Examples of security management include:

- Controlling access to network management functions
- Controlling access to network logical resources

Security for the Prime Optical system can be divided into the following areas:

- Prime Optical security domain: To log into the Prime Optical client, a username and password are required. A user profile defines the access privileges. Prime Optical passwords are stored using MD5 one-way encryption. DES 64-bit encrypted passwords are stored in MD5 on the Prime Optical server. A password entered on the Prime Optical client is converted to DES-64 before being sent to the Prime Optical server. If the password matches the password on the server that the SuperUser or SysAdmin configured for the user, or if the user changed his or her password when prompted, that password is stored on the server. Passwords are not stored on the user's local workstation.
- OSS security domain: OSS-to-Prime Optical sessions are configured by the Prime Optical GateWay EMS-to-NMS interface architectural component.
- NE security domain: At the NE level, a username and password are configured to enable the user to connect directly through the console port (EIA/TIA-232), through the management port (10BASE-T), or remotely through a Telnet session. NE passwords are stored using base-64 two-way encryption.

- Prime Optical server login: You must have root user privileges to log into the Prime Optical server workstation for debugging or changing the Prime Optical server program. A username and password are required.
- Oracle database access: Access to the Oracle database requires Oracle root user authentication, as well as Prime Optical database access authentication. The Oracle username and password are encrypted in the server configuration file.

Prime Optical supports the following security features:

- Login advisory message
- User management and profiles
- NE access control
- Audit Log

2.7.1 Login Advisory Message

The following is the default advisory message after logging into the Prime Optical client:

```
Cisco Prime Optical is a carrier-class, multitechnology management system that integrates
the end-to-end management of legacy transport networks and packet optical transport
networks. Cisco Prime Optical helps communication service providers (CSPs) deliver the
capacity and quality of service (QoS) required to support the delivery of
rich-content-based services and high-bandwidth applications.
```

Note The login advisory message is not shown if you login to Prime Optical through Prime Central.

You can customize the default advisory message, or disable it altogether. See Chapter 8, "Managing Security."

2.7.2 Network Partitioning

You can configure for network partitioning by dividing the network into logical areas. You can then access only the areas that are specified under your security profile. The nodes and elements must fall under the area or areas that fit your security profile for each Prime Optical application.

You can:

- Define the network partitions from the associated list of nodes.
- Define, modify, and view the areas within your network.
- Manage only the areas under your security profile.
- Manage connections that originate and terminate within the assigned area(s). The domain can include multiple areas.

2.7.3 User Management and Profiles

Prime Optical user management includes the ability to:

- Manage predefined default user profiles with different access privileges. The default user types are:
  - SuperUser—Users who have access to all operations.

  - SysAdmin—System administrators who manage Prime Optical access.
  - NetworkAdmin—Typically, network operations center (NOC) supervisors who perform daily network surveillance, provisioning, and PM activities on any group or NE.
  - Provisioner—Users who perform daily network surveillance, provisioning, and PM activities on specific NEs. Each provisioner can have only one active session. Provisioners cannot access administrative information.
  - Operator—Users who perform daily network surveillance and PM activities on specific NEs. Each operator can have only one active session. Operators cannot access administrative information.
- Create, delete, modify, and duplicate custom user profiles with certain privileges. Custom user profiles are grouped into categories and each category has a set of operations.
- Create, delete, or modify Prime Optical users; view logged-in users; and end active user sessions.
- Regulate user logins, including password aging, login disable period, and logout time.
- Specify a CTC username and password.

Note Prime Optical can connect to a CTC-based NE only if that NE is configured with a CTC user who has SuperUser privileges.

- Configure the username and password used by the Prime Optical server to access NEs.
- View, add, modify, and delete NE user accounts on one or more NEs.

Note For detailed information about user management, see Chapter 8, "Managing Security."

2.7.4 NE Access Control

NE access control includes the ability to:

- Configure the username and password used by the Prime Optical server to access NEs and retrieve alarms, configuration, and inventory information.

Note Each username and password specified must exist on the selected NE in order for Prime Optical to manage it. A new or modified password takes effect at the next reconnection.

- Configure the username and password on multiple NEs by using the bulk NE authentication feature. With a single operation, you can specify the same username and password for NEs that belong to the same group or are assigned to the same user.
- Manage NE user accounts by using the NE User Access Administration table. This feature supports the ability to view, add, modify, and delete NE user accounts on one or more NEs.
- Monitor active NE users and log out selected users.
- Add predefined users on a selected NE.

2.7.5 Audit Log

The Audit Log contains information about significant events (user-initiated changes and activities) that occurred on the Prime Optical server during a specific time period for the purposes of establishing accountability. It also helps in identifying remedial actions to correct an improper activity. The Audit Log is implemented in the Prime Optical database, where each record has a time stamp, record type, and message string.

Note See Chapter 8, "Managing Security" for a list of runtime-affecting operations that the Audit Log records for monitoring purposes.

Building the Network

After you have planned your network, you can begin building the network components: groups, network partitions, subnetworks, NEs, links, and network maps.

This chapter contains the following sections:

- 3.1 Overview, page 3-1
- 3.2 How Do I Build Groups?, page 3-2
- 3.3 How Do I Build Network Partitions?, page 3-4
- 3.4 How Do I Build Subnetworks?, page 3-5
- 3.5 How Do I Build NEs?, page 3-7
- 3.6 How Do I Build Links?, page 3-28
- 3.7 How Do I Build Server Trails?, page 3-53
- 3.8 How Do I Use Network Maps?, page 3-55
- 3.9 How Do I Discover the Network for Optical Devices?, page 3-63
- 3.10 How Do I Manually Discover NEs and Add Them to Specific Network Partitions?
- 3.11 How Do I Test Connectivity for Optical and Routing Devices?, page 3-73

3.1 Overview

The Cisco Prime Optical management domain is the top-level root node in the Domain Explorer tree. The management domain contains NEs and the following network components:

- Groups—Collection of groups or collection of NEs. NEs are often grouped geographically or by domain.
- Network Partitions—Logical segment of NEs (grouped in subnetworks) in which NEs of the same model type are managed by a single NE service.
- Subnetworks—Sets of NEs interconnected at a specific network layer (such as physical, section, line, and so on). Subnetworks are contained within network partitions. NEs must belong to the same subnetwork to create circuits between them.
- Links—Physical or logical entities (for example, a fiber) between two physical points (for example, ports). Circuits are provisioned through links.
- Network Maps—Geographic representation of the NEs in the domain, the circuits and links between NEs, and the number of alarms associated with NEs.

3.2 How Do I Build Groups?

NEs in the Domain Explorer are organized into groups, which consist of NEs or other groups. NEs are often grouped geographically or by domain. The same NE or group can be assigned to different groups. The following sections describe how to add, copy, move, and delete groups.

3.2.1 Adding Groups

Step 1 Select a node or group in the Domain Explorer tree.

Note You cannot add a new group to the Discovered Network Elements or Deleted Network Elements groups.

Step 2 Choose **File > New Group** (or click the **Add a New Group** tool). The New Group dialog box opens.

Step 3 Enter the following information in the New Group dialog box.

Table 3-1 Field Descriptions for the New Group Dialog Box

Field	Description
Group ID	Unique name for the group.
Location Name	Geographic location of the group.
Description	Description of the group.

Step 4 Click **OK**. The new group appears in the Domain Explorer tree.

3.2.2 Copying Groups

You can easily create domains for multiple users in Prime Optical. Just copy the same groups in different domains, so that users who work different shifts can use the same group.

Step 1 In the Domain Explorer tree, select the group to be copied.

Step 2 Choose **Edit > Copy** (or click the **Copy** tool).

Step 3 Select the group where the group will be pasted and choose **Edit > Paste** (or click the **Paste** tool). This pastes the group under the selected group.

Note You cannot paste a group into the Discovered Network Elements or Deleted Network Elements groups.

Tip The drag-and-drop feature can also be used to copy groups. Use the mouse to drag and drop the group to a new location.

Since they cannot see the entire domain, users with the Assign NEs property (Provisioner, Operator, and some custom user profiles) are not allowed to modify the topology using copy, cut, paste, or drag and drop. See Chapter 8, "Managing Security" for information about the Assign NEs property.

3.2.3 Moving Groups

Prime Optical provides drag-and-drop capabilities to easily move groups in the Domain Explorer tree.

Step 1 In the Domain Explorer tree, select the group to be moved.

Step 2 Use the mouse to drag and drop the selected group to a new location.

Note You cannot move groups into the Discovered Network Elements or Deleted Network Elements groups.

3.2.4 Deleting Groups

Prime Optical allows you to delete a single group or multiple groups.

3.2.4.1 Deleting a Single Group

Step 1 In the Domain Explorer tree, select the group to be deleted.

Step 2 You can delete either the selected instance of the group or all instances of the group:

- To remove the selected instance of the group, choose **Edit > Delete**; then, click **Yes** in the confirmation dialog box.
- To remove all instances of the selected group, choose **Edit > Delete All**; then, click **Yes** in the confirmation dialog box.

Note Before deleting the last instance of a group, the group must be empty. Move all of the NEs and groups that the group contains to a different group.

3.2.4.2 Deleting Multiple Groups

Step 1 In the Domain Explorer tree, select the group to be deleted. Select multiple groups by pressing the **Ctrl** key, then click each group that will be deleted.

Step 2 You can delete either the selected instance of the groups or all instances of the groups:

- To remove the selected instance of the groups, choose **Edit > Delete**; then, click **Yes** in the confirmation dialog box.
- To remove all instances of the selected groups, choose **Edit > Delete All**; then, click **Yes** in the confirmation dialog box.

Note Before deleting the last instance of a group, the group must be empty. Move all of the NEs and groups that the group contains to a different group.

3.3 How Do I Build Network Partitions?

Network partitions are groups of subnetworks or groups of NEs that are managed by the same NE service. Different network partitions mean different NE services. You can add, modify, or delete network partitions in the Subnetwork Explorer window.

Note Prime Optical contains one network partition by default.

Note A single network partition should contain fewer than 500 CTC-based NEs. Multiple network partitions must be used if your NE counts exceed these limits or if you are managing ANSI and ETSI devices in the same Prime Optical domain.

Note When automatic subnetwork grouping is enabled while performing operations on a network partition, NE visibility might be affected. Wait for a few minutes while Prime Optical arranges the NEs and subnetworks in the correct network partition. For more information on automatic subnetwork grouping, see 3.5.6 Automatically Grouping NEs in Subnetworks, page 3-23.

3.3.1 Adding Network Partitions

Step 1 In the Domain Explorer window, choose **File > Subnetwork Explorer**.

Step 2 In the Subnetwork Explorer window, choose **File > Add New Network Partition** (or click the **Add a New Network Partition** tool). The Add New Network Partition dialog box opens.

Step 3 Enter the following information.

Table 3-2 Field Descriptions for the Add New Network Partition Dialog Box

Field	Description
Network Partition ID	ID of the network partition. The range is from 1 to 128 alphanumeric or special characters.
Description	Network partition description.

Step 4 Click **OK**. The new network partition appears in the Subnetwork Explorer tree.

3.3.2 Modifying Network Partitions

Step 1 In the Domain Explorer window, choose **File > Subnetwork Explorer**. The Subnetwork Explorer opens.

Step 2 In the Subnetwork Explorer tree, select a network partition to modify.

Step 3 In the Network Partition Properties pane, click the **Identification** tab.

Step 4 Modify the following information as needed.

Table 3-3 Field Descriptions for the Network Partition Properties Pane

Field	Description
Network Partition ID	ID of the network partition. The range is from 1 to 128 alphanumeric or special characters.
Description	Network partition description.

Step 5 Click **Save**.

Step 6 In the confirmation dialog box, click **Yes**. The modifications are visible in the Subnetwork Explorer tree and Network Partition Properties pane.

3.3.3 Deleting Network Partitions

Step 1 In the Domain Explorer window, choose **File > Subnetwork Explorer**. The Subnetwork Explorer opens.

Step 2 In the Subnetwork Explorer tree, select the network partition that you want to delete; then, choose **Edit > Delete**.

Note A network partition cannot be deleted if it is associated with any subnetwork in the domain, or if it is the last network partition in the domain. When the network partition is deleted, any running instances of the NE Service that were associated with the partition stop running.

Step 3 In the confirmation dialog box, click **Yes**. The network partition is removed from the Subnetwork Explorer tree.

3.4 How Do I Build Subnetworks?

Subnetworks are sets of NEs interconnected at a specific network layer (such as physical, section, line, and so on). Subnetworks are contained within network partitions. NEs must belong to the same subnetwork to create circuits between them.

The following sections describe how to add, move, and delete subnetworks. Users with the Assign NEs property (Provisioner, Operator, and some custom user profiles) can see only the subnetworks of the NEs that are assigned to them.

Note When automatic subnetwork grouping is enabled while performing operations on a subnetwork, NE visibility might be affected. Wait for a few minutes while Prime Optical arranges the NEs in the correct subnetwork. For information on automatic subnetwork grouping, see 3.5.6 Automatically Grouping NEs in Subnetworks, page 3-23.

3.4.1 Adding Subnetworks

Step 1 In the Domain Explorer window, choose **File > Subnetwork Explorer**.

Note To open the Subnetwork Explorer, the domain must contain at least one NE. If the domain does not contain any NEs, the Subnetwork Explorer menu option is unavailable.

Step 2 In the Subnetwork Explorer tree, select the network partition where you will add the subnetwork and choose **File > Add New Subnetwork** (or click the **Add a New Subnetwork** tool). The Add New Subnetwork dialog box opens.

Step 3 Enter the following information in the Add New Subnetwork dialog box.

Table 3-4 Field Descriptions for the Add New Subnetwork Dialog Box

Field	Description
Subnetwork ID	Unique name for the subnetwork. The name can contain up to 32 alphanumeric or special characters.
Subnetwork Type	Type of subnetwork (SONET, SDH, other, or unknown).
Subnetwork Topology	Subnetwork topology.
Description	Description of the subnetwork.

Step 4 Click **OK**. The new subnetwork appears in the Subnetwork Explorer tree.

Note The Add New Subnetwork feature is not available for users with the Assign NEs property (Provisioner, Operator, and custom user profiles) because they cannot see the entire domain.

3.4.2 Moving Subnetworks

A subnetwork can be moved from one network partition to another if there are no routable links among the NEs that belong to that subnetwork and if automatic subnetwork grouping is disabled. (For information about automatic subnetwork grouping, see 3.5.6 Automatically Grouping NEs in Subnetworks, page 3-23.)

Step 1 In the Domain Explorer window, choose **File > Subnetwork Explorer**.

Step 2 In the Subnetwork Explorer tree, select the subnetwork to be moved.

Step 3 Use the mouse to drag and drop the selected subnetwork to a new network partition.

3.4.3 Deleting Subnetworks

Step 1 In the Domain Explorer window, choose **File > Subnetwork Explorer**.

Step 2 In the Subnetwork Explorer tree, click the subnetwork that will be deleted.

Note Only an empty subnetwork can be deleted. An empty subnetwork is one that does not contain any NEs or deleted NEs. Trying to delete a subnetwork that contains deleted NEs will generate the error message: "Selected subnetwork has some deleted NEs. Prune those NEs to delete the subnetwork." Before deleting the subnetwork, remove the deleted NEs from the Prime Optical database. For more information, see 3.5.7.4 Removing a Deleted NE, page 3-27.

Step 3 Choose **Edit > Delete**.

Step 4 In the confirmation dialog box, click **Yes** to remove the subnetwork from the tree.

3.5 How Do I Build NEs?

When you add a new NE, you select the subnetwork to which you will add it. Consequently, the NE is added to the network partition that contains the selected subnetwork. This allows you to create circuits between NEs.

You can also add a new NE without selecting a subnetwork. A new subnetwork will be created for each new NE.

3.5.1 Prerequisites for Adding NEs

Before adding a new NE, enable the NE service for that NE. (You can, however, add the NE even if the NE service is disabled.) The NE service is enabled by default, but the service is not started as a process unless you activate an NE for that particular service. You must also meet certain other specific prerequisites depending on the type of NE you are adding.

Note There are no prerequisites for adding ONS 15327, ONS 15600 SONET, or ONS 15600 SDH NEs.

3.5.1.1 Prerequisites for Adding ONS 15216 EDFA2 and EDFA3 NEs

Before adding ONS 15216 EDFA2 and EDFA3 NEs to Prime Optical, you must do the following:

- Configure the Prime Optical SNMP community string with read-write access on the ONS 15216 EDFA2 or EDFA3. Refer to the NE documentation for more information.
- Ensure that the Prime Optical SNMP community string value and the CommTrapEntry community string value on the ONS 15216 EDFA2 or EDFA3 match. To ensure that these values match, enter the value from the CommTrapEntry in the ONS 15216 EDFA2 or EDFA3 into the SNMP Community String field in the Domain Explorer.
- (For the ONS 15216 EDFA3 only) Start the FTP service. To verify that the FTP service has started, enter the **ftp 0** command and enter the username and password specified during installation.
- (For the ONS 15216 EDFA2 only) Configure the TFTP service on the Prime Optical server to publish the TFTP directory and start the TFTP service. The directory to be published as a TFTP directory should have read-write access.

To configure the default tftpboot directory:

Step 1 Start the TFTP service on the Prime Optical server by uncommenting the TFTP service entry from the /etc/inetd.conf file, and update the name of the directory to be published as a TFTP directory. For example:

```
tftp dgram udp6 wait root /usr/sbin/in.tftpd in.tftpd -s /tftpboot
```

Step 2 Stop and restart the inetd process.

The name of the ONS 15216 EDFA3 NE must be unique and cannot be a null value. To set the name of the ONS 15216 EDFA3 NE:

Step 1 Log into TL1 for that particular NE. For example, enter:

telnet *IP-address* **3083**

Step 2 Enter the username and password. For example, enter:

ACT-USER::*username***:123::***password***;**

Step 3 Enter the following command to set the new name on the ONS 15216 EDFA3 NE:

ED-NE-GEN:::123:::NAME=*new-name***;**

Step 4 Enter the following command to verify that the name is correct:

RTRV-NE-GEN:::123;

Step 5 Enter the following command to log out:

CANC-USER::*username***:123;**

Note For passive ONS 15216 NEs, there is no communication between Prime Optical and the NE itself, and all the information is user-defined. For example, you can add inventory information in the Domain Explorer and add specific information (such as a serial number) in the NE Explorer. For passive ONS 15216 NEs with multiple slots, you can use the NE Explorer to specify the content of each slot. The information you define is maintained in the database and propagated to an external OSS by using Prime Optical GateWay/CORBA.

3.5.1.2 Prerequisites for Adding ONS 15305 NEs

Before adding ONS 15305 NEs to Prime Optical, be sure that a valid SNMP community string is set up on the ONS 15305 to allow performance monitoring and fault management data collection from the NE.

Note To enable you to add an ONS 15305 NE to Prime Optical, its SNMP Users table must contain the row 0.0.0.0 public true, where *public* is the community string. In addition, to obtain trap events from the NE, the Prime Optical server IP address must be added to the NE. See the Cisco Edge Craft user documentation for more information.

3.5.1.2.1 Important Note About Upgrading from ONS 15305 R2.0.2, R2.0.3, or R2.0.4 to ONS 15305 R3.0

When upgrading from ONS 15305 R2.0.2, R2.0.3, or R2.04 to ONS 15305 R3.0, note the following constraints:

- After you upgrade the NE to ONS 15305 R3.0, you must delete the R2.0 NE (with NE model "ONS 15305") from Prime Optical and add it again with the correct NE model attribute ("ONS 15305 CTC").
- All PM data that was collected before the upgrade will be lost.

These constraints exist because the NE service that manages the ONS 15305 R2.0.2, R2.0.3, and R2.0.4 is different from the NE service that manages the ONS 15305 R3.0.

3.5.1.3 Prerequisites for Adding ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH NEs

Before adding ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH NEs with ML-series cards to Prime Optical, be sure the NEs are set up as follows:

- Because Prime Optical does not support duplicate IP addresses, be sure that your ONS network does not contain duplicate IP addresses before adding ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH NEs.
- A valid SNMP community string must be given when adding an NE with ML-series cards to resynchronize Syslog and Configuration events. Audit log messages will be added in case of a resynchronization failure.

Note For SNMPv3 node configuration, see 8.4.6 Managing SNMPv3—CTC-Based Release 9.6 NEs, page 8-64.

- A trap destination with IP address equal to the Prime Optical server IP address, UDP port 162, SNMP version as SNMPv2c, maximum traps per second set to 0, and SNMP community string must be created and must allow SNMP sets to receive traps from ML-series cards.
- The Cisco IOS startup-config file must have the **snmp-server enable traps** command to receive traps from ML-series cards.
- Whenever the user changes the trap destination for NE IP address and port=162/391 in either CTC or Prime Optical, NEs must be out of service to resynchronize the ML-series card events and be registered for traps. Change the operational state of the NE to In Service after making the changes.
- CTC SuperUser credentials (NE username and password) are required to exploit full Prime Optical functionalities.
- If your network contains ML cards, SNMPv1/SNMPv2c uses the following configurations on GNEs and ENEs for traps:
  - GNE trap destination: Prime Optical server IP address
  - GNE trap port: 162
  - GNE community string: public
  - GNE version: v1 or v2c
  - ENE trap destination: GNE IP address
  - ENE trap port: 391
  - ENE community string: Same as on GNE
  - ENE version: v1 or v2c

Note Keep the SNMP version consistent across all the GNEs/ENEs in the ring.

3.5.1.3.1 Adding a DWDM Node to an Existing Multi-Service Transport Platform (MSTP) Network

Step 1 Mark the two NEs of the DWDM span (where you want to insert the new node) as Out of Service.

Step 2 Delete all invalid DWDM links between the two NEs from Prime Optical.

Step 3 Complete the steps in the *NTP-G129 Add a DWDM Node* section, described in the *Cisco ONS 15454 DWDM Procedure Guide*.

Step 4 Mark the two NEs as In Service. The newly added NE will be automatically discovered when the new links are running.

3.5.1.4 Prerequisites for Adding ONS 15530 and ONS 15540 NEs

Before adding ONS 15530 and ONS 15540 NEs to Prime Optical, verify that the NEs are set up correctly. You can perform most of the setup by using the NE CLI.

When adding NEs to the network, first add information to the SNMP Community String table; then, add one NE (in the Add New NE wizard) for each group of interconnected ONS 155xx NEs. This NE becomes the starting point for automatically discovering the other NEs. Immediately after you add this NE, the information in the SNMP Community String table is used to discover all other ONS 155xx NEs in the group.

The examples given in this section are provided as examples only. Refer to the relevant hardware documentation for detailed command information.

3.5.1.4.1 Hostnames and IP Addresses (Required)

All NEs must be configured with unique hostnames and IP addresses.

3.5.1.4.2 SNMP Community Strings (Required)

NEs must be reachable through SNMP. Use the **snmp-server host** command to add the Prime Optical server to the list of SNMP trap destinations on each NE. Use the **snmp-server enable traps** command to enable trap generation for events and alarms.

Note Only SNMP version 2c traps are supported.

Each NE must have an entry in the SNMP Community String table, which is the basis for ONS 155xx autodiscovery and must contain valid community strings for each ONS 155xx in the network. Autodiscovery relies on Cisco Discovery Protocol (CDP) or on the configuring topology on the device.

There is one default entry in this table, which provides SNMP access to all ONS 155xx NEs in the network, provided you are using the default community strings.

You can add, modify, and delete entries in this table. All fields in an entry must be filled in; blank fields are not permitted.

To add entries to the SNMP Community String table:

Step 1 In the Domain Explorer window, choose **Administration > ONS 155XX > ONS 155XX SNMP Settings Table**. The SNMP Community String table opens. Table 3-5 provides descriptions.

Step 2 If the IP address of the NE is not already in the table, choose **Edit > Add**. The Add SNMP Parameters dialog box opens.

Note The SNMP Community String table contains a default entry for all ONS 15530 and ONS 15540 NEs that are configured with the default community string.

Step 3 Add the IP address in the Target field; the IP addresses for all ONS 15530 and ONS 15540 NEs must be specified in this table.

Step 4 Be sure that the correct community strings for each ONS 15530 and ONS 15540 are in the table under the Read/Write field.

Step 5 (Optional) Configure the timeout and retry values.

Step 6 Click **OK**.

Table 3-5 Field Descriptions for the SNMP Community String Table

Field	Description
Target	IP address of the NE or range of NEs to which you are assigning the community strings in this entry. You can enter a specific IP address, wildcard characters (*) in any portion of the address, and ranges. For example: • 172.*.*.* • 172.20.[4-55].* You can add a combination of general and specific entries, but the community strings are read from most specific to least specific. Wildcard characters cannot appear in ranges.
Read/Write	Community string that allows read/write access to the NEs in the entry.
Retry	Number of times the server attempts to communicate with the device before reporting that the device has timed out. By default, the server makes one retry. You can specify from 0 to 5 retries.
Timeout	Length of time the server waits for a response from the device before performing the first retry. The Cisco default timeout is 15 seconds. You can specify from 0 to 60 seconds.

Note

- You can change SNMP Community String table entries at any time to match the community strings set on NEs. Routine community string changes take effect after the next health poll cycle or after a rediscovery. For information about the health poll or about discovery, see Chapter 4, "Maintaining an Efficient Network."
- You can modify SNMP parameters. In the SNMP Community String table, choose **Edit > Modify** to modify the SNMP parameters in the Modify SNMP Parameters window.
- You can delete SNMP parameters. In the SNMP Community String table, choose **Edit > Delete** to delete SNMP parameters.

3.5.1.4.3 Topology Setup

Appropriate topology information must be configured on ONS 15530 and ONS 15540 NEs for automatic discovery of neighbors and discovery of physical links. For the ONS 15530 and ONS 15540, the topology can be configured in two ways: by using CDP learning or through IP using Ethernet.

CDP neighbor information exchanged between the Optical Supervisory Channel (OSC) ports of two adjacent NEs, or between the wavelength division multiplexing (WDM) ports of two NEs that are directly connected, usually reflects the actual physical topology. CDP neighbor information can be used to populate the physical topology in these cases. To enable topology learning through CDP, you must first enable CDP on the corresponding OSC ports, and then enable topology learning via CDP. For example, assume that two ONS 15540 NEs are connected through the wdm0/0 port on each side, with OSC port Wave0 present on both sides:

1. The **cdp enable** CLI command, when entered in the interface configuration mode of interface Wave0 of both NEs, enables CDP on the two Wave0 interfaces.
2. The **topology neighbor cdp proxy Wave0** CLI command, when entered in the interface configuration mode of interface wdm0/0 of both NEs, enables physical topology learning via CDP information exchanged between the Wave0 ports of the two NEs.

For NEs without OSC, manually configure the appropriate topology neighbors between all of the connected inter-NE links by using **topology neighbor** commands, as in the following examples:

- For the ONS 15530 and ONS 15540, if wdm0/0 of NE1 (IP address 1.1.1.1) is connected to wdm1/0 of NE2 (IP address 2.2.2.2) in a point-to-point topology, add the following commands to the configuration for interface wdm0/0 of NE1:

```
topology neighbor name NE2 port name Wdm1/0
topology neighbor agent ip-address 2.2.2.2
```

  Add the following topology commands to the configuration for interface wdm1/0 of NE2:

```
topology neighbor name NE1 port name Wdm0/0
topology neighbor agent ip-address 1.1.1.1
```

3.5.1.4.4 Patch Setup

Optical patches must be set up on all NEs between through interfaces, WDM interfaces, and so on.

For NEs with OSC, additional configuration is required. Add patches between the Wave and OSC filter interfaces. For example, if the Wave 0 interface is connected physically to the OSC filter 0/0 interface, add a patch using the following command:

```
patch Wave 0 Oscfilter 0/0
```

3.5.1.4.5 Performance Monitoring (Optional)

Performance monitoring is optional, but you must enable it if you want to monitor threshold alarms and performance parameters.

You can enable performance monitoring by using the device CLI. For information about using the CLI, see the relevant hardware documentation.

3.5.1.5 Prerequisites for Adding CPT 200 and CPT 600 NEs

If a CPT 200 or CPT 600 NE is connected to an ONS 15454 NE, the CPT NE model must match the ONS 15454 NE model. For example, if the ONS 15454 NE is added as a SONET NE, the CPT 200 or CPT 600 NE must be added as a SONET NE.

If the CPT 200 or CPT 600 NE is a standalone NE, the NE model is irrelevant.

3.5.2 Adding NEs

From the Domain Explorer or Subnetwork Explorer tree, you can use the Add New NE wizard to add a single NE or multiple NEs.

Note Prime Optical does not support duplicate IP addresses. Before adding NEs, be sure that your network does not contain duplicate IP addresses.

3.5.2.1 Adding a Single NE

Note If you are adding an ONS 155xx NE, first verify that the NE is covered by an entry in the SNMP Community String table.

Step 1 Select a node in the Domain Explorer or Subnetwork Explorer tree; then, choose **File > Add Network Element(s)** (or click the **Add Network Element(s)** tool). The Add New NE wizard opens. Table 3-6 provides descriptions.

Note You cannot add a new NE to the Discovered Network Elements or Deleted Network Elements groups.

Step 2 Enter the following information:

- NE model
- NE type

Step 3 Click one of the following radio buttons in the NE Addition area:

- **Single NE Addition**—To add only one NE.
- **Single NE Addition (Use TL1 Tunnel)**—To add only one tunnel NE (TNE). Prime Optical can connect to a TNE that belongs to an OSI network behind a non-Cisco GNE.

Step 4 Complete the following substeps if you are adding a single NE:

a. Click one of the following radio buttons in the IP Address area:
   - IP
   - Hostname

b. Enter the IP address or hostname; then, click **Add**.

Note You can enter an IP address in IPv4 or IPv6 format.

To enable you to add an NE using its hostname, the hostname must be resolved inside the Domain Name Service (DNS).

Step 5 Complete the following substeps if you are adding a single TNE:

a. Enter the gateway NE.

b. Click one of the following radio buttons:
   - Use Default TL1 Port.
   - Use Other TL1 Port—If selected, enter the TL1 port number.

c. Choose a TL1 encoding mode from the drop-down list.

d. Check the GNE Login Required check box if GNE login is required.

e. Enter the GNE TID (*available if the GNE Login Required check box is checked*)

Step 6 Click **Next**.

Note If you click **Finish** in this window, Cisco default values are assigned to the remaining fields. In addition, the NE is placed in a preprovisioned state, and discovery does not start automatically. If you want to add the NE in a nonpreprovisioned state, click **Next** and proceed to the next window; then, in the Operational State field, select a state other than Preprovisioned.

Step 7 Enter the following information. Fields shown depend on the NE type.

a. NE ID

Note
- Do not use "Prime Optical" as an NE ID because the Alarm Browser might contain Prime Optical alarms with the source ID "Prime Optical." It will be difficult to distinguish between NE alarms and Prime Optical alarms if they both have the same source ID. For the same reason, do not cause Prime Optical to automatically populate an NE whose NE ID is "Prime Optical."
- If you are using Prime Optical with Prime Central, do not use "None" or "All" as the NE ID, because those names have internal meaning to Prime Central.
- If the NE ID field is left blank, it will default to the IP address. After communication is established, Prime Optical discovers the NE ID from the NE.

b. Alias

c. Operational state

d. Description

e. Location name

f. Subnetwork ID

Note This field is dimmed when the Automatically Group NEs in Subnetworks check box is checked in the UI Properties pane of the Control Panel.

g. Network partition ID.

Step 8 Click the icon to view the parameters.

Step 9 Click **OK** to change the discovery mode of the network partition.

Note You can also create new network partitions by clicking the ellipsis (...) icon. Specify a name and description for the new network partition.

Step 10 To view the threshold of the new network partition, the number of NEs (which will be 0), and the option to change the discovery mode, select either Manual or Automatic (the default) from the drop-down list.

If you choose Automatic, Prime Optical automatically discovers all NEs and adds them to the network partition. If you choose Manual, the NE is added and remains in the Undiscovered Network Elements folder (**Administration > Control Panel**).

Note If you have no NEs in a network partition but are still unable to change the discovery mode, check if the Allow Provisioning (**Administration > Control Panel > UI Properties**) check box is unchecked. Also, check the value of the Discovery Mode drop-down list.

Caution Be sure to specify the correct partition. If you specify the wrong partition, the new NE will not be added, and you will get an error message.

Step 11 Click **Next** if you are adding an ONS 15305, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15530, ONS 15540, or ONS 15600 SONET NE.

Note If you click Finish in this window, Cisco default values will be assigned to the remaining fields.

Step 12 Click **Finish** if you are adding an ONS 15216, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15600 SDH, or Not Managed/Other Vendor NE.

Step 13 Select the grouping option for the NE.

Step 14 Click **Finish** to add the new NE to the domain.

Wait 2 to 5 minutes while the Prime Optical server completes the node discovery. (Not applicable if the operational state is Preprovisioned.)

Step 15 Check to see if the communication state is correct. If Prime Optical cannot connect to the NE, the NE displays an unavailable communication state icon in the tree.

Step 16 Verify that the NE software version is listed in the Supported NE table (Domain Explorer > Administration > Supported NE table). If it is not listed, see 4.3.8 Adding a New NE Software Version to the Prime Optical Domain, page 4-40.

3.5.2.2 Adding Multiple NEs

Step 1 Select a node in the Domain Explorer or Subnetwork Explorer tree; then, choose **File > Add Network Element(s)** (or click the **Add Network Element(s)** tool). The Add New NE wizard opens. Table 3-6 provides descriptions.

Note You cannot add a new NE to the Discovered Network Elements or Deleted Network Elements group.

Step 2 Enter the following information:

- NE model.
- NE type.
- NE addition—Click the **Bulk NE Addition** radio button.

  Note Bulk NE addition does not apply to passive ONS 15216 NEs or Not Managed/Other Vendor NEs.

- IP address range—Enter the IP addresses in the From and To fields; then, click **Add**.

Note The IP addresses must be from the same subnetwork.

You can enter IP addresses in IPv4 or IPv6 format. You can only enter IPv6 addresses if all of the selected NE models support IPv6. Prime Optical provides IPv6 support for the following NE releases: ONS 15310 MA SDH R9.3, ONS 15310 MA SONET R9.3, ONS 15454 SDH R9.3, and ONS 15454 SONET R9.3.

- IP address selection—Add or remove IP addresses using the **Add** or **Remove** button.

Step 3 Click **Next**.

Note If you click Finish in this window, Cisco default values are assigned to the remaining fields.

Step 4 Enter the following information. Fields shown depend on the NE type.

a. NE ID—*Display only.*

b. Alias—*Display only.*

c. Operational state.

d. Description.

e. Location name.

f. Subnetwork ID.

Note This field is dimmed when the Automatically Group NEs in Subnetworks check box is checked in the UI Properties pane of the Control Panel.

g. Network partition ID.

Step 5 Click the icon to view the parameters.

Step 6 Click **OK** to change the discovery mode of the network partition.

Note You can also create new network partitions by clicking the ellipsis (...) icon. Specify a name and description for the new network partition.

Step 7 To view the threshold of the new network partition, the number of NEs (which will be 0), and the option to change the discovery mode, select either Manual or Automatic (the default) from the drop-down list.

If you choose Automatic, Prime Optical automatically discovers all NEs and adds them to the network partition. If you choose Manual, the NE is added and remains in the Undiscovered Network Elements folder (**Administration > Control Panel**).

Note If you have no NEs in a network partition but are still unable to change the discovery mode, check if the Allow Provisioning (**Administration > Control Panel > UI Properties**) check box is unchecked. Also, check the value of the Discovery Mode drop-down list.

Caution Be sure to specify the correct partition. If you specify the wrong partition, the new NE will not be added, and you will get an error message.

Step 8 Click **Next** if you are adding an ONS 15305, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15530, ONS 15540, or ONS 15600 SONET NE.

Note If you click Finish in this window, Cisco default values are assigned to the remaining fields.

Step 9 Click **Finish** if you are adding an ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, or ONS 15600 SDH NE.

Step 10 Select the grouping option for the NE.

Step 11 Click **Finish** to add the NEs to the domain.

Wait 2 to 5 minutes while the Prime Optical server completes the node discovery. (Not applicable if the operational state is Preprovisioned.)

Step 12 Check to see if the communication state is correct. If Prime Optical cannot connect to the NE, the NE displays an unavailable communication state icon in the tree.

Step 13 Verify that the NE software version is listed in the Supported NE table (Domain Explorer > Administration > Supported NE table). If it is not listed, see 4.3.8 Adding a New NE Software Version to the Prime Optical Domain, page 4-40.

Table 3-6 Field Descriptions for the Add New NE Wizard

Field	Description
NE Addition Panel	
NE Model	Select the NE model (Carrier Packet Transport 200, Carrier Packet Transport 200 SDH, Carrier Packet Transport 600, Carrier Packet Transport 600 SDH, Cisco ONS 15216 [all types], Cisco ONS 15305, Cisco ONS 15305 CTC, Cisco ONS 15310 CL, Cisco ONS 15310 MA SONET, Cisco ONS 15310 MA SDH, Cisco ONS 15327, Cisco ONS 15454 SONET, Cisco ONS 15454 SDH, Cisco ONS 15530, Cisco ONS 15540 ESP, Cisco ONS 15540 ESPx, Cisco ONS 15600 SONET, Cisco ONS 15600 SDH, or Not Managed/Other Vendor).
NE Type	Select the type of NE. Available types depend on the selected NE model.
NE Addition	Click one of the following radio buttons. The available fields change, depending on which option you select: • **Single NE Addition**—To add only one NE. • **Bulk NE Addition**—To add several NEs simultaneously. • **Single NE Addition (Use TL1 Tunnel)**—To add only one TNE.
IP Address	Click one of the following radio buttons: • IP—To enter an IP address in IPv4 or IPv6 format. • Hostname—To enter a hostname.

Table 3-6 Field Descriptions for the Add New NE Wizard (continued)

Field	Description
IP/Hostname (*for single NE additions*)	Enter a unique IP address or hostname for the NE. You can enter an IP address in IPv4 or IPv6 format. The IPv4 address must be in the form *ddd.ddd.ddd.ddd*, where *ddd* is a decimal octet expressed as an integer between 0 and 255. The first octet cannot be a zero. The IPv6 address is a 128-bit address (*hhhh:hhhh:hhhh:hhhh:hhhh:hhhh:hhhh:hhhh*) that is divided into 16-bit blocks, where each block is converted to a 4-digit hexadecimal number and separated by a colon (:). An IPv6 address is valid only if the NE model that you selected supports IPv6 addresses. **Note** Prior to the NE ID discovery, Prime Optical uses the NE IP address as a temporary NE ID. To enable you to add an NE using its hostname, the hostname must be resolved inside the DNS. The IP/Hostname field is unavailable when adding passive NEs and Not Managed/Other Vendor NEs.
From IP Address (*for bulk NE additions*)	Enter the beginning IP address for the range of NEs you want to add. **Note** You can enter an IP address in IPv4 or IPv6 format.
To IP Address (*for bulk NE additions*)	(Optional) Enter the ending IP address for the range of NEs you want to add. Click **Add** to add the range to the Selected IP field.
IP Address Selection (*for bulk NE additions*)	Select one or more IP addresses in the Deleted IP field and click **Add** to add them to the Selected IP field. Select one or more IP addresses in the Selected IP field and click **Remove** to remove them. Only the IP addresses in the Selected IP field are affected by clicking **Next**. **Note** You can add IPv6 addresses only if the selected NE model supports IPv6. Prime Optical provides IPv6 support for the following NE releases: ONS 15310 MA SDH R9.3, ONS 15310 MA SONET R9.3, ONS 15454 SDH R9.3, and ONS 15454 SONET R9.3.
Gateway NE (*for single TNE additions*)	If you selected Single NE Addition (Use TL1 Tunnel) in the NE Addition area, the Gateway NE area becomes visible. Fill in the following fields to add a TNE to the Prime Optical domain. The following NE models support TL1 tunnels: ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH. • GNE IP Address—IP address of the non-Cisco GNE that supports the TL1 tunnel. This field is mandatory. • Use Default TL1 Port—If selected, the default value for the TL1 port is used. • Use Other TL1 Port—If selected, specify the TL1 port number in the text field. • TL1 Encoding Mode—Specify the TL1 encoding mode: – LV + Base64 Payload: (Default) If selected, and if Use Default TL1 Port is selected, TL1 port 3081 is used. – LV + Binary Payload: If selected, and if Use Default TL1 Port is selected, TL1 port 3081 is used. – Raw: If selected, and if Use Default TL1 Port is selected, TL1 port 3082 is used. • GNE Login Required—If checked, a login is required on the non-Cisco GNE. The GNE login uses the following settings: – GNE TID: The value specified in the GNE TID field. – Username and password: The values specified in the Control Panel > Security Properties pane > CTC-Based SDH or CTC-Based SONET tab > Server - GNE Connection (TL1 Tunnel) area.

Table 3-6 Field Descriptions for the Add New NE Wizard (continued)

Field	Description
NE Properties Panel	
NE ID	Enter a unique name for the NE in the form of an ASCII text string. Apostrophes (') and quotation marks (") are not accepted. The NE ID you enter should be the same as the NE ID that is configured on the NE itself. If it is not the same, this field will be updated with the NE hostname. **Note** Do not use "Prime Optical" as an NE ID because the Alarm Browser might contain Prime Optical alarms with the source ID "Prime Optical." It will be difficult to distinguish between NE alarms and Prime Optical alarms if they both have the same source ID. For the same reason, do not cause Prime Optical to automatically populate an NE whose NE ID is "Prime Optical." **Note** If the NE ID field is blank, it will default to the IP address. After communication is established, Prime Optical autodiscovers the NE ID from the NE.
Alias	Enter a unique alias name for the NE. The alias name can contain alphanumeric characters. It can also contain characters from international character sets.
Operational State	Specify the operational state of the NE. There are four states: • Preprovisioned—The NE has been added to the database for provisioning but is not yet in service. • Under Maintenance—The NE is temporarily under maintenance but requires monitoring. • In Service—The NE is currently deployed and requires monitoring. • Out of Service—The NE has been marked Out of Service and does not require monitoring.
SNMP Community String	Enter the SNMP community string for the NE. The Cisco default is **public**. **Note** The SNMP community string applies only to the ONS 15216 EDFA2, ONS 15216 EDFA3, ONS 15305, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH NEs. **Note** When adding ONS 155xx NEs, this field is unavailable. You must enter the community strings in the SNMP Community String table before adding the NE.
Description	Enter a description of the NE.
Location Name	Enter the NE geographic location.
Subnetwork ID (*not selectable if automatic subnetwork grouping is enabled*)	Select the subnetwork ID associated with the NE.
Network Partition ID	Select the network partition associated with the NE. To add a CTC-based NE that was discovered manually, do the following: • To view the NE partition details, click the icon next to the NE partition ID. • Click **OK** to change the discovery mode. The discovery mode can be changed only if the network partition is empty. • You can also create new network partitions by clicking the ellipsis (...) icon. Specify a name and description for the network partition. **Note** When you are adding manually discovered NEs to a network partition, only the partitions that are compatible with the selected NE model are listed.

Table 3-6 Field Descriptions for the Add New NE Wizard (continued)

Field	Description
Group Properties Panel	
Grouping Option for Discovered NEs	Select one of the following grouping options for the discovered NEs: • Group discovered NEs in the Discovered Network Elements group • Group NEs with the NE that discovered them (Cisco default) • Group NEs by subnet **Note** If you are adding manually discovered NEs, the first option is preselected, and the other options are dimmed. To move an NE, cut and paste it into the desired group.

Note

- For Prime Optical to communicate with certain NE types, you must set the username and password that the Prime Optical server uses to establish a session with the NE. To enter user information, choose **Administration > Control Panel > Security Properties** tab; then, enter the username and password on the **ONS 15216 EDFA2**, **ONS 15216 EDFA3**, **ONS 15216 OADM**, **ONS 15305 CTC, ONS 15327**, **ONS 15454**, **ONS 15454 SDH**, **ONS 155XX**, **ONS 15600 SDH**, or **ONS 15600** tab.
- Regardless of the actual length of the password, the Password and Confirm Password fields display only a fixed-length string of 15 asterisks (*).
- For more information, see 8.3.3.13 Configuring Prime Optical Security Parameters, page 8-29. For NEs that do not use SNMP, you can set the username and password in the NE Authentication tab of the Domain Explorer. For more information, see 8.4.1 Setting NE Authentication, page 8-41.
- When adding more than one data communications channel (DCC)-connected, CTC-based NE, add one NE to a subnetwork and allow the other NEs to be automatically discovered and placed in the same subnetwork. When moving NEs from one subnetwork to another, move all DCC-connected NEs to the same subnetwork. Move the entire subnetwork instead of splitting DCC-connected NEs between subnetworks.
- Errors encountered while adding NEs are listed in the Error Log.

3.5.3 Copying an NE from One Group to Another

Groups for multiple users can easily be created in Prime Optical. Just copy the same NE into different groups.

Step 1 In the Domain Explorer tree, select the NE to be copied.

Step 2 Choose **Edit > Copy** (or click the **Copy** tool).

Step 3 Select the group or management domain node where the NE will be pasted and choose **Edit > Paste** (or click the **Paste** tool). This pastes the NE under the selected node.

Note You cannot paste an NE in the Discovered Network Elements or Deleted Network Elements groups. Also, you cannot paste an NE in a group where the same instance of the NE already exists.

Tip The drag-and-drop feature can also be used to copy NEs. Use the mouse to drag and drop the NE to a new location.

Note Since they cannot see the entire domain, users with the Assign NEs property (Provisioner, Operator, and some custom user profiles) are not allowed to modify the topology using copy, cut, paste, or drag and drop.

3.5.4 Moving an NE from One Group to Another

Prime Optical provides drag-and-drop capabilities to allow you to easily move NEs from one group to another.

Step 1 In the Domain Explorer tree, select the NE to be moved.

Step 2 Choose **Edit > Cut**, then **Edit > Paste**. You can also use the mouse to drag and drop the selected NE to a new location.

Note You cannot copy or move NEs into the Discovered Network Elements group.

Note Since they cannot see the entire domain, users with the Assign NEs property (Provisioner, Operator, and some custom user profiles) are not allowed to modify the topology using copy, cut, paste, or drag and drop.

3.5.5 Moving an NE from One Network Partition to Another

Caution Prime Optical cannot manage circuits across network partitions. Be sure that all connected NEs are managed under the same network partition.

Note Do not add SONET and SDH NEs in the same network partition.

Step 1 In the Domain Explorer tree, select **File > Subnetwork Explorer**. The Subnetwork Explorer opens.

Step 2 Identify the network partition ID:

a. In the Subnetwork Explorer tree, click the new network partition where you will move the NE.

b. In the Network Partition Properties pane, click the **Identification** tab.

Step 3 Identify the subnetwork(s) assigned to the new network partition.

Note A subnetwork can only be assigned to one network partition.

Step 4 In the Domain Explorer, click the NE to be moved. In the Network Element Properties pane, click the **Address** tab.

Step 5 Change the subnetwork ID to a subnetwork ID assigned to the new network partition. Choose from the list of subnetwork IDs; then, click **OK**.

Step 6 Click **Save**.

3.5.6 Automatically Grouping NEs in Subnetworks

Note An NE can be assigned to only one subnetwork.

Prime Optical allows you to automatically group NEs in a subnetwork. When this feature is enabled, Prime Optical automatically creates the subnetwork, which consists of NEs that are connected by topological links; you cannot change the subnetwork of the NE. This means that:

- When adding a new NE, the option to select the subnetwork ID is disabled. The Subnetwork ID field displays *System Default*.
- In the Address tab of the Domain Explorer > Network Element Properties pane, you cannot change the subnetwork ID.
- You cannot drag and drop NEs in the Subnetwork Explorer tree.

Complete the following steps to automatically group NEs in a subnetwork:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel** and click **UI Properties**.

Step 2 In the Subnetwork Grouping area, check the **Automatically Group NEs in Subnetworks** check box.

Step 3 Click **Save**.

Note If a topological link is deleted while NEs are automatically grouped in subnetworks, Prime Optical deletes isolated NEs, creates a new subnetwork, and moves the deleted NEs to the new subnetwork.

If a topological link is discovered or added manually, it will result in a network that contains disjointed

subnetworks. Prime Optical deletes the NEs from the disjointed subnetwork that contains fewer NEs, deletes the disjointed subnetwork, and adds the deleted NEs to the subnetwork where the topological link was added manually.

3.5.7 Deleting NEs

From the Domain Explorer tree, you can delete a single NE, multiple NEs, or out-of-service NEs.

Note All links from the NE are deleted automatically from the database during the purge phase of NE deletion. The purge process does not start if there are valid links on the NEs scheduled for permanent deletion. You must wait until all links on the NE become invalid and then try again.

3.5.7.1 Deleting a Single NE

Only out-of-service or preprovisioned NEs can be placed in the Deleted Network Elements group.

If a CTC-based NE is deleted and then DCC connectivity to the deleted NE is removed, Prime Optical rediscovers the deleted NE. If DCC connectivity is removed *before* deleting the NE, Prime Optical does not rediscover the NE. Therefore, remove DCC connectivity to the NE before deleting the NE from Prime Optical.

Step 1 In the Domain Explorer tree, select the NE that will be deleted.

Step 2 In the Status tab of the Network Element Properties pane, set the Operational State field to **Out of Service**; then, click **Save**. Click **Yes** in the confirmation dialog box.

Note If there is more than one instance of an NE (that is, if the NE was copied so two versions exist), you do not need to move the NE to Out of Service before deleting it.

Step 3 You can delete either a selected instance of the NE or all instances of the NE:

- Deleting the selected instance of the NE—Only the specific NE that you selected in the Domain Explorer tree is deleted. To delete the selected instance of the NE, choose **Edit > Delete**; then, click **Yes**. If this is the last instance of the NE, the NE is placed in the Deleted Network Elements group.

  Note A GNE that has associated subtending NEs cannot be deleted. A subtending NE can be disassociated from the GNE by removing the NE from the Prime Optical domain or by assigning it to a different GNE.

- Deleting all instances of the NE—All NEs in the user domain that have the same NE ID are deleted. To delete all instances of the selected NE, choose **Edit > Delete All**; then, click **Yes** in the confirmation dialog box. The NE is placed in the Deleted Network Elements group.

Note Check the Audit Log to confirm that the selected NE has been successfully deleted from the database. The deletion is not complete until the following message is displayed in the Audit Log: *AUD-5015 NE ID has been successfully purged*. See 8.5.1 Viewing the Audit Log, page 8-73 for information on how to view the Audit Log.

No client views for an NE can be opened in the Deleted Network Elements group. Also, no properties of a deleted NE can be modified. The deleted NE and its associated data are removed from all client views except the Domain Explorer.

Step 4 To purge the NEs in the Deleted Network Elements group, see 3.5.7.4 Removing a Deleted NE, page 3-27.

3.5.7.2 Deleting Multiple NEs

Step 1 For each NE that will be deleted:

a. In the Domain Explorer tree, select the NE that will be deleted.

b. In the Status tab of the Network Element Properties pane, set the Operational State field to **Out of Service**; then, click **Save**.

Step 2 In the Domain Explorer tree, select again all the NEs that will be deleted. To select multiple NEs, press and hold down the **Ctrl** button; then, click each NE that will be deleted.

Step 3 You can delete the selected instance of the NEs or all instances of the NEs:

- Deleting the selected instance of the NE—Only the specific NEs that you selected in the Domain Explorer tree will be deleted. To delete the selected instance of the NEs, choose **Edit > Delete**; then, click **Yes** in the confirmation dialog box. If the selected NEs are the last instance of the NE, the NEs are placed in the Deleted Network Elements group.

Note A GNE that has associated subtending NEs cannot be deleted. A subtending NE can be disassociated from the GNE by removing the NE from the Prime Optical domain or by assigning it to a different GNE.

- Deleting all instances of the NEs—All NEs in the user domain that have the same NE ID as the NE being deleted will be deleted. To delete all instances of the selected NEs, choose **Edit > Delete All**; then, click **Yes** in the confirmation dialog box. The NEs are placed in the Deleted Network Elements group.

Note Both the Delete and Delete All menu options are enabled if at least one of the selected NEs can be deleted. The confirmation dialog box lists the NEs that can and cannot be deleted.

Note Check the Audit Log to confirm that the selected nodes have been successfully deleted from the database. The deletion is not complete until the following message is displayed in the Audit Log: *AUD-5015 NE ID has been successfully purged*. See 8.5.1 Viewing the Audit Log, page 8-73 for information on how to view the Audit Log.

Note You can use the mouse to drag and drop the selected NEs to the Deleted Network Elements group only if all the selected NEs can be deleted.

Step 4 To purge the NEs in the Deleted Network Elements group, see 3.5.7.4 Removing a Deleted NE, page 3-27.

3.5.7.3 Using the prune_ne.sh Script to Remove an Out-of-Service NE from the Database

Note It is recommended that you delete an out-of-service NE from the Prime Optical client (see 3.5.7.1 Deleting a Single NE, page 3-24 or 3.5.7.2 Deleting Multiple NEs, page 3-25), because doing so does not involve stopping and starting the Prime Optical server.

Aside from using the Domain Explorer to remove an out-of-service NE from the database, you can also use the **prune_ne.sh** script.

Note Shut down the Prime Optical server and all Prime Optical clients before running the prune_ne.sh script.

Step 1 In the Domain Explorer tree, select the NE that will be removed.

Step 2 In the Status tab of the Network Element Properties pane, set the Operational State field to **Out of Service**; then, click **Save**.

Step 3 Close the Prime Optical client.

Step 4 Log into the Prime Optical server as the root user and enter the following command to stop the server:

```
opticalctl stop
```

Step 5 Enter the following command to verify that all Prime Optical processes have stopped:

```
opticalctl status
```

a. If any processes are still running, enter the following command:

```
kill -9 process-id
```

b. Re-enter the following command to verify that the processes have stopped:

```
opticalctl status
```

Step 6 Change the directory to /opt/CiscoTransportManagerServer/bin and enter the following command:

```
prune_ne.sh NE-name
```

Step 7 Enter the following command to start the Prime Optical server:

```
opticalctl start
```

3.5.7.4 Removing a Deleted NE

Complete the following steps to remove an NE from the client view and delete all records associated with the NE from the database:

Step 1 In the Domain Explorer tree, click the **Deleted Network Elements** group.

Step 2 Click the NE that will be removed from the Prime Optical domain.

Step 3 Choose **Edit > Delete**; then, click **Yes**.

One of the following happens:

- The NE purge begins for NEs without any valid links.
- If the NEs that are scheduled for permanent deletion contain any valid links, the purge process does not start. You must wait until all links become invalid; then, then try again.

While the purge is in progress, the following icon is displayed in the Domain Explorer tree.

Figure 3-1 Domain Explorer Icon—NE Purge In Progress

If the NE purge fails, the following icon is displayed in the Domain Explorer tree. The Audit Log reports the purge failure. You can repeat the purge and view the progress.

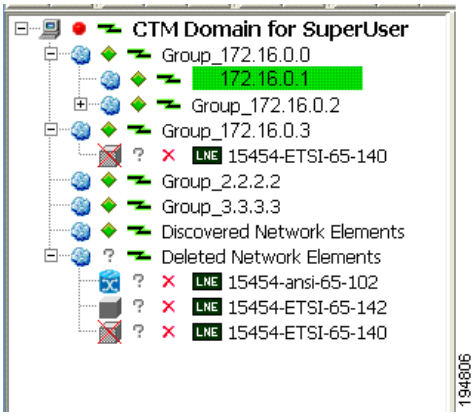
Figure 3-2 Domain Explorer Icon—NE Purge Failed

Step 4 When the NE purge completes successfully, the NE is removed from the Deleted Network Elements group.

The following figure shows the different purge states, where:

- 15454-ansi-65-102—NE has been deleted but not yet purged.
- 15454-ETSI-65-142—Purge is in progress.
- 15454-ETSI-65-140—Purge failed.

Figure 3-3 Sample Purge States: Deleted, In Progress, Failed



Note

- Wait until all records associated with the NE are deleted from the database before adding the NE back again.
- The amount of time it takes to prune NEs depends on the amount of data that needs to be removed, the amount of data in the database, the system performance, and so on. The Deleted Network Elements group is visible to users who have the add_delete_NE_group permission. You can purge or undelete an NE that is in the Deleted Network Elements group only if that NE was assigned to you.

3.5.8 Restoring a Deleted NE

Step 1 In the Domain Explorer tree, click the Deleted Network Elements group.

Step 2 Click the NE to restore.

Step 3 Choose **Edit > Undelete**.

Prime Optical restores the selected NE under the management domain node.

3.5.9 Searching for an NE

Prime Optical allows you to search for a specific NE in the network. See 1.6.5.1 Finding Data in the Domain Explorer, page 1-38.

3.6 How Do I Build Links?

A link is a connection between two termination points (TPs). Prime Optical represents the physical connectivity between NEs in the domain by defining the physical links between NEs. It is through these links that circuits (if supported on the NE) are provisioned. Links can be viewed, modified, created, and

deleted. Prime Optical automatically discovers links between CTC-based (including the ONS 15305 R3.0) and ONS 155xx NEs. For CTC-based NEs, links are autodiscovered only when the DCCs are created on both ends of the link. Autodiscovery requires configuration on ONS 15530 and ONS 15540 NEs. For the ONS 15216, links are manually added.

Note An autodiscovered link between two TPs will override previously autodiscovered links and any manual links on any of the TPs.

3.6.1 Setting Up ONS 15530 and ONS 15540 NEs for Link Discovery

Links between ONS 15530 and ONS 15540 NEs are automatically discovered and displayed, provided that physical topology is configured correctly on all ONS 15530 and ONS 15540 NEs in the network. Each physical topology neighbor of an NE represents a physical link between the NE and its neighbor NE. The ONS 15530 and ONS 15540 discovery service collects physical topology information and converts it into physical links displayed by Prime Optical.

Links between ONS 15530 and ONS 15540 devices can be bidirectional or unidirectional. A unidirectional link operates in the context of the transmit or receive side of a fiber connection and is represented by an arrowhead link in the Network Map.

Be sure that have you have set up the topology on all of the ONS 15530 and ONS 15540 NEs in your network, as described in 3.5.1.4 Prerequisites for Adding ONS 15530 and ONS 15540 NEs, page 3-10.

3.6.2 Overview of Supported Links

Links can be created at different layer rates depending on the card type. See Table 3-7 for the links supported between NEs at compatible layer rates. See Table 3-8 for the supported links per layer rate.

Note Links can be created for a Not Managed/Other Vendor NE only if the NE is in service or under maintenance. Links created for CTC-based NEs are for circuit routing purposes only. Links created for Not Managed/Other Vendor NEs are not used for circuit routing.

Note Physical nonroutable links can be created between NEs that are in the same or a different network partition(s).

Links between TXP_MR_2.5G, TXPP_MR_2.5G, MXP_2.5G_10G, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, TXP_MR_10E, or MXP_MR_10E cards are automatically discovered and cannot be manually created. They can exist if:

- The layer rate is Optical Channel Layer (OCH).
- Both cards support the same wavelength.
- The links are bidirectional.

Links between TXP_MR_2.5G, TXPP_MR_2.5G, MXP_2.5G_10G, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, TXP_MR_10E, MXP_MR_10E cards or DWDM cards are manually created and cannot be automatically discovered. They can be created if:

- The layer rate is Physical.

- The link is unidirectional.
- The link rate is 10G ITU if a MXP_2.5G_10G, TXP_MR_10G, TXP_MR_10E or MXP_MR_10E card is used at one end of the link, or 2.5 G ITU if a TXP_MR_2.5G, TXPP_MR_2.5G, 2.5G_DM or 2.5G_DMP card is used at one end of the link.
- The link is unprotected.
- The link is created between TXP_MR_2.5G, TXPP_MR_2.5G, MXP_2.5G_10G, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, TXP_MR_10E, or MXP_MR_10E trunk ports and DWDM channel ports.
- DWDM channel ports are unidirectional and can only be used as the link source if they are transmit ports and as the link destination if they are receive ports.
- The working wavelength of TXP_MR_2.5G, TXPP_MR_2.5G, MXP_2.5G_10G, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, TXP_MR_10E, and MXP_MR_10E cards is equal to the expected wavelength set on the DWDM channel port on the other end of the link.

Prime Optical discovers links that are created in CTC as L2 trunk-to-trunk links and displays them with a layer rate of L2. Only 10GE_XP and GE_XP cards in L2 mode support L2 trunk-to-trunk links.

When a DWDM transponder card (including a DWDM line card) is used as the destination of a manual link with a channel port, the wavelength is not calculated, because the physical connection works correctly. Therefore, verify that you want to create a manual link between a given channel (for example, a demux card) and a TXP card whose trunk port is set to a different wavelength.

Table 3-7 Links Supported Between NEs at Compatible Layer Rates

NE Model	Supports Links with These NEs at Compatible Layer Rates
ONS 15216	ONS 15216

3.6.3 Viewing the Link Table

The Link table shows information about each link attribute. Use the Link table to view, modify, and delete links. You can open the Link table for the Prime Optical domain, network partition, subnetwork, group, or NE.

- If you select the Prime Optical domain, network partition, subnetwork, or group, the Link table shows all links that terminate on any of the NEs contained in the Prime Optical domain, subnetwork, or group.
- If you select an NE, the Link table shows all links that terminate on that particular NE.

Use one of the following methods to open the Link table:

- From the Network Map—In the Domain Explorer or Subnetwork Explorer, choose **File > Network Map**. In the Network Map, select a network partition, subnetwork, group, or NE; then, choose **Configuration > Link Table**.
- From the Network Map—Right-click a link or server trail and choose **Link Table** from the shortcut menu.
- From the Domain Explorer—Select the Prime Optical domain, group, or NE; then choose **Configuration > Link Table**.
- From the Subnetwork Explorer—Select the Prime Optical domain, network partition, subnetwork, or NE; then, choose **Configuration > Link Table**.

Note

- A link is visible in the Link table even if the source or destination NE has been deleted, but this same link is not visible in the Network Map. If the NE is deleted from the Deleted Network Elements group, the references to that NE are removed from the Link table.
- When launching the Link table in a large or high-end network setup and on a larger scope (for example, for the Domain Explorer), a database timeout can occur due to the large volume of data that needs to be retrieved. As a workaround, launch the Link table on a smaller scope.

Note the following constraints for OCH unidirectional and bidirectional patchcord links, Optical Transmission Section (OTS) links, Y-cable patchcord links, server trail links, and autodiscovered links:

- An invalid patchcord link is a link that has been deleted from the Network Control Protocol (NCP) layer but is still present in the Prime Optical database. The resources allocated for the patchcord link are freed up and made available for a new link.
- Invalid links are shown in strikethrough font.
- An invalid patchcord link is removed from the Prime Optical database and disappears from the Link table only if a Prime Optical user deletes that link. All logical and physical resources are released from the deleted link.
- If the Link table contains an invalid patchcord link and you create a new patchcord link using the same termination points and attributes as the invalid link, the invalid patchcord link becomes valid and is shown in the Link table as a valid link.
- When an invalid patchcord link becomes valid, the link name changes. Prime Optical uses link identification numbers to create the patchcord link name. The NCP layer associates identification numbers to both terminations during the link creation phase. These numbers are used to identify the patchcord link inside the NCP layer and are required to delete the patchcord link. To change the patchcord link name:
  1. Use the Create Link wizard to create a new patchcord link.
  2. Force the patchcord link validity to change to INVALID (for example, by marking the NE as Out of Service or deleting the patchcord link).
  3. Create a new patchcord link that uses the same termination points and attributes as the invalid link.
  4. View the patchcord link name in the Link table. The link name has changed.

The following table describes the fields in the Link table.

Table 3-9 Field Descriptions for the Link Table

Field	Description
Link Alarm Severity	Highest severity alarm associated with the selected link.
Link Source ID	ID of the link source.
Link Source Termination Point	PTP of the link source.
Link Destination ID	ID of the link destination.
Link Destination Termination Point	PTP of the link destination. Because a link can have up to two destinations on the same NE, a “DST1” or “DST2” label is affixed to the destination to indicate the destination number.

Table 3-9 Field Descriptions for the Link Table (continued)

Field	Description
Layer Rate	Layer rate, defined as per ITU-T standard G.872 for multilayered optical networks. Values are Physical, Transmission Section, Optical Multiplex Section (OMS), OCH, SONET/SDH, Layer 2, Composite, and OTU.
Layer Detail	Bandwidth of the link as per the layer rate: • For SONET links, the link rate is OC-3, OC-12, OC-48, OC-192, or Layer 2, depending on the NE configuration. • For SDH links, the link rate is STM1, STM-4, STM-16, STM-64, or Layer 2. • For DWDM links, the link rate is 40G ITU, 10G ITU, 2.5G ITU, or OTS. • For OCH links, the link rate is 10G ITU or 2.5G ITU. • For patchcord links on Layer 2, the link rate is 10G ITU, 1G ITU, or Fast Ethernet. • For links between Not Managed/Other Vendor NEs, the link rate is Not Applicable. • For links between Not Managed/Other Vendor NEs and a CTC-based NE, the rate is that of the CTC-based NE. Links between a SONET/SDH link and a Not Managed/Other Vendor NE depend on the link source. If the link source is the Not Managed/Other Vendor NE, the layer rate is Not Applicable. If the link source is the SONET/SDH link, the layer rate is that of the SONET/SDH link. For server trails, this field displays the server trail type and the number of server trails.
Link Direction	Whether the link is unidirectional or bidirectional.
Link Provision Type	Whether the selected link is automatically discovered by an NE. Values are: • Manual—For manual links. • Auto—For automatically discovered links. • PatchCord—For patchcord links. For server trails, the value displayed is *Server Trail*. **Note** Autodiscovered links between transponder or muxponder cards on release 4.6 NEs are always reported with a constant size, regardless of payload type.

Table 3-9 Field Descriptions for the Link Table (continued)

Field	Description
Is Link Valid	Validity of the link. Values are Valid or Invalid. For autodiscovered links, the value is Valid if both the terminating NEs are in service and the NEs are able to confirm the presence of the link. An autodiscovered link is invalid if (1) the DCC is disabled on either PTP; (2) either PTP is marked as Out of Service (OOS); (3) there is a fiber cut or transmitter/receiver failure; or (4) either NE is marked as OOS. The following rules apply to link validity: • All invalid links are shown as gray in the Network Map. • Valid links are shown in the Network Map with a color corresponding to alarm severity, with green for no alarm, yellow for minor alarms, orange for major alarms, and red for critical alarms. • Manual and unmanaged links can be valid or invalid. • A link between an unmanaged NE and a managed NE can be valid or invalid. If the link is valid, it is shown with the same color as the PTP alarm on the managed NE. • The delete link operation is available for all links except for valid, autodiscovered links. You can delete links of the following type: – Manual (valid and invalid) – Virtual (valid and invalid) – Unmanaged (valid and invalid) – Invalid autodiscovered
Link Connection Type	Whether the link connection is inter-NE or intra-NE. An inter-NE link represents an external fiber connection between PTPs on different NEs. An intra-NE link represents a fiber connection between two PTPs on the same NE.
Link Protection Type	Whether the link protection is unprotected, 1+1, 1+1 with Y-cable protection, 2-fiber BLSR/MS-SPRing, 4-fiber BLSR/MS-SPRing, or not applicable. For ONS 155xx NEs, protection types are Y-cable/line card protection, trunk protection, splitter protection, or no protection. The Y-cable protection type also applies to ONS 15454 SONET and ONS 15454 SDH NEs.
Used for Routing	Whether the selected link is used for routing. Values are Yes or No.
Link Name	Name of the selected link. **Note** The names of bidirectional links are prone to change when they are rediscovered as a result of a system restart. Prime Optical assigns names to the links, combining their source and destination points. Because the links are bidirectional, the order of the source and destination points could change when the links are rediscovered.
Link Description	User-entered description of the selected link. If you do not modify the *System Default* string in the Create Link wizard, the description is a string built from the endpoint information.
Alarm Counts	Total number of critical, major, minor, and warning alarms associated with the selected link. **Note** This field does not apply to ONS 155xx NEs.
Link Cost	Numeric cost associated with the selected link. The link cost is used while routing a circuit. The lowest link cost is preferred in circuit routing. The Cisco default value is 1024. This attribute is editable for manual links in the SONET or SDH layer.

Table 3-9 Field Descriptions for the Link Table (continued)

Field	Description
Shared Risk Link Groups	(SONET/SDH layer rates only) Free-format string that represents the shared risk link group (SRLG), or a group of links that share a common risk. For example, a set of links that originate at a node share the node as the common risk. SRLGs allow you to classify links into logical groups. By grouping the links, you can specify diverse link routing for a circuit. That is, if the circuit is fully protected, it is routed on the working and protect paths with a diverse SRLG attribute. The Shared Risk Link Groups field supports up to 5 comma-separated values, with 32 characters per value.
Link Utilization	Link utilization information for Layer 3, SONET/SDH, and OTS links. For non-Layer 3, non-SONET/SDH, non-OTS links, this field shows Not Applicable. For detailed information about link utilization, see 3.6.9 Viewing Link Utilization, page 3-47.
Link Alias Name	Alias name of the link.

3.6.4 Filtering the Link Table

Step 1 In the Link table, choose **File > Filter**. The Filter dialog box opens.

Step 2 Specify the filter parameters described in the following table.

Step 3 Click **OK** to run the filter.

Table 3-10 Field Descriptions for the Link Table Filter Dialog Box

Field	Description
Source/Destination ID	Filters by source/destination IDs of the available NEs. Click **Add** and **Remove** to move NEs to and from the Selected NEs list.
Connection Type	Filters out inter-NE or intra-NE links. By default, all links are shown. Only the ONS 15530 and ONS 15540 have intra-NE connections. You can also filter on server trails.
Link Layer	Filters by layer combination. You can select any subset of the following layers: Physical, OTS, OMS, OCH, SONET/SDH, Layer 2, Layer 3, and OTU.

3.6.5 Creating Links

Step 1 Open the Create Link wizard by using one of the following methods:

- From the Network Map—Select the source NE and choose **Configuration > Create Link** (or right-click the NE and choose **Create Link**). Connect the line to the destination NE or click the map. The Create Link wizard opens. The Link Destination panel displays a list of NEs that support compatible layer rates with the source NE.
- From the Domain Explorer or Subnetwork Explorer—Select the source NE and choose **Configuration > Create Link** (or right-click the NE and choose **Create Link**). The pointer changes to a plus sign; select the destination NE or group. The Create Link wizard opens.

Note If you press the **Esc** key while the plus sign is enabled, the operation is canceled and the plus sign returns to a pointer.

Note Table 3-11 describes the fields in the Create Link wizard. Fields shown depend on the NE selected.

Step 2 Create the link, as follows:

a. Enter the following information in the Link Attributes panel:

- Name
- Link alias
- Description
- Provision type
- Layer
- Layer detail

Note Links from a Not Managed/Other Vendor NE to a CTC-based or Not Managed/Other Vendor NE will have a link rate of Not Applicable. Links from a CTC-based NE to a Not Managed/Other Vendor NE will have the link rate allowed for the CTC-based NE.

Note The layer details displayed in the Create Link wizard are based on the NE selected as the link source. For example, when you attempt to create a link from NE A to NE B, the link sizes displayed are based on the supported sizes and inventory of NE A. If the link is attempted in the reverse direction, from NE B to NE A, the link sizes displayed are based on the inventory and sizes for NE B. As a result, the link sizes displayed could differ when the operation is attempted differently. An error message is displayed in the Link Destination panel when the size displayed is not applicable for the destination NE.

- Wavelength (*available only if the layer is Optical Channel, the provisioning type is Patchcord, and the direction is Unidirectional*)
- Protection
- Direction

Note Prime Optical allows creation of bidirectional SONET/SDH links as well as unidirectional and bidirectional physical links.

If the layer rate is SONET/SDH or Layer 2, only bidirectional links are available. For other layer rates, both unidirectional and bidirectional links are available.

- Cost
- Shared risk link groups

b. Click **Next**.

c. Enter the following information in the Link Source panel:

- Node
- PTP slot
- PTP port
- PTP value
- Name

d. Click **Next**.

e. Enter the following information in the Link Destination panel:

- Node
- PTP slot
- PTP port
- PTP value
- Name

Note A PTP can be associated with only one bidirectional link or two unidirectional links at a particular layer rate for all NEs except Not Managed/Other Vendor NEs. For Not Managed/Other Vendor NEs, a PTP can terminate in only one link.

Note If you are creating a SONET/SDH-layer manual link between two CTC-based NEs, verify that no DCC exists on the endpoints that are selected for the link termination.

Note You can create a provisional patch cord (PPC), a virtual link, between 15600 and 15454 NEs destination points.

f. Click **Next**.

Step 3 The Link Summary panel summarizes the attributes of the new link. To change the link summary information, click **Back** and change the selections as needed.

Step 4 Click **Finish**.

Table 3-11 Field Descriptions for the Create Link Wizard

Field	Description
Link Attributes Panel	
Name	Enter a unique name for the new link. The link name is a free-format string, up to 256 characters.
Link Alias	Enter a unique alias name for the new link. The alias name can contain alphanumeric characters. It also supports international character sets.
Description	Enter a description of the new link. The link description is a free-format string, up to 256 characters.
Provision Type	Specify the type of link provisioning. Values are: • Manual—The link is manually provisioned. • Patchcord—(*Applicable only to links involving transponders and DWDM modules*) The link is an internode or intranode termination provisioned between homogeneous ports. A patchcord link represents the connection between a line card and a transponder, or the connection between a transponder and a DWDM card. Patchcord links can be provisioned by Prime Optical or CTC users and are maintained by the NEs. **Note** Protection groups are not recognized when creating patchcord or manual links.
Layer	Choose the link layer rate, defined as per ITU-T standard G.872 for multilayered optical networks. Values are: • Physical • Transmission Section • OMS • OCH • SONET/SDH • Layer 2 **Note** Patchcord links on Layer 2 can be created between NNI ports on GE-XP or 10GE-XP cards if the card modes are set to *L2 over DWDM*.
Layer Detail	Choose the bandwidth of the link as per the layer rate. • For SONET links, the link rate is OC-3, OC-12, OC-48, OC-192, or Layer 2, depending on the NE configuration. • For SDH links, the link rate is STM1, STM-4, STM-16, STM-64, or Layer 2. • For DWDM links, the link rate is 100G ITU, 40G ITU, 10G ITU, 2.5G ITU, or OTS. • For OCH links, the link rate is 10G ITU or 2.5G ITU. • For patchcord links on Layer 2, the link rate is 10G ITU,1G ITU, or Fast Ethernet. • For links between Not Managed/Other Vendor NEs, the link rate is Not Applicable. • For links between Not Managed/Other Vendor NEs and CTC-based NEs, the rate is that of the CTC-based NE. Links between a SONET/SDH link and a Not Managed/Other Vendor NE depend on the link source. If the link source is the Not Managed/Other Vendor NE, the layer rate is Not Applicable. If the link source is the SONET/SDH link, the layer rate is that of the SONET/SDH link.

Table 3-11 Field Descriptions for the Create Link Wizard (continued)

Field	Description
Wavelength	Filter the wavelength in the first drop-down list. In the second drop-down list, select the appropriate wavelength value according to the selected filter. The Wavelength drop-down lists are available only if the layer is *Optical Channel*, the provisioning type is *Patchcord*, and the direction is *Unidirectional*. **Note** When the layer is *Optical Channel*, the provisioning type is *Patchcord*, and the direction is *Bidirectional*, the Wavelength drop-down lists are disabled, but Prime Optical executes an automatic wavelength check on the endpoints before creating the link. If the link endpoints do not have the same wavelength value, the link is not created and a wavelength error is generated.
Protection	Specify the link protection: Unprotected, 1+1, Y-Cable (meaning 1+1 with Y-cable protection), 2-Fiber BLSR/MS-SPRing, 4-Fiber BLSR/MS-SPRing, or Not Applicable. For CTC-based NEs, select Unprotected, 1+1, or Y-Cable. For links between Not Managed/Other Vendor NEs, the link protection is Not Applicable. For links between Not Managed/Other Vendor NEs and CTC-based NEs, the link protection is that of the CTC-based NE.
Direction	Specify whether the link is unidirectional or bidirectional.
Cost	Specify a numeric cost associated with the SONET or SDH layer link. The cost range is 0 to 999999. This field applies only to links in the SONET or SDH layer between CTC-based NEs. For all other links, the Cisco default value is 1024. All autodiscovered links have the Cisco default cost 1024.
Shared Risk Link Groups	(SONET/SDH layer rates only) Enter a free-format string that represents the SRLG, or a group of links that share a common risk. For example, links that originate at a node share the node as the common risk. The Shared Risk Link Groups field supports up to 5 comma-separated values, with 32 characters per value.
Link Source Panel	
Node	Identify which NE serves as the source of the link.
Physical Termination Point	Identify the physical side, shelf, slot, subslot (if applicable), and port in the source NE. For the ONS 15216, identify the name of the PTP. **Note** The card type is shown adjacent to the slot number; for example, “1 (OC3_8)” represents the OC3_8 card in slot 1. **Note** If the port name is available, it is shown adjacent to the port number.
PTP Value	(Not Managed/Other Vendor NEs only) Specify the PTP value. The maximum length is 30 characters; the minimum length is 1 character.
Name	For the ONS 15530 and ONS 15540, identify the PTP as a single name, which includes a port type and slot number and might also include a subslot number and port number.
Link Destination Panel	
Node	This is a display-only field if you selected an NE as the destination of the link. If you selected a group as the destination of the link, select from the drop-down list a specific NE that will be the destination of the link.
Physical Termination Point	Identify the physical side, shelf, slot, subslot (if applicable), and port in the destination NE. For the ONS 15216, identify the name of the PTP. **Note** The card type is shown adjacent to the slot number; for example, “1 (OC3_8)” represents the OC3_8 card in slot 1. **Note** If the port name is available, it is shown adjacent to the port number.

Table 3-11 Field Descriptions for the Create Link Wizard (continued)

Field	Description
PTP Value	(Not Managed/Other Vendor NEs only) Specify the PTP value. The maximum length is 30 characters; the minimum length is 1 character.
Name	For the ONS 15530 and ONS 15540, identify the PTP as a single name, which includes a port type and slot number and might also include a subslot number and port number.
Link Summary Panel	
Link Summary	Summarizes the selections you made. To change the Link Summary, click **Back** and change your selection(s).

Note

- After the links are created, each link has a different color notation depending on the alarm status of the PTP on which the link is created. Links between Not Managed/Other Vendor NEs are always black. The color of the link between a Not Managed/Other Vendor NE and a CTC-based NE is the color of the TP of the CTC-based NE. The colors are green for no alarm, yellow for minor alarms, orange for major alarms, and red for critical alarms. Invalid links (as reflected in the Is Link Valid field) are gray. An autodiscovered link can become invalid if (1) the DCC is disabled on either PTP; (2) either PTP is marked as Out of Service (OOS); (3) there is a fiber cut or transmitter/receiver failure; or (4) either NE is marked as OOS. Manual links are colored to match the highest alarm severity on either PTP. L2 links are always gray.
- Links that are supported in different layer rates can be created only if the link endpoints are compatible with the specified layer rate.
- If Prime Optical discovers a link, it automatically assigns layer rates based on its endpoint.

The following table summarizes link color as it relates to link type and the involved NEs.

Table 3-12 Summary of Link Color

Link Type	Link Validity	Link Color	Can the Link Be Deleted?
Manual	Valid	Color of the highest severity alarm on the PTP.	Yes
Manual	Invalid	Gray.	Yes
Virtual	Valid	Color of the highest severity alarm on the PTP.	Yes
Virtual	Invalid	Gray.	Yes
Unmanaged	Valid	Black, if the link is between two unmanaged NEs. Otherwise, the color corresponds to the highest severity alarm on the PTP.	Yes
Unmanaged	Invalid	Gray.	Yes
Autodiscoverd	Valid	Color of the highest severity alarm on the PTP.	No
Autodiscovered	Invalid	Gray.	Yes

3.6.6 Modifying Links

Use the Modify Link wizard to modify the name, alias, description, cost, or SRLG (if applicable) of links displayed in the Link table. You can modify a link in the Link table or in the Network Map.

Note You cannot modify patchcord links.

Step 1 Open the Modify Link wizard (see Table 3-13) by using one of the following methods:

- In the Link table, select a link and choose **Edit > Modify Link** (or click the **Modify Selected Link** tool).
- In the Network Map, select a link and choose **Configuration > Modify Link** (or click the **Modify Selected Link** tool).

Step 2 In the Link Attributes panel, modify the following information, as needed:

- Name
- Link alias
- Description
- Direction
- Cost
- Shared risk link groups

Note If you modify the SRLG value, you receive the warning popup "There might be circuits routed with diverse SRLG constraints on this link. Changing risk link groups might affect the diversity constraint." Click **OK**; then, verify the SRLG value that you entered.

Step 3 Click **Next** until you reach the Finish panel.

Step 4 Verify the link summary and click **Finish**.

Note After certain topology reconfigurations that involve removing fiber, the Network Map might not report the correct links. This problem occurs because the Prime Optical server is not synchronized with the new network topology and cannot retrieve network or link updates. This problem applies only to CTC-based NEs. The workaround is to remove the links completely by deleting the SDCC termination on the ports, rather than by simply unplugging the fiber cable.

Table 3-13 Field Descriptions for the Modify Link Wizard

Field	Description
Link Attributes Panel	
Name	Modify the name of the selected link. The link name is a free-format string, up to 256 characters. The link name must be unique.
Link Alias	Modify the alias name of the selected link. The alias name can contain alphanumeric characters. It also supports international character sets.

Table 3-13 Field Descriptions for the Modify Link Wizard (continued)

Field	Description
Description	Modify the link description. The link description is a free-format string, up to 256 characters.
Provision Type	*Display only.* View the type of link provisioning (Manual or Patchcord).
Layer	*Display only.* View the link layer.
Layer Detail	*Display only.* View the link size.
Wavelength	*Display only.* View the link wavelength value.
Protection	*Display only.* View the link protection.
Direction	Modify whether the link is unidirectional or bidirectional.
Cost	Modify the numeric cost associated with the SONET or SDH layer link. The cost range is 0 to 999999. This field is editable only for links in the SONET or SDH layer. For all other links, the Cisco default value is 1024. All autodiscovered links have the Cisco default cost 1024.
Shared Risk Link Groups	(SONET/SDH layer rates only) Modify the strings that represent the SRLG. The SRLG attribute supports up to 5 comma-separated values, with 32 characters per value.
Link Summary Panel	
Link Summary	Summarizes the changes you made to the editable fields. To change the Link Summary, click **Back** and change your selection(s).

3.6.7 Deleting Links

You can delete one or multiple links from the Link table. You can delete a single link from the Network Map.

Step 1 In the Link table, select one or multiple links and choose **Edit > Delete Link** (or click the **Delete Selected Link** tool). In the Network Map, select a single link and choose **Configuration > Delete Link**.

Step 2 Click **OK** in the confirmation dialog box.

Step 3 For multiple link deletion, complete the following substeps:

a. The Deleting Links dialog box tracks the progress of the deletion. If you selected links that cannot be deleted, you receive the message: "Some of the links can't be deleted, proceed anyway?" Review the links that you selected for deletion; then, click **OK**.

b. The Multiple Link Deletion Summary dialog box opens, summarizing the results of the deletion. Click the **Details** button to see which links were deleted, and which links could not be deleted.

The following rules apply to single and multiple link deletion:

- User-created links or invalid autodiscovered links can be deleted.
- Valid autodiscovered links cannot be deleted.
- An autodiscovered link is marked Invalid when Prime Optical can no longer verify the link from either of the NEs at the ends of the link.
- To remove a valid autodiscovered link from Prime Optical, you must remove the topology neighbors from both NEs at the end of the link.
- Prime Optical can delete physical links even if there is an autodiscovered SONET/SDH link.

- If you use Prime Optical to delete invalid autodiscovered links, verify that the DCCs are deleted on both ends of the link. If you delete a partial link with a DCC up on one end, it might cause problems later with the creation of phantom links.
- When you delete an OSC termination, any autodiscovered links become invalid. If you then delete the invalid links and recreate the OSC termination, an update event is generated. But because Prime Optical cannot find a link to update, it discards the event and does not discover the link. This is normal Prime Optical behavior in response to the deletion of invalid links. The workaround is to mark the NE(s) as Out of Service and then In Service.

3.6.8 Viewing the Link Maintenance Report

The following new functionality is supported on the OCHCC, OCHNC and OCH Trail circuits:

- Protection groups related to the circuits sharing a selection of OTS links.
- Perform bulk protection operations on those circuits

The information is available in the Link Maintenance Report.

You can launch the Link Maintenance Report only from the network map by right clicking the multiple links selection.

Table 3-14 Field Descriptions for the Link Maintenance Report

Field	Description
Circuit Name	Displays the name of the selected circuit. **Note** If there are multiple circuits with the same name displayed in the Circuit table, the label Duplicate appears in this column.
Circuit Type	Displays the type of circuit selected. SONET circuit types are STS, VT, VT Aggregation, VT Tunnel, VT VCAT (shown as VT-v), STS VCAT (shown as STS-v), DWDM optical channel network connection (OCHNC), DWDM optical channel client connection (OCHCC), optical channel trail (OCHTRAIL), and OCHNC DCN. SDH circuit types are HOP, LOP, LOPA, LOPT, HOV (HO VCAT), LOV (LO VCAT), OCHNC, OCHCC, OCHTRAIL, and OCHNC DCN.
Customer ID	Optional text field that displays the customer ID of the circuit.
Service ID	Optional text field that displays the service ID of the selected circuit.
Operation on Source	The current operation on the protection group on circuit source.
Operation on Destination	The current operation on the protection group on circuit destination.
Link on Active Path	Displays the link on the active path. Values are: • Yes—If the links are on the active path of the protection group • No—If the links are on the standby path of the protection group • N/A—If no protection group is available
Protection Group Type	Displays the type of protection group.

Table 3-14 Field Descriptions for the Link Maintenance Report

Field	Description
Circuit Source NE	Circuit source Network Element
Circuit Destination NE	Circuit destination Network Element

3.6.8.1 Performing Switch Operations

You can perform protection operations on single and multiple circuits only if the following conditions are met:

- A protection group is present.
- Current protection operations on sources and destinations are the same.

From the Link Maintenance Report, click the **Perform Protection Switch Operations** button. An Operations dialog box containing the protection operations available for Y-Cable and Splitter protection groups is displayed.

Table 3-15 Field Descriptions for Operations Dialog_Box

Field	Descriptions
Switch Commands	
Clear	Clears a traffic switch on the card or port highlighted under Selected Group
Manual	(1+1, splitter, and Y-cable protection groups only) Initiates a manual switch on the selected port. This command switches traffic only if the path has an error rate less than the signal degrade (SD) bit error rate threshold.
Force	(1+1, splitter, and Y-cable protection groups only) Initiates a forced switch on the selected port. This command switches traffic even if the path has SD or signal fail (SF) conditions. A Force switch has a higher priority than a Manual switch.
Lockout Commands	
Unlock	Clears a lockout.
Lock Out	Prevents traffic from being switched to the card. Lockouts can only be applied to protect cards (in 1+1, splitter, and Y-cable configurations) and prevent traffic from switching to the protect port under any circumstance. Lockouts have the highest priority.
Lock On	Locks traffic on to the working card, that is, prevents a traffic switch from occurring. In a 1+1 configuration you can also apply a lock-on to the working port. A working port with a lock-on applied cannot switch traffic to the protect port in the protection group (pair). For splitter and Y-cable protection groups, Prime Optical allows Lock On for a protect port if other switch conditions (Manual, Force) exist. Lock On is not available if the protect port already has a Lock Out or Lock On present.

Once the operation is completed, a protection operation report with the result is displayed.

3.6.9 Viewing Link Utilization

The Link Utilization table displays utilization information for the selected links. Link utilization, shown as a percentage, displays the overall consumption of bandwidth. All bandwidths are in megabits per second (Mb/s).

% Link utilization = ([Bandwidth consumed] / [Total bandwidth of link]) x 100

Example: In SONET, for an OC12 link, the total bandwidth is (12 x 51.84) Mb/s, where STS-1/OC12 = 51.84 Mb/s.

Depending on the number of provisioned circuits, the consumed bandwidth is totaled. Circuits such as VAP/LAP and virtual tributary (VT) tunnel are preprovisioned and are not included in the calculation. This is applicable to SONET and SDH.

Example: In SDH, for an STM4 link, the total bandwidth is (4 x 155) Mb/s, where STM-1 = 155 Mb/s.

Note

- Link utilization does not apply to server trails. An error message is displayed if you attempt to launch the Link Utilization table from a server trail.
- The customize table view function is not available for the Link Utilization table.

To view the Link Utilization table:

Step 1 In the Domain Explorer window, choose **Configuration > Link Table**. The Link table opens.

Step 2 In the Link table, choose **Configuration > Link Utilization Table** (or click the **Open Link Utilization Table** tool). The following table provides descriptions.

Note You can launch the Circuit Trace window from a selected circuit in the Link Utilization table. Select a circuit in the Link Utilization table and then choose **View > Circuit Trace**. See 7.2.20 Tracing Circuits, page 7-159.

Table 3-16 Field Descriptions for the Link Utilization Table

Column	Description
STS ID (SONET only)	Displays the STS ID.
VT1.5 ID (SONET only)	Displays the VT 1.5 ID.
VT2 ID (SONET only)	Displays the VT2 ID.
VC4 ID (SDH only)	Displays the VC4 ID.
VC3/TUG3 ID (SDH only)	Displays the VC3/TUG3 ID.
TUG2 ID (SDH only)	Displays the TUG2 ID.
VC12 ID (SDH only)	Displays the VC12 ID.
VC11 ID (SDH only)	Displays the VC11 ID.
Circuit Name	Displays the name of any circuits passing through the link. When *Unused* appears in the Circuit Name field there is unused bandwidth available, and the Circuit Type, Circuit Protection Type, Customer ID, and Service ID fields are blank.
Circuit Alias	Displays a unique alias name for the new circuit. The alias name can contain alphanumeric characters. It also supports international character sets.
Circuit Type	Displays the circuit type.
Circuit Protection Type	Displays the circuit protection type.

Table 3-16 Field Descriptions for the Link Utilization Table (continued)

Column	Description
Switch State	Displays the switch state for UPSR protected circuits only. Values are: • CLEAR—Removes a previously set switch command. • MANUAL—A manual switch is active on the span. • FORCE—A force switch is active on the span. • LOCKOUT_OF_PROTECTION—A protection lockout is active on the span; traffic cannot be switched to the span. **Note** A force switch always overrides a manual switch. A protection lockout always overrides both a force switch and a manual switch. To configure the span switch state, see 3.6.9.2 Configuring the Span Switch State on a UPSR Protected Circuit, page 3-49. **Note** *N/A* is displayed for non-UPSR-protected circuits.
Customer ID	Displays the user-defined customer ID.
Service ID	Displays the user-defined service ID number.

3.6.9.1 Launching the Link Utilization Table for SONET/SDH or OTS Links from the Network Map

Step 1 In the Domain Explorer or Subnetwork Explorer tree, click a node and choose **File > Network Map** (or click the **Open Network Map** tool).

Step 2 Right-click a SONET/SDH or OTS link in the Network Map and choose **Link Utilization** from the right-click menu.

3.6.9.2 Configuring the Span Switch State on a UPSR Protected Circuit

Note The span switch is applicable to all UPSR circuits in the Link Utilization table. The selection context has no impact on the switching. When you perform protection switching after selecting an unprotected circuit, the protection switch applies to only UPSR-protected circuits.

Step 1 In the Domain Explorer window, choose **Configuration > Link Table**. The Link table opens.

Step 2 In the Link table, choose **Configuration > Link Utilization Table** (or click the **Open Link Utilization Table** tool).

Step 3 In the Link Utilization table, choose **Configuration > Span Switch > CLEAR, MANUAL, FORCE**, or **LOCKOUT_OF_PROTECTION**.

Note Switch states that cannot be applied are dimmed.

The possible switch state that can be applied to the circuits in the Link Utilization table is decided by switch priority. The switch priority order is:

1. MANUAL
2. FORCE
3. LOCKOUT_OF_PROTECTION
4. CLEAR

Note The CLEAR switch state overrides all other switch states.

Example 3-1 Unprotected OC-48 Link

```
1 - In Use
2 - In Use
3 - In Use
4 - VT Mapped (VTs 1-4 in use)
5 - Available
...
48 - Available

STS Utilization = 4/48 = 8.3%
VT Utilization = (3x28 + 4)/(28 x 48) = 6.5%
STS PCA Utilization = N/A
VT1.5 PCA Utilization = N/A
```

Example 3-2 2-Fiber BLSR OC-48 Link

```
1 - In Use
2 - In Use
3 - In Use
4 - VT Mapped (VTs 1-4 in use)
5 - Available
...
24 - Available
25 - STS PCA Circuit In Use
26 - 8 VT1.5 PCA circuits In Use
27 - Protection
...
48 - Protection

STS Utilization = 4/24 = 16.7%
VT-1.5 Utilization = (3x28 + 4)/(28 x 24) = 13.1%
STS PCA Utilization = 2/24 = 8.2%
VT-1.5 PCA Utilization = (1x28 + 8)/(28 x 24) = 5.4%
```

3.6.10 Filtering the Link Utilization Table

Step 1 In the Link Utilization table, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 2 Specify the filter parameters described in the following table.

Step 3 Click **OK** to run the filter.

Table 3-17 Field Descriptions for the Link Utilization Table Filter Dialog Box

Payload Type	Description
SONET	You can filter on the STS ID to see circuits going through that STS only. Select **All** to see all the tributaries on that link.
SDH	You can filter on specific VC4, VC3/TUG3, and TUG2 IDs. The ALL option shows all tributaries. The None option is available on VC3/TUG3 and TUG2. Using None, you can select VC4 circuits (including VC LO Path Tunnel and LAP).

3.6.11 Setting OTS Link Capacity

You can set the maximum number of wavelengths on one or more OTS links.

Step 1 In the Link table, select a single OTS link or multiple OTS links, and choose **Configuration > Set OTS Link Capacity** (or click the **OTS Link Capacity** window icon).

Step 2 Enter the maximum number of wavelengths for the selected OTS links.

Step 3 Click **Apply**. A Link Capacity Set Result window appears and summarizes the number of links that were configured or have failed.

Note A warning message appears when you select links of different layers.

Step 4 Click on the OTS success link to launch the report. The results can be printed in a text report.

3.6.12 Viewing OTS Link Utilization and Circuits

The OTS Link Utilization Report displays utilization information for the selected OTS links. OTS link utilization, shown as a percentage, displays the resources used. You can also view associated circuit names, types and wavelengths.

To view the Link Utilization and Circuit reports:

Step 1 In the Domain Explorer window, choose **Configuration > Link Table**. The Link table opens.

Step 2 Select the OTS links that you want to view utilization for.

Step 3 In the Link table, choose **Configuration > OTS Link Utilization Report** (or click the **Open Link Utilization Report** icon).

Step 4 From the OTS Link Utilization Report, select the link that you want to view associated circuit names, types, and wavelengths for.

Step 5 Click the **Open Circuit Report** icon.

If the Auto-Refresh check box is checked in the OTS Link Utilization Report window, the respective rows are automatically highlighted when a circuit undergoes a change. When the Auto-Refresh check box is not unchecked, a notification bar appears at the top of the window, stating that the reported data has changed. To refresh the report, click the **Refresh** tool.

If the report consists of more than one page, the Previous Page and Next Page arrows at the top-right corner of the Circuit Report window are enabled. The Pagination Settings tool allows you to select the number of records per page to display.

The status bar at the bottom of the OTS Link Utilization Report window displays:

- Current page number
- Total number of pages in the report
- Number of records displayed
- Number of records selected

To move to a specific page, enter the page number in the Page text box and press **Enter**.

3.6.13 Exporting the OTS Link Utilization Report

To export the OTS Link Utilization Report, complete the following steps:

Step 1 In the OTS Link Utilization Report window, choose **File > Export to CSV** (or click the **Export to CSV** tool). The Export to CSV dialog box appears.

Step 2 Specify the filter parameters described in the following table.

Step 3 Click **OK** to export.

Table 3-18 Field Descriptions for the Export to CSV Dialog Box

Field	Description
Separator Character	Allows you to select a separator character. Values are Comma, Tab, and Other. **Note** If you select Other, enter a value in the text box next to the Separator Character drop-down list.
Data to Export	Allows you to define the rows to be exported. Values are: • All {0} Selected Records • All Records at Page {0} • Entire Table **Note** The first option is available only if at least one record is selected. The second option is available only if there is more than one page.
Export File	Click **Browse** to select the location to which you want to export the file.

3.7 How Do I Build Server Trails?

A server trail is a subnetwork connection within a network that interconnects ONS 155xx edge connection termination points (CTPs). Some limitations of server trails are:

- A server trail connection should not cross the port boundary. For an NxVC4 server trail connection, all N-VC4 terminations must be on the same port.
- Users with permissions to manage links can also manage server trails. Link preferences and not circuit preferences are applied for server trail operations, even though the server trails terminate on CTPs. A user might therefore be allowed to create an STS-1 server trail but not able to create STS-1 circuits (if that circuit size is not allowed for the user).
- Server trail connections cannot be provisioned on DCC-enabled ports. If DCC is enabled on a port, you cannot use the port as the source or destination for the server trail.
- You cannot change the size of an existing server trail.
- Multiple server trails can start from the same PTP. On a given PTP, the server trail can be of different connection types.
- Only one server trail can start from a CTP. CTPs of multiple server trail connections should be of the same type.
- Server trail connections cannot overlap each other.
- The sum of server trail sizes for an existing port cannot exceed the size of the port.
- Any alarm on a physical port affects all links that have an endpoint on that port, including all server trail links. For example, an alarm that has a port as its physical location affects all server trails, even if the affected object is a specific VC within that port.

Following are the differences between manual links and server trails:

- Manual links occupy an entire port while server trails occupy parts of a port. This means that a single port can terminate only one link but several server trails.
- Manual links can terminate on optical cards. Server trails can terminate on optical and electrical cards.
- Manual links can be created on DCC-enabled ports, while you cannot create server trails using DCC-enabled ports.
- The endpoints of manual links should be the same size. The endpoints of server trails can be different sizes and types.

3.7.1 Creating Server Trails

Step 1 Select the source NE in the Domain Explorer or Subnetwork Explorer and choose **Configuration > Create Server Trail** (or right-click the NE and choose **Create Server Trail**). The pointer changes to a plus (+) symbol; select the destination NE. The Create Server Trail wizard opens.

Step 2 In the Server Trail Attributes pane, specify the following:

- Type—Select the type of server trail to create.
- Size—Select the size of the server trail. The options displayed depend on the type selected.
- Protection—Select the server trail protection type.
- Number of Trails—Enter the number of trails.

- Shared Risk Link Groups—Enter a free-format string that represents the shared risk link group or a group of links that share a common risk.
- Cost—Specify the numeric cost associated with the server trail.

Step 3 Click **Next**.

Step 4 In the Source pane, set the server trail source. The options displayed depend on the server trail type selected in the Server Trail Attributes pane.

Step 5 Click **Next**.

Step 6 In the Destination pane, set the server trail destination. The options displayed depend on the server trail type selected in the Server Trail Attributes pane.

Step 7 Click **Finish**. The server trail is listed in the Link table. You can also view the server trail in the Network Map.

Note Server trails that were created in Prime Optical or CTC are listed in the Link table. Open the Link table, and you will see that the value of the Link Provision Type field for server trails is *Server Trail*. See 3.6.3 Viewing the Link Table, page 3-34 for more information.

3.7.2 Modifying Server Trails

Step 1 Open the Modify Link wizard using one of the following methods:

- In the Link table, select a server trail and choose **Edit > Modify Link** (or click the **Modify Selected Link** tool).
- In the Network Map, select a server trail and choose **Configuration > Modify Link** (or click the **Modify Selected Link** tool).

Step 2 In the Link Attributes panel, modify the following information, as needed:

- Name
- Alias
- Description
- Cost
- Shared risk link groups

Note If you modify the SRLG value, you receive the warning popup "There might be circuits routed with diverse SRLG constraints on this link. Changing risk link groups might affect the diversity constraint." Click **OK**; then, verify the SRLG value that you entered.

Step 3 Click **Next**.

Step 4 Verify the link summary and click **Finish**.

3.7.3 Deleting Server Trails

Step 1 In the Link table, select a server trail and choose **Edit > Delete Link** (or click the **Delete Selected Link** tool). In the Network Map, select a server trail and choose **Configuration > Delete Link**.

Step 2 Click **OK** in the confirmation dialog box.

3.8 How Do I Use Network Maps?

The Network Map is organized into a multilevel hierarchy that corresponds to the structure of the Domain Explorer tree. The Network Map hierarchy consists of management domains, groups, and NEs that are displayed graphically.

Network Map backgrounds are provided by default as part of Prime Optical and are used to display a geographical layout of the network.

By default, the Network Map consists of the following areas:

- Center pane—Displays the map with individual groups, NEs, and link icons.
- Explorer pane—Displays a Search text box and Domain Explorer tree.
- Overview pane—Shows the position of the displayed map with respect to a larger world map.
- Properties pane—Displays the domain or group properties, including the number of alarms and the ID. It also displays the properties of selected links.

The Explorer pane in the Network Map contains a Search text box and the Domain Explorer tree. The Search text box allows you to search for NEs based on one or all of the following parameters:

- NE ID
- NE Alias ID
- NE IP Address
- NE Version
- NE Description
- NE Location Name
- Group Name
- NE Operational State
- NE Communication State
- NE Model

From the Search drop-down list, choose the parameter to search by, and enter appropriate data in the text box.

You can select one node or multiple nodes from the Domain Explorer tree in the Topology pane.

Tip Hold down the **Shift** key to select more than one node sequentially, or hold down the **Ctrl** key to select more than one node nonsequentially.

When you right-click a node in the Topology pane or on the map, a popup menu is displayed, from which you can select one of the following options:

- NE Explorer—Displays the NE Explorer for the selected node.
- Equipment Inventory Table—Displays the Equipment Inventory Table of the NE.
- Alarm Browser—Displays the Alarm Browser for the NE.
- Alarm Log—Displays the Alarm Log for the NE.
- Delete Map Element—Allows you to delete the selected node from the map.
- Create Link—Allows you to create a link between NEs.
- Create Server Trail—Allows you to create a server trail for the selected NE.
- Create Circuit—Allows you to create a circuit.
- Search Circuits—Displays the Circuit Search window.
- Circuit Report—Displays the Circuit Table for the NE.
- Link Table—Displays the Link Table for the NE.
- Test NE Connectivity—Tests connectivity to the NE.
- Change State—Allows you to change the state of the NE by selecting one of the following options:
  - Mark In Service
  - Mark Out of Service
  - Mark Under Maintenance
- Network—Allows you to view details of the NE selected on the map.

Note The popup menu is also displayed when you select and right-click multiple nodes of the same type. However, the following options are disabled: NE Explorer, Equipment Inventory Table, and Test NE Connectivity.

Unplaced NEs, or NEs for which the coordinates on the related Network Map are initially null, are represented in italics in the Domain Explorer tree of the Explorer pane. Checking the **Unplaced** check box in the Explorer pane filters the tree view to show only the unplaced NEs.

The Properties pane in the Network Map window displays domain or group properties and allows you to perform certain actions.

The following links are available at the bottom of the Properties pane:

- NE Explorer—Displays the NE Explorer for the selected node.
- Equipment Inventory Table—Displays the Equipment Inventory Table of the NE.
- Alarm Browser—Displays the Alarm Browser for the NE.
- Test NE Connectivity—Tests connectivity to the NE.
- Circuit Table—Displays the Circuit Table for the NE.
- Link Table—Displays the Link Table for the NE.

In the Overview pane, you can view the position of the displayed Network Map with respect to a larger world map and adjust the pan position of the Network Map.

Note The Explorer, Properties, and Overview panes can be docked, floated, or auto-hidden. These panes can also be grouped into a single tabbed pane by dragging and dropping one pane into another. In this case, each pane appears as a tab within a panel. From the Customize icon at the top-right corner, you can also select which of these panes to display.

3.8.1 Customizing a Network Map

Use the Edit menu and toolbar buttons to customize your network map.

Step 1 In the Domain Explorer tree, click a node and choose **File > Network Map** (or click the **Open Network Map** tool).

Note There is no Network Map for the Discovered Network Elements or Deleted Network Elements groups.

Step 2 Use the Edit menu in the Network Map window to customize the Network Map. Edit menu options include:

- Toggle Selection—Selects elements that you click on the map.
- Filter—Filters the network map by NEs, groups, or links.
- Toggle Panning—Pans across the map.
- Set Background—Allows you to set the map background.
- Zoom Magnify—Magnifies the area on the map where the pointer is placed when the left mouse button is held down.
- Zoom In—Zooms in on an object in the map view.
- Zoom Out—Zooms out on the map view.
- Zoom to Fit—Adjusts the view of the map to fit the window.
- Zoom Area—Lets you pan and zoom the view to a different region of the map.
- Zoom Magnify—Magnifies the area under the lens.
- Expand/Collapse Group—Shows or hides NEs contained in a group selected on the map.

Note A group on the map can be expanded if all of its nodes have a coordinate set at the given level. When a group is expanded, all nodes and subgroups are displayed around the expanded group.

- Collapse All Groups—Hides NEs contained in all groups on the map.
- Expand All Links—Shows links contained in an aggregate link.
- Collapse All Links—Hides links contained in an aggregate link.
- Grid Layout—Arranges nodes in a grid pattern.
- Explorer Mesh Layout—Arranges nodes in planar or nonplanar cyclic patterns.
- Uniform Length Edges Layout—Arranges nodes in patterns with edges of uniform length.

- User Preferences—Opens the User Preferences dialog box to set user preferences for options such as event notification and time.

Note Users with SuperUser privileges can configure labels for various nodes and device icons.

3.8.2 Viewing a Node on the Network Map

Icons on the Network Map are displayed based on the nodes you select in the Domain Explorer. Nodes on the Network Map do not have a default position unless one has been configured in a Network Partition Map or a SuperUser has configured one in the current map.

Launching the Network Map from the following nodes displays varying results:

- From the Prime Optical domain in the Domain Explorer—Displays all the groups and individual nodes in the Prime Optical domain.
- From a specific group in the Domain Explorer—Displays all NEs that belong to that group.
- From a specific NE in the Domain Explorer—Displays the parent group that the selected NE belongs to.
- From a specific network partition in the Subnetwork Explorer—Displays all the NEs in that network partition.

3.8.3 Adjusting the Zoom Level or Pan Position

When the Network Map is launched from the Prime Optical domain, it displays a world map with the individual groups, network partitions, and NE icons. To view a particular region or icon, you adjust the zoom level or pan position.

Step 1 In the Domain Explorer or Subnetwork Explorer tree, click a node and choose **File > Network Map** (or click the **Open Network Map** tool). The Network Map opens with the node preselected.

Step 2 Do any of the following:

- To adjust the zoom level, do either of the following:
  - On the Network Map, choose **Edit > Zoom In**, **Zoom Out**, **Zoom to Fit**, or **Zoom Area**.
  - Click the **Zoom In**, **Zoom Out**, **Zoom to Fit**, or **Zoom Area** tool.
- To adjust the pan position, choose **Edit >Toggle Panning** and use the mouse to pan across to the desired region on the map.
- View or hide the links contained in each link bundle (aggregate link):
  - To view links, click a link bundle and choose **Edit > Expand All Links** (or double-click a link bundle to show all the links)
  - To hide links from view in the Network Map, click a link bundle and choose **Edit > Collapse All Links**.

The following table describes how the zoom tools at the right of the Network Map work.

Zoom Tool	Description
Zoom In	Zoom in on an object in the map view. This tool increases the size of all of the graphic objects on the map.
Zoom Out	Zoom out on the map view. This tool decreases the size of all of the graphic objects on the map.
Zoom Slider	Adjust the zoom level of the map by moving the slider up or down between the Zoom In and Zoom Out icons.
Toggle Selection	Select elements on the map.
Toggle Panning	Pan across the map. You can move your view of the map up and down as well as left and right.
Zoom Area	Pan and zoom the view to a different region of the map. Hold down the left mouse button and use the Zoom Area box to highlight an area on the map. When you release the left mouse button, the zoom is applied to the selected area of the map.
Zoom to Fit	Click to adjust the view of the map to fit the window.
Zoom Magnify	Magnify the area under the lens. Click the zoom magnify icon, point to the map region that you want to magnify, and hold down the left mouse button. The area is magnified until the left mouse button is held down.

Note When the network map is zoomed in to show the entire node icon, the related device icons and labels are displayed. When the zoom level is low, only the Alarm Severity icon for each node is displayed. When zoom magnify is applied to the Alarm Severity icon, the entire node icon is visible, along with the related device icons and labels.

3.8.4 Modifying a Map Background Image

Network map backgrounds are provided by default as part of Prime Optical, and are used to display a geographical layout of the network. The icons in the Network Map can be customized. See Appendix A, "Icons and Menus Displayed in Prime Optical" for details of all the icons displayed in the Network Map window.

Prime Optical supports nonanimated GIF, JPG/JPEG, PNG, and shapefile format icons and maps. Shapefile is a universal standard for data files and allows users to zoom in and zoom out without losing details.

To modify a map background:

Step 1 In the Domain Explorer tree, click a node and choose **File > Network Map** (or click the **Open Network Map** tool).

Step 2 In the Network Map window, choose **Edit > Select Background**. The Select Background dialog box opens.

Step 3 Select a background image from the list of existing background images. The selected image appears in the Preview area.

Note If you want to add a new background image to the list, click the **Add** tool at the top of the list, browse, and select the file to be added. In the Data area on the right, you can provide the name, description, and additional files if any, for the newly added background image. Clicking the **Save** tool in the Data area will save the attributes you entered for the background image.

Step 4 After choosing a map background, click **Apply**. The new map background appears in the network map.

Step 5 Select the **No Background** check box if you do not want a background image displayed for the network map.

Step 6 Choose **File > Save Map Settings** to save your settings.

Note You can edit the name and description, and change or upload new files for an existing background image, by selecting the row and editing the fields in the Data area. You can delete files for a selected background image by clicking the **Remove** tool in the Data area.

You can also delete an existing background image by selecting it from the list and clicking the **Remove** tool at the top of the list.

Table 3-19 Field Descriptions for the Select Background Dialog Box

Field	Description
Current Background	Read-only. Displays the name of the current map background.
Name	Read-only. Lists the names of the map background images.
Type	Read-only. Displays the format of the corresponding map background image. Values include jpeg, shape, gif, and png.
Size	Read-only. Displays the size of the map background image in KB or MB.
Added By	Read-only. Displays the name of the user who added the image, and the time stamp.
No Background	Check this check box if you do not want a background image for the network map.
Data Area	
Name	Enter the name of the map background image that you are uploading.
Description	Enter a description for the map background image that you are uploading.
Files	Displays the files added for the selected background image.

3.8.5 Configuring the Network Map View

Prime Optical allows you to configure the appearance of the graphical components on the network map. You can set how nodes, groups, and links appear.

To configure the network map view:

Step 1 In the Network Map window, choose **Edit > Global Network Map Configuration**.

Step 2 On the Node tab:

- In the Badges area, from the list of badges, drag and drop the badges to be displayed on the nodes in the map. The badges available are:
  - Multishelf
  - WSON State
  - Node Role
  - Admin State
  - Alarm
  - Discovery State
  - Connection State
- From the Labels area, drag and drop the labels to be displayed for each node. The labels to choose from include:
  - Alias
  - Model Type
  - IP Address
  - Software Version
- If you want the alarm to be highlighted on the map, check the **Highlight on Alarm** check box.

Step 3 On the Group tab, check one or both check boxes (**Alarm** or **Connection State**) to display the Alarm or Connection State badge for the group on the network map.

Step 4 On the Link tab:

- Enter the desired values for the following:
  - Width of the link
  - Distance between links
  - Width of the links for a bundle
  - Minimum number of links for a bundle
- If you want to hide all links in a bundle on the network map, select the **Bundle Collapsed by Default** check box.
- If you want the DWDM side for the links displayed on the map, select the **Show DWDM Side** check box in the Link Attributes section.
- Specify how frequently you want the links refreshed on the map, by selecting the **Refresh Interval** in the Link Refresh Interval section.

Note The default value for the Refresh Interval is 15 minutes.

Step 5 Click **OK**.

3.8.6 Saving Changes to the Network Map

Step 1 In the Domain Explorer or Subnetwork Explorer tree, click a node and choose **File > Network Map** (or click the **Open Network Map** tool).

Step 2 After making the necessary changes to the map background, map position, zoom level, node icon, or node coordinates in the Network Map window, Choose **File > Save Map Settings** to save your settings.

Depending on the user type and the settings saved, one of the following happens:

- SuperUser saves background and coordinates for:
  - Network partition map—Settings are saved as Absolute settings for the map.
  - Domain map—Settings are saved as System settings for the map.
- Operator or Provisioner saves settings for domain map—Settings are saved as Custom settings for the user.

3.8.7 Searching for Circuits

Prime Optical 9.6.3 allows you to search for circuits from the Network Map window by selecting one or multiple NEs.

You can search for circuits using the Network Map in the following ways:

- Right-click an NE on the map and choose **Circuit Search**.
- Right-click a link on the map and choose **Circuit Search**.
- Use the **Enter Search Query** text box available at the top of the network map.

The circuits associated with the selected NEs are displayed in a dockable Circuit Search window at the bottom of the Network Map window. If you select another NE in the network map, and want to refresh search results, click the Sync tool at the top of the Circuit Search window.

The Circuit Search window allows you to view the links on the map for a selected circuit. When you click the **Toggle Path Trace** tool at the top of the Circuit Search window, the links that contain the selected circuits are highlighted in yellow on the map.

You can launch the Circuit Report from the Circuit Search window, by clicking the Circuit Report tool at the top. You can also filter, and export the search results by choosing the appropriate tools.

Note See Appendix A, "Icons and Menus Displayed in Prime Optical" for an explanation of the icons in the Circuit Search window.

The **Enter Search Query** text box in the Network Map window allows you to search for circuits by the following attributes:

- Alias
- Customer
- Description
- Name
- Service

- Type

Press **Ctrl-Space** to display attributes and select from the list; then type a keyword to search by. You can use multiple keywords for the same attribute, and also select more than one attribute. All circuits with either of the attributes mentioned are displayed in the search results.

Note Clicking the Help icon within the Enter Search Query field displays hints and examples to help you search for circuits effectively.

3.9 How Do I Discover the Network for Optical Devices?

The Prime Optical discovery service collects information from individual CTC-based and ONS 155xx NEs; discovers new NEs added to the network; updates network-level information (such as physical topology, logical circuits, and discrepancies); and updates device-level information (such as inventory and alarms).

When you add a new NE to Prime Optical, the discovery process starts. When the process finishes, all of the NE information (such as inventory, configuration, physical topology, and discrepancies) is collected and Prime Optical is updated.

Note The Discovered Network Elements group can be viewed only by users who have all NEs assigned to them. Therefore, in the Add New NE wizard, the grouping option "Group discovered NEs in the Discovered Network Elements Group" is not available.

3.9.1 Discovering CTC-Based NEs

When a CTC-based NE is added as a GNE, the following NEs are discovered automatically:

- All NEs that are DCC-connected to the GNE
- All NEs that are connected to the GNE by any link other than a manual link

The discovered NEs are added automatically to Prime Optical. The location of new NEs depends on the location you specified in the discovery wizard.

Alternatively, for CTC-based NEs, you can choose to manually discover NEs and add them to a specific network partition. You can disable discovery when the NEs are being added to the network partition. To choose the discovery mode:

Step 1 Choose **Administration > Control Panel**.

Step 2 From the left panel, expand the CTC-based SDH or CTC-based SONET service and choose a network service instance. The property sheet is displayed.

Step 3 Choose a discovery mode (Manual or Automatic).

3.9.2 Discovering ONS 155xx NEs

When you add a new ONS 155xx NE to Prime Optical, the discovery process starts. When the process finishes, all of the NE information (such as inventory, configuration, physical topology, logical circuits, and discrepancies) is collected and Prime Optical is updated. In addition, neighbors of the added NE are discovered. To discover new neighbors, the discovery service relies on CDP neighbor information and topology neighbor information obtained from the NEs.

The ONS 155xx discovery service uses the following measures to keep the NE and network information in Prime Optical synchronized with the NEs themselves:

- Periodic rediscovery based on the resynchronization interval. Periodic rediscovery brings the information in Prime Optical up to date for all ONS 155xx NEs in the network and rediscovers any new neighbors. You can view and reset the synchronization interval in the Control Panel. (For information about resetting the resynchronization interval, see 3.9.5 Resetting the Resync Interval, page 3-68.) If at least one ONS 155xx is already in the system, the first periodic rediscovery starts when the ONS 155xx NE service starts. The NE service usually starts when the Prime Optical server is restarted. If no ONS 155xx NEs are in the system when Prime Optical restarts, the first periodic discovery starts when the first ONS 155xx is added.
- Event-triggered rediscovery launched by certain changes to ONS 155xx NEs. Event-triggered discovery incrementally updates Prime Optical with the new information. New neighbors of the affected NE are discovered. The device changes that trigger rediscovery include, but are not limited to, the following: reboot, CPU switchover, patch and topology changes, and insertion and removal of physical components.
- User-requested rediscovery. Users can request rediscovery of selected ONS 155xx NEs or the entire ONS 155xx network at any time. This updates Prime Optical with information about the NEs. For more information about using rediscovery commands, see 3.9.3 Rediscovering ONS 155xx NEs, page 3-65.

Note Only active NEs (NEs that are in the In Service or Under Maintenance states) can participate in the rediscovery process.

3.9.2.1 Discovery Information Table

The Discovery Information table displays discovery information for individual devices and for main discovery. The main discovery includes the discovery of individual devices plus network-level computations for topology, discrepancies, and logical circuits. The Discovery Information table shows all types of discovery: periodic rediscovery, user-requested rediscovery, and update-triggered discovery. To view the table, choose **Configuration > ONS 155XX > Discovery Info Table** in the Domain Explorer.

The following table describes the fields in the Discovery Information table.

Table 3-20 Field Descriptions for the Discovery Information Table

Field	Description
Discovered NE	NE system ID of the NE selected for discovery, or Main for the main discovery.
Start Time (*time stamp*)	Discovery start time. When the element name is an NE system ID, the elapsed time between start time and end time represents the amount of time required to discover the individual device. When the element name is Main, the elapsed time between the start time and end time includes: • The time required to discover all of the individual NEs that participated in the current discovery cycle • The time required for the network-level computations for topology, discrepancy, and logical circuits
End Time (*time stamp*)	Discovery end time (if the discovery has completed).
Status	Status of the discovery (whether it succeeded, failed, or is in progress). The status “idle” means that no discovery has ever occurred on the NE.
Start Mode	How the discovery was started (periodic rediscovery, user-requested discovery, or discovery triggered by an update).
Description	Type of discovery that was performed. If the discovery fails, this column includes a description of the cause of the failure.

3.9.3 Rediscovering ONS 155xx NEs

The **Rediscover** and **Rediscover All** commands perform a rediscovery of selected ONS 155xx NEs or of the entire ONS 155xx network. Rediscovery updates Prime Optical with current network-level information (such as physical topology, logical circuits, and discrepancies) and device-level information (such as inventory and alarms).

Note Periodic rediscovery occurs every 24 hours, and certain changes on the device can trigger incremental rediscovery.

Start rediscovery from any of the following windows:

- Domain Explorer
- Subnetwork Explorer
- Network Map

Note Only users with the appropriate privileges can use the **Rediscover All** command.

Step 1 To rediscover selected NEs, select NEs or groups of NEs and choose **Configuration > ONS 155XX > Rediscover**.

Note This command is unavailable unless at least one NE in the selection is in the In Service or Under Maintenance states.

Step 2 To rediscover all ONS 155xx NEs in the network, choose **Configuration > ONS 155XX > Rediscover All**.

Note This command is unavailable unless at least one NE in the network is in the In Service or Under Maintenance states.

Step 3 Click **Yes** in the confirmation dialog box to initiate rediscovery.

Rediscover and Rediscover All operations are available only for in-service or under-maintenance NEs. If you try to initiate rediscovery for NE(s) that are not in service or under maintenance, the Error Log records the following minor error:

`Skipping rediscover for: NE-IP-address as its state is neither In Service nor Under Maintenance.`

Note If a Rediscover process is already in progress on a single NE and you choose Rediscover again, the request will be accepted but not executed. Similarly, if a Rediscover All process is already in progress and you choose Rediscover All again, the request will be accepted but not executed.

.

3.9.4 Viewing Manually Discovered NEs

Use the Orchestration Service pane to view the details of a discovery service and manage discovery processes. This page displays the status of a discovery service, which can be Running or Not Running. To view the Orchestration Service pane, choose **Administration > Control Panel > Orchestration Service**.

Table 3-21 Field Descriptions for the Orchestration Service Pane

Field	Description
Status Tab	
Service Status	Displays the status of the process associated with the discovery service. The status can be Running or Not Running. The Not Running status occurs only in the case of an unexpected system error.

Table 3-21 Field Descriptions for the Orchestration Service Pane (continued)

Field	Description
Discovery Properties Area	
Select link types to evaluate during discovery of adjacent nodes	To complete the discovery process, you must select at least one of the following link types: • Physical Links (including virtual links)—During the discovery process, all nodes that are connected by physical links are discovered. However, if the nodes are connected by virtual links, only the immediately adjacent node is discovered. • Server Trails. If you try to proceed without selecting a link type, the following message appears: `You must select at least one link type for evaluation during the discovery.`
Select details to retrieve	Check the details of the node you wish to retrieve during the discovery process. The details which you can retrieve are: • NE model • Software version • NE role The NE Model option is selected by default. If you deselect the option, the node is marked as Undefined NE in the Discovery Overview area (**Domain Explorer > Undiscovered Network Elements**). If you choose to discover additional details (Software Version and Connection Type), the discovery process will be slower. The following message appears: `The selected option(s) will slow down the discovery process.` By default, the node's IP address is retrieved.
Maximum Timeout in Seconds	Enter a maximum timeout, after which the discovery is interrupted. The minimum timeout you can define is 30 seconds.
Debug Tab	
Overall Logging	Enable—Choose the Enable radio button to enable logging. When you choose the Enable radio button, the debug modules in the Available list become selectable. Disable—Choose the Disable radio button to disable logging. When you choose the Disable radio button, the debug modules in the Available list become dimmed and you cannot make any selections.
Debug Modules	Available—Select one or more debug modules in the Available list and click **Add** to move them to the Selected list. **Tip** Hold down the Shift key to select more than one debug module sequentially. To select multiple debug modules nonsequentially, hold down the Ctrl key on your keyboard while using your mouse to select multiple debug modules. Selected—Select one or more debug modules in the Selected list and click **Remove** to move them to the Available list.
Save button	After making your selections, click **Save**. Changes take effect immediately.

3.9.5 Resetting the Resync Interval

The Resync Interval setting displays the frequency at which the configuration is rediscovered, retrieved, and processed for the NEs. The following information is retrieved:

- General system information including node name, system time zone, SNTP configuration, and power monitoring information
- NE's network information including IP address, static routes, OSPF, and RIP configuration
- Card provisioning data
- DCC configuration
- Timing synchronization
- Protection group configuration
- Ethernet Spanning Tree configuration
- Alarm profiles
- Security configuration
- NE defaults
- Routing table and protocol information

Complete the following steps to reset the resync interval:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Expand **NE Service**.

Step 3 Select an NE and change the Resync Interval field in the Resync Scheduling area.

Step 4 Click **Save**.

3.9.6 Discovering CRS-1 and CRS-3, NEs

Using Prime Optical, you can discover CRS-1, CRS-3 R4.2.3 and CRS-3 R4.3.0 NEs that are connected to a DWDM ONS 15454 NE using a virtual transponder. You can also manage the IP traffic that is exchanged in the CRS-1 and CRS-3 networks using the optical DWDM transport network. This is possible because of the presence of virtual transponders and DWDM colorless cards. Prime Optical does the following:

- Discovers the links that connect the ONS 15454 cards to the CRS-1 and CRS-3 virtual transponder cards.
- Discovers and manages CRS-1 and CRS-3 NEs.
- Discovers and manages OCH trail circuits between the CRS-1 and CRS-3 virtual transponder cards and the DWDM optical network. The following cards support OCH trail circuits:
  - Cisco CRS-1 1 x OC768 DPSK+ (C-band) DWDM PLIM
  - Cisco CRS-1 1 x OC768 (C-band) DWDM PLIM
  - Cisco CRS-1 4 x 10GE (C-band) DWDM PLIM
  - DWDM PLIM LINE card 10 GE
  - DWDM PLIM LINE card 100 GE

Note A virtual transponder is a virtual entity of the transponder cards. Prime Optical does not manage this type of equipment.

You cannot add a CRS-1 or CRS-3 NE directly to Prime Optical. For a CRS-1 or CRS-3 NE to be discovered and managed, it must be connected to Prime Optical through one of the following channels:

- An ONS 15454 DWDM NE through a link management protocol (LMP) link
- An ONS 15454 SDH DWDM NE through a link management protocol (LMP) link

Using the APIs available in the CTC library, Prime Optical discovers CRS-1 or CRS-3 NEs using the ONS 15454 or the ONS 15454 SDH NE service.

In the Domain Explorer window, select the CRS-1 or CRS-3 NE that you want to view. The property sheet is displayed. To discover a CRS-1 NE, you must log in with the credentials of the ONS 15454 NE to which it is connected; the NE Authentication tab, therefore, is unavailable for CRS-1 NEs.

Note In order to manage the CRS-1 and CRS-3 nodes, you must be logged in as a root user.

The following limitations apply to the discovery of CRS-1 or CRS-3 NEs:

- A CRS-1 or CRS-3 NE cannot be directly added to Prime Optical as can other NEs. It is discovered only if it is connected to an ONS 15454 NE.
- To discover a CRS-1 or CRS-3 NE, you must log in with the credentials of the ONS 15454 NE to which it is connected.
- You must use CTC to set up the physical connection between the ONS 15454 NE and CRS-1 NE or CRS-3.
- You cannot create an LMP link between the CRS-1 or CRS-3 NEs and 15454 ONS NEs using Prime Optical. Prime Optical automatically discovers CRS-1 or CRS-3 NEs through an existing LMP link. Also, you cannot manually discover CRS-1 or CRS-3 NEs. For information on creating LMP links through CTC, see NTP-G164 Configure Link Management Protocol.
- The NE Explorer is not supported on CRS-1 or CRS-3 NEs.

Once discovered, the Link table represents the CRS-1 or CRS-3 NE as autodiscovered; for more information, see 3.6.3 Viewing the Link Table, page 3-34. The type of link is Unidirectional.

You can use CTC to create OCH trail circuits between two PLIM cards on CRS-1 or CRS-3 NEs. For more information, see NTP-G178 Create, Delete, and Manage Optical Channel Trails. To use Prime Optical to enable the OCH trail circuit, you must enable a specific trunk protection called proactive protection, which applies to all supported cards involved in circuit routing. To define the proactive protection parameters, choose **Create Circuit Wizard > Trunk Filtering**. For more information on populating the Proactive Protection panel, see Table 7-6.

3.10 How Do I Manually Discover NEs and Add Them to Specific Network Partitions?

Using the manual mode of discovery of NEs, you can decide the NEs and the adjacencies you want Prime Optical to discover; once enabled, the respective NE service no longer discovers and manages NEs automatically. This feature lets you take more control over the method in which the network partitions are populated. The following are the advantages of enabling this feature:

- You can decide which NE needs to be added to which network partition. This is particularly useful if the partition reaches its threshold limit.
- You can partition a managed network into several network partitions without having to turn off the physical links connecting two NEs.
- You can effectively delete the NEs that you choose to not be managed. Unless you explicitly add it to a network partition, the NEs remain unmanaged by the network service, even after subsequent discoveries.

Prime Optical discovers NEs through the manual mode in two phases:

1. Enabling the manual mode of discovery at the NE service level—Once you enable the manual mode of discovery at the service level, all nodes that are connected to a managed NE are not automatically added to the service unless specifically added by the user.
2. Managing the discovered nodes—Once the unmanaged NEs are discovered through the manual mode of discovery, you can specify the network partition to manage the discovered NEs.

Limitations of Manual Mode of Discovery

- This feature lets you choose the network partition that will be manage the specified NE. Because of this, the NEs that are not managed yet are identified as missing. These missing NEs can lead to incomplete discovery of services such as links, circuits, BLSR, and L2 topologies.
- If you added NEs belonging to the same physical network (such as a DCN domain) to different network partitions, you have one of the following consequences:
  - The links between the NEs that belong to different network partitions are not discovered.
  - The services topologies (such as circuits, BLSR, L2, VLAN, and SVLAN—which consist of NEs that belong to different partitions) are partially discovered. Also, some of them might remain undiscovered.
  - L1 circuits that are partially discovered are labeled **Split** in the Circuits table. This occurs when the source and destination nodes of the circuit belong to different partitions. In such a scenario, the circuit is marked Split, and is present in the partition to which its source is attached to.

Note Services that are split are supported and provisioned only in case of manual mode of discovery.

3.10.1 Frequently Asked Questions

3.10.1.1 Mode of Discovery

Q. Can I change the mode of discovery for an existing service?

A. Yes. If you are a user with administrative privileges, you can change the mode of discovery of a CTC-based NE at any time. See 3.9.1 Discovering CTC-Based NEs, page 3-63.

Q. Can I change the mode of discovery from manual to automatic?

A. Yes; however, this is not recommended. Prime Optical considers the changed mode of discovery of NEs only during the first network topology change, such as change of a link state. If you need to change the mode, you must force the change by restarting the discovery of NEs, particularly those that are connected to devices that are not currently managed by the NE service.

Q. Can I change the mode of discovery from automatic to manual?

A. Yes. By changing the mode of discovery to Manual, you stop the automatic discovery of NEs, thus limiting the number of devices managed by an NE service. This is particularly useful when the NE service is about to reach its threshold. This allows you to selectively discover and manage the NEs.

Q. Can I define the mode of discovery while adding a new NE?

A. Defining the mode of discovery applies more at the NE service level than at the NE level. You can set the mode of discovery while adding the first NE to an NE service. You cannot set the mode of discovery for NE services that have already been initiated. For more information, see 3.5.2 Adding NEs, page 3-13.

Note You cannot set the mode of discovery to manual for CRS-1 NEs. All connected CRS-1 NEs are added automatically to the partition to which the peer ONS 15454 NE belongs.

3.10.1.2 Administrative Options

Q. What is the recommended link type setting for manual discovery?

A. Using the **Control Panel > Orchestration Service** pane, you can configure the initial set of options to be considered for the discovery process, one of which is the link type between the NEs. You can choose either Physical Links or Server Trails. Physical links include virtual links. With physical and virtual links, the information is cached locally. The information can be retrieved by querying a limited set of NEs. With server trails, the information is retrieved by contacting each NE.

Choosing Server Trails as the link type has an inherent risk of high response time. Therefore, this is not recommended as the default setting. However, if server trail links are present in your network, you must select this link type to be able to complete the discovery process. For more information, see 3.9.4 Viewing Manually Discovered NEs, page 3-66.

Q. How do I set a default mode of discovery for all network partitions?

A. Using the **Control Panel > UI Properties** pane, you can choose a default option to be applied for all network partitions.

- To set a default mode of discovery, and to disallow a change of the mode later, choose **Control Panel > UI Properties**. Uncheck the **Allow Provisioning** check box, and select a mode of discovery from the **Default Discovery Mode** drop-down list.
- To set a default mode of discovery, and to also allow a change of the mode later, check the **Allow Provisioning** check box. Select a mode of discovery from the **Default Discovery Mode** drop-down list. This lets you change the mode of discovery while creating a new NE service.

3.10.1.3 Discovery of Nodes

Q. How does the discovery of nodes work?

A. Once you set the parameters to be considered for the discovery process in the Orchestration Service pane, the NE service starts discovering NEs in its managed network based on the parameters specified. For more information on setting the parameters for mode of discovery, see 3.9.4 Viewing Manually Discovered NEs, page 3-66. The following events occur during the discovery process:

1. The NE service begins to analyze the network topology without actually communicating with NEs. Following the physical links and the server trails existing between the nodes, it determines the NEs that are currently not discovered and managed. Only NEs that are either in In Service state or in In Service - Initializing state are considered for discovery.
2. Once the undiscovered NEs are identified, the Orchestration Service starts retrieving from the remote devices the additional information that you specified.
3. After retrieving the required information, the Orchestration Service makes the data available to all the GUIs.

Q. How can I track the status and execution of discovery?

A. The main stages of discovery are tracked in the Audit Log. You can filter the messages from the log table based on an NE service.

To view the status of a discovery process, choose **Domain Explorer > Undiscovered Network Elements**. For information on undiscovered NEs, see 1.5.2.4 Undiscovered Network Elements, page 1-21.

Q. Can I limit the scope of discovery to reduce the waiting time?

A. When more than one NE service is configured in manual mode of discovery, you can choose the service for which you want the discovery process to begin first. Choose **Domain Explorer > Undiscovered Network Elements**; then, click **Start Discovery**. A table listing the available network partitions appears. Select the desired partitions.

Q. Should I wait for the discovery process to finish before I initiate the process for other nodes?

A. You can initiate the discovery process at any time. However, for a successful discovery, ensure that the following conditions are met:

- At least one NE present in the OSPF topology area must have been discovered—either in In Service state or in In Service - Initializing state.
- If you set the link type as Server Trails, all the NEs connected through server trails must have been fully discovered.

3.10.1.4 TMF CORBA Interface

Q. Is TMF CORBA supported?

A. The discovery mode does not support TMF CORBA. This feature is available only for GUI users. TMF CORBA users must interact with the Prime Optical GUI to define the discovery mode.

3.11 How Do I Test Connectivity for Optical and Routing Devices?

The following sections describe how to test server connectivity to an NE. The following table explains the difference between pinging an NE and testing NE connectivity.

Table 3-22 Testing NE Connectivity

Method	Description
Ping NE	Pinging the NE uses the standard UNIX **ping** command to verify IP connectivity between the Prime Optical server and an NE. If successful, the ping results include the NE's IP address, round-trip time, and packet loss statistics. A response of "Request timed out" means there was no response to the ping attempt. If the ping is unsuccessful, verify that the NE's IP address and SNMP settings are configured correctly.
Test NE connectivity	The Test NE Connectivity operation uses the appropriate management protocol (SNMP, TL1, or CORBA) to run the **ping** command to verify the server's IP connectivity to an NE. If the ping is successful, the Test NE Connectivity operation verifies that the management protocol is configured correctly. The results show whether the connection state of the NE is Available or Unavailable. If Available, the connection state of an NE is updated to Available in the Prime Optical database. If the connection state of an NE is listed as Unavailable, a connectivity or configuration problem exists. Complete the steps in G.5.5 NE Connection State Is Listed as Unavailable, page G-11 to resolve the problem and retest NE connectivity.

3.11.1 Pinging an NE

Step 1 In the Domain Explorer tree, select the NE to ping.

Step 2 Choose **Fault > Ping NE**. The ping results include round-trip time and packet loss statistics.

Step 3 Click **OK** in the dialog box.

Note This function is enabled if the operational state of the NE is In Service or Under Maintenance. It is disabled if the operational state of the NE is Out of Service or Preprovisioned.

Note A link to the ping utility must be present in your PATH variable on the Prime Optical server. The default location is /usr/sbin/ping. If a link to the ping utility is not present in your PATH variable, configure your PATH settings to include it.

3.11.2 Testing NE Connectivity

Step 1 In the Domain Explorer tree, select an NE.

Step 2 Choose **Fault > Test NE Connectivity**. The Test NE Connectivity operation runs the **ping** command to check the NE communication state. The results show whether the NE is available or unavailable:

- Available—If the Prime Optical client can reach the NE through its management protocol, the communication state of the NE in the database is checked. If the NE communication state is Unavailable, it is changed to Available and an event is sent to the Prime Optical client, stating that the communication state was changed. If the NE communication state is Available, there are no changes.
- Unavailable—If the Prime Optical client cannot reach the NE through its management protocol, the communication state of the NE in the database is checked. If the NE communication state is Available, it is changed to Unavailable and an event is sent to the Prime Optical client, stating that the communication state was changed. If the NE communication state is Unavailable, there are no changes.

Step 3 Click **OK** in the dialog box.

Maintaining an Efficient Network

This topic contains the following information to help you maintain an efficient network:

- 4.1 Overview, page 4-1
- 4.2 How Do I Manage the Database?, page 4-2
- 4.3 How Do I Manage the Network Software?, page 4-27
- 4.4 How Do I Modify the Network?, page 4-42
- 4.5 How Do I Manage Redundancy and Failover?, page 4-58
- 4.6 How Do I Monitor the Network?, page 4-87
- 4.7 How Do I Manage CTC Operations?, page 4-96

Note For information about configuring users and user-related parameters, creating and modifying advisory messages, and accessing logs, see Chapter 8, "Managing Security."

4.1 Overview

Maintaining your network focuses on tasks that will keep your network running smoothly. Examples include:

- Backing up and restoring memory and the database
- Creating and maintaining protection groups
- Restoring default settings when necessary
- Monitoring tasks and jobs
- Modifying basic server and NE information
- Finding modules or boards
- Updating software images and versions
- Exporting data and generating reports
- Performing administrative database operations

4.2 How Do I Manage the Database?

This section describes procedures for managing the Oracle database and deals specifically with Cisco Prime Optical data stored in the database. For a complete description, refer to the Oracle documentation.

A useful tool for managing the database is the Oracle Enterprise Manager, part of the Oracle 10g Client CD. The Oracle Enterprise Manager provides an integrated solution for managing heterogeneous environments and combines a graphical console, agents, common services, and tools to provide a comprehensive systems-management platform for managing Oracle products.

4.2.1 Viewing and Modifying Database Properties

The Database Properties pane in the Control Panel shows and defines database pruning parameters and the configuration that the Prime Optical server uses to connect to the Oracle database. The pane contains the following tabs:

- Configuration—Defines the values used by the Prime Optical server to log into the Oracle database. Fields are grouped into two columns: Activated After Restart and Active. The Activated After Restart column shows the values that the Prime Optical server uses after the server is restarted. The Active column displays the values currently used by the Prime Optical server.
- Pruning—Defines the Prime Optical database pruning frequency. Database pruning is enabled by default. You can configure the performance monitoring (PM) pruning interval for 5-minute, 10-minute, 15-minute, and 1-day data collection, giving you a finer level of control over the pruning of performance data from the system. Pruning frequency changes take effect as soon as you save them; you do not need to reboot the Prime Optical server.
- Database Operations—Allows you to start a database backup or export from the Control Panel. After entering the password, click Start to begin the database backup or export. The backup section is disabled if the database is not installed in ARCHIVELOG mode. The ARCHIVELOG mode is stored in the CTM_config_table by the server installer.

Complete the following steps to view and modify the database properties:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Database Properties** to open the Database Properties pane. The following table provides descriptions.

Step 3 (Optional) Modify the values in the Configuration, Pruning, or Database Operations tabs.

Step 4 Click **Save**.

Table 4-1 Field Descriptions for the Database Properties Pane

Field	Description
Configuration Tab	
Database Server Configuration	*Display only.* Displays the size of the database server.

Table 4-1 Field Descriptions for the Database Properties Pane (continued)

Field	Description

Enable ARCHIVELOG Mode	If checked, the ARCHIVELOG mode is enabled. When the database is in ARCHIVELOG mode, Prime Optical supports automatic pruning of the /db05 partition.
	Note When you check the Enable ARCHIVELOG Mode check box, the Archive Log Pruning Parameters check box (located in the Database Operations tab) is checked automatically.
	Caution To change the ARCHIVELOG mode in a high availability (HA) configuration, you must freeze the ctmgrp service group before making the change, and unfreeze the ctmgrp service group when the change is complete.
	Enter the following commands on all of the clusters to freeze the ctmgrp service group:
	`haconf -makerw`
	`hagrp -freeze ctmgrp -persistent`
	`haconf -dump -makero`
	After the Prime Optical server restarts, enter the following commands on all of the clusters to unfreeze the ctmgrp service group:
	`haconf -makerw`
	`hagrp -unfreeze ctmgrp -persistent`
	`haconf -dump -makero`

Configuration Mode	Configuration Mode tells the Prime Optical server the values to use to log into the Oracle database. When set to Auto, the Prime Optical server uses the configuration that was set when Prime Optical was installed. When set to Manual, the Password field can be changed, and the Prime Optical server uses the new password after the server is rebooted.
	Note If you change the configuration mode to Manual, enter the following commands to set the ORACLE_HOME and ORACLE_SID environment variables before logging into Prime Optical again. (The C-shell is assumed for all UNIX commands.)
	`setenv ORACLE_HOME` *`Oracle-home-directory`*
	`setenv ORACLE_SID CTM`
	`setenv LD_LIBRARY_PATH $ORACLE_HOME/lib`
	`setenv PATH $PATH:$ORACLE_HOME/bin`
	Restart the Prime Optical server after setting these environment variables. To do this, enter the **opticalctl stop** command to shut down the Prime Optical server. Then, enter the **opticalctl start** command to restart it.
	Caution If you set the configuration mode to Auto and restart the Prime Optical server, the CTMServer.cfg file does not change; the parameters retain their previous values.

Username	*Display only.* Displays the username that the Prime Optical server uses to access the Oracle database.

Table 4-1 Field Descriptions for the Database Properties Pane (continued)

Field	Description
Password	Displays the password that gives the username access to the Oracle database. You can change the database password only if the database is not embedded and if the configuration mode is set to Manual. If the configuration mode is set to Auto, the password is display only. **Note** The database password cannot contain the characters @, ", and /, because SQL*PLUS interprets them as special characters. **Note** After a Prime Optical server restart, the Prime Optical client attempts to log in automatically for 6 minutes before exiting. If the Prime Optical server initialization requires additional time to complete, you might need to restart the Prime Optical client. **Caution** The default password is *Ctm123!* and any changes are saved in the CTMServer.cfg file. If you change the default password, the following caution is displayed: "Changing the database password will restart the Prime Optical server. Are you sure you want to continue?" Click **Yes** to confirm the action. The password is validated and the following message is broadcast: "Caution: The database password has been changed by a user. The Prime Optical server will restart in 15 seconds." **Caution** To change the Oracle database password in an HA configuration, see "Changing the Oracle Database Password from the Prime Optical Client in an HA Configuration" in *Cisco Prime Optical Release 9.6 High Availability Installation Guide*.
Confirm Password	(Available when the configuration mode is set to Manual) Re-enter the database password to confirm it.
Location	*Display only.* Displays the IP address that the Prime Optical server uses to connect to the database.
Port	*Display only.* Displays the port number that is used to connect to the database.
System ID	*Display only.* Displays the Oracle system ID. The ORACLE_SID specifies the system identifier (SID) value of the database instance that you create with the Prime Optical installer. For a single-instance database, the SID value should be the same as the name of the database it manipulates (initialization parameter DB_NAME), and no more than four characters. **Note** During Prime Optical installation, the default system ID is *CTM*.

SQL Network Alias	*Display only.* Displays the SQL*Net listener alias set in the system listener.ora file. When the listener is running, entering the **ps** command displays the following output (not all systems display *listener_alias*):
	`tnslsnr [listener_alias] [-inherit]`
	Shadow processes (dedicated servers) spawned by the SQL*Net listener have the following syntax:
	`oracleSID [(LOCAL=NO)]`

Pruning Tab	
PM Data (5, 10, 15 min)	Specifies the number of days to save 5-, 10-, or 15-minute PM data before Prime Optical runs the database pruning script. You can save from 1 to 1000 days of data. The default value is 30 days. You can also specify the time of day when the PM data will be saved by choosing the hour and minute from the Hour, Minutes, and AM/PM fields. Minutes are listed in 5-minute intervals. Check the **Enable** check box to activate the PM data pruning.

Table 4-1 Field Descriptions for the Database Properties Pane (continued)

Field	Description
PM Data (1 day)	Specifies the number of days to save 1-day PM data before Prime Optical runs the database pruning script. You can save from 1 to 1000 days of data. The default value is 30 days. You can also specify the time of day when the PM data will be saved by choosing the hour and minute from the Hour, Minutes, and AM/PM fields. Minutes are listed in 5-minute intervals. Check the **Enable** check box to activate the PM data pruning.
FM Data	Specifies the number of days to save cleared and acknowledged alarms in the Alarm Log before Prime Optical prunes alarms from it. You can save from 1 to 1000 days of data. The default value is 7 days. You can also specify the time of day when alarms will be pruned by choosing the hour and minute from the Hour, Minutes, and AM/PM fields. Minutes are listed in 5-minute intervals. Check the **Enable** check box to activate alarm pruning. **Note** Alarms shown in the Alarm Browser are not pruned. They are saved to the Alarm Log when they are cleared and acknowledged. Alarms can be acknowledged manually by a user, or acknowledged automatically if the automatic acknowledgement feature is enabled in the **Control Panel > UI Properties pane > Fault Management** area.
Audit Log Data	Specifies the number of days to save Audit Log data before Prime Optical runs the database pruning script. You can save from 1 to 1000 days of data. The default value is 7 days. You can also specify the time of day when the Audit Log data will be saved by choosing the hour and minute from the Hour, Minutes, and AM/PM fields. Minutes are listed in 5-minute intervals. Check the **Enable** check box to activate the Audit Log data pruning.
Error Log Data	Specifies the number of days to save Error Log data before Prime Optical runs the database pruning script. You can save from 1 to 1000 days of data. The default value is 7 days. You can also specify the time of day when the Error Log data will be saved by choosing the hour and minute from the Hour, Minutes, and AM/PM fields. Minutes are listed in 5-minute intervals. Check the **Enable** check box to activate the Error Log data pruning.
Audit Trail Data (*for CTC-based NEs*)	Specifies the number of days to save audit trail data before Prime Optical runs the database pruning script. You can save from 1 to 1000 days of data. The default value is 7 days. You can also specify the time of day when the audit trail data will be saved by choosing the hour and minute from the Hour, Minutes, and AM/PM fields. Minutes are listed in 5-minute intervals. Check the **Enable** check box to activate the audit trail data pruning.
Self Monitor Data	Specifies the number of days to save self-monitoring data before Prime Optical runs the database pruning script. You can save from 1 to 1000 days of data. The default value is 7 days. You can also specify the time of day when the self-monitoring data will be saved by choosing the hour and minute from the Hour, Minutes, and AM/PM fields. Minutes are listed in 5-minute intervals. Check the **Enable** check box to activate the self-monitoring data pruning.
Job Monitor Data	Specifies the number of days to save job monitoring data before Prime Optical runs the database pruning script. You can save from 1 to 1000 days of data. The default value is 7 days. You can also specify the time of day when the job monitoring data will be saved by choosing the hour and minute from the Hour, Minutes, and AM/PM fields. Minutes are listed in 5-minute intervals. Check the **Enable** check box to activate the job monitoring data pruning.
Database Operations Tab > Backup Area	
'sys' Password	The password for the sys user. The default Oracle password for the sys user is *change_on_install*.
Backup Status	The status of the database hot backup. The default is Unknown.
Oracle Installation	Check this check box to back up the entire Oracle installation directory.
Solaris Configuration	Check this check box to back up the common Solaris configuration files used by the Oracle installation.

Table 4-1 Field Descriptions for the Database Properties Pane (continued)

Field	Description
Database Configuration	Check this check box to back up the operating system configuration files.
All	Check this check box to back up all of the database components (Oracle installation, Solaris configuration, and database configuration).
Start button	Click the **Start** button to back up the selected database component(s).
Database Operations Tab > Archive Log Pruning Parameters Area	
Enable	Allows you to enable (default) or disable archive log pruning. **Caution** If ARCHIVELOG mode is enabled, the archive log pruning should never be disabled. If the archive log pruning is disabled, the /db05 partition might fill up and the Prime Optical database might shut down.
Threshold	Enter the pruning threshold. By default, when the archive log reaches 70 percent of capacity, pruning begins. **Caution** Do not set this threshold to a high value (such as 90 percent). If the threshold is too high, the /db05 partition could fill up before the archive log pruning makes space available.
Archive Log Backup Directory	Specify the location for the archive log backup files. The default directory is /ctm_backup. **Caution** Make sure that the archive log backup directory exists and has enough space to store the compressed archive log files. Check periodically to make sure that this directory is not full.
Database Operations Tab > Export Area	
Export Status	The status of the database export process. The default is Unknown.
Oracle Installation	Check this check box to export the entire Oracle installation directory. **Caution** This option requires a large amount of disk space (about 2.5 GB) in the /ctm_backup directory.
Solaris Configuration	Check this check box to export the common Solaris configuration files used by the Oracle installation.
Database Configuration	Check this check box to export the operating system configuration files.
All	Check this check box to export all of the database components (Oracle installation, Solaris configuration, and database configuration).
Start button	Click the **Start** button to export the selected database component(s).

4.2.2 Changing the Prime Optical Database Password

Complete the following procedure to change the password that gives the username access to the Oracle database. You can perform this operation only if the database is not embedded.

The following procedure applies to changing the Oracle database password in a non-HA environment. To change the database password in an HA configuration, see "Changing the Oracle Database Password from the Prime Optical Client in an HA Configuration" in *Cisco Prime Optical Release 9.6 High Availability Installation Guide*.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Database Properties** to open the Database Properties pane.

Step 3 Click the **Configuration** tab.

Step 4 Change the password in the Password field. The default password is *Ctm123!* and any changes are saved in the CTMServer.cfg file. You can change the database password if the configuration mode is set to Manual. If the configuration mode is set to Auto, the password is display only.

Note The database password cannot contain the characters @, ", and /, because SQL*PLUS interprets them as special characters.

Step 5 In the Confirm Password field, re-enter the database password to confirm it.

Step 6 After you change the default password, the following caution is displayed: "Changing the database password will restart the Prime Optical server. Are you sure you want to continue?" Click **Yes** to confirm the action. The password is validated and the following message is broadcast: "Caution: The database password has been changed by a user. The Prime Optical server will restart in 15 seconds."

Step 7 Click **Save**.

The Audit Log records the history of the database password change.

- If the Prime Optical server stops, the database password change procedure executes and all Prime Optical clients are shut down.

  To check whether the password change succeeded, view the Alarm Browser, which should not indicate a failure with the database password change. The CTMServer.cfg file in the /opt/CiscoTransportManagerServer/cfg directory should report *CHANGED* in the db-password-change-status section of the file. You can view the file with a system editor or with the command **cat CTMServer.cfg**.

  If the Alarm Browser reports a password-related alarm, view the following report logs in the /temp directory:

  - change_db_password_execute.log (the logger file)
  - change_db_password_execute.err (the file that contains the error)
  - change_db_password.out (the output of the opticalctl stop and opticalctl start scripts)

- If the Prime Optical server does not stop, a prerequisite check failed. View the Alarm Browser for an alarm that explains the failure. Also view the preceding log files to understand the error.

4.2.3 Overview of Backing Up the Prime Optical Database

This section provides guidelines for backing up the Prime Optical database. Various factors affect the database backup, including the type of installation and the Prime Optical system performance. Ultimately, your database administrator (DBA) must determine the best method of backing up the Prime Optical database.

Consider the following definitions:

- *Backing up the database* means safely storing the data in the Prime Optical database.
- *Restoring the database* means taking a specific image of a previous database backup and applying it to re-establish an earlier situation.
- *Recovering the database* means taking a specific image of a previous database backup and applying it to recover from data corruption or loss of data.

You can back up the Prime Optical database using the following methods, which are described in Table 4-2 and in the subsequent sections:

- Hot backup
- Cold backup
- Export

Table 4-2 Methods for Backing Up the Prime Optical Database

Method	Description	Prime Optical Status	Available from the GUI?	Available from the CLI?
Hot backup	A physical copy of the database	The Prime Optical server can be running; the Prime Optical database (Oracle) must be running.	Yes	Yes
Cold backup	A physical copy of the database	The Prime Optical server and the Prime Optical database (Oracle) must be shut down.	No	Yes[1]
Export	A logical copy of the database	If the database is exported from the CLI, the Prime Optical server must be shut down and the Prime Optical database (Oracle) must be running. If the database is exported from the GUI, both the Prime Optical server and database must be running. In this case, all NE and PM services must be shut down, and only one Prime Optical client can be connected.	Yes[2]	Yes

1. You can perform a cold backup manually by using Telnet or an SSH session (CLI) on the Prime Optical database server; however, there are no Prime Optical scripts available for this operation.
2. The exported image might contain inconsistencies when exporting from the GUI, because the Prime Optical server is running during the export.

4.2.3.1 Understanding Hot Backup, ARCHIVELOG Mode, and the /db05 Directory

You can perform a hot backup while the Prime Optical server is running. A hot backup requires no downtime, but your Prime Optical database must be running in ARCHIVELOG mode.

In ARCHIVELOG mode, the database saves a redo log whenever a log switch occurs in /db05/*.arc files. Redo logs are composed of a group of special files that are filled cyclically. Before rewriting an existing redo log, the archive process makes a copy of the log and produces the archive (.arc) files.

Oracle registers in the redo logs every activity that occurs in the database.

It is not possible to estimate the rate of production of archive files, because the rate depends on the number of log switches in the system. The number of log switches relates to the Prime Optical server workload: During an intensive session with multiple commits of active transactions, the number of log switches increases.

The archive files, in addition to the initial backup of the database, are part of the backup itself and must be kept in a safe place, such as on tape or on a similar storage device. Prime Optical uses the /db05 partition to store the archive files.

During normal system operation, the /db05 directory fills up. You can configure automatic pruning of the /db05 directory in the Control Panel. If automatic pruning is enabled, the archive files are zipped and moved to the /ctm_backup directory.

Prime Optical checks the /db05 partition once every 5 minutes. When archive log pruning for the /db05 partition exceeds the configured threshold, all archive files except for the most recent one are compressed and moved to the /ctm_backup directory. Therefore, make sure that /db05 is in its own partition and not under the root directory.

Set the archive log pruning threshold to a medium value, such as 60 or 70 percent. If you set the threshold to a very high value (such as 90 percent), you risk filling up the /db05 partition. If the /db05 partition fills while ARCHIVELOG mode is enabled, Oracle stops and Prime Optical hangs.

If you set the threshold to a very low value (such as 10 percent), the /db05 partition is pruned continuously, which slows down the system unnecessarily.

To view or change the archive log pruning threshold:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Database Properties** to open the Database Properties pane.

Step 3 Click the **Database Operations** tab. The Archive Log Pruning Parameters area shows the configured threshold.

Step 4 After modifying the Threshold value, click **Save**.

A database backup comprises two main groups of files:

- The files produced under the /ctm_backup directory, which contains a compressed dump of all of the data in the database, including the actual read logs.
- The archive (.arc) files produced during and after the backup.

You can perform a hot backup from the GUI (see 4.2.4 Backing Up the Prime Optical Database from the Prime Optical GUI, page 4-12). You can also perform a hot backup from the CLI, using the backupdb.sh script (see 4.2.6 Backing Up or Exporting the Prime Optical Database from the CLI, page 4-14).

The Prime Optical restore procedure manages all of the information required to restore the database; you provide only the location of the backup and archive files.

A hot backup has the following advantages:

- You can recover the database contents up to the last transaction that occurred before a crash, returning the lowest amount of lost data.
- There is no Oracle downtime.
- You can use Oracle's RMAN product to configure the backup.

A hot backup has the following disadvantages:

- It requires more disk space, because depending on database activity, the archive log function produces many snapshots.
- It requires planning to avoid filling up the archive log and the /db05 partition.

Use the following guidelines for performing a hot backup:

- By default, the files created by the hot backup are saved in the /ctm_backup directory. Make sure that the /ctm_backup directory exists and has the correct permissions and adequate space.
- Make sure that /ctm_backup is not under the root partition, because it could fill up.
- For optimal results, the Prime Optical server should perform limited activity on the database while the hot backup is running. Therefore, launch the hot backup when users are not working on the system.
- All of the changes performed by the Prime Optical server after the backup starts are logged to the archive files under /db05. These archive files contain required copies of redo logs that are overwritten by Oracle along with the backup files under /ctm_backup.
- Perform a hot backup regularly, especially after completing a significant amount of work. Regular backups reduce the number of archive files to save.
- In a stable network, it is recommended that you perform both a hot backup and a full export. Before the first backup, remove all nonessential files from the /ctm_backup and /db05 directories.
- After a hot backup, save all files in the /db05 and /ctm_backup directories in a safe place.

Use the following guidelines for restoring the database:

- After using a hot backup to restore or recover the database, all previous backups become obsolete. It is recommended that you perform a hot backup after a restore, when all previous backups can be safely removed.
- Restore the database on the same workstation where the backup was performed. This is particularly important in high availability configurations.

Use the following guidelines for managing the archive log:

- It is important to store safely the archive files that are produced *after* a hot backup.
- To avoid generating many archive files that must be saved on disk or tape, perform a hot backup on a regular basis. Regular backups facilitate the restore/recovery operation by reducing the number of archive files to save.

4.2.3.2 Monitoring the Growth of the /ctm_backup Directory

Because it is not possible to estimate the rate of production of archive files, the /ctm_backup directory might exhaust the available disk space. Without disk space, the Oracle archive process cannot archive the redo logs to be overwritten, and the database freezes. The archive redo logs, which are vital to restore and recover a database, should be saved in a safe place. You might want to create a cron job to save your data.

4.2.3.3 Understanding Cold Backup

A cold backup is the safest way to take a snapshot of the database. In a cold backup, the Prime Optical server is stopped; then, the Oracle database is shut down. The database contents and the directories /db01, /db02, /db03, /db04, and /db05 are copied to a tape or storage device.

A cold backup has the following advantages:

- Thorough, safe physical backup of the database.
- Simple to complete using basic operating system (OS) commands and by copying all of the files and the directory structure of /db01, /db02, /db03, /db04, and /db05.

A cold backup has the following disadvantages:

- Because you take a physical copy of the entire database at a specific time while Prime Optical and Oracle are down, the database image is not updated with subsequent modifications.
- A cold backup requires you to shut down Prime Optical, during which time network monitoring is unavailable.

There is no recommended procedure to perform a cold backup; instead, your database administrator determines the exact steps. Use the following guidelines:

- Take a cold backup before any activities that could cause problems with Prime Optical or your OS (for example, before installing an Oracle patch or upgrading your Prime Optical version).
- Take a cold backup after important changes.
- Create a .tar file of all of the structures in $ORACLE_HOME and include it with the cold backup files.

4.2.3.4 Understanding Export

An export is a logical copy of the database objects on a single *.dmp file. You can export the database from the GUI (see 4.2.5 Exporting the Prime Optical Database from the Prime Optical GUI, page 4-13). You can also export the database from the CLI, using the export_full_db.sh script (see 4.2.6 Backing Up or Exporting the Prime Optical Database from the CLI, page 4-14).

When exporting the database, all of the constraints are removed; then, the objects and constraints are recreated. It is recommended that the Prime Optical server be shut down during the export operation.

An export has the following advantages:

- It is relatively easy to take a logical snapshot of the database contents at a specific time.
- There is no Oracle downtime.
- The restore operation is simple and can be applied on different servers (with the correct database schema).

An export has the following disadvantages:

- It is not a complete backup. If you have database corruption that you cannot recover from, you must recreate the database and then repopulate it with a full export.
- To avoid inconsistencies, you must stop the Prime Optical server.

Use the following general guidelines when exporting the database:

- An export is useful to re-establish the previous contents of the database. Use an export when you plan a critical modification or to eliminate fragmentation.

  For example, export the database before migrating from a single-server Prime Optical configuration (where the Prime Optical server and database are on the same workstation) to a dual-server Prime Optical configuration (where the Prime Optical server and database are on separate workstations).

- If you want to restore a database backup that was exported before you migrated to a later Prime Optical version, you must reinstall the earlier Prime Optical version in order to maintain the earlier Prime Optical database schema. Whenever you restore a database, you must restore it on the same Prime Optical version from which it was created. Otherwise, the restored data does not match the current database schema and Oracle cannot interpret the data.
- Export the database only after the Prime Optical server is stable; for example, after the first network discovery is complete. Doing so ensure that you have an accurate snapshot of your entire network configuration.

4.2.4 Backing Up the Prime Optical Database from the Prime Optical GUI

If your database is in ARCHIVELOG mode, you can perform a hot database backup or a database export. If your database is not installed in ARCHIVELOG mode, you can only perform a database export.

Prime Optical uses the /ctm_backup directory as the default backup directory.

To perform a hot database backup, complete the following steps:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Database Properties** to open the Database Properties pane. Table 4-1 provides descriptions.

Step 3 Click the **Database Operations** tab.

Step 4 In the Backup area, enter the sys password in the 'sys' Password field.

Step 5 (Optional) To back up additional database components, check any of the following check boxes in the Backup area:

- Oracle Installation—Backs up the entire Oracle installation directory.
- Solaris Configuration—Backs up the common Solaris configuration files used by the Oracle installation.
- Database Configuration—Backs up the operating system configuration files.
- All—Backs up all of the database components.

Note If you do not check any of the preceding check boxes, only the Prime Optical database is backed up.

Step 6 In the Backup area, click **Start**.

The backup log file is saved to /oracle/admin/*ORACLE-SID*/udump/backup_db.log. The log file contains all of the files that have been backed up.

Note If the backup is interrupted, you cannot start a new backup from a Prime Optical client; you must use the CLI. Launch the script /setDbBackupStatus.sh from the server as root where the database is installed, at the following location:

cd/opt/CiscoTransportManagerServer/bin

Note It is recommended that you protect your data by backing it up regularly. Backups can be stored on a local or network-mounted, disk-based file system; on a local tape drive; or on a remote tape drive. Commercially available tools for Oracle and system-level backup include:

- Legato Networker (or "Solstice Backup" when purchased from Sun Microsystems)
- VERITAS NetBackup
- BMC Software SQL Backtrack
- GNU Oraback.sh

4.2.5 Exporting the Prime Optical Database from the Prime Optical GUI

Caution Using the Prime Optical GUI to export the database could result in invalid or inconsistent data when other operations are performed on the database (for example, NEs are in service, alarms are being reported, or PM data is being collected). Whenever possible, use the CLI to export the database. If you use the GUI to export the database, verify the following *before* exporting the database:
— Only one Prime Optical client is connected to the Prime Optical server
— All NE and PM services are stopped

To perform a database export, complete the following steps:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Database Properties** to open the Database Properties pane. Table 4-1 provides descriptions.

Step 3 Click the **Database Operations** tab.

Step 4 Check any of the following check boxes in the Export area:

- Oracle Installation—Exports the entire Oracle installation directory.
- Solaris Configuration—Exports the common Solaris configuration files used by the Oracle installation.
- Database Configuration—Exports the operating system configuration files.
- All—Exports all of the database components.

Note If you do not check any of the preceding check boxes, only the Prime Optical database is exported.

Step 5 In the Export area, click **Start**.

The file is exported to the /ctm_backup/export_dir directory using the filename export_CTM*time-stamp*.dmp. The log file is named export_CTM.log.

4.2.6 Backing Up or Exporting the Prime Optical Database from the CLI

Prime Optical uses the /ctm_backup directory as the default backup directory.

Step 1 To perform a logical database backup (export) from the CLI, enter the following commands as the root user:

Note You can perform a logical database backup whether your database is running in ARCHIVELOG mode or in non-ARCHIVELOG mode.

Performing an export_full_db operation from the CLI requires you to shut down the Prime Optical server.

```
cd /opt/CiscoTransportManagerServer/bin
./export_full_db.sh
```

The file is exported to the /ctm_backup/export_dir directory using the filename export_CTM*time-stamp*.dmp. The log file is named export_CTM.log.

Step 2 To export the database and back up selected components, enter any of the following commands as the root user:

- **export_full_db.sh ORA_INST**—Exports the database and backs up the entire Oracle installation.
- **export_full_db.sh ORA_CFG_FILE**—Exports the database and backs up the configuration files, including init.ora, tnsnames.ora, listener.ora, and sqlnet.ora.
- **export_full_db.sh OS_CFG_FILE**—Exports the database and backs up the OS configuration files, including /etc/passwd, /etc/group, /etc/system, and /var/opt/oracle/oratab.
- **export_full_db.sh ALL**—Exports the database and backs up all of the preceding configuration files.

Step 3 To perform a full database hot backup, enter the following commands as the root user:

Note You can perform a hot database backup only if your database is running in ARCHIVELOG mode.

```
cd /opt/CiscoTransportManagerServer/bin
./backupdb.sh
```

The backup log file is saved to /oracle/admin/*ORACLE-SID*/udump/backup_db.log. The log file contains all of the files that have been backed up. Detailed logs of the export operation are located in the /ctm_backup/export_dir directory.

Step 4 To back up selected components, enter any of the following commands as the root user:

- **backupdb.sh ORA_INST**—Backs up the entire Oracle installation.
- **backupdb.sh ORA_CFG_FILE**—Backs up the configuration files, including init.ora, tnsnames.ora, listener.ora, and sqlnet.ora.
- **backupdb.sh OS_CFG_FILE**—Backs up the OS configuration files, including /etc/passwd, /etc/group, /etc/system, and /var/opt/oracle/oratab.

- **backupdb.sh ALL**—Backs up the database and all of the preceding configuration files.

4.2.7 Restoring the Prime Optical Database from the Previous Backup

Complete the following steps to restore the Prime Optical database from a hot database backup set or from an export.

Note The revert procedure will result in loss of local database information stored after the upgrade. In other words, a reverse database migration is not supported; rather, a backup copy of the original database is used.

Step 1 (*For HA configurations only; for non-HA configurations, begin at Step 2*) Enter the following commands on all of the clusters to freeze the ctmgrp service group:

```
haconf -makerw
hagrp -freeze ctmgrp -persistent
haconf -dump -makero
```

Step 2 Disconnect all of the Prime Optical clients and enter the following command to shut down the Prime Optical server, if it is running:

```
opticalctl stop
```

Step 3 To restore the database from a hot backup, log into the Prime Optical database workstation as the root user and enter the following commands:

```
cd /opt/CiscoTransportManagerServer/bin
./restore_db.sh backup-file-location backup-configuration-file log-directory
```

Note The default *backup-configuration-file* location is /ctm_backup/backup_conf.cfg. The restore_db.sh script uses the latest backup to restore the database.

Step 4 Enter the following command to manually restart the Prime Optical server:

```
opticalctl start
```

Note The Prime Optical server does not restart automatically after restoring the database.

Step 5 (*For HA configurations only; for non-HA configurations, skip this step*) After the Prime Optical server restarts, enter the following commands on all of the clusters to unfreeze the ctmgrp service group:

```
haconf -makerw
hagrp -unfreeze ctmgrp -persistent
haconf -dump -makero
```

Step 6 To restore from an export dump file, enter the following commands to import the database:

Caution Be sure to disable ARCHIVELOG mode before you import the database. If you do not disable ARCHIVELOG mode, the /db05 directory could fill up.

```
cd /opt/CiscoTransportManagerServer/bin
./import_full_db.sh export-file-location export-configuration-file log-directory
```

The default location of the configuration file is /ctm_backup/export_conf.cfg.

4.2.8 Pruning the Prime Optical Database

Database pruning is critical to Oracle server performance. If the Prime Optical database files grow too large, it creates extra work for Oracle to insert or remove records from the middle of the database. This section describes how to set the time and date for automatic database pruning and how to use pruning scripts.

4.2.8.1 Setting the Time and Date for Automatic Pruning

Choosing to prune the database automatically prunes daily all PM, FM, Audit Log, Error Log, audit trail, self monitor, and job monitor data older than the specified retention period.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Database Properties** to open the Database Properties pane.

Step 3 Click the **Pruning** tab.

Step 4 Check the **Enable** check box for each field as desired, and set the number of days and time of pruning.

Consider scheduling database pruning for the middle of the night, when Prime Optical is least busy. It is helpful to schedule each pruning activity to start separately, with some time between each pruning script. For example, you might start pruning at midnight and allow 30 to 45 minutes for each pruning activity before starting the next one.

Note that the start time for pruning activities is set according to Greenwich Mean Time (GMT), not local time.

Step 5 After making the selections, click **Save**. Changes take effect immediately.

4.2.8.2 Using Pruning Scripts

Aside from automatic pruning, you can also prune Prime Optical data from the Oracle database at any given time by running database pruning scripts. Pruning scripts allow you to prune the following types of data:

- Audit Log data
- Audit trail data
- Error Log data
- FM data
- All PM data
- NEs and all related information
- Self Monitor table data

Complete the following steps to prune Prime Optical data using pruning scripts:

Step 1 Log in as the root user on the Sun Solaris workstation where the Prime Optical server is installed.

Step 2 Enter the following command to change directories to the Prime Optical server bin directory:

```
cd /opt/CiscoTransportManagerServer/bin
```

Step 3 Enter the following command to see a list of pruning scripts:

```
ls -al prune*
```

Step 4 Select a script and a parameter (based on database pruning) and enter the corresponding command on the UNIX shell.

For example, to prune Error Log data older than 25 days, enter:

```
./prune_errlog.sh 25
```

The following table lists parameters that can be passed to the following scripts, and the tables that are affected:

- Prune Audit Log data
- Prune Error Log data
- Prune FM data
- Prune audit trail data
- Prune Job Monitor table data
- Prune Self Monitor table data

Table 4-3 Parameters for Database Pruning: Multiple Scripts

Tables Affected	Input Parameters	Remarks
Prune Audit Log Data Script (prune_auditlog.sh)		
transaction_log_table	No. of days (1 to 1000)	Removes all Transaction Log entries that were created before *n* days.
Prune Error Log Data Script (prune_errlog.sh)		
error_log_table	No. of days (1 to 1000)	Removes all Error Log entries that were created before *n* days.
Prune FM Data Script (prune_fm.sh)		
alarm_event_table	No. of days (1 to 1000)	Removes all alarm and event entries that were created before *n* days.
active_alarm_table	No. of days (1 to 1000)	
Prune Audit Trail Data Script (prune_audittrail.sh)		
ne_audit_trail_table	No. of days (1 to 1000)	Removes all NE audit trail entries that were created before *n* days.
PruneJob Monitor Table Script (prune_admin_job_table.sh)		
admin_job_table	No. of days (1 to 1000)	Removes all job monitor entries that were created before *n* days.

Table 4-3 Parameters for Database Pruning: Multiple Scripts (continued)

Tables Affected	Input Parameters	Remarks
Prune Self Monitor Table Script (prune_server_monitor.sh)		
server_monitor_table	No. of days (1 to 1000)	Removes all self monitor entries that were created before *n* days.

Table 4-4 lists parameters that can be passed to the prune_pm.sh script, and the tables that are affected. The prune_PM.sh script removes all PM entries that were created before *n* days.

Note Based on the value of "Is 24 flag," Prime Optical prunes 15-minute data, 1-day data, or both 15-minute and 1-day data. If the "Is 24 flag" value is blank, Prime Optical prunes both 15-minute and 1-day data.

Table 4-4 Parameters for Database Pruning: Prune PM Data Script (prune_pm.sh)

Tables Affected	Input Parameters
ONS15454_DS3_PM_TABLE	• No. of days (1 to 1000) • Is 24 flag (where 0 = 15 min, 1 = 1 day, and 2 = both 15 min and 1 day)
ONS15454_SONET_PATH_PM_TABLE	
ONS15454_SONET_LINE_PM_TABLE	
ONS15454_SONET_SEC_PM_TABLE	
ONS15454_ENET_PM_TABLE	
ONS15454_DS1_PM_TABLE	
ONS15454_Sonet_VT_PM_Table	
ONS15454SDH_RS_PM_Table	
ONS15454SDH_MS_PM_Table	
ONS15454SDH_HO_PM_Table	
ONS15454SDH_LO_PM_Table	
ONS15454SDH_E1_PM_Table	
ONS15454SDH_E3_PM_Table	
ONS15454SDH_E4_PM_Table	
ONS155XX_SONET_SEC_PM_TABLE	
ONS155xx_Phy_PM_Table	
ONS155xx_Opt_Power_PM_Table	
ONS155xx_CDL_PM_Table	
ONS155xx_Ether_Hist_PM_Table	
ONS155xx_FCM_PE_PM_Table	
ONS15600_Sonet_Sec_PM_TABLE	
ONS15600_Sonet_Line_PM_Table	
ONS15600_Sonet_Path_PM_Table	
ONS15454_PHY_LAYER_PM_Table	
ONS15454_POS_PM_Table	
ONS15454_OTN_SEC_PM_Table	
ONS15454_OTN_PATH_PM_Table	
ONS15454_OTN_FEC_PM_Table	
ONS15600SDH_RS_PM_Table	
ONS15600SDH_MS_PM_Table	
ONS15600SDH_HO_PM_Table	
ONS1530x_RS_PM_TABLE	
ONS1530x_MS_PM_TABLE	
ONS1530x_HO_PM_TABLE	
ONS1530x_LO_PM_TABLE	
ONS1530x_IP_PM_TABLE	

Table 4-5 lists parameters that can be passed to the prune_ne.sh script, and the tables that are affected. The prune_ne.sh script removes all information about the NE from the database. Use this script with extreme caution.

Caution Before running the script, shut down all Prime Optical clients and the Prime Optical server.

4.2.9 Using the SQL*PLUS Client to Manage the Database

To access the database and Prime Optical schema objects, use the SQL*PLUS client that ships with Oracle products. The SQL*PLUS client is available for Microsoft Windows 2000 or NT 4.0 PCs or Sun Solaris workstations. Refer to the Oracle documentation to install and run the SQL*PLUS client on a Windows 2000 or NT 4.0 PC.

On a Sun Solaris workstation, the SQL*PLUS client is installed as part of the Oracle server installation. The following guidelines are for logging into SQL*PLUS as a Prime Optical user and managing Prime Optical schema objects and data. Refer to Oracle's *SQL*PLUS User's Guide and Reference* for a complete description.

Step 1 On the Sun Solaris workstation running Oracle, log in as the Oracle owner user. Use the username that was used when installing Oracle 10g.

Note To verify the username, enter the **id** command on the shell.

Step 2 Verify that the following UNIX environment variables for the Oracle user are set correctly:

- ORACLE_HOME
- ORACLE_SID
- PATH variable has $ORACLE_HOME/bin in the path
- LD_LIBRARY_PATH

Step 3 On the command line, enter the following command:

```
sqlplus ctmanager/password
```

Caution The default password is *Ctm123!* and any changes are saved in the CTMServer.cfg file. If you change the default password, the following caution is displayed: "Changing the database password will restart the Prime Optical server. Are you sure you want to continue?" Click **Yes** to confirm the action. The password is validated and the following message is broadcast: "Caution: The database password has been changed by a user. The Prime Optical server will restart in 15 seconds."

The message "Connected to: Oracle10g..." and the SQL> prompt should appear. If not, enter the username and password again.

Step 4 Upon connection to SQL*PLUS, enter any SQL command supported by Oracle. For a list of SQL commands supported by Oracle, refer to the *SQL*PLUS User Guide*.

4.2.10 Understanding Basic SQL Commands for Prime Optical Schema Objects

The following table lists commands that display, update, or modify Prime Optical schema objects. Run each command in SQL*PLUS by entering the command at the SQL> prompt.

Table 4-6 SQL Commands for Prime Optical Schema Objects

SQL Command	Description
`select * from user_tables;`	Returns a list of all table names owned by the ctmanager user.
`select * from user_views;`	Returns a list of all views owned by the Prime Optical user.
`describe ;`	Takes a *table-name* as a parameter (valid table names are those returned by the first two commands) and lists the name, type, and size of columns in the table.
`describe ;`	Takes a *view-name* as a parameter (valid view names are those returned by the first two commands) and lists the name, type, and size of columns in the view.
`select col1, col2… coln from table-name;`	Takes *col1….coln* and *table-name* as parameters and displays data for all the columns listed. To display data for all columns, use an asterisk (*) instead of col1, col2, and so on.
`select col1, col2... coln from table-name where col1 = value1 and col2 = value2...`	Takes *col1...coln* and *table-name* as parameters and displays data for all the columns listed that meet the condition specified in the "where" clause. For example, the command: `select nedbaccessid from ne_info_table where nesysid = 'ANGEL';` returns the value of column nedbaccessid from table ne_info_table for all rows for which nesysid = ANGEL.
`select col1, col2... coln from view-name where col1 = value1 and col2 = value2...`	Takes *col1...coln* and *view-name* as parameters and displays data for all the columns listed that meet the condition specified in the "where" clause.
`delete table-name;`	Takes *table-name* as a parameter and deletes the entire contents of the table. To make the change permanent, enter **commit;** at the SQL> prompt.

4.2.11 Using the Prime Optical Interactive Database Console to Manage the Database

To access the database and Prime Optical schema objects, use the Prime Optical Interactive Database Console. The database console is used when the server is installed with an embedded database.

Get the Prime Optical Interactive Database Console from the Prime Optical Client service folder at one of the following locations (where xxx is the build number):

- Under the Windows folder at C:\Cisco\PrimeOptical_9.6_xxx\DB_Console
- Under the Solaris/Linux folder at C:\Cisco\PrimeOptical_9.6_xxx/DB_Console

4.2.11.1 Executing the Prime Optical Interactive Database Console

The Prime Optical Interactive Database Console tool is a Java application that you execute by running runme.bat (Windows) or runme.sh (Solaris/Linux). JRE 1.6 or higher is required to execute DB Console. Go to the Java website to obtain the latest version of Java Runtime Environment for your operating system.

4.2.11.2 Connecting to the Database

Complete the following steps to connect to the database:

Step 1 Choose **Session > Connect**.

Step 2 In the Hostname field, enter the hostname of the server or the IP address.

Step 3 Click **Connect**.

Note You must connect to the database through a special database user login. Using this login, you will only be able to view tables and other objects in the embedded database. You will not have read/write access.

4.2.11.3 Managing the Database Using the Prime Optical Interactive Database Console

Interactive Database Console is a command-line interface (CLI) that allows you to browse the database tables.

To get a list of allowed commands, execute the following command in the CLI:

```
help
```

To get the detailed synopsis and description of a specific command, execute the following command in the CLI:

```
help <command>
```

The following example shows output for the **import** command:

```
ctmreadonly@oracle:jeeg#1> help import
SYNOPSIS
```

```
    import from <filename> into <tablename> columns (col1[:type][,col2[:type]])
[column-delim "\t"] [row-delim "\n"] [encoding <encoding>] [start-row <number>]
[row-count|end-row <number>]
    col could be a column name or '-' if the column is to be ignored
    the optional type can be one of [string,number,date]

DESCRIPTION
    Import the content of the file into table according to the format
    If the filename ends with '.gz', the
    content is unzipped automatically
```

Table 4-44 lists the aliases that already exist to enable you to check the status of the Prime Optical database:

Table 4-7 Aliases for Checking the Prime Optical Database

Alias	Description
export <table>	Export the contents of a given table.
list_indexes	List all the indexes that Prime Optical DB uses.
list_jobs	List all the Prime Optical scheduled jobs with scheduling details.
list_nes	List all the NEs present in Prime Optical DB.
list_objects	List all the DB objects (tables, views, indexes, and so on.)
list_sequences	List all the DB sequences.
list_tasks	List all the DB tasks.
ls	List all the DB table names.
search_invalid_indexes	Search the DB for invalid indexes.
search_invalid_objects	Search the DB for invalid objects.
search_property	Search the CTM_CONFIG_TABLE.
size <table>	Count the number of rows in a given table.

The Database Interactive Console supports automatic command completion (Tab key), and command history (up/down arrow). To clear command history, choose **Edit > Clear History**.

4.2.11.4 Launching Batch Scripts

To launch automatic scripts, choose **File > Load Script**.

A batch script can contain any number of allowed commands. DB_Console includes an example script named report.txt that collects information on the status of the Prime Optical database.

4.2.11.5 Setting Preferences for the Prime Optical Interactive Database Console

Complete the following steps to set the preferences for the Interactive Database Console:

Step 1 Choose **Edit > Preferences.**

Step 2 In the General tab, set preference for the following:

- Default Hostname or IP Address
- Database Schema ID (SID)

- Screen Buffer Size

Step 3 In the Font and Color tab, set preferences for the following:

- Font color
- Background color
- Foreground color

Step 4 Click **Apply**. For some changes (for example, default host or screen buffer) to take effect, you must restart the application.

4.2.12 Regenerating Statistics in the Database

Internal Oracle statistics allow Oracle to work efficiently, especially during data query operations. If there is Prime Optical system performance degradation during normal database activities, the database might be using stale statistics. The database statistics should be regenerated to improve system performance, either before or after a significant system workload.

In Oracle 10g, the statistics are automatically regenerated every night. The Prime Optical installation uses the default settings of Oracle 10g. If you need to change the statistics regeneration schedule, refer to the official Oracle 10g documentation for instructions on how to change the settings.

4.2.13 Cleaning Up the Disk and Maintaining Disk Space on the Prime Optical Server

It is important to clean up the disk and maintain disk space on the Prime Optical server. To maintain an efficient server and maximize performance, you must delete unnecessary files and retain only the minimum number of files. For detailed information, see Clean Up the Disk and Maintain Disk Space on the CTM Server.

4.3 How Do I Manage the Network Software?

Follow the procedures described in this section to upgrade the Cisco Transport Controller (CTC) binary file and download new or modified images to supported NEs.

4.3.1 Transferring Images

You can transfer NE binary software images from the client file system into an appropriate NE software repository in the Prime Optical server, to make the images available for selection when requesting a software download.

Use the Image Transfer dialog box to transfer software images to the following NEs:

- ONS 15216 EDFA
- ONS 15216 EDFA2
- ONS 15216 EDFA3
- ONS 15305 (including the CTC-based ONS 15305 R3.0)

- ONS 15310 CL
- ONS 15310 MA SONET
- ONS 15310 MA SDH
- ONS 15327
- ONS 15454 SONET
- ONS 15454 SDH
- ONS 15530
- ONS 15540 ESP and ESPx
- ONS 15600 SONET
- ONS 15600 SDH

To transfer images into an appropriate NE software repository:

Step 1 In the Domain Explorer, select an NE and choose **Administration > Image Transfer**. The Image Transfer dialog box opens.

Step 2 Select the source files from the Local File Selection list.

Step 3 Click **Browse** to locate files that are not visible in the field. You can select multiple files from the local machine for the upload process.

Step 4 To remove a file from the Local File Selection list, select the file from the list and click **Delete**.

Step 5 Select the NE-specific folder from the Prime Optical server drop-down list to choose where to transfer the image.

Step 6 To remove a file that is already present on the Prime Optical server, select the file from the list and click **Delete**.

Step 7 Click **Upload**.

Note If you cancel the image transfer process while it is in progress, only the files that have already been transferred at the time of cancellation are retained. The current file being transferred and other pending files are canceled.

4.3.2 Software Management

Use the Software Management wizard to download software images to the following NEs:

- ONS 15216 EDFA2 (R2.3.0 and later)
- ONS 15216 EDFA3
- ONS 15305 (not supported for the ONS 15305 R3.0)
- ONS 15310 CL
- ONS 15310 MA SONET
- ONS 15310 MA SDH

- ONS 15327
- ONS 15454 SONET
- ONS 15454 SDH
- ONS 15530
- ONS 15540 ESP
- ONS 15540 ESPx
- ONS 15600 SONET
- ONS 15600 SDH

Follow the procedures described in this section to download new or modified images to NEs.

Usage Notes:

- Refer to the appropriate NE documentation for precautions and guidelines before performing an NE software upgrade.
- Before updating the software image on an NE, check the Prime Optical release notes to verify whether the NE software release is supported by Prime Optical. See the "Prime Optical-Supported NE Software Releases" table in the release notes at *http://www.cisco.com/en/US/products/ps11670/tsd_products_support_series_home.html*.
- If a software download has a status of Queued, and if it has a task in the running list, the download cannot be canceled.
- If you mark an NE as an Out of Service while a software download is in progress on that NE, the software download might not complete successfully.
- To download software images to NEs, it is recommended that the data communications network (DCN) bandwidth be 56 kb/s or higher. If DCN bandwidth is less than 56 kb/s, software download might take an extended period of time. For example, a typical ONS 15327 software image is approximately 2.5 MB. If a 2.5-MB file is downloaded to a single NE over a 19.2-kb/s link, it will take 15 to 30 minutes depending on the volume of traffic. Performing software downloads in parallel increases the length of time by a multiple of the number of NEs targeted.
- The latest ONS 15216 EDFA2 R2.4 hardware does not support software download to a software release other than 2.4.0. The ONS 15216 EDFA2 R2.3 hardware supports software download for NE software releases 2.3 and 2.4.

4.3.2.1 Downloading Software Images to ONS 15216, ONS 153xx, ONS 15454, and ONS 15600 NEs

Step 1 In the Domain Explorer tree, select a management domain or group that contains NEs that are assigned an In Service or Under Maintenance operational state. Alternatively, select an NE that is assigned an In Service or Under Maintenance state.

Note Only one software download can occur on a specific NE at any given time.

Step 2 Choose **Administration > Software Management > Optical**. The Software Management wizard opens. Table 4-8 provides descriptions.

Step 3 Enter the following information:

- NE model

- NEs
- Source
- Job comments
- Time

Caution If the Prime Optical client and server run on the same machine and thus the local source directory is the same as the default destination directory, an error message is generated. To retrieve the software image selected from the local source directory, navigate to the appropriate path and restore it from the *software-image-name.old* file.

Step 4 Click **Finish** to initiate the software download to the standby memory on the NE.

Step 5 To activate the new image automatically, select **Reboot and Activate**. If Reboot and Activate is selected, the NE is rebooted with the newly downloaded image. If Reboot and Activate is not selected, you can activate the image later from the Flash File table.

Step 6 Select the following information:

- NEs
- Flash banks

Note To view information about the files stored in the flash bank of the NE, click **Flash File Table** at the bottom of the wizard. The Flash File table shows the flash bank names and the name and status for each stored file.

Note The currently active flash bank is unavailable; users cannot download to the active flash bank.

Step 7 Click **Finish**. The image will be downloaded to all of the NEs in the Selected Downloads list.

Prime Optical stores two software versions: active and standby. When you download software, it is saved as the standby version.

Step 8 To check the status of the download job or verify that the download job was successful:

a. Check the Job Monitor table (**Administration > Job Monitor**).

b. Select the NE and check the Software Version field of the Equipment Inventory table (**Configuration >** *NE-model* **> Equipment Inventory Table**).

c. Select the NE and check the Active Software Filename field in the NE Software table (**Administration > NE Software Table**) for the software image version.

Note To download software to an ONS 15216 EDFA3 NE using the Server option, first choose **Administration > Image Transfer**. The Image Transfer dialog box opens. The image will be copied from the local file system in the directory specified in the Prime Optical Server area. Choose **Cisco ONS 15216 EDFA3** from the drop-down list; then, click **Upload**. Then, choose **Administration > Software Management > Optical**. The Software Management wizard opens with the Server radio button enabled.

Table 4-8 Field Descriptions for the Software Management Wizard

Field	Description
NE Model	Select the NE type to which you want to download software. The type you select determines the NEs that are displayed under Network Elements.
Network Elements	Use the **Add** and **Remove** buttons to move NEs to the Selected NEs list or remove NEs from the list. Software will be downloaded to NEs in the Selected NEs list.
Source	Specify the location of the software: • **Local** allows you to select an image on the current client system. • **Server** allows you to select an image on the Prime Optical server to which your client is connected. The Server radio button is not active unless an image file exists on the server. • **Remote** allows you to select an image on another network server that has TFTP or FTP configured and running. Specify the IP address of the server and the fully qualified pathname of the image, relative to the tftpboot directory. Remote is the only selectable source option for the ONS 15305 (earlier than R3.0). **Note** If the Remote TFTP Server option is selected for ONS 15216 EDFA2, the software image that you are downloading must have been saved in the default directory, such as the tftpboot directory on the remote TFTP server. **Note** The tftpboot directory must have read-write access, or the software download will fail. See Chapter 3, "Building the Network" for information about how to configure the TFTP directory with read-write access.
Job Comments	Enter comments about the software download.
Time *(time zone)*	Set a time for the download. Click **Now** to begin downloading immediately, or click **At Time** and specify when to begin downloading, in 5-minute increments. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.
Software Download Pane 2 for ONS 15530 and ONS 15540 NEs	
Image File Size	The size of the image file. If you are downloading from a remote TFTP server, the size of the image file is not available.
Cancel job if CPU state changes	Allows you to cancel the job if the CPU state changes between the time the job is scheduled and the time the job is executed.
Activate image on next reload	Activates the image the next time the NE is rebooted.
Reload	Reboots the NE right after activation so the new image takes effect immediately. If an active CPU is reloaded, this option will cause a switchover if a standby CPU is present. Otherwise, service might be disrupted until the CPU reboots.
Switchover after downloading and reloading standby	(Available only when you choose the "Activate image on next reload" and "Reload" options.) This option applies only when downloading to the standby CPU. Switchover to standby occurs after downloading to and reloading the standby CPU; the standby CPU becomes active and runs the newly downloaded image.
Selected NEs	NEs that will receive downloaded software. When you select an NE from this list, information about the available flash partitions on the NE is displayed in the Flash Partition Data area, and you can select a partition.

Table 4-8 Field Descriptions for the Software Management Wizard (continued)

Field	Description
Flash Partition Data	The flash partitions available for storing the downloaded image on the selected NE: • CPU Slot No.—Slot number of the CPU that contains the flash device. • Status—Status of the CPU (active or standby). • Name—Name of the flash partition; partitions on the standby CPU are indicated by *sby*. • Total Size—Total size of the partition, in bytes. • Available—Number of free bytes in the partition. If you select a partition that does not have enough space to store the image, a warning message is displayed.
Selected Downloads	The NEs selected for image download and the flash bank you selected for each NE. To see details about flash memory, select an NE and click **Flash File Table**. To remove an NE from the Selected Downloads list, select the NE and click **Drop**.

4.3.2.2 Downloading Software Images for ONS 15530 and ONS 15540 NEs

This section contains procedures for:

- Downloading software images on single-CPU NEs
- Downloading software images for dual-CPU NEs

Note Before downloading software on an ONS 155xx NE, verify that a read-write community string is available for the NE in the ONS 155xx SNMP Settings table. If there is no read-write community string available, the software download fails with a “No write access” or “Request timed out” error message.

4.3.2.2.1 Downloading Software Images on Single-CPU NEs

Step 1 In the Domain Explorer tree, select one of the following:

- A management domain or group that contains ONS 15530 or ONS 15540 NEs that are in service or under maintenance.
- An ONS 15530 or ONS 15540 NE that is in service or under maintenance.

Step 2 Choose **Administration > Software Management > Optical**. The Software Management wizard opens (see Table 4-8). Enter the following information:

- NE model
- NEs
- Source
- Job comments
- Time

Note The **Server** radio button is not active unless the relevant subdirectory in the /$CTMHOME/images/ directory contains an image file. The subdirectories are named Cisco_ONS15530, Cisco_ONS_15540_ESP, and Cisco_ONS_15540ESPx.

Caution If the Prime Optical client and server run on the same machine and thus the local source directory is the same as the default destination directory, an error message is generated. To retrieve the software image selected from the local source directory, navigate to the appropriate path and restore it from the *software-image-name.old* file.

Step 3 Click **Next**.

Step 4 Use the Image File Size field to determine which flash partition has enough free space to hold the image.

Step 5 Select desired image download options.

Step 6 Select the following information:

- NEs
- Flash partitions

Note If a flash partition is selected before displaying the Flash File table, information is shown about the files on that partition only.

Step 7 Click **Finish**. Downloads will be performed for all the NEs in the Selected Downloads list.

Note If a partition that has insufficient space is selected, a warning message appears when the **Finish** button is clicked. Decide whether or not to proceed with the download. This check for free space is not performed for the remote server option.

After validating the image, the Prime Optical server transfers the image to the selected flash partition through TFTP. When the transfer is completed, the configuration register value is set to 0x02 for automatic booting and the boot command is modified to put the downloaded image first on the list.

If the reload option is selected, the NE is rebooted with the newly downloaded image.

If the image option is activated, the new software image is activated. If this option is not selected, activate the image from the Flash File table. (See 4.3.4 Using the Flash File Table, page 4-36.)

Step 8 To check the status of the download job or verify that the download job was successful:

a. Check the Job Monitor table (**Administration > Job Monitor**).

b. Select the NE and check the Software Version field of the Equipment Inventory table (**Configuration > ONS 155XX > Equipment Inventory Table**).

c. Select the NE and check the Active Software Filename field in the NE Software table (**Administration > NE Software Table**) for the software image version.

4.3.2.2.2 Downloading Software Images for Dual-CPU NEs

Consider the following recommendations when downloading software images for dual CPUs:

- Update the standby CPU first and choose the switchover option. This ensures that the new image will run on an active CPU with minimum system interruption.
- Either update the second CPU immediately after updating the first one, or schedule the second CPU for downloading after the image has run successfully for some time on the first CPU.

Complete the following steps to download software images for dual CPUs:

Step 1 In the Domain Explorer tree, select one of the following:

- A management domain or group that contains ONS 15530 or ONS 15540 NEs that are in service or under maintenance.
- An NE that is in service or under maintenance.

Step 2 Select **Administration > Software Management > Optical**. The Software Management wizard opens. Enter the following information:

- NE model
- NEs
- Job comments
- Source
- Time

Note The **Server** radio button is not active unless the relevant subdirectory in the /$CTMHOME/images/ directory contains an image file. The subdirectories are named Cisco_ONS15530, Cisco_ONS_15540_ESP, and Cisco_ONS_15540ESPx.

Caution If the Prime Optical client and server run on the same machine and thus the local source directory is the same as the default destination directory, an error message is generated. To retrieve the software image selected from the local source directory, navigate to the appropriate path and restore it from the *software-image-name.old* file.

Step 3 Click **Next**.

Step 4 Check the Image File Size field against the list of flash partitions to determine which flash partition has enough free space to hold the image.

Step 5 Select desired image download options.

Note Before the image is activated, the Prime Optical server checks the state of the standby CPU. If the standby CPU is not in hot standby mode, the update operation is aborted after the image is downloaded. For more information, refer to the hardware documentation for information about updating with system images that are not hot-standby compatible.

Note If the “Switchover after downloading and reloading standby” option is selected, the image will always be downloaded to the selected CPU slot number. For example, assume that slot 6 is standby and the sby-bootflash (standby) partition is chosen. If a switchover occurs between job scheduling and job execution and slot 6 becomes active, the image will be downloaded to the slot 6 bootflash partition.

Step 6 Select the following information:

- NEs
- Flash partitions

Note If a flash partition is selected before displaying the Flash File table, information is shown about the files on that partition only.

Step 7 Click **Finish**. Downloads will be performed for all the NEs in the Selected Downloads list.

Note If a partition that has insufficient free space is selected, a warning message appears. Decide whether or not to proceed with the download. This check for free space is not performed for the remote server option.

After validating the image, the Prime Optical server transfers the image to the selected flash partition through TFTP. When the transfer is completed and the standby CPU is in hot standby mode, the configuration register value is set to 0x02 for automatic booting and the boot command is modified to put the downloaded image first on the list. If the reload option is chosen, the standby CPU is reloaded.

If the switchover option is selected, a switchover from the active CPU to the standby CPU is performed after reloading the standby CPU. The former standby CPU, which is now the active CPU, will run the newly downloaded image.

If the Activate option is not selected, activate the new image from the Flash File table. (See 4.3.4 Using the Flash File Table, page 4-36.)

Step 8 After updating the standby CPU (which is now the active CPU), use the same procedure to update the formerly active CPU (which is now the standby CPU), with one difference: there is no need to select the switchover option because the current active CPU is already running the new image.

Step 9 To check the status of the download job or verify that the download job was successful:

a. Check the Job Monitor table (**Administration > Job Monitor**).

b. Select the NE and check the Software Version field of the Equipment Inventory table (**Configuration > ONS 155XX > Equipment Inventory Table**).

c. Select the NE and check the Active Software Filename field in the NE Software table (**Administration > NE Software Table**) for the software image version.

4.3.3 Scheduling Bulk Software Activation

Use the Bulk Software Activation dialog box to schedule software activation for multiple NEs simultaneously. Bulk software activation is supported on NEs that support the Revert/Switch operation: ONS 15216 EDFA2, ONS 15216 EDFA3, ONS 15305, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, ONS 15600 SDH.

Step 1 In the Domain Explorer tree, select a management domain or group that contains NEs that are assigned an In Service or Under Maintenance operational state. Alternatively, select one or more NEs that are assigned an In Service or Under Maintenance state.

Step 2 Choose **Administration > Bulk Software Activation**. The Bulk Software Activation dialog box opens. The following table provides descriptions.

Note You can also launch the dialog box by selecting one or more rows in the NE Software table and choosing **Edit > Commit**.

Step 3 In the dialog box, select the NEs for which you want to activate software, enter any comments about the job, and specify the time for the software activation to occur.

Caution If you try to activate a software version that Prime Optical does not support, the following caution is displayed: "Caution: You are about to revert to an unsupported software version for the following NEs: *NE-versions*. Do you want to continue?"

If you activate an unsupported NE software version, the Prime Optical server might not communicate with one or more NEs in the domain, causing erroneous behavior.

Step 4 Click **OK**.

To view the results of the bulk software activation, check the Job Monitor table (**Administration > Job Monitor**).

Table 4-9 Field Descriptions for the Bulk Software Activation Dialog Box

Field	Description
Network Elements	Use the **Add** and **Remove** buttons to move the NEs for which you want to activate software to the Selected NEs list, or to remove NEs from the list.
Job Comments	Enter comments about the software activation, if needed.
Time *(time zone)*	Set a time for the bulk software activation. Click **Now** to begin software activation immediately, or click **At Time** and specify when to begin software activation, in 5-minute increments. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.

4.3.4 Using the Flash File Table

Use the Flash File table to activate a downloaded image and manipulate the files in the ONS 155xx NE flash memory.

Step 1 From the Domain Explorer, select an NE; then, select **Administration > ONS 155XX > Flash File Table**. The following table describes the fields in the Flash File table.

Step 2 Perform any of the functions listed in Table 4-11.

Table 4-10 Field Descriptions for the Flash File Table

Field	Description
Flash Partition Name	Name of the flash partition that contains the flash file.
Filename	Name of the flash file.
File Status	Status of the flash file: • Deleted—The file is marked as deleted. • Invalid Checksum—The file has an invalid checksum. • Valid—The file is valid.
File Size	Size of the file, in bytes.
File Checksum	File checksum stored in the file header. The checksum is computed and stored when the file is written into the flash partition and serves to validate the data in the file. A file is marked as having an invalid checksum if any checksum mismatch was detected while writing or reading the file. Incomplete files (files truncated because of either a lack of free space or a network download failure) are also written with a bad checksum and marked as invalid.

Table 4-11 Flash File Table Functions and Supported ONS 15530 and ONS 15540 NEs

Function	Procedure	Supported on ONS 15530?	Supported on ONS 15540 ESP and ONS 15540 ESPx?
Activate an image	Select the file and choose **Edit > Activate**. The image is activated, and the NE reboots.	Yes	Yes
Verify file checksum	Select the file and choose **Edit > Verify**.	Yes	Yes
Mark a file as deleted	Select the file and choose **Edit > Delete**. The status of the file changes to Deleted. The file is not actually deleted until the Squeeze function is used.	Yes	Yes
Mark a file as undeleted	Select a file that is marked Deleted and choose **Edit > Undelete**.	Yes	Yes
Physically remove a file	Select a file that is marked Deleted and choose **Edit > Squeeze**.	Yes	Yes

4.3.5 Viewing Software Versions and Restarting the NE with a New Software Image

The NE Software table lists the software that is installed on an NE. Use the Edit menu options to restart an NE with a new software image.

Tip Back up the NE database before activating or reverting to the standby software image on the NE.

Caution If you try to activate, revert, or switch to a software version that Prime Optical does not support, the following caution is displayed: "Caution: You are about to revert to an unsupported software version: *version-number*. Do you want to continue?"

If you activate, revert, or switch to an unsupported NE software version, the Prime Optical server might not communicate with one or more NEs in the domain, causing erroneous behavior.

Step 1 In the Domain Explorer tree, select an NE and choose **Administration > NE Software Table**. Table 4-12 provides descriptions.

- For NEs other than the ONS 15216 EDFA, the NE Software table displays the active and standby software versions for the NE.
- For ONS 15216 EDFA NEs, the NE Software table displays the active, standby, and running software versions.

Note The NE Software table can also be launched from the Job Monitor table. From the Job Monitor table, choose **Edit > NE Software Table** (or click the **NE Software Table** tool).

Step 2 To activate new software on an NE, select the NE in the table and choose **Edit > Commit** (or click the **Commit** tool). At the confirmation prompt, click **OK**.

For the ONS 15305 (non-CTC-based) and CTC-based NEs, this makes the standby software version the active version (if the standby version is newer than the active version) and restarts the NE with the newer version.

Note The Commit feature is not available for ONS 15216 EDFA NEs.

Step 3 To revert to the standby software version on an NE, select the NE and choose **Edit > Revert/Switch** (or click the **Revert/Switch** tool). At the confirmation prompt, click **OK**.

- For the ONS 15216 EDFA, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH, this reverts the active software version back to the standby version (if the standby version is older than the active version) and restarts the NE with the newer version.
- For the ONS 15600 SONET and ONS 15600 SDH, the Revert operation opens the Memory Restore dialog box, and you will need to provide a compatible database. For example, if the NE is running software release 1.1 and you want to download a release 1.0 package, you must provide a release 1.0 database after downloading the software release 1.0 package.

Step 4 To accept the software version of an NE, select the NE and choose **Edit > Accept** (or click the **Accept** tool). The Accept command copies the downloaded software onto the standby Timing & Shelf Controller (TSC) and activates it.

Note The Accept feature is only available for the ONS 15600 SONET and ONS 15600 SDH.

Table 4-12 Field Descriptions for the NE Software Table

Field	Description
NE Model Name	Displays the model of the selected NE.
Alias ID	Displays the alias name of the NE.
Physical Location	Displays the location where the software is running.
NE Type	For ONS 15454 NEs, displays the NE type. Values are: • DWDM—For ONS 15454 MSTP R9.2 or later NEs. • TDM—For ONS 15454 MSPP R9.2 or later NEs. • Not Available—For all other NE versions.
Active Software Filename	Displays the active software version. For the ONS 15530 and ONS 15540, displays the software version on the active CPU.
Standby Software Filename	Displays the standby software version. For the ONS 15305 (non-CTC-based), it is the NE software version that has been downloaded. For the ONS 15530 and ONS 15540, displays the software version on the standby processor if a standby processor is present. **Note** The standby software version is not available for the ONS 15305 R3.0.
Running Software Filename	For the ONS 15216 EDFA, displays the running software version.
Busy Flag	Indicates whether the NE is rebooting to perform a software commit or revert. While the NE is rebooting, the value is True; when the NE has finished rebooting, the value is False.
Partial Upgrade	Possible values are: • True • False • N/A
NE ID	Displays the ID name of the selected NE.

4.3.6 Activating a New NE Software Version on One or More ML-Series Cards

When an ONS 15310 CL, ONS 15454 SONET, or ONS 15454 SDH NE is partially upgraded to a new software version, you can choose to activate the new NE software version on one or more ML-series cards.

Note If the Partial Upgrade field in the NE Software Table is set to False, it means that the NE and all its cards are upgraded to the new NE software version. If set to True, it means that one or more cards are still running an older software version.

Step 1 In the Domain Explorer, select a group or an ONS 15310 CL, ONS 15454 SONET, or ONS 15454 SDH NE that contains ML-series cards, and choose **Administration > NE Software Table**.

Step 2 In the NE Software Table, select one or more NEs that are in Partial Upgrade mode and choose **Edit > Reset ML Cards** (or click the **Reset specific ML Cards** tool).

Step 3 In the Reset ML Cards dialog box, select the ML-series cards on which to activate the new software. Use the **Add** button to move the ML-series cards to the Selected list. Use the **Remove** button to move the ML-series cards to the Available list.

Step 4 Click **OK**.

4.3.7 Delaying Software Activation on the ML-Series Cards

You can delay software activation on an ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, or ONS 15454 SDH NE's ML-series cards when the NE is partially upgraded to a new software version and the NODE.software.AllowDelayedUpgrades parameter is set to TRUE.

Note You can change the value of the NODE.software.AllowDelayedUpgrades parameter in the NE Defaults tab of the NE Explorer.

Step 1 In the Domain Explorer, select a group or an ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, or ONS 15454 SDH NE that contains ML-series cards, and choose **Administration > NE Software Table**.

Step 2 In the NE Software table, select an NE that is in Partial Upgrade mode and choose **Edit > Commit** (or click the **Commit** tool). The Bulk Software Activation wizard opens.

Step 3 Do the following:

- **a.** Select the NE for which you want to activate software
- **b.** Enter any comments about the job.
- **c.** Specify the time for the software activation to occur.

Step 4 Click **OK**. The Software Activation dialog box opens.

Step 5 Check the **Delay automatic activation on the ML cards** check box to delay software activation. Uncheck the check box if you do not want to delay software activation.

Note The Delay automatic activation on ML cards check box is checked by default if the NODE.software.DefaultDelayedUpgrades parameter is set to TRUE.

Step 6 Click **OK** in the Software Activation dialog box.

Step 7 Click **OK** in the Confirm commit message box.

Step 8 Click **OK** in the Prime Optical Progress message box.

4.3.8 Adding a New NE Software Version to the Prime Optical Domain

The Supported NE table provides information about the software version that is currently supported on a selected NE.

Use this procedure only to apply a minor upgrade to the default, Prime Optical-supported software on the supported NE. Major upgrades to NE software might require you to update Prime Optical.

Caution It is recommended that this feature be used only at the advice of a Cisco technical support engineer. If incorrect modifications to data in the Supported NE table are made, the Prime Optical server might not communicate with one or more NEs in the domain.

Complete the following steps to add a new NE software version to the Prime Optical domain:

Step 1 In the Domain Explorer window, choose **Administration > Supported NE Table**. Table 4-13 provides descriptions.

Step 2 Select an NE.

Caution Make sure to select the correct NE row in the Supported NE table before proceeding. If the new software version is added to the wrong NE, the updated NE in the Prime Optical domain will show erroneous behavior.

Step 3 Choose **Edit > Add** (or click the **Add Device Maintenance Version** tool).

The Add Device Maintenance Version dialog box opens.

Step 4 From the NE Model drop-down list, select the NE model.

Step 5 In the Software Version field, enter the software version.

Step 6 Click **Submit**.

Note You cannot customize the Version Name field. Prime Optical retrieves the version name from the Version Name field of the base version.

A message appears, displaying the version name.

Step 7 Click **OK**.

The new NE is added and the newly added NE displays an icon in the Software Version column.

Table 4-13 Field Descriptions for the Supported NE Table

Field	Description
NE Model	Displays the model of the selected NE. **Note** The Supported NE table includes passive NEs, such as the ONS 15216 DCU and OSC. Passive NEs are shown in the Supported NE table for informational purposes only. The Prime Optical server does not check the software validity of passive NEs.

Table 4-13 Field Descriptions for the Supported NE Table (continued)

Field	Description
Software Version	Specifies the software version that is supported on the selected NE. **Note** You cannot delete the default NE software version. The default software version rows are created when the Prime Optical server is installed. These rows are the factory-default settings and cannot be deleted.
Version Name	Specifies the software version name. For example, "15454 7.00" represents ONS 15454 SONET R7.0. **Note** If the software version is manually added, the version name displays the value used by Prime Optical to manage the software version.

4.3.9 Deleting an NE Software Version from the Prime Optical Domain

Step 1 In the Domain Explorer window, choose **Administration > Supported NE Table**.

Step 2 Select the NE for which you want to delete the software version; then, choose **Edit > Delete** (or click the **Delete Supported NE Version** tool).

Note NE images that were manually added can be deleted. Default NE images cannot be deleted.

Step 3 Click **OK** in the confirmation dialog box.

4.4 How Do I Modify the Network?

Follow the procedures described in this section to change IP, subnet, and network addresses; configure proxy settings; change the operational state of an NE; set the date, time, and location on CTC-based NEs; and configure SNTP and application-specific parameters.

Note For information about setting up routing protocols, see 5.3 Configuring Routing Protocols on Optical NEs, page 5-2.

4.4.1 Changing IP Addresses for NEs

Prime Optical displays the active IP address of the selected NE. The active IP address field for end NEs (ENEs) is the IP address of the gateway NE (GNE) that the NE is using. This information is calculated on a theoretical projection, which does not necessarily equate to a real network situation.

4.4.1.1 Changing the NE IP Address on CTC-Based NEs

Step 1 In the Domain Explorer window, click the NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the property sheet of the NE Explorer, click the **Network** tab > **Address** subtab.

Step 3 Change the IP address in the IP Address field. (For an IPv6 node, change the address in the IPv6 Config > IPv6 Address field.)

Note If you enter an IP address that is already in use, you receive the error message "A network element with this IP address already exists in the database, or this is a secure IP address." You must enter a unique IP address.

Step 4 If necessary, change the following fields:

- Default Router (for an IPv4 node)
- Subnet Mask (for an IPv4 node)
- IPv6 Config > Default IPv6 Router (for an IPv6 node)
- IPv6 Config > IPv6 Subnet Mask (for an IPv6 node)

Step 5 Click **Apply**.

Step 6 A confirmation dialog box informs you that the NE will reboot. Click **Yes**. Prime Optical will lose connectivity to the NE. After several minutes, the NE will be back in service with the new IP address.

4.4.1.2 Changing the NE IP Address in a GNE/ENE Environment

When changing NE IP addresses in a GNE/ENE environment, change the IP address on the ENE node first; then, change the IP address on the GNE node. You do not need to remove NEs from Prime Optical.

Note This procedure applies only to NE releases 5.0 and later.

To change the IP address of a GNE and then convert all GNE/ENE settings to LAN-connected NE (LNE) in Prime Optical:

Step 1 Remove the ENE settings on the ENE. In the Network Explorer, click the **Network** tab > **Firewall/Proxy** subtab; then, uncheck the **Enable Proxy Server on Port** check box.

Step 2 Launch the NE Explorer for the ENE and click the **Network** tab > **Address** subtab. Change the IP address of the ENE. The NE reboots and does not come back up until the cable connections are correct in the network.

Step 3 Make the necessary cable connections to all NEs in the topology. (In this case, make all the NEs LAN-cable connected.)

Step 4 Remove the GNE settings on the GNE. In the Network Explorer, click the **Network** tab > **Firewall/Proxy** subtab; then, uncheck the **Enable Proxy Server on Port** check box.

The GNE becomes unavailable in Prime Optical. After some time, the GNE comes up as an LNE in Prime Optical.

Step 5 Wait until all the NEs come up as LNEs in Prime Optical.

4.4.1.3 Switching Connectivity from IPv4 to IPv6

Prime Optical provides IPv6 support for the following NE releases: ONS 15310 MA SDH R9.3, ONS 15310 MA SONET R9.3, ONS 15454 SDH R9.3, and ONS 15454 SONET R9.3.

Note IPv6 loopback address must be configured on the server in order for Prime Optical to work with IPv6.

Prime Optical tries to connect to an NE using its preferred IP address: IPv4 or IPv6, depending on how the NE was added or discovered by Prime Optical.

- For a user-added NE, the preferred IP address is the one that was entered when the NE was added.
- For a discovered NE, the preferred IP address depends on the IP connectivity of the GNE that discovered it.

If the preferred IP address is not reachable, Prime Optical tries to connect to the NE with the other IP address.

To enable IPv6 on an NE that supports this feature, complete the following steps:

Step 1 In the Domain Explorer tree, select the NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the property sheet of the NE Explorer, click the **Network** tab > **Address** subtab.

Step 3 In the IPv6 Config area, check the **Enable IPv6** check box and configure the following fields:

- IPv6 Address
- Default IPv6 Router
- IPv6 Subnet Mask

Step 4 Click **Apply**.

Note If the IPv4 address is unavailable or disabled on the NE, Prime Optical uses the IPv6 address. If the NE is reachable through its IPv4 address, Prime Optical uses that address.

4.4.1.4 Changing the NE IP Address in Prime Optical Only

Note If the IP address is changed in Prime Optical, the change is made only in Prime Optical. Use the CLI if changes in the IP address need to be applied to the ONS 155xx NEs. In the Domain Explorer, choose **Configuration > ONS 155XX > Launch CLI**.

Complete the following steps to change the IP address in Prime Optical only:

Step 1 In the Domain Explorer tree, select the NE that will be changed.

Step 2 Click the **Address** tab. In the Active IP Address field, enter the new IP address.

Step 3 Click **Save**.

4.4.2 Changing the Internal Subnet Address—ONS 15600 SONET and ONS 15600 SDH

To avoid IP address conflicts, change the class B subnet address if your internal network uses the same address range as the default subnet address. To change class B subnet address for the TSC cards, complete the following steps.

Caution All network changes should be approved by your network administrator.

Complete the following steps to change the internal subnet address:

Step 1 In the Domain Explorer tree, select an ONS 15600 SONET or ONS 15600 SDH NE.

Step 2 Choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 3 In the node properties pane of the NE Explorer, click the **Network** tab > **Internal Subnet** subtab.

Step 4 Specify the following values in the TSC section:

- TSC1—Class B subnet address for the first TSC.
- TSC2—If there are two TSCs are installed, enter the class B subnet address for the second TSC.

Step 5 Click **Apply**.

4.4.3 Viewing and Changing the Network Address—CTC-Based NEs

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane of the NE Explorer, click the **Network** tab > **Address** subtab.

Step 3 Complete the following information:

- IP Address—IP address of the NE.
- Default Router—IP address of the default router.
- Subnet Mask—Subnetwork mask ID of the NE.
- MAC Address—*Display only.* Address as identified in the IEEE 802 MAC layer.
- LCD IP Setting—(ONS 15454 SONET and SDH only) Select one of the following:
  - Allow Configuration—Allows users to change the shelf IP address from the LCD screen.
  - Display Only—Displays the shelf IP address in the LCD screen and does not allow any configuration.
  - Suppress Display—Shelf IP address is not displayed in, and cannot be configured from, the LCD screen.

- Forward DHCP Requests—When checked, forwards the Dynamic Host Configuration Protocol (DHCP) requests to the IP address.
- DHCP Server—IP address of the DHCP server.

Step 4 In the node properties pane of the NE Explorer, click the **Security** tab > **Access** subtab.

Step 5 In the CORBA (IIOP) Listener Port field, select one of the following values to allow communication with the NE through firewalls:

- Default-Fixed
- Standard Constant (683)
- Other Constant

Step 6 Click **Apply**.

4.4.4 Configuring Proxy Server Settings—CTC-Based NEs

CTC-based NEs have a proxy server feature set that allows networking these NEs in environments where visibility and accessibility are restricted. In the proxy server environment, CTC-based NEs are designated as either GNEs, ENEs, or tunnel NEs (TNEs). The GNE is LAN-connected to the DCN, while the ENE is accessed through the proxy server feature on the GNE over the SDCC. The ENE is not directly accessible through the IP address, while the GNE has an IP address that is valid for the DCN LAN. Prime Optical connects to TNEs that belong to an OSI network behind a non-Cisco GNE. Also, if an NE is LAN-connected and its proxy is disabled, the NE is shown as a LAN-connected NE (LNE).

4.4.4.1 Enabling Proxy

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the Properties pane of the NE Explorer, select the **Network** tab > **Firewall/Proxy** subtab.

Step 3 Check the **Enable Proxy Server on Port** check box. When enabled, the NE serves as a proxy for connections between CTC clients and the NEs that are DCC-connected to proxy NEs. Uncheck the check box to disable the proxy. The **on port** field has a default value of 1080.

Step 4 You can enable the proxy on one of the following:

- ENE
- GNE
- Proxy-only

If the ENE and GNE are in different IP subnets, or if the ENE and GNE are in different Ethernet segments, the proxy should be enabled on the GNE. If the firewall is enabled on the GNE, it prevents communication between the laptop connected to the LAN port of the ENE and the network operations center (NOC), even if the proxy is enabled on both the ENE and GNE. Whenever the firewall is enabled on a GNE, the proxy should be enabled on the GNE as well.

Step 5 Click **Apply**.

4.4.4.2 Notes on Configuring Proxy Server Settings

Note the following when configuring proxy server settings:

- In a proxy environment, you can launch CTC from Prime Optical for a proxy GNE if you are launching CTC for an ENE. CTC cannot be launched for a non-GNE if the proxy GNE is marked as Out of Service or is not reachable from Prime Optical. Launching CTC for NEs that are not reachable before Prime Optical can determine whether they are reachable displays the error messages "Error in launching CTC node view for *NE*" and "Initializing Class Loaders Failed–Timeout opening *NE IP*:*Port*."
- In a proxy environment, you cannot launch a TL1 Telnet session directly for an NE. You can launch the Telnet window for the GNE and then enter the **ACT-USER** command, specifying the ENE as the TID.
- Prime Optical can configure multiple GNEs but it can only associate a single GNE for a given ENE. If the GNE becomes inaccessible, Prime Optical can automatically use one of the other available GNEs to reach the ENE.
- When a proxy-enabled GNE (named GNE1) is first added to Prime Optical, Prime Optical automatically discovers all associated NEs (through the topology discovery feature) and identifies them as ENEs associated with GNE1. If there are other proxy-enabled GNEs that are discovered from GNE1, Prime Optical will mark them as GNEs. When proxy is enabled on any GNE, all ENEs lose connectivity and eventually regain it. In a multiple DCC-connected GNE scenario, NEs that do not regain connectivity should be marked as Out of Service, then marked as In Service again.
- If both LAN and DCC connections exist between the GNE and ENEs, the DCC connection takes precedence.

4.4.4.3 Configuring Proxy Server Settings for NEs Equipped with ML-Series Cards

Prime Optical supports only the following configurations for NEs that are equipped with ML-series cards:

- GNE with SNMPv1, v2, and v3.

  Note Prime Optical considers an NE to be a GNE if proxy-only is enabled, or if proxy with firewall is enabled.

- ENE with SNMPv1, v2, and v3.

  Note Prime Optical considers an NE to be an ENE if proxy is not enabled, or if proxy/firewall and craft access are enabled.

For NE release 4.6 and earlier, see Table 4-14. For NE release 5.0 and later, see Table 4-15. In order for Prime Optical to support a proxy/firewall scenario, the scenario must have a "Yes" in all four columns of the table, and CLI launch must be supported.

For an explanation of proxy server settings on the NEs, refer to the NE hardware documentation.

The following table describes the proxy server settings for release 4.6 and earlier NEs.

Table 4-14 Proxy Server Settings for R4.6 and Earlier NEs

Proxy Scenario	FM	CM	PM	RMON Threshold
Proxy only, GNE (CLI launch is supported)[1]				
SNMPv1	No	Yes	Yes	Yes
SNMPv2	Yes	Yes	Yes	Yes
Proxy only, ENE (CLI launch is not supported)[2]				
SNMPv1	No	Yes	Yes	No
SNMPv2	No	Yes	Yes	No
Proxy and internal firewall, GNE (CLI launch is supported)[3]				
SNMPv1	No	Yes	Yes	Yes
SNMPv2	Yes	Yes	Yes	Yes
Proxy and internal firewall, ENE (CLI launch is not supported)[4]				
SNMPv1	No	Yes	Yes	No
SNMPv2	No	Yes	Yes	No
Proxy only, GNE, with external firewall and NAT (CLI launch is not supported)[5]				
SNMPv1	No	Yes	Yes	No
SNMPv2	Yes	Yes	Yes	No
Proxy only, GNE, with internal firewall, external firewall, and NAT (CLI launch is not supported)[6]				
SNMPv1	No	Yes	Yes	No
SNMPv2	No	Yes	Yes	No
Proxy only, ENE, with internal firewall, external firewall, and NAT (CLI launch is not supported)[7]				
SNMPv1	No	Yes	Yes	No
SNMPv2	No	Yes	Yes	No
External firewall and PAT[8] (CLI launch is not supported)[9]				
SNMPv1	No	No	No	No
SNMPv2	No	No	No	No

1. In this scenario, the NE is set up as a GNE with proxy enabled. The internal firewall is not turned on and there is no external firewall between the server and the NEs.
2. In this scenario, the NE is set up as an ENE with proxy enabled. The internal firewall is not turned on and there is no external firewall between the server and the NEs.
3. In this scenario, the NE is set up as a GNE with proxy and internal firewall enabled. There is no external firewall between the server and the NEs.
4. In this scenario, the NE is set up as an ENE with proxy and internal firewall enabled. There is no external firewall between the server and the NEs.
5. In this scenario, the NE is set up as a GNE with proxy enabled. The internal firewall is not turned on. There is an external firewall between the server and the NEs that is using NAT.
6. In this scenario, the NE is set up as a GNE with proxy and internal firewall enabled. There is an external firewall between the server and the NEs that is using NAT.
7. In this scenario, the NE is set up as an ENE with proxy and internal firewall enabled. There is an external firewall between the server and the NEs that is using NAT.
8. PAT = Port Address Translation.
9. There is an external firewall between the server and the NEs that is using PAT. The NE and Prime Optical do not support this configuration.

The following table describes the proxy server settings for release 5.0 and later NEs.

Table 4-15 Proxy Server Settings for R5.0 and Later NEs

Proxy Scenario	FM	CM	PM	RMON Threshold
Proxy only, GNE (CLI launch is supported)[1]				
SNMPv1	Yes	Yes	Yes	Yes
SNMPv2/v3	Yes	Yes	Yes	Yes
Proxy only, ENE (CLI launch is not supported)[2]				
SNMPv1	Yes	Yes	Yes	Yes
SNMPv2/v3	No	Yes	Yes	Yes
Proxy and internal firewall, GNE (CLI launch is supported)[3]				
SNMPv1	Yes	Yes	Yes	Yes
SNMPv2/v3	Yes	Yes	Yes	Yes
Proxy and internal firewall, ENE (CLI launch is not supported)[4]				
SNMPv1	Yes	Yes	Yes	Yes
SNMPv2/v3	No	Yes	Yes	Yes
Proxy only, GNE, with external firewall and NAT (CLI launch is not supported)[5]				
SNMPv1	Yes	Yes	Yes	Yes
SNMPv2/v3	Yes	Yes	Yes	Yes
Proxy only, GNE, with internal firewall, external firewall, and NAT (CLI launch is not supported)[6]				
SNMPv1	Yes	Yes	Yes	Yes
SNMPv2/v3	Yes	Yes	Yes	Yes
Proxy only, ENE, with internal firewall, external firewall, and NAT (CLI launch is not supported)[7]				
SNMPv1	Yes	Yes	Yes	Yes
SNMPv2/v3	No	Yes	Yes	Yes
External firewall and PAT (CLI launch is not supported)[8]				
SNMPv1	No	No	No	No
SNMPv2/v3	No	No	No	No

1. In this scenario, the NE is set up as a GNE with proxy enabled. The internal firewall is not turned on and there is no external firewall between the server and the NEs.
2. In this scenario, the NE is set up as an ENE with proxy enabled. The internal firewall is not turned on and there is no external firewall between the server and the NEs.
3. In this scenario, the NE is set up as a GNE with proxy and internal firewall enabled. There is no external firewall between the server and the NEs.
4. In this scenario, the NE is set up as an ENE with proxy and internal firewall enabled. There is no external firewall between the server and the NEs.
5. In this scenario, the NE is set up as a GNE with proxy enabled. The internal firewall is not turned on. There is an external firewall between the server and the NEs that is using NAT.
6. In this scenario, the NE is set up as a GNE with proxy and internal firewall enabled. There is an external firewall between the server and the NEs that is using NAT.
7. In this scenario, the NE is set up as an ENE with proxy and internal firewall enabled. There is an external firewall between the server and the NEs that is using NAT.
8. There is an external firewall between the server and the NEs that is using PAT. The NE and Prime Optical do not support this configuration.

4.4.4.4 Conditions Under Which Prime Optical Recognizes an NE as an LNE, a GNE, a TNE, or an ENE

An NE in Prime Optical can show up as an LNE, a GNE, a TNE, or an ENE. The type is denoted in a small rectangle next to the corresponding NE in the Domain Explorer tree. The following tables document how Prime Optical determines whether an NE in the network is considered an LNE, GNE, TNE, or ENE.

NE terminology:

- *LAN Connected* denotes whether the NE is connected directly to the LAN.
- *Proxy Enabled* denotes whether the "Enable Proxy" option is checked for the NE (in the NE Explorer > Network > Firewall/Proxy subtab).
- *Firewall Enabled* denotes whether the "Enable Firewall" option is checked for the NE (in the NE Explorer > Network > Firewall/Proxy subtab).
- *Craft Access Enabled* denotes whether the "Craft-Access Only" option is checked for the NE (in the NE Explorer > Network > Firewall/Proxy subtab).
- *GNE* denotes whether the "Gateway Network Element (GNE)" option is selected for the NE (in the NE Explorer > Network > Firewall/Proxy subtab).
- *ENE* denotes whether the "External Network Element (ENE)" option is selected for the NE (in the NE Explorer > Network > Firewall/Proxy subtab).
- *Proxy-only* denotes whether the "Proxy-only" option is selected for the NE (in the NE Explorer > Network > Firewall/Proxy subtab).
- A value of *N/A* indicates that the setting for that column is irrelevant to the end result.

Prime Optical terminology:

- Prime Optical *GNE*—Gateway network element. A GNE is an NE that is LAN-connected and provides access to and proxies for other NEs that are otherwise unreachable.
- Prime Optical *ENE*—External network element. An ENE is an NE that is not directly reachable. These NEs can only be accessed via (proxied by) a GNE.
- Prime Optical *LNE*—LAN-connected NE. An LNE is connected on the LAN and does not proxy for and is not proxied by other NEs.
- Prime Optical *TNE*—Tunnel NE. Prime Optical can connect to a TNE that belongs to an OSI network behind a non-Cisco GNE. You can open a new TL1 tunnel on a selected TNE, close an existing TL1 tunnel, or modify the TL1 tunnel settings. TNEs do not support SNMP. The following NE models support TL1 tunnels: ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH.

Note the following configuration restrictions:

- For all cases where the NE type is denoted as ENE, per current Prime Optical design, an ENE will not have connectivity in Prime Optical unless there is at least one GNE in the same ring as the ENE.
- All NEs on the same Ethernet segment must have the same value for craft access. Mixed values might leave some nodes unreachable through the shared Ethernet segment.
- All NEs on the same Ethernet segment must have the same value for the firewall. Mixed values might leave some nodes unreachable.
- All NEs in the same SDCC area must have the same value for the firewall. Mixed values might leave some nodes unreachable.
- If the firewall is enabled on an NE, the proxy server must also be enabled. If the proxy server is not enabled, CTC cannot see nodes on the DCC side of the NE.

- If Craft Access Only is enabled on an NE, the proxy server must also be enabled. If the proxy server is not enabled, CTC cannot see nodes on the DCC side of the NE.
- Only those NEs that have no LAN connectivity to the Prime Optical server can have Craft Access Only enabled or be set as an ENE.

Table 4-16 ONS 15327, ONS 15454 SONET/SDH R4.1.x

NE State Type	Proxy Enabled?	Craft Access Only?	Firewall Enabled?	LAN Connected?	DCC Connected?
GNE	Yes	No	Yes	Yes	N/A
GNE	Yes	No	No	Yes	N/A
ENE	Yes	N/A	N/A	No	Yes[1]
ENE	No	N/A	N/A	No	Yes[1]
ENE	No	N/A	N/A	Yes	Yes[1]
LNE	No	No	N/A	Yes	No
LNE	No	No	N/A	Yes	Yes[2]

1. Prime Optical discovers this NE as an ENE if there is at least one GNE on the same DCC domain with proxy server enabled.
2. Prime Optical discovers this NE as an LNE if all the NEs on the same DCC domain have proxy server disabled.

Table 4-17 ONS 15310, ONS 15327, ONS 15454 SONET/SDH R4.6 and Later

NE State Type	Proxy Enabled? (GNE, ENE, or Proxy-only Enabled on the NE)	LAN Connected?	DCC Connected?
GNE	Yes	Yes	Yes
GNE	Yes	Yes	No
ENE	Yes	No	Yes[1]
ENE	No	No	Yes[1]
ENE	No	Yes	Yes[1]
LNE	No	Yes	No
LNE	No	Yes	Yes[2]

1. Prime Optical discovers this NE as an ENE if there is at least one GNE on the same DCC domain with proxy server enabled.
2. Prime Optical discovers this NE as an LNE if all the NEs on the same DCC domain have proxy server disabled.

Table 4-18 ONS 15310 CL, ONS 15327, ONS 15454 SONET/SDH R6.0 and Later; ONS 15310 MA SONET R7.0 and Later; ONS 15310 MA SDH R9.1, R9.2, R9.3

NE State Type	Proxy Enabled?	Craft Access Only?	Firewall Enabled?	LAN Connected?	DCC Connected?
TNE	Yes	No	Yes	No	N/A
TNE	Yes	No	No	No	N/A

Table 4-19 ONS 15600 SONET R1.1.2, 1.1.3, 1.3.1; ONS 15600 SDH R1.4

NE State Type	Proxy Enabled?	Firewall Enabled?	LAN Connected?	DCC Connected?
GNE	Yes	Yes	Yes	N/A
GNE	Yes	No	Yes	N/A
ENE	Yes	N/A	No	Yes[1]
ENE	No	N/A	No	Yes[1]
ENE	No	N/A	Yes	Yes[1]
LNE	No	N/A	Yes	No
LNE	No	N/A	Yes	Yes[2]

1. Prime Optical discovers this NE as an ENE if there is at least one GNE on the same DCC domain with proxy server enabled.
2. Prime Optical discovers this NE as an LNE if all the NEs on the same DCC domain have proxy server disabled.

4.4.4.5 Creating a New Proxy Tunnel

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **Proxy Tunnels** subtab.

Step 4 Click **Create**. The Create New Proxy Tunnel dialog box opens. The following table provides descriptions.

Step 5 After making your selections, click **OK**.

Table 4-20 Field Descriptions for the Create New Proxy Tunnel Dialog Box

Field	Description
Source Address	Enter the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask Length	Specify the length of the source mask (from 0 to 32).
Source Mask	Enter the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Enter the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask Length	Specify the length of the destination mask (from 0 to 32).
Destination Mask	Enter the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

4.4.4.6 Creating a New Firewall Tunnel

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **Firewall Tunnels** subtab.

Step 4 Click **Create**. The Create New Firewall Tunnel dialog box opens. The following table provides descriptions.

Step 5 After making your selections, click **OK**.

Table 4-21 Field Descriptions for the Create New Firewall Tunnel Dialog Box

Field	Description
Source Address	Enter the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask Length	Specify the length of the source mask (from 0 to 32).
Source Mask	Enter the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Enter the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask Length	Specify the length of the destination mask (from 0 to 32).
Destination Mask	Enter the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

4.4.5 Changing the Operational State of an NE

Step 1 In the Domain Explorer tree, select the NE that will be changed.

Step 2 In the Network Element Properties pane > Status tab > Operational State field, choose one of the following values:

- Preprovisioned—(Not available if already provisioned) The NE has been added to the database for provisioning but is not yet in service. Prime Optical does not manage preprovisioned NEs.
- In Service—The NE is deployed and requires monitoring. Prime Optical collects polling, fault management (FM), configuration management (CM), and PM data from in-service NEs and stores the data in the database.
- Out of Service—The NE has been marked Out of Service by a network administrator and does not require monitoring. The Prime Optical database records the last known state of the NE when it was in service.
- Under Maintenance—The NE is temporarily under maintenance but requires monitoring. This state is the same as In Service except that Prime Optical does not report alarms or events for under-maintenance NEs.

Tip You can also right-click an NE in the Domain Explorer tree or Subnetwork Explorer tree and choose **Mark Under Maintenance**, **Mark In Service**, or **Mark Out of Service** from the shortcut menu.

There are two additional states that you cannot choose. These operational states are changed by Prime Optical based on the initialization tasks that are completed:

- In Service–Initializing—The NE is marked as In Service–Initializing when Prime Optical reaches connectivity of the NE (Communication State is marked as Available) and the discovery process starts. The initialization process is completed when fault and inventory have been synchronized. The operational state changes from In Service–Initializing to In–Service Synch Configuration.
- In-Service Synch Configuration—The NE is marked as In–Service Synch Configuration when Prime Optical uploads a configuration for that NE. You can change the operational state of an NE from In-Service Synch Configuration to Out of Service.

Step 3 Click **Save**.

Step 4 Click **Yes** in the confirmation dialog box.

Timesaver If an NE is brought down, mark it as **Out of Service** to prevent unnecessary polling traffic on the DCN.

Note When you mark an NE as Out of Service and then mark it as In Service, the Prime Optical alarm time stamp in the Alarm Browser window is resynchronized with the time stamp when the NE is put back in service.

4.4.6 Setting Date, Time, and Location on CTC-Based NEs

Step 1 In the Domain Explorer, select an NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **General** tab > **Identification** subtab.

Step 3 In the Location area:

- Set the latitude of the NE by selecting North or South from the Latitude drop-down list; then, enter the degrees and minutes (or click the up or down arrow to increase or decrease each by 1 unit).
- Set the longitude of the NE by selecting East or West from the Longitude drop-down list; then, enter the degrees and minutes (or click the up or down arrow to increase or decrease each by 1 unit).

Step 4 In the Date and Time area:

- Time—Enter the date and time.
- Time Zone—From the drop-down list, select the time zone where the NE is located.
- Use Daylight Savings Time—When checked, Daylight Savings Time is observed.

Step 5 Click **Apply**.

4.4.6.1 Using the SNTP Server to Set the Date and Time

Simple Network Time Protocol (SNTP) is an internet protocol used to synchronize the clocks of computers to a time reference. Using the SNTP server ensures that all NEs use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. To use the SNTP server to set the date and time for CTC-based NEs, complete the following steps.

Note SNTP is not supported on the CTC-based ONS 15305 R3.0.

Step 1 In the Domain Explorer, select an NE and choose **Configuration > NE Explorer**.

Step 2 In the node properties pane, click the **General** tab > **Identification** subtab.

Step 3 In the SNTP Settings area, do one of the following:

- Set up the SNTP server and optional backup SNTP server, to set the date and time of the node:
  - Check the **Use NTP/SNTP Server** check box.
  - In the SNTP Server field, enter the SNTP server's IP address.
  - (Optional) In the Backup SNTP Server field, enter the backup SNTP server's IP address.
- If you do not use the SNTP server, in the Date and Time area, enter the date and time in the Time field (for more information, see 4.4.6 Setting Date, Time, and Location on CTC-Based NEs, page 4-54).

Step 4 Click **Apply**.

4.4.7 Configuring SNTP for Multiple NEs

Use the SNTP Configuration dialog box to provision a set of SNTP parameters on multiple NEs at the same time. You can provision primary and secondary NTP and SNTP server addresses. Both the primary and secondary NTP/SNTP address can have IPv4 or IPv6 format.

When the SNTP address setting on an NE fails, the reason for the failure is logged in the Error Log table. As part of a bulk SNTP operation, if the setting on an NE fails, Prime Optical continues to set the SNTP server address on the remaining NEs that are part of the operation.

Note SNTP configuration is not available for ONS 15216 NEs.

Step 1 In the Domain Explorer, choose **Administration > SNTP Configuration**. The SNTP Configuration dialog box opens. Table 4-22 provides descriptions.

Step 2 Enter the following information:

- NEs
- Job comments
- SNTP
- Time (*time zone*)

Step 3 Click **Finish**.

A job is scheduled for each NE that was assigned the SNTP server IP address. The job status is listed in the Job Monitor table. (For more details, see 4.6.1.1 Viewing the Job Monitor Table, page 4-88.) The status of each SNTP set operation is updated as the job progresses. Job status can be one of the following:

- Queued—The job has been scheduled but has not yet been processed.
- Running—The job is being processed.
- Succeeded—The SNTP server IP address is set on the NE.
- Failed—The SNTP server IP address was not set on the NE. The reason for the failure is logged in the Error Log table.
- Waiting—The job is waiting for the NE to be in service.

Table 4-22 Field Descriptions for the SNTP Configuration Dialog Box

Field	Description
Network Elements	Use the **Add** and **Remove** buttons to move NEs to the Selected NEs list, or to remove NEs from the list. The SNTP server address is set on the NE(s) in the Selected NEs list.
Job Comments	Enter comments about the SNTP server address setting, if needed.
SNTP	Use the Resync Time (min; ONS 15305 only) field if you want the ONS 15305 NE to use the SNTP server to synchronize time information. The Resync Time field is the time passed between two synchronization operations. The NE uses this information to know when to synchronize with the SNTP server. If you check the **Use NTP/SNTP Server** check box, Prime Optical uses the NTP or SNTP server to set the date and time of the node. Using the NTP or SNTP server ensures that all NEs use the same date and time reference. After checking the check box, enter the server IP address in the SNTP IP Address field. If you want to include a backup SNTP server, enter the backup SNTP server IP address in the Backup SNTP Server field. If you do not check the Use NTP/SNTP Server check box, the NE stores the NTP or SNTP address but does not use it to synchronize time information. **Note** In the SNTP IP Address field, enter the IP address of your active SNTP server. Do not enter the IP address of your Prime Optical server. The Prime Optical server is not an NTP/SNTP server. If you do not know your SNTP server IP address, contact your system administrator.
Time (*time zone*)	Set a time for the SNTP address setting. Click **Now** to begin immediately, or click **At Time** and specify when to begin the SNTP set, specifying the date, hour, and minute in 5-minute increments. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.

4.4.8 Configuring Application-Specific Parameters

The UI Properties pane allows you to configure application-specific parameters.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **UI Properties** to open the UI Properties pane. The following table provides descriptions.

Step 3 After making your selections, click **Save**.

Table 4-23 Field Descriptions for the UI Properties Pane

Field	Description
Fault Management	• Alarm Acknowledgement—Allows you to specify automatic or manual alarm acknowledgement in the Alarm Browser window. If you choose manual alarm acknowledgment, you must manually acknowledge alarms. Cleared alarms move from the Alarm Browser to the Alarm Log. If you choose automatic alarm acknowledgment, the Prime Optical server automatically acknowledges alarms when they are cleared and moves them from the Alarm Browser to the Alarm Log. Before alarms move to the Alarm Log, they must be both cleared and acknowledged. **Note** You can still manually acknowledge alarms in automatic acknowledgement mode. • Overwrite Alarm Notes—Enables or disables the ability to overwrite alarm notes created by another user. • Alarm Unacknowledgement—Enables or disables the ability to unacknowledge alarms that have been acknowledged.
Circuit Management	• Overwrite Circuit Notes—Enables or disables the ability to overwrite circuit notes created by another user. • Automatically Route Internode Circuits—Enables or disables the ability to automatically route internode circuits. The default state is Enabled (that is, automatic routing is allowed). **Note** The Route Automatically option (located in the Routing Preferences pane in the Circuit Creation wizard) is disabled when the Automatically Route Internode Circuits radio button is set to Disable. **Note** When the Automatically Route Internode Circuits option is set to Enable/Disable, it is set for all client sessions logged into that Prime Optical server.
Job Management	Overwrite Job Notes: Enables or disables the ability to overwrite job notes created by another user.
Domain Management	Allows you to specify how node names longer than 25 characters are truncated in the Network Map. If a string is longer than 25 characters, the first 22 characters display followed by an ellipsis (...). You can choose to truncate the first or last characters of the node name.

Table 4-23 Field Descriptions for the UI Properties Pane (continued)

Field	Description
Subnetwork Grouping	Enables or disables the ability to automatically group NEs in subnetworks. If you check the **Automatically Group NEs in Subnetworks** check box, you cannot change the subnetwork of an NE, meaning: • The option of selecting a subnetwork in the Add New NE wizard is disabled and shows <System Default>. • The add NE process applies all automatic grouping rules. • Drag-and-drop functionality is disabled on the Subnetwork Explorer. • You cannot change the subnetwork assignment from the NE Properties pane. **Note** During the transient period when this option is changed, any current operations (such as dropping an NE in a subnetwork) are completed.
Network Discovery	Using the Allow Provisioning check box, you can allow or disallow the discovery mode that you have set to be changed later. • To allow a change of the mode later—Check the Allow Provisioning check box, and select a mode of discovery from the Default Discovery Mode drop-down list below. This lets you change the mode of discovery while creating a new NE service. • To disallow a change of the mode later—Uncheck the Allow Provisioning check box, and select a mode of discovery from the Default Discovery Mode drop-down list below. Using the Default Discovery Mode option, you can set the mode of discovery of the NEs; the mode of discovery can be manual or automatic. Set the discovery mode to one of the following: • Automatic—When a new NE is added, Prime Optical automatically discovers the NE and adds it to the network partition. • Manual—When a new NE is added to Prime Optical, the NE remains in the Undiscovered Network Elements group in the Domain Explorer. You can add the NE to the desired network partition. click **Add Undiscovered NEs** to add the NEs to a network partition. **Note** This option is available only for CTC-based NEs.
Audit Trail State	Allows you to enable or disable audit trails. NEs that are added or discovered will be assigned this setting.

4.5 How Do I Manage Redundancy and Failover?

Follow the procedures described in this section to back up and restore memory; modify NE service properties; back up client files; restore server configuration files; initialize a node resynchronization; manage protection groups; restore NE defaults; and configure card redundancy.

4.5.1 Backing Up NE Memory

Prime Optical allows you to back up and restore memory for selected NEs. For example, if you want to save your settings for a particular NE, you can back up the memory for only that NE.

Prime Optical backs up configuration and provisioning information residing in the flash memory of an NE. Prime Optical provides three methods by which to perform the configuration backup operation:

- Manually on demand

- Scheduling (one time only)
- Periodic, automatic scheduling based on a configurable time set by the operator

You can specify the number of backup configurations that should be kept at any given time. The default number is seven.

Note The maximum number of copies that can be saved is dictated by the amount of disk space available.

The oldest configuration that was backed up is replaced by the current backup depending on the configured number of copies you want to retain at any given time. The memory restore function in Prime Optical can then be used to roll back to any one of the previous configurations that was saved. Once the configuration is downloaded, you will need to enter CLI commands to activate the new configuration.

Note The restore operation is service affecting, because the node is rebooted to reflect the restored configuration.

Follow the procedures described in these sections to back up and restore memory (configuration data) on NEs. Prime Optical allows you to back up memory for the following NEs:

- ONS 15216 EDFA2 (R2.3.0 and later)
- ONS 15216 EDFA3
- ONS 15310 CL
- ONS 15310 MA SONET
- ONS 15310 MA SDH
- ONS 15327
- ONS 15454 SONET
- ONS 15454 SDH
- ONS 15530
- ONS 15540 ESP and ESPx
- ONS 15600 SONET
- ONS 15600 SDH
- CPT 200
- CPT 200 SDH
- CPT 600
- CPT 600 SDH

Usage Notes:

- The latest ONS 15216 EDFA2 R2.4 hardware does not support memory backup to a software release other than 2.4.0. The ONS 15216 EDFA2 R2.3 hardware supports memory backup for NE software releases 2.3 and 2.4.
- For the ONS 15530 and ONS 15540, the SNMP Community String table must have a valid write community string for the NE before memory can be backed up or restored. For more information, see Chapter 3, “Building the Network.”

- Prime Optical does not support memory backup for the ONS 15305 or Not Managed/Other Vendor NEs.

The Memory Backup procedure backs up configuration and provisioning information residing in the flash memory of an NE. By default, the Prime Optical server automatically backs up memory for NEs once a day for seven days and stores the backup files on the Prime Optical server. After seven days, the oldest backup file is replaced by the current backup. For more information, see 4.5.3.4 Configuring Automatic NE Backup Parameters, page 4-73.

Step 1 In the Domain Explorer tree, select a management domain or group that contains an NE that is assigned an In Service or Under Maintenance operational state. Alternatively, select an NE that is assigned an In Service or Under Maintenance state.

Note Memory backup is not allowed for preprovisioned or out-of-service NEs.

Step 2 Choose **Administration > Memory Backup**.

Step 3 The Memory Backup dialog box opens. Enter the following information (see Table 4-24 for details):

- NE model
- Selected NEs
- Job comments
- Tag name
- Time (time zone)

Note For the ONS 15216 EDFA2, the backup file must be saved in the default directory, such as the tftpboot directory on the remote TFTP server, in case the file will be restored from the remote TFTP server. The tftpboot directory must have read-write access, or the backup job will fail. See Chapter 3, "Building the Network" for information about configuring the tftp directory with read-write access.

Note The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.

Step 4 Depending on the type of NE, do one of the following:

- For ONS 15530 and ONS 15540 NEs, proceed to Step 5.
- For ONS 15600 NEs, proceed to Step 6.
- For ONS 15216, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NEs, click **Finish** to initiate the memory backup procedure.
- For the ONS 15216, the configuration file is copied to the $CTMHOME/admin/*NE-system-ID*/15216-*tag-name-time-stamp*-backup.cfg file.
- For the ONS 15310 CL, ONS 15310 MA SONET, or ONS 15310 MA SDH, the configuration file is copied to the $CTMHOME/admin/*NE-system-ID*/15310-*tag-name-time-stamp*-backup.cfg file.
- For the ONS 15327, the configuration file is copied to the $CTMHOME/admin/*NE-system-ID*/15327-*tag-name-time-stamp*-backup.cfg file.

- For the ONS 15454 SONET or ONS 15454 SDH, the configuration file is copied to the $CTMHOME/admin/*NE-system-ID*/15454-*tag-name-time-stamp*-backup.cfg file.

Note If **System Default** is chosen for the tag name, the tag is left blank and the filename is, for example, 15454--backup.cfg. If **User Specified** is chosen and **hello** is entered for the tag name, the filename is 15454-hello-*YYYYMMDDHHMM*-backup.cfg, where *YYYYMMDDHHMM* is the backup date, consisting of:

YYYY—Four-digit year
MM—Two-digit month
DD—Two-digit day
HH—Two-digit hour (in 24-hour format)
MM—Two-digit minute

Step 5 For ONS 15530 and ONS 15540 NEs:

a. Click **Next** to display memory backup options. Select an option (see Table 4-24 for details):

- Running Configuration
- Startup Configuration
- Save Running Config as Startup Config on NE

b. Click **Finish** to initiate the memory backup procedure.

The configuration file for each NE is copied to the $CTMHOME/admin/*NE-system-ID*/155*xx-tag-time-stamp-slot-number-of-active-CPU*-[running | startup].cfg file, where:

- $CTMHOME is the installation directory (by default, the installation directory is /opt/CiscoTransportManagerServer).
- *NE-system-ID* is the hostname of the ONS 15530 or ONS 15540.
- *tag-time-stamp* is the user-defined tag name and includes the time stamp. If **System Default** is selected, the tag is left blank and the filename is, for example, 15540-*time-stamp*-slot6-startup-backup.cfg. If **User Specified** is selected and **hello** is entered as the tag name, the filename is 15540-hello *YYYYMMDDHHMM*-slot6-startup.cfg, where *YYYYMMDDHHMM* is the time stamp.

The tag time stamp is ignored when the running configuration is saved as the startup configuration, because this operation is done on the NE itself and no backup file is saved on the Prime Optical server.

- *slot-number-of-active-CPU* is the slot number of the active CPU at the time of job execution. If the slot number cannot be obtained, the filename is 15540-*tag-time-stamp*-[running | startup].cfg.
- *running* or *startup* is the memory backup option chosen.

Note For the ONS 15530 and ONS 15540 NEs, the automatic backup files are named 155*xx-time-stamp-slot-number*-[running | startup].cfg.

Step 6 For ONS 15600 SONET and ONS 15600 SDH NEs:

a. Click **Next** to display memory backup options. Select the category of data to back up (see Table 4-24 for details):

- Provisioning data (is selected by default and is display only)

- Alarm data
- PM data

b. Click **Finish** to initiate the memory backup procedure.

The configuration file is copied to the $CTMHOME/admin/*NE-system-ID*/15600-*tag-name-time-stamp*-backup.cfg file.

After scheduling the backup, look at the Job Monitor table (**Administration > Job Monitor**) to see the job status. If the job fails, the Additional Information field in the Job Monitor table provides more information.

If a memory backup job fails, the EMS raises an alarm. All prior memory backup failure EMS-generated alarms on an NE are cleared under the following conditions:

- After a successful memory backup operation on the NE
- When the operational state of the NE changes to Out of Service

Table 4-24 Field Descriptions for the Memory Backup Dialog Box

Field	Description
NE Model	Select the NE type that you want to back up. The type you select determines the NEs that are displayed in the Network Elements area.
Network Elements	Use the **Add** and **Remove** buttons to move the NEs that you want to back up to the Selected NEs list, or to remove NEs from the list.
Job Comments	Enter comments about the backup, if needed.
Tag Name	Add a tag to the system-generated filename. If you select System Default, no tag name is added. If you select User Specified, you can enter a tag name.
Time *(time zone)*	Set a time for the backup. Click **Now** to begin backup immediately, or click **At Time** and specify when to begin backup, in 5-minute increments. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.
Memory Backup Dialog Box 2 for ONS 15530 and ONS 15540 NEs	
Running Configuration	Copies the running configuration of the active CPU to the backup file. The backup file is saved in the $CTMHOME/admin/*NE-system-ID* directory. The CPU slot number is included in the filename. If you selected a tag name, the tag and time stamp are included in the filename. For example, if the active CPU is in slot 6, the filename is 15540-*tag-time-stamp*-slot6-running-backup.cfg.
Startup Configuration	Copies the startup configuration of the active CPU to the backup file. The startup configuration is stored in NVRAM and used when the NE reboots. The backup file is saved in the $CTMHOME/admin/*NE-system-ID* directory. The CPU slot number is included in the filename. If you selected a tag name, the tag and time stamp are included in the filename. For example, if the active CPU is in slot 6, the filename is 15540-*tag-time-stamp*-slot6-startup-backup.cfg.
Save Running Config as Startup Config on NE	Saves the running configuration as the startup configuration on the NE itself. The user-defined tag name is ignored. This is the equivalent of the **write mem** CLI command.
Memory Backup Dialog Box 2 for ONS 15600 SONET and ONS 15600 SDH NEs	
Provisioning Data	*Display only.* Backs up the ONS 15600 provisioning data.

Table 4-24 Field Descriptions for the Memory Backup Dialog Box (continued)

Field	Description
Alarm Data	If checked, the ONS 15600 alarm data is backed up.
PM Data	If checked, the 15-minute and 1-day PM data for the ONS 15600 is backed up.

4.5.2 Restoring NE Memory

Use the Memory Restore dialog box to restore provisioning and configuration information stored in the flash memory of the following NEs. (This information is backed up by using the Memory Backup dialog box.)

- ONS 15216 EDFA2 (EDFA2 R2.3.0 and later)
- ONS 15216 EDFA3
- ONS 15310 CL
- ONS 15310 MA SONET
- ONS 15310 MA SDH
- ONS 15327
- ONS 15454 SONET
- ONS 15454 SDH
- ONS 15530
- ONS 15540 ESP and ESPx
- ONS 15600 SONET
- ONS 15600 SDH

Usage Notes:

- The latest ONS 15216 EDFA2 R2.4 hardware does not support memory restore to a software release other than 2.4.0. The ONS 15216 EDFA2 R2.3 hardware supports memory restore for NE software releases 2.3 and 2.4.
- For the ONS 15530 and ONS 15540, the SNMP Community String table must have a valid write community string for the NE before memory can be restored. For more information, see Chapter 3, "Building the Network."
- Prime Optical does not support memory restore for the ONS 15305 or Not Managed/Other Vendor NEs.

Complete the following steps to restore NE memory:

Step 1 In the Domain Explorer tree, select an NE that is assigned an In Service or Under Maintenance operational state.

Note Run the Memory Restore procedure for *one* NE at a time. You cannot restore memory for preprovisioned or out-of-service NEs.

Step 2 Choose **Administration > Memory Restore**. The Memory Restore dialog box opens.

Step 3 Enter the following information (see Table 4-26 for details):

- NE model
- NEs (select only one)
- Source
- Job comments
- Memory restore options (available only for CTC-based NEs)
- Time

Step 4 Depending on the type of NE, do one of the following:

- For the ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH, proceed to Step 5.
- For the ONS 15530 or ONS 15540, proceed to Step 6.
- For the ONS 15600 SONET or ONS 15600 SDH, proceed to Step 7.
- For the ONS 15216 EDFA2 or ONS 15216 EDFA3 NEs, click **Finish**.

Step 5 For the ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH, click **Next** to verify the following file properties:

- Node description
- Node name
- Node type
- IP address
- Software version

Prime Optical performs a compatibility check. The following table lists the compatibility factors and the corresponding action. The restore operation is not allowed if the NEs are of different types or if the software version is incompatible.

Table 4-25 Compatibility Factors for Memory Restore

Compatibility Factor	Action
Different NE type	Finish button is disabled; click **Cancel**.
Incompatible software version	Finish button is disabled; click **Cancel**.
Different node name	Prime Optical displays a warning message. You can click **Finish** to proceed with the restore operation or **Cancel** to cancel the operation.
Different software version	Prime Optical displays a warning message. You can click **Finish** to proceed with the restore operation or **Cancel** to cancel the operation.

Caution Restoring the memory of an NE using an incompatible or corrupted file might cause loss of traffic or loss of connectivity.

Step 6 For an ONS 15530 or ONS 15540:

a. Click **Next** to display the memory restore options. Select an option (see Table 4-26 for details):
   - Running configuration
   - Startup configuration

b. Click **Finish** to initiate the memory restore procedure.

Step 7 For the ONS 15600 SONET or ONS 15600 SDH:

a. Click **Next** to display the memory restore options. Select the category of data to restore (see Table 4-26 for details):
   - Provisioning data (is selected by default and is display only)
   - Alarm data
   - PM data

b. Click **Finish** to initiate the memory restore procedure.

To view the results of the memory restore operation, open the Job Monitor table (**Administration > Job Monitor**). For information about the Job Monitor table, see 4.6.1 Monitoring Scheduled Tasks, page 4-87.

Table 4-26 Field Descriptions for the Memory Restore Dialog Box

Field	Description
NE Model	Select the NE model that you want to restore. The model you select determines the NEs that are displayed in the Network Elements field.
Network Elements	Use the **Add** and **Remove** buttons to move the NE that you want to restore to the Selected NE list. You can run the Memory Restore procedure for only one NE at a time.

Table 4-26 Field Descriptions for the Memory Restore Dialog Box (continued)

Field	Description
Source	Specify the location of the backup file that you want to use to restore the NE: • Click **Local** to browse a local client directory for the backup file. • Click **Server** to restore the file from the Prime Optical server. The files shown are in the /opt/CiscoTransportManagerServer/admin/*NE-system-ID* directory in chronological order, with the most recent backup file displayed at the top of the list. The backup file uses the naming convention *NE-model-date time*-backup.cfg, where: – *date* has the format *YYYYMMDD* (that is, 20080206 is February 6, 2008) – *time* has the format *hhmmss* (that is, 144911 is 2:49:11 p.m.) For example, a valid backup filename is Cisco_ONS_15454-20080201144911-backup.cfg. **Note** The Server radio button is not active unless a file exists in that directory. • Click **Remote TFTP Server Address** to restore from another network server. (The Remote option is not supported for CTC-based NEs.) In the TFTP Server Address field, enter the IP address of the TFTP server. In the Relative TFTP File Path field, enter the fully qualified pathname of the backup file to be restored, relative to the tftpboot directory. TFTP must be configured and running on the network server. The Remote option is supported for the ONS 15216 EDFA2 R2.3.0 and later. **Note** If the Remote option is selected for the ONS 15216 EDFA, the backup file that you are restoring must have been saved in the default directory, such as the tftpboot directory on the remote TFTP server. **Note** The tftpboot directory must have read-write access, or the restore job will fail. See Chapter 3, "Building the Network" for information about how to configure the tftp directory with read-write access. • Click **Remote FTP Server Address** to restore from any UNIX workstation that is running FTP. This option requires authentication. In the FTP Server Address field, enter the IP address of the FTP server. In the FTP File Path field, enter the fully qualified pathname of the backup file to be restored, relative to the FTP directory. In the FTP Username field, enter the FTP username. In the FTP User Password field, enter the FTP user password. The Remote FTP Server option is supported only for the ONS 15216 EDFA3.
Job Comments	Enter comments about the restore procedure, if needed.
Memory Restore Options *(available only for CTC-based NEs)*	For CTC-based NEs, specify whether you want to partially or completely restore memory. This feature is available only to users with SuperUser or NetworkAdmin privileges. • Click **Partial Restore** to restore only the provisioning database, which includes information about links, circuits, and information contained in the NE Explorer. Partial Restore is selected by default. • Click **Complete Restore** to restore both the provisioning database and the system database. The system database parameters include software version, version name, NE node name, and so on.
Time *(time zone)*	Set a time for memory restore. Click **Now** to begin memory restore immediately, or click **At Time** and specify when to begin memory restore, in 5-minute increments. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.

Table 4-26 Field Descriptions for the Memory Restore Dialog Box (continued)

Field	Description
Memory Restore Dialog Box 2 for ONS 15530 and ONS 15540 NEs	
Running Configuration	Restores the currently running configuration of the NE. **Note** Configuration file commands are *added to* the current running configuration on the NE. The running configuration is not replaced by the configuration file.
Startup Configuration	Restores the startup configuration of the NE. This operation replaces the entire startup configuration file.
Memory Restore Dialog Box 2 for ONS 15600 SONET and ONS 15600 SDH NEs	
Provisioning Data	*Display only.* Restores the ONS 15600 provisioning data.
Alarm Data	If checked, the ONS 15600 alarm data is restored.
PM Data	If checked, the 15-minute and 1-day PM data for the ONS 15600 is restored.

4.5.3 Viewing and Modifying NE Service Properties

The NE Service pane in the Control Panel window allows you to view and update Prime Optical server configuration information, which includes timing parameters and NE backup parameters. You can also stop or start an individual NE service instance.

All server configuration changes take effect when you save them. The NE Service pane contains the following tabs, which are described in Table 4-27:

- NE Poller—Allows you to change timing parameters and CTC IIOP port information.
- NE Auto Backup—Allows you to configure automatic NE backup parameters.
- NE Manual Backup—Allows you to configure manual NE backup parameters.

Note The NE service is not started as a process until you activate an NE for that particular service.

When you add a network partition, the NE service is not started automatically. It starts only when you add an NE to the network partition. When the last NE is removed from the network partition, the NE service is not stopped automatically. The NE service stops only when the network partition is deleted.

Note Prime Optical is limited to running a maximum number of 23 Java processes. Enter the **opticalctl status** command to view the current number of running processes.

4.5.3.1 Understanding the Unmanaged NE Service

Unmanaged NEs have their own NE service. This Unmanaged NE Service allows Prime Optical to support unmanaged NE devices that are not in the Supported NE table. Unmanaged NEs can be Cisco or non-Cisco devices. The Unmanaged NE Service is required for operations such as:

- Creating manual links between managed and unmanaged NEs
- Creating manual links between unmanaged NEs

- Changing the operational state of unmanaged NEs

The Unmanaged NE Service also supports DWDM topology with IP Address along with the optical configuration.The following features are supported:

- Assign the type of the NE (CRS-1, CRS-3) and the IP address.
- Ability to cross-launch Prime Network from the unmanaged device.
- Create manual links between ONS and unmanaged NEs.
- Create patchcords that connects any CRS port to the ROADM device.

Note Passive NEs such as the ONS 15216 EDFA1 are not considered unmanaged NEs.

4.5.3.2 Changing Timing Parameters

Use the NE Service pane to tune timing parameters and accommodate different Prime Optical server-to-NE connectivity scenarios. When timing parameters are tuned, network utilization and Prime Optical server load are optimized. As a rule, timing parameters increase as the network slows.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **NE Service** to open the NE Service pane. Table 4-27 describes the fields in the NE Service pane.

Step 3 Click the **NE Poller** tab and enter the NE health poll interval.

Step 4 In the Control Panel window, expand the **NE Service** and click an NE. Table 4-28 describes the fields in the individual NE Service panes.

Step 5 In the Resync Scheduling area of the individual NE Service pane, enter the interval at which the configuration is retrieved and processed. This field is not available for all NEs.

Note The default values are adequate for most network configurations. Decreasing the values of the parameters could adversely impact server performance.

Step 6 Click **Save**. Changes take effect immediately.

Table 4-27 Field Descriptions for the NE Service Pane

Field	Subfield	Description
NE Poller Tab		
Timing Parameters	NE Health Poll Interval	Displays the NE polling interval (in seconds). The default is 240 seconds (4 minutes).

Table 4-27 Field Descriptions for the NE Service Pane (continued)

Field	Subfield	Description
CTC IIOP Port Configuration	CTC IIOP Port Range	Displays CTC IIOP ports or a range of ports for CTC-based network services that have been selected to be configured. When all ports have been removed in the CTC IIOP Selection dialog box, the CTC IIOP Port Range field displays a zero.
	Edit CTC IIOP Port Range button	Click the Edit CTC IIOP Port Range button to open the CTC IIOP Port Selection dialog box, which allows you to configure CTC IIOP ports or a range of ports for CTC-based network services. **Note** Table 4-29 describes the fields in the CTC IIOP Port Selection dialog box.
NE Auto Backup Tab		
Select Modify Mode	All NE Models, NE Model	Allows you to specify whether the automatic backup should apply to a specific NE model (ONS 15216 EDFA2 [R2.3.0 and later], ONS 15216 EDFA3, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454, ONS 15454 SDH, ONS 15530, ONS 15540 ESP, ONS 15540 ESPx, ONS 15600, ONS 15600 SDH, CPT 200, CPT 200 SDH, CPT 600, or CPT 600 SDH) or to all applicable NE models.
	Apply All Changes	If checked and All NE Models is selected, all of the values on this tab will be applied to all of the NE models. The applied changes also include the values that have not been modified currently. If unchecked, only the current changes will be applied to all of the NE models.

Table 4-27 Field Descriptions for the NE Service Pane (continued)

Field	Subfield	Description
Configuration Parameters	NE Model	If NE Model is selected under Select Modify Mode, this field allows you to specify the NE model that will be backed up automatically.
	Enable Auto Backup	If checked, the system automatically backs up all NE models, or a specific NE model. When NE Auto Backup State is set to Enabled, an entry is added to the Job Monitor table with a new job ID and a new task ID for each NE. Scheduled Time is set to the selected autobackup time and Task Status is set to Queued. When the autobackup time is reached and the task begins, Task Status is set to Running. After the backup is complete, Task Status is set back to Queued and Scheduled Time is reset to the time and date of the next scheduled backup time. When NE Auto Backup State is set to Disabled, Task Status is set to Cancelled. The default state is Disabled. When you first enable Memory Auto Backup, the job runs the same day if the scheduled time has not already passed. If the time has passed, the job runs the next day. However, if you later modify the Memory Auto Backup schedule, the job always runs the next day, regardless of whether or not the scheduled time has passed.
	Number of Backup Copies Retained	Allows you to specify the number of backup copies to keep. The valid range is from 1 to 50 backup copies; the default is 7. Only automatic backup copies count toward the total number of backup copies saved; manual backup copies do not count toward the total. For ONS 15530 and ONS 15540 NEs, the total number of backup copies includes both running and startup configuration files. For example, if you want to keep 7 copies of each configuration file, you should set the number of copies to 14. Each time Prime Optical creates a new backup file, it checks the existing number of backup copies. Prime Optical deletes files as needed, beginning with the oldest file, so as not to exceed the specified number of backup copies to keep.
	Backup Time	Allows you to set the time when the automatic backup will be performed.
NE Manual Backup Tab		
Select Modify Mode	—	Allows you to specify whether the manual backup should apply to a specific NE model (ONS 15216 EDFA2 [R2.3.0 and later], ONS 15216 EDFA3, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454, ONS 15454 SDH, ONS 15530, ONS 15540 ESP, ONS 15540 ESPx, ONS 15600, ONS 15600 SDH, CPT 200, CPT 200 SDH, CPT 600, or CPT 600 SDH) or to all applicable NE models.
Configuration Parameters	NE Model	If NE Model is selected under Select Modify Mode, this field allows you to specify the NE model that will be backed up manually.
	Number of Backup Copies Retained	Allows you to specify the number of backup copies to keep. The default is 7. Each time Prime Optical creates a new backup file, it checks the existing number of backup copies. Prime Optical deletes files as needed, beginning with the oldest file, so as not to exceed the specified number of backup copies to keep.

4.5.3.3 Viewing the Individual NE Service Panes

The individual NE Service panes in the Control Panel window allow you to stop, start, or configure an individual NE service instance.

Table 4-28 Field Descriptions for the Individual NE Service Panes

Field	Description
Status Tab	
Service Status *(This field is called Network Service Status for CTC-based SONET and CTC-based SDH NEs)*	Displays the current status of the service: Active or Not Active. By default, the status is Not Active. **Note** The NE service can take up to 60 seconds to initialize after the GUI status has changed to indicate that the service is up. The status is an indication of the successful initiation of the service startup, not successful initialization.
Service Action	Allows you to stop or start a process. Notice that the Service Action button toggles between Activate and Deactivate, and that the Service Status field changes accordingly.
Threshold	Displays the maximum number of NEs that each NE service instance can manage. The threshold depends on the NE type, as follows: • ONS 15216 NE Service can manage up to 1000 ONS 15216 NEs. • ONS 15305 NE Service can manage up to 1000 ONS 15305 NEs. • ONS 155xx NE Service can manage up to 1000 ONS 155xx NEs. • ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, or ONS 15600 SONET NE Service can manage up to 400 ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, or ONS 15600 SONET NEs (for NE releases earlier than R5.0). **Note** For NE release 5.0 or later in a large or high-end configuration, the NE service can manage up to 500 NEs. • ONS 15454 SDH and ONS 15600 SDH NE Service can manage up to 600 ONS 15454 SDH or ONS 15600 SDH NEs. • Unmanaged NE Service can manage up to 500 unmanaged NEs.

Table 4-28 Field Descriptions for the Individual NE Service Panes (continued)

Field	Description
Resync Scheduling *(not applicable to unmanaged or ONS 155xx NEs)*	Allows you to specify a schedule for database resynchronization for each NE model. A schedule consists of the following configurable parameters: • Days of the week to run: All, Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday. Check the check box next to the day(s) to run the configuration resynchronization. • Time of day to initiate the resynchronization, in *HH*:*MM* AM/PM format (specific format based on locale). • Interval between synchronizations, in *HH*:*MM* format. The maximum interval is 24:00; the minimum is 5:00. The resynchronization interval is calculated only until the end of the day. The schedule for the next day takes effect after the end of the current day. For example, if you choose Wednesday with a start time of 10:00 a.m. and an interval of 6 hours, the resynchronization occurs at 10:00 a.m., 4:00 p.m., and 10:00 p.m. on Wednesdays. After you set the time interval between synchronizations, the Prime Optical server resynchronizes the database with the configuration changes from the last resynchronization time. This synchronizes the database with NE, card, and line configuration information. **Note** The Last Resync field shows when the NE was last synchronized. • Enable Resync Alarms check box—This check box is available after you select the days of the week for database resynchronization. When checked, the Config Resync operation starts and Prime Optical resynchronizes with all the active alarms that are present on the NE.
Bandwidth Utilization Report *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Check the Enable Bandwidth Data Service Provisioning (DSP) check box to enable the bandwidth check during L2 service provisioning. The bandwidth utilization report shows available and used bandwidth for each L2 topology. This report can be used during L2 service provisioning to verify whether the requested Committed Information Rate (CIR) is available on the topology. Based on the report, a warning is returned if there is not enough bandwidth available for a drop port. Be careful not to oversubscribe the bandwidth.
Designated Socks Server *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Check the Enable Designated Socks Server check box to allow the CTC-based SONET or CTC-based SDH NEs to serve as a designated SOCKS server (DSS). If the NE is a DSS, it manages connectivity among other NEs through network firewalls.
Threshold Crossing Alerts *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Check the Enable Threshold Crossing Alerts Receiver check box to forward events to other services (for example, from network service to other services) for CTC-based SONET or CTC-based SDH NEs. If the Enable Threshold Crossing Alerts Receiver check box is unchecked, events are not forwarded to other services and TCA information is not saved on the database.
Robust Fault Synchronization *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Allows you to enable or disable the robust fault synchronization for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, ONS 15600 SDH, CPT 200, and CPT 600.
BLSR-Ring/MS-SPRing Switch Interval *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Allows you to set the BLSR or MS-SPRing switch interval, in seconds. The default is 60 seconds.

Table 4-28 Field Descriptions for the Individual NE Service Panes (continued)

Field	Description
TL1 Tunnel Connection Timeout *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Allows you to set the time it takes to set up a TL1 tunnel connection between the Prime Optical server and the tunneled NE (TNE). When a new NE is added using the Add NE wizard, you can connect to the new NE using a TL1 tunnel. The Prime Optical server establishes a TCP/IP connection to a non-Cisco GNE (NGNE) and the NGNE establishes an OSI connection to the TNE. If the Prime Optical server cannot set up the TL1 tunnel connection before the specified TL1 tunnel connection timeout, the Add NE operation fails and the TNE connection state becomes unavailable.
Audit Trail Collection Interval *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Allows you to set the audit trail collection interval, in minutes. **Note** For NE releases earlier than release 6.0, the audit trail records are not cleared automatically. Instead, you must clear the alarms manually by archiving the audit records from CTC. In NE release 6.0 and later, the CTC API clears the audit trail records automatically, and the alarms are cleared automatically in Prime Optical. To manually clear audit trail records for NE releases earlier than 6.0, launch CTC and choose **Maintenance > Audit > Archive**.
L2 Service Resync Delay *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Allows you to configure the delay after which Prime Optical performs a Cisco IOS configuration synchronization on ML cards to keep the NE and the Prime Optical Data Provisioning Service synchronized. This operation synchronizes the L2 topology. Full Cisco IOS configuration synchronization is performed automatically by Prime Optical to keep the NE and the Prime Optical Data Provisioning Service synchronized. Full configuration resynchronization might be delayed depending on Prime Optical server usage. For the Prime Optical server deployed as a monitoring server, the recommended value for the delay parameter is 120 seconds. For the Prime Optical server deployed as a provisioning server, the recommended value for the delay parameter is 10 minutes (600 seconds).
ENEs List Poll Interval *(applicable to CTC-based SONET and CTC-based SDH NEs)*	Time interval in which all CTC-based GNEs in Prime Optical need to refresh their list of ENEs. The list of ENEs for each GNE is obtained and compared with the existing ENE list. If there are any changes to the ENE list, topology changes are carried out so that the Domain Explorer will reflect the current topology with correct GNE and ENE icons.

4.5.3.4 Configuring Automatic NE Backup Parameters

Prime Optical can be configured to automatically back up ONS 15216 EDFA2, ONS 15216 EDFA3, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15530, ONS 15540 ESP, ONS 15540 ESPx, ONS 15600 SONET, and ONS 15600 SDH NEs once a day.

Automatic backup files are saved in the following locations and have the following names:

- $CTMHOME/admin/*NE-system-ID*/15216-*YYYYMMDDHHMM*-auto.cfg
- $CTMHOME/admin/*NE-system-ID*/[15530 | 15540]-*YYYYMMDDHHMM*-*Active-CPU-slot-number*-[running | startup]-auto.cfg
- $CTMHOME/admin/*NE-system-ID*/15310-*YYYYMMDDHHMM*-auto.cfg
- $CTMHOME/admin/*NE-system-ID*/Cisco_ONS_15327-*YYYYMMDDHHMM*-auto.cfg
- $CTMHOME/admin/*NE-system-ID*/15454-*YYYYMMDDHHMM*-auto.cfg

- $CTMHOME/admin/*NE-system-ID*/15600-*YYYYMMDDHHMM*-auto.cfg
- $CTMHOME/admin/*NE-system-ID*/*CTM-YYYYMMDDHHMM*-auto.cfg

where:

- *YYYYMMDDHHMM* is the date of the backup:
  - *YYYY* is the four-digit year
  - *MM* is the two-digit month
  - *DD* is the two-digit day
  - *HH* is the two-digit hour (in 24-hour format)
  - *MM* is the two-digit minute

  For example, 4:01 p.m. on September 29, 2006 is represented as 200609291601.
- *Active-CPU-slot-number* is the slot number of the active CPU at the time of job creation.
- [running | startup] indicates whether the backup is of the NE's running configuration or startup configuration.

Note Automatic backup is not available for all NEs.

Use the NE Service pane to set automatic NE backup parameters.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **NE Service** to open the NE Service pane. Click the **NE Auto Backup** tab. Table 4-27 provides descriptions.

Step 3 Enter the following information:

- Select Modify Mode
- NE Model
- Enable Auto Backup
- Number of Backup Copies Retained
- Backup Time
- Backup Data (available only if ONS 15600 SONET or ONS 15600 SDH is selected as the NE model)

Step 4 Click **Save**. Changes take effect immediately; however, the backup already scheduled for the next 24 hours remains in effect. A backup with the new parameters will occur after the previously scheduled backup runs.

If the time you scheduled for the backup is prior to the current time of the current day, a backup for the current day will be scheduled for immediate execution. Otherwise, backups for the current day and subsequent days will occur at the specified time.

To verify whether Prime Optical is automatically backing up the NE, go to the Job Monitor table (**Administration > Job Monitor**), verify that the task is listed, and check its task status. If automatic backup for an NE failed, the task status will be "Failed." This failure is logged in the Audit Log and an alarm is generated.

Note If the Prime Optical server restarts after the scheduled automatic backup time for that day, Prime Optical automatically schedules a backup for all ONS 15327, ONS 15454 SONET, ONS 15530, and ONS 15540 NEs to take place 5 to 10 minutes after the restart. Conversely, if the server restarts before the scheduled backup time for that day, the backup occurs at the regularly scheduled time. This behavior ensures that a backup is performed for each NE at least once a day.

For example, if the automatic backup time is set for 2:00 a.m. and the Prime Optical server restarts at 8:00 p.m., the server schedules a backup 5 to 10 minutes after the restart because the backup time is earlier than the restart time on the same day. As another example, if the automatic backup time is set for 11:00 p.m. and the Prime Optical server restarts at 8:00 p.m., the server waits until 11:00 p.m. to run the backup because the backup time is later than the restart time.

An entry is added to the Audit Log for each successful completion or failed NE autobackup task.

4.5.3.5 Configuring Manual NE Backup Parameters

Use the NE Service pane to set manual NE backup parameters.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **NE Service** to open the NE Service pane. Click the **NE Manual Backup** tab. Table 4-27 provides descriptions.

Step 3 Enter the following information:

- Select Modify Mode
- NE Model
- Number of Backup Copies Retained

Step 4 Click **Save**. Changes take effect immediately; however, the backup already scheduled for the next 24 hours remains in effect. A backup with the new parameters will occur after the previously scheduled backup runs.

4.5.3.6 CTC IIOP Port Configuration

The CTC IIOP Port Selection dialog box allows you to configure individual CTC IIOP ports, or a range of ports, for the CTC-based NE service.

Typically you would configure a specific CTC IIOP port (or a range of ports) if you have a firewall between the Prime Optical server and the NE.

The number of ports configured must equal the number of CTC-based NE services, unless you have SSLIOP configured on the NE. If you have SSLIOP configured on the NE, each NE service requires two ports (instead of one port): one for IIOP and one for SSLIOP.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **NE Service** to open the NE Service pane.

Step 3 Click the **NE Poller** tab.

Step 4 Click the **Edit CTC IIOP Port Range** button to open the CTC IIOP Port Selection dialog box, which allows you to select CTC IIOP ports or a range of ports for the CTC-based NE service. Table 4-29 provides descriptions.

Step 5 Enter the port values.

Note You can specify a single port (leaving the To text field blank) or a port range by specifying the initial value (From text field) and the end value (To text field).

Step 6 Click the **Add Port** button to add the ports you entered. The ports are added to the Selected Port list in ascending order.

Tip You can remove ports from the Selected Port list by selecting the port you want to remove and clicking the **Remove** button. The port moves to the Deleted Port list.

Step 7 Click **OK** to close the CTC IIOP Port Selection dialog box. At the confirmation prompt, click **OK**. The values displayed in the Selected Port list are formatted and displayed in the CTC IIOP Port Range field.

Caution The NE service will not start if the ports you select are already in use by the server. Verify that the port values you select in the CTC IIOP Port Selection dialog box are not already in use by the server before saving your changes.

Table 4-29 Field Descriptions for the CTC IIOP Port Selection Dialog Box

Field	Description
Specify CTC IIOP Port Range	
From/To fields	Enter a port range by specifying the initial value in the From field and the end value in the To field. You can specify a single port by entering the port value in the From field, leaving the To field blank. The valid range for the From/To fields is from 0 to 65,535.
Add Port button	Click the **Add Port** button to add the ports specified in the From/To fields to the Selected Port list. Ports listed in the Selected Port list will appear in the CTC IIOP Port Range field.
Port Selection	
Deleted Port	Displays the list of ports to be deleted from the CTC IIOP Port Range.
Selected Port	Displays the list of ports to be added to the CTC IIOP Port Range.
Add button	Select a port in the Deleted Port list and click the **Add** button to move the port to the Selected Port list. Ports listed in the Selected Port list will appear in the CTC IIOP Port Range field.
Remove button	Select a port in the Selected Port list and click the **Remove** button to move the port to the Deleted Port list. Ports listed in the Deleted Port list will not appear in the CTC IIOP Port Range field.

4.5.4 Viewing and Modifying Service Instance Properties

The NE Service Instance pane in the Control Panel window allows you to view a list of NEs managed by the service instance. You can also activate or deactivate debug logging on selected NEs.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, expand **NE Service**.

Step 3 Expand an individual NE service and click **NE Service Instance**. The following table provides descriptions.

Table 4-30 Field Descriptions for the NE Service Instance Pane

Field	Description
Status	
Network Partition	Displays the name of the associated Network Partition. This is a read-only field.
Service Status	Displays the current status of the service: Running or Stopped. The network service can take up to 60 seconds to initialize after the GUI status has changed to indicate that the service is up. The status is an indication of the successful initiation of the service startup, not successful initialization.
Start Service Instance, Stop Service Instance	Allows you to stop or start an individual network service instance. If you click **Start Service Instance**, the service status changes to *Running*. If you click **Stop Service Instance**, the status changes to *Stopped*. The list of managed NEs shows which NEs are being managed by the selected service instance. If you stop the specified service instance, the NEs in the list are no longer managed.
Dump Cache button	Click the **Dump Cache** button to export the cache (memory) information of the selected service instance to a log file. This feature applies only to CTC-based NE service instances.
Debug Table button	Click the **Debug Table** button to open the Prime Optical NE Module Level Debug table. See 4.5.4.1 Viewing the Prime Optical NE Module Level Debug Table, page 4-78.
Discovery Mode	Lets you set the mode of discovery of NEs; the mode of discovery can be manual or automatic. Set the discovery mode to one of the following: • Automatic—When a new NE is added, Prime Optical automatically discovers the NE and adds it to the network partition. • Manual—When a new NE is added to Prime Optical, the NE remains in the Undiscovered Network Elements group in the Domain Explorer. You can later add the NE to the desired network partition; click **Add Undiscovered NEs** to add the NEs to a network partition. **Note** This option is available only for CTC-based NEs.

Table 4-30 Field Descriptions for the NE Service Instance Pane (continued)

Field	Description
Overall Logging for the Instance	Enable—Click the **Enable** radio button to enable logging. When you click the Enable radio button, the debug modules in the Available list become selectable. Disable—Click the **Disable** radio button to disable logging. When you click the Disable radio button, the debug modules in the Available list become dimmed and you cannot make any selections from the Available list.
Managed NEs	
Filter button	Click the **Filter** button to filter the data displayed in the table.
NE ID	Displays the ID name of the selected NE.
IP Address	Displays the IP address of the selected NE.
NE State	Displays the state of the selected NE.
Communication State	Displays the current connectivity state between Prime Optical and the selected NE. Values are Available or Unavailable.
Subnet ID	Displays the name of the subnetwork associated with the selected NE.
Debug Option	Displays whether the debug option is enabled or disabled for the selected NE.

4.5.4.1 Viewing the Prime Optical NE Module Level Debug Table

The Prime Optical NE Module Level Debug table displays the debug state of the selected NEs, and it lists the modules for which debugging is active.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, expand **NE Service** or **PM Service** then do one of the following:

- Expand one of the following under NE Service:
  - CTC-Based SONET NEs
  - CTC-Based SDH NEs
- Expand one of the following under the PM Service:
  - ONS 15305/ONS 15305 CTC
  - ONS 15310 CL/ONS15310 MA/ONS 15327/ONS 15454
  - ONS 15310 MA SDH/ONS 15454 SDH
  - ONS 15600
  - ONS 15600 SDH

Step 3 Click **Network Service Instance** or **PM Service Instance**.

Step 4 Select one or more managed NEs from the Managed NEs table.

Step 5 Click the **Debug Table** button. The Prime Optical NE Module Level Debug table opens. The following table provides descriptions.

Table 4-31 Field Descriptions for the Prime Optical NE Module Level Debug Table

Field	Description
NE ID	Displays the ID name of the selected NE.
Debug State	Displays the debug state (enabled or disabled).
Debug Modules	Displays a list of debug modules active on the selected node.

4.5.4.2 Configuring the NE Logging Options

The Network Element Logging Options dialog box allows you to modify the debug state for selected NEs.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, expand **NE Service**.

Step 3 Expand **CTC-Based SONET NEs** or **CTC-Based SDH NEs** and click **Network Service Instance**.

Step 4 Select one or more managed NEs from the managed NEs table.

Step 5 Click the **Debug Table** button. The Prime Optical NE Module Level Debug table opens.

Step 6 Click the **Open Debug Dialog** tool to open the Network Element Logging Options dialog box. The following table provides descriptions.

Step 7 Click **Save** to save the NE logging options.

Table 4-32 Field Descriptions for the Network Element Logging Options Dialog Box

Field	Description
Overall Logging	
Enable	Choose the Enable radio button to enable logging. When you choose the Enable radio button, the debug modules in the Available list become selectable.
Disable	Choose the Disable radio button to disable logging. When you choose the Disable radio button, the debug modules in the Available list become dimmed and you cannot make any selections from the Available list.
Apply to All NEs	Check the Apply to All NEs check box to apply all the modules to the NEs selected in the Prime Optical NE Module Level Debug table.
Debug Modules	
Available	Displays the modules available for debugging.
Selected	Displays the modules selected for debugging.

4.5.5 Backing Up Client Files

Use the Backup File dialog box to view a list of NE configuration files that were created during routine backups and saved on the Prime Optical server from the NEs. You can select one or more files from the list and save them to a local client workstation.

Step 1 In the Domain Explorer window, choose **Administration > Memory Backup Upload**. The Backup File dialog box opens. The following table provides descriptions.

Step 2 In the Files area, select backup files from the list. To select multiple files, hold down the **Ctrl** key on your keyboard while using your mouse to click files. Click **Select All** to select all files in the list.

Step 3 In the Upload Location text box, specify where you want to save the backup files on the client. Click **Browse** to choose a client location different from the default.

Step 4 Click **Upload** to upload the selected backup files to the specified client workstation.

Table 4-33 Field Descriptions for the Backup File Dialog Box

Field	Description
Files	Lists the backup files that are available on the server.
Upload Location	Allows you to specify where you want to save the backup files on the client. The default location is *Prime Optical-client-installation-directory*\admin\ or *Prime Optical-client-installation-directory*/admin/. Click **Browse** to choose a different location.
Upload button	Uploads the selected backup files to the specified client location.
Select All button	Selects all of the backup files in the list.
Cancel button	Replaces any changes to user-defined fields with the previous values and closes the dialog box.
Help button	Launches the online help for the Backup File dialog box.

4.5.6 Restoring Server Configuration Files

Step 1 Log into the server workstation as the root user.

Step 2 On the command line, enter the following commands:

```
cd/opt/CiscoTransportManagerServer/bin
./restore_config.sh backup-file-location log-directory ISHA
```

Note The ISHA value is 0.

4.5.7 Configuring Nodes for Database Restore—ONS 15600

Use the Configure Node dialog box to configure the selected ONS 15600 SONET or ONS 15600 SDH node. This feature is essentially a database restore without the check for a matching node ID, software version, and IP address. Additionally, you can specify that a new IP address overrides the IP address in the database. When the node reboots after the database has been downloaded, it uses the new IP address you specified. Only the provisioning database is restored from the ONS 15600 database file, which can contain provisioning, alarm, PM, and audit databases.

Step 1 In the Domain Explorer tree, select an ONS 15600 SONET or ONS 15600 SDH NE that is assigned an In Service or Under Maintenance operational state. You cannot configure nodes for preprovisioned or out-of-service NEs.

Step 2 Choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Configure Node**. The Configure Node dialog box opens. The following table provides descriptions.

Step 3 Enter the following information:

- NE model
- Selected NE
- Source
- Job comments
- Time

Step 4 Click **Next**.

Step 5 Verify the configuration. If necessary, change the IP address with which the new node will be configured.

Step 6 Click **Finish**.

To view the results of the node configuration, check the Job Monitor table (**Administration > Job Monitor**).

Table 4-34 Field Descriptions for the Configure Node Dialog Box

Field	Description
NE Model	Select the NE type that you want to configure. The type you select determines the NEs that are displayed in the Network Elements field. **Note** You can only select ONS 15600 SONET or ONS 15600 SDH.
Network Elements	Use the **Add** and **Remove** buttons to move the NE that you want to configure to the Selected NE list. You can run the node configuration procedure for only one NE at a time.
Source	Specify the location of the backup file that you want to use to configure the NE: • Click **Local** to browse to a local client directory for the backup file. • Click **Server** to configure the file from the Prime Optical server. The files shown are in the directory /opt/CiscoTransportManagerServer/admin/*NE-system-ID*. The Server radio button is not active unless a file exists in that directory. **Note** The Remote options are disabled and do not apply.
Job Comments	Enter comments about the node configuration procedure, if needed.

Table 4-34 Field Descriptions for the Configure Node Dialog Box (continued)

Field	Description
Time (*time zone*)	Set a time for the node configuration. Click **Now** to begin node configuration immediately, or click **At Time** and specify when to begin node configuration, in 5-minute increments. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.
Current Node Configuration	*Display only.* Displays the NE software version and IP address of the current node.
Memory Configuration	*Display only.* Displays the NE software version and IP address in the database file provided for configuring the node. The check box shows that only provisioning data will be considered for restoration.
New Node Configuration	Displays the NE software version and IP address with which the new node will be configured. By default, the IP address is the same as that of the current node. You can modify the IP address.

4.5.8 Managing Protection Groups

A protection group allows you to group modules together, so that if one module goes down for some reason, the other modules will be protected and will not go down as well. The following sections describe how to create, enable, edit, and delete protection groups.

4.5.8.1 Creating Protection Groups

Step 1 Select a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the NE Explorer window, click the **Protection** tab.

Step 3 In the **Protection Groups** subtab, click **Create**. The Create Protection Group dialog box opens. Table 4-35 provides descriptions. Fields shown depend on the type of NE that is selected.

Step 4 Specify the following information:

- Name
- Type
- Protect module

Caution If you are using Prime Optical GateWay/CORBA, make sure that you do not create multiple protection groups with the same name. Prime Optical GateWay/CORBA cannot distinguish between multiple protection groups with the same name while executing a delete protection group command or a perform protection switch command.

Note 1:N protection is not supported for the ONS 15327.

The Layer 2 1+1 protection group is created only between client ports on GE_XP or 10GE_XP cards (in L2 over DWDM mode), and only if Layer 2 trunk-to-trunk internal patchcords are created between the cards' trunk ports.

Based on these selections, a list of available working cards or ports is displayed.

Step 5 From the Available Entities list, choose the card or port that will be the working card or port. Click the arrow button to move each card or port to the Working Entities list.

Step 6 Complete the remaining information:

- Bidirectional switching
- Revertive
- Reversion time
- Recovery guard time
- Verification guard time
- Detection guard time

Step 7 Click **OK**.

Caution Before running traffic on a protected card within a protection group, enable the ports of all protection group cards.

Note After creating a protection group on DS3XM-6 cards, wait for 2 minutes while Prime Optical receives updates for all of the ports supported by the DS3XM-6 cards. The protection group is not visible in Prime Optical until the 2-minute update period is complete.

Note The ONS 15600 SONET must have cards carrying live traffic in order to switch protection. Even a forced switch will be overridden by a failed signal. You cannot perform manual and forced switches on an ONS 15600 using preprovisioned cards. If you try to perform a switch using preprovisioned cards, the NE returns an error, and the protection operation does not switch from Active to Protect. An APS_CLEAR is generated, which can be cleared.

Table 4-35 Field Descriptions for the Create Protection Group Dialog Box

Field	Description
Name	Enter a name for the protection group. The name can have up to 32 alphanumeric characters. **Note** You cannot set the protection group name for ONS 15305 CTC protection groups.
Type	Choose the protection type from the drop-down list: • 1:1 (card) • 1:N (card) • Y Cable (port) • 1+1 (port) • 1+1 Optimized (port) • Layer 2 1+1 The protection selected determines the cards that are available to serve as protect and working cards. For example, if you choose 1:N protection, only DS-1N-14 and DS-3N-12E cards are displayed. If you choose Layer 2 1+1, only the 10GE_XP and GE_XP cards are displayed.
Protect Module	Choose the protect module if using 1:1, 1:N, or Layer 2 1+1.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	(Optical cards only) If checked, both the transmit and the receive channels switch if a failure occurs on one. This option is only available if you select 1+1 (port) type.
Revertive	If checked, the node reverts traffic to the working card or port after failure conditions remain corrected for the amount of time entered in the Reversion Time field. This option is not available if the 1:N (card) type has been selected.
Reversion Time	If Revertive is checked, choose the amount of time following failure condition correction that the node should switch back to the working card or port. Values are listed in half-minute increments.
Recovery Guard Time	Prevents rapid switches due to signal degrade (SD) or signal failure (SF) conditions. After the SD or SF condition is cleared on a facility protected by Optimized 1+1 protection, no switches are performed for the duration of the recovery guard timer.
Verification Guard Time	Specifies the amount of time that a user command has to complete. If a user command cannot be completed within the duration set by the verification guard timer, the command is cleared and an APS_CLEAR event is sent.
Detection Guard Time	Specifies the amount of time after a failure that the system has to complete a switch. After detecting an SD, SF, loss of signal (LOS), loss of frame (LOF), or alarm indication signal line (AISL) failure, the detection guard timer is started. If the detection guard timer is set to zero, the system completes a switch within 60 ms for failure events.

4.5.8.2 Enabling Ports of Protection Group Cards

Step 1 Select a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the card.

Step 3 In the card slot properties pane, click the **Line** tab.

Step 4 In the Line Config subtab, under the Admin State column, select **IS** (in service).

Step 5 Click **Apply**.

4.5.8.3 Editing Protection Groups

Step 1 Select a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the node properties pane, click the **Protection** tab > **Protection Groups** subtab.

Step 3 In the Protection Groups area, choose a protection group.

Step 4 In the Selected Protection Group area, edit the fields as appropriate.

Step 5 In the Protection tab, click the **Operations** subtab.

Step 6 In the Protection Groups area, choose a protection group.

Step 7 In the Protection Group Details area, select a protection group port; then, choose from among the following:

- Clear—Clears a traffic switch on protection group port.
- Manual—Initiates a manual switch on the selected port. This command switches traffic only if the path has an error rate less than the signal degrade (SD) bit error rate (BER) threshold.
- Force—Initiates a forced switch on the selected port. This command switches traffic even if the path has SD or signal fail (SF) conditions. A Force switch has a higher priority than a Manual switch.
- Unlock—Unlocks the protection group. This button is enabled only after you click the Lock Out button.
- Lock Out—For NE software release 8.5 and later, this button sends the lockout command to the ports of the protection group. There are two types of lockout commands:
  - Lockout of protection—If you select the Protect/Standby port of an unlocked protection group, the LOCKOUT OF PROTECTION command is sent to CTC. This prevents the Working/Active port from automatically switching to the protected state. This command also prevents events that force the Protect/Standby port to switch.
  - Lockout of working—If you select the Working/Active port of an unlocked protection group, the LOCKOUT OF WORKING command is sent to CTC. This prevents the Protect/Standby port from automatically switching to the working state. This command also prevents events that force the Working/Active port to switch.
- Lock On—For NE software release 8.5 and later, this button is dimmed and not used.

Step 8 In the confirmation dialog box, click **OK**.

Step 9 Click **Apply**.

4.5.8.4 Deleting Protection Groups

Step 1 Select a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the node properties pane, click the **Protection** tab.

Step 3 In the **Operations** subtab, make sure that the protect card is in standby mode and the working card is in active mode. If the protect card is still active, do not continue.

Step 4 In the **Protection Groups** subtab, select the protection group.

Step 5 Click **Delete**.

Step 6 In the confirmation dialog box, click **OK**.

4.5.9 Restoring NE Defaults

The NE Defaults Management wizard allows you to choose an NE from which an NE defaults file can be loaded. Alternatively, you can load the file from your local (client) disk. The wizard then provides you a list of NEs where you can download the file. When you click Finish, Prime Optical schedules a job for this action. The NE defaults file downloaded to each selected NE is tracked as a separate task on the Job Monitor table.

Note

- If you are applying NE defaults from one NE to another, the NE versions must be identical. For example, you cannot apply NE defaults from an ONS 15454 SONET R7.5 to an ONS 15454 SONET R8.5.
- This feature is available for R3.4 NEs and later.

If you want to revert back to the default settings for an NE, you can download and apply a defaults override file to one or more selected NEs, as follows:

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > NE Defaults Management**. The NE Defaults Management wizard opens. The following table provides descriptions.

Step 2 Choose an NE from which a defaults override file can be loaded. The following options are available:

- From NE
- From File

Step 3 Click **Next**. A display-only list of NE defaults is shown.

Step 4 Click **Next**.

Step 5 Select the NE(s) to which you want to download the default-override file. The following options are available:

- Save to NE
- Save to File

Step 6 Click **Finish**.

Table 4-36 Field Descriptions for the NE Defaults Management Wizard

Field	Description
Select an NE to View the Defaults	
From NE	Select **From NE** if the NE defaults file is on an NE. If you select From NE, the From File options are dimmed.
Select NE	Select the NE where the NE defaults file exists.
From File	Select **From File** if the NE defaults file is on your client workstation or a server. If you select From File, the From NE options are dimmed.
Local	Select **Local** if the file is on your local client workstation. Enter the path for the file, or click **Browse** to search for it.
Server	Select **Server** if the file is located on a server. Use the drop-down list to select a server.
NE Defaults	
Display only. Use this screen to view the selected NE defaults.	
Save the NE Defaults	
Save to NE(s)	To save the defaults to one or more NEs, select **Save to NE(s)**. If you select Save to NE(s), the Save to File options are dimmed.
Available NE(s)	Select one or more NEs in the Available NE(s) field and click **Add** to move them to the Selected NE(s) field.
Selected NE(s)	Select one or more NEs in the Selected NE(s) field and click **Remove** to move them to the Available NE(s) field.
Save to File	To save the defaults to a file on your client workstation or a server, select **Save to File**. If you select Save to File, the Save to NE(s) options are dimmed.
Local	Select **Local** to save the file on your local client workstation. Enter the path for the file, or click **Browse** to search for it.
Server	Select **Server** to save the file on a server. Enter a server path in the field.

4.6 How Do I Monitor the Network?

Follow the procedures in this section to manage scheduled tasks, view NE discrepancies, and monitor client and server configuration details.

4.6.1 Monitoring Scheduled Tasks

The Job Monitor table provides information about scheduled administrative tasks—memory backup, memory restore, and software download. For example, you can see the system username of the person who entered a specific task, the time when the task began, and the time when the task ended.

Note A job consists of multiple tasks.

The Job Monitor table also monitors bulk operations: adding multiple users to multiple NEs, modifying a user on multiple NEs, and deleting multiple users on multiple NEs. (See 8.4.3 Managing NE User Access, page 8-48 for more information about bulk operations.) When a request is made to the Prime Optical server to add, modify, or delete NE users, multiple entries are made in the Job Monitor table. Each entry consists of the following:

- Task Owner—User ID used during login.
- NE ID—NE ID on which the operation is executed.
- Task Creation Time—Server time when the request was made.

After these requests are executed, the job's status is updated accordingly in the Job Monitor table.

Note Sometimes, when a node is busy, a job request may fail. In such a scenario, Prime Optical automatically creates a new similar job and resends the request using the job retry functionality. The new job is triggered anytime within the first 10 minutes of detection of the failure. Prime Optical attempts to resend the request a maximum of five times. Rescheduled jobs can be monitored in the Job Monitor table.

Another task that is monitored is the BLSR/MS-SPRing switch scheduling. (See 7.3.7 Switching BLSRs, page 7-204 or 7.4.9 Switching MS-SPRings, page 7-215.) When the switch ring is scheduled, two tasks are created: the BLSR/MS-SPRing switch job in the west port and the BLSR/MS-SPRing switch job in the east port. The schedule time difference between these two tasks is specified in the Control Panel. (See 7.4.10 Changing the MS-SPRing Switch Interval, page 7-216.)

If you schedule a BLSR/MS-SPRing switch successfully, the corresponding task and its status are monitored in the Job Monitor table. If more than one BLSR switch is scheduled at a certain time on the same ring, only one BLSR switch will be successfully completed. Tasks are marked Succeeded when the switch command is accepted by the NE. If the switch fails due to the unavailability of the NE or if the switch command is rejected by the NE, an alarm is reported in the Alarm Browser and is cleared on the next successful switch or when the cross-connect is reset.

4.6.1.1 Viewing the Job Monitor Table

To view the Job Monitor table, choose **Administration > Job Monitor** in the Domain Explorer window. The following table provides descriptions.

Note Some fields in the Job Monitor table apply only to certain tasks, NEs, or NE versions.

Table 4-37 Field Descriptions for the Job Monitor Table

Field	Description
Job ID	ID number corresponding to the selected job.
Task ID	ID number corresponding to the task. If a job includes more than one NE, each NE has a separate task ID for the job.
Task Type	Type of task. Tasks include adding users, applying alarm profiles, creating BLSR/MS-SPRings, configuring nodes, creating alarm profiles, deleting users, logging out users, automatically backing up memory, manually backing up memory, restoring memory, modifying users, setting up SNTP, setting NE defaults, setting security advisory messages, activating software, downloading software, reverting software, and cloning ML cards.

Table 4-37 Field Descriptions for the Job Monitor Table (continued)

Field	Description
Task Owner	System username of the person who entered the task.
Alias ID	Alias name of the NE.
Task Status	Current status of the task: • Queued—The task is scheduled but has not yet begun. • Running—The task is in progress. • Canceled—The task has been canceled. • Succeeded—The task succeeded. • Failed—The task failed. • Waiting—The node manager must be initialized before a task can begin. If the node manager is not initialized, the status of the task is Waiting. After the node manager becomes initialized, the task status changes to Queued. **Note** A job can be canceled only when its task status is either Queued or Waiting.
Task Creation Time	Date and time when the task was entered into the system.
Task Scheduled Time	Date and time when the task is scheduled to begin.
Task Start Time	Date and time when the task began.
Task End Time	Date and time when the task ended.
Display Information	Information related to the Task Type column.
Note	Any user-entered comments relating to the task.
Additional Information	Any additional information.
NE ID	Name of the NE on which the task is scheduled to run.

4.6.1.2 Viewing the Job Monitor Filter Dialog Box

Use the Job Monitor Filter dialog box to filter job data according to criteria that you select and to display the results in the Job Monitor table. The following table provides descriptions.

Table 4-38 Field Descriptions for the Job Monitor Filter Dialog Box

Tab	Description
Creation Time (*time zone*)	Allows you to filter job monitor data for a specified time period, ranging from the past hour to the past 180 days. Additionally, you can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. Click **No Time Specified** if you want to filter events and the time period is not important. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue.
NE ID	Allows you to move NEs back and forth between the list of available NE IDs and selected NE IDs. The filter runs on the NEs in the Selected NE ID list.
Task Owner	Allows you to move owners back and forth between the list of available owners and selected owners. The filter runs on the owners in the Selected Task Owner list.
Job/Task ID	Allows you to filter jobs by job and task IDs. Jobs consist of multiple tasks. For example, if you perform a memory backup for multiple NEs, the backup operation is a job, and each NE is a task. • If you specify a start and end ID range in the Job ID field but leave the Task ID field blank, the filter runs on the job ID range. • If you specify a start and end ID range in the Task ID field but leave the Job ID field blank, the filter runs on the task ID range. • If you specify a start and end ID range in both the Job ID and Task ID fields, the filter first applies the values in the Job ID field, then narrows the filter according to the values in the Task ID field. For example, if you specify that Job ID Start = 1, Job ID End = 3, Task ID Start = 1, and Task ID End = 2, the returned value is all entries with a Job ID of 1, 2, or 3 and a Task ID of 1 or 2.
Task Type	Allows you to move task types back and forth between the list of available task types and selected task types. The filter runs on the tasks in the Selected Task Types list.
Task Status	Allows you to filter tasks by status: • Queued—The task is scheduled but has not yet begun. • Running—The task is in progress. • Canceled—The task has been canceled. • Failed—The task failed. • Succeeded—The task succeeded. • Waiting—The node manager must be initialized before a task can begin. If the node manager is not initialized, the status of the task is Waiting. After the node manager becomes initialized, the task status changes to Queued.

4.6.1.3 Canceling a Scheduled Job or Task

Step 1 In the Domain Explorer window, choose **Administration > Job Monitor**.

Step 2 Select a task to cancel; then, choose **Edit > Cancel Task** or **Cancel Job** (or click the **Cancel Task** or **Cancel Job** tools).

Note Cancel is enabled only for jobs and tasks with a Queued status. When a job contains more than one task in a Queued status, choosing **Cancel Job** cancels all tasks with the same job ID.

Step 3 Click **OK** in the confirmation dialog box.

4.6.1.4 Adding Job Monitor Notes

The Job Monitor Note dialog box allows you to view and add notes to jobs displayed in the Job Monitor table. If a job has a note, a Job Monitor Note tool appears under the User Comments column.

Step 1 In the Domain Explorer window, choose **Administration > Job Monitor**.

Step 2 Select a task and choose **Edit > User Note**. The following table describes the fields in the Job Monitor Note dialog box.

Comments are visible to all users.

Table 4-39 Field Descriptions for the Job Monitor Note Dialog Box

Field	Description
Note	Provides space for you to type your comments about the selected job. The maximum length of this field is 2048 characters. To add comments to the previous comments, click the **Append** radio button. To overwrite the previous comments, click **Replace**. To delete the comments, click **Delete**.
History	Displays comments entered by previous users.

4.6.2 Monitoring Service Status

The Service Monitor table shows the status of the services that are running on the Prime Optical server. To view the Service Monitor table, choose **Administration > Service Monitor** in the Domain Explorer window. The following table provides descriptions.

Table 4-40 Field Descriptions for the Service Monitor Table

Field	Description
Service Name	Displays the name of the selected service.
Logged In At	Displays the last time the service logged into the main Prime Optical server process.
IP Address	Displays the IP address of the selected service.
Session ID	Displays the unique session ID.

Note The **opticalctl status** command shows the processes that are running on the Prime Optical server. Because some of these processes implement Prime Optical services, the **opticalctl status** command is an alternate way of viewing services that are running on the Prime Optical server. The command also shows processes—such as the Apache web server—that are not Prime Optical services. Do not run multiple **opticalctl status** commands concurrently.

4.6.3 Monitoring Service Availability

You can view current and historical information about NE and PM services.

- The Service Availability table allows you to monitor the status of currently active services. See 4.6.3.1 Viewing the Service Availability Table, page 4-92.
- The Service Uptime Log allows you to view historical uptime data for services that were previously activated, but are currently deactivated. See 4.6.3.2 Viewing the Service Availability Log, page 4-93.

4.6.3.1 Viewing the Service Availability Table

The Service Availability table shows the services that are connected to the SM service, which is a process internal to the Prime Optical server. The Service Availability table differs from the Service Monitor table in that the Service Availability table does not show the SM service itself, whereas the Service Monitor table shows the SM service. Another difference is that Service Availability table displays and monitors service uptime, whereas the Service Monitor table shows only those services that are currently running.

To view the Service Availability table, choose **Administration > Service Uptime** in the Domain Explorer window. (See Table 4-41 for field descriptions.) The following events trigger an update to the Service Availability table:

- A service instance is started—For NE services, this occurs when you use the Add New NE wizard to add a new NE, and then you activate the corresponding NE service in the Control Panel. For PM services, this occurs when you activate a PM service in the Control Panel.
- A service instance is stopped—For NE services, this occurs when you deactivate an NE service in the Control Panel, or when there are no NEs added to that NE service in the Control Panel. For PM services, this occurs when you deactivate a PM service in the Control Panel.
- A service instance crashes—This occurs when a service stops running but is still active.
- A service instance is restarted after a crash.

If the Prime Optical server is shut down with the **opticalctl stop** or **opticalctl abort** command, all of the services are stopped. All service instances that were running when the Prime Optical server was shut down are marked as stopped and moved to the Service Uptime Log. When the Prime Optical server restarts, the new service instances are added to the Service Availability table.

Table 4-41 Field Descriptions for the Service Availability Table

Field	Description
Service Name	Name of the service instance.
Status	Current status of the service. Values are: • Running—The service is running. • Not Running—The service is not running.
Started At	Date and time when the service was started.
Last Crash	Date and time when the most recent service crash occurred. If the service has not crashed, this field displays a value of N/A.
Uptime	Amount of time that has elapsed since the most recent startup; or, if the service has not crashed, shows the amount of time that has elapsed since the service was started.
Total Time	Sum of all uptimes since the service was started.
Uptime Percentage	Percentage of time during which the service has been up. This value is the ratio between the total uptime and the amount of time that has elapsed since the service was started.

4.6.3.2 Viewing the Service Availability Log

The SM service sends an event to the Prime Optical client whenever a service instance is stopped. The Service Availability Log table refreshes to show a new row for each stopped service.

To view the Service Availability Log table, choose **Administration > Service Uptime Log** in the Domain Explorer window. The following table provides descriptions.

Table 4-42 Field Descriptions for the Service Availability Log Table

Field	Description
Service Name	Name of the stopped service instance.
Started At	Date and time when the service was started.
Stopped At	Date and time when the service was stopped.
Status	Current status of the service. The value is always Not Active, meaning the service has been stopped in the Control Panel, or, for NE services, no NEs of that type have been added to the Domain Explorer.
Last Crash	Amount of time that has elapsed since the most recent crash.
Total Uptime	Sum of all uptimes before the service was stopped.
Uptime Percentage	Percentage of time during which the service was up before it was stopped.

4.6.4 Viewing the NE Discrepancy Table

The NE Discrepancy table shows all ONS 155xx misconfigurations detected by Prime Optical.

Step 1 In the Domain Explorer or Subnetwork Explorer tree, select the ONS 155xx NE, group, or subnetwork for which to view misconfiguration data.

Step 2 Choose **Configuration > ONS 155XX > NE Discrepancy Table**. The NE Discrepancy table opens. The following table provides descriptions.

Table 4-43 Field Descriptions for the NE Discrepancy Table

Field	Description
Name	Type of discrepancy: • Wavelength Mismatch—Wavelengths cannot be added to a MUX/DEMUX card while the same wavelengths that were added by another MUX/DEMUX card on the network are passing through this MUX/DEMUX card passively. • Protection Mode Mismatch—The protection mode is configured differently at each end of a circuit or connection. • Protocol Mismatch—The protocol type is misconfigured at the ends of a circuit or connection. • Link Mismatch—A link has been configured to connect more than one device to the same port on a third device.
Description	Description of the discrepancy.
Perceived Severity	Severity level of the discrepancy: • CR—Critical • MJ—Major • MN—Minor • WN—Warning
Time Stamp	Date and time when the discrepancy was discovered.
Node 1	The first ONS 155xx involved in the discrepancy.
Node 2	The other ONS 155xx involved in the discrepancy. Discrepancies usually involve two devices.
Details	Details on the discrepancy, including its cause. If the text extends beyond the width of the field, use the pull-down arrow to the right of the field to read the remaining text. Alternatively, choose **File > Show Discrepancy Details** to read the full text.

4.6.5 Monitoring Prime Optical Client and Server Configuration Details

The Prime Optical Properties pane in the Control Panel window displays information about the Prime Optical server and client configuration.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **Cisco Prime Optical** to open the Prime Optical Properties pane. The following table provides descriptions.

Table 4-44 Field Descriptions for the Cisco Prime Optical Properties Pane

Field	Description
Server Configuration Tab	
Server Name	Workstation name where the Prime Optical server application resides.
IP Address	IP address of the Prime Optical server.
Software Version	Prime Optical software version that is running.
Server Size	Size of the Prime Optical server installation. Values are small, medium, large, or high end.
Port Information Area	
Server JMOCO Port	JMOCO port number of the Prime Optical server. The Active field displays the current port; the Activated After Restart field displays the port that is active after the server is rebooted.
Service Manager IIOP Port	Service manager port number.
Client Configuration Tab	
Hostname	Workstation name where the Prime Optical client application resides.
IP Address	IP address of the Prime Optical client.
Username	Name that was used to log into the Prime Optical client.

4.6.6 Viewing the Prime Optical Server Version

You can view the Prime Optical server version in the Control Panel and in the About Cisco Prime Optical dialog box. You can also view the server version in the Management Domain Properties pane.

Step 1 To view the Prime Optical server version in the Control Panel, complete the following substeps:

- **a.** In the Domain Explorer window, choose **Administration > Control Panel**.
- **b.** In the Control Panel window, click **Cisco Prime Optical** to open the Prime Optical Properties pane.
- **c.** Click the **Server Configuration** tab. The Prime Optical server version is shown in the Software Version field.

Step 2 To view the Prime Optical server version in the About dialog box, choose **Help > About Cisco Prime Optical** in any window.

Step 3 To view the Prime Optical server version in the Management Domain Properties pane, complete the following substeps:

- **a.** In the Domain Explorer tree, click the management domain node to open the Management Domain Properties pane.

b. Click the **Identification** tab. The Prime Optical server version is shown in the Software Version field.

4.7 How Do I Manage CTC Operations?

CTC is the software interface that provides provisioning and administrative functionality for the following NEs:

- ONS 15305 R3.0
- ONS 15310 CL
- ONS 15310 MA SONET
- ONS 15310 MA SDH
- ONS 15327
- ONS 15454 SONET
- ONS 15454 SDH
- ONS 15600 SONET
- ONS 15600 SDH

4.7.1 Functionality Provided in CTC that Is Not Available in Prime Optical

The following table lists the CTC functions that are not supported in Prime Optical through generic Prime Optical features (such as PM, software download, or memory backup) or through the native NE Explorer (equipment provisioning) for CTC-based NEs. The table provides a brief description of each function and a reference to the location within CTC where the function is provided.

Table 4-45 CTC Functions that Are Not Supported in Prime Optical

CTC Function	CTC Reference
Network Level	
Prime Optical does not support management of overhead circuits.	Network View > Provisioning > Overhead Circuits
Node Level	
Prime Optical does not support access to the EtherBridge MAC table (and related operations) or trunk utilization.	Node View > Maintenance > EtherBridge > MAC table Node View > Maintenance > EtherBridge > Trunk Utilization
Prime Optical does not support management of Unified Control Plane (UCP) parameters.	Node View > Provisioning > UCP
Prime Optical does not support retrieval of the diagnostics file or operation of the lamp test.	Node View > Maintenance > Diagnostics
Prime Optical does not support test access.	Node View > Maintenance > Test Access
Prime Optical does not support a Routing Information Protocol (RIP) table for BLSRs.	Node View > BLSR > RIP Table
Card Level	

Table 4-45 CTC Functions that Are Not Supported in Prime Optical (continued)

CTC Function	CTC Reference
Prime Optical does not support the ability to clear or reset PM register statistics on the NE.	Card View > Performance
Prime Optical does not support the ability to provision the user data channels (UDCs) or line DCC, or perform virtual wire maintenance operations.	AIC Card View > Maintenance > Virtual Wires AIC Card View > Maintenance > Overhead Termination
Prime Optical does not support the ability to upgrade automatically the OC-n cards and spans.	Network View > Span Upgrade
Prime Optical does not support the ability to provision passive cards.	Node View > Provisioning > WDM-ANS > Passive Cards
Prime Optical does not support the ability to provision any objects in the Rack View.	—
Circuit Management	
Prime Optical does not support the ability to create TL1-like cross-connections. Prime Optical does not support specification of the interdomain SLA.	Circuit Creation wizard
Prime Optical does not support the ability to edit path selector attributes of an existing circuit.	Tools > Circuits > Set Path Selector Attributes
Prime Optical does not support the ability to provision internal patchcords that include passive cards.	Node View > Provisioning > WDM-ANS > Internal Patchcords
Prime Optical does not support the Spanning Tree Map for E-series Ethernet cards.	—
Prime Optical does not support in-service topology upgrades.	Tools > Topology Upgrade > Convert UPSR to BLSR Tools > Topology Upgrade > Convert Unprotected to BLSR

4.7.2 Specifying CTC Partitions for CTC-Based NEs

CTC-based NEs that are added to the Prime Optical domain to access other CTC-based NEs are called GNEs, or topology hosts. When starting CTC for a particular CTC-based NE, the GNE for that NE is specified in CTC. CTC can take more than one GNE as input and discover the nodes behind those GNEs.

In a stable network, if CTC is started with a particular set of GNEs, the CTC view looks the same every time it is started with that set of GNEs. Prime Optical tries to copy this behavior when starting CTC for a given NE.

The Prime Optical client smart-link feature maintains an association between the CTC instance and the list of CTC-based NEs that it can manage. You can navigate through NEs within the same CTC partition without relaunching CTC. This feature conserves memory resources and ensures a fast response time.

If you launch and exit one instance of CTC and then launch a second CTC instance from the same partition, the second CTC launch goes through a 1-minute timeout period to ensure that the previous instance has exited. The 1-minute timeout occurs even if you launched and exited the previous CTC instance for a different NE. After the timeout, CTC initializes and a new window is launched. There is a delay of 10 to 20 seconds while the CTC launch initializes.

Caution ONS 15454 SONET and ONS 15454 SDH NEs propagate VLANs whenever a node appears in the same network view as another node, regardless of whether or not the nodes are DCC-connected. When there is more than one CTC management domain in Prime Optical, nodes that are not connected through DCC often appear in the same CTC view that is launched for that domain. The ONS 15454 NEs propagate VLAN information to these DCC-disconnected nodes. To prevent VLAN propagation, make sure that DCC-disconnected nodes do not appear in the same CTC view.

Configuring Hardware

This chapter describes the various NE configuration procedures that can be managed by Cisco Prime Optical. It contains the following sections:

- 5.1 Overview, page 5-1
- 5.2 Using the NE Explorer to Configure Optical NEs, page 5-2
- 5.3 Configuring Routing Protocols on Optical NEs, page 5-2
- 5.4 Synchronizing the Network, page 5-29
- 5.5 Configuring the ONS 15216, page 5-39
- 5.6 Configuring the ONS 15305 Earlier than R3.0, page 5-39
- 5.7 Configuring the ONS 15305 R3.0, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH, page 5-39
- 5.8 Configuring the ONS 15600 SONET and ONS 15600 SDH, page 5-44

5.1 Overview

For Prime Optical to communicate with NEs, certain configuration tasks must be performed on the NEs. Until these configuration tasks are completed, Prime Optical cannot contact the NEs, and no management can begin.

Before Prime Optical can manage NEs, the following conditions must be met:

- Ethernet—Management Ethernet port must be configured.
- Password—Current privileged command password must be configured.
- Telnet—Gigabit Route Processor (GRP) should accept a Telnet session.
- SNMP—GRP must be SNMP-manageable.

Configuration management functions control, identify, retrieve data from, and provide data to network resources to deliver customer services. Configuration management includes broad categories traditionally known as network planning and engineering, installation, network and service provisioning, service planning and negotiation, and status and control.

5.2 Using the NE Explorer to Configure Optical NEs

Step 1 In the Domain Explorer window, select the NE that you want to configure.

Note Not all NEs have an associated NE Explorer. See Table 1-14 on page 1-32 for more information.

Step 2 Choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 3 In the NE Explorer tree, click the top-level NE node to open the node properties pane.

Step 4 Click the tab (or subtab) that corresponds to the setting(s) you want to change. Modify the settings. For drop-down lists, select an item from the list. For numerics or editable text fields, double-click the field and type the new number or text. Click **Apply**.

5.3 Configuring Routing Protocols on Optical NEs

This section describes how to configure the various routing protocols supported by Prime Optical. This section contains the following information:

- 5.3.1 Specifying a Routing Protocol, page 5-3
- 5.3.2 Viewing Routing Tables for CTC-Based NEs, page 5-3
- 5.3.3 Creating Static Routes for CTC-Based NEs, page 5-3
- 5.3.4 Using OSPF with CTC-Based NEs, page 5-4
- 5.3.5 Using RIP, page 5-8
- 5.3.6 Creating and Modifying an SDCC, LDCC, or GCC Termination on Transponder Cards, page 5-10
- 5.3.7 Creating and Modifying an SDCC, LDCC, GCC, or OSC Termination on SONET or SDH Cards, page 5-12
- 5.3.8 Creating a DCC Tunnel Connection, page 5-15
- 5.3.9 Using SNMP, page 5-15
- 5.3.10 Configuring FTP Hosts for CTC-Based NEs, page 5-22
- 5.3.11 Specifying the Preferred Copy—ONS 15600 SONET or ONS 15600 SDH, page 5-24
- 5.3.12 Enabling Intermediate Path Performance Monitoring, page 5-25
- 5.3.13 Enabling Pointer Justification Count Monitoring for CTC-Based NEs, page 5-27
- 5.3.14 Changing the Power Monitoring Threshold for the ONS 15454 SONET and ONS 15454 SDH, page 5-27
- 5.3.15 Changing the Power Monitoring Threshold for the ONS 15600 SONET and ONS 15600 SDH, page 5-28
- 5.3.16 Creating an Ethernet Threshold, page 5-29

5.3.1 Specifying a Routing Protocol

Prime Optical allows you to choose a routing protocol for the LAN interface for CTC-based NEs. You can choose one of the following:

- Open Shortest Path First (OSPF)
- Routing Information Protocol (RIP)
- SNMP

By default, no routing protocol is specified.

5.3.2 Viewing Routing Tables for CTC-Based NEs

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **Routing Table** subtab. The following table provides field descriptions.

Table 5-1 Field Descriptions for the Routing Table

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Usage	Displays the number of times the listed route has been used.
Interface	Displays the node interface used to access the destination.

5.3.3 Creating Static Routes for CTC-Based NEs

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **Static Routes** subtab.

Step 4 Click **Create**. The Create New Static Route dialog box opens. The following table provides descriptions.

Step 5 After making your selections, click **OK**.

Table 5-2 Field Descriptions for the Create New Static Route Dialog Box

Field	Description
Destination IP	Enter the IP address of the computer running Prime Optical.
Length	Enter the subnet mask length (a decimal number representing the subnet mask length, in bits).
Subnet Mask	Enter the subnetwork mask IP address.
Next Hop	Enter the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Enter the number of hops between the NE and the computer running Prime Optical.

5.3.4 Using OSPF with CTC-Based NEs

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **OSPF** subtab.

Step 4 Complete the following fields. Fields shown depend on the type of NE selected.

- DCC OSPF Area ID—Number that identifies the NE as a unique OSPF area. It can be between 0.0.0.0 and 255.255.255.255. The number must be unique to the LAN OSPF area.
- SDCC Metric—Cost of sending packets across the SDCC, which is used by OSPF routers to calculate the shortest path.
- LDCC Metric—Cost of sending packets across the LDCC, which is used by OSPF routers to calculate the shortest path.
- OSPF Active on LAN—When checked, it enables the OSPF topology to be advertised to OSPF routers on the LAN.
- LAN Port Area ID—OSPF area ID for the router port where the NE is connected. This number is different from the DCC OSPF Area ID.
- Authentication Type—Displays either one of the following:
  - Simple Password—If the router where the NE is connected uses authentication.
  - No Authentication—If the router where the NE is connected does not use authentication.
- Authentication Key—Displays the OSPF key (or password) if authentication is enabled.
- Confirm Authentication Key—Re-enter the OSPF authentication key to confirm it.
- Router Priority—Designated router for a subnet.
- Hello Interval—Number of seconds between OSPF hello packet advertisements sent by OSPF routers. The Cisco default is 10 seconds.
- Dead Interval—Number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. The Cisco default is 40 seconds.
- Transit Delay—Service speed. The Cisco default is 1 second.
- Retransmit Int—Time that will elapse before a packet is resent. The Cisco default is 5 seconds.

- LAN Metric—Cost for sending packets across the LAN. Values should be greater than zero.

Step 5 Click **Apply**.

5.3.4.1 Creating an OSPF Area Range

Note The ONS 15305 R3.0 does not support OSPF area ranges.

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **OSPF** subtab and check the OSPF Active on LAN check box. (See 5.3.4 Using OSPF with CTC-Based NEs, page 5-4 for more information.)

Step 4 Click **Apply**.

Step 5 Click the **OSPF Area Range** subtab.

Step 6 Click **Create**. The Create OSPF Area Range dialog box opens. The following table provides descriptions.

Step 7 After making your selections, click **OK**.

Note If no range address is created when enabling OSPF on a LAN from Prime Optical, you must manually provision the OSPF area range address for the respective range area IDs, as described in this procedure. Alternatively, enable OSPF from CTC so that the range address is created when OSPF is enabled. This is a known issue that has been tracked using DDTS number CSCin62975.

Table 5-3 Field Descriptions for the Create OSPF Area Range Dialog Box

Field	Description
Range Address	Enter the area IP address for the NEs that reside within the OSPF area. For example, if the OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Enter the OSPF area ID for the NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the Area ID for LAN Port field. The ID cannot be 0.0.0.0.
Mask Length	Enter the subnet mask length.
Mask	Enter the subnet mask.
Advertise	Check this check box if you want the area range to be advertised.

5.3.4.2 Deleting an OSPF Area Range

Note The ONS 15305 R3.0 does not support OSPF area ranges.

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **OSPF Area Range** subtab.

Step 4 Select the OSPF area range from the table; then, click **Delete**.

Step 5 Click **OK** in the confirmation message box.

5.3.4.3 Managing OSPF Virtual Links

The following sections describe how to manage OSPF virtual links.

Note The ONS 15305 R3.0 does not support OSPF virtual links.

5.3.4.3.1 Viewing OSPF Virtual Links

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **OSPF Virtual Links** subtab. The following information is displayed:

- Neighbor—Router ID of the Area 0 router.
- Transit Delay—Service speed. The Cisco default is 1 second.
- Retransmit Interval—Time that will elapse before a packet is resent. The Cisco default is 5 seconds.
- Hello Interval—Number of seconds between OSPF hello packet advertisements sent by OSPF routers.
- Dead Interval—Number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down.
- Authentication Type—Authentication type.
- Auth Key—Authentication key.

5.3.4.3.2 Creating an OSPF Virtual Link

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **OSPF** subtab and check the OSPF Active on LAN check box. (See 5.3.4 Using OSPF with CTC-Based NEs, page 5-4 for more information.)

Step 4 Click **Apply**.

Step 5 Click the **OSPF Virtual Links** subtab.

Step 6 Click **Create**. The Create New Virtual Link dialog box opens and allows you to define a link between OSPF area border routers. The following table provides descriptions.

Step 7 After making your selections, click **OK**.

Table 5-4 Field Descriptions for the Create New Virtual Link Dialog Box

Field	Description
Neighbor	Specify the IP address of the Area 0 router.
Transit Delay	Specify the service speed. The Cisco default is 1 second.
Retransmit Interval	Specify the time that will elapse before a packet is resent. The Cisco default is 5 seconds.
Hello Interval	Specify the number of seconds between OSPF hello packet advertisements. The Cisco default is 10 seconds.
Dead Interval	Specify the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. The Cisco default is 40 seconds.
Authentication Type	Specify the authentication type. Select **Simple Password** if the router where the NE is connected uses authentication. Otherwise, select **No Authentication**.
Authentication Key	Enter the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Reenter the authentication key to confirm it.

5.3.4.3.3 Modifying an OSPF Virtual Link

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **OSPF Virtual Links** subtab.

Step 4 Select an OSPF virtual link to modify; then click **Edit**.

Step 5 The Modify Virtual Link dialog box opens. Modify the following:

- Neighbor—Enter the new IP address.
- Transit Delay—Indicates the service speed.
- Retransmit Delay—Sets the time that will elapse before a packet is resent.
- Hello Interval—Sets the number of seconds between OSPF hello packet advertisements sent by OSPF routers.
- Dead Interval—Sets the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down.

- Authentication Type—Select the authentication type. Select either No Authentication or Simple Authentication.
- Auth Key—If Simple Authentication is selected as authentication type, enter the authentication key.
- Confirm Auth Key—Re-enter the authentication key.

Step 6 Click **OK**.

5.3.4.3.4 Deleting an OSPF Virtual Link

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **OSPF Virtual Links** subtab.

Step 4 Select an OSPF virtual link to delete; then, click **Delete**.

Step 5 Click **Yes** in the confirmation dialog box.

5.3.5 Using RIP

Step 1 In the Domain Explorer tree, select an ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **RIP** subtab.

Step 4 Complete the following:

- RIP Active—Check to enable RIP.
- RIP Type—Select the RIP version from the drop-down list.
- Metric—Select a number between 1 and 15. This represents the number of hops.
- Authentication Type—By default, RIP is set to **No Authentication**. If the router that the NE is connected to requires authentication, set this to **Simple Password**.
- Authentication Key—If the Authentication Type is set to Simple Password, enter the password.
- Confirm Authentication Key—Re-enter the password to confirm it.

Step 5 If you want to create an address summary, complete the following steps:

a. Click **Create**. Complete the address summary only if the NE is a gateway network element (GNE) with multiple end NEs attached and IP addresses in different subnets.

b. In the Create RIP Address Summary dialog box that opens, create aggregate addresses, which will be represented in the routing table by a summary address. Table 5-5 provides descriptions. The NEs use the IP summary address for RIP to advertise a summarized local IP address pool on the NE so that the address pool can be provided to clients.

c. After making your selections, click **OK**. The RIP address information is displayed in the RIP Address Summary table.

Step 6 If you want to delete a RIP address, complete the following steps:

a. Select the RIP address from the RIP Address Summary table and click **Delete**.

b. Click **Yes** in the confirmation dialog box.

Step 7 Click **Apply**.

Note Both the OSPF and RIP tabs are enabled if no routing advertisement is enabled. If either OSPF or RIP is enabled, the other routing protocol is disabled.

Table 5-5 Field Descriptions for the Create RIP Address Summary Dialog Box

Field	Description
Summary Address	Specify the IP address of the RIP summary. This field is set to the NE IP address, with an applied mask of 255.255.255.0. For example, if the NE IP address is 10.20.30.15, the summary address is 10.20.30.0.
Mask Length	Enter the subnet mask length. The valid range is from 1 to 24.
Mask Address	*Display only.* View the subnet mask address, which is 255.255.255.0 by default.
Cost	Enter the hop count metric (the number of hops between the NE and the destination). The valid range is from 1 to 15. The smaller the number of hops, the higher the priority.

5.3.5.1 Viewing the RIP Routing Table

Step 1 In the Domain Explorer tree, select an ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **RIP Routing Table** subtab. The RIP Routing table is displayed with the following information:

- Destination—*Display only.* The IP address of the destination network or host.
- Mask—*Display only.* The subnet mask used to reach the destination host or network.
- Gateway—*Display only.* The IP address of the gateway used to reach the destination network or host.
- Cost—*Display only.* The hop count metric. The valid range is 1 to 15.

5.3.6 Creating and Modifying an SDCC, LDCC, or GCC Termination on Transponder Cards

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane of the NE Explorer, click one of the following tabs. Tabs shown depend on the type of NE selected.

- DCC—DCC (Data Communications Channel) carries provisioning and maintenance data/information between network elements in the SONET overhead.
- DCC/GCC/OSC—GCC (General Communications Channel) is used for transponders and muxponders in dense wavelength division multiplexing (DWDM) applications. Optical Service Channel (OSC) is a bidirectional channel that connects two adjacent nodes in a DWDM ring.

  For more information on GCC see, 6.5.9 Create, Edit, and Delete GCC, page 6-17.
- LDCC—LDCC (Line Data Communications Channel or Line DCC) is a 576-kb/s data communications channel embedded in the section overhead for OAM&P traffic between two NEs.
- SDCC—SDCC (Section Data Communications Channel or Section DCC) is a 192-kb/s data communications channel embedded in the section overhead for OAM&P traffic between two NEs.

Step 3 Click the subtab that corresponds to the termination that you want to create or modify. For example, to create or modify an LDCC termination, click the **LDCC** subtab.

Step 4 Complete one of the following options, depending on whether you want to create a new termination or modify an existing one:

- Click the **Create** button above the Transponder area. The Create *SDCC, LDCC, GCC, or OSC* dialog box opens and allows you to create new terminations on transponder cards. The following table provides descriptions.

  Note The fields shown in the Create *SDCC, LDCC, GCC, or OSC* dialog box depend on the type of termination that is being created. The fields shown also depend on the NE type.

- Select an existing termination and click the **Edit** button above the Transponder area. The Edit *SDCC, LDCC, GCC, or OSC* dialog box opens and allows you to modify existing terminations on transponder cards. The following table provides descriptions.

  Note The fields shown in the Edit *SDCC, LDCC, GCC, or OSC* dialog box depend on the type of termination that is being modified. The fields shown also depend on the NE type.

Step 5 After making your selections, click **OK**.

Table 5-6 Field Descriptions for the Create or Modify SDCC, LDCC, GCC, or OSC Dialog Box

Tab	Description
SDCC/LDCC Info	(*Available for SDCC and LDCC terminations*) Displays the slot and port number of the SDCC or LDCC termination. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
GCC Terminations	(*Available for GCC terminations*) Displays the slot and port number of the GCC termination. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
OSPF Disabled on Link	Indicates whether Open Shortest Path First (OSPF) is disabled on the link. OSPF should be disabled only when the slot and port connect to third-party equipment that does not support OSPF.
Foreign	If checked, it means that the far-end node is a non-ONS node.
Admin State	Indicates the SDCC or LDCC port state. Select one of the following: **Note** Admin state options that appear in the drop-down list depend on the NE type. • Leave Unchanged • IS • OOS MT • IS AINS
Layer3/Layer 2 Config	
Layer3 (Layer2) Config	Select one of the following: • OSI (LAPD)—When selected, all fields in the OSI Subnet and LAPD areas are enabled. The Layer 3 protocol used for the DCC is OSI (IP not applicable); the Layer 2 protocol is LAPD. The OSI (LAPD) option applies only to SDCC and is disabled for all other DCC types. • IP (PPP)—When selected, all fields in the OSI Subnet and LAPD areas are disabled. The Layer 3 protocol used for the DCC is IP only; the Layer 2 protocol is PPP. • OSI and IP (PPP)—When selected, only the fields in the OSI Subnet area are enabled. The Layer 3 protocol includes both OSI and IP, but the Layer 2 protocol remains as PPP. **Note** When editing an existing DCC, you can toggle between the IP (PPP) and OSI and IP (PPP) options if either option exists on the DCC. **Note** If the DCC is configured as OSI (LAPD), you cannot modify the Layer 3/Layer 2 configuration.
OSI Subnet	
Router Number	The OSI virtual router where the subnet (SDCC or LDCC) is provisioned.
IS-IS Cost	Sets the cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path.
ISH	Sets the Intermediate System Hello (ISH) protocol data unit (PDU) propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds. The range is from 10 to 1000 seconds.
ESH	Sets the End System Hello (ESH) propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds. The range is from 10 to 1000 seconds.

Table 5-6 Field Descriptions for the Create or Modify SDCC, LDCC, GCC, or OSC Dialog Box (continued)

Tab	Description
IIH	Sets the Intermediate System to Intermediate System Hello PDU propagation frequency. The IS-IS Hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds. The range is from 1 to 600 seconds.
LAPD	
Acknowledgement	Indicates the Link Access Protocol on the D channel (LAPD) acknowledgement type. Select either: • Acknowledged Information Transfer Service (AITS) • Unacknowledged Information Transfer Service (UITS)
T200	Shows the time between Set Asynchronous Balanced Mode (SABM) frame transmissions. The range is from 0.2 to 20 seconds.
T203	Shows the maximum time between LAPD frame exchanges. The range is from 4 to 120 seconds.
Mode	Indicates the LAPD frame command/response role. Values are: • Network • User
MTU	Sets the maximum transfer unit (MTU).

5.3.7 Creating and Modifying an SDCC, LDCC, GCC, or OSC Termination on SONET or SDH Cards

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane of the NE Explorer, click one of the following tabs. Tabs shown depend on the type of NE selected.

- DCC—DCC carries provisioning and maintenance data/information between network elements in the SONET overhead.
- DCC/GCC/OSC—GCC is used for transponders and muxponders in DWDM applications. OSC is a bidirectional channel that connects two adjacent nodes in a DWDM ring.

  For more information on GCC, see 6.5.9 Create, Edit, and Delete GCC, page 6-17.
- LDCC—LDCC is a 576-kb/s data communications channel embedded in the section overhead for OAM&P traffic between two NEs.
- SDCC—SDCC is a 192-kb/s data communications channel embedded in the section overhead for OAM&P traffic between two NEs.

Step 3 Click the subtab that corresponds to the termination that you want to create or modify. For example, to create or modify an LDCC termination, click the **LDCC** subtab.

Step 4 Complete one of the following options, depending on whether you want to create a new termination or modify an existing one:

- Click the **Create** button above the SONET/SDH area. The Create *SDCC, LDCC, GCC, or OSC* dialog box opens and allows you to create new terminations on SONET or SDH cards. The following table provides descriptions.

  Note The fields shown in the Create *SDCC, LDCC, GCC, or OSC* dialog box depend on the type of termination that is being created. The fields shown also depend on the NE type.

- Select an existing termination and click the **Edit** button above the SONET/SDH area. The Edit *SDCC, LDCC, GCC, or OSC* dialog box opens and allows you to modify existing terminations on SONET or SDH cards. The following table provides descriptions.

  Note The fields shown in the Edit *SDCC, LDCC, GCC, or OSC* dialog box depend on the type of termination that is being modified. The fields shown also depend on the NE type.

Step 5 After making your selections, click **OK**.

Table 5-7 Field Descriptions for the Create or Edit SDCC, LDCC, GCC, or OSC Dialog Box

Field	Description
SDCC/LDCC Info	(*Available for SDCC and LDCC terminations*) Displays the slot and port number of the SDCC or LDCC termination.
GCC Terminations	(*Available for GCC terminations*) Displays the slot and port number of the GCC termination.
OSC Terminations	(*Available for OSC terminations*) Displays the slot and port number of the OSC termination.
OSPF Disabled on Link	Indicates whether Open Shortest Path First (OSPF) is disabled on the link. OSPF should be disabled only when the slot and port connect to third-party equipment that does not support OSPF.
Foreign	If checked, it means that the far-end node is a non-ONS node.
Admin State	Indicates the SDCC or LDCC port state. Select one of the following: **Note** Admin state options that appear in the drop-down list depend on the NE type. • Leave Unchanged • IS • OOS MT • IS AINS
GCC Rate	(*Available for GCC terminations*) Select the GCC rate.

Table 5-7 Field Descriptions for the Create or Edit SDCC, LDCC, GCC, or OSC Dialog Box (continued)

Field	Description
Layer3/Layer 2 Config	
Layer3 (Layer2) Config	Select one of the following: • OSI (LAPD)—When selected, all fields in the OSI Subnet and LAPD areas are enabled. The Layer 3 protocol used for the DCC is OSI (IP not applicable); the Layer 2 protocol is LAPD. The OSI (LAPD) option applies only to SDCC and is disabled for all other DCC types. • IP (PPP)—When selected, all fields in the OSI Subnet and LAPD areas are disabled. The Layer 3 protocol used for the DCC is IP only; the Layer 2 protocol is PPP. • OSI and IP (PPP)—When selected, only the fields in the OSI Subnet area are enabled. The Layer 3 protocol includes both OSI and IP, but the Layer 2 protocol remains as PPP. **Note** When editing an existing DCC, you can toggle between the IP (PPP) and OSI and IP (PPP) options if either option exists on the DCC. **Note** If the DCC is configured as OSI (LAPD), you cannot modify the Layer 3/Layer 2 configuration.
OSI Subnet	
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
IS-IS Cost	Sets the cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path.
ISH	Sets the Intermediate System Hello (ISH) protocol data unit (PDU) propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds. The range is from 10 to 1000 seconds.
ESH	Sets the End System Hello (ESH) propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds. The range is from 10 to 1000 seconds.
IIH	Sets the Intermediate System to Intermediate System Hello PDU propagation frequency. The IS-IS Hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds. The range is from 1 to 600 seconds.
LAPD	
Acknowledgement	Indicates the Link Access Protocol on the D channel (LAPD) acknowledgement type. Select either: • Acknowledged Information Transfer Service (AITS) • Unacknowledged Information Transfer Service (UITS)
T200	Shows the time between Set Asynchronous Balanced Mode (SABM) frame transmissions. The range is from 0.2 to 20 seconds.
T203	Shows the maximum time between LAPD frame exchanges. The range is from 4 to 120 seconds.
Mode	Indicates the LAPD frame command/response role. Values are: • Network • User
MTU	Sets the maximum transfer unit (MTU).

5.3.8 Creating a DCC Tunnel Connection

The Create DCC Tunnel Connection dialog box allows you to create new DCC tunnel connections for the ONS 15454 SONET R3.3 and earlier.

Step 1 In the Domain Explorer tree, select the R3.3 or earlier ONS 15454 SONET NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane of the NE Explorer, click the **DCC/GCC/OSC** tab.

Step 3 Click the **DCC Tunnel Connection** subtab.

Step 4 Click **Create**. The Create dialog box opens. The following table provides descriptions.

Step 5 After making your selections, click **OK**.

Table 5-8 Field Descriptions for the Create DCC Tunnel Connection Dialog Box

Field	Description
From A	Select a beginning interface for the DCC tunnel.
From B	Select an ending interface for the DCC tunnel.

5.3.9 Using SNMP

5.3.9.1 Changing the SNMP Community String—CTC-Based NEs

Use the SNMP Trap Destination dialog box in CTC to provision community names for all SNMP requests (for example, get, next, bulk, and set) for CTC-based NEs R3.3 and later. Any SNMP request that uses a community name that matches a community name in the list of provisioned SNMP trap destinations is considered valid.

If an SNMP request contains an invalid community name (one that does not match a provisioned community name), the request is dropped silently. The MIB variable snmpInBadCommunityNames increments, and an authenticationFailure trap is sent.

Due to security concerns, the community names *public* and *private* do not have the special meaning that they have in most SNMP interfaces.

5.3.9.2 Configuring SNMP for CTC-Based NEs

Step 1 Select a CTC-based NE in the Domain Explorer tree and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab; then, click the **SNMP** subtab. Fields shown depend on the type of NE that is selected.

Step 3 To allow SNMP proxy, check the **Allow SNMP Proxy** check box.

Step 4 To use the SNMP management software with the NE, check the **Allow SNMP Set** check box.

Step 5 Click **Apply**.

Step 6 Click **Create**. The Create SNMP Trap Destination dialog box opens. The following table provides descriptions.

Step 7 After making your selections, click **OK**.

Step 8 Click **Apply**.

Table 5-9 Field Descriptions for the Create SNMP Trap Destination Dialog Box

Field	Description
IP Address	Enter the IP address of your NMS.
Community Name	Enter the SNMP community name. For a description of SNMP community names, refer to the SNMP information in the NE reference guide. **Note** The community name is a form of authentication and access control. The community name assigned to the ONS 15600 is case-sensitive and must match the community name of the NMS.
UDP Port	Set the UDP port for SNMP. The Cisco default port is 162. Allowed UDP port values are 162, 391, and values between 1024 and 65535.
Trap Version	Set the Trap Version field for either SNMPv1 or SNMPv2. See your NMS documentation to determine whether to use SNMPv1 or SNMPv2.
Max Traps per Second *(not applicable to all NEs)*	Enter the maximum number of traps per second that will be sent to the SNMP manager. A zero value indicates that there is no maximum and all traps are sent to the SNMP manager.

5.3.9.3 Creating an SNMP Community—ONS 15216 EDFA2

The Create SNMP Community View dialog box allows you to create an SNMP community for the ONS 15216 EDFA2.

Note SNMP views are supported only for EDFA2 R2.4.0. The SNMP tab is not present in the EDFA2 R2.1.1 and R2.3.0.

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **SNMP Community Table** subtab.

Step 4 Click **Create**. The Create SNMP Community View dialog box opens. The following table provides descriptions.

Table 5-10 Field Descriptions for the Create SNMP Community View Dialog Box

Field	Description
Community Name	Enter the SNMP community name.
Privileges	Enter the access privileges that govern what management operations a particular community can perform. These privileges are expressed as a sum of values, where each value represents a particular operation. See Table 5-11 for the SNMP operation decimal values.
IP Address	Enter the IP address from which network management traffic for the new SNMP community originates.
Subnet Mask	Enter the subnet mask for the source IP address.

Step 5 After making your selections, click **OK** in the Create SNMP Community View dialog box.

Step 6 Click **Apply** in the node properties pane. The new SNMP community is listed in the SNMP Community table.

The following table displays the decimal values for the different SNMP operations. For example, 255 is the sum of all decimal values and specifies access to all SNMP operations. This sum is the default private community. 247 is the sum for all SNMP operations with the exception of the Set operation. This sum is the default public community.

Table 5-11 SNMP Operation Decimal Values

SNMP Operation	Decimal Values
Get	1
GetNext	2
Response (enable for all community strings)	4
Set	8
SNMPv1-Trap	16
GetBulk	32
Inform (enable for all community strings)	64
SNMPv2-Trap (enable for all community strings)	128

5.3.9.4 Modifying an SNMP Community—ONS 15216 EDFA2

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **SNMP Community Table** subtab.

Step 4 In the SNMP Community table, select the SNMP community to modify.

Step 5 Double-click a specific field and modify the following:

- Community Name—New community string.
- View Index—New index number.

- Privilege—New access privilege that governs what management operations a particular community can perform. These privileges are expressed as a sum of values, where each value represents a particular operation. See Table 5-11 for the SNMP operation decimal values.
- IP Address—New IP address from which network management traffic for the new SNMP community originates.
- Subnet Mask—New subnet mask for the source IP address.
- Status—*Display only.*

Step 6 Click **Apply**.

5.3.9.5 Deleting an SNMP Community—ONS 15216 EDFA2

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **SNMP Community Table** subtab.

Step 4 In the SNMP Community table, select an SNMP community to delete.

Step 5 Click **Delete**; then, click **OK**.

Step 6 Click **Apply**.

5.3.9.6 Creating an SNMP Trap Destination—ONS 15216 EDFA2

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **Trap Destination Table** subtab.

Step 4 Click **Create**. The Create Trap Destination dialog box opens. The following table provides descriptions.

Step 5 After making your selections, click **OK**.

Step 6 Click **Apply** in the node properties pane. The new SNMP trap destination is listed in the Trap Destination table.

Table 5-12 Field Descriptions for the Create Trap Destination Dialog Box

Field	Description
IP Address	Type the SNMP trap destination IP address.
UDP Port	Set the trap destination User Datagram Protocol (UDP) port for SNMP.

Table 5-12 Field Descriptions for the Create Trap Destination Dialog Box (continued)

Field	Description
Community Name	Type the SNMP community name.
Version	Enter the trap version number.

5.3.9.7 Modifying an SNMP Trap Destination—ONS 15216 EDFA2

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **Trap Destination Table** subtab.

Step 4 In the Trap Destination table, select the SNMP trap destination to modify.

Step 5 Double-click a specific field and modify the following:

- IP Address—IP address of the SNMP trap destination.
- UDP Port—UDP port number of the SNMP trap destination.
- Community Name—SNMP trap destination community string name.
- Version—Select the version from the pull-down menu.
- View Index—New index number.
- Status—*Display only.*

Step 6 Click **Apply**.

5.3.9.8 Deleting an SNMP Trap Destination—ONS 15216 EDFA2

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **Trap Destination Table** subtab.

Step 4 In the Trap Destination table, select an SNMP trap destination to delete.

Step 5 Click **Delete**; then, click **OK**.

Step 6 Click **Apply**.

5.3.9.9 Creating an SNMP View—ONS 15216 EDFA2

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **SNMP Views** subtab.

Step 4 Click **Create**. The Create SNMP View dialog box opens. The following table provides descriptions.

Step 5 After making your selections, click **OK**.

Step 6 Click **Apply** in the node properties pane. The new SNMP view is listed in the SNMP Views table.

Table 5-13 Field Descriptions for the Create SNMP View Dialog Box

Field	Description
View Index	Enter the view index number, which is a unique value for each MIB view.
Subtree	Enter an object identifier that designates a subtree element in the MIB hierarchy.
Mask	Enter the bit mask that identifies objects in the subtree.
Type	From the pull-down menu, select the flag that specifies the status of the view. Values are included and excluded.

5.3.9.10 Modifying an SNMP View—ONS 15216 EDFA2

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **SNMP Views** subtab.

Step 4 In the SNMP Views table, select the SNMP view to modify.

Step 5 Double-click a specific field and modify the following:

- View Index—*Display only.*
- Subtree—*Display only.*
- Mask—Modify the bit mask that identifies objects in the subtree.
- Type—From the pull-down menu, select the flag that specifies the status of the view.
- Status—*Display only.*

Step 6 Click **Apply**.

5.3.9.11 Deleting an SNMP View—ONS 15216 EDFA2

Step 1 In the Domain Explorer, select an ONS 15216 EDFA2 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **SNMP Views** subtab.

Step 4 In the SNMP Views table, select an SNMP view to delete.

Step 5 Click **Delete**; then, click **OK**.

Step 6 Click **Apply**.

5.3.9.12 Creating an SNMP Trap Destination—ONS 15216 EDFA3

Step 1 In the Domain Explorer, select an ONS 15216 EDFA3 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click **Add Row**. The Create Trap Destination table opens. The following table provides descriptions.

Step 4 After making your selections, click **OK**.

Step 5 Click **Apply** in the node properties pane. The new SNMP trap destination is listed in the Trap Destination table.

Note A maximum of 10 SNMP hosts can be configured for the EDFA3. (The EDFA2 has no such restriction.)

Table 5-14 Field Descriptions for the Trap Destination Table Subtab

Field	Description
IP Address	Enter the trap destination IP address.
UDP Port	Set the trap destination UDP port for SNMP.
Community Name	Enter the SNMP trap destination community string name.
Version	Enter the trap version number.

5.3.9.13 Modifying an SNMP Trap Destination—ONS 15216 EDFA3

Step 1 In the Domain Explorer, select an ONS 15216 EDFA3 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **Trap Destination Table** subtab.

Step 4 In the Trap Destination table, select the SNMP trap destination to modify.

Step 5 Double-click a specific field and modify the following:

- IP Address—IP address of the SNMP trap destination.
- UDP Port—UDP port number of the SNMP trap destination.
- Community Name—SNMP trap destination community string name.

- Version—Select the version from the pull-down menu.

Step 6 Click **Apply**.

5.3.9.14 Deleting an SNMP Trap Destination—ONS 15216 EDFA3

Step 1 In the Domain Explorer, select an ONS 15216 EDFA3 and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **SNMP** tab.

Step 3 Click the **Trap Destination Table** subtab.

Step 4 In the Trap Destination table, select an SNMP trap destination to delete; then, click **Delete Row**.

Step 5 Click **Apply**.

5.3.10 Configuring FTP Hosts for CTC-Based NEs

The following sections describe how to configure database backup or restore and software download to an ENE when a firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which time the FTP relay resumes blocking all FTP access for the ENEs.

5.3.10.1 Creating an FTP Host

Step 1 In a CTC-based GNE/ENE configuration with proxy/firewall enabled, select one of the following NEs in the Domain Explorer tree and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool):

- ONS 15310 CL
- ONS 15310 MA SONET
- ONS 15310 MA SDH
- ONS 15454 SONET
- ONS 15454 SDH
- ONS 15600 SONET
- ONS 15600 SDH

Step 2 In the node properties pane, click the **Network** tab; then, click the **FTP Hosts** subtab.

Step 3 Click the **Create** button. The Create New FTP Host dialog box opens.

Note You can create up to a maximum of 12 FTP hosts.

Step 4 Configure the fields described in the following table.

Step 5 Click **OK**. The new FTP host is created and appears in the FTP Hosts subtab.

Table 5-15 Field Descriptions for the Create New FTP Host Dialog Box

Field	Description
FTP Host Address	Enter the FTP host IP address.
Prefix Length	Specify the FTP host subnet mask length.
Enable FTP Relay	Check this check box to enable FTP relay. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Enter the number of minutes for the FTP relay to continue, after which time the FTP relay resumes blocking all FTP access for the ENEs.

5.3.10.2 Creating FTP Hosts on Multiple NEs Simultaneously

Use the FTP Hosts Creation wizard to create FTP hosts on multiple NEs simultaneously in a GNE/ENE firewall environment.

Step 1 In a CTC-based GNE/ENE configuration with proxy/firewall enabled, choose **Administration > Bulk FTP Configuration** in the Domain Explorer. The FTP Hosts Creation wizard opens.

Step 2 In the Add FTP Hosts pane, click **Add Row**. For each new FTP host, configure the following information:

- FTP host address—Enter the IP address for the FTP host.
- Prefix length—Specify the subnet mask length for the FTP host.
- FTP relay—Enable or disable FTP relay. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
- FTP relay timer—Enter the number of minutes for the FTP relay to continue, after which time the FTP relay resumes blocking all FTP access for the ENEs.

Step 3 Repeat Step 2 for each new FTP host that you want to create. If you make a mistake, select the row and click **Delete Selected Row**. When you are finished, click **Next**.

Step 4 In the Save the FTP Hosts pane, complete the following substeps:

a. In the Available NEs list, select the NEs on which to add the new FTP hosts and click **Add**. The NEs move to the Selected NEs list.

b. In the Job Comments area, enter comments about the bulk FTP host creation, if needed.

c. In the Time (*time zone*) area, set a time for the operation. Click **Now** to begin FTP host creation immediately, or click **At Time** and specify when to begin the operation. You can specify a time based on 5-minute increments. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.

d. Click **Finish**.

Step 5 To view the results of the operation, check the Job Monitor table (**Administration > Job Monitor**). After the bulk FTP host creation succeeds, the details are displayed in the NE Explorer node properties pane > Network tab > FTP Hosts subtab for each NE.

5.3.10.3 Modifying an FTP Host

Step 1 In the Domain Explorer tree, select the NE that contains the FTP that you want to modify and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab; then, click the **FTP Hosts** subtab.

Step 3 Modify the following fields in the FTP Hosts subtab:

- FTP Host Address—*Display only.*
- Prefix Length—*Display only.*
- Enable FTP Relay—Check this check box to enable FTP relay. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
- FTP Relay Timer—Modify the number of minutes for the FTP relay to continue, after which time the FTP relay resumes blocking all FTP access for the ENEs.

Step 4 Click **Apply**. The modified FTP host appears in the FTP Hosts subtab.

5.3.10.4 Deleting an FTP Host

Step 1 In the Domain Explorer tree, select the NE that contains the FTP host and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab; then, click the **FTP Hosts** subtab.

Step 3 Select the FTP host that you want to delete; then, click the **Delete** button.

Step 4 In the confirmation dialog box, click **Yes**. The FTP host disappears from the FTP Hosts subtab.

5.3.11 Specifying the Preferred Copy—ONS 15600 SONET or ONS 15600 SDH

Step 1 In the Domain Explorer tree, select the ONS 15600 SONET or ONS 15600 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Maintenance** tab.

Step 3 In the **Preferred Copy** subtab > Data Copy area, select the preferred data from the Preferred Data pull-down list.

Step 4 Click **Apply**.

5.3.12 Enabling Intermediate Path Performance Monitoring

Most CTC-based networks use line-terminating equipment (LTE) to enable intermediate path performance monitoring (IPPM). IPPM allows you to transparently monitor a transmission signal originating from any equipment without terminating the channel of that signal. To use IPPM, create the STS circuit on the DS-N cards; then, enable IPPM on the EC1-12 or OC-N cards that carry the circuit.

Note IPPM occurs only on STS paths that have IPPM enabled; threshold crossing alerts (TCAs) are raised only for PM parameters on the IPPM-enabled paths. The monitored IPPM parameters are STS CV-P, STS ES-P, STS SES-P, STS UAS-P, and STS FC-P.

Note IPPM is not supported for the CTC-based ONS 15305 R3.0.

Step 1 In the Domain Explorer, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Select an LTE card. The following table lists the LTE cards.

Table 5-16 Traffic Cards that Terminate the Line (LTE Cards)

NE	Line-Terminating Equipment	
ONS 15327	XTC-14	XTC-28-3
	OC3 IR4 1310	OC12 IR 1310
	OC12 LR 1550	OC48 IR 1310
	OC48 LR 1550	—

Table 5-16 Traffic Cards that Terminate the Line (LTE Cards) (continued)

NE	Line-Terminating Equipment	
ONS 15454 SONET	**Electrical LTE**	
	EC1-12	DS1-14
	DS1N-14	DS3-12
	DS3N-12	DS3-12E
	DS3N-12E	DS3XM-6
	DS3i/DS3iN	—
	Optical LTE	
	OC3 IR 4/STM1 SH 1310	OC3 IR/STM1 SH 1310-8
	OC12 IR/STM4 SH 1310	OC12 LR/STM4 LH 1310
	OC12 LR/STM4 LH 1550	OC12 IR/STM4 SH 1310-4
	OC48 IR 1310	OC48 LR 1550
	OC48 IR/STM16 SH AS 1310	OC48 LR/STM16 LH AS 1550
	OC48 ELR/STM16 EH 100 GHz	OC48 ELR 200 GHz
	OC192 SR/STM64 IO 1310	OC192 IR/STM64 SH 1550
	OC192 LR/STM64 LH 1550	OC192 LR/STM64 LH ITU 15xx.xx
	TXP_MR_10G	MXP_2.5G_10G
ONS 15454 SDH	**Electrical LTE**	
	E1-N-14	E1-42
	E3-12	DS3i-N-12
	STM1E-12	—
	Optical LTE	
	OC3 IR 4/STM1 SH 1310	OC3 IR/STM1 SH 1310-8
	OC12 IR/STM4 SH 1310	OC12 LR/STM4 LH 1310
	OC12 LR/STM4 LH 1550	OC12 IR/STM4 SH 1310-4
	OC48 IR/STM16 SH AS 1310	OC48 LR/STM16 LH AS 1550
	OC48 ELR/STM16 EH 100 GHz	OC192 SR/STM64 IO 1310
	OC192 IR/STM64 SH 1550	OC192 LR/STM64 LH 1550
	OC192 LR/STM64 LH ITU 15xx.xx	—
ONS 15600	OC48/STM16 LR/LH 16 Port 1550	OC192/STM64 LR/LH 4 Port 1550

Step 3 Click the **STS** tab.

Step 4 Click the **STS Config** subtab.

Step 5 Check the **IPPM Enabled** check box.

Step 6 Click **Apply**.

5.3.13 Enabling Pointer Justification Count Monitoring for CTC-Based NEs

Note Pointer justification count monitoring is not available for the ONS 15600 SONET and ONS 15600 SDH NEs.

Pointers are used in CTC-based NEs to compensate for frequency and phase variations. They provide a way to align the phase variations in STS and VT payloads. Pointer justification counts indicate timing differences on SONET networks.

There are positive pointer justification count (PPJC) and negative pointer justification count (NPJC) parameters. PPJC is a count of path-detected (PPJC-Pdet) or path-generated (PPJC-Pgen) positive pointer justifications. NPJC is a count of path-detected (NPJC-Pdet) or path-generated (NPJC-Pgen) negative pointer justifications depending on the specific PM name.

A consistent pointer justification count indicates clock synchronization problems between nodes. A difference between the counts means the node transmitting the original pointer justification has timing variations with the node detecting and transmitting this count. Positive pointer adjustments occur when the frame rate of the synchronous payload envelope (SPE) is too slow in relation to the rate of the STS-1.

To enable performance monitoring of the pointer justification count:

Step 1 In the Domain Explorer, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Select an LTE card. See Table 5-16 for a list of LTE cards.

Step 3 Click the **Line** tab.

Step 4 Click the **Line Config** subtab.

Step 5 Double-click the **PJStsMon#** field and select a number:

- The value *Off* means pointer justification monitoring is disabled.
- The values *1* to *n* are the STS numbers on one port. One STS per port can be enabled from the PJStsMon# menu, as follows:
  - EC1-12 PJStsMon# card field: 0 or 1 can be selected on a total of 12 ports.
  - OC-3 PJStsMon# card field: 1, 2, or 3 can be selected on a total of 4 ports.
  - OC-12 PJStsMon# card field: Between 1 and 12 can be selected on 1 port.
  - OC-48 PJStsMon# card field: Between 1 and 48 can be selected on 1 port.
  - OC-192 PJStsMon# card field: Between 1 and 192 can be selected on 1 port.

Step 6 Click **Apply**.

5.3.14 Changing the Power Monitoring Threshold for the ONS 15454 SONET and ONS 15454 SDH

Step 1 In the Domain Explorer tree, select an ONS 154545 SONET or ONS 15454 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **General** tab.

Step 3 Click the **Power Monitor** subtab.

Step 4 In the Voltage Thresholds area, select the threshold for the following:

- ELWBATVG—Very low battery voltage.
- LWBATVG—Low battery voltage. Available on ONS 15454 SONET only.
- HIBATVG—High battery voltage. Available on ONS 15454 SONET only.
- EHIBATVG—Very high battery voltage.
- Current Voltage Environment—*Display only.*

Note You can set thresholds in 0.5 VDC increments.

Step 5 Click **Apply**.

5.3.15 Changing the Power Monitoring Threshold for the ONS 15600 SONET and ONS 15600 SDH

Step 1 In the Domain Explorer tree, select an ONS 15600 SONET or ONS 15600 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **General** tab.

Step 3 Click the **Power Monitor** subtab.

Step 4 In the Voltage Thresholds area, select the threshold for the following:

- ELWBATVG—Very low battery voltage.
- LWBATVG—Low battery voltage. Available on ONS 15600 SONET only.
- HIBATVG—High battery voltage. Available on ONS 15600 SONET only.
- EHIBATVG—Very high battery voltage.
- Current Voltage Environment—*Display only.*

Note You can set thresholds in 0.5 VDC increments.

Step 5 Click **Apply**.

5.3.16 Creating an Ethernet Threshold

The Create Ethernet Threshold dialog box allows you to create new Ethernet thresholds for the G1000-2, G1000-4, ETH100, ETH1000, and ML-series cards for ONS 15327, ONS 15454 SONET, and ONS 15454 SDH NEs.

Step 1 In the Domain Explorer, select a CTC-based NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the NE Explorer tree, select an Ethernet card.

Step 3 Click the **Thresholds** tab.

Step 4 Click **Create**. The Create Ether Thresholds dialog box opens. The following table provides descriptions.

Step 5 After making your selections, click **OK**.

Step 6 Click **Apply**.

Table 5-17 Field Descriptions for the Create Ethernet Thresholds Dialog Box

Field	Description
Slot	Select a slot for the new Ethernet threshold.
Port	Select a port for the selected slot. If you select All, the threshold is created on all ports for that slot. This operation might take several minutes to complete.
Variable	Select a variable for the new Ethernet threshold. The list of variables differs based on the type of card that is installed in the slot selected in the Slot field.
Alarm Type	Select an alarm type for the new Ethernet threshold. Available alarm types are Rising, Falling, and Rising and Falling.
Sample Type	Select a sample type for the new Ethernet threshold. Available sample types are Relative and Absolute.
Sample Period	Enter a sample period for the new Ethernet threshold. The sample period is measured in seconds.
Rising Threshold	Enter a rising threshold for the new Ethernet threshold. The value must be equal to or greater than the Falling Threshold value.
Falling Threshold	Enter a falling threshold for the new Ethernet threshold. The value must be equal to or less than the Rising Threshold value.

5.4 Synchronizing the Network

Use the NE Explorer to synchronize the CTC-based NEs in your network. The following sections describe the synchronization settings in detail.

5.4.1 Synchronization Settings for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, and ONS 15600 SONET

Full Cisco IOS configuration synchronization is performed automatically by Prime Optical to keep the NE and the Prime Optical Data Provisioning Service synchronized. Full configuration resynchronization might be delayed depending on Prime Optical server usage. For more information, see Chapter 7, "Provisioning Services and Connections."

Synchronization status messaging (SSM) is a SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. These messages enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops.

SSM messages are either Generation 1 or Generation 2. Generation 1 is the first and most widely deployed SSM message set. Generation 2 is a newer version. If SSM is enabled, consult the timing reference documentation to determine which message set to use. The following tables show the Generation 1 and Generation 2 message sets.

Table 5-18 SSM Generation 1 Message Set

Message	Quality	Description
PRS	1	Primary reference source—Stratum 1
STU	2	Synchronization traceability unknown
ST2	3	Stratum 2
ST3	4	Stratum 3
SMC	5	SONET minimum clock
ST4	6	Stratum 4
DUS	7	Do not use for timing synchronization
RES	—	Reserved; quality level set by user

Table 5-19 SSM Generation 2 Message Set

Message	Quality	Description
PRS	1	Primary reference source—Stratum 1
STU	2	Synchronization traceability unknown
ST2	3	Stratum 2
TNC	4	Transit node clock
ST3E	5	Stratum 3E
ST3	6	Stratum 3
SMC	7	SONET minimum clock
ST4	8	Stratum 4
DUS	9	Do not use for timing synchronization
RES	—	Reserved; quality level set by user

Note Alarms relating to PM collection indicate that the load on the system is high. Reduce the load on the system before proceeding.

5.4.1.1 Setting Up External or Line Timing for CTC-Based SONET NEs

Step 1 Select an ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, or ONS 15600 SONET NE and choose **Configuration > NE Explorer**.

Step 2 In the node property pane, click the **Timing** tab. Fields shown depend on the NE that is selected.

Step 3 In the General Timing section of the **General** subtab, complete the following information:

- Timing Mode—Set to **External** if the NE derives its timing from a building integrated timing supply (BITS) source wired to the backplane pins; set to **Line** if timing is derived from an OC-N card that is optically connected to the timing node. A third option, **Mixed**, allows users to set external and line timing references.

Caution Because mixed timing can cause timing loops, Cisco does not recommend its use. Use this mode with care.

Note The Mixed option is not applicable to the ONS 15600 SONET.

- SSM Message Set—Choose the message set level supported by the network. If a Generation 1 node receives a Generation 2 message, the message will be mapped down to the next available Generation 1. For example, an ST3E message becomes an ST3.
- Revertive—If checked, the NE reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
- Reversion Time—If Revertive is checked, indicate the amount of time that the NE will wait before reverting back to its primary timing source.
- Quality of RES—If the timing source supports the reserved S1 byte, set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.

Step 4 In the BITS Facilities section of the **General** subtab, complete the following information:

Note The BITS Facilities section sets the parameters for BITS1 and BITS2 timing references. Many of these settings are determined by the timing source manufacturer. If the equipment is timed through BITS Out, set the timing parameters to meet the requirements of the equipment.

- In State—If Timing Mode is set to External or Mixed, set In State for BITS 1 and/or BITS 2 to in service (IS), depending on whether one or both BITS input pin pairs on the backplane are connected to the external timing source. If Timing Mode is set to Line, set the In State to **OOS** (Out of Service).
- Out State—If equipment is connected to the node's BITS output pins on the backplane and you want to time the equipment from a node reference, set Out State for BITS 1 and/or BITS 2 to **IS**, depending on which BITS output pins are used for external equipment. If equipment is not attached to the BITS output pins, set the Out State to **OOS**.

- Coding—Set to the coding used by the BITS reference: **B8ZS** (binary 8-zero substitution) or **AMI** (alternate mark inversion).
- Framing—Set to the framing used by the BITS reference: **ESF** (Extended Superframe) or **SF(D4)** (Super Frame). SSM is not available with Super Frame.
- Sync Messaging—Check to enable SSM.
- AIS Threshold (Not applicable to the ONS 15600 SONET)—Sets the quality level where a node sends an alarm indication signal (AIS) from the BITS 1 Out and BITS 2 Out backplane pins. When a node times at or below the AIS threshold quality, an AIS is sent. This is used when SSM is disabled or when the frame is SF.
- LBO (Not applicable to the ONS 15600 SONET)—If you are timing an external device connected to the BITS Out pins, set the distance between the device and the NE. Options are 0-133 ft. (Cisco default), 134-266 ft., 267-399 ft., 400-533 ft., and 534-655 ft.

Step 5 In the **Reference List** subtab, complete the following information:

Note Reference lists define up to three timing references for the node and up to six BITS Out references. BITS Out references define the timing references used by equipment that can be attached to the node BITS Out pins on the backplane. If you attach equipment to BITS Out pins, you normally attach it to a node with Line mode because equipment near the External timing reference can be directly wired to the reference.

- NE References—Define up to three timing references (Ref-1, Ref-2, Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TCC+/TCC2 card. The options displayed depend on the Timing Mode setting:
  - Timing Mode set to External—Options are BITS1, BITS2, and Internal Clock.
  - Timing Mode set to Line—Options are the node's working OC-N cards (non-DWDM nodes), OSC cards (DWDM nodes), and Internal Clock. Select the cards and ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk (span) cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if slot 5 is connected to the node wired to the BITS source, select slot 5 as Reference 1.
  - Timing Mode set to Mixed—Both BITS and optical cards are available, which allows you to set a mixture of external BITS and OC-N trunk cards as timing references.
- BITS 1 Out/BITS 2 Out—Define the timing references for equipment wired to the BITS Out backplane pins. BITS 1 Out and BITS 2 Out are enabled when BITS 1 and BITS 2 facilities are put in service. If Timing Mode is set to external, choose the OC-N card used to set timing. If Timing Mode is set to Line, you can choose an OC-N card or choose NE reference to have BITS 1 out and/or BITS 2 Out follow the same timing reference as the NE.

Step 6 In the **Status** subtab, complete the following information:

- NE Clock
  - NE Reference—Set the NE timing reference to internal, BITS 1, or BITS 2.
  - Status—*Display only.* Displays the status of the NE clock.
  - Operations—Execute a switch on the NE timing reference.
- BITS 1 OUT
  - BITS 1 Out—Set the BITS 1 Out timing reference.
  - Status—*Display only.* Displays the status of the BITS 1 out timing reference.

  - Operations—Execute a switch on the BITS 1 out timing reference.
- BITS 2 OUT
  - BITS 2 Out—Set the BITS 2 Out timing reference.
  - Status—*Display only.* Displays the status of the BITS 2 out timing reference.
  - Operations—Execute a switch on the BITS 2 out timing reference.

Step 7 In the **Timing Report** subtab, you can view the timing status report summary for the node.

Step 8 Click **Apply**.

Note Refer to the relevant ONS 15310 CL, ONS 15310 MA, ONS 15327, ONS 15454, or ONS 15600 troubleshooting guide for timing-related alarms.

5.4.1.2 Setting Up Internal Timing for CTC-Based SONET NEs

If no BITS source is available, set up internal timing by timing all nodes in the ring from the internal clock of one node.

Caution Internal timing is Stratum 3 and not intended for permanent use. All nodes should be timed to a Stratum 2 or better primary reference source.

Complete the following steps to set up internal timing for CTC-based SONET NEs:

Step 1 Select an ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, or ONS 15600 SONET NE and choose **Configuration > NE Explorer**.

Step 2 In the node property pane, click the **Timing** tab. Fields shown depend on the NE that is selected.

Step 3 In the General Timing section of the **General** subtab, enter the following information:

- Timing Mode—Set to **External**.
- SSM Message Set—Set to **Generation 1**.
- Revertive—Not relevant for internal timing; the default setting (checked) is sufficient.
- Reversion Time—The default setting is sufficient.
- Quality of RES—Set to **RES=DUS**.

Step 4 In the BITS Facilities section of the **General** subtab, enter the following information:

- In State—Set BITS 1 and BITS 2 to **OOS**.
- Out State—Set BITS 1 and BITS 2 to **OOS**.
- Coding—Not relevant for internal timing. The default (B8ZS) is sufficient.
- Framing—Not relevant for internal timing. The default (ESF) is sufficient.
- Sync Messaging—Checked.
- AIS Threshold—Not available.
- LBO—Not relevant.

Step 5 In the **Reference List** subtab, enter the following information:

- NE References
  - Ref-1—Set to **Internal Clock**.
  - Ref-2—Set to **Internal Clock**.
  - Ref-3—Set to **Internal Clock**.
- BITS 1 Out/BITS 2 Out—Set to **None**.

Step 6 Click **Apply**.

Step 7 In the Domain Explorer tree, select the node that you set up in Step 1 through Step 6 and choose **Configuration > NE Explorer**.

Step 8 In the **Timing** tab, enter the same information that was entered in Step 3, except for the following:

- In the General Timing section of the **General** subtab, set the Timing Mode field to **Line**.
- In the NE References section of the **Reference List** subtab:
  - Ref-1—Set to the OC-N trunk (span) card (non-DWDM node) or OSC card (DWDM) with the closest connection to the node.
  - Ref-2—Set to the OC-N trunk (span) card (non-DWDM node) or OSC card (DWDM) with the next closest connection to the node.
  - Ref-3—Set to **Internal Clock**.

Step 9 Click **Apply**.

Step 10 Repeat Step 3 through Step 9 for each node in the ring that will be timed from the internal clock of the selected node.

5.4.2 Synchronization Settings for the ONS 15310 MA SDH, ONS 15454 SDH, and ONS 15600 SDH

SSM communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SDH section overhead. These messages enable SDH devices to automatically select the highest quality timing reference and to avoid timing loops.

SSM messages are either Generation 1 or Generation 2. Generation 1 is the first and most widely deployed SSM message set. Generation 2 is a newer version. If you enable SSM for the ONS 15454 SDH, consult your timing reference documentation to determine which message set to use. The following table shows the SDH message set.

Table 5-20 SDH SSM Message Set

Message	Quality	Description
G811	1	Primary reference clock
STU	2	Synchronization traceability unknown
G812T	3	Transit node clock traceable
G812L	4	Local node clock traceable

Table 5-20 SDH SSM Message Set (continued)

Message	Quality	Description
SETS	5	Synchronous equipment
DUS	6	Do not use for timing synchronization

Note Alarms relating to PM collection indicate that the load on the system is high. Reduce the load on the system before proceeding.

5.4.2.1 Setting Up External or Line Timing for CTC-Based SDH NEs

Step 1 Select an ONS 15310 MA SDH, ONS 15454 SDH, or ONS 15600 SDH NE and choose **Configuration > NE Explorer**.

Step 2 In the node property pane, select the **Timing** tab. Fields shown depend on the NE that is selected.

Step 3 In the General Timing section of the **General** subtab, complete the following information:

- Timing Mode
  - For the ONS 15310 MA SDH and ONS 15454 SDH:

    Choose **External** if the ONS 15310 MA SDH or ONS 15454 SDH NE derives its timing from an MIC-C/T/P FMEC; choose **Line** if timing is derived from an STM-N card (non-DWDM node) or OSC card (DWDM node) that is optically connected to the timing node. A third option, **Mixed**, allows you to set external and line timing references.
  - For the ONS 15600 SDH:

    Choose **External** if the ONS 15600 SDH NE derives its timing from a BITS source wired to the backplane; choose **Line** if timing is derived from an STM-N card that is optionally connected to the timing node. A third option, **Mixed**, allows you to set external and line timing references.

Caution Because mixed timing may cause timing loops, Cisco does not recommend its use. Use this mode with care.

- Revertive—If checked, the NE reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
- Reversion Time—If Revertive is checked, indicate the amount of time the NE will wait before reverting to its primary timing source.
- SSM Message Set (Applicable to the ONS 15600 SDH)—Enabled only if T1 signal type is selected. Choose the message set level supported by the network.

Step 4 In the BITS Facilities section of the **General** subtab, complete the following information:

Note The BITS Facilities section sets the parameters for your BITS 1 and BITS 2 timing references. Many of these settings are determined by the timing source manufacturer. If equipment is timed through BITS Out, you can set timing parameters to meet the requirements of the equipment.

- Facility Type—Choose the facility type that applies to the signal supported in your market. For example, 64 KHz is used in Japan. E1, 2.048 MHz, and 64 KHz are physical signal modes used to transmit the external clock (from a GPS, for example) to BITS.
- In State—If Timing Mode is set to External or Mixed, set In State for BITS 1 and/or BITS 2 to in service (IS), depending whether one or both BITS input pin pairs on the backplane are connected to the external timing source. If Timing Mode is set to Line, set In State to Locked.
- Out State—If equipment is connected to the node's BITS output pins on the backplane and you want to time the equipment from a node reference, set Out State for BITS 1 and/or BITS 2 to IS, depending on which BITS output pins are used for external equipment. If equipment is not attached to the BITS output pins, set Out State to Locked.
- State (Applicable to the ONS 15600 SDH)—For nodes using external timing, set State to Unlocked.
- Coding—Choose the coding used by your BITS reference: **HDB3** or **AMI**. If you selected 2.048 MHz or 64 KHz, the coding option is disabled.
- Framing—Choose the framing used by your BITS reference: **unframed**, **FAS**, **FAS + CAS**, **FAS + CRC**, or **FAS + CAS + CRC**. If you selected 2.048 MHz or 64 KHz, the framing option is disabled.
- Sync Messaging—Select the check box to enable SSM. SSM is used to deliver clock quality. SSM options supported in SDH are G811, STU, G812T, G812L, SETS, DUS (ordered from high quality to low quality). If you selected 2.048 MHz, 64 KHz, or E1 with FAS, or if FAS + CAS framing is provisioned, the SSM option is disabled.
- AIS Threshold (Applicable to the ONS 15310 MA SDH and ONS 15454 SDH)—Sets the quality level at which a node sends an alarm indication signal (AIS) from the BITS 1 Out and BITS 2 Out FMEC connectors. When a node times at or below the AIS threshold quality, an AIS is raised. (The AIS threshold is used when SSM is disabled or framing is set to unframed, FAS, or FAS + CAS.)
- LBO (Applicable to the ONS 15310 MA SDH and ONS 15454 SDH)—Choose a BITS cable length. Line build out (LBO) relates to the BITS cable length.
- Cable Type (Applicable to the ONS 15600 SDH)—Choose 75 ohm or 120 ohm.
- Sa bit—Choose one of 5 Sa bits (**4**, **5**, **6**, **7**, or **8**). The Sa bit transmits the SSM message. If you selected 2.048 MHz or 64 KHz, the Sa bit option is disabled.

Step 5 In the **Reference List** subtab, complete the following information:

Note Reference lists define up to three timing references for the node and up to six BITS Out references. BITS Out references define the timing references used by equipment attached to the node's MIC-C/T/P FMEC Timing A Out and Timing B Out connectors. If you attach equipment to the Timing A Out or Timing B Out connector, you normally attach it to a node with line mode because equipment near the external timing reference can be directly wired to the reference.

- NE References—Allows you to define three timing references (Ref-1, Ref-2, Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case the node uses Reference 2. If Reference 2 fails, the node uses Reference 3, which is typically set to Internal Clock. The internal clock is the Stratum 3 clock provided on the TCC2. The options displayed depend on the Timing Mode setting:
  - Timing Mode set to External—Options are BITS 1, BITS 2, and Internal Clock.
  - Timing Mode set to Line—For the ONS 15310 MA SDH and ONS 15454 SDH, options are the node's working OC-N cards (non-DWDM nodes), OSC cards (DWDM nodes), and Internal Clock. For the ONS 15600 SDH, options are Internal Clock and the node's STM-N ports, except for the ports that have been specified as protection ports in 1+1 groups (Linear Multiplex

Section Protection [LMSP] groups). Select the cards and ports that are directly or indirectly connected to the node wired to the BITS source; that is, select the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1.

  - Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk (span) cards as timing references.

- BITS 1 Out/BITS 2 Out References (Applicable to the ONS 15310 MA SDH and ONS 15454 SDH)—Define the timing references for equipment connected to the Timing A Out or Timing B Out FMEC connector. Normally, Timing Out is used with line nodes, so the options displayed are the working optical cards. Timing A Out and Timing B Out are enabled as soon as BITS 1 and BITS 2 facilities are placed in service.

Step 6 In the **Status** subtab, complete the following information:

- NE Clock
  - NE Reference—Set the NE timing reference to internal, BITS 1, or BITS 2.
  - Status—*Display only.* Displays the status of the NE clock.
  - Operations—Execute a switch on the NE timing reference.
- BITS 1 OUT
  - BITS 1 Out—Set the BITS 1 out timing reference.
  - Status—*Display only.* Displays the status of the BITS 1 out timing reference.
  - Operations—Execute a switch on the BITS 1 out timing reference.
- BITS 2 OUT
  - BITS 2 Out—Set the BITS 2 out timing reference.
  - Status—*Display only.* Displays the status of the BITS 2 out timing reference.
  - Operations—Execute a switch on the BITS 2 out timing reference.

Step 7 In the **Timing Report** subtab, you can view the timing status report summary for the node.

Step 8 Click **Apply**.

Note Refer to the *Cisco ONS 15454 SDH Troubleshooting Guide* or *Cisco ONS 15600 SDH Troubleshooting Guide* for timing-related alarms.

5.4.2.2 Setting Up Internal Timing for CTC-Based SDH NEs

If no BITS source is available, you can set up internal timing by timing all nodes in the ring from the internal clock of one node.

Caution Internal timing is Stratum 3 and not intended for permanent use. All nodes should be timed to a Stratum 2 or better primary reference source.

Complete the following steps to set up internal timing for CTC-based SDH NEs:

Step 1 Select an ONS 15310 MA SDH, ONS 15454 SDH, or ONS 15600 SDH NE and choose **Configuration > NE Explorer**.

Step 2 In the node property pane, select the **Timing** tab.

Step 3 In the General Timing section of the **General** subtab, enter the following information:

- Timing Mode—Choose **External**.
- Revertive—Not applicable for internal timing; the default setting (checked) is sufficient.
- Reversion Time—Not applicable; leave unchanged.

Step 4 In the BITS Facilities section of the **General** subtab, enter the following information:

- Facility Type—Choose the facility type that applies to the signal supported in your market. For example, 64 KHz is used in Japan. E1, 2.048 MHz, and 64 KHz are physical signal modes used to transmit the external clock (from a GPS, for example) to BITS.
- In State—Set BITS 1 and BITS 2 to **Locked**.
- Out State—Set BITS 1 and BITS 2 to **Locked**.
- State (Applicable to the ONS 15600 SDH)—Set BITS 1 and BITS 2 to **Locked**.
- Coding—Not relevant for internal timing; the default is sufficient.
- Framing—Not relevant for internal timing; the default is sufficient.
- Sync Messaging—Checked automatically. SSM is used to deliver clock quality. SSM options supported in SDH are G811, STU, G812T, G812L, SETS, DUS (ordered from high quality to low quality). If you selected 2.048 MHz or 64 KHz, the SSM option is disabled.
- AIS Threshold—Not relevant for internal timing.
- LBO—Not relevant for internal timing.
- Sa bit—Not relevant for internal timing.

Step 5 In the **Reference List** subtab, enter the following information:

- NE References
  - Ref-1—Set to **Internal Clock**.
  - Ref-2—Set to **Internal Clock**.
  - Ref-3—Set to **Internal Clock**.
- BITS 1 Out/BITS 2 Out (Applicable to the ONS 15310 MA SDH and ONS 1545 SDH)—Set to **None**.

Step 6 Click **Apply**.

Step 7 In the Domain Explorer tree, select the node that you set up in Step 1 to Step 6 and choose **Configuration > NE Explorer**.

Step 8 In the **Timing** tab, complete the following:

- In the General Timing section of the **General** subtab:
  - Timing Mode—Set to **Line**.
  - Revertive—Not applicable for internal timing; the default setting is sufficient.
  - Reversion Time—Not applicable for internal timing; the default setting is sufficient.
- In the NE References section of the **Reference List** subtab:

- Ref-1—Set to the STM-N trunk card with the closest connection to the node.
- Ref-2—Set to the STM-N trunk card with the next closest connection to the node.
- Ref-3—Set to **Internal Clock**.

Step 9 Click **Apply**.

Step 10 Repeat Steps 7 through 9 for each node that will be timed by the node.

5.5 Configuring the ONS 15216

Step 1 In the Domain Explorer tree, select the ONS 15216 NE that will be configured and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool). The NE Explorer window displays configuration information for the selected ONS 15216 NE.

Step 2 Make any necessary changes to the fields in the properties pane that corresponds to the NE or its components. Click **Apply** to save the changes to the Prime Optical database and apply the changes to the NE.

5.6 Configuring the ONS 15305 Earlier than R3.0

Within Prime Optical, use Cisco Edge Craft to configure ONS 15305 NEs earlier than R3.0. (For the ONS 15305 R3.0, use the Prime Optical NE Explorer. See 5.7 Configuring the ONS 15305 R3.0, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH, page 5-39.) Select the ONS 15305 NE in the Domain Explorer tree and choose **Configuration > ONS 15305 > Launch Cisco Edge Craft**. Refer to the "Installing the Cisco Prime Optical Client and Cisco Edge Craft" chapter in the *Cisco Prime Optical 9.6.3 Installation Guide* for instructions on how to start Cisco Edge Craft.

Note To configure ONS 15305 NEs through Cisco Edge Craft, refer to *Cisco Edge Craft Software Guide*.

5.7 Configuring the ONS 15305 R3.0, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH

You can use the Prime Optical NE Explorer, CTC, or TL1 to configure CTC-based NEs.

5.7.1 Launching the Prime Optical NE Explorer

Step 1 In the Domain Explorer tree, select the NE that will be configured and choose **Configuration > NE Explorer**. The NE Explorer window displays configuration information about the selected NE.

Step 2 Make any necessary changes to the fields in the properties pane that corresponds to the NE or its components. Click **Apply** to save the changes to the Prime Optical database and apply the changes to the NE.

5.7.2 Launching CTC

Only the latest CTC release is launched from Prime Optical, regardless of the NE release you selected. If you need to use other CTC releases, launch CTC from a web browser and connect directly to the NE that has the required CTC release.

Step 1 In the Domain Explorer tree, Subnetwork Explorer tree, or Network Map, select the NE that will be configured and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Launch CTC**.

Step 2 The Launch CTC dialog box opens with the Username and Password fields filled in with the values contained in the Cisco Prime Optical Users table for that user. If the CTC Username value for that user is empty in the Cisco Prime Optical Users table, the fields in the Launch CTC dialog box are empty; enter the username and password.

Step 3 Check the **Enable Socks Server** check box to set the CTC DSS property (ctc.proxy.designatedgnes), which contains all of the GNEs present in the network partition. This feature speeds up network discovery and enables the cross-launch of CTC on all NEs that are not directly connected to the LAN.

Step 4 Click **OK**.

5.7.3 Launching TL1

In the Domain Explorer tree, Subnetwork Explorer tree, or Network Map, select the NE that will be configured and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Launch TL1 Interface**. This launches a Telnet session directed at the TL1 port on the NE.

5.7.4 Provisioning an ONS 15305 R3.0, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Card Slot

You can use this procedure to reset, delete, or change a card.

Step 1 In the Domain Explorer tree, select the NE that will be configured and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the tree view or in the shelf view of the node properties pane, right-click an unprovisioned slot and choose **Add Card** from the shortcut menu.

Step 3 Select the type of card. The list of cards in the Add Card menu depends on the NE and the slot selected.

Step 4 Click **OK** in the confirmation dialog box.

It might take several minutes for the newly provisioned card to be added on the NE. During this time, it is possible to add additional cards on the same slot. However, only the first card added will be shown in the NE Explorer tree view and in the shelf view.

5.7.5 Resetting a Card

Step 1 In the Domain Explorer tree, select the NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the tree view or in the shelf view of the node properties pane, right-click the card that you want to reset and choose **Reset Card** from the shortcut menu.

Step 3 Click **OK** in the confirmation dialog box.

5.7.6 Deleting a Card

Step 1 In the Domain Explorer tree, select the NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the tree view or in the shelf view of the node properties pane, right-click the card that you want to delete and choose **Delete Card** from the shortcut menu.

Note For the ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH, you cannot delete the CTX card.

Step 3 Click **OK** in the confirmation dialog box.

5.7.7 Changing a Card

Step 1 In the Domain Explorer tree, select the NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the tree view or in the shelf view of the node properties pane, right-click the card that you want to change and choose **Change Card** from the shortcut menu.

Note For the ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH, you cannot change the CTX card.

Step 3 Select the type of the new card. The list of cards in the Change Card menu depends on the slot selected.

Step 4 Click **OK** in the confirmation dialog box.

Tip If you receive a mismatched equipment alarm (MEA) after changing a card, troubleshoot the MEA with the *Cisco ONS 15454 Troubleshooting Guide*.

5.7.8 Inserting an AIS-V on an STS-1 SD-P

Note This procedure does not apply to the ONS 15454 SDH.

Step 1 In the Domain Explorer tree, select the ONS 15305 R3.0, ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, or ONS 15454 SONET NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Identification** tab.

Step 3 In the AIS-V Insertion on STS-1 Signal Degrade-Path area, complete the following substeps:

- **a.** Check the **Insert AIS-V on STS-1 SD-P** check box to insert an AIS-V on the STS-1 Signal Degrade-Path.
- **b.** Click **OK** in the warning message dialog box.
- **c.** Select the SD-P BER from the drop-down list.

Step 4 Click **Apply**.

5.7.9 Changing Secure Config Mode—ONS 15454 SONET or ONS 15454 SDH

The TCC2P card supports secure config mode. When the secure mode is ON, the NE has two IP addresses, one for the backplane and one for the front port. The front port IP address is used by the DCC-connected NEs. The secure config mode feature applies to the ONS 15454 SONET R5.0 and ONS 15454 SDH R5.0 and later.

The Secure Config Mode subtab allows you to configure the secure config mode. The fields shown depend on whether the NE is in secure mode. For example, the Backplane Ethernet Port values are displayed only when the NE is in secure mode.

Step 1 In the Domain Explorer tree, select the ONS 15454 SONET or ONS 15454 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **Secure Config Mode** subtab.

Step 4 Click the **Change Mode** button. The Change Secure Mode dialog box opens.

Note The Change Mode button is enabled only if an active TCC2P card exists on the NE.

Step 5 Complete one of the following options, depending on your configuration:

- If you are changing the secure mode from secure to nonsecure, fill in the fields described in Table 5-21.
- If you are changing the secure mode from nonsecure to secure, fill in the fields described in Table 5-22.

Step 6 Click **OK**.

Table 5-21 Field Descriptions for the Change Secure Mode Dialog Box when the NE Is Secure

Field	Description
Node IP Address	
Backplane LAN Port	Click this radio button to use the IP address currently assigned to the backplane LAN port as the IP address of the NE in normal (nonsecure) mode.
TCC LAN Port	Click this radio button to use the IP address currently assigned to the TCC LAN port as the IP address of the NE in normal (nonsecure) mode.
New IP Address	Click this radio button to use neither the backplane nor the TCC LAN port IP address, but instead assign a completely new IP address to the NE.
IP Address	(Available only if New IP Address is selected) Enter the backplane IP address.
Net/Subnet Mask Length	(Available only if New IP Address is selected) Enter the mask length of the secure IP address. Use the up or down arrows to change the mask length.
Default Router	(Available only if New IP Address is selected) Enter the address of the default router for this NE.
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15454 SONET or ONS 15454 SDH serves as a proxy for connections between the Prime Optical server and NEs that are DCC-connected to the proxy NE. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server uses port number 1080. If unchecked, the node does not proxy.
End Network Element (ENE)	(Available only if Enable Proxy Server on Port is checked) Enables the node to proxy as an ENE.
Gateway Network Element (GNE)	(Available only if Enable Proxy Server on Port is checked) Enables the node to proxy as a GNE.
Proxy-only	(Available only if Enable Proxy Server on Port is checked) Enables proxy only.

Table 5-22 Field Descriptions for the Change Secure Mode Dialog Box when the NE Is Not Secure

Field	Description
TCC Ethernet Port	
IP Address	Enter the TCC Ethernet port IP address.
Net/Subnet Mask Length	Enter the mask length of the secure IP address. Use the up or down arrows to change the mask length.
Backplane Ethernet Port	
IP Address	Enter the backplane Ethernet port IP address.
Default Router	Enter the address of the default router for this NE.
Subnet Mask	Enter the subnet mask of the secure IP address.
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15454 SONET or ONS 15454 SDH serves as a proxy for connections between the Prime Optical server and NEs that are DCC-connected to the proxy NE. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server uses port number 1080. **Note** When you are changing the config mode to secure, you cannot disable proxy. If unchecked, the node does not proxy.
End Network Element (ENE)	(Available only if Enable Proxy Server on Port is checked) Enables the node to proxy as an ENE.
Gateway Network Element (GNE)	(Available only if Enable Proxy Server on Port is checked) Enables the node to proxy as a GNE.
Proxy-only	(Available only if Enable Proxy Server on Port is checked) Enables proxy only.

5.8 Configuring the ONS 15600 SONET and ONS 15600 SDH

You can use the Prime Optical NE Explorer or CTC to configure ONS 15600 SONET and ONS 15600 SDH NEs.

5.8.1 Launching the Prime Optical NE Explorer

Step 1 In the Domain Explorer tree, select the ONS 15600 SONET or ONS 15600 SDH NE that will be configured and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool). The NE Explorer window displays configuration information about the selected ONS 15600 SONET or ONS 15600 SDH NE.

Step 2 Make any necessary changes to the fields in the properties pane that corresponds to the NE or its components. Click **Apply** to save the changes to the Prime Optical database and apply the changes to the NE.

5.8.2 Launching CTC

See 5.7.2 Launching CTC, page 5-40, which also applies to ONS 15600 SONET and ONS 15600 SDH NEs.

5.8.3 Resetting a Card

Step 1 In the Domain Explorer tree, select the ONS 15600 SONET or ONS 15600 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **Shelf View** tab.

Step 3 On the shelf graphic, right-click a card and select either **Hard Reset Card** or **Soft Reset Card** from the shortcut menu.

Step 4 Click **OK** in the confirmation message box.

5.8.4 Deleting a Card

Step 1 In the Domain Explorer tree, select the ONS 15600 SONET or ONS 15600 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the tree view or in the shelf view of the node properties pane, right-click the card that you want to delete and choose **Delete Card** from the shortcut menu.

Step 3 Click **OK** in the confirmation dialog box.

5.8.5 Changing a Card

Step 1 In the Domain Explorer tree, select the ONS 15600 SONET or ONS 15600 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the tree view or in the shelf view of the node properties pane, right-click the card that you want to change and choose **Change Card** from the shortcut menu.

Step 3 Select the type of the new card. The list of cards in the Change Card menu depends on the slot selected.

Step 4 Click **OK** in the confirmation dialog box.

Provisioning Cards

This chapter provides instructions on how to provision a subset of Cisco Prime Optical-supported cards. For more information on card provisioning, see the NE-related documentation.

This chapter contains the following sections:

- 6.1 How Do I Provision Cards?, page 6-1
- 6.2 Common Cards, page 6-2
- 6.3 DWDM Cards, page 6-2
- 6.4 Electrical Cards, page 6-2
- 6.5 Ethernet Cards, page 6-8
- 6.6 FC_MR-4 Card, page 6-21
- 6.7 FMEC Cards, page 6-21
- 6.8 Multirate Cards, page 6-21
- 6.9 Optical Cards, page 6-21

6.1 How Do I Provision Cards?

Where supported, use the NE Explorer to view and provision card settings.

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the card that you want to provision.

Step 3 In the slot properties pane, click the tab or subtab that corresponds to the settings that you want to modify. For detailed information on the different tabs and subtabs available for each card, see:

- Appendix C, "Slot Properties Pane Information—Common, DWDM, Electrical, and Ethernet Cards"
- Appendix D, "Slot Property Information—FC_MR-4, FMEC, Multirate, and Optical Cards"

Step 4 Modify the settings. For drop-down lists, select an item from the list. For numerics, double-click the field and type the new number.

Step 5 Click **Apply**.

6.2 Common Cards

For the common cards supported in Prime Optical and the NEs that contain common cards, see C.1 Common Cards, page C-1.

6.3 DWDM Cards

For the DWDM cards supported in Prime Optical and the NEs that contain DWDM cards, see C.2 DWDM Cards, page C-111.

6.3.1 Provisioning Pluggable Entities on DWDM Cards

Step 1 Select a CTC-based NE in the Domain Explorer tree and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the DWDM card that you want to provision and click the **PPM** tab.

Step 3 Click **Create**. Depending on the selection context, one of the following dialog boxes opens; fields vary accordingly:

- Create PPM
- Create Port

Step 4 In the PPM No. field, select the PPM number from the drop-down list.

Step 5 In the PPM Type field, select the type of PPM from the drop-down list. (This field is not visible in the Create Port dialog box.)

Step 6 In the Port Rate field, select the port rate from the drop-down list. (This field is not visible in the Create PPM dialog box.)

Step 7 Click **OK**.

6.4 Electrical Cards

For the electrical cards supported in Prime Optical and the NEs that contain electrical cards, see C.3 Electrical Cards, page C-651.

6.4.1 Converting DS1-14 Cards from 1:1 to 1:N Protection

Note This procedure assumes that DS1-14 cards are installed in slots 1 through 6 and/or slots 12 through 17. The DS1-14 cards in slots 3 and 15, which are the protection slots, will be replaced with DS1N-14 cards. The ONS 15454 must run CTC Release 2.0 or later. The procedure also requires at least one DS1N-14 card and a protection group with DS1-14 cards.

Step 1 Select the NE in the Domain Explorer; then, choose **Configuration > NE Explorer**.

Step 2 In NE node property sheet, click the **Protection** tab.

Step 3 In the **Protection Groups** subtab, select the protection group containing slot 3 or slot 15 (where the DS1N-14 card will be installed).

Step 4 Be sure that the slot that is being upgraded is not carrying working traffic. In the **Operations** tab, look at the Protection Groups Details. The protect slot must be Protect/Standby and not Protect/Active. If the protect slot status is Protect/Active, complete the following steps to switch traffic to the working card:

a. In the Protection Group Details list, click the protect card.

b. In the Switch Commands area, click **Switch**.

The working slot should change to Working/Active and the protect slot should change to Protect/Standby. If they do not change, do not continue. Troubleshoot the working card and slot to determine why the card cannot carry working traffic.

c. In the Switch Commands area, click **Clear**.

Step 5 Repeat Step 1 to Step 4 for each protection group that you want to convert.

Step 6 Verify that no standing alarms exist for any of the DS1-14 cards that will be converted. If alarms exist that cannot be cleared, contact the next level of support.

Step 7 Click the **Protection Groups** subtab.

Step 8 Click the 1:1 protection group that contains the cards that will be moved into the new protection group.

Step 9 Click **Delete**.

Step 10 When the confirmation dialog box opens, click **OK**.

Note Deleting the 1:1 protection groups will not disrupt service. However, no protection bandwidth exists for the working circuits until the 1:N protection procedure is completed. Therefore, complete this procedure as quickly as possible.

Step 11 If needed, repeat Step 6 to Step 10 for any other protection groups.

Step 12 Physically remove the DS1-14 card from slot 3 or slot 15. This generates an improper removal alarm.

Step 13 In the node view, right-click the slot that held the removed card and choose **Delete card** from the drop-down list. Wait for the card to disappear from the node view.

Step 14 Physically insert a DS1N-14 card into the same slot.

Step 15 Verify that the card boots up properly.

Step 16 Choose **Configuration > CTC-Based SONET NEs > Equipment Inventory Table** and verify that the new card appears as a DS1N-14 card.

Step 17 Click the node view in the NE Explorer tree.

Step 18 Click the **Protection** tab; then, click the **Protection Groups** subtab.

Step 19 Click **Create**. The Create Protection Group dialog box opens.

Step 20 (Optional) In the Name field, enter a name for the protection group.

Step 21 In the Type field, choose **1:N (card)** from the drop-down list.

Step 22 In the Protect Module field, choose the protection slot from the drop-down list.

The Create Protection Group dialog box shows the protect card in the Protect Card field and the available cards in the Available Cards field.

Step 23 Verify that the DS1N-14 card appears in the Protect Card field.

Step 24 In the Available Cards list, highlight the card that will be included in the protection group. Click the arrow (>>) to move the card to the Working Cards list.

Step 25 In the Reversion Time field, choose the reversion time from the drop-down list.

Step 26 Click **OK**.

Step 27 When the confirmation dialog box opens, click **Yes**.

The protection group should appear in the Protection Groups list on the Protection subtab.

6.4.2 Converting DS3-12 Cards from 1:1 to 1:N Protection

Note This procedure assumes that DS3-12 cards are installed in slots 1 through 6 and/or slots 12 through 17. The DS3-12 cards in slots 3 and 15, which are the protection slots, will be replaced with DS3N-12 cards. The ONS 15454 must run CTC Release 2.0 or later. This procedure also requires at least one DS3N-12 card and a protection group with DS3-12 cards.

Step 1 Select the NE in the Domain Explorer; then, choose **Configuration > NE Explorer**.

Step 2 In the NE node property sheet, click the **Protection** tab.

Step 3 In the **Protection Groups** subtab, select the protection group containing slot 3 or slot 15 (where the DS3N-12 card will be installed).

Step 4 Be sure that the slot that is being upgraded is not carrying working traffic. In the **Operations** tab, look at the Protection Groups Details. The protect slot must be Protect/Standby and not Protect/Active. If the protect slot status is Protect/Active, complete the following steps to switch traffic to the working card:

a. In the Protection Group Details list, click the protect card.

b. In the Switch Commands area, click **Switch**.

The working slot should change to Working/Active and the protect slot should change to Protect/Standby. If they fail to change, do not continue. Troubleshoot the working card and slot to determine why the card cannot carry working traffic.

c. In the Switch Commands area, click **Clear**.

Step 5 Repeat Step 1 to Step 4 for each protection group that you want to convert.

Step 6 Verify that no standing alarms exist for any of the DS3-12 cards that are being converted. If alarms exist that cannot be cleared, contact the next level of support.

Step 7 Click the **Protection Groups** subtab.

Step 8 Click the 1:1 protection group that contains the cards that will be moved into the new protection group.

Step 9 Click **Delete**.

Step 10 When the confirmation dialog box opens, click **OK**.

Note Deleting the 1:1 protection groups will not disrupt service. However, no protection bandwidth exists for the working circuits until the 1:N protection procedure is completed. Therefore, complete this procedure as quickly as possible.

Step 11 If needed, repeat Step 6 to Step 10 for each protection group.

Step 12 Physically remove the DS3-12 card from slot 3 or slot 15. This generates an improper removal alarm.

Step 13 In the node view, right-click the slot that held the removed card and choose **Delete card** from the drop-down list. Wait for the card to disappear from the node view.

Step 14 Physically insert a DS3N-12 card into the same slot.

Step 15 Verify that the card boots up properly.

Step 16 Choose **Configuration > CTC-Based SONET NEs > Equipment Inventory Table** and verify that the new card appears as a DS3N-12 card.

Step 17 Click the node view in the NE Explorer tree.

Step 18 Click the **Protection** tab; then, click the **Protection Groups** subtab.

Step 19 Click **Create**. The Create Protection Group dialog box opens.

Step 20 (Optional) In the Name field, enter a name for the protection group.

Step 21 In the Type field, choose **1:N (card)** from the drop-down list.

Step 22 In the Protect Module field, choose the protection slot from the drop-down list.

The Create Protection Group dialog box shows the protect card in the Protect Card field and the available cards in the Available Cards field.

Step 23 Verify that the DS3N-12 card appears in the Protect Card field.

Step 24 In the Available Cards list, highlight the card that will be included in the protection group. Click the arrow (>>) to move the card to the Working Cards list.

Step 25 In the Reversion Time field, choose a reversion time from the drop-down list.

Step 26 Click **OK**.

Step 27 When the confirmation dialog box opens, click **Yes**.

The protection group should appear in the Protection Groups list on the Protection subtab.

6.4.3 Converting E1-N-14 Cards from 1:1 to 1:N Protection

Note

- This procedure assumes that E1-N-14 cards are installed in slots 1 through 6 and/or slots 12 through 17. The E1-N-14 cards in slots 3 and 15, which are the protection slots, will be converted from 1:1 to 1:N protection. (E1-N-14 cards can work in 1:1 and 1:N protection schemes.)
- Be sure that the slot containing the E1-N-14 card is not carrying working traffic. Also, be sure that there are no existing alarms for the E1-N-14 card that you are converting.

Complete the following steps to convert E1-N-14 cards from 1:1 to 1:N protection:

Step 1 Select the NE in the Domain Explorer; then, choose **Configuration > NE Explorer**.

Step 2 In NE node property sheet, click the **Protection** tab.

Step 3 In the **Protection Groups** subtab, select the protection group containing slot 3 or slot 15 (where the E1-N-14 card will be installed).

Step 4 Be sure that the slot that is being upgraded is not carrying working traffic. In the **Operations** tab, look at the Protection Groups Details. The protect slot must be Protect/Standby and not Protect/Active. If the protect slot status is Protect/Active, complete the following steps to switch traffic to the working card:

a. In the Protection Group Details list, click the protect card.

b. In the Switch Commands area, click **Switch**.

The working slot should change to Working/Active and the protect slot should change to Protect/Standby. If they fail to change, do not continue. Troubleshoot the working card and slot to determine why the card cannot carry working traffic.

c. In the Switch Commands area, click **Clear**.

Step 5 Repeat Step 1 to Step 4 for each protection group that you want to convert.

Step 6 Verify that no standing alarms exist for any of the E1-N-14 cards that are being converted. If alarms exist that cannot be cleared, contact the next level of support.

Step 7 Click the **Protection Groups** subtab.

Step 8 Click the 1:1 protection group that contains the cards that will be moved into the new protection group.

Step 9 Click **Delete**.

Step 10 When the confirmation dialog box opens, click **OK**.

Note Deleting the 1:1 protection groups will not disrupt service. However, no protection bandwidth exists for the working circuits until the 1:N protection procedure is completed. Therefore, complete this procedure as quickly as possible.

Step 11 If needed, repeat Step 6 to Step 10 for each protection group.

Step 12 Click **Create**. The Create Protection Group dialog box opens.

Step 13 (Optional) In the Name field, enter a name for the protection group.

Step 14 In the Type field, choose **1:N (card)** from the drop-down list.

Step 15 Verify that the E1-N-14 card appears in the Protect Card field.

Step 16 In the Available Cards list, highlight the card that will be included in the protection group. Click the arrow (**>>**) to move the card to the Working Cards list.

Step 17 Click **OK**.

Step 18 When the confirmation dialog box opens, click **Yes**.

The protection group should appear in the Protection Groups list on the Protection subtab.

6.4.4 Converting DS3i-N-12 Cards from 1:1 to 1:N Protection

Note This procedure assumes that DS3i-N-12 cards are installed in slots 1 to 6 and/or slots 12 to 17.

Step 1 Select the NE in the Domain Explorer; then, choose **Configuration > NE Explorer**.

Step 2 In NE node property sheet, click the **Protection** tab.

Step 3 In the **Protection Groups** subtab, select the protection group containing slot 3 or slot 15 (where the DS3i-N-12 card will be installed).

Step 4 Be sure that the slot that is being upgraded is not carrying working traffic. In the **Operations** tab, look at the Protection Groups Details. The protect slot must be Protect/Standby and not Protect/Active. If the protect slot status is Protect/Active, complete the following steps to switch traffic to the working card:

a. In the Protection Group Details list, click the protect card.

b. In the Switch Commands area, click **Switch**.

The working slot should change to Working/Active and the protect slot should change to Protect/Standby. If they fail to change, do not continue. Troubleshoot the working card and slot to determine why the card cannot carry working traffic.

c. In the Switch Commands area, click **Clear**.

Step 5 Repeat Step 1 to Step 4 for each protection group that you want to convert.

Step 6 Verify that no standing alarms exist for any of the DS3i-N-12 cards that are being converted. If alarms exist that cannot be cleared, contact the next level of support.

Step 7 Click the **Protection Groups** subtab.

Step 8 Click the 1:1 protection group that contains the cards that will be moved into the new protection group.

Step 9 Click **Delete**.

Step 10 When the confirmation dialog box opens, click **OK**.

Note Deleting the 1:1 protection groups will not disrupt service. However, no protection bandwidth exists for the working circuits until the 1:N protection procedure is completed. Therefore, complete this procedure as quickly as possible.

Step 11 If needed, repeat Step 6 to Step 10 for each protection group.

Step 12 Verify that the card boots up properly.

Step 13 Click the node view in the NE Explorer tree.

Step 14 Click the **Protection** tab; then, click the **Protection Groups** subtab.

Step 15 Click **Create**. The Create Protection Group dialog box opens.

Step 16 (Optional) In the Name field, enter a name for the protection group.

Step 17 In the Type field, choose **1:N (card)** from the drop-down list.

Step 18 Verify that the DS3i-N-12 card appears in the Protect Card field.

Step 19 In the Available Cards list, highlight the card that will be included in the protection group. Click the arrow (>>) to move the card to the Working Cards list.

Step 20 Click **OK**.

Step 21 When the confirmation dialog box opens, click **Yes**.

The protection group should appear in the Protection Groups list on the Protection subtab.

Note When a manual OC-N protection switch is performed incorrectly, a warning message indicates that Prime Optical cannot perform the operation.

6.4.5 Resetting NE Thresholds to the Default Values

You can reset NE thresholds on electrical and optical cards.

Step 1 Select the NE in the Domain Explorer; then, choose **Configuration > NE Explorer**.

Step 2 Open the card slot property sheet for the electrical or optical card.

Step 3 Click the **Line** or **STS** tab.

Step 4 Click the threshold subtab that contains the values that you want to revert to the default.

Step 5 In the threshold subtab, click the **Reset to Default** button.

Step 6 At the confirmation prompt, click **Yes**.

6.5 Ethernet Cards

For the Ethernet cards supported in Prime Optical and the NEs that contain Ethernet cards, see C.4 Ethernet Cards, page C-832.

6.5.1 Provisioning E-Series Ethernet Ports for VLAN Membership

Caution The ONS 15305 CTC, ONS 15454 SONET, and ONS 15454 SDH propagate VLANs whenever a node appears on the same network view as another node, regardless of whether or not the nodes connect through data communication channels (DCCs). For example, if two ONS 15454 SONETs or ONS 15454 SDHs without DCC connectivity belong to the same Login Node Group, whenever CTC is launched from within this login node group, VLANs propagate from one to the other. This happens even though the ONS 15454 SONETs or ONS 15454 SDHs do not belong to the same ring.

Caution If a node is unreachable or out of service, and if the DCC connections used to reach the NE still exist, Prime Optical does not allow the deletion of a VLAN on the NE. You must delete the DCC connections before deleting a VLAN.

The ONS 15305 CTC, ONS 15327, ONS 15454 SONET, and ONS 15454 SDH allow configuration of the VLAN membership and Q-tag handling of individual Ethernet ports.

Step 1 Select an ONS 15305 CTC, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE in the Domain Explorer tree and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the card that you want to provision and click the **VLAN** tab.

Step 3 To put a port in a VLAN, click the port and choose **Tagged** or **Untag**.

If a port is a member of only one VLAN, go to the row of that VLAN and choose **Untag** from the Port column. Choose **--** for all the other VLAN rows in that Port column. The VLAN with **Untag** selected can connect to the port, but other VLANs cannot access that port.

If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, that also supports trunking. A trunk port must have tagging (802.1Q) enabled for all the VLANs that connect to that external device. Choose **Tagged** at all VLAN rows that need to be trunked. Choose **Untag** at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must be attached to at least one untagged VLAN. The following table describes the port settings.

Table 6-1 Port Settings

Setting	Description
--	A port marked with this symbol does not belong to the VLAN.
Untag	The node will tag ingress frames and strip tags from egress frames.
Tagged	The node will handle ingress frames according to VLAN ID; egress frames will not have their tags removed.

Step 4 After each port is in the appropriate VLAN, click **Apply**.

Note If Tagged is chosen, the attached external devices must recognize IEEE 802.1Q VLANs.

Note Both ports on an individual E1000-2 or E1000-2-G card cannot be members of the same VLAN.

6.5.2 Specifying the ML-Series Card Username and Password

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Security Properties**; then, click one of the following:

- **CTC-Based SDH** tab > **ONS 15454 SDH**, **ONS 15600 SDH**, **ONS 15305 CTC**, or **ONS 15310 MA SDH** subtab
- **CTC-Based SONET** tab > **ONS 15454**, **ONS 15600**, **ONS 15327**, **ONS 15310 CL**, or **ONS 15310 MA** subtab

Step 3 In the Server - ML Series Card Connection area, enter the username and password. Retype the password as confirmation.

Note The Prime Optical barebone Cisco IOS configuration file uses CTM123+ as the predefined password. By default, the same password is set in the Control Panel at installation.

Step 4 Click **Save**.

6.5.3 Modifying Configuration Settings for the ML-Series Cards—ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH

Full Cisco IOS configuration synchronization is performed automatically by Prime Optical to keep the NE and the Prime Optical Data Provisioning Service synchronized. Full configuration resynchronization might be delayed depending on the usage of the Prime Optical server. For the Prime Optical server deployed as the monitoring server, the recommended value for the delay parameter is 120 seconds. For the Prime Optical server deployed as the provisioning server, the recommended value for the delay parameter is 10 minutes (for example, 600 seconds). The default value is provided in the Control Panel > NE Service > CTC-Based SONET NEs or CTC-Based SDH NEs > NE Service pane > L2 Service Resync Delay field. For example, for the CTC-based SONET or CTC-based SDH network service, the default L2 Service Resync Delay value is 600 seconds.

To upload or download a configuration file for the ML-series card:

Step 1 Select an ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, or ONS 15454 SDH NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ML card.

Step 3 Click the **Configuration** tab. The following parameters are displayed:

- Source—Source of the configuration file.
- Host—Host machine where the configuration file is stored or the location where the file will be downloaded.
- Filename—Name of the configuration file.
- Directory—Directory on the host machine for the configuration file.
- Time Stamp—Date and time of the file upload or download.

Note These parameters are initially grayed out or disabled. When a file download or upload is completed, the fields display the parameters of the download or upload. These parameters are related to the newly loaded barebone configuration file. Once a change is made to the barebone configuration file, the fields are cleared.

Step 4 To download the file from the Timing Communications and Control (TCC) card to the host machine:

a. In the **Configuration** subtab, click **TCC>>File**. The Download from TCC dialog box opens.

b. Select the location of the file to download. Click either the **Local** or the **Server** radio button.

Step 5 To upload the file from the host machine to the TCC card:

a. In the **Configuration** subtab, click **File>> TCC**. The Upload to TCC dialog box opens.

b. Select the location of the file to upload. Click either the **Local** or **Server** radio button.

Note If you select Local, the file is first copied to the Prime Optical server and then uploaded to the TCC card. The host refers to the server; the directory refers to the directory on the server where the file resides.

Step 6 Be sure to reset the ML-series cards after uploading a Cisco IOS startup config file to a TCC card.

Step 7 To launch the command-line interface (CLI), click **Launch CLI**.

6.5.4 Creating RMON Thresholds

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the card.

Step 3 Depending on the card selected, click the **Thresholds** tab or **Line** tab > **RMON Thresholds** or **RPR Span** subtab.

Step 4 Click **Create**. The Create RMON Thresholds dialog box opens. The following table provides descriptions. Fields shown depend on the type of NE that is selected.

Step 5 Click **OK**.

Table 6-2 Field Descriptions for the Create RMON Thresholds Dialog Box

Field	Description
Slot	Choose the appropriate card.
Port	Choose the applicable port on the card you selected.
Variable	Choose the MIB variable to monitor.
Alarm Type	Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Depending on the type of data module used by the NE, choose Relative, Absolute, or Delta. • Relative restricts the threshold to use the number of occurrences in the user-set sample period. • Absolute sets the threshold to use the total number of occurrences, regardless of time period. • Delta tests the delta between samples.
Sample Period	Specify the sample period, in seconds.

Table 6-2 Field Descriptions for the Create RMON Thresholds Dialog Box (continued)

Field	Description
Rising Thresholds	Enter the appropriate number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Thresholds	Enter the appropriate number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15 minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).

6.5.5 Creating Segments

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the GE_XP or 10GE_XP card.

Step 3 Click the **REP** tab > **Segment** subtab.

Step 4 Click **Create**. The Create Segment dialog box opens.

Step 5 Enter the segment ID in the Segment field. Valid values are from 1 to 1024.

Step 6 From the Port drop-drown list, choose a REP port that must belong to this segment.

Note A REP port can belong to only one segment.

Step 7 From the Port Role area, choose whether you want to configure the port as an edge port or a regular port. The options are:

- Edge—The port is configured as an edge port.
  - Check the **Primary** check box to configure the edge port as a primary edge port.
  - Uncheck the **Primary** check box to configure the edge port as a secondary edge port.
  - Check the **Preferred** check box to configure the edge port as a preferred alternate port.
  - Check the **NoNeighbor** check box if the edge port must not have a neighbor port. REP does not check for neighbor adjacency.
- None—The port is configured as a regular port. If you choose this option, Segment Topology Change Notifications (STCN) and VLAN Load Balancing (VLB) configurations are disabled.

  Check the **Preferred** check box to configure the regular port as a preferred alternate port.

Step 8 From the STCN area, configure the destination of STCN messages:

a. Check the **Enable** check box to enable sending STCN messages.

b. From the **Port** drop-down list, do one of the following:

- Choose the STCN port to send STCN messages.
- Enter the segment ID in the Segment field to send STCN messages. The STCN port and REP port must be unique.

Step 9 From the VLAN Load Balancing area, configure VLB:

a. Check the **Enable** check box to enable VLB.

b. Enter a single SVLAN or range of SVLANs in the SVLAN field.

c. Enter the REP Port ID in the REP PortId field.

d. Check the **Preferred** check box to identify the preferred alternate port for VLAN load balancing.

Step 10 From the VLB Preempt Delay area, enter the trigger delay for automatic VLB activation. Valid values are from 15 to 300 seconds.

Step 11 Click **Next**.

Step 12 Enter the details of the second port to add it to the segment. Repeat Step 6 through Step 10 when the first port is configured as a regular port and the second port is configured as a primary edge port. Repeat Step 6 and Step 7 when the first port is configured as a primary edge port and the second port is configured as a regular port.

Step 13 Click **Finish**.

6.5.6 Editing Segments

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the GE_XP or 10GE_XP card.

Step 3 Click the **REP** tab > **Segment** subtab.

The list of segments appears.

Step 4 Choose a segment from the list of segments that you want to edit.

Step 5 Click **Edit**. The Edit Segment dialog box opens.

Note You can edit only the STCN and VLB entries for a segment.

Step 6 Segment ID—*Display only.* Displays the Segment ID.

Step 7 Port—*Display only.* Displays the REP port that belongs to this segment.

Step 8 In the Port Role area (which is display only), the details of the edge port or regular port is displayed.

Step 9 From the STCN area, modify the destination of STCN messages:

a. Check the **Enable** check box to enable sending STCN messages.

b. From the **Port** drop-down list, do one of the following:

- Choose the STCN port to send STCN messages.
- Modify the segment ID in the Segment field to send STCN messages. The STCN port and REP port must be unique.

Step 10 From the VLAN Load Balancing area, modify VLB:

a. Check the **Enable** check box to enable VLB.

b. Modify a single SVLAN or range of SVLANs in the SVLAN field.

c. Modify the REP Port ID in the REP PortId field.

d. Check the **Preferred** check box to identify the preferred alternate port for VLAN load balancing.

Step 11 From the VLB Preempt Delay area, modify the trigger delay for automatic VLB activation. Valid values are from 15 to 300 seconds.

Step 12 Click **Next**.

Step 13 Modify the details of the second port in the segment, if required.

Step 14 Click **Finish**.

6.5.7 Creating Configurations

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the 10x10G_LC, 100G_LC_C, or CFP_LC card.

Step 3 Click the **Card** tab.

For the 10x10G_LC card:

1. Click **Create**. The Configure Operating Mode dialog box opens.
2. From the Configuration Mode drop-down list, choose the configuration.

   The card configuration options vary depending on the card. For more information about card configurations, see Table C-821. For more information about Operating Modes, see Table 6-3. Fields shown depend on the type of NE that is selected.
3. Click **Next**.

   The following happens in the Port Mappings area:

   – If you select MXP-10G or FANOUT, the configuration requires all the client ports. The CXP port is available for FANOUT mode only. Proceed to Step 5.

   – If you select TXP-10G, RGN-10G, or LOW-LATENCY, you can select the available ports. Click **Next** to view all the ports that are about to be configured.

Note The Create button is disabled once the MXP-10x10G- or FANOUT is created on the card mode. You cannot configure any other modes for the card, since it requires all ten client ports.

Note If you need to create some other card mode, delete the existing card mode that was created and create a new card mode.

For the CFP_LC card:

There are two operating modes for the CFP_LC card:

- CFP-TXP
- CFP-MXP

1. Click **Create**. The Configure Operating Mode dialog box opens.
2. From the Configuration Mode drop-down list, choose the configuration. The card configuration options vary depending on the card. For more information about the card configurations, see Table 6-3. For more information about Operating Modes, see Table C-821. Fields shown depend on the type of NE that is selected.
3. Click **Next** to map a peer card with the port.

Step 4 In the Configure Operating Mode window, to map a peer card with a port, drag and drop the peer card to the port field. CFP_LC supports two ports.

A maximum of two peer cards are available. You can also unmap the selected peer card from the port field. The selected peer card information along with the port details is displayed on the left side of the Configure Operating Mode window.

For CFP-MXP, the configuration uses two ports and one peer card only. You can map a peer card to both ports.

Note You can also map one more port to the card mode, since there is one more available port.

For 100G_LC_C card:

1. Click **Create**. The Configure Operating Mode dialog box opens.
2. Choose the configuration from the Configuration Mode drop-down list. The card configuration options vary depending on the card. For more information about the card configurations, see Table 6-3. For more information about Operating Modes, see Table C-821. Fields shown depend on the type of NE that is selected. Proceed to Step 5.

Note The TXP-100G card configuration does not require any peer card.

Step 5 Click **Finish**.

The selected operating mode is provisioned on the 10x10G_LC, 100G_LC_C, and CFP_LC card. The selected operating mode information, along with the port details, is displayed on the left side of the Configure Operating Mode window.

Table 6-3 Field Descriptions for the Create Operating Mode Dialog Box

Field	Description
Configuration Mode	Choose one of the following card configuration options from the drop-down list: • TXP-10G (10x10G_LC)—Provisions the 10x10G_LC card as a standalone supporting multi-transponder functionality. The 10 Gb/s SFP+ ports are paired providing 10 G transponder functionality for each port pair. • RGN-10G (10x10G_LC)—Provisions the 10x10G_LC card as a standalone regenerator. • MXP-10x10G (10x10G_LC)—Provisions the 10x10G_LC card as a 10x10G muxponder. The 100G_LC_C card is connected through the Cisco ONS 15454 M6 or Cisco ONS 15454 M2 backplane to the 10x10G_LC card to support 10-port 10 G muxponder capabilities. **Note** For MXP-10x10G operating mode, you cannot proceed to completion unless a peer card is selected. • FANOUT (10x10G_LC)—Provisions the 10x10G_LC card as a standalone functionary. **Note** You cannot configure any other modes for the card, once a MXP-10x10G and FANOUT mode are configured. • LOW-LATENCY (10x10G_LC)—Provisions the 10x10G_LC card as a standalone functionary. It occupies only two ports and can coexist with other card modes such as RGN-10G and TXP-10G. It is possible to configure multiple pair of ports in LOW-LATENCY mode. There is no support for Terminal or Facility loopback on this mode, or for backplane loopback functionality on a card that has any ports in this mode. • CFP-TXP (CFP_LC)—Provisions the CF_LC card as a 100 G transponder. The CFP_LC card is connected to the 100G_LC_C card to support the 100GE-BASELR4 client interface for 100 Gb/s transponder capabilities. The CFP_LC card can be connected through the Cisco ONS 15454 M6 backplane with up to two 100G_LC_C cards placed in the upper and lower slots of the same shelf. • CFP-MXP (CFP_LC)—Provisions the CFP_LC card as a two-port 40G muxponder. The CFP_LC card is connected with the 100G_LC_LC card through the Cisco ONS 15454 M6 or Cisco ONS 15454 M2 backplane. • TXP-100G (100G_LC_C)—Provisions the 100G_LC_C card as a 100G standalone transponder. • RGN-100G (100G_LC_C)—Provisions the 100G_LC_C card as a regenerator. Two 100G_LC_C cards can be connected to work in back-to-back mode through the backplane in the same shelf. Regeneration is performed by leveraging the OTU4 backplane interconnection supported by the Cisco ONS 15454 M6 or Cisco ONS 15454 M2 chassis.
Peer Card	Displays the shelf and slot number of the peer card that is set up for a specific card configuration. If the peer card is not set up, “N/A” is displayed. **Note** The MXP-10x10G, RGN-100G, CFP-MXP, and CFP-TXP operating modes support peer card configuration only.
Port Mapping	Click the toggle button to select a port for configuration. Port Status options are as follows: • Available for Selection—You can select the ports for configuration. • Not Available/Invalid—Already selected or invalid for the chosen operating mode. • Selected for Configuration—Ports are selected for configuration.
Finish	Completes the card configuration and closes the dialog box.
Cancel	Cancels the card configuration and closes the dialog box.

6.5.8 Adding a Peer Card

Note You can add another 100G_LC_C peer card to the CFP-TXP card configuration with only one peer card configured in the Create Configuration section. This option is available for CFP-TXP card mode only.

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the **Provisioning > Card** tab.

Step 3 Click the **Add Peer Card** button to open the dialog showing the available peer card and the port left out to be mapped.

Note The Add Peer button is enabled only if the CFP card is configured with CFP-TXP card mode with one peer card; otherwise, this button is disabled.

Step 4 Click **OK**.

The peer card and map are added to the available port. If the peer card is unavailable, you will see the following error message:

```
No peer cards are available to add. Create a peer card and try again.
```

Step 5 Click **OK**.

6.5.9 Create, Edit, and Delete GCC

This procedure creates, edits, and deletes the DWDM GCC terminations required for network setup when using the TXP and MXP cards. Perform this task before you create OCHCC or OCHNC circuits for the cards. In this task, you can also set up the node so that it has direct IP access to a far-end, non-ONS node over the GCC network.

6.5.9.1 Create GCC

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the CFP_LC card.

Step 3 Click the **Card** tab.

Step 4 Click **Create**. The Create Terminations dialog box appears.

Step 5 Select the ports where you want to create the GCC termination.

Step 6 Under Port Admin State area, select one of the following:

- Leave unchanged—Does not change the DCC/GCC termination port administrative state.
- Set to IS or Set to Unlocked—Puts the DCC/GCC termination port in service.
- Set OOS,DSLBD to IS,AINS (for ANSI) or Set Locked,disabled to Unlocked,automaticInService (for ETSI)—Changes a port that is currently out of service or locked to automatic in service.

- Set OOS,DSLBD to OOS,MT (for ANSI) or Set Locked,disabled to Locked,maintenance (for ETSI)—Changes a port that is currently out of service or locked to out of service for maintenance.

Note For GCC termination, default GCC rate is 192 kb/s and cannot be changed.

Step 7 In the Layer 3 area, do one of the following:

- Check the **IP** box only if the GCC is between the ONS 15454 and another ONS node, and only ONS nodes reside on the network. The GCC will use Point-to-Point Protocol (PPP).
- Check both the **IP** box and the **OSI and IP** box if the GCC is between the ONS 15454 and another ONS node, and third-party NEs that use the OSI protocol stack are on the same network. The GCC will use PPP.

Step 8 If you checked OSI, complete the following substeps. If you checked IP only, continue with Step 9.

- Click **Next**.
- Provision the following fields:
  - Router—Choose the OSI router.
  - ESH—Sets the End System Hello (ESH) propagation frequency. End system (ES) NEs transmit ESHs to inform other ESs and intermediate systems (ISs) about the Network Service Access Points (NSAPs) that the ES NEs serve. The default is 10 seconds. The range is 10 to 1000 seconds.
  - ISH—Sets the Intermediate System Hello (ISH) protocol data unit (PDU) propagation frequency. IS NEs send ISHs to other ESs and ISs to inform them about the IS NEs that the IS NEs serve. The default is 10 seconds. The range is 10 to 1000 seconds.
  - IIH—Sets the Intermediate System to Intermediate System Hello (IIH) PDU propagation frequency. The IS-IS Hello PDUs establish and maintain adjacencies between ISs. The default is 3 seconds. The range is 1 to 600 seconds.
  - IS-IS Cost—Sets the cost for sending packets on the LAN subnet. The IS-IS protocol uses the cost to calculate the shortest routing path. The default metric cost for LAN subnets is 60. The cost normally should not be changed.

Step 9 Click **Finish**. The following alarms appear until all the network DCC/GCC terminations are created and the ports are in service:

- GCC-EOC for GCC termination
- EOC for SDCC termination
- EOC-L for LDCC termination.

6.5.9.2 Edit GCC

This task modifies a GCC termination.You can enable or disable OSPF and the foreign node setting.

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the CFP_LC card.

Step 3 Click the **Card** tab.

Step 4 Select the GCC that you want to change.

Step 5 Click **Edit**. The Edit Termination dialog box appears.

Step 6 Complete the following as necessary:

- GCC Rate—(Display only) Indicates the communication channel rate.
- Disable OSPF on Link—If checked, OSPF is disabled on the link. OSPF should be disabled only when the slot and port connect to third-party equipment that does not support OSPF.
- Far End is Foreign—Check this box to specify that the DCC/GCC termination is a non-ONS node.
- Far end IP—If you checked the Far End is Foreign check box, type the IP address of the far-end node or leave the 0.0.0.0 default. An IP address of 0.0.0.0 means that any address can be used by the far end.

Step 7 Click **OK**.

6.5.9.3 Delete GCC

This task deletes the DWDM GCC terminations required for network setup when using TXP or MXP cards.

Step 1 Select an NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the CFP_LC card.

Step 3 Click the **Card** tab.

Step 4 Select the GCC that you want to change.

Step 5 Click **Delete**. The Delete Termination dialog box appears.

Step 6 (Optional) To place ports out of service, check the **Set port OOS** check box.

Step 7 Click **Yes**. The following alarms will appear until all network terminations are deleted and the ports are out of service:

- GCC-EOC for GCC termination
- EOC for SDCC termination
- EOC-L for LDCC termination

6.5.10 E-Series Spanning Tree Protocol (IEEE 802.1D)

The ONS 15327, ONS 15454 SONET, and ONS 15454 SDH operate Spanning Tree Protocol (STP) according to IEEE 802.1D when an Ethernet card is installed. STP operates over all packet-switched ports, including Ethernet and ONS 15327, ONS 15454 SONET, or ONS 15454 SDH ports. On Ethernet ports, STP is disabled by default and can be enabled by checking the check box under the Port subtab of the **Provisioning** tab at the card-level view. On ONS 15327, ONS 15454 SONET, or ONS 15454 SDH interface ports, STP is active by default and cannot be disabled.

The Ethernet card can enable STP on the Ethernet ports to allow redundant paths to the attached Ethernet equipment. STP spans cards so that both equipment and facilities are protected against failure.

STP detects and eliminates network loops. When STP detects multiple paths between any two network hosts, STP blocks ports until only one path exists between any two network hosts. The single path eliminates possible bridge loops. This is crucial for shared packet rings, which naturally include a loop.

To remove loops, STP defines a tree that spans all of the switches in an extended network. STP forces certain redundant data paths into a standby (blocked) state. If one network segment in the STP becomes unreachable, the spanning-tree algorithm reconfigures the spanning-tree topology and reactivates the blocked path to reestablish the link. STP operation is transparent to end stations, which do not discriminate between connections to a single LAN segment and a switched LAN with multiple segments. The ONS 15327, ONS 15454 SONET, and ONS 15454 SDH support one STP instance per circuit and a maximum of eight STP instances per ONS 15327, ONS 15454 SONET, or ONS 15454 SDH.

Note When an Ethernet card is provisioned, the STP state might need to be updated. Click the **Update** button in the NE Explorer to update the STP state.

The ONS 15327, ONS 15454 SONET, or ONS 15454 SDH can operate multiple instances of STP to support VLANs in a looped topology. Separate circuits can be dedicated across the SONET ring for different VLAN groups (that is, one for private TLS services and one for Internet access). Each circuit runs its own STP to maintain VLAN connectivity in a multiring environment.

6.5.10.1 Viewing E-Series Spanning-Tree Configurations

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE in the Domain Explorer tree and choose **Configuration > NE Explorer**.

Step 2 Click the **EtherBridge** tab.

Step 3 Click the **Spanning Tree Config** subtab. The spanning-tree configuration parameters are listed in the following table.

Table 6-4 Spanning-Tree Configuration Parameters

Parameter	Cisco Default Value	Value Range
Priority	32768	0–65535
Bridge Max Age	20 seconds	6–40 seconds
Bridge Hello Time	2 seconds	1–10 seconds
Bridge Forward Delay	15 seconds	4–30 seconds

6.5.10.2 Viewing E-Series Spanning-Tree Parameters

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE in the Domain Explorer tree and choose **Configuration > NE Explorer**.

Step 2 Click the **EtherBridge** tab.

Step 3 Click the **Spanning Tree Status** subtab. The spanning-tree parameters are listed in the following table.

Table 6-5 Spanning-Tree Parameters

Parameter	Description
BridgeID	Unique identifier that transmits the configuration bridge protocol data unit (BPDU); the bridge ID is a combination of the bridge priority and the NE MAC address.
Topo Age	Amount of time in seconds since the last topology change.
Topo Changes	Number of times the spanning-tree topology has been changed since the node booted up.
Designated Root	The designated root of the spanning tree for a particular spanning-tree instance.
Root Cost	The total path cost to the designated root.
Root Port	Port used to reach the root.
Max Age	Maximum time that received-protocol information is retained before it is discarded.
Hello Time	Time interval, in seconds, between the transmission of configuration BPDUs by a bridge that is the spanning-tree root or is attempting to become the spanning-tree root.
Hold Time	Minimum time period, in seconds, that elapses during the transmission of configuration information about a given port.
Forward Delay	Time spent by a port in the listening state and the learning state.

6.6 FC_MR-4 Card

For the NEs that support the FC_MR-4 card, D.1 FC_MR-4 Card, page D-1.

6.7 FMEC Cards

For the FMEC cards supported in Prime Optical and the NEs that contain FMEC cards, see D.2 FMEC Cards, page D-7.

6.8 Multirate Cards

For the multirate cards supported in Prime Optical and the NEs that contain multirate cards, see D.3 Multirate Cards, page D-16.

6.9 Optical Cards

For the optical cards supported in Prime Optical and the NEs that contain optical cards, see D.4 Optical Cards, page D-84.

6.9.1 Provisioning an OC-N Card for ONS 15454 SONET

ONS 15454 SONET OC-3, OC-12, and OC-48 cards can be provisioned to support either SONET or SONET over SDH signals.

Step 1 Select an ONS 15454 SONET NE in the Domain Explorer tree and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the OC-N card.

Step 3 Click the **Line** tab; then, click the **Line Config** subtab.

Step 4 In the EnableSyncMsg column, uncheck the check box.

Step 5 Be sure that the Admin state of the port is selected as OOS (only then can the SONET port be configured as SDH).

Step 6 In the **Type** column, choose **SDH**.

Step 7 Click **Apply**.

6.9.2 Resetting NE Thresholds to the Default Values

See 6.4.5 Resetting NE Thresholds to the Default Values, page 6-8.

Provisioning Services and Connections

This section describes how to use Cisco Prime Optical to provision network services. It also explains the tasks required to create new connections, and display, modify, and delete existing connections.

This section includes the following topics:

- 7.1 Overview, page 7-1
- 7.2 Managing Circuits, page 7-2
- 7.3 Managing BLSRs, page 7-198
- 7.4 Managing MS-SPRings, page 7-208
- 7.5 Managing VLANs for E-Series Cards, page 7-218
- 7.6 Managing VLANs (ML-Series Cards), page 7-220
- 7.7 Managing SVLAN Profiles, page 7-221
- 7.9 Managing SVLANs, page 7-224
- 7.10 Provisioning Data Services, page 7-235
- 7.11 Managing QoS Profiles, page 7-323
- 7.12 Managing DWDM Nodes, page 7-330

7.1 Overview

A metro network is a network that aggregates customer traffic and connects customers to services. The metro network is responsible for receiving network traffic from long-haul transport networks and routing this traffic to and from enterprises and end users.

The service point-of-presence (POP) performs service adaptation and packet switching. This layer performs the following functions:

- Grooming of traffic from the metro network
- Edge packet switching, where IP services are enabled
- Core packet switching, where POPs are interconnected over the IP backbone

The service POP is the hub of high-value Internet services. The core network, where optical technologies predominate, is the domain of the long-haul carrier. This high-speed transport fabric interconnects service POPs and has traditionally been built as SONET ring architectures.

Prime Optical simplifies operations support system (OSS) integration for service providers for the end-to-end management of transport networks.

7.2 Managing Circuits

A circuit represents an end-to-end connection between two or more connection termination points (CTPs). A circuit consists of an alternating series of cross-connections and link connections. In its simplest form, a circuit consists of a single cross-connection (if the circuit is defined between two CTPs on the same NE). A circuit can be bidirectional or unidirectional, point-to-point (PTP) or point-to-multipoint, and protected or unprotected.

Prime Optical allows you to create unidirectional and bidirectional circuits for CTC-based NEs. For unidirectional path switched ring (UPSR) circuits, you can create revertive or nonrevertive circuits. Prime Optical can route the circuits automatically, or you can route them manually. For CTC-based NEs (including the ONS 15305 R3.0), circuits can be viewed, created, modified, traced, and deleted. For the ONS 15530 or ONS 15540, a circuit is an end-to-end connection between two ports on ONS 15530 or ONS 15540 NEs in terms of lambda (wavelength). For the ONS 155xx, circuit services provide the following major capabilities:

- Finding all end-to-end connections between NEs in terms of client ports, provided the entire path was traversed within ONS 15530 and ONS 15540 NEs.
- Displaying the protection information associated with each circuit.
- Displaying all directional-based paths that have been configured and are in use for a protected circuit.
- Displaying the active and standby paths that have been configured and are in use for a protected circuit.

Note Circuit information is not available for the ONS 15216. For the ONS 15305, circuits can be created through CEC (**Configuration > ONS 15305 > Launch Cisco Edge Craft**).

For ONS 15305 NE releases 3.0 and later, circuits can be created in Prime Optical, CTC, and CEC. Circuits that are created in Prime Optical or CTC can be managed in Prime Optical, CTC, and CEC. But circuits that are created in CEC show unpredictable and erroneous behavior in Prime Optical and CTC.

For ONS 15305 NE releases earlier than R3.0, the circuit information is not available in Prime Optical. Circuits can be created in CEC but cannot be managed in Prime Optical.

Note Circuit management performance depends on an efficient DCN network. See the ONS 15454 user documentation for details.

The following table defines the circuit terms and options that are used throughout this chapter.

Table 7-1 Circuit Terms and Options

Circuit Option	Description
Link	Represents a topological relationship between two physical termination points (PTPs) for a particular layer rate. The possible set of layer rates is determined by the layer rates terminated by the PTP. For example, an OC-N port will terminate a physical layer rate and a SONET layer rate.
Circuit	Represents an end-to-end connection between two or more CTPs.
Cross-connection	A (normally flexible) connection between two CTPs within the same NE.

Table 7-1 Circuit Terms and Options (continued)

Circuit Option	Description
Link connection	An inflexible (or fixed) connection between two CTPs that are contained by two PTPs connected by a link. It represents a portion of the transport capacity of a link, such as an STS-1 channel within an OC-N link.
PTP	A termination point that is the actual or potential endpoint of a link that might be abstracted as a PTP. It is the representation of a physical port.
CTP	Represents the actual or potential endpoint of a cross-connection, link connection, or circuit. A CTP is contained within a PTP. In some cases, there is a single CTP associated with a PTP, such as with a DS-1 PTP. There could also be multiple CTPs, such as with STS-1 or STS-Nc CTPs contained within an OC-N PTP.
Source	The circuit source is where the circuit enters the network.
Destination	The circuit destination is where the circuit exits the network.
Automatic circuit routing	Prime Optical routes the circuit automatically on the shortest available path based on routing parameters and bandwidth availability.
Manual circuit routing	Manual routing allows you to choose a specific path, not just the shortest path chosen by automatic routing. You can choose a specific STS or VT for each circuit segment for SONET nodes, or a specific VC4, VC3, or VC12 for each circuit segment for SDH nodes. You can also create circuits from work orders prepared by an OSS such as the Telcordia TIRKS system.
Low-order tunnel	Low-order tunnels allow VC3 and VC12 circuits to pass through an SDH node without using cross-connect card (XC10G and XCVXL) resources. Low-order circuits using tunnels use cross-connect capacity only at the source and destination nodes. One low-order tunnel can carry three VC3s, and each VC3 can carry 21 VC12s. One tunnel can carry one VC3 circuit span and 42 VC12 circuit spans, and each VC3 is a separate container that can contain a VC3 circuit span or 21 VC12 circuit spans.
Low-order aggregation point	Low-order aggregation points (LAPs) allow low-order VC12 and VC3 circuits to be aggregated into a VC4 for handoff to non-ONS networks or equipment, such as interoffice facilities (IOFs), switches, or digital access cross-connect systems. The VC4 grooming end of the LAP requires an STM-N card. LAPs can be created on MS-SPRings, 1-1, or unprotected nodes, but cannot be created on subnetwork connection protection (SNCP) nodes.
VT tunnel	VT tunnels allow VT1.5 circuits to pass through a SONET node without using cross-connect resources. VT circuits using VT tunnels use cross-connect capacity only at the source and destination nodes. One VT tunnel can carry 28 VT1.5 circuits.
VT aggregation point	VT aggregation points (VAPs) allow VT circuits to be aggregated into an STS for handoff to non-ONS networks or equipment, such as IOFs, switches, or digital access cross-connect systems. VAPs reduce VT matrix resource utilization at the node where the VT1.5s are aggregated onto the STS. This node is called the STS grooming end. The STS grooming end requires an OC-N, EC-1, or DS3XM-6 card. VT aggregation points can be created on BLSR, 1+1, or unprotected nodes, but cannot be created on UPSR nodes.

7.2.1 Circuit Table Launch Points

The following table describes the various launch points and the expected behavior for the Circuit table.

Table 7-2 Circuit Table Launch Points and Expected Behavior

Selection	Circuit Table
Domain Explorer > Configuration > Circuit Table	For a top-level root node or group nodes in the Domain Explorer, all circuits that have NEs in the domain as source/destination or pass-through NEs. For an NE node in the Domain Explorer, all circuits that have the selected NE node as the source/destination or pass-through NE.
Subnetwork Explorer > Configuration > Circuit Table	For a top-level root node or subnetwork nodes in the Subnetwork Explorer, all circuits that have NEs in the subnetwork as source/destination or pass-through NEs. For an NE node in the Subnetwork Explorer, all circuits that have the selected NE node as the source/destination or pass-through NE.
Domain Explorer > Edit > Find **Note** Select Sonet Circuits or SDH Circuits from the Object Type drop-down list.	All SONET or SDH circuits that have NEs in the domain as source/destination or pass-through NEs.
Circuit Report > Circuit > Circuit Table	Displays the Circuit Table for the selected circuit.
L2 Topology Table > Configuration > Circuits	Displays the Circuit Table for the selected circuit.

7.2.2 Viewing the Circuit Table

The Circuit table shows circuit information for all circuits that make up a topology. A circuit describes a fixed-size bandwidth pipe that is fully cross-connected from one user-defined source point (node, slot, or port) to a second user-defined destination point across some number of node-to-node optical spans (zero if the circuit is local to a single NE).

An endpoint can be an actual physical drop port (DS-1, DS-3, and so on) or an STS-n or VT1.5 channel in an optical line. A multicast circuit consists of circuit spans that have one source endpoint and a sequence of destination endpoints.

Note See Appendix A, "Icons and Menus Displayed in Prime Optical" for details of all the icons displayed in this window.

To launch the Circuit table, do any of the following:

- Select a node in the Domain Explorer tree or Network Map and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Circuit Table**.
- Right-click a node in the Domain Explorer tree and choose **Circuit Table**.
- (For CTC-based NEs) Open the Layer 2 Topology table and choose **Configuration > Circuits**.

Note When launching the Circuit table in a large or high-end network setup and on a larger scope (for example, for the Domain Explorer), a database timeout can occur due to the high volume of data being retrieved. As a workaround, launch the Circuit table on a smaller scope.

The following table describes the fields in the Circuit table.

Table 7-3 Field Descriptions for the Circuit Table

Column Name	Description
Circuit Name	Displays the name of the selected circuit. **Note** If there are multiple circuits with the same name displayed in the Circuit table, the label *Duplicate* appears in this column.
Note	Displays comments that have been entered for the selected circuit, and allows you to add additional comments.
Source NE: Module Type/Physical Loc/Interface	Displays the NE ID and module type at the span source, the slot and port name and numbers (physical location), and the STS number (interface). You can sort this column in ascending or descending order. The sort order is based on the NE ID and physical location.
Destination NE: Module Type/Physical Loc/Interface	Displays the NE ID, the module type at the destination, the slot and port name and numbers (physical location), and the STS number (interface). You can sort this column in ascending or descending order. The sort order is based on the NE ID and physical location.
Circuit Type	Displays the type of circuit selected. SONET circuit types are STS, VT, VT Aggregation, VT Tunnel, VT VCAT (shown as VT-v), STS VCAT (shown as STS-v), DWDM optical channel network connection (OCHNC), DWDM optical channel client connection (OCHCC), optical channel trail (OCHTRAIL), and OCHNC DCN. SDH circuit types are HOP, LOP, LOPA, LOPT, HOV (HO VCAT), LOV (LO VCAT), OCHNC, OCHCC, OCHTRAIL, and OCHNC DCN.
Acpt Threshold	Displays the optical validation acceptance threshold value set for the GMPLS circuit.
Optical Value	Displays the optical validation result for the GMPLS circuit.

Table 7-3 Field Descriptions for the Circuit Table (continued)

Column Name	Description
Circuit Size	Displays the size of the circuit: • SONET circuit sizes are VT1.5, VT2, STS 1, STS 3c, STS 6c, STS 9c, STS 12c, STS 24c, STS 48c, STS 96c, STS 192c, STS-1-*n*v, STS-3c-*n*v, STS-12c-*n*v, and VT1.5-*n*v. • SDH circuit sizes are VC11, VC12, VC3, VC4, VC4-2c, VC4-3c, VC4-4c, VC4-8c, VC4-16c, VC4-32c, VC4-64c, VC4-*n*v, VC4-4c-*n*v, and VC3-*n*v. **Note** *n* can be any value from 0 through 256 (0 is valid when all members of a VCAT circuit are deleted). • FC/FICON circuit sizes are 10GFC, 4GFC, 2GFC, 1GFC, 4GFiCon, 2GFiCon, and 1GFiCon. • Data/Storage circuit sizes are ESCON, ETR-CLO, ISC-PEER, ISC3-PEER-1G, ISC-PEER-2G, ISC-COMPACT, ISC-CHANNEL1, and InfiniBand. • Video circuit sizes are HVDT, SD1/D1, DV6000, and DVB-ASI. • OCHNC circuit size is fixed as *Equipment Not Specific*. • OCHCC circuit sizes are STM1, STM4, STM16, STM64, OC3, OC12, OC48, OC192, 10GE, 1GE, 10GFC, 4GFC, 2GFC, 1GFC, 4GFiCon, 2GFiCon, 1GFiCon, ESCON, ETR-CLO, ISC-PEER, ISC3-PEER-1G, ISC-PEER-2G, ISC-COMPACT, HDVT, SD1/D1, DV6000, or Pass Through. **Note** Not all circuit sizes are supported on all NE releases.
Circuit Direction	Indicates whether the circuit carries unidirectional (one-way) or bidirectional (two-way) traffic.
Customer ID	Optional text field that displays the customer ID of the circuit.
Service ID	Optional text field that displays the service ID of the selected circuit.
Circuit Status	Displays the status of the selected optical circuit: • Discovered—The circuit is completely configured in the network; all components are in place and a complete path exists from the circuit source to the circuit destination. • Partial—The circuit is not complete; one or more cross-connections are not in place or one of the spans is missing. • Creating—Prime Optical is creating the circuit. • Deleting—Prime Optical is deleting the circuit. • Discovered_TL1—A TL1-created circuit or a TL1-like Prime Optical-created circuit is complete and has upgradable cross-connects. A complete path from source to destination(s) exists. • Partial_TL1—A TL1-created circuit or a TL1-like Prime Optical-created circuit with upgradable cross-connects is missing a cross-connect, and a complete path from source to destination(s) does not exist. The circuit cannot be upgraded until the missing cross-connects are in place. • Partial (Split)—The circuit involves NEs that belongs to different network partitions and cannot be fully discovered by Prime Optical.

Table 7-3 Field Descriptions for the Circuit Table (continued)

Column Name	Description
Circuit Service State	The circuit service state is an aggregate of the cross-connect states within the circuit. SONET, SDH, and DWDM circuits have different values. For SONET circuits, values are: • In Service (IS)—All cross-connects in a circuit are in the In Service and Normal (IS-NR) service state. • Out of Service (OOS)—All cross-connects in a circuit are in an Out of Service (OOS) service state, such as Out of Service and Management, Maintenance (OOS-MA,MT); Out of Service and Management, Disabled (OOS-MA,DSBLD); or Out of Service and Autonomous, Automatic In Service (OOS-AU,AINS). • OOS-PARTIAL—PARTIAL is appended to the OOS circuit service state when circuit cross-connect states are mixed and not all in IS-NR. The OOS-PARTIAL state can occur during automatic or manual transitions between states. For example, OOS-PARTIAL appears if you assign the IS,AINS administrative state to a circuit with DS-1 or DS3XM cards as the source or destination. Some cross-connects transition to the IS-NR service state, while others transition to OOS-AU,AINS. OOS-PARTIAL can appear during a manual transition caused by an abnormal event such as a CTC crash or communication error, or if one of the cross-connects could not be changed. The OOS-PARTIAL circuit state does not apply to OCHNC circuit types. For SDH circuits, values are: • Unlocked—All cross-connects in a circuit are in the Unlocked-enabled service state. • Locked—All cross-connects in a circuit are in a Locked state (such as Locked-enabled,maintenance; Unlocked-disabled,automaticInService; or Locked-enabled,disabled). • Locked-partial—Partial is appended to the Locked circuit service state when circuit cross-connect states are mixed and not all in the Unlocked-enabled service state. The Locked-partial state can occur during automatic or manual transitions between states. The Locked-partial service state can appear during a manual transition caused by an abnormal event such as a CTC crash or communication error, or if one of the cross-connects could not be changed. The Locked-partial circuit state does not apply to OCHNC circuit types.

Table 7-3 Field Descriptions for the Circuit Table (continued)

Column Name	Description
Circuit Service State *(continued)*	For DWDM circuits, OCHCCs, OCH trails, and OCHNCs occupy three different optical layers. Each OCH circuit has its own administrative and service states: • The OCHCC service state is the sum of the OCHCC service state and the OCH trail service state. When creating an OCHCC circuit, you can specify an initial state for both the OCHCC and the OCH trail layers, including the source and destination port states. The ANSI/ETSI administrative states for the OCHCC circuits and connections are: – IS/Unlocked – IS,AINS/Unlocked,AutomaticInService – OOS,DSBLD/Locked,disabled • OCH trail ANSI/ETSI administrative states include: – IS/Unlocked – IS,AINS/Unlocked,automaticInService – OOS,DSBLD/Locked,disabled • The OCHNC circuit states are not linked to the OCHCC circuit states. The administrative states for the OCHNC circuit layer are: – IS,AINS/Unlocked,AutomaticInService – OOS,DSBLD/Locked,disabled
Is Monitor	A value of True means that the circuit is a monitor circuit. A value of False means that the circuit is not a monitor circuit.

Table 7-3 Field Descriptions for the Circuit Table (continued)

Column Name	Description
Circuit Protection Type	Indicates the circuit protection scheme. Values are: • 2F BLSR—The circuit is protected by a 2-fiber bidirectional line switch ring (BLSR). • 4F BLSR—The circuit is protected by a 4-fiber BLSR. • BLSR—The circuit is protected by both 2-fiber and 4-fiber BLSR. • UPSR—The circuit is protected by UPSR. • DRI—The circuit is protected by a UPSR dual ring interconnection (DRI). • 1+1—The circuit is protected by a 1+1 protection group. • Y-Cable—The circuit is protected by a transponder or muxponder card Y-cable protection group. • Protected—The circuit is protected by diverse SONET topologies; for example, a BLSR and a UPSR, or a UPSR and 1+1. • Unprotected—The circuit is not protected. • 2F-PCA—The circuit is routed on a protection channel access (PCA) path on a 2-fiber BLSR. PCA circuits are unprotected. • 4F-PCA—The circuit is routed on a PCA path on a 4-fiber BLSR. PCA circuits are unprotected. • PCA—The circuit is routed on a PCA path on both 2-fiber and 4-fiber BLSRs. PCA circuits are unprotected. • SPLITTER—The circuit is protected by a splitter protected transponder (TXPP_MR_2.5G or 2.5G_DMP). • Unknown—Circuit protection types appear in the Circuit Protection Type column of the Circuit table when the circuit status is Discovered. If the circuit is not discovered, the protection type is *Unknown*. • Lost—The circuit was protected, but the protection has been lost due to changes in the network.
Description	Displays a description of the selected circuit.
No. of VLANs	Displays the number of VLANs associated with the circuit.
No. of SPANs	Displays the number of spans for each contiguous concatenation (CCAT) circuit. For VCAT circuits, *N/A* is displayed. You must launch the member table for the parent VCAT to see the number of spans per member VCAT.
Is VCAT or Member Circuit	A value of True means that the circuit is a VCAT circuit. A value of False means that the circuit is a normal CCAT circuit.
OCHNC Wavelength	Indicates the wavelength provisioned for the OCHNC, in nanometers (nm).
OCHNC Direction	Indicates the direction of the OCHNC. Values are east-to-west, west-to-east, or N/A.
VCAT Member State	For VCAT members, indicates whether the members are enabled and active or temporarily disabled. When VCAT members are enabled and active, the value is In Group. If any of the members are disabled temporarily, the value changes to Out of Group. For non-VCAT members, the value of this field is always N/A.

Table 7-3 Field Descriptions for the Circuit Table (continued)

Column Name	Description
Circuit Alias Name	Displays the alias name of the circuit.
Restoration Status	Indicates the status of the circuit. Values are: • None—Circuit does not have any active restoration facility. **Note** A value of "None" does not indicate that the circuit is not restorable. • Restoring—Circuit is restoring and the system is searching for a new optical path. • Restored—Circuit has been successfully restored and a new optical path has been found for the circuit. • Failed—Restoration facility has failed to retrieve a new optical path for the circuit. • Revertible—Circuit has been successfully restored and can be reverted to the original optical path by a specific user action. **Note** The Revertible status can be reached only if the revert option value is Manual.

Note If a card is upgraded or changed on an NE and an existing circuit terminates on the changed card, the Circuit table display does not reflect the new card type for the circuit until Prime Optical next reads the circuit information from the network. You can force all circuits involved with the upgraded card in the Circuit table to update by marking the NE as Out of Service and then In Service.

Caution For TL1 circuits, if you simultaneously mark all of the NEs involved in the circuit as Out of Service, Prime Optical loses the EMS attributes (such as circuit alias, customer ID, and service ID). If you later mark all of the NEs involved in the TL1 circuit as In Service, the circuits are discovered, but the EMS attributes remain missing. To retain EMS attributes, you must upgrade the TL1 circuits to regular CTC circuits before adding EMS attributes and marking the NEs as Out of Service. To do this, select the TL1 circuit in the Circuit table and choose **Configuration > Reconfigure Circuit(s)**.

Note Circuit names are obtained from:

- The source NE (for circuits created in Prime Optical or CTC)
- Cross-connection names (for circuits created via TL1, or if the source NE is not discovered)

However, some NE versions do not support cross-connection names. For these NEs, circuits created in CTC are always discovered with the name "Unknown" in Prime Optical. Also, if the source NE is not connected, and if the only NEs available in Prime Optical are those NE versions that do not support cross-connection names, circuits created with CTC or Prime Optical have the name "Unknown" until the source NE is discovered.

7.2.3 Creating Circuits Using the Circuit Wizard

The Create Circuit wizard (**Configuration > Create Circuit**) allows you to create circuits on CTC-based NEs. Use the Create Circuit wizard to create an end-to-end circuit through a subnetwork. A subnetwork is defined as a set of NEs that are interconnected directly or indirectly through links known by Prime Optical. Prime Optical supports circuit provisioning across a heterogeneous network. Establish a circuit by specifying the A and Z termination points (TPs). You can create multiple circuits using the Create Circuit wizard; however, for VT tunnel circuits, the number you can create is limited by the bandwidth available on the VT tunnel being used. The maximum number of VT circuits that can be routed through a VT tunnel is 28.

Caution When adding CTC-based circuits, examine the links in the network to ensure correct operation. If any links are down, verify that the ports are not data communications channel (DCC) enabled. For information about viewing links, see 3.6.3 Viewing the Link Table, page 3-34.

Note You can create new circuits across subnetworks. To do so, you must first disable automatic grouping of NEs in the Control Panel. See 4.4.8 Configuring Application-Specific Parameters, page 4-57 for more information.

Note In earlier CTM releases, circuit creation failed if you tried to use automatic routing to create a circuit with 20 or more spans. In CTM R9.1 and later, you can use SQL to configure the circuit-autorouting-creation-timeout property in the Prime Optical database. This property increases the reply timeout for CORBA requests when you use automatic routing to create a complex circuit that uses 20 or more spans. You cannot configure the circuit-autorouting-creation-timeout property in the Prime Optical GUI; rather, you must use SQL to configure the value in the CTM_CONFIG_TABLE in the Prime Optical database. The range is from 0 to 600 seconds; the default is 150 seconds. Note that you can configure the value as high as 2,147,483,647 seconds; however, Prime Optical considers anything higher than 600 seconds as invalid. Also, a value of 0 (zero) indicates no timeout (or an instantaneous reply from the server), which is impossible in an actual application. Therefore, Prime Optical ignores a zero value or anything higher than 600 seconds and uses the default value of 150 seconds instead. Configuring the circuit-autorouting-creation-timeout property is helpful in large, complex network topologies when circuits involve 20 or more spans. For more information, see the *Cisco Prime Optical 9.6.3 Database Schema*.

The following table describes the launch points and the expected behavior for the Create Circuit wizard.

Table 7-4 Create Circuit Wizard Launch Points and Expected Behavior

Launch Point	Expected Behavior
Source and destination NE nodes in the Domain Explorer or Subnetwork Explorer	Select the source NE in the Domain Explorer or Subnetwork Explorer and choose **Configuration > Create Circuit** (or right-click the NE and choose **Create Circuit**). The pointer changes to a plus (+) symbol; select the destination NE. The destination NE must be in the same network partition as the source. The Create Circuit wizard opens. Source and destination NEs are preset to the selected source and destination. **Note** If the **Esc** key is pressed while the plus symbol is enabled, the operation is canceled and the plus symbol returns to a pointer.
Source and destination NE nodes in the Network Map	Select the source NE in the Network Map and choose **Configuration > Create Circuit** (or right-click the NE and choose **Create Circuit**). The pointer displays a line extending from the source NE; select the destination NE. The Create Circuit wizard opens. Source and destination NEs in the Create Circuit wizard are preset to the selected source and destination NE nodes in the Network Map.
Configuration > Create Circuit in the Circuit table	Choose **Configuration > Create Circuit** in the Circuit table. The Create Circuit wizard opens. Select source and destination nodes. Destination nodes are filtered based on the source node. Source and destination nodes must be in the same network partition.
Configuration > Create Circuit in the NE Explorer	Choose **Configuration > Create Circuit** in the NE Explorer for CTC-based NEs. The Create Circuit wizard opens with the selected NE as the source node. Source and destination nodes must be in the same subnetwork.

The following table describes the various types of circuits that can be created. The type of circuit that you can create depends on the NEs that you select as the source and destination.

Table 7-5 Circuit Types that Can Be Created Using the Create Circuit Wizard

Task	Description	See
Create an STS (including Ethernet), VT, VT tunnel, or VT aggregation circuit	—	7.2.3.1 Creating an STS (Including Ethernet), STS-V, VT, VT-V, VT Tunnel, or VT Aggregation Circuit, page 7-30
Create a VCAT circuit	You can create regular or open-ended VCAT circuits (STS-v, VT-v, VC_HO_PATH_VCAT_CIRCUIT, or VC_LO_PATH_VCAT_CIRCUIT).	7.2.3.2 Creating a Regular or Open-Ended VCAT Circuit, page 7-37
Create a VC_HO_path circuit	You can create unidirectional or bidirectional, revertive or nonrevertive, high-order path circuits.	7.2.3.3 Creating a VC_HO_Path_Circuit, page 7-45
Create a VC_LO_path circuit	You can create unidirectional or bidirectional, revertive or nonrevertive, low-order path circuits.	7.2.3.4 Creating a VC_LO_Path_Circuit, page 7-51
Create a VC low path tunnel connection	—	7.2.3.5 Creating a VC_LO_Path_Tunnel, page 7-57
Create a VC low path aggregation connection	—	7.2.3.6 Creating a VC_LO_Path_Aggregation Circuit, page 7-62

Table 7-5 Circuit Types that Can Be Created Using the Create Circuit Wizard (continued)

Task	Description	See
Create a DWDM optical channel connection	—	7.2.3.7 Creating a DWDM OCHNC—ONS 15454 MSTP, page 7-67
Create a DWDM optical channel client connection	—	7.2.3.8 Creating a DWDM OCHCC—ONS 15454 MSTP, page 7-72
Create a DWDM optical channel trail	—	7.2.3.9 Creating a DWDM OCH Trail Circuit—ONS 15454 MSTP, page 7-76
Create a monitor circuit	Use the Circuit table to create new circuits from the Prime Optical database and the associated cross-connections between NEs.	7.2.3.10 Creating a Monitor Circuit—CTC-Based NEs, page 7-80
Create a unidirectional drop circuit	Use the Create Drop wizard to create a new protected or unprotected unidirectional circuit drop.	7.2.3.11 Creating a Unidirectional Drop Circuit—CTC-Based NEs, page 7-84
Create a G1000-4 circuit	Provision G1000-4 point-to-point circuits and Ethernet manual cross-connects.	7.2.3.12 Creating G1000-4 Circuits, page 7-85
Create an E-series circuit	Create these configurations and Ethernet manual cross-connects.	7.2.3.13 Creating E-Series Circuits, page 7-97
Create a BLSR DRI or MS-SPRing DRI circuit	—	7.2.3.14 Creating a BLSR DRI or MS-SPRing DRI Circuit Automatically, page 7-127 7.2.3.15 Creating a BLSR DRI or MS-SPRing DRI Circuit Manually, page 7-132

Note Low-order (LO) circuit options are not available for LO_VCAT circuits. Routing a LO_VCAT circuit, by selecting LO routing options to create a LAP/VC tunnel automatically, is not supported. If the LAP/VC tunnel already exists, and bandwidth is available, the LAP/VC tunnel is used to route LO_VCAT circuits.

Note When you create a low-order circuit and choose to create a tunnel automatically (by selecting the VT Tunnel on Transit Nodes option), the alias for the tunnel circuit will be the same as that provided for the low-order circuit. When you create multiple low-order circuits, the alias for the tunnel will be the same as the alias of the first low-order circuit.

The following table describes the fields in the Create Circuit wizard for optical devices.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices

Field	Description
Navigation Pane	
The navigation pane on the left side of the Create Circuit wizard tells you where you are in the process of creating the circuit. The list of tasks shown initially is the default list of all possible tasks. As you move through the circuit creation, you are taken to the appropriate task. You can use the navigation pane to jump quickly from one task to the next, or to an already visited task. Using the navigation pane is faster than using the Back and Next buttons, because you can jump over multiple panes in one step versus clicking Back or Next and moving through the panes sequentially. **Tip** As you proceed through the wizard, the panes you have visited are highlighted in white and identified by a number. Panes that are not applicable to the current circuit creation sequence are shown in strikethrough italics. **Tip** Click the Maximize button to expand the Create Circuit wizard. After you expand the Create Circuit wizard, the Maximize button changes to the Reset Size button. Click the Reset Size button to reduce the Create Circuit wizard to its original size.	

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Type	
Type	Select the type of circuit to create from the Type field. **Note** The circuit type selected is displayed (dimmed) in other panes in the Create Circuit wizard. To change the circuit type you must return to the Type pane and make a new selection. SONET and SDH circuits have different types. For SONET circuits, values are: • OCHCC; see 7.2.3.8 Creating a DWDM OCHCC—ONS 15454 MSTP, page 7-72 • OCHNC; see 7.2.3.7 Creating a DWDM OCHNC—ONS 15454 MSTP, page 7-67 • OCHTRAIL • STS (including Ethernet circuits) • STS-v • VT • VT Aggregation • VT Tunnel • VT-v For SDH circuits, values are: • OCHCC • OCHNC • OCHTRAIL • VC_HO_PATH_CIRCUIT • VC_HO_PATH_VCAT_CIRCUIT • VC_LO_PATH_AGGREGATION • VC_LO_PATH_CIRCUIT • VC_LO_PATH_TUNNEL • VC_LO_PATH_VCAT_CIRCUIT **Note** The available circuit types are based on the types selected for the user during user creation.
Number of Circuits	Enter the number of circuits that you want to create.
Auto-Ranged	If you are creating multiple circuits with the same slot and sequential port numbers, you can use Auto-Ranged to create the circuits automatically. The Auto-Ranged check box is checked automatically for multiple circuits.
For VC3 Port Grouping Only	(For SDH tunnel circuits only) Check this check box to create VC low-order path tunnels for port grouping. Using these circuits, VC4 tunnels can transport VC3 signal rates. Three ports form a port group. For example, in one E3 or one DS3i card, there are four port groups: Ports 1–3 = PG1, ports 4–6 = PG2, ports 7–9 = PG3, and ports 10–12 = PG4.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Attributes	
(fields depend on the circuit type)	
Circuit	
Name	Enter a unique name for the new circuit. The circuit name is a free-format string, up to 80 ASCII characters. In earlier Prime Optical releases, the maximum circuit length was 48 ASCII characters. For VCAT circuits, the maximum circuit name length is 44 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit. **Note** This field is mandatory if the GMPLS (for OCHxx circuits only) check box is checked. If you enter a character that is not supported by a specific router, a warning dialog box appears before you proceed to the Source tab.
Circuit Alias	Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
Description	Enter a description for the new circuit, up to 256 ASCII characters.
Type	*Display only.* Indicates the type of circuit that you selected in the Type pane. **Note** To change the circuit type you must return to the Type pane and make a new selection.
Size Group	Choose a size for the group that you want to provision. The following options are available: • SONET • SDH • Ethernet • FC/FICON • Data/Storage • Video • Other

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Size	Specify the size of the circuit. SONET circuit sizes are VT 1.5, VT2, STS-1, STS-3c, STS-6c, STS-9c, STS-12c, STS-18c, STS-24c, STS-36c, STS-48c, STS-96c, and STS-192c. SDH circuit sizes are VC11, VC12, VC3, VC4, VC4-2c, VC4-3c, VC4-4c, VC4-6c, VC4-8c, VC4-12c, VC4-16c, VC4-32c, and VC4-64c. If OCHNC is selected in Type, the OCHNC circuit size is Equipment Not Specific. OCHCC circuit sizes are STM1, STM4, STM16, STM64, OC3, OC12, OC48, OC192, 10GE, 1GE, 10GFC, 4GFC, 2GFC, 1GFC, 4GFiCon, 2GFiCon, 1GFiCon, ESCON, ETR-CLO, ISC-PEER, ISC3-PEER-1G, ISC-PEER-2G, ISC-COMPACT, HDVT, SD1/D1, DV6000, or Pass Through. For supported circuit sizes on Ethernet cards, see the *Cisco ONS 15454 Reference Manual*. For single-card EtherSwitch, only STS-1, STS-3c, STS-6c, and STS-12c apply. For multicard EtherSwitch, only STS-1, STS-3c, and STS-6c apply. FC/FICON circuit sizes are 10GFC, 4GFC, 2GFC, 1GFC, 4GFiCon, 2GFiCon, and 1GFiCon. Data/Storage circuit sizes are ESCON, ETR-CLO, ISC-PEER, ISC3-PEER-1G, ISC-PEER-2G, ISC-COMPACT, ISC-CHANNEL1, and InfiniBand. Video circuit sizes are HVDT, SD1/D1, DV6000, and DVB-ASI. **Note** The available circuit sizes are based on the size limitation imposed on the user during user creation.
OCHNC Wavelength	If OCHNC is selected in Type, the wavelength of the OCHNC is selected here. If OCHNC is not selected in Type, this option is not available.
Band	(OCHNC circuits only) Choose the band that you want to provision.
Use OCHNC Direction	Choose whether or not to specify the OCHNC direction. Select the check box to allow you to specify the circuit direction (for NEs up to and including R6.0) in the OCHNC Direction drop-down list. If the check box is unchecked (for R7.0 NEs) the OCHNC Direction drop-down list is disabled.
Channel Group	Choose the channel group that you want to provision.
OCHCC Wavelength	If OCHCC is selected in Type, the wavelength of the OCHCC is selected here. If OCHCC is not selected in Type, this option is not available.
OCHNC Direction	If OCHNC is selected in Type, the east-to-west or west-to-east direction of the OCHNC is selected here. If OCHNC is not selected in Type, this option is not available.
Bidirectional	Check this check box to create a two-way circuit; uncheck it to create a one-way circuit.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
State	Select an administrative state for the new circuit. SONET and SDH circuits have different values. For SONET circuits, values are: • IS (In Service)—The circuit is in service and able to carry traffic. • IS AINS (In Service–Auto In Service)—Alarm reporting is suppressed, but the circuit is able to carry traffic. • OOS DSBLD (Out of Service–Disabled)—The circuit is out of service and unable to carry traffic. • OOS_MT (Out of Service–Maintenance)—The circuit is in maintenance state. The maintenance state does not interrupt traffic flow; it suppresses alarms and conditions and allows loopbacks to be performed on the circuit. For SDH circuits, corresponding values are: • Unlocked • Unlocked,autoInService • Locked,disabled • Locked,maintenance
Apply to Source/Destination Ports, If Allowed	Check this check box to apply the selected state to the source and destination ports.
Trunk Filtering *(available for OCHCC circuit type only)*	
G.709 OTN	Disables or enables the G.709 OTN feature. Check this check box to filter the list of circuits to display only G.709 OTN-compatible circuits.
FEC	Disables or enables forward error correction. OTN must be enabled before you can enable FEC.
SF BER	Allows you to enter the signal fail bit error rate.
SD BER	Allows you to select the signal degrade bit error rate.
Mapping	The card can perform multiplexing per ITU-T G.709. The ODUk (client SONET/SDH payload) can be mapped to the Optical Channel (OTUk) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting.
Proactive Protection Attributes	
Proactive Protection	Allows you to enable or disable the proactive protection that informs the CRS-1 routers of incoming Forward Error Correction (FEC) errors. By default, proactive protection is disabled.
Trigger Threshold	The maximum BER above which the Fast Re Route (FRR) is triggered. The default value for Enhanced FEC (EFEC) and FEC is 1E-3.
Revert Threshold	The BER value below which the FRR indication is switched off. The default value for EFEC and FEC is 1E-4. **Note** The revert threshold value cannot be higher than the trigger threshold value.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Trigger Window	The time period for which the BER value is monitored to check whether it is higher than the trigger threshold. If the BER value is higher than the trigger threshold, an FRR request is triggered. The default value for EFEC and FEC is 30 ms. The valid trigger window range is from 1 to 10000.
Revert Window	The time period for which the BER value is monitored to check whether it is less than the revert threshold. If the BER value is below the revert threshold, the FRR indication given to the routers is removed. The default value for EFEC and FEC is 2000 ms. The valid revert window range is from 1 to 10000.
Protection	
Protected	If checked, protection is enabled for OCHNC circuits. **Note** The protected OCHNC must be bidirectional; the Bidirectional check box in the Circuit area must be checked. If the Use OCHNC Direction check box is checked, the Protected check box is dimmed.
Customer Information	
Customer ID	Optional text field that displays the customer ID of the circuit. The customer ID can contain 0 to 256 alphanumeric and special characters.
Service ID	Optional text field that displays the service ID of the selected circuit. The service ID can contain 0 to 256 alphanumeric and special characters.
VCAT	
Symmetric	*Display only.* Provisions the same number of members in both directions. For STS VCAT circuits, this check box is checked by default. Members use the same set of time slots but in opposite directions.
Open VCAT	Check this check box to create an open-ended VCAT circuit. **Note** You cannot use open-ended VCAT circuits to create L2 topologies.
Member Size	Select a size for each VCAT member.
Number of Members	Specify the number of members to be configured for the VCAT circuit.
Mode	Choose the protection mode for the VCAT circuit: • None—Provides no protection. A failure on one member causes the entire VCAT circuit to fail. • SW-LCAS—Allows the VCAT circuit to adapt to member failures and keep traffic flowing after failures at a reduced bandwidth. • LCAS—Uses a signaling protocol where the members in a virtual concatenation group (VCG) can be dynamically changed without interrupting the operation of uninvolved members. If implemented correctly, there are no errors. LCAS allows the source and destination nodes of a VCG to signal to each other so that the addition or deletion of a member from the VCG can be synchronized without errors.
Protection	
Protected	Check this check box to specify that circuit endpoints have to be selected only from cards that have embedded splitter-type protection.
Protected Drops (Non-Ethernet)	Specify whether protected drops are indicated. If selected, this option restricts the set of displayed source or destination termination points to those in 1:1, 1:n, or 1+1 protection groups.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Provision Working Go and Return on Primary Path	Check this check box to provision SNCP/UPSR protection routes in a Go and Return fashion as detailed in ITU-T G.841, to avoid too long a delay on another direction of traffic. This feature applies only to bidirectional UPSR/SNCP circuits. Unidirectional UPSR/SNCP circuits are not affected and the shortest path to the destination is always used as the working path.
Revertive	Specify whether traffic is reverted back to its original path when the conditions that diverted the circuit to the protect path are repaired. If you do not choose Revertive, traffic remains on the protect path.
Reversion Time	Specify the amount of time (in minutes) after which traffic reverts back to the original working path when conditions that caused the switch are cleared. The range is from 0.5 to 12.0 minutes. The Cisco default is 5 minutes.
SF Threshold *(for SONET circuits only)*	Set the UPSR path-level signal failure (SF) threshold. **Note** This field is visible only for point-to-point topologies.
SD Threshold *(for SONET circuits only)*	Set the UPSR path-level signal degrade (SD) threshold. **Note** This field is visible only for point-to-point topologies.
Switch on PDI-P *(for SONET circuits only)*	Specify whether traffic should switch based on a received STS payload defect indication. **Note** This field is visible only for point-to-point topologies.
Source	
(fields depend on the NE selected and the circuit type)	
Use Secondary Source	(For DRI, open UPSR, and open-ended SNCP circuits) Check this check box to define a secondary source. Then, specify the slot, port, STS, DS-1, or VT for the secondary source. **Note** The Use Secondary Source check box is disabled when OCH-NC is selected as the circuit type.
NE ID	Select from the list of available NE IDs to specify the source NE ID.
Subnetwork ID	*Display only.* Displays the ID of the subnetwork associated with the circuit source.
Slot	Specify the source slot (only for SONET/SDH circuits).
Port	Specify the source port (only for SONET/SDH circuits).
STS	(For SONET circuits) Specify the source STS.
VT	(For SONET circuits) Specify the source VT.
DS1	(For SONET circuits) Specify the source DS-1.
VC4	(For SDH circuits) Specify the source VC4.
VC3	(For SDH circuits) Specify the source VC3.
VC11	(For SDH circuits) Specify the source VC11.
VC12	(For SDH circuits) Specify the source VC12.
TUG3	(For SDH circuits) Specify the source TUG3.
TUG2	(For SDH circuits) Specify the source TUG2.
Destination	
(fields depend on the NE selected and the circuit type)	

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Use Secondary Destination	(For DRI, open UPSR, and open-ended SNCP circuits) Check this check box to define a secondary destination. Then, specify the slot, port, STS, DS-1, or VT for the secondary destination. **Note** The Use Secondary Destination check box is disabled when OCH-NC is selected as the circuit type.
NE ID	Select from the list of available TPs to specify the destination TP.
Subnetwork ID	*Display only.* Displays the ID of the subnetwork associated with the circuit destination.
Slot	(For SONET and SDH circuits) Specify the destination slot.
Port	(For SONET and SDH circuits) Specify the destination port.
STS	(For SONET circuits) Specify the destination STS.
VT	(For SONET circuits) Specify the destination VT.
DS1	(For SONET circuits) Specify the destination DS-1.
VC4	(For SDH circuits) Specify the destination VC4.
VC3	(For SDH circuits) Specify the destination VC3.
VC11	(For SDH circuits) Specify the destination VC11.
VC12	(For SDH circuits) Specify the destination VC12.
TUG3	(For SDH circuits) Specify the destination TUG3.
TUG2	(For SDH circuits) Specify the destination TUG2.
OCHxx Options	
G.709 OTN	Disable or enable the G.709 OTN feature. Check this check box to filter the list of circuits to display only G.709 OTN-compatible circuits.
FEC	Disable or enable forward error correction. G.709 OTN must be enabled before you can enable FEC.
SD BER	Set the signal degrade bit error rate.
Mapping	The card can perform multiplexing per ITU-T G.709. The ODUk (client SONET/SDH payload) can be mapped to the optical channel (OTUk) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting.
Revert/Reversion Time	(For protected circuits) Select the splitter-type protection.
Members Destination *(available only for open-ended VCAT circuits)*	
Autoranged	Check this check box if you want to specify only the first member destination, and Prime Optical will automatically choose the remaining destinations. (Note that you will lose previous selections if you switch to Autoranged.) When Autoranged is enabled, available consecutive endpoints are returned, starting from the endpoint that you selected. The destination endpoints can be on different ports only if the source endpoint supports split routing. If you want to specify all of the destinations, leave the Autoranged check box unchecked.
VCAT Member Number	Select the member number to create.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Use Secondary Destination	Check this check box if you want to create a secondary destination. Then, specify the NE ID, subnetwork ID, slot, port, STS, VC, and VT for the primary and secondary destinations. **Note** The Use Secondary Destination check box is dimmed if the source endpoint does not support split routing.
NE ID	Select from the list of available NE IDs to specify the destination NE ID (and secondary NE ID, if applicable).
Subnetwork ID	*Display only.* Displays the ID of the subnetwork associated with the circuit destination (and secondary subnetwork ID, if applicable).
Slot	Specify the destination slot (and secondary slot, if applicable).
Port	Specify the destination port (and secondary port, if applicable).
STS	Specify the destination STS (and secondary STS, if applicable).
VC	Specify the destination VC (and secondary VC, if applicable).
VT	Specify the destination VT (and secondary VT, if applicable).
Add Destination button	Click this button to save the selected endpoint for the member number shown in the VCAT Member Number list box. **Note** An error message warns you if duplicate endpoints are selected.
Show Destinations button	Click this button to launch a table that shows all of the open-ended VCAT primary and secondary destinations by VCAT member number.
Routing Preferences	
Route Automatically	Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. Alternatively, you can disable automatic route selection and manually route the circuit where you specify all the intermediate hops on a hop-by-hop basis (up to 64 hops per circuit). You can manually route the circuit using either one of the following views: • Graphical—Provides a map view that displays the nodes and links you can use to create the circuits. You can select the nodes and links that you need for your circuit from the map view. • Graphical Enhanced—Provides an enhanced map view that includes top-level and detailed views. Top-level view types are subnetworks or groups to which the nodes belong. Each subnetwork or group view type contains a detailed view that displays the nodes and links that belong to the specific subnetwork or group. From the detailed view, you can select the nodes and links that you need for creating the circuit. • Textual—Provides a text view that lists the nodes and links you can use to create the circuits. **Note** If the source and destination of the circuit are on the same node, automatic routing is enabled.
Using Required Nodes/Links	(Available only if Route Automatically is checked) If checked, Prime Optical automatically routes the circuit through the required nodes and/or links. There are several ways you can specify the required nodes and links. Choose one of the following: • Graphical • Graphical Enhanced • Textual

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Review Route Before Creation	(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route in one of the following ways: • Graphical • Graphical Enhanced
VT-DS3 Mapped Conversion	(Available only if Route Automatically is checked) If checked, you can route the circuit using the DS3XM12 card. Not applicable for data cards (ML-series and CE-100T-8 cards). VT-DS3 mapped conversion is for VAP circuits and is automatically selected while creating a VAP circuit using a DS3 port.
Time Slot Restriction	If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical will use to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks. **Note** Time Slot Restriction is not available for OCHCC and OCHNC circuit types. **Note** For VCAT circuits, you must enter multiple STS/VC4 values in the Time Slot Restriction field, in the Member Preferences table. The STS/VC4 values you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.
Common Fiber Routing	(For VCAT circuits) Click this radio button to route each member circuit on the same fiber.
Split Routing	(For VCAT circuits) Click this radio button to route member circuits on separate paths.
Member Preferences	(For VCAT circuits) Specify the following information for member circuits: • Number—Enter a number between 1 and 256 to identify the member. • Name—Enter a unique name to identify the member. The name can contain up to 48 alphanumeric characters, including spaces. • Protection—Specify the member circuit protection type (Fully Protected, PCA, DRI, or Unprotected). • Node Diverse—Specify the node diversity for each member circuit: – Required—Ensures that the primary and alternate paths are node-diverse. – Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse. – Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse. The paths might be node-diverse, but Prime Optical does not check for node diversity. • Set Protection for All—Allows you to choose the same protection type for all members. • Set Node Diversity for All—Allows you to specify the same node diversity for all members.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Fully Protected Path	If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit in a UPSR DRI topology by checking the Dual Ring Interconnect check box. Alternatively, if the circuit must pass across unprotected links, Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications: • Required—Ensures that the primary and alternate paths of the UPSR portions of the complete circuit path are node-diverse. • Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. • Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
Protection Channel Access	To route the circuit on a BLSR protection channel, if available, uncheck the Fully Protected Path check box, and check the Protection Channel Access check box.
Dual Ring Interconnect	If you selected Fully Protected Path and the circuit will be routed on a DRI, check the Dual Ring Interconnect check box. **Note** For DRI and iDRI manually created circuits, you must double-click the DRI span for it to become DRI. A single-click does not enable the DRI span.
Diverse Shared Risk Link Group (SRLG)	If checked, fully protected circuits are routed through working and protected links that do not share risk groups.
Overlay Ring	Check this check box if your configuration uses multiple cross-connections per node, and you want to provision the circuit across multiple rings. An overlay ring circuit traverses at least one node more than once and results in multiple cross-connections per node, per circuit. An overlay ring circuit can be protected or unprotected. Note that Prime Optical does not support a configuration where the source or destination node requires multiple cross-connections.
Conversion Route Constraints *(available only if VT-DS3 Mapped Conversion is checked)*	
NE ID	Select from the list of available NE IDs to specify the source NE ID.
Subnetwork ID	*Display only.* Displays the ID of the subnetwork associated with the circuit source.
Slot	Specify the source slot that contains the DS3XM12 card.
DS3 Mapped STS	Choose **Circuit Source** or **Circuit Dest**.
VT/VC LO Circuit Options *(available only for VT and VC LO path circuits)*	
VT/VC LO Tunnel on Transit Nodes	This option is available if the VT or VC circuit passes through a node that does not have a low-order tunnel, or if an existing low-order tunnel is full. Low-order tunnels allow VT/VC circuits to pass through NEs without consuming low-order cross-connect card resources. In general, creating tunnels is a good idea if you are creating many low-order circuits from the same source and destination. **Note** For VCAT circuits, the VC LO Tunnel on Transit Nodes check box is disabled if you selected Split Routing as the routing preference and you specified any route constraints in the Route Constraints pane.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
VT Aggregation Point (VAP)/VC LO Aggregation Point (LAP)	(For SONET) This option is available if you are creating a VT1.5 circuit to a DS-1, EC-1, DS3XM-6; or an OC-N port on a BLSR, 1+1, or Unprotected node. A VAP allows VT1.5 circuits to be routed through a node using one STS connection on the cross-connect card matrix rather than multiple connections on the VT1.5 matrix. (For SDH) This option is available if you are creating a VC12 circuit to an STM-N port for handoff to non-SDH networks or equipment, such as an IOF, switch, or DACS. A LAP allows low-order circuits to be routed through a node using one VC4 connection on the cross-connect card high-order matrix rather than multiple connections on the low-order matrix.
Circuit Source is STS/VC4 Grooming Node	Creates the VAP or LAP on the VT or VC circuit source node. This option is available only if the VT circuit originates on a DS-1, EC-1, DS3XM-6, or OC-N card, or if the VC circuit originates on an STM-N card.
Circuit Destination is STS/VC4 Grooming Node	Creates the VAP or LAP on the VT or VC circuit destination node. This option is available only if the VT circuit terminates on a DS-1, EC-1, DS3XM-6, or OC-N card, or if the VC circuit terminates on an STM-N card.
None	Choose this option if you do not want to create a low-order tunnel or a VAP/LAP. This is the only available option if Prime Optical cannot create a low-order tunnel or VAP/LAP.
VLAN Selection *(available only for Ethernet cards or EtherGroups)*	
VLANs	Select from the list of available VLANs to associate an existing VLAN to the circuit. If the Circuit VLANs list is empty, Prime Optical assigns the default VLAN. To create a new VLAN, click the **New VLAN** button. Enter a unique VLAN name and ID. The VLAN ID must be an integer greater than 1 but less than 4093. Click **OK**; then, click **OK** in the Successfully created VLAN confirmation dialog box. The new VLAN appears in the list of VLANs. The list is ordered alphanumerically by VLAN name, where numbers precede letters and uppercase letters precede lowercase ones. **Note** Gigabit Ethernet G-series, ML-series, and E-series cards that are configured in port ML-series mode do not support VLAN assignment.
Enable Spanning Tree	Check this check box to enable spanning tree protection for the circuit. This option is disabled for intranode and multicard Ethernet circuits.
VT/VC LO Grooming Node Selection	
Map view	Allows you to tag a node in the map view as a VT or VC LO grooming node. By clicking a node icon, the node is automatically tagged as a VT or VC LO grooming node.
Manual Provisioning *(available if the Route Automatically check box is unchecked and the Graphical or Graphical Enhanced radio button is selected)*	
VCAT Member Number	(For VCAT circuits) Use the drop-down list to select route constraints for each member circuit.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Map view	Displays the NEs that are available in the subnetwork for circuit creation. Map view also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view is used to manually route the circuit from the source to the destination specified by the addition of the links selected. When you position your mouse cursor over a link, the tooltip displays ring information. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default. • Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Include list with the default STS or VC4 value. The Add option applies to manual provisioning across all circuit types.
Operation in progress	(*Available if the Graphical Enhanced radio button is selected*) Shows the percentage of the operation that is complete during the calculation of the graphic objects.
Selected view type	(*Available if the Graphical Enhanced radio button is selected*) Select one of the following top-level view types: • Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type. • Group—Allows you to view the group(s) to which the NEs belong.
Current view	(*Display only and available if the Graphical Enhanced radio button is selected*) Displays the detailed view type that you selected.
Available view	(*Available if the Graphical Enhanced radio button is selected*) Allows you to select a detailed view type.
Top view button	(*Available if the Graphical Enhanced radio button is selected*) Click this button to change the top-level view type at any time.
Available Spans	Select a link on the map view (related to the selected node) and its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field. The newly added link appears in blue on the map view.
Selected Spans	Select one or more spans and click **Remove** to remove them from the Selected Spans field. The removed link appears in green to indicate its unselected state. **Note** To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.
Links/Nodes tab	Select the links/nodes in the graphic to populate the selected node field.
BLSR DRI Nodes or MS-SPRing DRI Nodes tab	(For BLSR DRI or MS-SPRing DRI circuits) Click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Manual Provisioning	
(available if the Route Automatically check box is unchecked and the Textual radio button is selected)	
Src NE ID	Displays the circuit source NE.
Dest NE ID	Displays the circuit destination NE.
Current NE ID	Displays the currently selected NE.
Adj NE ID	Displays all the NEs that are adjacent to the currently selected NE.
Available Links	Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
Available Spans	After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
Selected Spans	Select one or more spans and click **Remove** to remove them from the Selected Spans field.
Next Hop	Click **Next Hop** to specify the next intermediate hop.
Reset	Click **Reset** to reset all hop information to the default values.
Alternate Route	Click **Alternate Route** to specify hop information for the alternate circuit route.
Route Constraints	
(applicable only if the Using Required Nodes/Links check box is checked)	
VCAT Member Number	(For VCAT circuits) Use the drop-down list to select route constraints for each member circuit.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Map view	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view is used for the inclusion and exclusion of links or nodes during the specification of route constraints. The included nodes are shown in blue and the excluded links are shown in magenta. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default. • Exclude All Nodes—Allows you to exclude all nodes associated with the source and destination nodes. This reduces the time required to calculate the best route. The excluded nodes are dimmed, and are listed in the Excluded Links/Nodes pane. All nodes that are not listed in the Excluded Links/Nodes pane are accounted for while calculating the best route. To include a node again for a route-constraint calculation, select the link from the list and click **Remove**. If you are using the Graphical Enhanced view, to exclude a node while calculating the route constraints, select the node and click **Exclude**. The excluded nodes are dimmed, and are listed in the Excluded Links/Nodes pane. To include a node again for a route-constraint calculation, select the link from the list and click **Remove**. Right-click a link or link bundle and choose **Expand** or **Collapse** from the shortcut menu. If you choose **Collapse**, the links are hidden and the link bundle is displayed. If you choose **Expand**, the link bundle is hidden and the links are displayed. The color of the link bundle represents the link selection status, which has the following order of priority (from highest to lowest): • Magenta—The link bundle contains at least one excluded link. • Blue—The link bundle contains at least one selected link. • White—The link bundle contains at least one selecting link. • Green—All links in the link bundle are selectable. • Red—The link bundle contains at least one unselectable link. The link bundle tooltip reports the number of links in the bundle and the name of each link. The background color of each link name in the tooltip represents the link selection status.
Src NE ID	(For textual manual provisioning) Displays the circuit source NE.
Dest NE ID	(For textual manual provisioning) Displays the circuit destination NE.
Nodes	(For textual manual provisioning) Select **Nodes** if you want to add nodes to your circuit route.
Links	(For textual manual provisioning) Select **Links** if you want to add links to your circuit route.
Current NE ID	(For textual manual provisioning) Displays the currently selected NE.
Adj NE ID	(For textual manual provisioning) Displays all the NEs that are adjacent to the currently selected NE.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Available Links	(For textual manual provisioning) Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
Select Nodes	(For textual manual provisioning) Lists all nodes related to the currently selected NE. Select a node from the list.
Selected Node/Link	Displays the currently selected NE or link.
Included Links/Nodes	Displays the list of links or nodes that are included in the route. All links and nodes listed in this pane are considered while calculating route constraints.
Excluded Links/Nodes	Displays the list of links or nodes that are excluded from the route. To remove the links and nodes from the list (to include the nodes to calculate route constraints), select the node and click **Remove**.
Review Route *(applicable only if the Review Route before creation check box is checked)*	
VCAT Member Number	(For VCAT circuits) Use the drop-down list to view the route chosen for each member circuit.
Map view	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view is used for the inclusion and exclusion of links or nodes during the specification of route constraints. The included nodes are shown in blue and the excluded links are shown in magenta. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default.
Review Route	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view displays information about the spans selected during autorouting in the subnetwork. The selected spans are shown in blue. When you select a span, its corresponding details are displayed in the Selected Span pane. The circuit summary displays the total hops and the cost for working and protect paths for the routed circuit.
Source NE ID	Displays the ID of the NE selected as the source node.
Destination NE ID	Displays the ID of the NE selected as the destination node.
Included Spans	If you enabled automatic route selection in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.
Selected Span	Displays detailed information about the span selected in the Included Spans list.

Table 7-6 Field Descriptions for the Create Circuit Wizard—Optical Devices (continued)

Field	Description
Add and Remove buttons	You can review and modify the automatic route that is selected for circuit creation. Click **Add** to change the automatically selected route by adding a route to the Selected Spans list. Click **Remove** to remove a route from the list. This functionality is similar to manual routing, except that the route from the source to the destination is preselected. **Note** You can modify the review route only for the following circuit types: STS_CIRCUIT, VT_CIRCUIT, VT_TUNNEL, VT_AGGREGATION, STS_VCAT_CIRCUIT, VT_VCAT_CIRCUIT, VC_HO_PATH_CIRCUIT, VC_LO_PATH_CIRCUIT, VC_LO_PATH_TUNNEL, VC_LO_PATH_AGGREGATION, VC_HO_VCAT_CIRCUIT, and VC_LO_VCAT_CIRCUIT.
Circuit Summary	
Circuit Summary	Summarizes the selections you made in the wizard panes. To change the circuit summary, click **Back** and change your selection(s).

7.2.3.1 Creating an STS (Including Ethernet), STS-V, VT, VT-V, VT Tunnel, or VT Aggregation Circuit

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose STS (including Ethernet circuits), STS-v, VT, VT-v, VT Tunnel, or VT Aggregation. (Choose STS for ML-series circuits. For ONS 15454, choose STS for circuits starting and ending at a fiber channel [FCMR] card). In the Number of Circuits field, enter the number of circuits you want to create. The Cisco default is 1. If you enter a number higher than 1, you can use autoranging to create the additional circuits automatically. You can create only one circuit for the following circuit types:

- ML-series
- VT-v
- STS-v
- VT aggregation
- VT tunnel

Step 3 Click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Size (STS circuits only)—Specify STS-1, STS-9c, STS-12c, STS-24c, STS-48c, STS-96c, or STS-192c. The valid size for circuits involving the DS3i card is STS-3c. Valid sizes for circuits involving the FC_MR-4 card are STS-1, STS-3c, STS-24c, and STS-48c.

For a single-card EtherSwitch, only STS-1, STS-3c, STS-6c, and STS-12c apply. For a multicard EtherSwitch, only STS-1, STS-3c, and STS-6c apply.

Valid circuit sizes for an ML-series circuit are STS-1, STS-3c, STS6c, STS-9c, STS-12c, STS-24c, and STS-96c.

- Bidirectional—Check this check box to create a two-way circuit; uncheck it to create a one-way circuit. (For STS and VT circuits only; E-series circuits, G-series circuits, ML-series circuits, VAP circuits, and VT tunnels are bidirectional.)
- State—Choose an administrative state to apply to the circuit:
  - IS—The circuit is in service.
  - OOS—The circuit is out of service. Traffic is not passed on the circuit.
  - OOS–AINS—The circuit is out of service until it receives a valid signal, at which time the circuit state automatically changes to in service.
  - OOS–MT—The circuit is in maintenance state. The maintenance state does not interrupt traffic flow; it suppresses alarms and conditions and allows loopbacks to be performed on the circuit.
- Apply to source/destination ports—Check this check box to apply the selected state in the State field to the circuit source and destination ports. Uncheck this check box for ML-series circuits.
- Protected Drops (Non-Ethernet)—Check this check box if you want the circuit routed on protected drops only. If selected, this option restricts the set of displayed source or destination termination points to those in 1:1, 1:N, or 1+1 protection groups. Uncheck this check box for ML-series circuits.
- Provision working go and return on primary path (bidirectional UPSR/SNCP protection only)—Check this check box to provision the working path to go or return to the primary path.

Note Prime Optical currently provisions unidirectional SNCP/UPSR circuits following the GR-1400 standard. For bidirectional SNCP/UPSR circuits, you can check the Provision working go and return on primary path check box to route the working and protect paths in one direction following the ITU-T G.841 standard. Unidirectional UPSR/SNCP circuits are not affected by this new routing, and the shortest path is always used as the working path.

- Path Selectors (UPSR protection only)—If the circuit will be routed on a UPSR, set the UPSR path selectors as follows:
  - Revertive—Check this check box if you want traffic to revert to the working path when the conditions that diverted it to the protect path are repaired. If you do not choose Revertive, traffic remains on the protect path.
  - Reversion Time—If Revertive is checked, specify the amount of time (in minutes) after which traffic reverts back to the original working path when the conditions that caused the switch are cleared.
  - SF Threshold (for STS circuits only)—Set the UPSR path-level SF bit error rate (BER) threshold. This field is visible only for point-to-point topologies.
  - SD Threshold (for STS circuits only)—Set the UPSR path-level SD BER threshold. This field is visible only for point-to-point topologies.
  - Switch on PDI-P (for STS circuits only)—Specify whether or not traffic should switch based on a received STS payload defect indication. This field is visible only for point-to-point topologies.
- (Optional) Specify the customer information:
  - Customer ID—Identify the end user of the circuit.

– Service ID—Enter the service ID of the circuit.

Step 5 In the Source pane, enter the following information; then, click **Next**:

- NE ID—Select from the list of available TPs to specify the source TP.
- Source—Specify the source slot, port, STS, DS1-14, and VT.
- Use Secondary Source—Check this check box to create a secondary source. Then, specify the NE ID, slot, port, STS, DS1-14, and VT for the secondary source.

Note The secondary source is applied to open-ended UPSR and DRI.

Step 6 In the Destination pane, enter the following information; then, click **Next**:

- NE ID—Select from the list of available TPs to specify the destination TP.
- Destination—Specify the destination slot, port, STS, DS1-14, and VT.
- Use Secondary Destination—Check this check box to create a secondary destination. Then, specify the slot, port, STS, DS1-14, and VT for the secondary destination.

Note The secondary destination is applied to open-ended UPSR and DRI.

Step 7 In the VLAN Selection pane (available only if an E-series Ethernet card or EtherGroup is chosen as the source or destination slot), do the following; then, click **Next**:

a. Select from the list of available VLANs to associate an existing VLAN to the circuit. If the Circuit VLANs list is empty, Prime Optical assigns the default VLAN.

Note Gigabit Ethernet G-series, ML-series, and E-series cards that are configured in Port Mapped mode do not support VLAN assignment.

b. To create a new VLAN, click the **New VLAN** button. Enter a unique VLAN name and ID. The VLAN ID must be an integer greater than 1 but less than 4093. Click **OK**; then, click **OK** in the Successfully created VLAN confirmation dialog box. The new VLAN appears in the list of VLANs. The list is arranged alphanumerically by VLAN name, where numbers precede letters and uppercase letters precede lowercase ones.

c. Check the Enable Spanning Tree check box to enable spanning tree protection for the circuit. This option is disabled for intranode and multicard Ethernet circuits.

Step 8 In the Routing Preferences pane, do the following; then, click **Next**.

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. VT-DS3 Mapped Conversion—(Available only if Route Automatically is checked) If checked, you can route the circuit using the DS3XM12 card. Not applicable for data cards (ML-series and CE-100T-8 cards). VT-DS3 mapped conversion is for VAP circuits and is automatically selected while creating a VAP circuit using a DS3 port.

e. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Time Slot Restriction field, in the Member Preferences table. The STS/VC4 values you enter in the Time Slot Restriction field cannot be identical or circuit creation will fail with an error message.

f. Fully Protected Path—If not selected, choose **Protection Channel Access** to route the circuit on a BLSR protection channel.

g. Fully Protected Path—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit in a UPSR DRI topology by checking **Dual Ring Interconnect**. Alternatively, if the circuit must pass across unprotected links, Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

- Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
- Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
- Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
- Dual Ring Interconnect—If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

h. Overlay Ring—(*For STS high-order circuits only*) Check this check box if your configuration uses multiple cross-connections per node, and you want to provision the circuit across multiple rings. An overlay ring circuit traverses at least one node more than once and results in multiple cross-connections per node, per circuit. An overlay ring circuit can be protected or unprotected. Note that Prime Optical does not support a configuration where the source or destination node requires multiple cross-connections.

Step 9 In the VT Options pane (available only if you are creating a VT circuit and automatic routing is selected), choose one of the following radio buttons; then, click **Next**:

- VT Tunnel on Transit Nodes

- VAP
- None

Step 10 If you created a VAP, in the VT Grooming pane, select the following:

- STS Grooming Node
- VT Grooming Node

Step 11 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list with the default STS or VC4 value. The Add option applies to manual provisioning across all circuit types.

d. Select a link on the map view (related to the selected node) and its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field. The newly added link appears in blue on the map view.

e. Select one or more spans and click **Remove** to remove them from the Selected Spans field. The removed link appears in green to indicate its unselected state.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

f. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 12 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 13 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the nodes or links to include in the circuit route. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 14 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat these substeps for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 15 In the Review Route pane (available only if Review Route Before Creation is checked), do the following:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Displays the following information about the span selected in the Included Spans list:

- From—Span source
- To—Span destination
- Source STS—STS value
- VT—VT time slot

Note If you selected VT as the circuit type in the Attributes pane, chose Review Route Before Creation in the Routing Preferences pane, and selected VT Tunnel on Transit Nodes in the VT Options pane, the VT tunnel is created regardless of whether or not you are finished provisioning the circuit. Even if you click the Back button in the Review Route pane and change the VT circuit options, the newly created VT tunnel will not be deleted.

d. (Optional) You can review and modify the automatic route that is selected for circuit creation. Click **Add** to change the automatically selected route by adding a route to the Selected Spans list. Click **Remove** to remove a route from the list.

e. Click **Finish**.

Step 16 In the message box, click **OK**.

Caution It takes several seconds to create a circuit. During that interval, if a new circuit is added with the same name, both circuits might be identified as duplicates. Therefore, be careful not to add a duplicate circuit during the creation of the first circuit.

7.2.3.2 Creating a Regular or Open-Ended VCAT Circuit

This section describes how to create regular and open-ended VCAT circuits (STS-v, VT-v, VC_HO_PATH_VCAT_CIRCUIT, or VC_LO_PATH_VCAT_CIRCUIT).

Prime Optical supports open-ended VCAT circuits that originate on Ethernet or ML-series cards. The destination can be OC-n or STM-n cards. You can route open-ended VCAT circuits to or from any of the cards or ports where VCAT circuits originate or terminate. Compared to a standard VCAT circuit, an open-ended VCAT circuit has only one VCG.

VCAT and open-ended VCAT circuits are supported on the following cards:

- CE-100T-8—Supported on ONS 15454 SONET NEs
- CE-MR-6—Supported on ONS 15310 MA SONET and ONS 15310 MA SDH NEs
- CE-MR-10—Supported on ONS 15454 SONET and ONS 15454 SDH NEs
- E100-WAN-8, GigE-WAN-2, STM-1-1-8-LC—Regular VCAT circuits are supported on ONS 15305 CTC NEs

Note Open-ended VCAT circuits are not supported on ONS 15305 CTC NEs.

- FCMR—Supported on ONS 15454 SONET and ONS 15454 SDH NEs
- ML1000, ML100T, ML-MR-10—Supported on ONS 15454 SONET and ONS 15454 SDH NEs
- ML-100T-8—Supported on ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH NEs

Note Each card supports a different number of members. You can create only bidirectional, revertive/nonrevertive, high-order/low-order path circuits. Prime Optical can route the circuits automatically, or you can route them manually. Also, all members can be routed through a single fiber, or you can specify a split-fiber routing preference. You must choose a destination for each member.

Complete the following steps to create a VCAT or open-ended VCAT circuit:

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, select STS-v, VT-v, VC_HO_PATH_VCAT_CIRCUIT, or VC_LO_PATH_VCAT_CIRCUIT.

For SDH nodes:

- LO_VCAT circuits from an ONS 15454 SDH CE-100T-8 card to a 15305 E-100 card, and a CE-MR-10 card to another CE-MR-10, ML-series, G1000, or OC*n* card are supported for VCAT circuits
- LO_VCAT (VC3) circuits between a GigE-WAN-2 and ML1000 card (number of members = 2), and between a GigE-WAN-2 card and CE-100T-8 card (number of members = 1) are supported for VCAT circuits

Step 3 In the Number of Circuits field, enter the number of circuits you want to create. The Cisco default is 1. If you enter a number higher than 1, you can use autoranging to create the additional circuits automatically.

Note You can create only one VCAT circuit at a time.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. For VCAT circuits, the circuit name is a free-format string, up to 44 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Type—Displays the circuit type.
- Bidirectional—In this release, only bidirectional VCAT circuits are supported.
- State—Specify IS, OOS_DSBLD, OOS_MT, IS_AINS, or OOS_OOG (Out of Service–Out of Group).
- Apply to source/destination ports—Check this check box to apply the selected state to the source and destination ports.
- Symmetric—*Display only.*
- Open VCAT—Check this check box to create an open-ended VCAT circuit. You cannot use open-ended VCAT circuits to create L2 topologies.
- Member Size—Select the size of the member for the VCAT circuit. This is the unit for VCAT circuit size.

- Number of Members—Select the number of members (for the member size previously selected). Different cards support different numbers of members with different sizes.
- Mode—Select the LCAS mode (None, Sw-LCAS, or LCAS) for the VCAT circuit. If you select a mode other than None, only the cards supporting the LCAS mode selected are listed for the source and destination selection.
- Protected Drops—Check this check box if you want the circuit routed to protected drops only; that is, to cards that are in 1:1, 1:N, or 1+1 protection.
- Provision working go and return on primary path (bidirectional UPSR/SNCP protection only)—Check this check box to provision the working path to go and return to the primary path.
- Path Selectors—If the circuit will be routed on an SNCP node, set the defaults as follows:
  - Revertive—Check this check box if you want traffic to revert to the working path when the conditions that diverted it to the protect path are repaired. If Revertive is not chosen, traffic remains on the protect path.
  - Reversion time—If Revertive is checked, set the reversion time. This is the amount of time that elapses before the traffic reverts to the working path. Traffic can revert when conditions causing the switch are cleared. (The Cisco default reversion time is 5 minutes.)
  - SF threshold—Choose from 1 E-3, 1 E-4, or 1 E-5.
  - SD threshold—Choose from 1 E-5, 1 E-6, 1 E-7, 1 E-8, or 1 E-9.
  - Switch on PDI-P—Not applicable.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Note The customer ID and service ID for the VCAT circuit are applied to all member circuits.

Step 5 In the Source pane, set the circuit source. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed on the node. Enter the following information; then, click **Next**:

- NE ID—Select from the list of available TPs to specify the source TP.
- Source—Specify the following:
  - Source slot.
  - Port.
  - Member—Available only if the source slot is a CE-MR-10 card in Manual mode. Click **Edit Members** to add or remove member CTP(s) of the source TP. In the Member Selection dialog box, you can use the **Add** button to move the CTP(s) to the Selected CTPs list, use the **Remove** button to move the CTP(s) to the Available CTPs list, or click **Up** or **Down** to reorder the Selected CTPs list. Click **OK** to close the Member Selection dialog box.

Step 6 In the Destination pane (available for regular VCAT circuits), set the circuit destination. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed on the node. Enter the following information; then, click **Next**:

- NE ID—Select from the list of available TPs to specify the destination TP.
- Source—Specify the following:
  - Destination slot.
  - Port.

- Member—Available only if the source slot is a CE-MR-10 card in Manual mode. Click **Edit Members** to add or remove member CTP(s) of the source TP. In the Member Selection dialog box, you can use the **Add** button to move the CTP(s) to the Selected CTPs list, use the **Remove** button to move the CTP(s) to the Available CTPs list, or click **Up** or **Down** to reorder the Selected CTPs list. Click **OK** to close the Member Selection dialog box.

Step 7 In the Members Destination pane (available for open-ended VCAT circuits), do the following; then, click **Next**:

a. Specify the destinations:

- To specify only the first member destination, check the Autoranged check box; Prime Optical will automatically choose the remaining destinations. (Note that you will lose previous selections if you switch to Autoranged.) When Autoranged is enabled, available consecutive endpoints are returned, starting from the endpoint that you selected. The destination endpoints can be on different ports only if the source endpoint supports split routing.
- To specify all of the destinations, leave the Autoranged check box unchecked.

b. In the VCAT Member Number list box, select the member number to create.

c. If you want to create a secondary destination, check the Use Secondary Destination check box. Then, specify the NE ID, subnetwork ID, slot, port, STS, VC, and VT for the primary and secondary destinations.

Note The Use Secondary Destination check box is dimmed if the source endpoint does not support split routing.

d. Click the **Add Destination** button to save the selected endpoint for the member number shown in the VCAT Member Number list box.

e. Click the **Show Destinations** button to launch a table that shows all of the open-ended VCAT primary and secondary destinations by VCAT member number.

Step 8 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical

- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Select the routing preference for VCAT members. If all members are to be routed on a single fiber, choose **Common Fiber Routing**. If members are to be routed through different fibers in case one fiber does not have sufficient bandwidth, choose **Split Routing**.

f. Specify the following member preferences:

- Number—Select the member number, a unique number from 1 to 256.
- Name—Edit the name for the member circuit. By default, *VCAT-NAME_Default MemberNumber* is the member name, where *VCAT-NAME* is the parent VCAT circuit name being created.
- Protection—Select the protection mechanism for member circuits:
  - Fully Protected—To route the circuit on a protected path, choose **Fully Protected** (default). A fully protected circuit route is created based on the diversity option you choose. Fully protected paths might or might not have UPSR/SNCP path segments with primary and alternate paths. The path diversity options apply only to UPSR/SNCP path segments, if any exist.
  - Unprotected—To create an unprotected circuit, choose **Unprotected**.
  - PCA—To route the circuit on a PCA route, choose **PCA**. PCA circuits are unprotected. Once you enable PCA, a label reading PCA will appear on the link.
  - DRI—To configure dual ring interconnect protection on a VCAT circuit, choose **DRI**. All VCAT members must share the same DRI protection type. You cannot assign DRI protection when textual manual provisioning is enabled.
- Node Diversity—Select node diversity for each member circuit.
- Diverse SRLG—Select **True** if fully protected circuits will be routed through working or protected links that do not share risk groups.

g. If you selected Fully Protected Path, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended UPSR/SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended UPSR/SNCP mesh network portion of the complete circuit path.
- Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended UPSR/SNCP mesh network portions of the complete circuit path are needed.
- N/A (Not Applicable)—Prime Optical does not support Dual Ring Interconnect.

Note Node diversity can be set for each member when Fully Protected is selected and Split Fiber Routing is selected.

Step 9 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 10 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 11 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Select the member from the Member list box at the top of the pane. For common fiber routing, there is no Member list box, because constraints are applied to all the members. In split fiber routing, you can select different constraints for different members by selecting a member and then selecting spans or NEs to be included or excluded for routing the circuit. Specify the nodes or links to include in the circuit route. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the VCAT Member Number list box, select the member for which constraints are to be selected.

d. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

e. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

f. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

g. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

h. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

i. Repeat substeps d to h for each node or link that you want to include in the circuit route.

j. (Optional) Repeat substeps c to i for each member.

k. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 12 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 13 In the Review Route pane (available only if Review Route Before Creation is checked), do the following:

Note Member routing information is displayed when a particular member is selected from the list box.

a. In the VCAT Member Number list box, select the member.

b. In the circuit display, review the ID of the source and destination NEs.

c. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

d. Selected Span—Review the span information.

e. (Optional) You can review and modify the automatic route that is selected for circuit creation. Click **Add** to change the automatically selected route by adding a route to the Selected Spans list. Click **Remove** to remove a route from the list.

f. Click **Finish**.

Step 14 In the message box, click **OK**. The VCAT or open-ended VCAT circuit is displayed in the Circuit table.

7.2.3.3 Creating a VC_HO_Path_Circuit

The E1-N-14 card, STM-N cards, and Ethernet cards all use high-order path circuits. You can create unidirectional or bidirectional, revertive or nonrevertive, high-order path circuits. Prime Optical can route the circuits automatically, or you can route them manually. The E3-12 and DS3i-N-12 cards use VC low-order path tunnels.

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose **VC_HO_Path_Circuit**. The circuit type determines the provisioning options that are displayed. In the Number of Circuits field, enter the number of circuits you want to create. The Cisco default is 1. If you enter a number higher than 1, you can use autoranging to create the additional circuits automatically.

Step 3 Click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Size—Select the circuit size. VC high-order path circuits can be VC4, VC4-2c, VC4-3c, VC4-4c, VC4-8c, VC4-16c, or VC4-64c for optical cards and for some Ethernet cards (depending on the card type). Of the Ethernet cards, only the G-1000 can use VC4-3c, VC4-8c, and VC4-16c. The “c” indicates concatenated VC4s.
- Bidirectional—Check this check box to create a two-way circuit; uncheck it to create a one-way circuit.
- State—Specify the circuit state. Options vary depending on the type of circuit selected.

- Apply to source/destination ports—Check this check box to apply the selected state to the source and destination ports.
- Protected Drops—Check this check box if you want the circuit routed to protected drops only; that is, to cards that are in 1:1, 1:N, or 1+1 protection.
- Provision working go and return on primary path (bidirectional UPSR/SNCP protection only)—Check this check box to provision the working path to go and return to the primary path.

Note Prime Optical currently provisions unidirectional SNCP/UPSR circuits following the GR-1400 standard. For bidirectional SNCP/UPSR circuits, you can check the Provision working go and return on primary path check box to route the working and protect paths in one direction following the ITU-T G.841 standard. Unidirectional UPSR/SNCP circuits are not affected by this new routing, and the shortest path is always used as the working path.

- Path Selectors (SNCP Protection Only)—If the circuit will be routed on an SNCP node, set the defaults as follows:
  - Revertive—Check this check box if you want traffic to revert to the working path when the conditions that diverted it to the protect path are repaired. If Revertive is not chosen, traffic remains on the protect path.
  - Reversion time—If Revertive is checked, set the reversion time. This is the amount of time that elapses before the traffic reverts to the working path. Traffic can revert when conditions causing the switch are cleared. (The Cisco default reversion time is 5 minutes.)
  - SF threshold—Choose from 1 E-3, 1 E-4, or 1 E-5.
  - SD threshold—Choose from 1 E-5, 1 E-6, 1 E-7, 1 E-8, or 1 E-9.
  - Switch on PDI-P—Not applicable.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Step 5 In the Source pane, set the circuit source. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Source** if you want to create an SNCP bridge/selector circuit entry point in a multivendor SNCP.

Step 6 Click **Next**.

Step 7 In the Destination pane, set the circuit destination. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Destination** if you want to create a circuit destination point for unidirectional/bidirectional circuits.

Step 8 Click **Next**.

Step 9 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:
   - Graphical
   - Graphical Enhanced
   - Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:
   - Graphical
   - Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:
   - To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
   - To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 10.
   - To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 10.

f. If you selected **Fully Protected Path**, choose one of the following options:
   - Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
   - Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
   - Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
   - Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.
   - Diverse Shared Risk Link Group—If checked, fully protected circuits are routed through working and protected links that do not share risk groups.

g. Overlay Ring—Check this check box if your configuration uses multiple cross-connections per node, and you want to provision the circuit across multiple rings. An overlay ring circuit traverses at least one node more than once and results in multiple cross-connections per node, per circuit. An overlay ring circuit can be protected or unprotected. Note that Prime Optical does not support a configuration where the source or destination node requires multiple cross-connections.

Step 10 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

l. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 11 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 12 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

   In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 13 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 14 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 15 In the message box, click **OK**.

7.2.3.4 Creating a VC_LO_Path_Circuit

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose **VC_LO_Path_Circuit**. The circuit type determines the provisioning options that are displayed. In the Number of Circuits field, enter the number of circuits you want to create. The Cisco default is 1. If you enter a number higher than 1, you can use autoranging to create the additional circuits automatically.

Step 3 Click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Size—Select **VC3**, **VC11**, or **VC12**.
- Bidirectional—Check this check box to create a two-way circuit; uncheck it to create a one-way circuit.
- State—Specify the circuit state. Options vary depending on the type of circuit selected.
- Apply to source/destination ports—Check this check box to apply the selected state to the source and destination ports.
- Protected Drops—Check this check box if you want the circuit routed to protected drops only; that is, to cards that are in 1:1, 1:N, or 1+1 protection.
- Provision working go and return on primary path (bidirectional UPSR/SNCP protection only)—Check this check box to provision the working path to go and return to the primary path.

Note Prime Optical currently provisions unidirectional SNCP/UPSR circuits following the GR-1400 standard. For bidirectional SNCP/UPSR circuits, you can check the Provision working go and return on primary path check box to route the working and protect paths in one direction following the ITU-T G.841 standard. Unidirectional UPSR/SNCP circuits are not affected by this new routing, and the shortest path is always used as the working path.

- SNCP path selector defaults—If the circuit will be routed on an SNCP node, set the defaults as follows:
  - Revertive—Check this check box if you want traffic to revert to the working path when the conditions that diverted it to the protect path are repaired. If Revertive is not chosen, traffic remains on the protect path.
  - Reversion time—If Revertive is checked, set the reversion time. This is the amount of time that elapses before the traffic reverts to the working path. Traffic can revert when conditions causing the switch are cleared. (The Cisco default reversion time is 5 minutes.)
  - SF threshold.
  - SD threshold.
  - Switch on PDI-P—Not applicable.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Step 5 In the Source pane, set the circuit source. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Source** if you want to create an SNCP bridge/selector circuit entry point in a multivendor SNCP.

Step 6 Click **Next**.

Step 7 In the Destination pane, set the circuit destination. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Destination** if you want to create a circuit destination point for unidirectional/bidirectional and VC_LO_Path_Circuits.

Step 8 Click **Next**.

Step 9 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:
- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:
- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:
- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 10.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 10.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 10 If you did not select Using Required Nodes/Links in Step 9, specify VC-LO circuit options. In the VC LO Options pane, choose one of the following radio buttons; then, click **Finish** (if you did not check Review Route Before Creation in Step 9) or **Next** (to view the spans included in the route in the Review Route pane):

a. VC LO Tunnel on transit nodes

b. VC LAP

- Circuit source is VC4 grooming node
- Circuit destination is VC4 grooming node

c. None

Step 11 If you created a VC LAP, in the VC LO Options pane, select the following; then, click **Finish** (if you did not check Review Route Before Creation in Step 9) or **Next** (to view the spans included in the route in the Review Route pane).

- VC4 Grooming Node
- VC LO Grooming Node

Step 12 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 13 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 14 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 15 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 16 In the Review Route pane (available only if Review Route Before Creation is checked), do the following:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically chooses spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

d. (Optional) You can review and modify the automatic route that is selected for circuit creation. Click **Add** to change the automatically selected route by adding a route to the Selected Spans list. Click **Remove** to remove a route from the list.

e. Click **Finish**.

Step 17 In the message box, click **OK**.

7.2.3.5 Creating a VC_LO_Path_Tunnel

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose **VC_LO_Path_Tunnel**. The circuit type determines the provisioning options that are displayed. The E3-12 and DS3i-N-12 cards must use VC low-order path tunnels. In the Number of Circuits field, enter the number of circuits you want to create. The Cisco default is 1. If you enter a number higher than 1, you can use autoranging to create the additional circuits automatically. Check the For VC3 Port Grouping Only check box to create VC low-order path tunnels for port grouping.

Step 3 Click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Size—For VC_LO_Path_Tunnel, VC4 is the default setting.
- Bidirectional—For VC_LO_Path_Tunnel, Bidirectional is the default setting.
- State—Specify the circuit state. Options vary depending on the type of circuit selected.
- Apply to source/destination ports—Check this check box to apply the selected state to the source and destination ports.
- Protected Drops—Check this check box if you want the circuit routed to protected drops only; that is, to cards that are in 1:1, 1:N, or 1+1 protection.
- Provision working go and return on primary path—Check this check box to provision the working path to go and return to the primary path.
- SNCP path selector defaults—If the circuit will be routed on an SNCP node, set the defaults as follows:
  - Revertive—Check this check box if you want traffic to revert to the working path when the conditions that diverted it to the protect path are repaired. If Revertive is not chosen, traffic remains on the protect path.
  - Reversion time—If Revertive is checked, set the reversion time. This is the amount of time that elapses before the traffic reverts to the working path. Traffic can revert when conditions causing the switch are cleared. (The Cisco default reversion time is 5 minutes.)
  - SF threshold—Choose from 1 E-3, 1 E-4, or 1 E-5.
  - SD threshold—Choose from 1 E-5, 1 E-6, 1 E-7, 1 E-8, or 1 E-9.
  - Switch on PDI-P—Not applicable.

- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Step 5 In the Source pane, set the circuit source. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Source** if you want to create an SNCP bridge/selector circuit entry point in a multivendor SNCP.

Step 6 Click **Next**.

Step 7 In the Destination pane, set the circuit destination. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Destination** if you want to create a circuit destination point for unidirectional/bidirectional.

Step 8 Click **Next**.

Step 9 If port grouping is disabled, do the following in the Routing Preferences pane; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

Note Route Automatically is disabled if port grouping is enabled.

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Step 10 Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and go to Step 11. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 12.

- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 12.

Step 11 If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.

Step 12 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 13 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 14 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

   In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 15 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 16 In the Review Route pane (available only if Review Route Before Creation is checked), do the following:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically chooses spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

d. (Optional) You can review and modify the automatic route that is selected for circuit creation. Click **Add** to change the automatically selected route by adding a route to the Selected Spans list. Click **Remove** to remove a route from the list.

e. Click **Finish**.

Step 17 In the message box, click **OK**.

7.2.3.6 Creating a VC_LO_Path_Aggregation Circuit

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Note VC_LO_path_aggregation circuits are not supported by the ONS 15305 CTC.

Step 2 In the Type pane, choose **VC_LO_Path_Aggregation**. The circuit type determines the provisioning options that are displayed. In the Number of Circuits field, enter the number of circuits you want to create. The Cisco default is 1. If you enter a number higher than 1, you can use autoranging to create the additional circuits automatically.

Step 3 Click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Size—For VC_LO_Path_Aggregation, VC4 is the default setting.
- Bidirectional—For VC_LO_Path_Aggregation, Bidirectional is the default setting.
- State—Specify the circuit state. Options vary depending on the type of circuit selected.
- Apply to source/destination ports—Check this check box to apply the selected state to the source and destination ports.
- Protected Drops—Check this check box if you want the circuit routed to protected drops only; that is, to cards that are in 1:1, 1:N, or 1+1 protection.
- SNCP path selector defaults—If the circuit will be routed on an SNCP node, set the defaults as follows:
  - Revertive—Check this check box if you want traffic to revert to the working path when the conditions that diverted it to the protect path are repaired. If Revertive is not chosen, traffic remains on the protect path.

  - Reversion time—If Revertive is checked, set the reversion time. This is the amount of time that elapses before the traffic reverts to the working path. Traffic can revert when conditions causing the switch are cleared. (The Cisco reversion time is 5 minutes.)
  - SF threshold—Choose from 1 E-3, 1 E-4, or 1 E-5.
  - SD threshold—Choose from 1 E-5, 1 E-6, 1 E-7, 1 E-8, or 1 E-9.
  - Switch on PDI-P—Not applicable.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Step 5 In the Source pane, set the circuit source. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node.

Step 6 Click **Next**.

Step 7 In the Destination pane, enter the appropriate information for the circuit destination.

Step 8 Click **Next**.

Step 9 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 10.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 10.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 10 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 11 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 12 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 13 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 14 In the Review Route pane (available only if Review Route Before Creation is checked), do the following:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

d. (Optional) You can review and modify the automatic route that is selected for circuit creation. Click **Add** to change the automatically selected route by adding a route to the Selected Spans list. Click **Remove** to remove a route from the list.

e. Click **Finish**.

Step 15 In the message box, click **OK**.

7.2.3.7 Creating a DWDM OCHNC—ONS 15454 MSTP

Prime Optical creates an OCHNC between two optical nodes upon a specified C-band wavelength through the ports residing on the 32WSS, 40-WSS-C, 40-WSS-CE, 32DMX, 40-DMX-C, 40-DMX-CE, 40-SMR1-C, 40-SMR2-C, 80-WXC-C, 15216-MD-40-EVEN, and 15216-MD-40-ODD wavelength selective switches, multiplexers, demultiplexers, and add/drop cards.

Note You cannot create an OCHNC DCN circuit from Prime Optical. You must use CTC to create OCHNC DCN circuits.

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose **OCHNC**. The circuit type determines the provisioning options that are displayed.

Step 3 Check the Generalized Multiprotocol Label Switching (GMPLS) check box (only if you require GMPLS provisioning) and click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.

Note This field is mandatory if the GMPLS check box (for OCHxx circuits only) is checked.

- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Size—*Display only*. Displays Equipment Not Specific.
- OCHNC Wavelength—Choose the OCHNC wavelength that you want to provision. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected.
- Channel Group—Choose the channel group that you want to provision.
- Use OCHNC Direction—Choose whether or not to specify the OCHNC direction. Select the check box to allow you to specify the circuit direction (for NEs up to and including R6.0) in the OCHNC Direction drop-down list. If the check box is unchecked (for R7.0 NEs and later releases), the OCHNC Direction drop-down list is disabled.
- OCHNC Direction—Choose whether the OCHNC direction is east-to-west to west-to-east.
- Bidirectional—Check this check box to create a bidirectional OCHNC, or uncheck it to create a unidirectional OCHNC. Bidirectional circuits have been supported since CTM R5.0.
- State—Specify the circuit state.
- Protection—Check to create a protected OCHNC. There are two possible scenarios, depending on whether the GMPLS check box is unchecked or checked.
  - When the GMPLS check box is *unchecked*:

    Protected—Check this check box to select source/destination ports from protected cards only (TXPP/MXPP).
  - When the GMPLS check box is *checked*:

    GMPLS Protection Type—Set the protection type. Values are:

    – Not Defined—For unprotected services.

    – PSM—When a PSM card is connected to a TXP card.

    Optical Validation—Set the validation mode:

    – Validation—Set the validation mode. See Table 7-7 for a listing of validation modes.

    – Required—Set the optical validation threshold value for the GMPLS circuit for the working path. The circuit is created if the actual optical validation result is greater than or equal to the value set in this field. See Table 7-8 for a listing of validation threshold values.

    – Required (protect)—Set the optical validation threshold value for the protected GMPLS circuit for the protected path.

Table 7-7 Validation Modes

Validation Mode	Description
Full	The circuit is created when the circuit validation result is greater than or equal to the acceptance threshold value.
None	The circuit is created without considering the acceptance threshold value. The Opt Valid column in the Circuits tab displays the value “No Valid.”

The GMPLS control plane validates the optical feasibility of an OCH circuit to ensure that the circuit is operational after provisioning. Optical feasibility is determined based on optical impairments. Table 7-8 describes the validation thresholds.

Table 7-8 Validation Thresholds

Color	Description
Green	Indicates that the channel failure risk is 0%.
Yellow	Indicates that the channel failure risk is between 0% and 16%.
Orange	Indicates that the channel failure risk is between 16% and 50%.
Red	Indicates that the channel failure risk is greater that 50%.

- (Optional) Restoration Configuration—Defines the restoration and revertive parameters required for creating a GMPLS circuit (OCHNC and OCH Trail). See 7.2.27 Restoration of GMPLS Circuits.
  - Restoration Balloon icon—Displays the most relevant current restoration value. See 7.2.27.1 Restoration Balloon Icon for more information.
  - Open GMPLS Restore/Revert Dialog button—When clicked, the Restoration Pop Up Dialog box opens. See 7.2.27.2 Restoration Configuration Pane for more information.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Note The remaining fields in the Attributes pane are unavailable.

Step 5 In the Source pane, set the circuit source (shelf, slot, or port; shelf only in the case of NEs configured as multishelf); then, click **Next**.

When you select OCHNC as the circuit type, you can also select a local drop endpoint along with the circuit source when the OCHNC is bidirectional.

Note
- If the Use OCHNC Direction check box was unchecked (for R7.0 NEs and later) in Step 4, you must select a shelf, slot, and port. If the Use OCHNC Direction check box was checked (for R6.0 NEs and earlier), you need only select the source NE.
- The OCHNC circuit endpoints must be selected on channel ports, express add/drop ports, or add/drop ports. If other ports are selected, a warning is displayed, prompting you to change the circuit type.

The Circuit Wizard can manage the alien wavelength for the source and destination panels. After the ports are selected, if the GMPLS check box is checked, the Alien Wavelength Selection pane is displayed, showing options for the RX and TX channels at the endpoints of the circuit.

To add an alien wavelength to the circuit wizard in the Alien Wavelength Selection pane:

a. From the Alien Wavelength drop-down list, choose Alien Wavelength.

b. From the FEC drop-down list, choose the Forward Error Correction (FEC) mode.

c. Click **Add** to add the alien wavelength for both the RX and TX channels. See 7.12.15 Creating Alien Wavelength and 7.12.16 Editing Alien Wavelength for more information.

   The alien wavelength is added and displayed in the circuit wizard.

d. Click **Apply** in the Alien Wavelength Selection pane to save the settings.

Note The Alien Wavelength is applicable only for OCHNC services. An OCHNC GMPLS service can be provisioned only if the corresponding alien wavelength has been configured.

Step 6 For R6.0 NEs and earlier, click **Finish**. For R7.0 NEs and later, proceed to Step 7.

Step 7 In the Destination pane, enter the circuit destination information; then, click **Next**.

When you select OCHNC as the circuit type, you can also select a local source endpoint along with the circuit destination when the circuit is bidirectional.

Note In the Routing Preferences pane, some check boxes are checked and cannot be unchecked.

Step 8 In the Routing Preferences pane, the Route Automatically check box is checked by default. You can finish circuit creation at this point by clicking **Finish**. Alternatively, you can do the following; then, click **Next**:

a. Using Required Nodes/Links—Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:
   - Graphical
   - Graphical Enhanced
   - Textual

b. Review Route Before Creation—Check this check box to review the route before it is created. You can review the route using one of the following views:
   - Graphical
   - Graphical Enhanced

Step 9 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the network is displayed, including source and destination nodes. You can add route constraints in this pane. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:
   - Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
   - Group—Allows you to view the group(s) to which the NEs belong.

   The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

   In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node in the route. The node appears in the Included Nodes list.

e. Click **Exclude** to exclude the selected node from the route. The node appears in the Excluded Nodes list.

f. Click **Remove** to remove the selected node from the Included Nodes or Excluded Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. (Optional) Select an NE from the Included Nodes list and click **Side**. Specify the in/out sides to be included in the route and click **OK**.

i. Repeat substeps c to h for each node or link that you want to include in the circuit route.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, proceed to Step 11.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 10 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, proceed to Step 11.

Step 11 Click **Next**. The routing for the OCHNC circuit is calculated.

Step 12 In the Review Route pane, review the following information; then, click **Finish**:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all of the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 13 In the message box, click **OK**.

After the circuit status has been verified, the DISCOVERED status appears in the Status column of the circuit table.

Caution It takes several seconds to create a circuit. During that interval, if a new circuit is added with the same name, both circuits might be identified as duplicates. Therefore, be careful not to add a duplicate circuit during the creation of the first circuit.

7.2.3.8 Creating a DWDM OCHCC—ONS 15454 MSTP

Prime Optical allows you to create OCHCC circuits between two ONS 15454 MSTP NEs. OCHCC increases ONS 15454 MSTP platform functionalities, allowing you to create a new end-to-end circuit layer with transponder/muxponder client ports or ITU-T line card trunk ports as endpoints.

OCHCC can be created in a peer-to-peer setup, where the trunk ports are directly connected by a routable virtual link, or in an MSTP setup, where the circuit is routed through a tunnel circuit, which is created between the trunk ports (OCH trail tunnel), and which contains an OCHNC-type circuit.

Step 1 Select the source and destination nodes for which to create a circuit and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose **OCHCC**. The circuit type determines the provisioning options that are displayed.

Step 3 If you require GMPLS provisioning, check the GMPLS check box; then, click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.

Note This field is mandatory if the GMPLS check box (for OCHxx circuits only) is checked.

- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Type—*Display only.* Displays the circuit type.
- Size Group—Choose the type of interface that you want to provision. Size Group and Size are used together to select the circuit size. (Because there are many possible sizes, they have been grouped.)
- Size—Choose the layer rate.
- OCHCC Wavelength—Choose the OCHCC wavelength that you want to provision.
- Channel Group—Choose the channel group that you want to provision.
- Bidirectional—*Display only.* OCHCC circuits are always bidirectional.
- State—Specify the circuit state.
- Apply to source/destination ports, if allowed—Check this check box to apply the status value indicated for the circuit to the client/trunk ports that are involved in the circuit.
- Protection—Check to create a protected OCHCC. There are two possible scenarios, depending on whether the GMPLS check box is unchecked or checked.
  - When the GMPLS check box is *unchecked*:

Protected—Check this check box to select source/destination ports from protected cards only (TXPP/MXPP).

- When GMPLS check box is *checked*:

  GMPLS Protection Type—Set the protection type. Values are:

  – Not Defined—For unprotected services.

  – PSM—When a PSM card is connected to a TXP card.

  – Y CABLE—The circuit is protected by a transponder or muxponder card in a Y-cable protection group.

  – SPLITTER—When a MXPP/TXPP card is used. The circuit source and destination are on MXPP_MR_2.5G and TXPP_MR_2.5G cards. These cards provides splitter (line-level) protection (trunk protection typically on TXPP or MXPP transponder cards).

- **Optical Validation**—Set the validation mode.

  – Validation—Set the validation mode. See Table 7-7 for a listing of validation modes.

  – Required—Set the optical validation threshold value for the GMPLS circuit for the working path. The circuit is created if the actual optical validation result is greater than or equal to the value set in this field. See Table 7-8 for a listing of validation thresholds.

  – Required (protect)—Set the optical validation threshold value for the protected GMPLS circuit for the protected path.

- Restoration Configuration—Defines the restoration and revertive parameters required for creating a GMPLS circuit (OCHNC and OCH Trail). See 7.2.27 Restoration of GMPLS Circuits.
  - Restoration Balloon icon—Displays the most relevant current restoration value. See 7.2.27.1 Restoration Balloon Icon for more information.
  - Open GMPLS Restore/Revert Dialog button—When clicked the Restoration Pop Up Dialog box opens. See 7.2.27.2 Restoration Configuration Pane.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Step 5 In the Source pane, select the circuit source (shelf, slot, card, and port; shelf applies to multishelf NEs). Then, click **Next**.

Step 6 In the Destination pane, enter the circuit destination information; then, click **Next**.

Note Circuit creation will fail if the source or destination endpoints are in Unmanaged state. Circuit creation is not allowed between NEs in Out of Service or Unmanaged states.

Step 7 In the OCHxx Options pane, specify the following attributes for the trunk ports that are involved in the circuit; then, click **Next**:

- G.709 OTN—Disables or enables the G.709 OTN feature.
- FEC—Disables or enables forward error correction. G.709 OTN must be enabled before you can enable FEC.
- SD BER—Sets the signal degrade bit error rate.
- Mapping—The card can perform multiplexing per ITU-T G.709. The ODUk (client SONET/SDH payload) can be mapped to the optical channel (OTUk) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting.
- OTU Mapping—Sets the client payload mapping to the trunk.

- Revert/Reversion Time—Only for protected circuits (splitter-type protection).

If GMPLS check box is checked and if Y-cable is chosen as the protection type, the circuit wizard creates both the working and the protected paths in a single operation.

After a port is selected in the map as the source or destination endpoint, the Working Port Parameters pane, or Protected Port Parameters pane, or both are displayed depending on whether the selected ports are on the working or protect path. The working and protect port parameters on the source and destination endpoints must match with each other. Otherwise, the mismatched parameters are displayed in red in the port parameters pane. If feasible, align the parameters by using the various drop-down lists available in this pane.

Define the working or protect port parameters. Click **Apply** in the Working Port Parameters pane and Protected Port Parameters pane, to apply the settings.

Step 8 In the Routing Preferences pane, the Route Automatically check box is checked by default. You can finish circuit creation at this point by clicking **Finish**. Alternatively, you can do the following; then, click **Next**:

a. Using Required Nodes/Links—Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Review Route Before Creation—Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

Step 9 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the network is displayed, including source and destination nodes. You can add route constraints in this pane. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node in the route. The node appears in the Included Nodes list.

e. Click **Exclude** to exclude the selected node from the route. The node appears in the Excluded Nodes list.

f. Click **Remove** to remove the selected node from the Included Nodes or Excluded Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. (Optional) Select an NE from the Included Nodes list and click **Side**. Specify the in/out sides to be included in the route and click **OK**.

i. (Optional) Click the **Protected** tab. Repeat substeps d through h. This allows you to provide different constraints for both working and protected paths.

j. Repeat substeps c to i for each node or link that you want to include in the circuit route.

k. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, proceed to Step 11.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 10 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, proceed to Step 11.

Step 11 Click **Next**. The routing for the OCHCC circuit is calculated.

Step 12 The Review Route pane displays the selected route. Click **Finish** to create the circuit, **Back** to return to the Route Constraints pane, or **Cancel** to cancel the circuit creation.

If the circuit is being created for an AR_MXP, AR_XPE or AR_XP card with MXP_MR (low or high rate) or MXPP_MR (low or high rate) operating mode, select the ODU1/ODU0 and the respective time slot within the selected ODU1. Table 7-9 describes the bandwidth utilization for the selected payload.

Note You cannot select the ODU1 or the time slot parameters for any other cards or card modes.

Table 7-9 Bandwidth Utilization for the Selected Payload

Payload	Number of ODU1s Required	Number of Timeslot Required/ODU1
OC3 FE	1	1
OC12	1	4
OC48	1	16
FC2 ISC3-2G	1	14
ESCON	1	2
GE FC1 ISC3-1G	1	7
FC4G	2	16

Click **Finish**. The OCHCC and its OCH trail appear in the Circuits page. After the circuit status has been verified, the DISCOVERED status appears in the Status column.

Step 13 In the message box, click **OK**. You can view the OCHCC circuit information in the Circuit table. See 7.2.2 Viewing the Circuit Table, page 7-4. After the circuit status has been verified, the DISCOVERED status appears in the Status column of the circuit table. For a graphical representation of the circuit, view the circuit trace. See 7.2.20 Tracing Circuits, page 7-159.

Caution It takes several seconds to create a circuit. During that interval, if a new circuit is added with the same name, both circuits might be identified as duplicates. Therefore, be careful not to add a duplicate circuit during the creation of the first circuit.

7.2.3.9 Creating a DWDM OCH Trail Circuit—ONS 15454 MSTP

Prime Optical allows you to create independent OCH trail circuits between two ONS 15454 MSTP NEs. For transponder and muxponder cards, OCH trail circuits are created automatically when an OCHCC is created. You can create independent OCH trail circuits for the following cards:

- ADM-10G
- Protection Switch Module (PSM)
- XP_10GE, XP_GE (when configured as an L2 switch)
- CRS-1, and CRS-3 routers

For OCH trails connecting ADM-10G cards, the OCH trail provides the low-layer path to route STS or VC circuits over ADM-10G cards.

For OCH trails connecting GE_XP, 10GE_XP, GE_XPE, and 10GE_XPE cards in L2-over-DWDM mode, the OCH trail provides the links associated to the SVLAN entities.

For OCH trails connecting CRS-1, and CRS-3 routers, the OCH trail provides end-to-end circuit connectivity between the CRS-1, and CRS-3 routers passing through an MSTP network.

Complete the following steps to create a DWDM OCH trail circuit:

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose **OCHTRAIL**. The circuit type determines the provisioning options that are displayed.

Step 3 If you require GMPLS provisioning, check the GMPLS check box; then, click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.

Note This field is mandatory if the GMPLS check box (for OCHxx circuits only) is checked.

- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Type—*Display only.*
- Size—*Display only.*
- OCHCC Wavelength—Choose the wavelength that you want to provision.
- Channel Group—Choose the channel group that you want to provision.
- Bidirectional—*Display only.* OCHCC circuits are always bidirectional.
- State—Specify the circuit state.
- Apply to source/destination ports, if allowed—Check this check box to apply the status value indicated for the circuit to the trunk ports that are involved in the circuit.
- Protection—Displayed only when the GMPLS check box is checked.
  - GMPLS Protection Type—Choose the protection type. Value is Not Defined.
  - Optical Validation—Set the validation mode.
    a. Validation—Choose the validation mode. The validation modes are listed in Table 7-7.
    b. Required—Set the optical validation threshold value for the GMPLS circuit for the working path. The circuit is created if the actual optical validation result is greater than or equal to the value set in this field. The Validation Threshold values are listed in Table 7-8.
- Restoration Configuration—Defines the restoration and revertive parameters required for creating a GMPLS circuit (OCHNC and OCH Trail). See 7.2.27 Restoration of GMPLS Circuits.
  - Restoration Balloon icon—Displays the most relevant current restoration value. See 7.2.27.1 Restoration Balloon Icon for more information.
  - Open GMPLS Restore/Revert Dialog button—When clicked, the Restoration Pop Up Dialog box opens. See 7.2.27.2 Restoration Configuration Pane for more information.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Step 5 In the Source pane, select the circuit source (shelf, slot, card, and port; shelf applies to multishelf NEs). Then, click **Next**.

Step 6 In the Destination pane, enter the circuit destination information; then, click **Next**.

Step 7 In the OCHxx Options pane, specify the following attributes for the trunk ports that are involved in the circuit; then, click **Next**.

- G.709 OTN—Disables or enables the G.709 OTN feature.
- FEC—Disables or enables forward error correction. G.709 OTN must be enabled before you can enable FEC.
- SD BER—Sets the signal degrade bit error rate.
- Mapping—The card can perform multiplexing per ITU-T G.709. The ODUk (client SONET/SDH payload) can be mapped to the optical channel (OTUk) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting.

Step 8 In the Routing Preferences pane, the Route Automatically check box is checked by default. You can finish circuit creation at this point by clicking **Finish**. Alternatively, you can do the following; then, click **Next**:

a. Using Required Nodes/Links—Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Review Route Before Creation—Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

Step 9 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the network is displayed, including source and destination nodes. You can add route constraints in this pane. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node in the route. The node appears in the Included Nodes list.

e. Click **Exclude** to exclude the selected node from the route. The node appears in the Excluded Nodes list.

f. Click **Remove** to remove the selected node from the Included Nodes or Excluded Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. (Optional) Select an NE from the Included Nodes list and click **Side**. Specify the in/out sides to be included in the route and click **OK**.

i. Repeat substeps c to h for each node or link that you want to include in the circuit route.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, proceed to Step 11.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 10 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, proceed to Step 11.

Step 11 Click **Next**.

Step 12 The Review Route pane displays the selected route. Click **Finish** to create the circuit, **Back** to return to the Route Constraints pane, or **Cancel** to cancel the circuit creation.

Step 13 In the message box, click **OK**. You can view the OCH trail circuit information in the Circuit table. See 7.2.2 Viewing the Circuit Table, page 7-4. After the circuit status has been verified, the DISCOVERED status appears in the Status column of the circuit table. For a graphical representation of the circuit, view the circuit trace. See 7.2.20 Tracing Circuits, page 7-159.

Caution It takes several seconds to create a circuit. During that interval, if a new circuit is added with the same name, both circuits might be identified as duplicates. Therefore, be careful not to add a duplicate circuit during the creation of the first circuit.

7.2.3.10 Creating a Monitor Circuit—CTC-Based NEs

Use the Create Monitor Circuit wizard to create a new monitor circuit on CTC-based NEs.

Note A monitor circuit's alias is based on the alias of the original circuit. Prime Optical does not generate unique numbers; therefore, two monitor circuits created on the same circuit have the same alias, while their names are different (including two unique numbers appended in the network).

Step 1 Select the CTC-based NE where you want to create a monitor circuit and open the Circuit table. For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.

Step 2 In the Circuit table, select the bidirectional circuit to be monitored.

Step 3 Choose **Configuration > Modify Circuit** (or click the **Modify** tool). The Modify Circuit dialog box opens.

Step 4 In the Modify Circuit dialog box, click the **Monitor** tab. The Monitor tab displays the ports that can be used to monitor the circuit selected in Step 2.

Step 5 In the Monitor tab, select the monitor source and click **Create Monitors**. The Create Monitor Circuit wizard opens.

Step 6 In the Create Monitor Circuit wizard, enter the following monitor circuit information; then, click **Next**:

- Name—Enter the monitor circuit name.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- State—Specify the circuit state. Options vary depending on the type of circuit selected.

Step 7 In the Source pane, choose the source node, slot, port, STS, VT, or DS-1 for the monitored circuit; then, click **Next**.

Step 8 In the Destination pane, choose the destination node, slot, port, STS, VT, or DS-1 for the monitored circuit; then, click **Next**.

Step 9 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 10.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 10.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 10 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical radio button is selected), do the following; then, click **Next**:

a. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.

- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

b. In the VCAT Member Number list box, select the member for which the route is to be selected.

c. In the circuit display, select the span to use for the next hop.

d. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

e. Click **Add**. The span is added to the Selected Spans list.

f. Repeat substeps b to d for each intermediate NE until the destination NE is reached.

g. Repeat substeps a to e for each member until all members are routed.

h. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

i. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Step 11 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 12 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

b. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

c. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

d. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

e. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

f. Repeat substeps a to e for each node or link that you want to include in the circuit route.

g. (Optional) Repeat substeps a to f for each intermediate NE until the destination NE is reached.

h. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 13 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to g for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 14 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 15 In the message box, click **OK**.

Step 16 In the confirmation dialog box, click **OK**.

Step 17 In the Modify Circuit dialog box, click **Close**. The new monitor circuit is displayed in the Circuit table.

7.2.3.11 Creating a Unidirectional Drop Circuit—CTC-Based NEs

Use the Create Drop wizard to create a new protected or unprotected unidirectional circuit drop. A circuit drop can also be created on bidirectional Ethernet circuits. For all other types of circuits, drop creation is possible only on unidirectional circuits.

Step 1 Select the CTC-based NE where you want to create a new unidirectional circuit drop and open the Circuit table. For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.

Step 2 In the Circuit table, select the unidirectional circuit where you want to create the drop.

Step 3 Choose **Configuration > Modify Circuit** (or click the **Modify** tool). The Modify Circuit dialog box opens.

Step 4 In the Modify Circuit dialog box, click the **Drops** tab, which displays the existing drops on the selected circuit.

Step 5 In the Drops tab, click **Create**. The Create Drop wizard opens.

Step 6 In the Create Drop wizard, fill in the following fields; then, click **Next**.

Note Fields shown depend on the type and size of the selected circuit.

- NE ID—Select the NE ID.
- Slot—Specify the drop slot.
- Port—Specify the drop port.
- STS—(For SONET circuits) Specify the drop STS.
- VT—(For SONET circuits) Specify the drop VT.
- DS1—(For SONET circuits) Specify the drop DS-1.
- VC4—(For SDH circuits) Specify the drop VC4.
- VC3—(For SDH circuits) Specify the drop VC3.
- VC11—(For SDH circuits) Specify the drop VC11.
- VC12—(For SDH circuits) Specify the drop VC12.
- TUG3—(For SDH circuits) Specify the drop TUG3.
- TUG2—(For SDH circuits) Specify the drop TUG2.
- Target Circuit State—Select an administrative state for the new circuit drop. SONET and SDH circuits have different values. For SONET circuits, values are:
  - IS
  - OOS DSBLD

  - IS AINS
  - OOS MT

  For SDH circuits, values are:

  - Unlocked
  - Locked, disabled
  - Unlocked, automaticInService
  - Locked, maintenance

- Apply to drop ports—Check this check box to apply the selected state to the drop port.

Step 7 (For protected unidirectional circuits) In the Routing Preferences pane, specify the routing and protection preferences for the new drop.

The Routing Preferences pane in the Create Drop wizard is similar to the Routing Preferences pane in the Create Circuit wizard, except that for a drop, the Fully Protected Path check box is unchecked (disabled) for Ethernet circuits and unchecked (enabled) for all other circuits. You can check or uncheck the Fully Protected Path check box. If the existing circuit is protected and during drop creation you check or uncheck the Fully Protected Path check box, an error message is returned after you click Next. You must change the protection option if the error message indicates that all drops must have the same protection.

Subsequent panes in the Create Drop wizard are identical to the panes in the Create Circuit wizard (see Table 7-6 on page 7-14).

Step 8 Click **Finish**.

Step 9 In the message box, click **OK**.

Step 10 In the Modify Circuit dialog box, click **Close**.

7.2.3.12 Creating G1000-4 Circuits

This section explains how to provision G1000-4 point-to-point circuits and Ethernet manual cross-connects. Ethernet manual cross-connects allow you to cross-connect individual Ethernet circuits to an STS channel on the ONS 15454 SONET or ONS 15454 SDH optical interface and to bridge non-ONS SONET network segments.

7.2.3.12.1 G1000-4 Point-to-Point Ethernet Circuits

G1000-4 cards support point-to-point circuit configuration. Provisionable circuit sizes are STS-1, STS-3c, STS-6c, STS-9c, STS-12c, STS-24c, and STS-48c. Each Ethernet port maps to a unique STS circuit on the SONET side of the G1000-4.

The G1000-4 card supports any combination of up to four circuits from the list of valid circuit sizes; however, the circuit sizes can add up to no more than 48 STSs. Due to hardware constraints, the initial release of the G1000-4 card (software release 3.2) imposes additional restrictions on the combinations of circuits that can be dropped onto a G1000-4 card. These restrictions are transparently enforced by the ONS 15454 SONET and ONS 15454 SDH, so there is no need to keep track of restricted circuit combinations.

- The restriction occurs when a single STS-24c is dropped on a card. In this instance, the remaining circuits on that card can be another single STS-24c or any combination of circuits of STS-12c size or smaller that add up to no more than 12 STSs (that is, a total of 36 STSs on the card).
- No circuit restrictions are present if STS-24c circuits are not being dropped on the card. The full 48 STSs of bandwidth can be used (for example, a single STS-48c circuit or 4 STS-12c circuits).
- Since the restrictions apply only when STS-24c circuits are involved but do not apply when two STS-24c circuits are on the same card, the impact of these restrictions can be easily minimized. Group the STS-24c circuits together on a card separate from circuits of other sizes. The grouped circuits can be dropped onto other G1000-4 cards on the ONS 15454 SONET or ONS 15454 SDH. The G1000-4 uses STS cross-connects only. No VT-level cross-connects are used. All SONET-side STS circuits must be contiguous.

Caution G1000-4 circuits connect with OC-N cards or other G1000-4 cards. G1000-4 cards do not connect with E-series Ethernet cards.

Caution The G1000-4 card requires the XC10G card to operate. The G1000-4 card is not compatible with XC or XCVT cards.

Complete the following steps to create G1000-4 point-to-point Ethernet circuits:

Step 1 In the Domain Explorer, select the ONS 15454 SONET or ONS 15454 SDH NE to use as one of the Ethernet circuit endpoints.

Step 2 Do the following in the Domain Explorer:

a. Select the source circuit.

b. Choose **Configuration > Create Circuit**.

c. Select the destination circuit. The Create Circuit wizard opens.

Step 3 From the Type field, choose **STS**; then, click **Next**. The Attributes pane opens.

Note The VT and VT Tunnel types do not apply to Ethernet circuits.

Step 4 In the Name field, enter a name for the circuit.

Step 5 In the Circuit Alias field, enter a unique alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.

Step 6 From the Size field, choose the size of the circuit. The valid circuit sizes for a G1000-4 circuit are STS-1, STS-3c, STS-6c, STS-9c, STS-12c, STS-24c, and STS-48c.

Step 7 Verify that the **Bidirectional** check box is checked.

Note The states of the Number of Circuits check box and the Protected Drops check box are provided.

Caution If provisioning a G1000-4 circuit on a UPSR, do not check the Switch on PDI-P check box. Checking the Switch on PDI-P check box might cause unnecessary UPSR protection switches.

Step 8 (Optional) Specify the customer information:

- Customer ID
- Service ID

Step 9 Click **Next**.

Step 10 In the Source pane, choose the circuit source node. Either end node can be the circuit source.

Step 11 From the Slot field, choose the slot containing the G1000-4 card to use as one end of the point-to-point circuit.

Step 12 In the Port field, choose a port.

Step 13 Click **Next**.

Step 14 In the Destination pane, choose the circuit destination node.

Step 15 In the Slot field, choose the slot containing the G1000-4 card to use as the other end of the point-to-point circuit.

Step 16 From the Port field, choose a port.

Step 17 Click **Next**. The Routing Preferences pane opens.

Step 18 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 19.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 19.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 19 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 20 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 21 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 22 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 23 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, verify the following information about the point-to-point circuit:

- Circuit name
- Circuit type
- Circuit size
- ONS 15454 SONET or ONS 15454 SDH nodes are included in the circuit

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 24 In the message box, click **OK**.

Step 25 To change the slot property information for the Ethernet card, see C.4.16 Slot Properties—G1000-4, page C-906.

Note To change the capacity of a G1000-4 point-to-point circuit, delete the original circuit and reprovision a new, larger circuit.

7.2.3.12.2 G1000-4 Manual Cross-Connects

ONS 15454 SONET and ONS 15454 SDH NEs require end-to-end CTC visibility between nodes for normal provisioning of Ethernet circuits. When equipment from other vendors is placed between the ONS 15454 SONET and ONS 15454 SDH, equipment based on Open System Interconnection/Target Identifier Address Resolution Protocol (OSI/TARP) does not allow tunneling of the ONS 15454 SONET or ONS 15454 SDH TCP/IP-based data communications channel (DCC). To circumvent a lack of continuous DCC, the Ethernet circuit must be manually cross-connected to an STS channel riding through the non-ONS network. This allows an Ethernet circuit to run from ONS node to ONS node while utilizing the non-ONS network.

Note In this topic, cross-connect and circuit have the following meanings: *Cross-connect* refers to the connections that occur within a single ONS 15454 SONET or ONS 15454 SDH to allow a circuit to enter and exit an ONS 15454 SONET or ONS 15454 SDH. *Circuit* refers to the series of connections from a traffic source (where traffic enters the ONS 15454 SONET or ONS 15454 SDH network) to the drop or destination (where traffic exits an ONS 15454 SONET or ONS 15454 SDH network).

Step 1 In the Domain Explorer, select the ONS 15454 SONET and ONS 15454 SDH Ethernet circuit endpoint nodes.

Step 2 Do the following in the Domain Explorer:

a. Select the source circuit.

b. Choose **Configuration > Create Circuit**.

c. Select the destination circuit. The Create Circuit wizard opens.

Step 3 From the Type field, choose **STS**; then, click **Next**. The Attributes pane opens.

Note The VT and VT Tunnel types do not apply to Ethernet circuits.

Step 4 In the Name field, enter a name for the circuit.

Step 5 In the Circuit Alias field, enter a unique alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.

Step 6 From the Size field, choose the size of the circuit. The valid circuit sizes for a G1000-4 circuit are STS-1, STS-3c, STS-6c, STS-9c, STS-12c, STS-24c, and STS-48c.

Step 7 Verify that the **Bidirectional** check box is checked.

Step 8 (Optional) Specify the customer information:

- Customer ID
- Service ID

Step 9 Click **Next**.

Step 10 In the Source pane, choose the circuit source node.

Step 11 From the Slot field, choose the slot containing the Ethernet card.

Step 12 From the Port field, choose a port.

Step 13 Click **Next**.

Step 14 In the Destination pane, choose the current node as the circuit destination.

Step 15 From the Slot field, choose the optical card that will carry the circuit.

Step 16 Choose the STS that will carry the circuit from the STS field; then, click **Next**. The Routing Preferences pane opens.

Note For Ethernet manual cross-connects, the same ONS 15454 SONET or ONS 15454 SDH serves as both source and destination.

Step 17 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:
   - Graphical
   - Graphical Enhanced
   - Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:
   - Graphical
   - Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:
   - To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
   - To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 18.
   - To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 18.

f. If you selected **Fully Protected Path**, choose one of the following options:
   - Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
   - Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
   - Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
   - Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 18 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 19 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 20 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Right-click the line, and click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Right-click the line, and click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 21 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Right-click the line, and click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Right-click the line, and click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 22 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, verify the following information about the point-to-point circuit:

- Circuit name
- Circuit type
- Circuit size
- ONS 15454 SONET or ONS 15454 SDH nodes are included in the circuit

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 23 In the message box, click **OK**.

Step 24 Provision the Ethernet ports. For port provisioning instructions, see 6.5.1 Provisioning E-Series Ethernet Ports for VLAN Membership, page 6-8.

Step 25 To complete the procedure, repeat Steps 1 to 23 for the second ONS 15454 SONET or ONS 15454 SDH.

Note The appropriate STS circuit must exist in the non-ONS 15454 SONET or non-ONS 15454 SDH equipment to connect the two STSs from the ONS 15454 SONET or ONS 15454 SDH Ethernet manual cross-connect endpoints.

Caution If a CARLOSS alarm repeatedly appears and clears on an Ethernet manual cross-connect, the two Ethernet circuits might have a circuit-size mismatch. For example, a circuit size of STS-3c might have been configured on the first ONS 15454 SONET or ONS 15454 SDH, and a circuit size of STS-12c might have been configured on the second ONS 15454 SONET or ONS 15454 SDH. To troubleshoot the cause of the CARLOSS alarm, see the "Alarm Troubleshooting" chapter of the *Cisco ONS 15454 Troubleshooting Guide* or *Cisco ONS 15454 SDH Troubleshooting Guide*.

7.2.3.13 Creating E-Series Circuits

Ethernet circuits can link ONS nodes through point-to-point, shared packet ring, or hub-and-spoke configurations. Two nodes usually connect with a point-to-point configuration. More than two nodes usually connect with a shared packet ring configuration or a hub-and-spoke configuration. This section includes procedures for creating these configurations and also explains how to create Ethernet manual cross-connects. Ethernet manual cross-connects allow you to cross-connect individual Ethernet circuits to an STS channel on the ONS 15454 SONET or ONS 15454 SDH optical interface and also to bridge non-ONS SONET network segments.

Note Before creating Ethernet connections, choose an STS-1, STS-3c, STS-6c, or STS-12c circuit size.

Note When creating an STS-12c Ethernet circuit, Ethernet cards must be configured as single-card EtherSwitch. Multicard mode does not support STS-12c Ethernet circuits.

7.2.3.13.1 Provisioning E-Series EtherSwitch Point-to-Point Ethernet Circuits (Multicard, Single-Card, or Port-Mapped)

The ONS 15327, ONS 15454 SONET, and ONS 15454 SDH can set up a point-to-point (straight) Ethernet circuit as single-card or multicard. Multicard EtherSwitch is limited to STS-6c of bandwidth between two Ethernet circuit points, but allows you to add nodes and cards and create a shared packet ring. Single-card EtherSwitch allows a full STS-12c of bandwidth between two Ethernet circuit points.

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet circuit endpoint nodes.

Step 3 Click the **Identification** tab.

Step 4 If you are building a multicard EtherSwitch point-to-point circuit:

a. In the Card Mode field, choose **Multicard EtherSwitch Group**.

b. In the message box, click **OK**.

c. Repeat Step 2 to Step 4 for each Ethernet card in the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH that will carry the circuit.

Step 5 If you are building a single-card EtherSwitch circuit:

a. In the Card Mode field, choose **Single-card EtherSwitch**.

b. In the message box, click **OK**.

Step 6 If you are building a port mapped circuit:

a. In the Card Mode field, choose **Port Mapped**.

b. In the message box, click **OK**.

Step 7 Navigate to the other ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet circuit endpoint.

Step 8 Repeat Step 1 to Step 7 for the other ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet circuit endpoint.

Step 9 Do the following in the Domain Explorer:

a. Select the source circuit.

b. Choose **Configuration > Create Circuit**.

c. Select the destination circuit. The Create Circuit wizard opens.

Step 10 In the Type field, choose **STS**; then, click **Next**. The Attributes pane opens.

Note The VT and VT Tunnel types do not apply to Ethernet circuits.

Step 11 In the Name field, enter a name for the circuit.

Step 12 In the Circuit Alias field, enter a unique alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.

Step 13 From the Size field, choose the size of the circuit.

- The valid circuit sizes for an Ethernet multicard circuit are STS-1, STS-3c, and STS-6c.
- The valid circuit sizes for an Ethernet single-card circuit are STS-1, STS-3c, STS-6c, and STS-12c.

Step 14 Verify that the **Bidirectional** check box is checked.

Step 15 (Optional) Specify the customer information:

- Customer ID
- Service ID

Step 16 Click **Next**. The Source pane opens.

a. From the Slot field, choose the circuit source. Either end node can be the circuit source.

b. When building a multicard EtherSwitch circuit, choose **Ethergroup** from the Slot field and click **Next**.

c. When building a single-card EtherSwitch circuit, from the Slot field choose the Ethernet card where the single-card EtherSwitch was enabled and click **Next**.

d. When building a circuit in port-mapped mode, from the Slot field choose the slot containing the E-series card that you will use for one end of the point-to-point circuit. Choose a port from the Port drop-down list and click **Next**.

Step 17 The Destination pane opens.

a. From the Slot field, choose the circuit destination. Choose the node that is not the source.

b. When building a multicard EtherSwitch circuit, choose **Ethergroup** from the Slot field and click **Next**.

c. When building a **single-card EtherSwitch** circuit, from the Slot field choose the Ethernet card where the single-card EtherSwitch was enabled and click **Next**.

d. When building a circuit in port-mapped mode, from the Slot field choose the slot containing the E-series card that you will use for the other end of the point-to-point circuit. Choose a port from the Port drop-down list and click **Next**. The VLAN Selection pane opens.

Step 18 Create the VLAN.

a. Click the **New VLAN** button. The Define New VLAN dialog box opens.

b. Assign an easily identifiable name to the VLAN.

c. Assign a VLAN ID.

Note The VLAN ID should be the next available number from 2 to 4093 that is not already assigned to an existing VLAN. Each ONS 15327, ONS 15454 SONET, or ONS 15454 SDH network supports a maximum of 509 user-provisionable VLANs.

d. Click **OK**.

e. Highlight the VLAN name and click the **Add** button to move the available VLAN to the Circuit VLANs list box.

Note A maximum of 509 VLANs are supported on a DCC-connected network.

Step 19 Check the **Enable Spanning Tree** check box to enable spanning tree protection.

Step 20 Click **Next**. The Routing Preferences pane opens.

Step 21 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 22.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 22.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 22 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:
   - Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
   - Zoom In—Allows you to zoom in on an object in the map view.
   - Zoom Out—Allows you to zoom out on the map view.
   - Reset Zoom—Resets the current zoom level to the default.
   - Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:
   - From—Displays the source of the span
   - To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 23 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:
   - Src NE ID—*Display only.*
   - Dest NE ID—*Display only.*
   - Current NE ID—*Display only.*

- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 24 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Right-click the line, and click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Right-click the line, and click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 25 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 26 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, verify the following information about the point-to-point circuit:

- Circuit name
- Circuit type
- Circuit size
- VLANS on the circuit
- ONS 15454 SONET or ONS 15454 SDH nodes are included in the circuit

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 27 In the message box, click **OK**.

Step 28 Provision the Ethernet ports and assign ports to VLANs. For information about changing the slot properties, see C.4 Ethernet Cards, page C-832. For information about assigning ports to VLANs, see 6.5.10 E-Series Spanning Tree Protocol (IEEE 802.1D), page 6-19. For information about provisioning circuits manually, see 7.2.3.13.4 E-Series Ethernet Manual Cross-Connects, page 7-114.

7.2.3.13.2 Provisioning E-Series Shared Packet Ring Ethernet Circuits

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet circuit endpoint nodes.

Step 3 Click the **Identification** tab.

Step 4 In the Card Mode field, choose **Multicard EtherSwitch Group**.

Step 5 Click **Apply**.

Step 6 Repeat Step 2 to Step 5 for each Ethernet card in the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH that will carry the shared packet ring.

Step 7 Navigate to the other ONS 15327, ONS 15454 SONET, or ONS 15454 SDH endpoint.

Step 8 Repeat Step 2 to Step 7 for the other ONS 15327, ONS 15454 SONET, or ONS 15454 SDH endpoint.

Step 9 Do the following in the Domain Explorer:

- **a.** Select the source circuit.
- **b.** Choose **Configuration > Create Circuit**.
- **c.** Select the destination circuit. The Create Circuit wizard opens.

Step 10 In the Type field, choose **STS**; then, click **Next**. The Attributes pane opens.

Note The VT and VT Tunnel types do not apply to Ethernet circuits.

Step 11 In the Name field, enter a name for the circuit.

Step 12 In the Circuit Alias field, enter a unique alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.

Step 13 From the Size field, choose the size of the circuit. For shared packet ring Ethernet, valid circuit sizes are STS-1, STS-3c, and STS-6c.

Step 14 Verify that the **Bidirectional** check box is checked.

Note When building a shared packet ring configuration, the circuits must be provisioned manually.

Step 15 Click **Next**. The Source pane opens.

Step 16 From the Slot field, choose the circuit source. Any shared packet ring node can serve as the circuit source.

Step 17 Choose **Ethergroup** from the Slot field and click **Next**. The Destination pane opens.

Step 18 Choose the circuit destination from the Slot field. Except for the source node, any shared packet ring node can serve as the circuit destination.

Step 19 Choose **Ethergroup** from the Slot field and click **Next**. The VLAN Selection pane opens.

Step 20 Create the VLAN.

- **a.** Click the **New VLAN** button. The Define New VLAN dialog box opens.
- **b.** Assign an easily identifiable name to the VLAN.
- **c.** Assign a VLAN ID.

Note The VLAN ID number must be unique. It should be the next available number from 2 to 4093 that is not already assigned to an existing VLAN. Each ONS 15327, ONS 15454 SONET, or ONS 15454 SDH network supports a maximum of 509 user-provisionable VLANs.

d. Click **OK**.

e. Highlight the VLAN name and click the **Add** button to move the VLAN from the Available VLANs column to the Circuit VLANs list box. When you move the VLAN from the Available VLANs column to the Circuit VLANs column, all of the VLAN traffic is forced to use the shared packet ring circuit that was created.

Step 21 Click **Next**.

Step 22 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.

- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 23.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 23.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Note If you selected VT as the circuit type in the Attributes pane and unchecked Route Automatically, the new VT tunnel is created when circuit provisioning is finished.

Step 23 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:
   - From—Displays the source of the span
   - To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 24 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:
   - Src NE ID—*Display only.*
   - Dest NE ID—*Display only.*
   - Current NE ID—*Display only.*
   - Adj NE ID—*Display only.*
   - Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
   - Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
   - Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 25 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 26 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 27 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, verify that the new circuit is configured correctly.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 28 In the message box, click **OK**.

Step 29 Provision the Ethernet ports and assign ports to VLANs. For information about changing the slot properties, see C.4 Ethernet Cards, page C-832. For information about assigning ports to VLANs, see 6.5.10 E-Series Spanning Tree Protocol (IEEE 802.1D), page 6-19.

7.2.3.13.3 Provisioning E-Series Hub-and-Spoke Ethernet Circuits

This section provides steps for creating a hub-and-spoke Ethernet circuit configuration. The hub-and-spoke configuration connects point-to-point circuits (the spokes) to an aggregation point (the hub). In many cases, the hub links to a high-speed connection and the spokes are Ethernet cards.

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet circuit endpoint nodes.

Step 3 Click the **Identification** tab.

Step 4 Under Card Mode, choose **Single-card EtherSwitch** and click **Apply**.

Step 5 Navigate to the other ONS 15327, ONS 15454 SONET, or ONS 15454 SDH endpoint and repeat Step 2 to Step 4.

Step 6 Do the following in the Domain Explorer:

a. Select the source circuit.

b. Choose **Configuration > Create Circuit**.

c. Select the destination circuit. The Create Circuit wizard opens.

Step 7 From the Type field, choose **STS**; then, click **Next**. The Attributes pane opens.

Note The VT and VT Tunnel types do not apply to Ethernet circuits.

Step 8 In the Name field, enter a name for the circuit.

Step 9 In the Circuit Alias field, enter a unique alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.

Step 10 From the Size field, choose the size of the circuit.

Step 11 Verify that the **Bidirectional** check box is checked and click **Next**. The Source pane opens.

Step 12 Choose the circuit source. Either end node can be the circuit source.

Step 13 From the Slot field, choose the Ethernet card where the single-card EtherSwitch was enabled and click **Next**. The Destination pane opens.

Step 14 Choose the circuit destination. Choose the node that is not the source.

Step 15 From the Slot field, choose the Ethernet card where the single-card EtherSwitch was enabled and click **Next**. The VLAN Selection pane opens.

Step 16 Create the VLAN.

a. Click the **New VLAN** button. The Define New VLAN dialog box opens.

b. Assign an easily identifiable name to the VLAN.

c. Assign a VLAN ID.

Note The VLAN ID number must be unique. It should be the next available number from 2 to 4093 that is not already assigned to an existing VLAN. Each ONS 15327, ONS 15454 SONET, or ONS 15454 SDH network supports a maximum of 509 user-provisionable VLANs.

d. Click **OK**.

e. Highlight the VLAN name and click the **Add** button to move the VLAN from the Available VLANs column to the Circuit VLANs column.

Step 17 Click **Next**. The Routing Preferences pane opens.

Step 18 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical

- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 19.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 19.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 19 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 20 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.

- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 21 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 22 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 23 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, verify the following information about the point-to-point circuit:

- Circuit name
- Circuit type
- Circuit size
- VLANs that will be transported across this circuit
- ONS 15327, ONS 15454 SONET, or ONS 15454 SDH nodes are included on this circuit

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 24 In the message box, click **OK**.

Step 25 Provision the second circuit and attach it to the already created VLAN.

Step 26 Provision the Ethernet ports and assign ports to VLANs. For information about changing the slot properties, see C.4 Ethernet Cards, page C-832. For information about assigning ports to VLANs, see 6.5.10 E-Series Spanning Tree Protocol (IEEE 802.1D), page 6-19.

7.2.3.13.4 E-Series Ethernet Manual Cross-Connects

ONS 15327, ONS 15454 SONET, and ONS 15454 SDH NEs require end-to-end CTC visibility between nodes for normal provisioning of Ethernet circuits. When equipment from other vendors is positioned between ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NEs, equipment based on OSI/TARP does not allow tunneling of the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH TCP/IP-based

DCC. To circumvent this lack of continuous DCC, the Ethernet circuit must be manually cross-connected to an STS channel riding through the non-ONS network. This allows an Ethernet circuit to run from ONS node to ONS node by utilizing the non-ONS network.

Note Provisioning manual cross-connects for *multicard* EtherSwitch circuits is a separate procedure from provisioning manual cross-connects for *single-card* EtherSwitch circuits. Both procedures are provided in the following sections.

7.2.3.13.5 Provisioning a Single-Card EtherSwitch Manual Cross-Connect

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet circuit endpoint nodes.

Step 3 Click the **Identification** tab.

Step 4 In Card Mode field, choose **Single-card EtherSwitch** and click **Apply**.

Step 5 Do the following in the Domain Explorer:

- **a.** Select the source circuit.
- **b.** Choose **Configuration > Create Circuit**.
- **c.** Select the destination circuit. The Create Circuit wizard opens.

Step 6 From the Type field, choose **STS**; then, click **Next**. The Attributes pane opens.

Note The VT and VT Tunnel types do not apply to Ethernet circuits.

Step 7 In the Name field, enter a name for the circuit.

Step 8 In the Circuit Alias field, enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.

Step 9 From the Size field, choose the size of the circuit. The valid circuit sizes for an Ethernet single-card circuit are STS-1, STS-3c and STS-6c.

Step 10 Verify that the **Bidirectional** check box is checked and click **Next**. The Source pane opens.

Step 11 Choose the current node as the circuit source.

Step 12 From the Slot field, choose the Ethernet card that will carry the circuit and click **Next**. The Destination pane opens.

Step 13 Choose the current node as the circuit destination.

Step 14 From the Slot field, choose the optical card that will carry the circuit.

Step 15 Choose the STS that will carry the circuit from the STS field and click **Next**. The VLAN Selection pane opens.

Note For Ethernet manual cross-connects, the same node serves as both source and destination.

Step 16 Create the VLAN.

- **a.** Click the **New VLAN** button. The Define New VLAN dialog box opens.

b. Assign an easily identifiable name to the VLAN.

c. Assign a VLAN ID.

Note The VLAN ID should be the next available number from 2 to 4093 that is not already assigned to an existing VLAN. Each ONS 15327, ONS 15454 SONET, or ONS 15454 SDH network supports a maximum of 509 user-provisionable VLANs.

d. Click **OK**.

e. Highlight the VLAN name and click the **Add** button to move the VLAN from the Available VLANs column to the Circuit VLANs column.

Step 17 Click **Next**. The Routing Preferences pane opens.

Step 18 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 19.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 19.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 19 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 20 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 21 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 22 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 23 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, verify the following information about the point-to-point circuit:

- Circuit name
- Circuit type
- Circuit size
- VLANs on this circuit
- ONS 15327, ONS 15454 SONET, or ONS 15454 SDH nodes are included on this circuit

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 24 In the message box, click **OK**.

Step 25 Provision the Ethernet ports and assign ports to VLANs. For information about changing the slot properties, see C.4 Ethernet Cards, page C-832. For information about assigning ports to VLANs, see 6.5.10 E-Series Spanning Tree Protocol (IEEE 802.1D), page 6-19.

Step 26 After assigning the ports to the VLANs, repeat Step 1 to Step 25 at the second ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet manual cross-connect endpoint.

Note The appropriate STS circuit must exist in the non-ONS 15454 SONET equipment to connect the two STSs from the ONS 15454 SONET Ethernet manual cross-connect endpoints.

Caution If a CARLOSS alarm repeatedly appears and clears on an Ethernet manual cross-connect, the two Ethernet circuits might have a circuit-size mismatch. For example, a circuit size of STS-3c might have been configured on the first ONS 15454 SONET or ONS 15454 SDH, and a circuit size of STS-12c might have been configured on the second ONS 15327, ONS 15454 SONET, or ONS 15454 SDH. To troubleshoot the CARLOSS alarm, see the CARLOSS alarm troubleshooting procedure in the "Alarm Troubleshooting" chapter of the *Cisco ONS 15454 Troubleshooting Guide* or *Cisco ONS 15454 SDH Troubleshooting Guide*.

7.2.3.13.6 Provisioning an E-Series Multicard EtherSwitch Manual Cross-Connect

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet circuit endpoint nodes.

Step 3 Click the **Identification** tab.

Step 4 In the Card Mode field, choose **Multicard EtherSwitch Group** and click **Apply**.

Step 5 Repeat Step 2 to Step 4 for each Ethernet card in the ONS 15327, ONS 15454 SONET, or ONS 15454 SDH that will carry the circuit.

Step 6 Do the following in the Domain Explorer:

- **a.** Select the source circuit.
- **b.** Choose **Configuration > Create Circuit**.
- **c.** Select the destination circuit. The Create Circuit wizard opens.

Step 7 From the Type field, choose **STS**; then, click **Next**. The Attributes pane opens.

Note The VT and VT Tunnel types do not apply to Ethernet circuits.

Step 8 In the Name field, enter a name for the circuit.

Step 9 In the Circuit Alias field, enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.

Step 10 From the Size field, choose the size of the circuit. The valid circuit sizes for an Ethernet multicard circuit are STS-1, STS-3c, and STS-6c.

Step 11 Verify that the **Bidirectional** check box is checked and click **Next**. The Source pane opens.

Step 12 Choose the current node as the circuit source.

Step 13 Choose **Ethergroup** from the Slot field and click **Next**. The Destination pane opens.

Step 14 Choose the current node as the circuit destination.

Step 15 Choose the Ethernet card that will carry the circuit from the Slot field and click **Next**. The VLAN Selection pane opens.

Note For the Ethernet manual cross-connect, the destination and source should be the same node.

Step 16 Create the VLAN.

- **a.** Click the **New VLAN** button. The Define New VLAN dialog box opens.
- **b.** Assign an easily identifiable name to the VLAN.
- **c.** Assign a VLAN ID.

Note The VLAN ID should be the next available number from 2 to 4093 that is not already assigned to an existing VLAN. Each ONS 15327, ONS 15454 SONET, or ONS 15454 SDH network supports a maximum of 509 user-provisionable VLANs.

d. Click **OK**.

e. Highlight the VLAN name and click the **Add** button to move the VLAN from the Available VLANs column to the Circuit VLANs column.

Step 17 Click **Next**. The Routing Preferences pane opens.

Step 18 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 19.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 19.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.

- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 19 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 20 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 21 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 22 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 23 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, verify the following information about the point-to-point circuit:

- Circuit name
- Circuit type

- Circuit size
- VLANs on this circuit
- ONS 15327, ONS 15454 SONET, or ONS 15454 SDH nodes are included on this circuit

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 24 In the message box, click **OK**.

Step 25 Provision the Ethernet ports and assign ports to VLANs. For information about changing the slot properties, see C.4 Ethernet Cards, page C-832. For information about assigning ports to VLANs, see 6.5.10 E-Series Spanning Tree Protocol (IEEE 802.1D), page 6-19. Return to Step 26 of this procedure after assigning the ports to VLANs.

Step 26 Highlight the circuit and click **Edit**. The Edit Circuit dialog box opens.

Step 27 Click **Drops**; then, click **Create**. The Define New Drop dialog box opens.

Step 28 From the Slot field, choose the optical card that links the ONS 15454 SONET or ONS 15454 SDH to the non-ONS 15454 equipment.

Step 29 From the Port field, choose the appropriate port.

Step 30 From the STS field, choose the STS that matches the STS of the connecting non-ONS 15454 equipment.

Step 31 Click **OK**. The Edit Circuit dialog box opens.

Step 32 Confirm the circuit information that is displayed in the Circuit Information dialog box and click **Close**.

Step 33 Repeat Step 1 to Step 32 at the second ONS 15327, ONS 15454 SONET, or ONS 15454 SDH Ethernet manual cross-connect endpoint.

Note The appropriate STS circuit must exist in the non-ONS 15454 equipment to connect the two ONS 15454 SONET or ONS 15454 SDH Ethernet manual cross-connect endpoints.

Caution If a CARLOSS alarm repeatedly appears and clears on an Ethernet manual cross-connect, the two Ethernet circuits might have a circuit-size mismatch. For example, a circuit size of STS-3c might have been configured on the first ONS 15454 SONET or ONS 15454 SDH, and a circuit size of STS-12c might have been configured on the second ONS 15454 SONET or ONS 15454 SDH. To troubleshoot the CARLOSS alarm, see the CARLOSS alarm troubleshooting procedure in the "Alarm Troubleshooting" chapter of the *Cisco ONS 15454 Troubleshooting Guide* or *Cisco ONS 15454 SDH Troubleshooting Guide*.

7.2.3.14 Creating a BLSR DRI or MS-SPRing DRI Circuit Automatically

The BLSR/MS-SPRing DRI feature allows you to provision a circuit in a DRI topology to provide the required protection when transitioning traffic between two rings, where at least one ring is a BLSR or MS-SPRing.

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose **VC_HO_Path_Circuit** for SDH circuits or **STS** for SONET circuits. In the Number of Circuits field, enter the number of circuits you want to create. The default is 1. If you enter a number higher than 1, you can use autoranging to create the additional circuits automatically.

Step 3 Click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Size—Select the circuit size. VC high-order path circuits can be VC4, VC4-2c, VC4-3c, VC4-4c, VC4-8c, VC4-16c, or VC4-64c for optical cards and for some Ethernet cards (depending on the card type). Of the Ethernet cards, only the G-1000 can use VC4-3c, VC4-8c, and VC4-16c. The “c” indicates concatenated VC4s.
- Bidirectional—Check this check box to create a two-way circuit; uncheck it to create a one-way circuit.
- State—Specify the circuit state. Options vary depending on the type of circuit selected.
- Apply to source/destination ports—Check this check box to apply the selected state to the source and destination ports.
- Protected Drops—Check this check box if you want the circuit routed to protected drops only; that is, to cards that are in 1:1, 1:N, or 1+1 protection.
- Provision working go and return on primary path (bidirectional UPSR/SNCP protection only)—Check this check box to provision the working path to go and return to the primary path.

  Note Prime Optical currently provisions unidirectional SNCP/UPSR circuits following the GR-1400 standard. For bidirectional SNCP/UPSR circuits, you can check the Provision working go and return on primary path check box to route the working and protect paths in one direction following the ITU-T G.841 standard. Unidirectional UPSR/SNCP circuits are not affected by this new routing, and the shortest path is always used as the working path.

- SNCP path selector defaults—If the circuit will be routed on an SNCP node, set the defaults as follows:
  - Revertive—Check this check box if you want traffic to revert to the working path when the conditions that diverted it to the protect path are repaired. If Revertive is not chosen, traffic remains on the protect path.

  - Reversion time—If Revertive is checked, set the reversion time. This is the amount of time that elapses before the traffic reverts to the working path. Traffic can revert when conditions causing the switch are cleared. (The Cisco default reversion time is 5 minutes.)
  - SF threshold—Choose from 1 E-3, 1 E-4, or 1 E-5.
  - SD threshold—Choose from 1 E-5, 1 E-6, 1 E-7, 1 E-8, or 1 E-9.
  - Switch on PDI-P—Not applicable.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Step 5 In the Source pane, set the circuit source. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Source** if you want to create an SNCP bridge/selector circuit entry point in a multivendor SNCP.

Step 6 Click **Next**.

Step 7 In the Destination pane, set the circuit destination. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Destination** if you want to create a circuit destination point for unidirectional/bidirectional circuits.

Step 8 Click **Next**.

Step 9 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

Check the Route Automatically check box.

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links. You can specify the required nodes and links using one of the following views:

- Graphical
- Graphical Enhanced
- Textual

c. Check the **Review Route Before Creation** check box to review the route before it is created. You can review the route using one of the following views:

- Graphical
- Graphical Enhanced

d. To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default). A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist. When you select **Fully Protected Path**, Required is selected automatically.

e. Check the **Dual Ring Interconnect** check box.

Step 10 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 11 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 12 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 13 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route. The BLSR/MS-SPRing DRI dialog box opens. Use this dialog box to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Check the **Use RIP bandwidth on secondary path** check box to use RIP protection for the BLSR or MS-SPRing DRI circuit. Click **OK**. The information you specified in the BLSR/MS-SPRing DRI dialog box is shown in the Route Constraints pane, in the Included Links/Nodes field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 14 After clicking Next, if you did not check the Revertive check box in the Attributes pane, a dialog box opens with the message “This Circuit Is Configured As Non-Revertive.” If you do not want to specify reversion settings, click **OK** without filling in the fields in the dialog box. If you want to specify reversion settings, check the **Revertive** check box, specify the reversion time in 0.5-minute increments, and click **OK**.

Step 15 In the Review Route pane, review the following information; then, click **Finish**:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Review the span information.

Step 16 In the message box, click **OK**.

7.2.3.15 Creating a BLSR DRI or MS-SPRing DRI Circuit Manually

The BLSR/MS-SPRing DRI feature allows you to provision a circuit in a DRI topology to provide the required protection when transitioning traffic between two rings, where at least one ring is a BLSR or MS-SPRing.

Step 1 Select a node for which to create a circuit, and open the Create Circuit wizard. For an explanation of wizard launch points, see Table 7-4 on page 7-12.

Step 2 In the Type pane, choose **VC_HO_Path_Circuit** for SDH circuits or **STS** for SONET circuits. In the Number of Circuits field, enter the number of circuits you want to create. The default is 1. If you enter a number higher than 1, you can use autoranging to create the additional circuits automatically.

Step 3 Click **Next**.

Step 4 In the Attributes pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new circuit. The circuit name is a free-format string of up to 48 ASCII characters. If you leave the field blank, Prime Optical assigns a default name to the circuit.
- Circuit Alias—Enter a unique alias name for the new circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a circuit description of up to 256 characters.
- Size—Select the circuit size. VC high-order path circuits can be VC4, VC4-2c, VC4-3c, VC4-4c, VC4-8c, VC4-16c, or VC4-64c for optical cards and for some Ethernet cards (depending on the card type). Of the Ethernet cards, only the G-1000 can use VC4-3c, VC4-8c, and VC4-16c. The “c” indicates concatenated VC4s.
- Bidirectional—Check this check box to create a two-way circuit; uncheck it to create a one-way circuit.
- State—Specify the circuit state. Options vary depending on the type of circuit selected.
- Apply to source/destination ports—Check this check box to apply the selected state to the source and destination ports.
- Protected Drops—Check this check box if you want the circuit routed to protected drops only; that is, to cards that are in 1:1, 1:N, or 1+1 protection.
- Provision working go and return on primary path (bidirectional UPSR/SNCP protection only)—Check this check box to provision the working path to go and return to the primary path.

Note Prime Optical currently provisions unidirectional SNCP/UPSR circuits following the GR-1400 standard. For bidirectional SNCP/UPSR circuits, you can check the Provision working go and return on primary path check box to route the working and protect paths in one direction following the ITU-T G.841 standard. Unidirectional UPSR/SNCP circuits are not affected by this new routing, and the shortest path is always used as the working path.

- SNCP path selector defaults—If the circuit will be routed on an SNCP node, set the defaults as follows:
  - Revertive—Check this check box if you want traffic to revert to the working path when the conditions that diverted it to the protect path are repaired. If Revertive is not chosen, traffic remains on the protect path.
  - Reversion time—If Revertive is checked, set the reversion time. This is the amount of time that elapses before the traffic reverts to the working path. Traffic can revert when conditions causing the switch are cleared. (The Cisco default reversion time is 5 minutes.)
  - SF threshold—Choose from 1 E-3, 1 E-4, or 1 E-5.
  - SD threshold—Choose from 1 E-5, 1 E-6, 1 E-7, 1 E-8, or 1 E-9.
  - Switch on PDI-P—Not applicable.
- Customer ID (optional)—Identify the end user of the circuit.
- Service ID (optional)—Enter the service ID of the circuit.

Step 5 In the Source pane, set the circuit source. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Source** if you want to create an SNCP bridge/selector circuit entry point in a multivendor SNCP.

Step 6 Click **Next**.

Step 7 In the Destination pane, set the circuit destination. The options displayed depend on the circuit type, the circuit properties selected in the Attributes pane, and the cards installed in the node. Click **Use Secondary Destination** if you want to create a circuit destination point for unidirectional/bidirectional circuits.

Step 8 Click **Next**.

Step 9 In the Routing Preferences pane, do the following; then, click **Next**:

a. Uncheck the **Route Automatically** check box to disable automatic route selection. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:
- Graphical
- Graphical Enhanced
- Textual

b. To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default). A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist. When you select **Fully Protected Path**, Required is selected automatically.

c. Check the **Dual Ring Interconnect** check box.

Step 10 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical or Graphical Enhanced radio button is selected), do the following; then, click **Next**:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:

- Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
- Zoom In—Allows you to zoom in on an object in the map view.
- Zoom Out—Allows you to zoom out on the map view.
- Reset Zoom—Resets the current zoom level to the default.
- Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

d. In the VCAT Member Number list box, select the member for which the route is to be selected.

e. In the circuit display, select the span to use for the next hop.

f. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

g. Click **Add**. The span is added to the Selected Spans list.

h. Repeat substeps d to f for each intermediate NE until the destination NE is reached.

i. Repeat substeps c to g for each member until all members are routed.

j. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

k. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 11 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Current NE ID—*Display only.*
- Adj NE ID—*Display only.*
- Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 12 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical or Graphical Enhanced radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. (Applicable if the Graphical Enhanced radio button is selected) Select one of the following top-level view types from the **Selected View Type** list:

- Subnetwork—Allows you to view the subnetwork(s) to which the NEs belong. This is the default view type.
- Group—Allows you to view the group(s) to which the NEs belong.

The Current View field is set to Top.

b. (Applicable if the Graphical Enhanced radio button is selected) Select a detailed view type from the **Available Views** list, or right-click a subnetwork or group and choose **View**. The Current View field is set to the detailed view type that you selected.

In a complex network, it might take several minutes or longer to calculate and display the graphic objects in the map view. The progress bar at the top of the map tracks the percentage of completion while the map is updated.

c. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps c to g for each node or link that you want to include in the circuit route.

i. (Optional) Repeat substeps c to h for each intermediate NE until the destination NE is reached.

j. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Note If the Graphical Enhanced radio button is selected and you want to change the top-level view type at any time, click **Top View**. The map view reverts to the default Subnetwork view type.

Step 13 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route. The BLSR/MS-SPRing DRI dialog box opens. Use this dialog box to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Check the **Use RIP bandwidth on secondary path** check box to use RIP protection for the BLSR or MS-SPRing DRI circuit. Click **OK**. The information you specified in the BLSR/MS-SPRing DRI dialog box is shown in the Route Constraints pane, in the Included Links/Nodes field.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 14 After clicking Finish, if you did not check the Revertive check box in the Attributes pane, a dialog box opens with the message “This Circuit Is Configured As Non-Revertive.” If you do not want to specify reversion settings, click **OK** without filling in the fields in the dialog box. If you want to specify reversion settings, check the **Revertive** check box, specify the reversion time in 0.5-minute increments, and click **OK**.

Step 15 In the message box, click **OK**.

7.2.4 Modifying Circuits on CTC-Based NEs

Use the Modify Circuit dialog box to modify properties of an existing circuit.

Step 1 Select the node that contains the circuit to be modified and open the Circuit table. For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.

Step 2 In the Circuit table, select the circuit to be modified and choose **Configuration > Modify Circuit** (or click the **Modify** tool). The Modify Circuit dialog box opens.

The tabs shown in the Modify Circuit dialog box depend on the type of circuit selected. The following table provides descriptions.

Table 7-10 Field Descriptions for the Modify Circuit Dialog Box

Field	Description
General	
Circuit ID	Enter a new circuit ID.
Circuit Alias	Enter a new alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
Description	Enter a new description of the selected circuit.
Customer ID	Optional text field that displays the customer ID of the circuit. The customer ID can contain 0 to 256 alphanumeric and special characters. For VCAT member circuits, the Customer ID and Service ID fields are disabled. You cannot edit the customer ID or service ID for individual VCAT member circuits; rather, the individual circuits inherit this information from the parent VCAT circuit. The customer ID of the VCAT circuit is applied to all member circuits. When the Customer ID field is changed for the parent VCAT circuit, the new value is applied to all members. The Customer ID text field is disabled in the VCAT Member Circuit Edit area. You can still edit the member circuit ID (Name), Description, and Circuit Admin State. When a new VCAT member circuit is added, the parent VCAT circuit's customer ID is also applied to the new member circuit.

Table 7-10 Field Descriptions for the Modify Circuit Dialog Box (continued)

Field	Description
Service ID	Optional text field that displays a service ID of the selected circuit. The service ID can contain 0 to 256 alphanumeric and special characters. For VCAT member circuits, the Customer ID and Service ID fields are disabled. You cannot edit the customer ID or service ID for individual VCAT member circuits; rather, the individual circuits inherit this information from the parent VCAT circuit. The service ID of the VCAT circuit is applied to all member circuits. When the Service ID field is changed for the parent VCAT circuit, the new value is applied to all members. The Service ID text field is disabled in the VCAT Member Circuit Edit area. You can still edit the member circuit ID (Name), Description, and Circuit Admin State. When a new VCAT member circuit is added, the parent VCAT circuit's service ID is also applied to the new member circuit.
Circuit Service State	*Display only.* The circuit service state is an aggregate of the cross-connect states within the circuit. SONET, SDH, and DWDM circuits have different values; see Table 7-3.
Circuit Admin State	Specify the administrative state to set for the selected circuit. SONET and SDH circuits have different values. For SONET circuits, values are: • IS (In Service)—The circuit is in service and able to carry traffic. • IS AINS (In Service-Auto In Service)—Alarm reporting is suppressed, but the circuit is able to carry traffic. • OOS DSBLD (Out of Service–Disabled)—The circuit is Out of Service and unable to carry traffic. • OOS MT (Out of Service–Maintenance)—The circuit is in maintenance state. The maintenance state does not interrupt traffic flow; it suppresses alarms and conditions and allows loopbacks to be performed on the circuit. • OOS OOG (Out of Service–Out of Group)—The VCAT member cross-connection is no longer used for carrying VCAT group traffic, but the cross-connection still exists. • No Change For SDH circuits, corresponding values are: • Unlocked • Unlocked,autoInService • Locked,disabled • Locked,maintenance • No Change
Apply to source/ destination ports, if allowed	Check this check box to apply the selected state to the source and destination ports.
Routing Preferences *(VCAT circuits only)*	*Display only.* Indicates the type of routing for VCAT member circuits: • Common Route—Each member circuit in the selected VCAT circuit is routed on the same fiber. • Split Route—Member circuits are routed on separate paths.

Table 7-10 Field Descriptions for the Modify Circuit Dialog Box (continued)

Field	Description
VCAT Attributes *(VCAT circuits only)*	*Display only.* Displays the attributes that have been assigned to the selected VCAT circuit, including: • Node—Node name. • VCG Name—Virtual concatenation group name. • Mode—Circuit mode (None, SW-LCAS, or LCAS). • No. of Members—Number of members that have been configured for the VCAT circuit.
Monitor	
Select Monitor Sources	Select a circuit monitor source from the list. Click **Create Monitors** to create a new monitor source for the circuit.
Drops (Unidirectional and stitched Ethernet circuits only)	

Drops	Displays the list of circuit drops. By default, the drop list has only one original destination point of the circuit. You can create additional drop points to avoid excessive traffic in the circuit.
	Follow these steps to create an additional drop point:
	1. Click **Create** to open the Create Drop wizard.
	2. Select a drop from the Destination panel.
	3. Click **Next**.
	4. Click **Finish** in the Routing Preference Panel.
	The following message appears in the dialog box. Click **OK**.
	`Successfully submitted circuit creation request.`
	Note Verify that the new drop point has been added in the Circuit table.
	Follow these steps to delete a drop point:
	1. Select a drop from the Destination panel.
	2. Click **Delete**.
	The following message appears in the dialog box. Click **Yes**.
	`Deleting drops may be service affecting. Really delete the selected drops?`
	Note Ensure that the Delete button is disabled only if one destination point is listed.

Nodes (Stitched Ethernet circuits only)	
Nodes	Displays the source nodes of the selected circuit. Select a node and click **Remove** to remove the node from the circuit. Click **Add** to open the Add Circuit Node window, where you can add a new node as a source NE.
VLANs (E-series cards in single-card and multicard mode only)	
Available VLANs	Displays the list of available VLANs. Select one or more VLANs and click **Add** to add them to the Circuit VLANs field. Click **New VLAN** to open the Define New VLAN window, where you can enter a name and ID for a new VLAN for the selected circuit.
Circuit VLANs	Displays the list of selected VLANs. Select one or more VLANs and click **Remove** to remove them from the Circuit VLANs field. If the Circuit VLANs list is empty, Prime Optical assigns the default VLAN.
Enable Spanning Tree	Check this check box to enable spanning tree protection for the circuit.

Table 7-10 Field Descriptions for the Modify Circuit Dialog Box (continued)

Field	Description
UPSR, SNCP (UPSR is for CTC-based SONET protected circuits, SNCP is for CTC-based SDH protected circuits)	
Note UPSR and SNCP attributes are editable only for VCAT member circuits, not for the VCAT parent circuit.	
Node ID	Displays the name of the node.
Working Path	One of the two paths entering the selector function. In a revertive system, this is the preferred path. In a nonrevertive system, this is the path that is specified as the working path.
Protect Path	One of the two paths entering the selector function. In a revertive system, this is the nonpreferred path. In a nonrevertive system, this is the path that is not specified as the working path.
Reversion Time	Controls whether traffic reverts to the working path when conditions that diverted it to the protect path are repaired. If you choose Never, traffic does not revert. Choosing a time sets the amount of time that elapses before traffic reverts to the working path.
SF BER Level	(STS and VC4 circuits only) Sets the UPSR SF BER threshold.
SD BER Level	(STS and VC4 circuits only) Sets the UPSR SD BER threshold.
PDI-P	(STS and VC4 circuits only) When checked, traffic switches if an STS payload defect indication is received.
Switch State	Switches circuit traffic between the working and protect paths. The color of the Working Path and Protect Path fields indicates the active path (the path selected at an exit node) versus the standby path (the path not selected at an exit node). Normally, the working path is green and the protect path is purple. If the protect path is green, working traffic has switched to the protect path. • CLEAR—Removes a previously set switch command. • LOCKOUT OF PROTECT—Prevents traffic from switching to the protect circuit path under any circumstances. Of all switch states, LOCKOUT has the highest priority. • FORCE TO WORKING—Forces traffic to switch to the working circuit path, even if the path has SD or SF conditions. FORCE switch states have a higher priority than MANUAL switch. • FORCE TO PROTECT—Forces traffic to switch to the protect circuit path, even if the path has SD or SF conditions. FORCE switch states have a higher priority than MANUAL switch. • MANUAL TO WORKING—Switches traffic to the working circuit path if the path has an error rate less than the SD. • MANUAL TO PROTECT—Switches traffic to the protect circuit path if the path has an error rate less than the SD. ⚠ **Caution** The FORCE and LOCKOUT commands override normal protection switching mechanisms. Applying these commands incorrectly can cause traffic outages.
Hold Off Time	(DRI path selectors only) Sets the hold off time. Values are 0 to 10000 milliseconds, in increments of 100 milliseconds.

Use the tabs in the Modify Circuit dialog box as follows:

- Use the **General** tab to edit the circuit ID and circuit description.

- Use the **Monitor** tab to create monitors for the source drops. Select a drop in the Select Monitor Sources list and click **Create Monitors**. The Create Circuit wizard opens, with the source node and drops preset. See 7.2.3.1 Creating an STS (Including Ethernet), STS-V, VT, VT-V, VT Tunnel, or VT Aggregation Circuit, page 7-30 to create a new circuit.
- Use the **Drops** tab to create multiple drops on existing unidirectional circuits. This feature is used to support different types of applications that could be routed from the same source to different destinations (video, voice, and so on). The multiple drops are provisioned on the destination side of the circuit. The source drop remains the same. In the Drops tab, select the required drops and click **Create** to provision a multidrop circuit. Make the selections and click **OK**.
- Use the **UPSR** tab to edit UPSR selector attributes.

Note UPSR selectors can be edited on a circuit basis, but not on a span basis.

- Use the **Nodes** tab to add or delete nodes in multicard Ethernet circuits. Select a node from the list and click **Add** or **Remove**.
- Use the **VLANs** tab to edit VLANs for a VLAN-capable circuit.

Note If you make a mistake while editing VLANs, click the **Reset** button. This clears the selections entered, and you can restart the VLAN selection.

Step 3 Click **Apply**. (If the Apply button is not visible, proceed to Step 4.)

Step 4 Click **Close**.

Changes are visible in the Circuit table after the window has been refreshed.

7.2.5 Modifying Circuits on ONS 15530 or ONS 15540 NEs

Step 1 In the Domain Explorer, Subnetwork Explorer, or Network Map, select an ONS 15530 or ONS 15540 (or a group or domain containing an ONS 15530 or ONS 15540) and choose **Configuration > ONS 155XX > Circuit Table**. The Circuit table opens.

Step 2 Select a circuit and choose **Configuration > Modify Circuit**. The Modify Circuit dialog box opens.

Step 3 Change the circuit name or description. For ONS 15530 and ONS 15540 circuits, the circuit name can contain up to 64 characters, and the circuit description can contain up to 256 characters.

Step 4 Click **Apply**.

Changes are visible in the Circuit table after the window has been refreshed.

7.2.6 Summary of Edit Circuit Options

The following table summarizes the options to edit circuits.

Table 7-11 Summary of Edit Circuit Options

Circuits	Edit Option	Type	Comments
All	Edit circuit ID, description, state, customer ID, and service ID	All	Change the circuit ID, but the ID must be unique. The description can contain up to 256 characters.
STS/VC_HO_PATH_CIRCUIT and VT/VC_LO_PATH_CIRCUIT in a UPSR ring	Change UPSR/SNCP selector attributes	Unidirectional and bidirectional	Change UPSR/SNCP selector attributes for STS/VC_HO_PATH_CIRCUIT and VT/VC_LO_PATH_CIRCUIT bidirectional circuits.
STS/VC_HO_PATH_CIRCUIT	Add drops	Unidirectional STS/VC_HO_PATH_CIRCUIT and unidirectional VT/VC_LO_PATH_CIRCUIT	Add a drop and verify it in the Prime Optical database or in the Circuit table.
	Add drops to Ethernet circuits	Bidirectional STS/VC_HO_PATH_CIRCUIT	Add a drop and verify it in the Prime Optical database or in the Circuit table.
	Add monitor circuits to STS circuits	Bidirectional STS/VC_HO_PATH_CIRCUIT	Monitor circuits must be unidirectional. Create a maximum of four monitor circuits for each STS circuit.
	Add nodes to multicard Ethernet circuits	Multicard circuits	—
	Add VLANs to Ethernet circuits	Bidirectional STS/VC_HO_PATH_CIRCUIT	Associate VLANs with the circuit and verify.
SDH circuits	Add monitor circuits	Bidirectional VC LO path tunnel	—

7.2.7 Updating Circuits

You must update circuits after adding nodes to the network.

Step 1 In the Domain Explorer tree, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Update Circuit**. A message appears, stating that Prime Optical has successfully updated the circuit.

Step 2 Click **OK**.

7.2.8 Merging Circuits

Use the circuit merge feature to merge different circuits into one or more new circuits. This feature enables you to merge many circuits (including TL1 and OCHNC DCN circuits), thereby ensuring that the aligned sections are spliced into one circuit.

Step 1 In the Domain Explorer tree, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Circuit Table**.

Step 2 In the Circuit table, select a circuit; this circuit will be the master circuit.

Step 3 Choose **Configuration > Merge Table**. The fields in the Circuit Merge table are identical to the fields in the Circuit table (Table 7-3 on page 7-5). The Circuit Merge table displays the circuits that are path aligned with the master circuit. These circuits are called *slave circuits*. The Circuit Merge table shows circuits (slave circuits) that are the same size as the master circuit.

Note You must merge *n* selected slave circuits with one selected master circuit. When circuits are merged from Prime Optical, EMS attributes such as customer ID, service ID, description, and comments are retained only for master circuits. If the circuit merge is done through CTC, the EMS attributes are not retained in Prime Optical.

Note Circuits are allowed to merge only if the following conditions exist:
— Their connections are path aligned.
— They have compatible circuit type, size, and direction.
— They do not have different VLAN assignments.
— They do not have different nondefault SLA values.
— They have compatible circuit endpoints.
— They do not form an invalid circuit.

Step 4 To refresh any new aligned circuits with the selected circuit, choose **Configuration > Refresh Lined Up Circuits** (or click the **Refresh Lined Up Circuits** tool).

Step 5 Specify the circuit(s) that you want to merge with the selected circuit and choose **Configuration > Merge** (or click the **Merge** tool).

Step 6 If the selected circuit(s) cannot be merged completely into the current circuit, the following message appears:

```
The selected circuit(s) cannot be merged completely into the current circuit. Disjointed
remnants of the selected circuit(s) might remain after the merge. Click OK to continue.
```

Step 7 Click **OK** to continue with the merge, or click **Cancel** to cancel the operation.

7.2.9 Reconfiguring Circuits

Use the reconfigure circuit(s) feature to upgrade TL1 circuits to regular circuits.

Step 1 In the Domain Explorer tree, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Circuit Table**.

Step 2 Select the TL1 circuit(s) to reconfigure and choose **Configuration > Reconfigure Circuit(s)**.

Tip Hold down the **Shift** key to select more than one option sequentially, or hold down the **Ctrl** key to select more than one option nonsequentially.

Step 3 In the confirmation dialog box, click **OK**.

A progress bar tracks the status of the reconfiguration. A failed or succeeded message displays the results of the reconfiguration. When the operation succeeds, the Circuit Status field in the Circuit table changes from *Discovered-TL1* to *Discovered*.

Note The EMS attributes of the circuits are lost after the circuit reconfiguration.

7.2.10 Repairing Circuits

The Alarm Interface Panel (AIP) provides surge protection for CTC-based NEs. This pane has a nonvolatile memory chip that stores the unique node address known as the MAC address. The MAC address identifies the nodes that support circuits. It allows Prime Optical to determine circuit sources, destinations, and spans. If an AIP fails, an alarm is generated and the LCD display on the fan tray assemblies of the NEs becomes blank. To perform an in-service replacement of the AIP, you must contact the Cisco Technical Assistance Center (TAC). For contact information, visit the TAC website at http://www.cisco.com/tac.

You can replace the AIP on an in-service system without affecting traffic by using the circuit repair feature. If the AIP card needs to be replaced, you will need to repair circuits affected by the MAC address change on the NE. Circuit repair will work when all nodes are running the same software version. Each individual AIP replacement requires an individual circuit repair; if AIPs are replaced on two NEs, the circuit repair must be performed twice. Repairing circuits allows you to change the MAC address of all circuits originating at an NE to a user-provided NE ID.

To repair a Prime Optical circuit when an AIP card is changed, restart the Prime Optical server or complete the following steps:

Note
- While completing the following steps, do not create or delete any circuits using Prime Optical.
- The following procedure applies to circuits on CTC-based NEs.

Step 1 See the *Cisco ONS 15454 Reference Manual* to replace the AIP card.

Note Reset both Timing Communications and Control (TCC) cards after the AIP card is replaced.

Step 2 In the Domain Explorer, choose **Administration > Control Panel**.

Step 3 Expand **NE Service**.

Step 4 Select **CTC-Based SONET NEs** or **CTC-Based SDH NEs** and deactivate the network service. Click **Save**.

Step 5 Activate the network service again and click **Save**.

Step 6 In the Domain Explorer, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Repair Circuit**. The Repair Circuit dialog box opens.

The Repair Circuit dialog box allows you to change the MAC address of all circuits originating at the selected NE with a user-provided NE ID. MAC addresses are a subset of data link layer addresses. MAC addresses identify network entities in LANs implementing the IEEE MAC sublayer of the data link layer. The following table provides descriptions.

Step 7 After making your selections, click **OK**.

Table 7-12 Field Descriptions for the Repair Circuit Dialog Box

Field	Description
Old MAC Address	Enter the current MAC address of the NE. MAC addresses are 48 bits in length and are expressed as 12 hexadecimal digits (0-9, a-f): • The first 6 hexadecimal digits are the manufacturer identification (or vendor code), called the Organizational Unique Identifier (OUI). These 6 digits are administered by the IEEE. • The last 6 hexadecimal digits are the interface serial number or another value administered by the specific vendor.
New MAC Address	Enter the new MAC address of the NE.

7.2.11 Deleting Circuits

Use the Circuit table to delete an existing circuit or multiple circuits from the Prime Optical database and remove the associated cross-connections from the NEs.

Note
- You cannot delete VT tunnel and VAP circuits that are in use.
- You cannot delete OCHNC DCN circuits from Prime Optical. If you try to delete an OCHNC DCN circuit, Prime Optical returns the following error message: “Circuit deletion failed. Failed to delete the following circuit(s). Circuit details: You cannot remove a DCN OCHNC circuit from CTM.” You must use CTC to delete OCHNC DCN circuits.
- You cannot delete OCH trail circuits that are created automatically upon OCHCC circuit creation. OCH trail circuits are removed automatically when the corresponding OCHCC circuit is removed.

Complete the following steps to delete circuits:

Step 1 Select the node that contains the circuit to be deleted and open the Circuit table. For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.

Step 2 In the Circuit table, select the circuit(s) to be deleted and choose **Configuration > Delete Circuit** (or click the **Delete** tool).

Step 3 (For CTC-based NEs) In the Delete Circuit(s) confirmation box, do the following:

a. Check the **Change drop port admin state** check box.

b. Select the state of the source or destination port from the drop-down list. For SONET and OCHCC circuits, the available states are:

- IS (In Service)—The circuit is in service and able to carry traffic.
- IS,AINS (In Service–Auto In Service)—Alarm reporting is suppressed, but the circuit is able to carry traffic.
- OOS,DSBLD (Out of Service–Disabled)—The circuit is out of service and unable to carry traffic.
- OOS,MT (Out of Service–Maintenance)—The circuit is in maintenance state. The maintenance state does not interrupt traffic flow; it suppresses alarms and conditions and allows loopbacks to be performed on the circuit.

For SDH circuits, the corresponding values are:

- Unlocked
- Unlocked,autoInService
- Locked,disabled
- Locked,maintenance

Step 4 Click **Yes**.

Step 5 In the message box, click **OK**.

Note When deleting multiple circuits, if an error occurs during the deletion of a particular circuit, the operation continues with the deletion of the remaining selected circuits.

7.2.12 Viewing Circuit Spans

In the Circuit table, you can select a circuit and choose **Configuration > Open Circuit Span** (or click the **Open Circuit Span** tool). The Circuit Span table opens, showing information about all spans associated with the selected circuit. The following table provides descriptions.

Table 7-13 Field Descriptions for the Circuit Span Table

Column Name	Description
Circuit Name	Displays the name of the selected circuit.
Circuit Type	Displays the type of circuit that the span belongs to.
Circuit Alias	Enter a new alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
Circuit Size	Displays the size of the circuit that the span belongs to.
Source Network Element	Displays the NE ID of the span source.
Source Module Type/Physical Loc/Interface	Displays the module type at the span source, the slot and port name and numbers (physical location), and the STS number (interface).
Source State	Displays the state of the circuit span according to the source circuit node. Valid values are: • Inactive—The circuit is inactive and the segment cannot be used. • Stranded—Bandwidth is not available and the segment cannot be used. • Routed—Circuit is being routed, but not provisioned, meaning that cross-connects have not been provisioned on the node/TCC. • Tentative—Cross-connects have been created on the node, but circuit information is incomplete or has not been updated correctly. This is not a complete circuit. • Active—Segment is in use.
Destination Network Element	Displays the NE ID of the span destination.
Destination Module Type/Physical Loc/Interface	Displays the module type at the span destination, the slot and port numbers (physical location), and the STS number (interface).
Destination State	Displays the state of the circuit span from the destination circuit node point of view. Valid values are Inactive, Stranded, Routed, Tentative, and Active.
Span Part of UPSR Ring	Indicates whether or not the circuit span is part of a UPSR.
Span Part of SNCP Ring *(ONS 15454 SDH only)*	Indicates whether or not the circuit span is part of an SNCP.
Span Active State	Indicates whether or not the circuit span carries active traffic.
Span Protection State	Displays the last successful span protection operation performed on the selected circuit span. Values are Clear, Manual, Force, and Lockout. This field only applies to circuit spans that are part of an SNCP ring.

7.2.13 Viewing VLAN Information

For CTC-based NEs, you can select a circuit in the Circuit table and choose **Configuration > VLAN Table**. The VLAN table opens, showing VLAN information associated with the selected circuit. The following table provides descriptions.

Table 7-14 Field Descriptions for the VLAN Table

Field	Description
VLAN ID	Displays the numerical ID of the VLAN. The VLAN ID range is from 1 to 4093.
VLAN Name	Displays the user-assigned name of the VLAN.

7.2.14 Viewing the ONS 15530 and ONS 15540 Circuit Table

The Circuit table displays circuit information for a network of ONS 15530 and ONS 15540 NEs. A circuit is an end-to-end connection between two ONS 15530 or ONS 15540 ports in terms of lambda (wavelength). The ONS 15530 and ONS 15540 provide transport for traffic over fiber, using dense wavelength division multiplexing (DWDM) technology to multiplex many lambdas over the same fiber.

By using circuit services, you can:

- Find all end-to-end connections between ONS 155xx NEs in terms of client ports, provided the entire path is traversed within ONS 155xx NEs.
- View each circuit's protection information.
- For all circuits, view directional-based paths that have been configured and are in use.
- For protected circuits, view active and standby paths that have been configured and are in use.
- Filter the Circuit table display by choosing **File > Filter**.
- Modify a circuit name or description by selecting the circuit and choosing **Configuration > Modify Circuit**.
- Display ONS 15530 contained circuits (if any) by selecting a circuit and choosing **Configuration > Show Contained Circuits**.
- Display the paths in a circuit by selecting the circuit and choosing **Configuration > Open Circuit Path Table**.

Complete the following steps to view the ONS 15530 and ONS 15540 Circuit table:

Step 1 In the Domain Explorer, Subnetwork Explorer, or Network Map, select the ONS 15530 or ONS 15540 group and choose **Configuration > ONS 155XX > Circuit Table**.

The Circuit table opens, showing circuit information for the selected NEs. Only those circuits for which the selected ONS 15530 or ONS 15540 is either the source or the destination are listed. See Table 7-15 for descriptions.

Step 2 To filter the Circuit table, choose **File > Filter**. The filter dialog box opens, containing circuits that you can filter in the following ways:

- By circuit name.
- By type and size of circuit.
- By NE ID.
- By active/inactive status—Filters out inactive circuits.
- By passthrough status—Filters out passthrough circuits (circuits that pass through a node without being dropped).

Step 3 To display contained circuits on an ONS 15530 or ONS 15540, select a circuit in the Circuit table and choose **Configuration > Show Contained Circuits**. Another Circuit table opens, showing any circuits contained within the selected circuit.

Table 7-15 Field Descriptions for the Circuit Table–ONS 15530 and ONS 15540

Field	Description
Circuit Name	The name of the circuit.
Circuit Description	The circuit description.
Note	Displays any comments that have been entered for the selected circuit. Allows you to add additional comments.
Circuit Type	The type of circuit selected. Values are: • SONET • Gigabit Ethernet • 10-Gigabit Ethernet (GE) • Fiber Channel • FICON • ESCON • SDH • ISC Compatible • ISC Peer • SYSPLEX • DWDM Transparent—A circuit associated with the transparent port • DWDM Wavelength—A circuit associated with the OSC channel • Fast Ethernet • FDDI • 2.5-GE Trunk Wavelength • 10-GE Trunk Wavelength • 10-GE Trunk

Table 7-15 Field Descriptions for the Circuit Table–ONS 15530 and ONS 15540 (continued)

Field	Description
Circuit Size	The size of the circuit. Values are: • STS1 • STS3C • STS12C • STS48C • DWDM_2.5G • DWDM_10G • FIBERCHANNEL1 • FIBERCHANNEL2 • FICON • ESCON • SYSPLEX • FAST_ETHERNET • GIGABIT_ETHERNET • 10_GIGABIT_ETHERNET • FDDI • STM1C • STM4C • STM16C • ISC_COMPATIBLE • ISC_PEER • SYSPLEX_TIMER_ETR • SYSPLEX_TIMER_CLO
Circuit Direction	Whether the circuit carries unidirectional (one-way) or bidirectional (two-way) traffic.
Circuit State	The state of the circuit. Values are: • Active—The circuit is active and completely discovered. • Incomplete—The circuit was not completely discovered; that is, Prime Optical was not able to trace the circuit all the way from source to destination. • Errored—The circuit was discovered but it might be down. A circuit in this state might be operating and carrying traffic because circuits are shown as errored when one or more paths are down. Check the Circuit Path table (**Configuration > Open Circuit Path Table**) to find out whether any paths are still carrying traffic. • Inactive—The source or destination port(s) have been shut down administratively.
Source Network Element	The source NE ID.
Source Interface	The module type at the circuit source node, the slot and port numbers (physical location), and the interface name.

Table 7-15 Field Descriptions for the Circuit Table–ONS 15530 and ONS 15540 (continued)

Field	Description
Secondary Source Interface	The module type of the secondary source node, the slot and port numbers (physical location), and the interface name. The secondary source node is on the same device as the source module. Note that a secondary source is displayed only when the circuit has Y-cable protection at the source side.
Destination Network Element	The destination NE ID.
Destination Interface	The module type at the destination node, the slot and port numbers (physical location), and the interface name.
Source Protection Type	The type of protection at the source. Values are: • Not Protected—There is no protection at the source • Splitter Protection • Y-cable/Line-Card Protection • Trunk Protection
Destination Protection Type	The type of protection at the destination. Values are: • No Protection—There is no protection at the destination • Splitter Protection • Y-cable/Line-Card Protection • Trunk Protection
Additional Information	Wavelength, frequency, channel number, and band name of the source and secondary source. Secondary source information is applicable only when the circuit has Y-cable or line-card protection.
CDL Flow ID	(ONS 15530 only) The ID of the converged data link layer.

7.2.15 Viewing Circuits in the Circuit Path Table—ONS 15530 and ONS 15540

The Circuit Path table displays information about all of the paths associated with the selected circuit or link.

Step 1 In the Domain Explorer, choose **Configuration > Link Table**.

Step 2 In the Link table, choose **Configuration > Circuit Path Table**. The Circuit Path table opens. The following table provides descriptions.

Table 7-16 Field Descriptions for the Circuit Path Table

Field	Description
Circuit Name	The circuit name of the circuit associated with the path.
Circuit Alias	The alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
Circuit Path Number	The unique path number associated with the path.
Source NE ID	The source NE system ID for the path.
Source Interface	The source interface name for the path.
Destination NE ID	The destination NE system ID for the path.
Destination Interface	The destination interface name for the path.
Path Status	The overall status of the path: • Active—The path is active and completely discovered. The possible paths for a circuit are Active-Working, Active-Protected, Standby-Working, or Standby-Protected. • Incomplete—The path is active but not completely discovered. Prime Optical cannot trace the path all the way from source to destination. • Errored—The path was discovered but one or more interfaces are down.
Working Path	Whether the path is configured to be working or protected.
Active Path	Whether the path is active or on standby.
Down Interfaces	If the path is in the errored state, the list of interfaces that are causing this state.
Destination Optical Power (dBm)	The optical power level at the destination. This value is not refreshed automatically. By default, the value shown is the value obtained at the last discovery. To refresh the value in this column, choose **File > Refresh Circuit Power Levels**.

7.2.16 Viewing Circuits in the Circuit Path Span Table—ONS 15530 and ONS 15540

The Circuit Path Span table displays detailed lightpath information about all spans associated with the selected circuit. Each entry in the Circuit Path Span table displays a cross-connect (span within the NE) or segment (span between NEs) being used by the selected circuit.

Step 1 In the Domain Explorer, choose **Configuration > Link Table**.

Step 2 In the Link table, choose **Configuration > Circuit Path Table**.

Step 3 Select a circuit path and choose **Configuration > Open Circuit Path Span Table**. The Circuit Path Span table opens. The following table provides descriptions.

Table 7-17 Field Descriptions for the Circuit Path Span Table

Field	Description
Circuit Name	The circuit name.
Circuit Alias	The alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
Circuit Type	The type of the selected circuit.
Circuit Size	The size of the selected circuit.
Path Number	The number of the cross-connect or segment.
Path Hop Number	The hop number of the cross-connect or segment.
Source Network Element	The name of the NE where the circuit span originates.
Source Interface	The name of the interface that is the source for the cross-connect or segment.
Destination Network Element	The name of the NE where the circuit span terminates.
Destination Interface	The name of the interface that is the destination of the cross-connect or segment.

7.2.17 Viewing VCAT Member Circuits

Use the VCAT Member table to view members of a VCAT circuit.

Step 1 Select a CTC-based NE in the Domain Explorer tree and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Circuit Table**.

Step 2 In the Circuit table, choose **Configuration > Member Circuits**. The VCAT Member table opens. The following table provides descriptions.

Table 7-18 Field Descriptions for the VCAT Member Table

Field	Description
Circuit Name	Displays the VCAT member name. **Note** If there are multiple circuits with the same name displayed in the Circuit table, the label *Duplicate* appears in this column.
Circuit Alias	Displays the alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
Note	Displays comments that have been entered for the selected VCAT member circuit. Allows you to add additional comments.
Source NE—Module Type/Physical Loc/Interface	Displays the NE ID and module type at the span source, the slot and port name and numbers (physical location), and the STS number (interface).
Destination NE—Module Type/Physical Loc/Interface	Displays the NE ID, the module type at the destination, the slot and port name and numbers (physical location), and the STS number (interface).

Table 7-18 Field Descriptions for the VCAT Member Table (continued)

Field	Description
Circuit Type	Displays the type of VCAT member circuit selected. SONET circuit types are STS, VT, VT Aggregation, VT Tunnel, VT VCAT (shown as VT-v), STS VCAT (shown as STS-v), DWDM OCHNC, and DWDM OCHCC. SDH circuit types are HOP, LOP, LOPA, LOPT, HOV (HO VCAT), LOV (LO VCAT), OCHNC, and OCHCC.
Circuit Size	Displays the size of the VCAT member circuit. • SONET circuit sizes are VT1.5, VT2, STS 1, STS 3c, STS 6c, STS 9c, STS 12c, STS 24c, STS 48c, and STS 192c. • SDH circuit sizes are VC11, VC12, VC3, VC4, VC4-2c, VC4-3c, VC4-4c, VC4-8c, VC4-16c, and VC4-64c. • OCHNC circuit sizes are multirate, 2.5 Gb/s FEC, 2.5 Gb/s No FEC, 10 Gb/s FEC, and 10 Gb/s No FEC. • OCHCC circuit sizes are STM1, STM4, STM16, STM64, OC3, OC12, OC48, OC192, 10GE, 1GE, 10GFC, 4GFC, 2GFC, 1GFC, 4GFiCon, 2GFiCon, 1GFiCon, ESCON, ETR-CLO, ISC-PEER, ISC3-PEER-1G, ISC-PEER-2G, ISC-COMPACT, HDVT, SD1/D1, DV6000, or Pass Through. **Note** Not all circuit sizes are supported on all NE releases.
Circuit Direction	Indicates whether the VCAT member circuit carries unidirectional or bidirectional traffic.
Customer ID	Optional text field that displays the customer ID of the VCAT member circuit.
Service ID	Optional text field that displays the service ID of the VCAT member circuit.
Circuit Status	Displays the status of the selected VCAT member circuit: • Discovered—The circuit is completely configured in the network; all components are in place and a complete path exists from the circuit source to the circuit destination. • Partial—The circuit is not complete; one or more cross-connections are not in place. • Creating—Prime Optical is creating the circuit. • Deleting—Prime Optical is deleting the circuit. • Discovered_TL1—A TL1-created circuit or a TL1-like Prime Optical-created circuit is complete and has upgradable cross-connects. A complete path from source to destination(s) exists. • Partial_TL1—A TL1-created circuit or a TL1-like Prime Optical-created circuit with upgradable cross-connects is missing a cross-connect, and a complete path from source to destination(s) does not exist. The circuit cannot be upgraded until the missing cross-connects are in place.
Circuit Service State	The circuit service state is an aggregate of the cross-connect states within the circuit. SONET, SDH, and DWDM circuits have different values; see Table 7-3.
Is Monitor	A value of True means that the VCAT member circuit is a monitor circuit. A value of False means that the VCAT member circuit is not a monitor circuit.

Table 7-18 Field Descriptions for the VCAT Member Table (continued)

Field	Description
Circuit Protection Type	Indicates the VCAT member circuit protection scheme. Options are: • 2F BLSR—The circuit is protected by a 2-fiber BLSR. • 4F BLSR—The circuit is protected by a 4-fiber BLSR. • BLSR—The circuit is protected by both 2-fiber and 4-fiber BLSR. • UPSR—The circuit is protected by UPSR. • DRI—The circuit is protected by a UPSR dual ring interconnection. • 1+1—The circuit is protected by 1+1 protection group. • Y-Cable—The circuit is protected by a transponder or muxponder card Y-cable protection group. • Protected—The circuit is protected by diverse SONET topologies; for example, a BLSR and a UPSR, or a UPSR and 1+1. • Unprotected—The circuit is not protected. • 2F-PCA—The circuit is routed on a PCA path on a 2-fiber BLSR. PCA circuits are unprotected. • 4F-PCA—The circuit is routed on a PCA path on a 4-fiber BLSR. PCA circuits are unprotected. • PCA—The circuit is routed on a PCA path on both 2-fiber and 4-fiber BLSRs. PCA circuits are unprotected. • Unknown—Circuit protection types appear in the Circuit Protection Type column of the Circuit table when the circuit status is Discovered. If the circuit not discovered, the protection type is *Unknown*. • Lost—The circuit was protected, but the protection has been lost due to changes in the network.
Description	Displays the description of the selected VCAT member circuit.
No. of VLANs	Displays the number of VLANs associated with the VCAT member circuit.
Is VCAT or Member Circuit	A value of True means that the circuit is a VCAT member circuit.
OCHNC Wavelength	Indicates the wavelength provisioned for the OCHNC, in nanometers (nm).
OCHNC Direction	Indicates the direction of the OCHNC. Values are east-to-west or west-to-east.

7.2.18 Creating VCAT Member Circuits

Use the Add Member wizard to add new members to an existing VCAT or open-ended VCAT circuit.

Note
- You can launch the Add Member wizard only for VCAT circuits that allow reconfiguration.
- VCAT circuits created through TL1 cannot be reconfigured (**Add/Delete Member**) until the parent VCAT circuit is reconfigured (**Configuration > Reconfigure Circuit(s)** in the Circuit table).

- To specify member endpoints for VCAT circuit endpoints on CE-MR-10 cards, the Add Member wizard shows the Endpoint Selection pane (with slot/port/STS, Member Selection button, and a link for circuit creation).

Complete the following steps to create VCAT member circuits:

Step 1 Select a CTC-based NE in the Domain Explorer tree and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Circuit Table**.

Step 2 In the Circuit table, choose **Configuration > Member Circuits**.

Step 3 In the VCAT Member table, choose **Configuration > Add Member**. The Add Member wizard opens. The following table provides descriptions.

Step 4 In the Add Members pane, specify the number of members to add to the existing VCAT circuit. Choose the administrative state for the new VCAT member circuit. All of the other panes (Routing Preferences, Manual Provisioning, Route Constraints, Review Route, and so on) are identical to the Create Circuit wizard. (See Table 7-6 on page 7-14.)

Step 5 Click **Next** to proceed through the wizard panes. After finalizing your selections, click **Finish**.

Table 7-19 Field Descriptions for the Add Member Wizard

Field	Description
Add Members	
Current Circuit Size	Displays the current size of the circuit.
Number of Members	Enter the number of members to add to the existing VCAT circuit.
New Circuit Size	Displays the new size of the circuit.
State	Select an administrative state for the new VCAT member circuit. SONET and SDH circuits have different values. For SONET circuits, values are: • IS—The circuit is in service and able to carry traffic. • IS AINS—Alarm reporting is suppressed, but the circuit is able to carry traffic. • OOS DSBLD—The circuit is out of service and unable to carry traffic. • OOS_MT—The circuit is in maintenance state. The maintenance state does not interrupt traffic flow; it suppresses alarms and conditions and allows loopbacks to be performed on the circuit. For SDH circuits, corresponding values are: • Unlocked • Unlocked, autoInService • Locked, disabled • Locked, maintenance
Add to Drop Ports	Check this check box to apply the selected state to the drop ports.
Circuit Summary	Summarizes the selections you made in the wizard panes. To change the circuit summary, click **Back** and change your selection(s).

7.2.19 Filtering the Circuit Table

Use the Circuit table filter to filter circuit data according to criteria that you select.

Step 1 In the Domain Explorer tree, select the NE for which to view circuit information.

Step 2 From the **Configuration** menu, choose **CTC-Based SONET NEs**, **CTC-Based SDH NEs**, or **ONS 155xx**; then, choose **Circuit Table** from the submenu. The Circuit table opens, showing circuit information for the selected NE.

Step 3 Choose **File > Filter** (or click the **Filter Data** tool). The Circuit table filter opens. The following table provides descriptions. Fields shown depend on the type of NE selected.

Step 4 After making your selections, click **OK**. The filtered circuit data is displayed in the Circuit table.

Table 7-20 Field Descriptions for the Circuit Table Filter Dialog Box

Field	Description
Circuit Names	Displays the list of available circuit names. Click **Add** and **Remove** to move circuit names to and from the Selected Names list. If you check **Ignore Circuit Names**, Prime Optical ignores all circuit names and the Available Names and Selected Names lists and Add and Remove buttons are disabled. This is equivalent to selecting all the names in the Available Names list of the Circuit Names tab.
Circuit Alias	Enter a new alias name for the circuit. The alias name can contain alphanumeric characters. International character sets are also supported.
Type and Size (CTC-based SONET NEs)	Allows you to specify the type and size of circuit to display. Select **All** to display circuit data for all Ethernet, STS, VT, VT Aggregation, VT Tunnel, VT VCAT (shown as VT-v), STS VCAT (shown as STS-v), DWDM OCHNC, and DWDM OCHCC circuits. Select **Size All** to display circuit data for all VT1.5, VT2, STS-1, STS-3c, STS-6c, STS-9c, STS-12c, STS-18c, STS-24c, STS-36c, STS-48c, STS-96c, and STS-192c interfaces. OCHNC and OCHCC sizes (shown only when the OCHNC or OCHCC circuit type is selected, not when the All option is selected) include multirate, 2.5 Gb/s FEC, 2.5 Gb/s No FEC, 10 Gb/s FEC, and 10 Gb/s No FEC. **Note** When you select All, all circuit types and sizes for the specific NE model are displayed. **Note** When circuit size is selected for filtering circuits, a VCAT circuit will be filtered if the size matches its member circuit size.

Table 7-20 Field Descriptions for the Circuit Table Filter Dialog Box (continued)

Field	Description
Type and Size (CTC-based SDH NEs)	Allows you to specify the type and size of circuit to display. Select **Type All** to display circuit data for all HOP, LOP, LOPA, LOPT, HOV (HO VCAT), LOV (LO VCAT), OCHNC and OCHCC circuits. Select **Size All** to display circuit data for all VC11, VC12, VC3, VC4, VC4-2c, VC4-3c, VC4-4c, VC4-6c, VC4-8c, VC4-12c, VC4-16c, VC4-32c, and VC4-64c interfaces. OCHNC, and OCHCC sizes (shown only when the OCHNC, or OCHCC circuit type is selected, not when the All option is selected) include multirate, 2.5 Gb/s FEC, 2.5 Gb/s No FEC, 10 Gb/s FEC, and 10 Gb/s No FEC.
Type and Size (ONS 15530 and ONS 15540 NEs)	Allows you to specify the type and size of circuit to display. Select **All** to display circuit data for all 2.5 GB interfaces.
NE ID	Displays the list of available NE IDs. Click **Add** and **Remove** to move NEs to and from the Selected NE IDs list, and then run the filter.
Links (CTC-based NEs)	Displays all available links. **Note** If you open the Circuit table from the Find window or the Domain Explorer, the Links tab is disabled. The tab is enabled only if you open the Circuit table from the Link table.
Description (CTC-based NEs)	Allows you to filter by circuit description.
Circuit State (ONS 15530 and ONS 15540 NEs)	Allows you to specify whether to display active or inactive circuits.
Passthru Circuits (ONS 15530 and ONS 15540 NEs)	Allows you to specify whether to display passthrough circuits. If checked, all circuits that pass through the selected node without being dropped are displayed. If unchecked, only the circuits being dropped at the node are displayed.
Customer ID	Displays a list of available customer IDs. Click **Add** and **Remove** to move customer IDs to and from the Selected Customer IDs list, and then run the filter. If you check **Ignore All Customer IDs**, Prime Optical ignores the customer IDs in the filter criteria.
Service ID	Displays a list of available service IDs. Click **Add** and **Remove** to move service IDs to and from the Selected Service IDs list, and then run the filter. If you check **Ignore All Service IDs**, Prime Optical ignores the service IDs in the filter criteria.
No. of VLANs	Displays filter criteria for the VLAN count. Enter the VLAN count in the text box and specify one of the options for comparison: Greater than or equal to, Less than or equal to, or Equal to.
SRLG	Displays a list of available SRLGs. Click **Add** and **Remove** to move SRLG entries to and from the Selected SRLG Entries list, and then run the filter. If you check **Ignore SRLG**, Prime Optical ignores the SRLGs in the filter criteria.

7.2.20 Tracing Circuits

Use the Circuit Trace window to trace the connectivity of a circuit by showing the source node, the destination node, and any intermediate nodes in graphical format. In addition, the Circuit Trace window displays the primary and secondary circuit paths. A circuit trace report is available only for ONS 15305 and CTC-based NEs.

7.2.20.1 Tracing High-Level Circuits

Prime Optical displays a High-Level Circuit Trace window, where:

- A graphic map uses high-level span information such as NEs and links to display the circuit trace.
- The graphic map displays *logical* and *physical* high-level views:
  - Logical view—The circuit is traced on the map using logical links. For example, OCHCC circuits use OCH trail links for the trace.
  - Physical view—The circuit is traced on the map using physical links. For example, OCHCC circuits use OTS links for the trace.
- Links are highlighted according to the high-level view that is selected.
- Link color corresponds to link status. For example, working links are shown in green.
- The window does not trace the following link types:
  - 2-fiber BLSR with protection channel access (PROT_BLSR_2F_PCA)
  - 4-fiber BLSR with protection channel access (PROT_BLSR_4F_PCA)

To view a high-level circuit trace, complete the following steps:

Step 1 Select the node that contains the circuit to be traced and open the Circuit table. For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.

Step 2 In the Circuit table, select the circuit to be traced, and choose **Configuration > Trace High-Level Circuit** (or click the **High-Level Trace** tool). The High-Level Circuit Trace window opens. Based on the NEs involved in the circuit, all links that belong to the subnetwork are retrieved and displayed.

Note You cannot trace STS VCAT, VT VCAT, VC HO VCAT, and VC LO VCAT circuits, or circuits with a status other than Active or Roll Pending.

Step 3 By default, the High-Level Circuit Trace window opens with the logical view displayed. Choose **View > WDM Topology** to switch to the physical view. The window highlights the relevant links according to your selection.

Step 4 When multiple links belong to the same NE object, a link bundle is created automatically to manage the set of links. You can right-click a link or link bundle and choose **Expand** or **Collapse** from the shortcut menu. If you choose **Collapse**, the links are hidden and the link bundle is displayed. If you choose **Expand**, the link bundle is hidden and the links are displayed. The color of the link bundle represents the link selection status, which has the following order of priority (from highest to lowest):

- Magenta—The link bundle contains at least one excluded link.
- Blue—The link bundle contains at least one selected link.
- White—The link bundle contains at least one selecting link.
- Green—All links in the link bundle are selectable.

- Red—The link bundle contains at least one unselectable link.

Step 5 Position your mouse cursor over a link. The tooltip reports the following information, if available:

- Link type.
- Source NE name, slot number, card name, port number, side information.
- Destination NE name, slot number, card name, port number, side information.
- Protection type.

Note When you move the cursor over an NE for a high level circuit, the tooltip displays the fiber information for that NE. In case of invalid values such as a different forward and backward lengths, the background of the tooltip is shown in red color.

Step 6 To adjust the zoom level within the map view, do any of the following:

- Choose **Edit > Zoom In**, **Zoom Out**, or **Zoom Area**.
- In the toolbar, click the **Zoom In**, **Zoom Out**, or **Zoom Area** tool.
- Right-click an empty area of the map and choose **Zoom In**, **Zoom Out**, or **Zoom Area** from the popup menu.

The zoom tools work as follows:

- Zoom In—Allows you to zoom in on an object in the map view. This tool increases the size of all of the graphic objects on the map.
- Zoom Out—Allows you to zoom out on the map view. This tool decreases the size of all of the graphic objects on the map.
- Zoom Area—Allows you to pan and zoom the view to a different region of the map. Hold down the left mouse button and use the Zoom Area box to highlight an area on the map. When you release the left mouse button, the zoom is applied on the selected area of the map.

Step 7 Click an NE object to open the NE Explorer window for that NE.

Step 8 Choose **View > Detailed View** to open a detailed Circuit Trace window from the current window. For information about the detailed view, see 7.2.20.2 Tracing Detailed Circuits, page 7-162.

The following table describes the icons in the High-Level Circuit Trace window.

Table 7-21 Object Icon Descriptions for the High-Level Circuit Trace Window

Object	Icon
The color of the NE represents the highest alarm severity on that entity. For icon colors, see Table A-2 on page A-3. The label under the NE icon shows the NE name.	
While the NE is initializing, a small hourglass is shown to the right of the NE. The hourglass icon disappears when the NE state changes to In Service.	

Table 7-21 Object Icon Descriptions for the High-Level Circuit Trace Window (continued)

Object	Icon
Circuit source, where *n* indicates the source number.	
Circuit destination, where *n* indicates the destination number.	
Solid green link with bidirectional arrows: The link is active and bidirectional, and supports the working (main) span.	
Solid magenta link with bidirectional arrows: The link is active and bidirectional, and supports the protected (standby) span.	
Solid green link with unidirectional arrows: A single arrow in the middle of the link shows the direction of the source or destination.	Solid magenta link with unidirectional arrows: A single arrow in the middle of the link shows the direction of the source or destination.	Solid gray link: The link is active but is not directly involved in the circuit.	Dashed-line link: A dashed line represents an invalid link or a logical link, such as an OCH trail link. **Note** If the logical link is involved in a circuit, the circuit type is shown above the dashed line.	
Dashed-line link that uses triple dots with spacing: While the NE is being discovered, the links are created but might remain invalid. In this case, the link is shown on the map as a dashed line that uses triple dots with spacing.	

The Refresh Data tool flashes when updates are available. Or, if the automatic Refresh Data feature is enabled, the High-Level Circuit Trace window refreshes automatically whenever updates occur. The following table shows which events prompt a real-time update to the High-Level Circuit Trace window.

Table 7-22 Events that Cause a Real-Time Update to the High-Level Circuit Trace Window

Event	Action
Add a link	The graphic object representing the link is added to the map.
Modify a link	If the link validity changes, the corresponding graphic object is updated.
Delete a link	The graphic object representing the link is deleted from the map.
Change the NE state to Out of Service	The NE icon color changes to gray. All links that belong to the NE are deleted and removed from the map.
Change the NE state to In Maintenance	The NE icon color changes. All links that belong to the NE are deleted and removed from the map.
Change the NE state to In Service	The NE icon color reflects the highest alarm severity on that entity, and the hourglass icon disappears. All links that belong to the NE are discovered and shown on the map.
Change the NE state to Initializing	A small hourglass is shown to the right of the NE while the NE initializes.
Change the circuit name	The window title updates to show the new circuit name.
Delete a circuit	A warning message informs you that the circuit has been deleted. Then, the High-Level Circuit Trace window closes automatically.

Note If you are trying to trace subnetwork information but there are insufficient map coordinates for the Subnetwork Explorer, the graphic objects are placed randomly on the Circuit Trace window. To fix this problem, open the Subnetwork Explorer map view and click **Save** to save the graphic objects' positions.

7.2.20.2 Tracing Detailed Circuits

In addition to high-level circuit traces, Prime Optical displays detailed circuit traces. To view a detailed circuit trace, complete the following steps:

Step 1 Select the node that contains the circuit to be traced and open one of the following:

- Circuit table. For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.
- Link Utilization table. To launch the Link Utilization table, see 3.6.9 Viewing Link Utilization, page 3-47.

Step 2 In the Circuit table, select the circuit to be traced, and choose **Configuration > Trace Circuit** (or click the **Trace** tool). The Circuit Trace window opens.

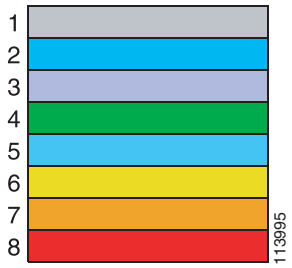
Step 3 In the Link Utilization table, select the circuit to be traced, and choose **View > Circuit Trace**. The Circuit Trace window opens.

Step 4 In the Circuit Trace window, choose **Edit > Zoom In**, **Zoom Out**, or **Zoom Area** to adjust the zoom level. You can also click the **Zoom In**, **Zoom Out**, or **Zoom Area** tool.

Note Prime Optical traces the connectivity of circuits in Partial state. However, if the source or destination node information is not available during circuit discovery, Prime Optical cannot start the circuit trace and generates an error message.

The following figure shows the color scheme used to represent the port state and alarm status in the Circuit Trace window. The color of the NEs and ports represents the highest alarm severity on that entity.

Figure 7-1 Colors of Port State and Alarm Status



Row	Color	Port State	Port State Abbreviation	Alarm Status
1	Gray	Out of Service	OOS_DSBLD	—
2	Cyan	Out of Service–Maintenance	OOS_MT	—
3	Purple	In Service	IS_AINS	—
4	Green	In Service	IS	Clear
5	Light blue	In Service	IS	Warning
6	Yellow	In Service	IS	Minor
7	Orange	In Service	IS	Major
8	Red	In Service	IS	Critical

Note
- The administrative state color (OOS_DSBLD, OOS_MT, IS_AINS) overrides the alarm state color.
- For in-service (IS) ports, the alarm state color overrides the administrative state color.

The following table describes the icons in the detailed Circuit Trace window.

Table 7-23 Object Icon Descriptions for the Detailed Circuit Trace Window

Object	Icon
Circuit source, where *n* indicates the source number	
Circuit destination, where *n* indicates the destination number	
NE	<Cross-connect size>  <Node name>
Active span **Note** Arrows indicate the direction of traffic flow, with green indicating active traffic.	
Standby span **Note** Arrows indicate the direction of traffic flow, with purple indicating standby traffic.	
PCA, VT tunnel, or VAP span **Note** Each span is tagged with a *Tunnel*, *VAP*, or *PCA* label.	
Rolled path **Note** The rolled path could be the source, the destination, or one or more spans. All entities that have been added to a circuit are shown in orange once the roll is created.	

Table 7-23 Object Icon Descriptions for the Detailed Circuit Trace Window (continued)

Object	Icon
Port **Note** If there are multiple ports displayed, the ports on the top of the NE icon have a left-right to bottom-top association with the port name.	Unidirectional circuit	Bidirectional circuit	UPSR selector **Note** The color of the UPSR selector represents the switch state. Green indicates that the selector is using the traffic from the working path; purple indicates that the selector is using traffic from the protected path.	(For UPSR selectors) Switched state is *Locked*	
(For UPSR selectors) Switched state is *Forced*	
(For UPSR selectors) Switched state is *Manual*	
(For UPSR selectors) Switched state is *APS clear*	

Table 7-23 Object Icon Descriptions for the Detailed Circuit Trace Window (continued)

Object	Icon
(For UPSR selectors) Switched state is *Exercise*	
(For UPSR selectors) Provisioning type is *Protected* (PRT)	<*PTP*>*Port name*<*CTP*>**(PRT)**
(For UPSR selectors) Provisioning type is *Working* (WRK)	<*PTP*>*Port name*<*CTP*>**(WRK)**
Internal drop for VT tunnel	Internal drop for VAP circuit	Internal drop for Ethernet circuit	Facility (line) loopback	
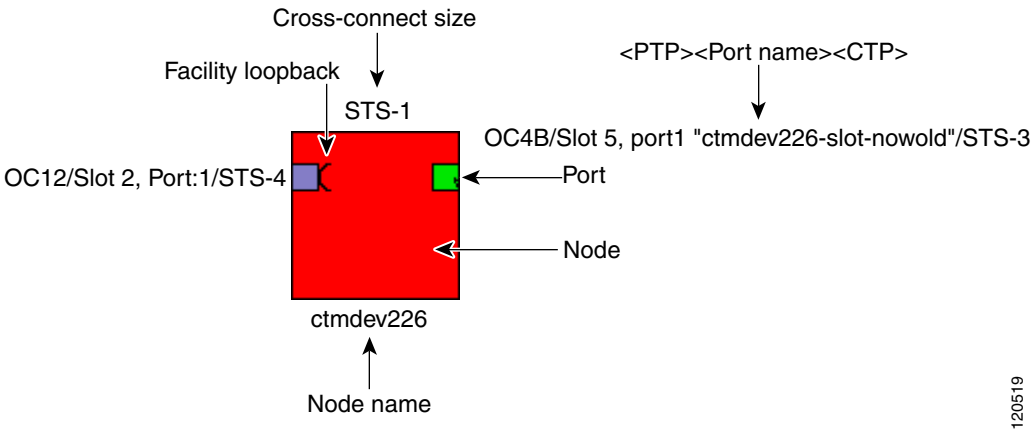
Terminal loopback	
Automatic J1 path trace mode	

Table 7-23 Object Icon Descriptions for the Detailed Circuit Trace Window (continued)

Object	Icon
Manual J1 path trace mode	
Dual Connection Node	

The following figure shows a sample circuit diagram that uses many of the objects and icons described in Table 7-23.

Figure 7-2 Sample Circuit Diagram



The Circuit Trace window provides tooltips. For each span, the tooltip displays link protection and bandwidth information. If a circuit passes through a VT tunnel, the intermediate nodes through which the VT tunnel passes are displayed and the level of cross-connection is STS-1.

For DRI circuits, DRI nodes are tagged with a *DRI* label.

The Circuit Trace also displays ONS 15600 circuits that are in Roll Pending state. The Roll From circuit path is marked in green and the Roll To circuit path is marked in orange. CTPs that are part of the roll are labeled *RollTo* and *RollFrom*.

7.2.20.3 Viewing Photonic Path Trace Details

Prime Optical displays Photonic Path Trace (PPT) for Layer 1 services of OCHNC and OCH Trail circuits. The PPT is a graphic representation of the Optical Power and the corresponding Threshold values for each port.

Note Prime Optical displays PPT details only for unidirectional circuits. For bidirectional circuits, the Photonic Path trace details are displayed individually for each direction: Source to Destination, and Destination to Source.

To view Photonic Path Trace, complete the following steps:

Step 1 Select the node that contains the circuit to be traced and open one of the following:

- Circuit table—For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.
- Link Utilization table—To launch the Link Utilization table, see 3.6.9 Viewing Link Utilization, page 3-47.

Step 2 In the Circuit table, select the circuit to be traced, and choose **Configuration > Trace Circuit** (or click the **Trace** tool). The Circuit Trace window opens.

Step 3 In the Link Utilization table, select the circuit to be traced, and choose **View > Circuit Trace**. The Circuit Trace window opens.

Step 4 In the Circuit Trace window, choose the Photonic Path Trace tab.

Note For optimal network performance, PPT details are not automatically displayed when the Circuit Trace window is opened.

Step 5 In the Photonic Path Trace tab, click **Start**. All NEs in the circuit are displayed in the left pane.

Note For a bidirectional circuit, the NEs are displayed under two NE groups in the left pane: one group for each direction.

Step 6 Click the specific NE for which to view the PPT details. The corresponding PPT graph is displayed in the right pane.

The Photonic Path Trace tab also displays the date and time at which the PPT data was last retrieved. You will find it next to the **Start** button at the bottom-left corner of the tab.

Note You can also export PPT data as an HTML file by clicking **Export** at the bottom of the Photonic Path Trace tab.

The following limitations apply to Photonic Path Trace:

- When the service is provisioned on preprovisioned cards, the PPT tab is available in the Circuit Trace window, but PPT data cannot be retrieved. In such cases, the NEs that are listed are affixed with <N/A> to indicate that PPT data is not available.
- When the service is splitter-protected or is part of a regeneration group, an error message is displayed when you try to start PPT data collection.

7.2.20.4 Viewing a Port or Node from the Circuit Trace Window

To view a port or node from the Circuit Trace Window, complete the following steps:

Step 1 Launch the Circuit Trace window. See 7.2.20 Tracing Circuits, page 7-159.

Step 2 To view a port, right-click it and choose **Open Port** from the shortcut menu (or double-click the port). The NE Explorer opens and displays the port.

Step 3 To view a node, double-click it. The NE Explorer opens and displays the shelf view of the node.

Step 4 For OCHCC circuits, you can view the complete circuit span between the source and destination NE by choosing **View > WDM Topology** in the Circuit Trace window. This feature shows the complete circuit span between two endpoints.

7.2.20.5 Editing the Trail Trace Identifier from the Circuit Trace Window

You can edit the trail trace identifier (TTI) from the Circuit Trace window. The Edit TTI option is available on all trunk ports that support OTN. The Edit TTI option does not appear if:

- You disable OTN on the trunk port.
- The trunk port is the protected actor of the protection group.

To edit TTI from the Circuit Trace window, complete the following steps:

Step 1 Launch the Circuit Trace window. See 7.2.20 Tracing Circuits, page 7-159.

Step 2 Right-click the port and choose **Edit TTI** from the shortcut menu. The Edit TTI dialog box opens. Table 7-24 provides field descriptions. Specify the following information:

- Level—Select the trail trace identifier level. You can select either Section or Path.
- Received Trace Mode—Enable the expected string for the path trace. Choose one of these options:
  - Off/None—Disables received trace mode.
  - Manual—Uses the value of the Current Expected String field as the baseline. An alarm is raised when a string that differs from the Current Expected String is received.
- Disable FDI on TTIM—Check this check box to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.

Note The received trace mode must be set to Manual before you can disable FDI on TTIM.

- In the Transmit area, do the following:
  - In the New Transmit String text box, enter the new string to be transmitted.
  - Click **Hex Mode** to display the string in hexadecimal mode. The string is displayed in the Current Transmit String area.
  - Click **ASCII Mode** to display the string in ASCII format. The string is displayed in the Current Transmit String area.
- In the Expected area, do the following:
  - Select the Expected String Type. You can select either ASCII or Hex (1 byte).
  - If you set the Received Trace Mode to Manual, enter the string that the target card should receive in the New Expected String text box.
  - Click **Hex Mode** to display the string in hexadecimal mode. The string is displayed in the Current Expected String area.

  - Click **ASCII Mode** to display the string in ASCII format. The string is displayed in the Current Expected String area.
- In the Received area, the current received string is displayed in the Current Received String area. Do one of the following:
  - Click **Hex Mode** to display the string in hexadecimal mode.
  - Click **ASCII Mode** to display the string in ASCII format.

Step 3 Complete one of the following options:

- Click **Reset** to reset the values.
- Click **Default** to restore the default values.
- Click **Apply** to apply the information you specified.
- Click **Close** to close the Edit TTI dialog box.

Table 7-24 Field Descriptions for the Edit Trail Trace Identifier Dialog Box

Field	Description
Port	Displays the port number.
Level	Allows you to set the trail trace identifier level (Section or Path).
Received Trace Mode	Allows you to modify the received trace mode (Off/None or Manual).
Disable FDI on TTIM	Allows you to disable FDI for TTIM alarms. **Note** The received trace mode must be set to Manual before you can disable FDI on TTIM.
Current Transmit String	Displays the current transmit string.
New Transmit String	Allows you to set a new transmit string.
Hex Mode	Click **Hex Mode** to display the string in hexadecimal mode.
Current Expected String	Displays the current expected string.
Expected String Type	Allows you to select the expected string type. You can choose one of the following: • ASCII—Displays the string in ASCII format. • Hex (1 byte)—Displays the string in hexadecimal mode. If you choose Hex (1 byte), only one character (1 byte) is allowed.
New Expected String	Allows you to set a new expected string.
Hex Mode	Click **Hex Mode** to display the string in hexadecimal mode.
Current Received String	*Display only.* Displays the current received string.
Hex Mode	Click **Hex Mode** to display the string in hexadecimal mode.

Table 7-24 Field Descriptions for the Edit Trail Trace Identifier Dialog Box (continued)

Field	Description
Refresh	Allows you to refresh the data shown in the Edit TTI dialog box.
Auto-Refresh	Allows you to set the time interval at which the Edit TTI dialog box refreshes automatically. The following values are allowed: • None—Disables auto-refresh, if enabled. • Every 5 seconds. • Every 30 seconds. • Every 1 minute. • Every 5 minutes. • Every 15 minutes. • Every 30 minutes. **Note** You cannot enable auto-refresh if the remote entity does not support it.

7.2.20.6 Using the Circuit Trace Window to Apply Protection to the Ports in a Splitter-Protection Group

You can use the Circuit Trace window to apply optical protection to the ports in a splitter-protection group.

7.2.20.6.1 Overview of Protected OCHNC

OCHNC identifies a wavelength optical path in an MSTP node. The optical path can be:

- Pass-through—The wavelength crosses the node in its path from source to destination. Pass-through OCHNC has two side line ports as transmit and receive endpoints.
- Add—The wavelength path starts from the node. Add OCHNC has an OCH filter port as the receiving endpoint and a side line port as the transmitting endpoint.
- Drop—The wavelength path ends at the node. Drop OCHNC has an OCH filter port as the transmitting endpoint and a side line port as the receiving endpoint.

PSM extends OCHNC on the source and destination node, adding protected OCHNC for add and drop. Splitter-protection OCHNC is bidirectional only.

According to the protection used, the ports involved in protected OCHNC are different even if each protected OCHNC is always characterized by the parameters shown in the following table.

Table 7-25 Endpoints Involved In Protected OCHNC

	Protection Type		
Endpoint	OCH	Multiplex Section	Path
TX/RX OCH NC endpoints	PSM COM-TX and COM-RX ports	Mux/Dmx CHAN-TX and CHAN-RX ports	Mux/Dmx CHAN-TX and CHAN-RX ports

Table 7-25 Endpoints Involved In Protected OCHNC (continued)

Endpoint	Protection Type		
	OCH	Multiplex Section	Path
Working TX/RX OTS ports	Unprotected-side line ports	Working-side line ports	PSM W-TX and W-RX (working-side line ports)
Protect TX/RX OTS ports	Unprotected-side line ports	Protect-side line ports	PSM P-TX and P-RX (protect-side line ports)

Protected OCHNC is supported on:

- ROADM (2-4-8 degree) and OADM for OCH protection
- Terminal site for multiplex section or path protection

Wavelength is determined by Mux/Dmx OCH ports, not by PSM units. Protected OCHNC involves all physical ports and patchcords that connect the OCH/OTS endpoint.

Multiplex section and path protection are supported by terminal sites only. The patchcord manager must consider the following limitations when identifying the line side ports for PSM:

- One PSM and a ROADM/OADM unit supporting line ports requires OCH protection.
- One PSM and one additional unit supporting line ports requires path protection.
- One PSM and two additional units supporting line ports requires multiplex section protection.

Note If the node equips more than one side, PSM can be connected only in an OCH protection configuration. Other patchcord creation requests are denied.

7.2.20.6.2 General Rules for Automatic Patchcord Creation

Note the following general rules for automatic patchcord creation:

- Using the Calculate Connections feature, the patchcord manager always tries to connect optical units that belong to the same side to match one of the known layouts.
- The Calculate Connections feature does not connect OCH trunk and OCH filter ports because it is difficult to add TxP and MxP to a standard managed layout in a multiside node. Every algorithm involving TxP or MxP requires a user-provisioned TxP wavelength.
- The patchcord manager connects PSM in a path or multiplex section configuration if there is only one PSM provisioned or equipped on the node, and if there are no incompatible patchcords provisioned on any of the PSM ports.
- To distinguish between path and section, the patchcord manager considers the number of preamplifiers and booster amplifiers, assuming that in the multiplex section the two fiber stages have the same layout.
- For protected layouts, if more than two line side ports are identified (for example, a node equips three boosters), only the first two ports are connected to PSM.
- The patchcord manager creates working and protection sides; that is, A(W) and A(P) for PSM in a path-protection configuration.

7.2.20.6.3 Applying Optical Protection

To apply optical protection to the ports in a splitter-protection group:

Step 1 Launch the Circuit Trace window. See 7.2.20 Tracing Circuits, page 7-159.

Step 2 Right-click a port in a splitter-protection group and choose **Protection Group** from the shortcut menu. This feature applies to OCHCC, OCHTRAIL, and OCHNC circuits that use optical protection.

Step 3 Choose from among the following options. Unavailable functions are dimmed, and the current function is indicated in parentheses. A menu separator divides the switch functions from the locking functions:

- Clear—Removes a previously set switch command.
- Manual to Working—Switches traffic to the working circuit path if the path has an error rate less than the signal degrade.
- Manual to Protect—Switches traffic to the protect circuit path if the path has an error rate less than the signal degrade.
- Force to Working—Forces traffic to switch to the working circuit path, even if the path has signal degrade or signal failure conditions. Force switch states have a higher priority than manual switch.
- Force to Protect—Forces traffic to switch to the protect circuit path, even if the path has signal degrade or signal failure conditions.
- Unlock—Unlocks the port from its current state.
- Lockout of Working—Prevents traffic from switching to the working circuit path under any circumstances. Of all switch states, lockout has the highest priority.
- Lockout of Protect—Prevents traffic from switching to the protect circuit path under any circumstances.

Caution Force and lockout commands override normal protection switching mechanisms. Applying these commands incorrectly can cause traffic outages.

Step 4 At the Confirm Selector Switch prompt, click **OK**.

A message indicates whether the operation succeeded or failed.

7.2.20.7 Viewing a J1 Path Trace from the NE Explorer

The SONET J1 path trace is a repeated, fixed-length string comprised of 64 consecutive J1 bytes. You can use the string to monitor interruptions or changes to circuit traffic. The *Cisco ONS 15454 Reference Manual* shows the ONS 15454 cards that support path trace. DS-1 and DS-3 cards can transmit and receive the J1 field, while the EC-1, OC-3, OC-48AS, and OC-192 can only receive J1 bytes. Cards that are not listed in the reference manual do not support J1 bytes.

To view a J1 path trace from the NE Explorer:

Step 1 Select a CTC-based NE in the Domain Explorer tree and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the NE Explorer, select a card in the NE Explorer tree; then, click the **J1 Path Trace** tab in the card properties pane.

Step 3 Click the **Retrieve** button to retrieve J1 path trace information. Information is displayed in the properties pane.

Step 4 Select the row that corresponds to the port for which you want to display circuit trace information.

Step 5 Click **Display**. The Trace dialog box opens. The following table provides descriptions.

Table 7-26 Field Descriptions for the J1 Path Trace Dialog Box

Field	Description
STS Choices (J1 STS path trace only)	Choose the STS circuit that has path trace provisioned on the source and destination ports. This field does not appear on the J1 VC Path Trace dialog box.
VC3/VC4 Choices (J1 VC path trace only)	Choose the VC3 or VC4 circuit that has path trace provisioned on the source and destination ports. This field does not appear on the J1 STS Path Trace dialog box.
Path Trace Mode	Enable the path trace expected string by choosing one of the following values from the Path Trace Mode drop-down list: • Off/None—Path trace mode is disabled. • Auto—Uses the first string received from the port at the other end as the baseline string. An alarm is raised when a string that differs from the baseline is received. For OC-N ports, Auto is recommended, since Manual mode requires you to trace the circuit on the Edit Circuit window to determine whether the port is the source or destination path. • Manual—Uses the Current Expected String field as the baseline string. An alarm is raised when a string that differs from the Current Expected String is received.
Disable AIS and RDI if TIM-P is Detected	Check the Disable AIS on TIM-P check box if you want to suppress the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the STS or VC3/VC4 path trace identifier mismatch (TIM-P) alarm is detected.
Path Trace String Size	Select the path trace string size. **Note** For information about the different path trace string sizes, see the *Cisco ONS 15454 Procedure Guide* or *Cisco ONS 15454 SDH Reference Manual*.
Current Expected String	Displays the current expected string. Click **Hex Mode** to display the string in hexadecimal mode. Click **ASCII Mode** to display the string in ASCII text.
New Expected String	If you set Path Trace Mode to Manual, enter the string that the OC-N port should receive in the New Expected String field.
Current Received String	Displays the current received string.

7.2.20.8 Editing a J1 Path Trace

Step 1 Select the CTC-based node that contains the circuit to be traced and open the Circuit table. For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.

Step 2 In the Circuit table, select the circuit to be traced, and choose **Configuration > Trace Circuit**.

Step 3 Right-click a port and choose **Edit J1 Path Trace**. The J1 Path Trace dialog box opens. The Edit J1 Path Trace drop-down list is not displayed (when you right click) for ports that do not support the J1/J2 string. (See Table 7-26 for field descriptions.) Specify the following information:

- Path Trace Mode—Enable the path trace expected string. Select one of the following options:
  - Off/None—Path trace mode is disabled.
  - Auto—Uses the first string received from the port at the other end as the baseline string. An alarm is raised when a string that differs from the baseline is received.
  - Manual—Uses the Current Expected String field as the baseline string. An alarm is raised when a string that differs from the Current Expected String is received.
- Alarm Action—Select one of the following options:
  - Disable AIS and RDI on J1-TIM—Check this check box to suppress the alarm indication signal and the remote defect indication when the circuit TIM-P alarm is detected. This option is disabled if you select Off/None as path trace mode.
  - Disable AIS on C2 Mismatch—Check this check box to suppress the alarm indication signal when the C2 byte mismatch alarm is detected.
- Path Trace String Size—Select the path trace string size (16 byte or 64 byte).
- In the Transmit area, do the following:
  - In the New Transmit String text box, enter the new string to be transmitted.
  - Click **Hex Mode** to display the string in hexadecimal mode. The string is displayed in the Current Transmit String area.
  - Click **ASCII Mode** to display the string in ASCII format. The string is displayed in the Current Transmit String area.
- In the Expected area, do the following:
  - If you set the path trace mode to Manual, enter the string that the target card should receive in the New Expected String field.
  - Click **Hex Mode** to display the string in hexadecimal mode. The string is displayed in the Current Expected String area.
  - Click **ASCII Mode** to display the string in ASCII format. The string is displayed in the Current Expected String area.
- In the Received area, the current received string is displayed in the Current Received String area. Do one of the following:
  - Click **Hex Mode** to display the string in hexadecimal mode.
  - Click **ASCII Mode** to display the string in ASCII format.

Step 4 Complete one of the following options:

- Click **Default** to restore the default values for the J1 path trace fields.
- Click **Refresh** to refresh the J1 path trace information.
- Click **Apply** to apply the information you specified.

7.2.20.9 Editing a J2 Path Trace

Step 1 Select the CTC-based SDH NE that contains the VC12 circuit to be traced and open the Circuit table. For an explanation of Circuit table launch points, see Table 7-2 on page 7-4.

Step 2 In the Circuit table, select the VC12 circuit and choose **Configuration > Trace Circuit**.

Step 3 Right-click a port and choose **Edit J2 Path Trace**. The J2 Path Trace dialog box opens. Specify the following information:

- Path Trace Mode—Enable the path trace expected string. Select one of the following options:
  - Off/None—Path trace mode is disabled.
  - Auto—Uses the first string received from the port at the other end as the baseline string. An alarm is raised when a string that differs from the baseline is received.
  - Manual—Uses the Current Expected String field as the baseline string. An alarm is raised when a string that differs from the Current Expected String is received.
- Alarm Action—Select one of the following options:
  - Disable AIS and RDI on J2-TIM—Check this check box to suppress the alarm indication signal and the remote defect indication when the VC12 circuit TIM-P alarm is detected. This is disabled if you select Off/None as path trace mode.
  - Disable AIS on LO SLM—Check this check box to suppress the alarm indication signal when the VC12 circuit, low-order signal label mismatch (LO SLM) alarm is detected.
- Path Trace String Size—Select the path trace string size (16 byte or 64 byte).
- In the Transmit area, do the following:
  - In the New Transmit String text box, enter the new string to be transmitted.
  - Click **Hex Mode** to display the string in hexadecimal mode. The string is displayed in the Current Transmit String area.
  - Click **ASCII Mode** to display the string in ASCII format. The string is displayed in the Current Transmit String area.
- In the Expected area, do the following:
  - If you set the path trace mode to Manual, enter the string that the EC-42 card should receive in the New Expected String field.
  - Click **Hex Mode** to display the string in hexadecimal mode. The string is displayed in the Current Expected String area.
  - Click **ASCII Mode** to display the string in ASCII format. The string is displayed in the Current Expected String area.
- In the Received area, the current received string is displayed in the Current Received String area. Do one of the following:
  - Click **Hex Mode** to display the string in hexadecimal mode.
  - Click **ASCII Mode** to display the string in ASCII format.

Step 4 Complete one of the following options:

- Click **Default** to restore the default values for the J2 path trace fields.
- Click **Refresh** to refresh the J2 path trace information.

- Click **Apply** to apply the information you specified.

7.2.21 Modifying Traces

Trace information can be used to find faults. The Modify Trace dialog box allows you to change the section trace information for applicable cards. Select a port and click **Modify** to open the Modify Trace dialog box. Fields shown depend on the type of card selected. The following table provides descriptions.

Table 7-27 Field Descriptions for the Modify Trace Dialog Box

Field	Description
Port Number	Displays the port number.
Level	Allows you to set the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Auto, Manual, or Off).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms. **Note** The trace mode must be set to Manual before you can disable FDI on TTIM.
Disable AIS/RDI on TIM-S	Allows you to disable the AIS and the RDI when the path trace identifier mismatch section (TIM-S) alarm is detected. **Note** The trace mode must be set to Manual before you can disable AIS/RDI on TIM-S.
Transmit Length	Select a transmit length for the trace. Values are 1 byte, 16 bytes, or 64 bytes.
Current Transmit String	Displays the current transmit string.
New Transmit String	Allows you to set a new transmit string.
Hex Mode	Click **Hex Mode** to display the string in hexadecimal mode.
Current Expected String	Displays the current expected string.
New Expected String	Allows you to set a new expected string.
Hex Mode	Click **Hex Mode** to display the string in hexadecimal mode.
Current Received String	*Display only.* Displays the current received string.
Hex Mode	Click **Hex Mode** to display the string in hexadecimal mode.

7.2.22 Managing Circuit Notes

The Circuit Note dialog box allows you to view and add notes to circuits displayed in the Circuit table. If a circuit has a note, the Circuit Note tool appears under the Note column. Comments are visible to all users.

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Circuit Table**.

Step 2 In the Circuit table, choose **Configuration > Show Circuit Note** (or click the **Show Circuit Note** tool). The Circuit Note dialog box opens. The following table provides descriptions.

Step 3 After reading, adding, or deleting notes, click **OK**.

Table 7-28 Field Descriptions for the Circuit Note Dialog Box

Field	Description
Note	Provides space to type comments about the selected circuit. To add your comments to the previous comments, click the **Append** radio button. To overwrite the previous comments, click **Replace**. To delete the comments, click **Delete**. **Note** You can enable and disable the Replace and Delete functions in the Control Panel > UI Properties pane > Overwrite Circuit Notes field.
History	Displays comments that were entered by previous users.

7.2.23 Managing Circuit Rolls

Use the following procedures to manage circuit rolls:

- 7.2.23.1 Viewing the Rolls Table, page 7-178
- 7.2.23.2 Rolling a Circuit, page 7-179
- 7.2.23.3 Completing a Roll, page 7-186
- 7.2.23.4 Forcing a Valid Signal, page 7-186
- 7.2.23.5 Finishing a Roll, page 7-187
- 7.2.23.6 Canceling a Roll, page 7-187
- 7.2.23.7 Filtering the Rolls Table, page 7-187
- 7.2.23.8 Deleting a Roll, page 7-188

7.2.23.1 Viewing the Rolls Table

The Rolls table displays circuit roll information for the selected NE or NEs. The rolling maintenance function is available in CTC-based NEs to move live traffic from one entity to another. The connections can be single- or dual-ended. Only path-level (not line-level) bridging and rolling is supported.

To view the Rolls table, select a CTC-based NE in the Domain Explorer tree and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Rolls Table**. The following table provides descriptions.

Table 7-29 Field Descriptions for the Rolls Table

Field	Description
Roll from Circuit	Displays the name of the circuit where the circuit roll originates.
Roll to Circuit	Displays the name of the circuit where the circuit roll terminates. This value could be the same as Roll From Circuit when only a single circuit is involved in a roll.
Roll State	Displays the current state of the circuit roll. Values are: • ROLL_PENDING—The roll is awaiting completion or cancellation. • ROLL_COMPLETED—The roll has already been completed. • ROLL_CANCELLED—The roll has been cancelled.
Roll Valid Signal	Displays the roll valid signal status (True or False).
Roll Mode	Displays the roll mode. Values are: • Automatic—When a valid signal is received on the new path, Prime Optical completes the roll on the node automatically. You can cancel an automatic roll only when the Roll Valid Signal value is False. One-way source rolls are always automatic. • Manual—You must complete a manual roll after a valid signal is received. You can cancel a manual roll at any time. One-way destination rolls are always manual.
Roll Path	Displays the roll path for the entire circuit roll.
Roll from Path	Indicates the path that is being rolled away. The original cross-connection goes from Roll Path to Roll from Path.
Roll to Path	Indicates the new path being rolled to. After a successful completion of a roll, the new cross-connection goes from Roll Path to Roll to Path.

7.2.23.2 Rolling a Circuit

Use the Roll Circuit wizard to transfer CTC-based NE traffic from one facility to another without service interruption. The wizard is generally used to move a circuit off a card (for card or facility replacements) or to increase bandwidth utilization (for example, by moving lower-rate circuits across a shared high-rate circuit or rerouting circuits or parts of a circuit). You can roll SONET and SDH circuits only.

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Circuit Table**.

Step 2 In the Circuit table, select the circuit to roll and choose **Configuration > Roll Circuit** (or click the **Roll Circuit** tool). The Roll Circuit wizard opens. The following table provides descriptions.

Table 7-30 Field Descriptions for the Roll Circuit Wizard

Field	Description
Roll Attributes	
Circuit Roll Mode	Select the circuit roll mode (Auto or Manual).
Circuit Roll Type	Select the circuit roll type (Single or Dual).
Roll From Circuit	If you selected multiple circuits, select a circuit to roll from in the Roll From Circuit list.

Table 7-30 Field Descriptions for the Roll Circuit Wizard (continued)

Field	Description
Roll Summary	Displays the results of your choices on this screen.
Pivot/Fixed Point 1	
Circuit Trace	The Roll From Circuit is traced so that you can select the circuit termination point. Select a circuit termination point from the graphic.
Selected CTP	Displays the user-selected circuit termination point.
Roll Summary	Displays the results of your choices on this screen.
Pivot/Fixed Point 2 (available when Circuit Roll Type is Dual)	
Circuit Trace	The Roll From Circuit is traced so that you can select the circuit termination point. Select a circuit termination point from the graphic.
Selected CTP	Displays the user-selected circuit termination point.
Roll Summary	Displays the results of your choices on this screen.
Select New Endpoint (available when Circuit Roll Type is Single; fields depend on the NE selected and the circuit type)	
NE ID	Select a new NE as the endpoint from the list of available NE IDs.
Subnetwork ID	*Display only.* Displays the ID of the subnetwork.
Slot	(For SONET/SDH circuits) Select the slot from the list.
Port	(For SONET/SDH circuits) Select the port from the list.
STS	(For SONET circuits) Select an STS from the list.
VT	(For SONET circuits) Select the VT for the new endpoint from the list.
VC4	(For SDH circuits) Select the VC4 from the list.
VC11	(For SDH circuits) Select the VC11 from the list.
VC12	(For SDH circuits) Select the VC12 from the list.
TUG3	(For SDH circuits) Select the TUG3 from the list.
TUG2	(For SDH circuits) Select the TUG2 from the list.
Routing Preferences View (available when Circuit Roll Mode is Dual)	
Route Automatically	Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. Alternatively, you can choose manual routing and specify all the intermediate hops on a hop-by-hop basis (up to 64 hops per circuit). **Note** If the source and destination of the circuit are on the same node, automatic routing is enabled.
Using Required Nodes/Links	(Available only if Route Automatically is checked) If checked, Prime Optical automatically routes the circuit through the required nodes and/or links.
Review Route Before Creation	(Available only if Route Automatically is checked) Check this check box to review the route before it is created.
VT-DS3 Mapped Conversion	*Display only.* If checked, the roll-away path includes the node on which the VT/DS-3 conversion is done. If unchecked, the roll-away path does not include the node on which the VT/DS-3 conversion is done.

Table 7-30 Field Descriptions for the Roll Circuit Wizard (continued)

Field	Description
Time Slot Restriction	If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks. **Note** Time Slot Restriction is not available for OCHCC and OCHNC circuit types. **Note** For VCAT circuits, you must enter multiple STS/VC4 values in the Time Slot Restriction field, in the Member Preferences table. The STS/VC4 values you enter in the Time Slot Restriction field cannot be identical or circuit creation will fail with an error message.
Fully Protected Path	If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit in a UPSR DRI topology by checking the Dual Ring Interconnect check box. Alternatively, if the circuit must pass across unprotected links, Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications: • Required—Ensures that the primary and alternate paths of the UPSR portions of the complete circuit path are node-diverse. • Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. • Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
Protection Channel Access	To route the circuit on a BLSR protection channel, if available, uncheck the Fully Protected Path check box, and check the Protection Channel Access check box.
Dual Ring Interconnect	If you selected Fully Protected Path and the circuit will be routed on a DRI, check the Dual Ring Interconnect check box. **Note** For DRI and iDRI manually created circuits, you must double-click the DRI span for it to become DRI. A single-click does not enable the DRI span.
Diverse Shared Risk Link Group (SRLG)	If checked, fully protected circuits are routed through working and protected links that do not share risk groups.
Manual Provisioning	
Map view	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view is used to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default.

Table 7-30 Field Descriptions for the Roll Circuit Wizard (continued)

Field	Description
Available Spans	Select a link on the map view (related to the selected node) and its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field. The newly added link appears in blue on the map view.
Selected Spans	Select one or more spans and click **Remove** to remove them from the Selected Spans field. The removed link appears in green to indicate its unselected state. **Note** To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.
Links/Nodes tab	Select the links/nodes in the graphic to populate the selected node field.
BLSR DRI Nodes or MS-SPRing DRI Nodes tab	(For BLSR DRI or MS-SPRing DRI circuits) Click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.
Route Constraints (available only if the Using Required Node/Links check box is checked)	
Map view	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view is used for the inclusion and exclusion of links or nodes during the specification of route constraints. The included nodes are shown in blue and the excluded links are shown in magenta. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default.
Selected Node/Link	Displays the currently selected NE or link.
Included Links/Nodes	Displays the list of links or nodes that are included in the route.
Excluded Links/Nodes	Displays the list of links or nodes that are excluded from the route.
VT/VC LO Circuit Options (available only for VT and VC LO path circuits)	
VT/VC LO Tunnel on Transit Nodes	This option is available if the VT or VC circuit passes through a node that does not have a low-order tunnel, or if an existing low-order tunnel is full. Low-order tunnels allow VT/VC circuits to pass through NEs without consuming low-order cross-connect card resources. In general, creating tunnels is a good idea if you are creating many low-order circuits from the same source and destination.
VT Aggregation Point (VAP)/VC LO Aggregation Point (LAP)	(For SONET) This option is available if you are creating a VT1.5 circuit on a DS-1, EC-1, DS3XM-6; or an OC-N port on a BLSR, 1+1, or unprotected node. A VAP allows VT1.5 circuits to be routed through a node using one STS connection on the cross-connect card matrix rather than multiple connections on the VT1.5 matrix. (For SDH) This option is available if you are creating a VC12 circuit on an STM-N port for handoff to non-SDH networks or equipment, such as an IOF, switch, or DACS. A LAP allows low-order circuits to be routed through a node using one VC4 connection on the cross-connect card high-order matrix rather than multiple connections on the low-order matrix.

Table 7-30 Field Descriptions for the Roll Circuit Wizard (continued)

Field	Description
First fixed point is STS/VC4 Grooming Node	Creates the VAP or LAP on the VT or VC circuit source node. This option is available only if the VT circuit originates on a DS-1, EC-1, DS3XM-6, or OC-N card, or if the VC circuit originates on an STM-N card.
Second fixed point is STS/VC4 Grooming Node	Creates the VAP or LAP on the VT or VC circuit destination node. This option is available only if the VT circuit terminates on a DS-1, EC-1, DS3XM-6, or OC-N card, or if the VC circuit terminates on an STM-N card.
None	Choose this option if you do not want to create a low-order tunnel or a VAP/LAP. This is the only available option if Prime Optical cannot create a low-order tunnel or VAP/LAP.
Conversion Route Constraints (available only if VT-DS3 Mapped Conversion is checked)	
NE ID	Select from the list of available NE IDs to specify the source NE ID.
Subnetwork ID	*Display only.* Displays the ID of the subnetwork associated with the circuit source.
Slot	Specify the source slot that contains the DS3XM12 card.
DS3 Mapped STS	Choose **Circuit Source** or **Circuit Dest**.
Review Route (available only if the Review Route Before Creation check box is checked)	
Map view	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view is used for the inclusion and exclusion of links or nodes during the specification of route constraints. The included nodes are shown in blue and the excluded links are shown in magenta. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default.
Review Route	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view displays information about the spans selected during autorouting in the subnetwork. The selected spans are shown in blue. When you select a span, its corresponding details are displayed in the Selected Span pane. The circuit summary displays the total hops and the cost for working and protect paths for the routed circuit.
Source NE ID	Displays the ID of the NE selected as the source node.
Destination NE ID	Displays the ID of the NE selected as the destination node.
Included Spans	If you enabled automatic route selection in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.
Selected Span	Displays detailed information about the span selected in the Included Spans list.

Step 3 In the Roll section of the Roll Attributes pane, specify the following information:

- Circuit Roll Mode—Select either:

  - Auto—Create an automatic roll (required for a one-way source roll).
  - Manual—Create a manual roll (required for a one-way destination roll).
- Circuit Roll Type—Select either Single or Dual. If you select Dual, click **OK** in the message box.

Step 4 In the Roll From Circuit section of the Roll Attributes pane, select the circuit from which to roll the circuit.

Step 5 Click **Next**.

Step 6 The Pivot/Fixed 1 pane displays the circuit trace. Click the square in the graphic image that represents the facility that you want to keep. This facility is the fixed location in the cross-connection involved in the roll process. The identifier appears in the text box below the graphic image. The facility not selected is the Roll From path, which is deleted after the roll is completed.

Step 7 Depending on which circuit roll type you selected, do one of the following:

a. If you selected Single as the circuit roll type, the Select New Endpoint pane opens. The selections in this pane indicate the Roll To facility. Specify the following (when available) for the new endpoint; then, click **Next**:

- NE ID
- Slot
- Port
- STS
- VT

b. If you selected Dual as the circuit roll type, specify the roll points and click **Next**.

Step 8 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled.

b. Using Required Nodes/Links—Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links.

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created.

d. Fully Protected Path—If not selected, choose **Protection Channel Access** to route the circuit on a BLSR protection channel.

e. Fully Protected Path—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit in a UPSR DRI topology by checking **Dual Ring Interconnect**. Alternatively, if the circuit must pass across unprotected links, Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

- Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
- Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
- Don’t Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.

- Dual Ring Interconnect—If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 9 In the Manual Provisioning pane (available when Route Automatically is unchecked), a graphical representation of the circuit is displayed, including source and destination nodes. Select the member from the Member list box at the top of the pane. You must select each member and route the member from source to destination manually, by selecting spans and adding them to the route until the destination is reached. When the member selection is changed, the display is refreshed for the new member. Complete the following substeps; then, click **Finish**:

a. In the circuit display, select the span to use for the next hop.

b. In the Available Spans area, complete the following information:

- From—Displays the source of the span
- To—Displays the destination of the span

c. Click **Add**. The span is added to the Selected Spans list.

d. Repeat substeps a to c for each intermediate NE until the destination NE is reached.

e. Repeat substeps a to d for each member until all members are routed.

f. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Step 10 In the Route Constraints pane (available only if Route Automatically and Using Required Nodes/Links are checked), do the following; then, click **Next** to view the Review Route pane:

a. Selected Nodes/Links area:

- Nodes—Select whether to use nodes in the circuit route
- Links—Select whether to specify the links in the circuit route

b. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

c. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

d. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

e. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

f. If the Review Route Before Creation check box is checked, click **Next** to review the route summary.

Step 11 If you did not select Using Required Nodes/Links, specify VC-LO circuit options. In the VC LO Options pane, choose one of the following radio buttons; then, click **Finish** (if you did not check Review Route Before Creation) or **Next** (to view the spans included in the route in the Review Route pane):

a. VC LO Tunnel on transit nodes

b. VC LAP

- First fixed point is VC4 grooming node
- Second fixed point is VC4 grooming node

c. None

Step 12 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Displays the following information about the span selected in the Included Spans list:

- From—Span source
- To—Span destination
- Source STS—STS value
- VT—VT time slot

Step 13 In the message box, click **OK**.

7.2.23.3 Completing a Roll

Use the Complete Roll button to terminate a manual roll. You can do this when a manual roll is in a ROLL_PENDING state and you have not yet completed the roll or have not canceled its sibling roll.

Step 1 In the Domain Explorer tree, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Rolls Table**.

Step 2 In the Rolls table, choose a roll to complete; then, choose **Configuration > Complete Roll** (or click the **Complete Roll** tool). The traffic is routed to the new port.

7.2.23.4 Forcing a Valid Signal

Use the Force Valid Signal button to force a valid signal on a pending roll so the roll will be completed.

Note You cannot force a valid signal on a one-way cross-connection that is involved in a manual roll.

Step 1 In the Domain Explorer tree, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Rolls Table**.

Step 2 In the Rolls table, choose a roll to complete. The Roll Valid Signal field of the roll you selected is set to false.

Step 3 Choose **Configuration > Force Valid Signal**.

7.2.23.5 Finishing a Roll

Use the Finish Roll tool to complete the circuit processing of both manual and automatic rolls. It changes the circuit state from ROLL_PENDING to ACTIVE.

Step 1 In the Domain Explorer tree, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Rolls Table**.

Step 2 In the Rolls table, choose a roll to finish; then, choose **Configuration > Finish Roll** (or click the **Finish Roll** tool). The roll is cleared from the Rolls table and the new rolled circuit on the Circuit table returns to Active state.

7.2.23.6 Canceling a Roll

Use the Cancel Roll tool to cancel the selected roll. You can cancel a manual roll at any time; you can cancel an automatic roll only if the Roll Valid Signal is False.

Step 1 In the Domain Explorer tree, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Rolls Table**.

Step 2 In the Rolls table, choose a roll to cancel; then, choose **Configuration > Cancel Roll** (or click the **Cancel Roll** tool).

Note To cancel a dual roll, both rolls must have the same roll state.

7.2.23.7 Filtering the Rolls Table

Use the Rolls table filter to filter circuit roll data according to criteria that you select and to display the results in the Rolls table.

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Rolls Table**.

Step 2 Choose **File > Filter** (or click the **Filter Data** tool). The Rolls table filter opens.

Step 3 The Roll Path tab displays the list of available roll paths. Click **Add** and **Remove** to move roll paths to and from the Selected Roll Path list.

Step 4 After making your selections, click **OK**.

7.2.23.8 Deleting a Roll

Step 1 In the Domain Explorer tree, select the CTC-based NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Rolls Table**.

Step 2 In the Rolls table, choose a roll to delete; then, choose **Configuration > Delete Roll**.

Note To delete a dual roll, both rolls must have the same roll state.

Step 3 In the message box, click **OK**.

7.2.24 Circuit Promotion of GMPLS Circuits

Circuit promotion upgrades a non-GMPLS circuit to a GMPLS circuit.

Step 1 From the circuit table, select the circuit to be upgraded.

Step 2 Click WSON and choose **Promote**. The Update Circuit to WSON dialog box opens.

Step 3 From the Validation drop-down list, choose the validation mode. For more information about the validation modes, see Table 7-7Validation Modes, page 7-68.

Step 4 From the Required drop-down list, choose the optical validation value. For more information about the validation threshold values, see Table 7-8Validation Thresholds, page 7-69.

When you position your mouse cursor over the circuit information field, the tooltip gives information about the device name, circuit alias, size, type, and wavelength.

Step 5 Click **Apply**.

The progress bar is displayed. After the operation is successfully completed, the circuit is upgraded.

7.2.25 Validation of GMPLS Circuits

To validate a GMPLS circuit:

Step 1 Select the GMPLS circuit to be validated.

Step 2 Click **WSON** and choose **Validate**.

The Validation dialog box opens.

Step 3 Click **Apply**.

The progress bar is displayed. After the operation is successfully completed, the circuit is validated.

7.2.26 Reroute Wavelength of GMPLS Circuits

This task reroutes an existing GMPLS circuit through an alternate path based on the specified path constraints.

Note GMPLS OCHCC circuits cannot be rerouted. Only the OCH Trail associated with the OCHCC circuit can be rerouted.

Step 1 From the circuit table, select the circuit to be upgraded.

Step 2 Click **WSON** and choose **Re-route Wavelength**. The Re-route Wavelength pane is displayed.

Step 3 Select the GMPLS circuit to be rerouted.

Step 4 From the Constraint Config drop-down list, select the required constraint type. Values are:

- exclude Node—The rerouted path does not pass through the selected node.
- include Node—The rerouted path passes through the selected node.
- exclude Link—The rerouted path does not use the selected span.
- include Link—The rerouted path uses the selected span.

Step 5 Right-click the map or click the **Add/Remove** button to select the node or link to which the constraint is to be applied.

Step 6 Repeat Step 3 and Step 4 to apply more constraints, as needed.

Note When you apply a constraint to include a node or link on the alternate path, you must select nodes or links sequentially, from the source to the destination of the circuit.

Step 7 Click **Apply**.

The circuit is rerouted if a feasible path is found that complies with the specified constraints. After a successful reroute, a confirmation message is displayed. Otherwise, a failure notification is displayed.

Step 8 If the reroute failed in Step 7, repeat the reroute process.

Step 9 Do the following in the Re-route Wavelength pane:

- Click **Clear** to clear the previous selections.
- Click the **Side** toggle button to view the link side information.
- Click the **Working/Protected** toggle button to select the path.

Step 10 Repeat Step 4 through Step 7 as needed.

Step 11 Click **Apply** to apply your changes, or click **Cancel** to cancel the operation.

7.2.27 Restoration of GMPLS Circuits

The restoration functionality works on the GMPLS OCHXX circuits.

The Restoration functionality supports the following:

- You can discover a new optical path when a failure is detected.
- Works on protected and unprotected OCHXX circuits.
- Does not exclude or substitute the protections available for the OCHXX services.
- You can enable or disable the restore feasibility

The Restoration functionality works when the following failures are detected:

- Link failure—Alarms indicating a Loss Of Signal (LOS) on the span.
- Node failure—Result of the failure of all the links terminated on the node.
- Signal failure—Transponders indicating signal problems (for example, OTN signal alarms at RX Transceiver + excessive BER and Pre-FEC errors).

Note You can automatically or manually revert the service to the original path when the failures are resolved.

7.2.27.1 Restoration Balloon Icon

The Restoration balloon icon shows the current restoration values.

Note You cannot modify the values from the balloon icon.

The following describe actions you can take in the Restoration balloon icon:

- Click the **Open GMPLS Restore/Revert Operation Dialog** box to modify the restoration values.
- You cannot click the **OK** button because it is always disabled.
- Click **Cancel** to close the balloon icon.
- Click the **Back** or **Next** buttons to automatically close the Restoration Balloon icon.

7.2.27.2 Restoration Configuration Pane

Use the Restoration Configuration pane to define the restoration and revertive parameters required for creating a GMPLS circuit (OCHNC and OCH Trail). You can also modify the restoration values from this pane.

Step 1 From the circuit table, select the circuit to be restored.

Step 2 Choose one of the following:

- **Configuration > Restore Operations**
- **WSON > Restore Operations**

The Restore/Revert Operations pane is displayed.

Step 3 Choose **Ignore Path Alarms** check box to disable all the other restoration parameters.

Note If you check the **Ignore Path Alarms** check box, the circuit is created even if an alarm (failure) is active on the optical patch.

Step 4 In the GMPLS/WSON Restoration Configuration pane, do one of the following:

- Click **Restoration** to switch the circuit from the original path to an alternate path because of failure in the original path.
- Click **Revert** to revert the circuit from the restored path to the original path after the failure is fixed.

Step 5 In the Revertive Parameters section, do one of the following:

- Click **Automatic** to automatically revert the circuit from the restored path to the original path after the failure is fixed, WSON alarms are acknowledged, and the soak time expires**.**
- Click **Manual** to revert the circuit from the restored path to the original path after the failure is fixed, the WSON alarms are acknowledged, and the soak time expires.

Step 6 Click **Soak Time** (**in hours, minutes, and seconds**), which is the period that the circuit on the restored path waits before switching to the original path after the failure is fixed. The circuit is revertible to the original path after the soak time expires. The minimum value of the soak time must be 00:00:01.

Step 7 Do one of the following:

- Click **Apply** to apply the restoration values to the circuit.
- Click **Restore** to restore all the restoration values.
- Click **Reset** to reset all the restoration values to the defaults.

Step 8 (Optional) To modify the restoration values, do the following in Restore/Revert Operations pane:

Choose **WSON > Restore Operations** to open the Restore/Revert Operations dialog box. The following are displayed on the menu bar:

- Auto Refresh—Enables or disables the automatic update. If the automatic updated is not enabled and the data displayed in the dialog must be refreshed, an information bar will be automatically displayed,
- A tool tip that reports all GMPLS information related to the circuit is displayed on the menu bar.

Do the following in the Restore/Revert Operation section:

- Manual Revert—Reverts the circuit to the original path from the restored path after the soak time expires. You can manually revert the circuit only when the restoration status of the circuit is REST-REVERTIBLE.
- Upgrade Restored—Discards the original path and makes the restored path the working path.
- Revert Test—Forcefully reverts the circuit from the restored path to the original path. When the circuit is forcefully reverted, the circuit cannot be restored and reverted.

Step 9 Click **Apply**.

7.2.28 Circuit Reports

The Circuit Report displays circuit information for Layer 1 services of ONS 15305 CTC, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 MSTP, ONS 15454 SONET, ONS 15454 SDH, ONS 15454-M6, ONS 15454-M2, ONS 15600 SONET, and ONS 15600 SDH. The Circuit Report displays both ANSI and ETSI circuits. Also, both VCAT and member circuits are displayed together.

Note Circuit Reports are not available for ONS155XX NEs. However, you can view the Circuit table for ONS155XX NEs. For more information, see 7.2.2 Viewing the Circuit Table.

You can view three types of circuit reports within the main circuit report: Spans, CTP, and WSON. These reports are dockable.

7.2.28.1 Circuit Report Launch Points

You can access the Circuit Report via the following launch points:

- **Domain Explorer > Configuration > Circuit Report**
- **Subnetwork Explorer > Configuration > Circuit Report**
- **NE Explorer > Configuration > Circuit Report**
- **Network Map > Configuration > Circuit Report**
- **Link Table > Configuration > Circuit Report**

Note You can also launch the Circuit Report by right-clicking an NE or NE node in the Domain Explorer, Subnetwork Explorer, or Network Map.

7.2.28.2 Working with Circuit Reports

To perform actions on Circuit Reports, complete the following steps:

Step 1 In the Domain Explorer, Subnetwork Explorer, or Network Map window, select the NE and choose **Configuration > Circuit Report**.

The Circuit Report opens, displaying the following information for the selected NE:

- Circuit Name
- Note
- Circuit Type
- Circuit Size
- Customer ID
- Service ID
- Alias Name
- Description
- Discovery State

- Service State
- Direction
- Protection
- Wavelength

Note Only those circuits for which the selected NE is either the source or the destination are listed.

Note For 155XX NEs, the Circuit Report appears blank.

Step 2 To filter the Circuit Report, click the Filter tool in the Circuit Report window. A filter drop-down text box appears at the top of each column, from which you can select the values by which to filter the report.

Step 3 To trace a circuit listed in the Circuit Report, do one of the following:

- Right-click the circuit and choose **Circuit Trace**.
- Select the circuit and choose **Circuit > Circuit Trace**.
- Click the **Open Circuit Trace** tool in the toolbar of the Circuit Report window.

  The Circuit Trace window is displayed.

Step 4 To view a high-level trace or detailed trace for a circuit listed in the Circuit Report, do one of the following:

- Right-click the circuit and choose **High-Level Circuit Trace**.
- Select the circuit and choose **Circuit > High-Level Circuit Trace**.
- Click the **Open High-Level Circuit Trace** tool in the toolbar of the Circuit Report window.

  The Circuit High Level Trace window is displayed.

Note High-level circuit trace is available only for circuits that are in the following states: Active, Incomplete, TL1 Active, or Roll Pending.

Step 5 To edit a circuit listed in the Circuit Report, do one of the following:

- Right-click the circuit and choose **Circuit Edit**.
- Select the circuit and choose **Circuit > Edit Circuit**.
- Click the **Open Circuit Edit** tool in the toolbar of the Circuit Report window.

  The Edit Circuit window is displayed.

Step 6 To delete a circuit, select the circuit and do one of the following:

- Right-click the circuit and choose **Delete Circuit**.
- Choose **Circuit > Delete Circuit**.
- Click the **Delete Circuit** tool in the toolbar of the Circuit Report window.

The Delete Circuit(s) dialog box is displayed. For more information, see 7.2.11 Deleting Circuits.

Step 7 To create a new circuit from the NEs associated with the circuits listed in the Circuit Report, select the circuit and choose **Circuit > Create** (or click the **Create Circuit** tool). The Circuit Wizard is displayed. For more information on using the Circuit Wizard, see 7.2.3 Creating Circuits Using the Circuit Wizard.

Step 8 To open the Circuit table from the Circuit report, select the circuit and choose **Circuit > Circuit Table** (or click the **Circuit Table** tool). The Circuit table is displayed. For more information, see 7.2.2 Viewing the Circuit Table.

Note You can select multiple circuits for which to view the Circuit table, provided they are of the same type: either ANSI or ETSI.

Step 9 To add or edit a note for a circuit, choose **Circuit > Add/Modify Note** (or click the **Add/Modify Note** tool.)

Step 10 To roll a circuit, choose **Circuit > Roll Circuit**. The Roll Circuit Wizard is displayed. For more information, see 7.2.23.2 Rolling a Circuit.

Step 11 To promote a circuit to WSON, choose **Circuit > Promote WSON**. For more information on promoting a circuit, see 7.2.24 Circuit Promotion of GMPLS Circuits.

Once the circuit is promoted, you can view its WSON details in the WSON Report.

Step 12 To merge circuits from the Circuit Report, choose **Circuit > Circuit Merge Table**. The Circuit Merge table is displayed. For more information on merging circuits, see 7.2.8 Merging Circuits.

In the Circuit Report window and the subreports—Spans Report, CTPs Report, and WSON Report—if the Auto-Refresh check box is selected in the Circuit Report window, the respective rows are automatically highlighted when a circuit undergoes a change. When the Auto-Refresh check box is not selected, a notification bar appears at the top of the Circuit Report window stating that the reported data has changed. You can click the Refresh tool to refresh the report.

If the report has more than one page, the **Previous Page** and **Next Page** arrows at the top-right corner of the Circuit report window are enabled. The **Pagination Settings** tool allows you to specify whether notes should be displayed and to select the number of records to be displayed per page.

The status bar at the bottom of the Circuit Report window displays:

- Current page number
- Total number of pages in the report
- Number of records displayed
- Number of records selected

If you want to move to a specific page, you can enter the page number in the **Page** text box and press **Enter**.

7.2.28.3 Searching for Circuits Within a Report

You can search for circuits within the Circuit Report using the **Enter Search Query** text box at the top of the Circuit Report window. The **Enter Search Query** text box allows you to search for circuits by the following attributes:

- Alias
- Customer
- Description
- Name
- NE

- Port
- Service
- Slot
- Type

In the **Enter Search Query** text box, press **Ctrl-Space** to display attributes and select from the list; then type a keyword to search by.

You can use multiple keywords for the same attribute, and you can select more than one attribute. All circuits with one or more of the preceding attributes are displayed in the search results.

Tip For hints and examples to help you with your search, click the **Help** icon within the Enter Search Query field.

7.2.28.4 Viewing Circuit Properties

To view the properties of a circuit from the Circuit Report window, do the following:

Step 1 From the **Toggle Frames Visibility** drop-down list, select **Properties**. A dockable Properties window displays the following details:

- Circuit Name
- Note
- Circuit Type
- Circuit Size
- Customer ID
- Service ID
- Alias Name
- Description
- Discovery State
- Service State
- Direction
- Protection
- Wavelength
- Is WSON
- Is Monitor
- Is VCAT Member

7.2.28.5 Exporting Circuit Reports

To export a Circuit Report, complete the following steps:

Step 1 In the Circuit Report window, select **File > Export to CSV** (or click the **Export to CSV** tool). The Export to CSV dialog box appears.

Step 2 Specify the filter parameters in the Export to CSV dialog box. See Table 3-18, "Field Descriptions for the Export to CSV Dialog Box," on page 52.

Step 3 Click **OK** to export.

Note You can export the Spans Report, CTPs Report and WSON Report individually by clicking the **Export to CSV** tool in the respective windows.

7.2.28.6 Viewing the Spans Report

The Spans Report allows you to view information about all spans associated with the selected circuit.

To view the Spans Report, do the following:

Step 1 From the **Toggle frames visibility** drop-down list, select **Spans Report**. A dockable Spans Report window displays the following details:

- Circuit Name
- Source NE ID
- Source Location
- Source Interface
- Source State
- Destination NE ID
- Destination Location
- Destination Interface
- Destination State
- Is Active
- UPSR Protection Operation
- UPSR Protection

Note If the Spans Report is already open, click the **Refresh** tool within the Spans Report after selecting the circuit in the main Circuit report. The Spans Report will then display information for the selected circuit. If you select the **Auto-Refresh** check box within the Spans Report window, the Spans report is automatically updated each time a circuit is selected in the main Circuit Report.

7.2.28.7 Viewing the CTPs Report

The CTP report allows you to view the source and destination termination points of circuits.

To view the CTPs Report, do the following:

Step 1 From the **Toggle frames visibility** drop-down list, select **CTPs Report**. A dockable CTPs Report window displays the following details:

- Circuit Name
- Layer
- NE ID
- Location
- Equipment Type
- Payload Type
- Interface
- Role

Note If the CTPs Report is already open, click the **Refresh** tool within the CTPs report after selecting the circuit in the main Circuit Report. The CTPs report will then display information for the selected circuit. If you select the **Auto-Refresh** check box within the CTPs Report window, the CTPs report is automatically updated each time a circuit is selected in the main Circuit Report.

You can launch the Alarm Browser for a circuit from the CTPs Report by clicking the **Alarm Browser** tool. You can also locate an NE on the Domain Explorer by clicking the **Locate on Domain Explorer** tool.

7.2.28.8 Viewing the WSON Report

The WSON Report allows you to view details of WSON circuits.

To view the WSON Report, do the following:

Step 1 From the **Toggle frames visibility** drop-down list, select **WSON Report**. A dockable WSON Report window displays the following details for the selected circuit:

- Circuit Name
- Expected
- Actual
- Restoration Status
- Revertive Mode
- Soak Time

Note If the WSON Report is already open, click the **Refresh** tool within the WSON Report after selecting the circuit in the main Circuit Report. The WSON Report will then display information for the selected circuit. If you select the **Auto-Refresh** check box within the WSON window, the WSON Report is automatically updated each time a circuit is selected in the main Circuit Report.

The WSON Actions tool allows you to perform the following actions for a selected circuit:

- Validation
- Rerouting
- Restore and Revert

For more information on each of the above actions, see 7.2.25 Validation of GMPLS Circuits, 7.2.26 Reroute Wavelength of GMPLS Circuits, and 7.2.27 Restoration of GMPLS Circuits.

7.3 Managing BLSRs

Use the following procedures to manage BLSRs. You can launch the BLSR table from either the Domain Explorer or the NE Explorer.

- 7.3.1.1 Viewing the BLSR Table from the Domain Explorer, page 7-199
- 7.3.2.1 Creating a BLSR from the Domain Explorer, page 7-200
- 7.3.2.2 Creating a BLSR from the NE Explorer, page 7-200
- 7.3.12.1 Deleting a BLSR from the Domain Explorer, page 7-208
- 7.3.12.2 Deleting a BLSR from the NE Explorer, page 7-208

7.3.1 Viewing the BLSR Table

You can launch the BLSR table from either the Domain Explorer (see 7.3.1.1 Viewing the BLSR Table from the Domain Explorer, page 7-199) or the NE Explorer (see 7.3.1.2 Viewing the BLSR Table from the NE Explorer, page 7-199). Use the BLSR table to view BLSRs that are available in a subnetwork. The BLSR table displays the BLSR attributes and the nodes that participate in the ring. You can select a BLSR in the table and edit, delete, switch, or upgrade the ring from 2-fiber to 4-fiber. The following table provides descriptions.

Table 7-31 Field Descriptions for the BLSR Table

Field	Description
Ring ID	Displays the ring ID as an alphanumeric value of up to six characters.
Ring Type	Displays the ring type.
Line Rate	Displays the line rate. For SONET, the rates are OC12, OC48, and OC192. For SDH, the rates are STM4, STM16, and STM64.
Status	Displays the ring status.

Table 7-31 Field Descriptions for the BLSR Table (continued)

Field	Description
Nodes	Displays the nodes associated with the ring.
Ring Reversion	Displays the ring reversion time, in minutes.
Span Reversion	Displays the span reversion time, in minutes.

7.3.1.1 Viewing the BLSR Table from the Domain Explorer

In the Domain Explorer, select the NE; then, choose **Configuration > CTC-Based SONET NEs > BLSR Table**. The BLSR table opens.

7.3.1.2 Viewing the BLSR Table from the NE Explorer

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15600 SONET NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **BLSR** tab. The BLSR tab contains the following fields:

- Fiber Type—Indicates whether the fiber type is 2-fiber or 4-fiber.
- Rate—BLSR rate.
- Ring Name—Not available for the ONS 15600. Name of the BLSR ring.
- Ring ID—Assign a ring ID number from 0 to 9999. Nodes in the same BLSR must have the same ring ID.
- Node ID—Assign a node ID that identifies the node to the BLSR. Nodes in the same BLSR must have unique node IDs.
- Ring Reversion—Set the amount of time before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in a BLSR ring should have the same ring reversion setting, particularly if Never (that is, nonrevertive) is selected.
- Span Reversion—Not available for the ONS 15327. Set the amount of time to pass before the span reverts to the working path.
- East Line—Assign the east BLSR port.
- East Switch—Displays a list of switch commands for the east port.
- West Line—Assign the west BLSR port.
- West Switch—Displays a list of switch commands for the west port.
- East Protect—Not available for the ONS 15327. For 4-fiber BLSR, assign the east BLSR protect port.
- West Protect—Not available for the ONS 15327. For 4-fiber BLSR, assign the west BLSR protect port.

7.3.2 Creating a BLSR for an Individual Node

Use the BLSR Creation wizard to create BLSRs for the selected CTC-based SONET NE. The creation wizard can be launched by selecting an NE from the Domain Explorer, Subnetwork Explorer, or Network Map.

Note Use the Create BLSR wizard to create the BLSR for all desired nodes simultaneously. See 7.3.3 Creating BLSRs for Multiple Nodes Simultaneously, page 7-202.

7.3.2.1 Creating a BLSR from the Domain Explorer

Step 1 In the Domain Explorer, select the NE; then, choose **Configuration > CTC-Based SONET NEs > Create BLSR**. The **BLSR Creation** wizard opens. The following table provides descriptions.

Step 2 After making your selections, click **Next**.

Step 3 A graphical view of the BLSR is displayed. You can complete any of the following:

- Selected Link—Displays the link information for a selected link in the BLSR graphical view.
- Add Span—Add a span. A span is represented by a green line.
- Remove Span—Remove an existing span. A deleted span is represented by a black line.
- Reverse Span—Allows you to reverse the direction of the span.
- Excluded Nodes—Provides a list of nodes that were not included in the BLSR.

Step 4 Click **Finish**.

Table 7-32 Field Descriptions for the Create BLSR Wizard

Field	Description
Type	Specify the fiber type (2-fiber or 4-fiber).
Line Rate	Choose the BLSR ring speed: OC-12 (2-fiber BLSR only), OC-48, or OC-192. The speed must match the OC-N speed of the BLSR trunk (span) cards.
Ring ID	Assign a ring ID, which can be any combination of up to six alphanumeric characters. Nodes in the same BLSR must have the same ring ID.
Ring Reversion	Set the amount of time that elapses before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in a BLSR ring should have the same ring reversion setting, particularly if Never (that is, nonrevertive) is selected.
Span Reversion	(For 4-fiber BLSRs only) Set the amount of time that elapses before the traffic reverts to the original working path following a span switch. The Cisco default is 5 minutes. Span reversions can be set to Never.

7.3.2.2 Creating a BLSR from the NE Explorer

Step 1 Select a CTC-based SONET NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **BLSR** tab.

Step 3 Click **Create**.

Step 4 In the Create BLSR dialog box, set the BLSR properties:

- Fiber Type—Select the BLSR fiber ring type (2-fiber or 4-fiber).
- Ring Name—Assign the BLSR ring name.
- Ring ID—Assign a ring ID (a number from 0 to 9999). Nodes in the same BLSR must have the same ring ID.
- Node ID—Assign a node ID. The node ID identifies the node to the BLSR. Nodes in the same BLSR must have unique node IDs.
- Ring Reversion—Set the amount of time that elapses before the traffic reverts to the original working path. The Cisco default is 5.0. All nodes in a BLSR ring should have the same ring reversion setting, particularly if Never (that is, nonrevertive) is selected.
- West Line—Assign the west BLSR port for the node from the drop-down list.
- East Line—Assign the east BLSR port for the node from the drop-down list.

For 4-fiber BLSRs, complete the following information:

- Span Reversion—Set the amount of time that elapses before the traffic reverts to the original working path following a span reversion. The Cisco default is 5 minutes. Span reversions can be set to Never. If a ring reversion time was set, the times must be the same for both ends of the span. That is, if the west fiber of Node A is connected to the east port of Node B, the Node A west span reversion time must be the same as the Node B east span reversion time. To avoid reversion time mismatches, it is recommended that you use the same span reversion time throughout the ring.
- West Protect—Assign the west BLSR port that will connect to the west protect fiber.
- East Protect—Assign the east BLSR port that will connect to the east protect fiber.

Step 5 Click **OK**.

Note Some or all of the following alarms appear during BLSR setup: E-W MISMATCH, RING MISMATCH, APSCIMP, APSDFLTK, BLSROSYNC. The alarms clear after all of the nodes in the BLSR are configured.

Step 6 Complete Step 1 through Step 5 at each node where the BLSR will be added.

Step 7 After configuring the last BLSR node, wait for the BLSR Ring Map Change dialog box to appear. This can take from 10 to 30 seconds.

Note The dialog box does not appear if SDCC Termination alarms (such as EOC) or BLSR alarms (such as E-W MISMATCH and RING MISMATCH) are present. If an SDCC alarm is present, review the DCC provisioning at each node. If BLSR alarms have not cleared, repeat Step 1 through Step 5 at each node, making sure that each node is provisioned correctly. The dialog box does not apply to the ONS 15327 R3.4 or ONS 15454 R3.4.

Step 8 In the BLSR Ring Map Change dialog box, click **Yes**.

Step 9 In the BLSR Ring Map Change dialog box, verify that the ring map contains all of the provisioned nodes in the expected order. If so, click **Accept**. If the nodes do not appear, or are not in the expected order, repeat Step 1 through Step 8, making sure that no errors are made.

Step 10 Test the BLSR using the following standard site testing procedure:

a. Run test traffic through the ring.

b. Click the **BLSR** tab and then click **BLSR Span**. Choose **MANUAL RING** from the East Switch list. Click **Apply**.

c. In the Alarm Browser, verify that a Ring Switch West event is displayed, and that the far-end node that responded to this request reports a Ring Switch East event.

d. Verify that traffic switches normally.

e. Choose **Clear** from the East Switch list and click **Apply**.

f. Repeat substeps a through d for the west switch.

g. Disconnect the fibers at one node and verify that traffic switches normally.

7.3.3 Creating BLSRs for Multiple Nodes Simultaneously

Use the Create BLSR wizard from the Domain Explorer to create a BLSR for all desired SONET nodes simultaneously.

Table 7-33 Field Descriptions for the Create BLSR Wizard

Field	Description
BLSR Attributes	
Type	The BLSR type (2-fiber or 4-fiber).
Line Rate	The line rate (OC12, OC48, or OC192).
Ring ID	Used-defined ring ID. The value can be any combination of up to six alphanumeric characters.
Ring Reversion	Ring reversion time, in minutes.
Span Reversion	Span reversion time, in minutes.
Working Spans Selection	
After the attributes are defined, a possible BLSR map is shown. You can select the spans from the map and perform Add, Remove, or Reverse operations. The Add operation adds all the spans to the ring. The Remove operation removes the selected span. The Reverse operation switches the east and west ports in the span. If all the spans are added to make a loop, the Finish button is enabled. **Note** For 4-fiber BLSRs, instead of Finish, the Next button is provided. Click **Excluded Nodes** to view the nodes that are being excluded from the BLSR and the reason for the exclusion.	
Protect Ports Selection	
(4-fiber BLSRs only) The table lists all the spans along with the potential protect ports. You can select the desired protect ports (east and west) for each span in the ring. The Finish button is enabled if all the required protect ports are selected.	

7.3.4 Viewing the BLSR Ring Map Table

The Ring Map table contains BLSR information for the selected object in the table.

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15600 SONET NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **BLSR** tab; then, click **Ring Map**. The Ring Map table opens. The following table provides descriptions.

Table 7-34 Field Descriptions for the Ring Map Table

Field	Description
Node ID	Displays the node ID, which identifies the node to the BLSR. Nodes in the same BLSR must have unique node IDs.
IP Address	Displays the NE IP address.

7.3.5 Viewing the BLSR Squelch Table

When multiple fiber cuts isolate a BLSR node, the Squelch table displays the circuits that are isolated on the node by STS number, east source/destination, and west source/destination. The table is display only.

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15600 SONET NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **BLSR** tab; then, select a ring in the table.

Step 3 Click **Squelch Table**. The Squelch table opens. The following table provides descriptions.

Table 7-35 Field Descriptions for the Squelch Table

Field	Description
STS No.	Displays the STS number of the circuit.
East Source	Displays the east source NE.
East Destination	Displays the east destination NE.
West Source	Displays the west source NE.
West Destination	Displays the west destination NE.

7.3.6 Editing BLSRs

Step 1 In the Domain Explorer, select the NE; then, choose **Configuration > CTC-Based SONET NEs > BLSR Table**.

Step 2 In the BLSR table, select the ring to edit; then, choose **Edit > Edit BLSR** (or click the **Edit Selected BLSR** tool).

Step 3 Edit the BLSR attributes:

- Ring ID—Specify an ID of up to six alphanumeric characters.
- Ring Reversion (min)—Set the ring reversion time to Never or from 0.5 to 12 minutes.
- Span Reversion (min)—Set the span reversion time to Never or from 0.5 to 12 minutes.

Step 4 Click **Apply**.

7.3.7 Switching BLSRs

The Switch BLSR dialog box displays a graphical representation of a BLSR, including the following details:

- The NEs that are part of the ring are shown along with the node name.
- The colors of the NEs reflect the state.
- The working ports that are selected during creation of the ring are shown in green. The working port names are also shown in green.
- The protect ports that are selected during creation of the ring are shown in purple. The protect port names are also shown in purple.
- The working spans are shown in green. This identifies spans that are selected during creation as the working spans.
- The protect spans are shown in purple. For a 2-fiber BLSR, these spans are automatically assigned during creation. For a 4-fiber BLSR, these spans are based on the protect ports selected.

Complete the following steps to switch BLSRs:

Step 1 In the Domain Explorer, select the NE; then, choose **Configuration > CTC-Based SONET NEs > BLSR Table**.

Step 2 In the BLSR table, select the ring to edit; then, choose **Edit > Switch BLSR** (or click the **Switch Selected BLSR** tool). The Switch BLSR dialog box opens. The following table provides descriptions.

Step 3 After making your selections, click **OK**.

Step 4 The job is queued in the Job Monitor table. For more information, see 4.6.1 Monitoring Scheduled Tasks, page 4-87.

Table 7-36 Field Descriptions for the Switch BLSR Dialog Box

Field	Description
Initial Node	Select the initial node from the graphic. The name of the selected node appears in the field.
Switch Command	Select one from the following switch commands: • Clear—Clears an existing switch command • Lockout Span—Prevents automatic switching • Force Ring—Performs a forced BLSR switch • Manual Ring—Performs a manual BLSR switch • Switch Ring—Switches BLSRs
Time	Schedule the switch to occur immediately or at an exact time, including date, hour, and minute. Choose **Now** to schedule the BLSR switch to begin immediately. Choose **At Time** to set the specific date and time of the switch. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. To repeat the switch, select a repeat interval from the **Frequency** drop-down list. A switch can occur once, daily, or weekly.

7.3.8 Changing the BLSR Switch Interval

The interval between BLSR switches can be configured in the Control Panel. This interval represents the interval between east and west tasks of a ring switch task.

Step 1 In the Domain Explorer, choose **Administration > Control Panel**.

Step 2 In the Control Panel, expand **NE Service** and choose **CTC-Based SONET NEs**.

Step 3 In the BLSR-Ring Switch Interval field, enter the interval time. The Cisco default is 60 seconds.

Step 4 Click **Save**.

7.3.9 Using the BLSR Upgrade Table

Use the BLSR Upgrade table to upgrade a 2-fiber BLSR to a 4-fiber ring. The BLSR Upgrade wizard allows you to select the span reversion along with upgrade options. After selecting the spans, the protect ports selection wizard is displayed.

The following table describes the fields in the BLSR Upgrade table.

Table 7-37 Field Descriptions for the BLSR Upgrade Table

Field	Description
Ring ID	Allows you to modify the ring ID. It can be any combination of up to six alphanumeric characters.
Ring Reversion	Allows you to modify the ring reversion time.
Span Reversion	Allows you to modify the span reversion time.

7.3.10 Upgrading BLSRs

Use the Upgrade BLSR wizard to upgrade 2-fiber BLSRs to 4-fiber BLSRs. Only OC-48 (or higher) rings can be upgraded.

Step 1 In the Domain Explorer, select the NE; then, choose **Configuration > CTC-Based SONET NEs > BLSR Table**.

Step 2 In the BLSR table, select the ring to edit; then, choose **Edit > Upgrade BLSR** (or click the **Upgrade Selected BLSR** tool). The Upgrade BLSR wizard opens. The following table provides descriptions.

Step 3 In the Upgrade BLSR wizard, specify the following information:

- Span reversion
- Upgrade options

Step 4 Click **Next**.

Step 5 The Protect Ports table opens and displays the following port information:

- Name
- West Working
- West Protect
- East Working
- East Protect

Step 6 Click **Finish**.

Table 7-38 Field Descriptions for the Upgrade BLSR Wizard

Field	Description
BLSR Attributes	
Span Reversion	Select the span reversion time, in minutes.

Table 7-38 Field Descriptions for the Upgrade BLSR Wizard (continued)

Field	Description
Upgrade Options	Select an upgrade option for the BLSR: • Override Protection Operations—The upgrade procedure automatically clears all the protection operations and proceeds with the BLSR upgrade. • Override Protection Switch—The upgrade continues despite the protection switch. If a protection switch occurs as a result of a fiber cut, there is a loss of traffic. • Ignore PCA—If there is extra PCA traffic on the ring, the traffic is dropped during the upgrade.
BLSR Summary	Summarizes the selections you made on this screen.
Protect Ports Selection	
Protect Ports table	Displays the protect ports for the upgraded BLSR.
BLSR Summary	Summarizes the selections you made on this screen.

7.3.11 Filtering the BLSR Table

Step 1 In the Domain Explorer, select the NE; then, choose **Configuration > CTC-Based SONET NEs > BLSR Table**.

Step 2 In the BLSR table, choose **File > Filter** (or click the **Filter Data** tool). The filter dialog box opens.

Step 3 Use the filter to filter data according to criteria that you select and to display the results in the table. The following table provides descriptions.

Table 7-39 Field Descriptions for the BLSR Filter Dialog Box

Field	Description
Network Elements	Displays the list of available NE IDs. Click **Add** and **Remove** to move NEs to and from the Selected list. The filter runs against the NEs in the Selected list.
BLSR Names	Allows you to filter the table using a range of BLSR names. The filter runs against the names in the Selected Names list. Check the **Ignore All BLSR Names** check box if you want to filter BLSR data and the name is not important.
Ring Type	Allows you to filter the table using a specific ring type (All, 2-fiber, or 4-fiber).
Line Rate	Allows you to filter the table using a specific line rate (All, OC12, OC48, or OC192). You can also select **Inconsistent** as a filter option, meaning that the BLSR goes into an inconsistent state if it has been provisioned correctly but is nonfunctional due to changes in the network.

7.3.12 Deleting BLSRs

You can delete a BLSR from the Domain Explorer or the NE Explorer.

7.3.12.1 Deleting a BLSR from the Domain Explorer

Step 1 In the Domain Explorer, select the NE; then, choose **Configuration > CTC-Based SONET NEs > BLSR Table**.

Step 2 In the BLSR table, select the ring to delete; then, choose **Edit > Delete BLSR** (or click the **Delete Selected BLSR** tool).

Step 3 In the confirmation dialog box, click **Yes**.

7.3.12.2 Deleting a BLSR from the NE Explorer

Step 1 Select an ONS 15327, ONS 15454 SONET, or ONS 15600 NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **BLSR** tab.

Step 3 Select the ring to delete and click **Delete**.

Step 4 In the confirmation dialog box, click **OK**.

7.4 Managing MS-SPRings

Use the following procedures to manage MS-SPRings.

- 7.4.1.1 Viewing an MS-SPRing from the Domain Explorer, page 7-209
- 7.4.1.2 Viewing an MS-SPRing from the NE Explorer, page 7-209
- 7.4.2.1 Creating an MS-SPRing from the Domain Explorer, page 7-210
- 7.4.2.2 Creating an MS-SPRing from the NE Explorer, page 7-211
- 7.4.12.1 Deleting an MS-SPRing from the Domain Explorer, page 7-217
- 7.4.12.2 Deleting an MS-SPRing from the NE Explorer, page 7-217
- 7.4.12.2 Deleting an MS-SPRing from the NE Explorer, page 7-217

7.4.1 Viewing the MS-SPRing Table

Use the MS-SPRing table to view MS-SPRings that are available in a subnetwork. The MS-SPRing table displays the MS-SPRing attributes and the nodes that participate in the ring. You can select an MS-SPRing in the table and edit, delete, switch, or upgrade the ring from 2-fiber to 4-fiber.

The following table provides descriptions.

Table 7-40 Field Descriptions for the MS-SPRing Table

Field	Description
Ring ID	Displays the ring ID as an alphanumeric value of up to six characters.
Ring Type	Displays the ring type.
Line Rate	Displays the line rate. For SONET, the rates are OC12, OC48, and OC192. For SDH, the rates are STM4, STM16, and STM64.
Status	Displays the ring status.
Nodes	Displays the nodes associated with the ring.
Ring Reversion	Displays the ring reversion time, in minutes.
Span Reversion	Displays the span reversion time, in minutes.

You can launch the MS-SPRing table from either the Domain Explorer or the NE Explorer.

7.4.1.1 Viewing an MS-SPRing from the Domain Explorer

In the Domain Explorer, click an ONS 15454 SDH or ONS 15600 SDH NE; then, choose **Configuration > CTC-Based SDH NEs > MS-SPRing Table**. The MS-SPRing table displays the information shown in Table 7-40.

7.4.1.2 Viewing an MS-SPRing from the NE Explorer

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **MS-SPRing** tab. The tab displays the following information:

- Type—Indicates whether the fiber type is 2-fiber or 4-fiber.
- Rate—Select the MS-SPRing rate.
- Ring ID—Assign a ring ID, using alphanumeric values. Nodes in the same MS-SPRing must have the same ring ID.
- Node ID—Assign a node ID. This identifies the node to the MS-SPRing. Nodes in the same MS-SPRing must have a unique node ID.
- Ring Reversion—Set the amount of time that elapses before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in an MS-SPRing should have the same ring reversion setting, particularly if Never is selected.
- Span Reversion—Set the amount of time to pass before the span reverts to the working path.
- East Line—Assign the east MS-SPRing port.
- East Switch—Displays a list of switch commands for the east port.
- West Line—Assign the west MS-SPRing port.
- West Switch—Displays a list of switch commands for the west port.
- East Protect—For a 4-fiber MS-SPRing, assign the east MS-SPRing protect port.

- West Protect—For a 4-fiber MS-SPRing, assign the west MS-SPRing protect port.

7.4.2 Creating an MS-SPRing for an Individual Node

Use the MS-SPRing Creation wizard to create MS-SPRings for the selected ONS 15454 SDH or ONS 15600 SDH NE. MS-SPRings share the ring bandwidth equally between working and protection traffic. Half of the payload bandwidth is reserved for protection in each direction, making the communication pipe half-full under normal operation.

Note Use the Create MS-SPRing wizard to create the MS-SPRing for all desired nodes simultaneously. See 7.4.3 Creating MS-SPRings for Multiple Nodes Simultaneously, page 7-211.

You can create an MS-SPRing from the Domain Explorer or the NE Explorer.

7.4.2.1 Creating an MS-SPRing from the Domain Explorer

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > CTC-Based SDH NEs > Create MS-SPRing**. The MS-SPRing Creation wizard opens. The following table provides descriptions.

Step 2 After making your selections, click **Next**.

Step 3 A graphical view of the MS-SPRing is displayed. You can complete any of the following:

- Selected Link—Displays the link information for a selected link in the MS-SPRing graphical view.
- Add Span—Add a span. A span is represented by a green line.
- Remove Span—Remove an existing span. A deleted span is represented by a black line.
- Reverse Span—Allows you to reverse the direction of the span.
- Excluded Nodes—Provides a list of nodes that were not included in the MS-SPRing.

Step 4 Click **Finish**.

Table 7-41 Field Descriptions for the MS-SPRing Creation Wizard

Field	Description
Type	MS-SPRing type (2-fiber or 4-fiber).
Line Rate	Line rate (STM4, STM16, or STM64).
Ring ID	Used-defined ring ID. The value can be any combination of up to six alphanumeric characters.
Ring Reversion	Ring reversion time, in minutes.

Table 7-41 Field Descriptions for the MS-SPRing Creation Wizard (continued)

Field	Description
Span Reversion	Span reversion time, in minutes.
Working Spans Selection	After the attributes are defined, a possible MS-SPRing map is shown. You can select the spans from the map and perform Add, Remove, or Reverse operations. The Add operation adds all the spans to the ring. The Remove operation removes the selected span. The Reverse operation switches the east and west ports in the span. If all the spans are added to make a loop, the Finish button is enabled.

7.4.2.2 Creating an MS-SPRing from the NE Explorer

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **MS-SPRing** tab; then, click **Create**.

Step 3 In the Create MS-SPRing dialog box, set the MS-SPRing properties:

- Type—Select the MS-SPRing ring type, either **two fiber** or **four fiber**.
- Ring ID—Assign a ring ID (a number from 0 to 9999). Nodes in the same MS-SPRing must have the same ring ID.
- Node ID—Select the node ID (0-31).
- Ring Reversion—Set the amount of time that elapses before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in an MS-SPRing ring should have the same ring reversion setting, particularly if Never (that is, nonrevertive) is selected.
- West Line—Select the west port.
- East Line—Select the east port.
- Span Reversion—Choose the amount of time that elapses before the traffic reverts to the original working path following a traffic failure. The Cisco default is 5 minutes. Span reversions can be set to Never. If you set a ring reversion time, the times must be the same for both ends of the span. That is, if Node A's west fiber is connected to Node B's east port, the Node A west span reversion time must be the same as the Node B east span reversion time.
- West Protect—Select the west MS-SPRing port that will connect to the west protect fiber.
- East Protect—Select the east MS-SPRing port that will connect to the east protect fiber.

Step 4 Click **OK**.

7.4.3 Creating MS-SPRings for Multiple Nodes Simultaneously

Use the Create MS-SPRing wizard to create an MS-SPRing for all desired SDH nodes simultaneously.

Table 7-42 Field Descriptions for the Create MS-SPRing Wizard

Field	Description
MS-SPring Attributes	
Type	MS-SPRing type (2-fiber or 4-fiber).
Line Rate	Line rate (STM4, STM16, or STM64).
Ring ID	Used-defined ring ID. The value can be any combination of up to six alphanumeric characters.
Ring Reversion	Ring reversion time, in minutes.
Span Reversion	Span reversion time, in minutes.
Working Spans Selection	
After the attributes are defined, a possible MS-SPRing map is shown. You can select the spans from the map and perform Add, Remove, or Reverse operations. The Add operation adds all the spans to the ring. The Remove operation removes the selected span. The Reverse operation switches the east and west ports in the span. If all the spans are added to make a loop, the Finish button is enabled. **Note** For 4-fiber MS-SPRings, instead of Finish, the Next button is provided. Click **Excluded Nodes** to view the nodes that are being excluded from the MS-SPRing and the reason for the exclusion.	
Protect Ports Selection	
(4-fiber MS-SPRings only) The table lists all the spans along with the potential protect ports. You can select the desired protect ports (east and west) for each span in the ring. The Finish button is enabled if all the required protect ports are selected.	

7.4.4 Editing MS-SPRings

Use the MS-SPRing Edit window to modify the ring ID, ring reversion, and span reversion on a ring.

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > CTC-Based SDH NEs > MS-SPRing Table**.

Step 2 In the MS-SPRing table, select the ring to edit; then, choose **Edit > Edit MS-SPRing** (or click the **Edit Selected MS-SPRing** tool).

Step 3 Edit the MS-SPRing attributes:

- Ring ID—Specify an ID from 0 to 9999.
- Ring Reversion (min)—Set the ring reversion time to Never or from 0.5 to 12 minutes.
- Span Reversion (min)—Set the span reversion time to Never or from 0.5 to 12 minutes.

Step 4 Click **Apply**.

7.4.5 Using the MS-SPRing Upgrade Table

Use the MS-SPRing Upgrade table to upgrade a 2-fiber MS-SPRing to a 4-fiber ring. The MS-SPRing Upgrade wizard allows you to select the span reversion along with upgrade options. After selecting the spans, the protect ports selection wizard is displayed.

The following table provides descriptions.

Table 7-43 Field Descriptions for the MS-SPRing Upgrade Table

Field	Description
Ring ID	Allows you to modify the ring ID. It can be any combination of up to six alphanumeric characters.
Ring Reversion	Allows you to modify the ring reversion time.
Span Reversion	Allows you to modify the span reversion time.

7.4.6 Upgrading MS-SPRings

Only STM16 (or higher) rings can be upgraded.

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > CTC-Based SDH NEs > MS-SPRing Table.**

Step 2 In the MS-SPRing table, select the ring to edit; then, choose **Edit > Upgrade MS-SPRing**.

Step 3 In the Upgrade MS-SPRing dialog box, specify the following information:

- Span reversion
- Upgrade options—Choose one of the following options:
  - Override Protection Operations—The upgrade procedure automatically clears all the protection operations and proceeds with the upgrade.
  - Override Protection Switch—The upgrade continues despite the protection switch. If a protection switch occurs as a result of a fiber cut, there is a loss of traffic.
  - Ignore PCA—If there is extra PCA traffic on the ring, the traffic is dropped during the upgrade.

Step 4 Click **Next**. The Protect Ports table opens, displaying the following protect ports information for the upgraded MS-SPRing:

- Name
- West Working
- West Protect
- East Working
- East Protect

Step 5 Click **Finish**.

7.4.7 Viewing the MS-SPRing Ring Map Table

The Ring Map table contains MS-SPRing information for the selected object in the table.

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **MS-SPRing** tab; then, select a ring in the table.

Step 3 Click **Ring Map**. The Ring Map table opens. The following table provides descriptions.

Table 7-44 Field Descriptions for the Ring Map Table

Field	Description
Node ID	Displays the Node ID, which identifies the node to the MS-SPRing. Nodes in the same MS-SPRing must have unique node IDs.
IP Address	Displays the NE IP address.

7.4.8 Viewing the MS-SPRing Squelch Table

When multiple fiber cuts isolate an MS-SPRing node, the Squelch table displays the circuits that are isolated on the node by STS number, east source/destination, and west source/destination. The table is display only.

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **MS-SPRing** tab; then, select a ring in the table.

Step 3 Click **Squelch Table**. The Squelch table opens. The following table provides descriptions.

Table 7-45 Field Descriptions for the Squelch Table

Field	Description
STS No.	Displays the STS number of the circuit.
East Source	Displays the east source NE.
East Destination	Displays the east destination NE.
West Source	Displays the west source NE.
West Destination	Displays the west destination NE.

7.4.9 Switching MS-SPRings

The Switch MS-SPRing dialog box displays a graphical representation of an MS-SPRing, including the following details:

- The NEs that are part of the ring are shown along with the node name.
- The colors of the NEs reflect the state.
- The working ports that are selected during creation of the ring are shown in green. The working port names are also shown in green.
- The protect ports that are selected during creation of the ring are shown in purple. The protect port names are also shown in purple.
- The working spans are shown in green. This identifies spans that are selected during creation as the working spans.
- The protect spans are shown in purple. For a 2-fiber MS-SPRing, these spans are automatically assigned during creation. For a 4-fiber MS-SPRing, these spans are based on the protect ports selected.

Complete the following steps to switch MS-SPRings:

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > CTC-Based SDH NEs > MS-SPRing Table**.

Step 2 In the MS-SPRing table, choose **Edit > Switch MS-SPRing** (or click the **Switch Selected MS-SPRing** tool). The Switch MS-SPRing dialog box opens. The following table provides descriptions.

Step 3 After making your selections, click **OK**.

The job is queued in the Job Monitor table. For more information, see 4.6.1 Monitoring Scheduled Tasks, page 4-87.

Table 7-46 Field Descriptions for the Switch MS-SPRing Dialog Box

Field	Description
Initial Node	Select the initial node from the graphic. The name of the selected node is displayed in the field.

Table 7-46 Field Descriptions for the Switch MS-SPRing Dialog Box (continued)

Field	Description
Switch Command	Select one from the following switch commands: • Clear—Clears an existing switch command • Lockout Span—Prevents automatic switching • Force Ring—Performs a forced MS-SPRing switch • Manual Ring—Performs a manual MS-SPRing switch • Switch Ring—Switches MS-SPRings
Time	Set up the MS-SPRing switch to occur immediately or at an exact time, including date, hour, and minute. Choose **Now** to schedule the MS-SPRing switch to begin immediately. Choose **At Time** to set the specific date and time of the switch. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. To repeat the switch, select a repeat interval from the Frequency drop-down list. A switch can occur once, daily, or weekly.

7.4.10 Changing the MS-SPRing Switch Interval

The interval between the MS-SPRing switches can be configured in the Control Panel. This interval represents the interval between east and west tasks of a ring switch task.

Step 1 In the Domain Explorer, choose **Administration > Control Panel**.

Step 2 In the Control Panel, expand **NE Service** and choose **CTC-Based SDH NEs**.

Step 3 In the MS-SPRing Switch Interval field, enter the interval time. The Cisco default is 60 seconds.

Step 4 Click **Save**.

7.4.11 Filtering the MS-SPRing Table

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > CTC-Based SDH NEs > MS-SPRing Table**.

Step 2 In the MS-SPRing table, choose **File > Filter** (or click the **Filter Data** tool). The filter dialog box opens.

Step 3 Use the filter to filter data according to criteria that you select and to display the results in the table. The following table provides descriptions.

Table 7-47 Field Descriptions for the MS-SPRing Filter Dialog Box

Field	Description
Network Elements	Displays the list of available NE IDs. Click **Add** and **Remove** to move NEs to and from the Selected list. The filter runs against the NEs in the Selected list.
MS-SPRing Names	Allows you to filter the table using a range of MS-SPRing names. The filter runs against the names in the Selected Names list. Check the **Ignore All MS-SPRing Names** check box if you want to filter data and the name is not important.
Ring Type	Allows you to filter the table using a specific ring type (All, 2-fiber, or 4-fiber).
Line Rate	Allows you to filter the table using a specific line rate (All, STM4, STM16, STM64). You can also select **Inconsistent** as a filter option, meaning that the MS-SPRing goes into an inconsistent state if it has been provisioned correctly but is nonfunctional due to changes in the network.

7.4.12 Deleting MS-SPRings

You can delete an MS-SPRing from the Domain Explorer or the NE Explorer.

7.4.12.1 Deleting an MS-SPRing from the Domain Explorer

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH NE in the Domain Explorer and choose **Configuration > CTC-Based SDH NEs > MS-SPRing Table.**

Step 2 In the MS-SPRing table, select the ring to delete; then, choose **Edit > Delete MS-SPRing** (or click the **Delete Selected MS-SPRing** tool).

Step 3 In the confirmation dialog box, click **Yes**.

7.4.12.2 Deleting an MS-SPRing from the NE Explorer

Step 1 Select an ONS 15454 SDH or ONS 15600 SDH in the Domain Explorer and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 Click the **MS-SPRing** tab.

Step 3 Select the ring to delete and click **Delete**.

Step 4 In the confirmation dialog box, click **OK**.

7.5 Managing VLANs for E-Series Cards

VLANs are managed at the network partition level. All VLANs that are discovered on one NE are propagated to all available NEs under the same network partition. Creating, editing, or deleting VLANs affects all the NEs under the network partition.

Caution Be sure that the VLANs are unique across the entire network partition.

If you use CTC to manage VLANs, Prime Optical will discover two VLANs with the same name but different IDs if the following conditions exist:

- You created a VLAN with an ID and name in one ring
- You created another VLAN with the same name but a different ID in another ring managed by another instance of CTC
- Both rings are managed by the same network partition in Prime Optical

A similar situation arises when two or more VLANs are created with the same ID but different names.

Note The procedures in this section apply only to E-series cards. VLAN association for E-series cards is done during circuit creation.

Use the following procedures to manage VLANs:

- 7.5.1 Creating VLANs, page 7-218
- 7.5.2 Tracing VLANs, page 7-219
- 7.5.3 Deleting VLANs, page 7-220

7.5.1 Creating VLANs

Use the Manage VLANs dialog box to create new VLANs or delete existing VLANs from the Prime Optical domain. All Prime Optical user types can access the Manage VLANs dialog box, but Operators cannot create or delete VLANs.

The Manage VLANs dialog box displays a list of all available VLANs in the Prime Optical domain. The list is ordered alphanumerically by VLAN name, where numbers precede letters and uppercase letters precede lowercase ones.

Step 1 In the Domain Explorer, select a CTC-based NE and choose **Configuration > Manage VLANs**. The following table describes the fields in the Manage VLANs dialog box.

Alternatively, perform one of the following tasks to open the Manage VLANs dialog box:

- Select a CTC-based NE in the Subnetwork Explorer and choose **Configuration > Manage VLANs**.
- Select a CTC-based NE in the Network Map and choose **Configuration > Manage VLANs**.

Table 7-48 Field Descriptions for the Manage VLANs Dialog Box

Button	Description
All VLANs	
Trace	Allows you to trace a VLAN.
Create	Allows you to add a new VLAN.
Delete	Allows you to delete a VLAN.
Close	Allows you to cancel the VLAN creation or deletion and close the dialog box.

Step 2 In the Manage VLANs dialog box, click **Create**.

Step 3 In the Define New VLAN dialog box, enter a unique VLAN name and ID. The VLAN ID must be an integer greater than 1.

Step 4 Click **OK**.

Step 5 In the confirmation dialog box, click **OK**.

Note If the VLAN creation fails with an error message, it means that the Prime Optical server is in a Config Resync operation state. In this state, all provisioning operations are blocked because the server is retrieving updated configuration information from the card. Close the Manage VLANs dialog box and wait 2 to 3 minutes; then, retry the VLAN creation.

7.5.2 Tracing VLANs

The VLAN Trace table displays a tabular representation of the endpoints associated with the VLAN in the selected network partition.

Step 1 In the Domain Explorer, Subnetwork Explorer, or Network Map window, select a CTC-based NE and choose **Configuration > Manage VLANs**.

Step 2 In the Manage VLANs dialog box, select the VLAN to be traced and click **Trace**. The VLAN Trace table opens. The following table provides descriptions.

Table 7-49 Field Descriptions for the VLAN Trace Table

Field	Description
Bridge ID	Displays the bridge ID.
Designated Root	Displays the root bridge.
NE ID	Displays the name of the node.
Physical Location	Displays the slot and port that identify the PTP.

Table 7-49 Field Descriptions for the VLAN Trace Table (continued)

Field	Description
STP State	Displays the current spanning tree protocol (STP) state.
STP Enabled	Indicates whether or not STP is enabled for the card.
Network Partition ID	Displays the network partition ID.

7.5.3 Deleting VLANs

Step 1 In the Domain Explorer, Subnetwork Explorer, or Network Map window, choose **Configuration > Manage VLANs**.

Step 2 In the Manage VLANs dialog box, select the VLAN to be deleted and click **Delete**.

Note You cannot delete a VLAN that is in use. VLAN deletion will fail if any of the NEs in the network partition are not reachable.

Step 3 You are prompted to confirm the deletion request. Click **OK**.

Step 4 In the confirmation dialog box, click **OK**.

7.6 Managing VLANs (ML-Series Cards)

A VLAN is an end-to-end service within a Layer 2 topology. When provisioning a VLAN, Prime Optical internally configures bridge groups, one on each card, wherever an Ethernet service drop is specified. A bridge group associates a service drop with the service VLAN ID, the optical virtual port subinterface. A VLAN service is a collection of bridge groups on a particular Layer 2 topology.

Bridge groups are invisible on the Layer 2 service provisioning application. You can review the associated service drops on each VLAN service.

Step 1 Select an existing Layer 2 topology from the Layer 2 Topology table.

Step 2 Select a service provider VLAN ID.

Step 3 Specify a customer ID and service ID. These are strings that you can assign to a VLAN service during provisioning. This information is local to Prime Optical and is not configurable on the NE.

Step 4 Specify the QoS parameters (CIR/PIR).

Step 5 Specify the service drops. There must be at least one drop per ML card for point-to-point and Layer 2 topologies, and at least two drops, on a different card, for Resilient Packet Ring (RPR).

Step 6 For each drop port, specify the port type and connection type.

7.7 Managing SVLAN Profiles

You can add, modify, and delete service provider virtual LAN (SVLAN) profiles on ONS 15454 SONET and ONS 15454 SDH NEs.

Step 1 In the Domain Explorer, Subnetwork Explorer, or Network Map window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN Profile Management**. The SVLAN Profile Management wizard opens. Table 7-50 provides descriptions.

Step 2 In the Select a Resource pane, select the resource from which to load the SVLAN profile. You can load the SVLAN profile from the network, from a local file, or from a remote file. Alternatively, you can choose None, and an empty table will be shown in the next step. After specifying a resource, click **Next**.

Step 3 In the Edit SVLAN Profiles pane, edit the parameters described in Table 7-50. Click **Add Row** if you want to add a new SVLAN profile. Click **Delete Row** if you want to delete an existing SVLAN profile. Click **Delete All** if you want to delete the entire set of SVLAN profiles. Then, click **Next**.

Step 4 In the Select a Resource pane, select a resource on which to store the new SVLAN profile(s). You can specify one or more resources in the network, on a local file, or on a remote file.

Step 5 Click **Finish**.

Table 7-50 Field Descriptions for the SVLAN Profile Management Wizard

Field	Description
Select a Resource	
Network	From the list of nodes displayed, choose the resource on which you want to load the new SVLAN profile.
Local File	Specify the file from the local drive by clicking the **Local File** radio button and specifying the directory path. You can click the **Browse** button and navigate to a specific file on your local drive. You can select a file with a .svp extension.
Remote File	Specify the file from the server by clicking the **Remote File** radio button. You can select a file with a .svp extension.
None	Click the **None** radio button if you want to edit a blank SVLAN profile instead of loading a profile from the network or from a file.
Edit SVLAN Profiles	
Name	User-defined name that identifies the SVLAN profile.
Committed Info	Sets the guaranteed information rate as provided by the service provider's service-level agreement. The default value is 100 and the range is 0 to 100 percent. **Note** When you set the Committed Info Rate above 40% on 10GE_XP and 10GE_XPE cards, the Committed Burst Size and Excess Burst Size must be set to at least 32K. The Committed Burst Size and Excess Burst Size can be increased based on the packet size and Committed Info Rate value.
Committed Burst	In Frame Relay links, sets the maximum number of bits that are transferred per second. The value is in megabits per second (mb/s) or kilobits per second (kb/s).
Peak Info Rate	Sets the maximum information rate as provided by the service provider's service-level agreement. The default value is 100 and the range is 0 to 100 percent. However, the value must be greater than or equal to the Committed Info Rate.

Table 7-50 Field Descriptions for the SVLAN Profile Management Wizard (continued)

Field	Description
Excess Burst	Sets the maximum number of bits that are credited for later transfer in the event the committed burst rate cannot be transmitted. The value is mb/s or kb/s.
Link Integrity	Enables or disables link integrity.
Insert a profile name	Enter a name for the new SVLAN profile, up to a maximum of 32 characters.
Add Row	Click the **Add Row** button to add the new SVLAN profile to the pane.
Delete Row	Click the **Delete Row** button to delete an existing SVLAN profile from the pane.
Delete All	Click the **Delete All** button to delete the entire set of SVLAN profiles.

7.8 Managing the SVLAN Database

You can provision the SVLAN database for the network of ONS 15454 SONET and ONS 15454 SDH NEs. On NE releases earlier than 9.0, the SVLAN database is stored on the NE itself. On NE releases 9.0 and later, the SVLAN database is stored on the 10GE_XP and GE_XP cards.

Step 1 In the Domain Explorer, Subnetwork Explorer, or Network Map window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN DB Management**. The SVLAN Database Management wizard opens. Table 7-51 provides descriptions.

Step 2 In the Select a Resource pane, select the resource from which to load the SVLAN database. You can load the SVLAN database from the network, from a local file, or from a remote file. Alternatively, you can choose Empty DB, and an empty table will be shown in the next step. After specifying a resource, click **Next**.

Step 3 In the Edit VLAN Database pane, edit the parameters described in Table 7-51. Click **Add Row** if you want to add a new SVLAN database. Click **Delete Row** if you want to delete an existing SVLAN database. Click **Delete All** if you want to delete the entire SVLAN database. Then, click **Next**.

Step 4 In the Select a Resource pane, specify where you want to store the new SVLAN database. You can select a network resource (NE or cards, depending on the NE software version), a local file, or a remote file.

Step 5 Click **Finish**.

Step 6 At the confirmation prompt, click **Yes**.

Step 7 The wizard schedules the operation. Click **OK**.

You can view the results of the operation in the Job Monitor table. For more information, see 4.6.1 Monitoring Scheduled Tasks, page 4-87.

Table 7-51 Field Descriptions for the SVLAN Database Management Wizard

Field	Description
Select a Resource	
Network	Choose the resource where the new SVLAN database will be applied. The tree represents the NE-card relationship, where cards are organized by shelf. Use the check box to select each branch of the tree. For NE releases earlier than 9.0 (where the SVLAN database is stored on the NE, not on the cards), no cards are shown. • Node—Lists all of the working NEs. If you select an NE release 9.0 or later, the slot list contains all GE_XP or 10GE_XP cards that are provisioned with L2 over DWDM card mode. You can select only one card. If you select an NE release earlier than 9.0, you can select only the NE; no cards are listed in the slot list. • Shelf—Specify the shelf in which the GE_XP or 10GE_XP card(s) are located. • Slot—Specify the slot in which the GE_XP or 10GE_XP card(s) are located.
Local File	Specify the file from the local drive by clicking the **Local File** radio button and specifying the directory path. You can click the **Browse** button and navigate to a specific file on your local drive. You can select a file with a .vlf extension.
Remote File	Specify the file from the server by clicking the **Remote File** radio button. You can select a file with a .vlf extension.
Empty DB	Click the **Empty DB** radio button if you want to edit a blank SVLAN database instead of loading a database from the network or from a file. Use the drop-down list to specify the database version to create.
Edit VLAN Database, for NE releases earlier than 9.0	
VLAN ID	Unique number that identifies the VLAN in an SVLAN database profile. The range is from 1 to 4093.
VLAN Name	SVLAN name, up to a maximum of 32 characters.
Protection	If checked, the SVLAN is protected.
Edit VLAN Database, for NE release 9.0 and later	
SVLAN ID	Unique number that identifies the SVLAN in a VLAN database profile.
SVLAN Name	SVLAN name, up to a maximum of 32 characters.
Protection	If checked, the SVLAN is protected.
MAC Learning	Enables or disables MAC learning for the port. MAC learning is used by Layer 2 switches to learn the MAC addresses of network nodes so they know where to send traffic. Layer 2 switches—including GE_XP and 10GE_XP cards in L2 over DWDM mode—maintain a MAC learning table that associates the MAC addresses and VLANs with a given port.
IGMP	Enables or disables Internet Group Management Protocol (IGMP), which is a protocol used by IPv4 systems to report IP multicast memberships to neighboring multicast routers. IGMP is used to dynamically register individual hosts in a multicast group on a particular LAN. IGMP provides a means to automatically control and limit the flow of multicast traffic throughout your network with the use of special multicast queriers and hosts.

Table 7-51 Field Descriptions for the SVLAN Database Management Wizard (continued)

Field	Description
IGMP Fast Leave	Enables or disables IGMP fast leave. IGMP-snooping fast-leave processing allows the switch to remove an interface from the forwarding-table entry without first sending out MAC-based general queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Fast-leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are being used simultaneously.
IGMP Suppression	Enables or disables IGMP report suppression. Switches use IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.
Insert a new SVLAN ID	Enter a numeric ID from 1 to 4094 for the new SVLAN database. This field does not accept letters or special characters.
Add Row	Click the **Add Row** button to add the new SVLAN database to the pane.
Delete Row	Click the **Delete Row** button to delete an existing SVLAN database from the pane.
Delete All	Click the **Delete All** button to delete the entire set of SVLAN databases.
Select a Resource	
Network	Choose the NE(s) on which to save the SVLAN database for NE releases earlier than 9.0; or choose the cards on which to save the SVLAN database for NE release 9.0 or later.
Select Mode	Use the Select Mode drop-down list to overwrite or append the SVLAN database: • Overwrite—Prime Optical overwrites the existing SVLAN database stored on the network equipment with the newly provisioned database. • Append—Prime Optical appends the new SVLAN database to the existing SVLAN database. If an SVLAN ID is already provisioned on the network equipment, the operation fails. **Note** When you choose Append mode, Prime Optical takes longer to execute the task.
Local File	Specify the file from the local drive by clicking the **Local File** radio button and specifying the directory path. You can click the **Browse** button and navigate to a specific file on your local drive. You can select a file with a .vlf extension.
Remote File	Specify the file from the server by clicking the **Remote File** radio button. You can select a file with a .vlf extension.

7.9 Managing SVLANs

You can view, create, modify, trace, and delete SVLANs on GE_XP or 10GE_XP cards on ONS 15454 SONET and ONS 15454 SDH R9.1 and later NEs. You can also add and delete SVLAN drops.

7.9.1 Viewing the SVLAN Table

Use the SVLAN table to view, modify, and delete existing SVLANs that are provisioned on GE_XP or 10GE_XP cards on ONS 15454 SONET and ONS 15454 SDH R9.1 and later NEs.

In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN Table**. The SVLAN table opens. Table 7-52 provides descriptions.

The SVLAN table is empty when you first open it. The table is populated only after you use the Filter Data tool (or choose **File > Filter**) to define a specific SVLAN ID range.

Use the menu options or toolbar icons to filter the SVLAN table; create, modify, trace, or delete an SVLAN; add or delete an SVLAN drop; or cancel the SVLAN query.

Table 7-52 Field Descriptions for the SVLAN Table

Field	Description
SVLAN Name	Displays the user-assigned name of the SVLAN.
SVLAN ID	Displays the numerical ID of the SVLAN.
SVLAN Endpoints	Displays a string (in NE/card/slot/port format) that represents the SVLAN endpoints that are currently provisioned. **Tip** The SVLAN Endpoints row in the lower half of the table has a drop-down arrow that you can click to view the different endpoints associated with this SVLAN.
Protection	Indicates whether protection is enabled (True) or disabled (False) for the selected SVLAN.
Spans	Displays the number of spans associated with the selected SVLAN.
Status	Indicates the status of the SVLAN. Values are: • Discovered—The SVLAN is completely configured in the network; all components are in place and a complete path exists from the source to the destination endpoint. • Partial—The SVLAN is not complete; one or more endpoints are not in place or one of the spans is missing.
Type	Displays the type of circuit selected.
Direction	Indicates whether the circuit carries unidirectional (one-way) or bidirectional (two-way) traffic.

7.9.2 Filtering the SVLAN Table

Use the SVLAN ID Query dialog box to filter on a range of SVLAN IDs and display the results in the SVLAN table.

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN Table**. The SVLAN table opens.

Step 2 In the SVLAN table, choose **File > Filter** (or click the **Filter Data** tool). The SVLAN ID Query dialog box opens.

Step 3 Do one of the following to narrow the filter scope:

- In the Select Single Range tab, specify a starting and ending range in the From and To text fields. Alternatively, check the **Get All** check box to filter on all SVLAN IDs without specifying an exact range. When you choose Get All, the From and To text fields are dimmed.
- In the Select Multiple Ranges tab, specify a starting and ending range in the From and To text fields; then, click **Add**. The ID range appears in the list on the right. You can specify a second range and click **Add** again. Repeat this process for all ID ranges that you want to filter. To remove all ranges from the list, click **Clear**.

Note The SVLAN ID range is from 1 to 4093.

- In the Select Query Scope tab, narrow the query to the list of NEs in the current selection context (group or subnetwork). Choose one of the following options from the drop-down list:
  - NE Service—Selecting this option could slow down the query, depending on network conditions and the number of managed NEs.
  - Selected NEs—Queries only those NEs in the current selection context. Although this query is faster than the NE Service option, you should choose **Selected NEs** only when the SVLAN NEs belong to the same group or subnetwork.

  Click the **Display NEs** button to view the list of NEs in the current selection context.

Note The Select Query Scope tab is disabled if only one NE is selected, because an SVLAN query on a single NE returns partial circuits.

Step 4 After making your selections, click **OK** to run the filter. The results are displayed in the SVLAN table.

Step 5 (Optional) To cancel the SVLAN query, choose **Configuration > Cancel Query** (or click the **Cancel Query** tool) in the SVLAN table. At the following confirmation message, click **OK**:

```
This operation will cancel the current SVLAN query. Do you want to continue?
```

Note Because communication between the Prime Optical server and NEs is remote, the Cancel Query operation might take a while to complete.

Note If you click the **Refresh Data** tool, a new SVLAN query does not start unless the query parameters changed. Use the Refresh Data tool when network conditions prevent the complete discovery of the provisioned SVLAN circuits. Refreshing the SVLAN table synchronizes the displayed data with the latest results of the server-side processing. In most cases, a new discovery does not start, which makes the Refresh Data operation faster than the SVLAN query.

7.9.3 Creating an SVLAN

Use the Create SVLAN wizard to configure SVLANs on GE_XP or 10GE_XP cards on ONS 15454 SONET and ONS 15454 SDH R9.1 and later NEs.

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Create SVLAN**. The Create SVLAN wizard opens. Table 7-53 provides descriptions.

Note The Create SVLAN menu option is dimmed if there are no ONS 15454 SONET or ONS 15454 SDH R9.1, R9.2 or R9.3 NEs in the selected domain, group, subnetwork, or network partition.

Tip You can also launch the Create SVLAN wizard by choosing **Configuration > Create SVLAN** in the SVLAN table.

Step 2 In the Info View pane, enter the following information; then, click **Next**:

- Name—Enter a unique name for the new SVLAN. The SVLAN name is a free-format string of up to 48 ASCII characters.
- ID—Enter the ID of the new SVLAN. The valid range is from 1 to 4093.
- Protection—Check this check box to enable protection for the SVLAN.

Step 3 In the Source pane, configure the SVLAN source endpoint parameters (source, shelf, slot, and port); then, click **Next**.

Note Ports that are network-node interfaces (NNIs) have "NNI" appended to the port name, indicating that the port connects to other network nodes.

Step 4 In the Destination pane (not available if the SVLAN is protected), configure the destination endpoint parameters (source, shelf, slot, and port) and routing preferences; then, click **Next**:

- Using Required Nodes—If checked, you manually include or exclude nodes. Once a node is selected, the intermediate hops are determined automatically (if a route path exists).
- Review Route Before Creation—Check this check box to review the route before it is created.

Step 5 In the Endpoint QinQ Settings pane, configure the source and destination QinQ settings:

Note QinQ settings enable the encapsulation of different SVLAN IDs within a parent Ethernet frame, thereby shielding the IDs during data transmission.

a. Configure the source QinQ settings:

- Source Client Port—Source port on which to provision IEEE 802.1 QinQ VLAN tags on the GE_XP or 10GE_XP cards.
- Source Client Mode—Set the source QinQ mode (Selective or Transparent). If you select Transparent, the SVLAN table disappears and the Add/Remove buttons are dimmed.
- BPDU—Set the source bridge protocol data unit (BPDU) mode (Drop or Tunnel).
- Transparent SVLAN ID—Displays the SVLAN ID.

- DSCP-CoS—Displays the DSCP-CoS mapping table for provisioning the CoS based on DSCP for the port.

b. Click **Add** (available only if you chose the Selective source client mode).

c. To specify a source customer VLAN (CVLAN) range, enter the CVLAN range in the boxes next to the Add CVLAN Range button; then, click **Add CVLAN Range**.

A source QinQ table entry will be added for each CVLAN in the range.

d. Configure the destination QinQ settings:

- Destination Client Port—Destination port on which to provision IEEE 802.1 QinQ VLAN tags on the GE_XP or 10GE_XP cards.
- Destination Client Mode—Set the destination QinQ mode (Selective or Transparent).
- BPDU—Set the destination BPDU mode (Drop or Tunnel).
- Transparent SVLAN ID—Displays the SVLAN ID.
- DSCP-CoS—Displays the DSCP-CoS mapping table for provisioning the CoS based on DSCP for the port.

Note QinQ destination settings are not displayed if the SVLAN is protected.

e. Click **Add** (available only if you chose the Selective source client mode).

f. To specify a destination customer VLAN (CVLAN) range, enter the CVLAN range in the boxes next to the Add CVLAN Range button; then, click **Add CVLAN Range**.

A source QinQ table entry will be added for each CVLAN in the range.

Step 6 In the Routing Constraints pane (available only if Using Required Nodes is selected), a graphical representation of the SVLAN is displayed, including source and destination nodes. Specify the nodes to include in the SVLAN. Complete the following substeps:

a. In the map view, select the node. The NE ID is displayed in the Selected Node field.

b. Click **Include** to include the selected node in the route. The node appears in the Included Nodes list.

c. Click **Exclude** to exclude the selected node from the route. The node appears in the Excluded Nodes list.

d. Click **Remove** to remove the selected node from the Included Nodes or Excluded Nodes lists.

e. Click **Up** or **Down** to set the sequence of the nodes and spans included in the SVLAN.

f. Repeat substeps a to e for each node that you want to include in the SVLAN route.

g. Click **Finish** or **Next**.

Step 7 In the Routing Summary pane, do the following:

a. In the map view, review the ID of the source and destination NEs.

b. Included Spans—Lists all of the spans that the Prime Optical server selected automatically.

c. Selected Span—Displays the following information about the span selected in the Included Spans list:

- From—Span source.
- To—Span destination.

d. Click **Finish**.

Step 8 In the message box, click **OK**.

Caution It takes several seconds to create an SVLAN. During that interval, if a new SVLAN is added with the same name, both SVLANs are identified as duplicates. If another user tries to provision one of the duplicate SVLANs, the operation fails. Therefore, be careful not to add a duplicate SVLAN during the creation of the first SVLAN.

Table 7-53 Field Descriptions for the Create SVLAN Wizard

Field	Description
Navigation Pane	
The navigation pane on the left side of the Create SVLAN wizard tells you where you are in the process of creating the SVLAN. The list of tasks shown initially is the default list of all possible tasks. As you move through the SVLAN creation, you are taken to the appropriate task. You can use the navigation pane to jump quickly from one task to the next, or to an already visited task. Using the navigation pane is faster than using the Back and Next buttons, because you can jump over multiple panes in one step versus clicking Back or Next and moving through the panes sequentially. **Tip** As you proceed through the wizard, the panes you have visited are highlighted in white and identified by a number. **Tip** Click the Maximize button to expand the Create SVLAN wizard. After you expand the Create SVLAN wizard, the Maximize button changes to the Reset Size button. Click the Reset Size button to reduce the Create SVLAN wizard to its original size.	
Info View	
Name	Enter a unique name for the new SVLAN. The SVLAN name is a free-format string, up to 48 ASCII characters.
ID	Enter the ID of the new SVLAN. The valid range is from 1 to 4093.
Protection	If checked, protection is enabled for the new SVLAN. If protection is enabled, provisioning succeeds only if the GE_XP or 10GE_XP cards are connected by contiguous OCH trail circuits configured in a Fast Access Protection Switch (FAPS) ring topology. Source and client ports coincide for protected SVLAN, and a master node must be provisioned. 1+1 card protection is also supported for protected SVLAN, but an intertrunk patchcord must be provisioned among trunk ports within the protection group. You can provision protection only on SVLAN IDs that are defined as protected in the database.
Source	
Source	Select from the list of available NEs to specify the source NE.
Shelf	Select from the list of available shelves to specify the source shelf.
Slot	Specify the source slot.
Port	Specify the source port. NNI source ports have “NNI” appended to the port name.
Destination (not available if the SVLAN is protected)	
Destination	Select from the list of available NEs to specify the destination NE.
Shelf	Select from the list of available shelves to specify the destination shelf.
Slot	Specify the destination slot.
Port	Specify the destination port. NNI destination ports have “NNI” appended to the port name.

Table 7-53 Field Descriptions for the Create SVLAN Wizard (continued)

Field	Description
Review Route Before Creation	Check this check box to review the route before it is created.
Using Required Nodes	If checked, you manually include or exclude nodes. Once a node is selected, the intermediate hops are determined automatically (if a route path exists).
Endpoint QinQ Settings	
Source Client Port	Shows the source port on which to provision IEEE 802.1 QinQ VLAN tags on the GE_XP or 10GE_XP cards. QinQ tags expand the VLAN capability by tagging the tagged packets to produce a "double-tagged" Ethernet frame. For service providers, the expanded VLAN allows specific services to be provided on specific VLANs for specific customers, while other types of services can be provided to other customers on other VLANs.
Source Client Mode	Set the source QinQ mode. The options are: • Selective—Allows you to specify the mapping between CVLANs and SVLANs. The Selective setting acts on port and VLAN tags. You can provision different operations on the ID tags carried by the received frames. • Transparent—Allows you to specify a single SVLAN. With the Transparent port setting, when a port receives a frame, that frame is tagged with the current SVLAN ID.
BPDU	Set the source BPDU mode. BPDUs are transmitted to identify network topology tunnel settings and enable transparent data transmission among devices. The BPDU options are: • Drop—Discards incoming packets with the MAC address on the BPDU list. • Tunnel—Transports packets with MAC addresses on the BPDU list.
Transparent SVLAN ID	Displays the SVLAN ID used when the QinQ mode is set to Transparent. When the QinQ mode is set to Selective, you can specify the mapping between the customer VLAN and the service VLAN.
DSCP-CoS	Click the **DSCP-CoS** button. The DSCP-CoS mapping table for provisioning the CoS based on DSCP for each port is displayed with the following information: • DSCP—Displays the DSCP value. • CoS Value—Displays the CoS value. Choose a CoS value from 0 to 7 and click **OK**. The **DSCP-CoS** button is enabled only when the following conditions are met: • QinQ mode is set to Selective. • Ingress CoS is set to DSCP on the Ether and Channel Group ports. The **DSCP-CoS** button is enabled only if XPE cards are provisioned in the slot.
Destination Client Port	Shows the destination port on which to provision IEEE 802.1 QinQ VLAN tags on the GE_XP or 10GE_XP cards. **Note** QinQ destination settings are not displayed if the SVLAN is protected.
Destination Client Mode	Set the destination QinQ mode. The options are: • Selective—Allows you to specify the mapping between CVLANs and SVLANs. The Selective setting acts on port and VLAN tags. You can provision different operations on the ID tags carried by the received frames. • Transparent—Allows you to specify a single SVLAN. With the Transparent port setting, when a port receives a frame, that frame is tagged with the current SVLAN ID.

Table 7-53 Field Descriptions for the Create SVLAN Wizard (continued)

Field	Description
BPDU	Set the destination BPDU mode. The options are: • Drop—Discards incoming packets with the MAC address on the BPDU list. • Tunnel—Transports packets with MAC addresses on the BPDU list.
Transparent SVLAN ID	Displays the SVLAN ID used when the QinQ mode is set to Transparent. When the QinQ mode is set to Selective, you can specify the mapping between the customer VLAN and the service VLAN.
DSCP-CoS	Click the **DSCP-CoS** button. The DSCP-CoS mapping table for provisioning the CoS based on DSCP for each port is displayed with the following information: • DSCP—Displays the DSCP value. • CoS Value—Displays the CoS value. Choose a CoS value from 0 to 7 and click **OK**. The **DSCP-CoS** button is enabled only when the following conditions are met: • QinQ mode is set to Selective. • Ingress CoS is set to DSCP on the Ether and Channel Group ports. The **DSCP-CoS** button is enabled only if XPE cards are provisioned in the slot.
Add and Remove buttons	Click the **Add** button to add the source or destination QinQ setting to the table on the right side of the pane. Click the **Remove** button to remove the selected row(s) from the table. If the client source port mode is set to Transparent, the settings table disappears and the Add/Remove buttons are dimmed.
Add CVLAN Range button	To specify a source CVLAN range, enter the CVLAN range in the boxes next to the Add CVLAN Range button; then, click **Add CVLAN Range**. A source QinQ table entry is added for each CVLAN in the range.

Table 7-53 Field Descriptions for the Create SVLAN Wizard (continued)

Field	Description
SVLAN table	• CVLAN—Sets the CVLAN range. • SVLAN—Represents the SVLAN ID. • Operation—Specifies the operation mode. The options are: – Add—Appends a new .1Q tag with a specific SVLAN ID to all the incoming Ethernet frames tagged with a CVLAN ID. – Double Add—Adds a double tag for the incoming untagged packets. – Translate—Translates the incoming VLAN ID of the incoming Ethernet frames tagged with a CVLAN ID. The CVLAN ID is translated into an SVLAN ID. After this translation, the .1Q tag of the frame is SVLAN. – Translate Add—Adds the outer SVLAN and translates the inner VLAN for incoming single-tagged packets. • Inner SVLAN—Represents the VLAN of the incoming packet. This value can be set only when the operation mode is Double Add or Translate Add. • CoS—Displays the CoS egress queue (0 through 7). • IGMP CVLAN—Displays the IGMP CVLAN values. An IGMP CVLAN check box is provided to set the IGMP CVLAN for each row. Note the following IGMP CVLAN setting restrictions: – You can only set one IGMP CVLAN. – You cannot set IGMP CVLAN on the CVLAN range. – You cannot set IGMP CVLAN when the operation mode is set to either Double Add or Translate Add. To set this option, the card mode must be L2 over DWDM. **Note** If the IGMP CVLAN check box is not enabled in the MVR tab, the field shows N/A.
Routing Constraints (available only if Using Required Nodes is selected)	
Map view	(For graphical manual provisioning) Displays the NEs that are available in the subnetwork for SVLAN creation. This pane also indicates the source and destination NEs selected for SVLAN creation. The map view is used for the inclusion and exclusion of nodes during the specification of route constraints. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click OK. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default.
Selected Node	Displays the currently selected NE.
Included Nodes	Displays the list of nodes that are included in the route.
Excluded Nodes	Displays the list of nodes that are excluded from the route.

Table 7-53 Field Descriptions for the Create SVLAN Wizard (continued)

Field	Description
Routing Summary	
Map view	The map view indicates the source and destination NEs selected for SVLAN creation. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default.
Included Spans	Lists all of the spans that the Prime Optical server selected automatically.
Selected Span	Displays detailed information about the span selected in the Included Spans list.
Summary	
Summarizes the selections you made in the wizard panes. To change the SVLAN summary, click **Back** and change your selection(s).	

7.9.4 Modifying an SVLAN

Use the Modify SVLAN dialog box to change the name of an existing SVLAN on a GE_XP or 10GE_XP card on an ONS 15454 SONET or ONS 15454 SDH R9.1 or later NEs.

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN Table**. The SVLAN table opens.

Step 2 Select the SVLAN whose name you want to change and choose **Edit > Modify SVLAN** (or click the **Modify** tool). The Modify SVLAN dialog box opens.

Step 3 In the Name field, enter a unique name for the SVLAN. The SVLAN name is a free-format string, up to 48 ASCII characters.

Step 4 Click **OK**.

Step 5 Click the **Refresh Data** tool to view the modified SVLAN name in the SVLAN table.

7.9.5 Deleting an SVLAN

Use the Delete SVLAN dialog box to delete an existing SVLAN from a GE_XP or 10GE_XP card on an ONS 15454 SONET or ONS 15454 SDH R9.1 or later NEs.

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN Table**. The SVLAN table opens.

Step 2 Select the SVLAN that you want to delete and choose **Edit > Delete SVLAN** (or click the **Delete** tool).

Step 3 In the confirmation dialog box, click **OK**.

Step 4 Click the **Refresh Data** tool. After the window refreshes, the deleted SVLAN is no longer visible in the SVLAN table.

7.9.6 Adding an SVLAN Drop

You can add a new SVLAN drop that belongs to:

- NEs that are part of the current SVLAN
- NEs that are connected via an existing route (such as an OCH trail tunnel link or a Layer 2 trunk-to-trunk patchcord)

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN Table**. The SVLAN table opens.

Step 2 Choose **Configuration > Add Drop** (or click the **Add SVLAN Drop** tool). The Create SVLAN wizard opens.

Step 3 In the Add New Drop pane, configure the SVLAN drop details (destination, shelf, slot, and port); then, click **Next**.

Step 4 In the Endpoint QinQ Settings pane, configure QinQ settings for the drop. QinQ settings enable the encapsulation of different SVLAN IDs within a parent Ethernet frame, thereby shielding the IDs during data transmission.

- SVLAN Drop—*Display only.* View the drop port on which to provision IEEE 802.1 QinQ VLAN tags on the GE_XP or 10GE_XP cards.
- SVLAN Drop Mode—Set the drop QinQ mode (Selective or Transparent). If you select Transparent, the SVLAN table disappears and the Add/Remove buttons are dimmed.
- BPDU—Set the drop BPDU mode (Drop or Tunnel).
- Add and Remove buttons—Click the **Add** button to add the drop QinQ setting to the table on the right side of the pane. Click the **Remove** button to remove the selected row(s) from the table. If the drop mode is set to Transparent, the settings table disappears and the Add/Remove buttons are dimmed.

Step 5 Click **Finish**.

Step 6 Click the **Refresh Data** tool. After the window refreshes, the new SVLAN drop appears in the SVLAN table.

7.9.7 Deleting an SVLAN Drop

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN Table**. The SVLAN table opens.

Step 2 In the SVLAN table, choose **Edit > Delete SVLAN Drop** (or click the **Delete** tool). The Delete SVLAN Drop dialog box opens.

Step 3 From the SVLAN Drops list, select the drop that you want to delete. You can delete one drop at a time; you cannot select multiple drops in the list.

Step 4 Click **OK**.

Step 5 Click the **Refresh Data** tool. After the window refreshes, the deleted SVLAN drop is no longer visible in the SVLAN table.

7.9.8 Tracing an SVLAN

Use the SVLAN Trace window to display spans and endpoints for a specific SVLAN.

Step 1 In the Domain Explorer, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > SVLAN Table**. The SVLAN table opens.

Step 2 Select the SVLAN that you want to trace and choose **Configuration > Trace SVLAN** (or click the **Trace SVLAN** tool). The SVLAN Trace window opens.

Note The SVLAN Trace window does not have a Refresh Data tool. The port labels shown are those that belong to circuit spans.

Step 3 Right-click an endpoint (EP) marker to view the list of endpoints that belong to the node to which the marker refers.

7.10 Provisioning Data Services

Note Layer 2 (L2) services apply to ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH NEs only.

Note You need to complete all prerequisites for adding NEs before provisioning data services. See section 3.5.1 Prerequisites for Adding NEs, page 3-7 for information.

Note See *Cisco Prime Optical 9.6.3 ML Provisioning Methodology* for more information on the methodology that Prime Optical uses for data functionalities.

Metro Ethernet service capability is available through the ML-series cards on the ONS 15454 NE and the ML-100T-8 card on the ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH.

These cards provide the Ethernet interface (access point) to the service provider customer equipment and enable the transport of the customer traffic over the optical network domain.

Prime Optical supports Layer 2, Ethernet, service provisioning, and discovery. Before an Ethernet service can be provisioned, you must define an access domain, referred to in Prime Optical as a Layer 2 topology. A Layer 2 topology consists of optical circuits with specific Layer 2 configurations. Prime Optical supports Layer 2 topology provisioning and discovery. The following table summarizes the types of Layer 2 topology supported.

Table 7-54 Types of Layer 2 Topology Supported in Prime Optical

Type	Description	See
Point-to-point	A single point-to-point optical circuit with specific Layer 2 configuration.	7.10.6 Creating Layer 2 Topologies, page 7-247
Hub and spoke	In Prime Optical, this refers to a maximum of two point-to-point Layer 2 topologies connected by a single ML-series card on which both point-to-point Layer 2 topologies are created. **Note** You can create other hub-and-spoke configurations, including one in which the ML-series card is placed at the spoke locations, with the G-series card providing an extension of the traffic to a Cisco 7600, which forms the hub of the architecture.	
RPR	A chain of optical circuits connected through packet over SONET (POS) ports with a specific Layer 2 configuration.	

The following table summarizes the Ethernet service types supported by Prime Optical.

Table 7-55 Types of Ethernet Services Supported in Prime Optical

Type	Description	See
UNI QinQ	Transparent LAN service. Service can be multiplexed with other UNI Dot1Q services.	7.10.13 Layer 2 Service Management Tasks, page 7-286
UNI Dot1Q	Services are multiplexed at the UNI.	
NNI Dot1Q	Network-to-network interface. Services are multiplexed at the NNI.	
UNI untagged	Service occupies the entire interface. This type is designed for interface with a device that does not provide user VLAN ID capability.	

Caution Prime Optical provides optical circuit provisioning on the device through the CORBA interface and data service through the Cisco IOS command-line interface (CLI). On the Cisco IOS side, Prime Optical only recognizes the CLI configuration that is supported by Prime Optical and ignores unsupported CLI configurations. Prime Optical does not explicitly overwrite the existing configuration on the card. However, it can erase some of the configuration on the card without its knowledge. If you intend to use Prime Optical to provision the supported services and plan to directly configure the nonsupported services on the card by passing Prime Optical, consult Cisco first to prevent any configuration overwrite.

7.10.1 Initializing Layer 2 Cards

Before provisioning, you must first enable Prime Optical communication with the Layer 2 cards. The cards to be managed must be initialized with a minimum configuration.

To allow Prime Optical to communicate with Layer 2 cards, you must configure each card with a username, password, and hostname. You can customize this information in the Cisco IOS configuration file before loading it on the ML-series card.

When a Layer 2 topology is configured on NEs, Prime Optical configures each ML-series card with a barebone configuration file. This file contains the minimum configuration required for Prime Optical to support the Layer 2 topology and Layer 2 services on it.

Prime Optical provides the following barebone configuration files:

- barebone15454CLI_Security.txt—Use this base barebone configuration file for ML100, ML1000, or ML100X cards on ONS 15454 SONET and ONS 15454 SDH NEs. This file loads the ML card in microcode base mode. This barebone configuration file is the recommended default.
- barebone15454CLI_Enhanced_Security.txt—This configuration file provides microcode enhanced commands. Use this file to load a microcode enhanced image on ML100, ML1000, or ML100X cards on ONS 15454 SONET and ONS 15454 SDH NEs. The enhanced microcode image is required for CoS PM collection on ML cards.
- bareboneCLI_Generic.txt—Use this barebone configuration file for ML-100T-8 cards on ONS 15310 NEs. This file loads the ML-100T-8 card in microcode enhanced mode. Microcode base mode is not supported on the ML-100T-8 card. Also use this barebone configuration file for ONS 15454 SONET and ONS 15454 SDH R4.1.7 and earlier NEs, because these software versions do not support the microcode security feature.

Note The barebone configuration files are located on the server installation CD (Disk1/misc/). After you install the Prime Optical server, the appropriate barebone configuration file is automatically copied by default to the opt/CiscoTransportManagerServer/IosConfig directory.

A sample Cisco IOS configuration file is shown below.

Note If you use a username/password combination other than CISCO15/CTM123+, it is recommended that you download this barebone configuration file to one of your ML-series cards, change the username and password to the ones you use, and manually copy the running configuration to all your ML-series cards.

```

```

You must perform the following steps before Prime Optical can manage Layer 2 cards correctly:

Step 1 Initialize each card with the barebone configuration file through the Prime Optical NE Explorer.

Step 2 Set the username and password, so that Prime Optical will use the same username and password to communicate with the cards. This is done through the **Control Panel > Security Properties** tab for ONS 15454 SONET and ONS 15454 SDH NEs.

7.10.2 Backing Up and Restoring ML Configuration Files on Layer 2 Cards

You can back up and restore ML configuration files using CTC or the Cisco IOS commands on the ML-series cards.

- To store a backup version of the TCC2 (software) database on the workstation running CTC or on a network server, see the *Cisco ONS 15454 Procedure Guide*.
- To load a Cisco IOS startup configuration file through CTC, see the *Cisco ONS 15454 SONET/SDH ML-Series Multilayer Ethernet Card Software Feature and Configuration Guide*.

7.10.3 Naming Convention for Discovered Layer 2 Topologies

Prime Optical follows a set naming convention when creating Layer 2 topologies.

If an RPR topology is created through Prime Optical with the name *toponame*, the Layer 1 member circuits are named as follows: toponame.1CTML2, toponame.2CTML2, and so on. During discovery, if Layer 1 circuits matching this naming convention are discovered, a Layer 2 topology with the name *toponame* is added to Prime Optical.

If the CTM naming convention is not followed for discovered circuits, the RPR topology takes the name of one of the circuits in the RPR topology.

In the case of point-to-point topologies, the Layer 1 circuit has the same name as the topology. On the other hand, when a Layer 1 circuit between an ML and a non-ML series card is discovered, a point-to-point topology with the same name as the Layer 1 circuit is added to the Prime Optical database.

Note There are no VLAN naming conventions.

For RPR or point-to-point topologies created as a result of creating Layer 1 circuits for a TL1 interface, the name appears as a numeric string. This numeric string is based on the unique number used to identify the circuits.

7.10.4 Provisioning Layer 2 Topologies

Prime Optical allows you to create VCAT circuits and their constituent member circuits during Layer 2 topology creation. To support a Layer 2 topology, for RPR, Prime Optical allows you to create all VCAT circuits (and contained member circuits), all CCAT circuits, or a combination of VCAT and CCAT circuits. For a point-to-point L2 topology you can create either a VCAT or a CCAT circuit.

The Layer 2 topology can be a point-to-point optical circuit, or RPR consisting of a chain of optical circuits, or hub and spoke consisting of multiple optical circuits connected in a hub-and-spoke fashion:

- Point-to-point topology—Select the source and destination of the point-to-point topology and provide the routing information for the SONET/SDH circuit. Both manual and automatic routing are supported. The following table lists the NE models and cards supported for L2 point-to-point topologies.

Table 7-56 NE Models and Cards Supported by Prime Optical for L2 Topology

ONS 15305	ONS 15310 CL	ONS 15310 MA SONET	ONS 15310 MA SDH	ONS 15327	ONS 15454 SONET	ONS 15454 SDH	ONS 15600 SONET	ONS 15600 SDH
L2-supported source NE?								
No	Yes	Yes	Yes	No	Yes	Yes	No	No
L2-supported destination NE?

ML-series cards and L2-enabled ONS 15310 ML-100T-8 cards as source point of L2 topology?								
—	Yes	Yes	Yes	No	Yes	Yes	—	—
ML-series cards and L2-enabled ONS 15310 ML-100T-8 cards as destination point of L2 topology?								
—	Yes	Yes	Yes	No	Yes	Yes	—	—
OC-n and STM-n cards as destination point of L2 topology?								

Table 7-56 NE Models and Cards Supported by Prime Optical for L2 Topology (continued)

ONS 15305	ONS 15310 CL	ONS 15310 MA SONET	ONS 15310 MA SDH	ONS 15327	ONS 15454 SONET	ONS 15454 SDH	ONS 15600 SONET	ONS 15600 SDH
—	Yes	Yes	Yes	No	Yes	Yes	—	—
G-series cards as destination point of L2 topology?								
—	Yes	Yes	Yes	No	Yes	Yes	—	—
CE-100, CE-1000, and CE-MR-6 cards as destination point of L2 topology?								
—	Yes	Yes	Yes	No	Yes	Yes	—	—
E-series cards as destination point of L2 topology?								
—	—	—	—	Yes[1]	No	No	—	—

1. Available only in LAN extension (LEX) encapsulation mode.

Note The E-series card requires a a field-programmable gate array (FPGA) upgrade to be compatible with ML-series and G-series cards. 16-bit cyclic redundancy check (CRC) is required.

Note The G-series to E-series card combination does not involve the L2 Topology wizard.

- RPR topology—Select the set of nodes that contains ML-series cards and then the set of ML-series cards. The ML-series order is important because it defines the order of the cards inside the rings. Once the ML-series cards have been selected, you are prompted with the set of SONET/SDH circuits that will be created underneath the Layer 2 topology. You can automatically route all the circuits or manually route the circuits that will be created underneath the Layer 2 topology. A minimum of two ML-series cards is required to configure an RPR.
- Hub-and-spoke topologies—In Prime Optical, this refers to a maximum of two point-to-point Layer 2 topologies connected by a single ML-series card on which both point-to-point Layer 2 topologies are created. For point-to-point topologies, the following combinations of cards are supported:
  - ML-series to ML-series
  - ML-series to G-series
  - ML-series to OC-n/STM-n

  When deployed as hub and spoke, the ML-series cards can be placed at the spoke locations, with the G-series cards providing an extension of the traffic to a Cisco 7600, which forms the hub of the architecture. This arrangement provides a cost-effective way to interface to the Cisco 7600. Alternatively, the ML-series cards can be deployed at both the hub and the spoke sites. See the *ML-Series Metro Ethernet Design and Implementation Guide* for network configurations.

  Note When creating a hub-and-spoke topology, during creation of a PTP topology on an ML-series card that already has a PTP created on it, you cannot modify the base card configuration. This limitation ensures that the pre-existing base card configuration is retained.

  When deployed as RPR, all sites contain ML-series cards.

The Create Circuit wizard is used to repair a Layer 2 topology when the bottom circuit has been deleted or removed erroneously.

The Layer 2 Topology table reports the operational state and the state for each Layer 2 topology. For point-to-point topologies, the operational state reflects the state of the underlying optical circuit. For RPR topologies, the operational state can have one of the following values:

- In Service (IS)—RPR is in IS state when all the circuits underneath it are in IS state.
- In Service Partial (IS–Partial)—RPR is in IS–Partial state when only one circuit underneath it is in OOS state and all remaining circuits underneath it are in IS state.
- Out of Service (OOS)—RPR is in OOS state when more than two circuits underneath the RPR are in OOS state.

The Layer 2 Service Resync state provides the configuration synchronization state after discovery of the Layer 2 topology. The state can be In Progress, Complete, Partially Complete, Layer 2 Service Not Ready, or Sync Failed. VLAN status is different and is available in the Layer 2 Services table.

Prime Optical can discover a Layer 2 topology through the Create Layer 2 Topology wizard or Create Circuit wizard, through CTC, or through the TL1 interface.

A Layer 2 topology provisioned by this application is Layer 2 service enabled, meaning the optical circuit and the Cisco IOS configuration are set for subsequent Layer 2 services. However, a Layer 2 topology created through other means (such as through the Create Circuit wizard, CTC, or TL1 interface) is not Layer 2 service enabled. This is because the Cisco IOS configuration is missing. This type of Layer 2 topology must be Layer 2 service enabled if you want to provision Layer 2 services.

Note Layer 2 topology discovery in Prime Optical depends on the underlying L1 circuit endpoints and not on the shared packet ring (SPR) interface ID configured on the ML card. If you change the SPR interface ID on a card used in an RPR topology so that the ID is a duplicate of an SPR interface ID configured on another card in the topology, Prime Optical does not recognize the anomaly and does not display alarms.

Note Network Control Protocol (NCP) circuit update events received by Prime Optical might be scattered in time, especially in complex GNE-ENE network configurations. As a result, the discovery of L2 topologies in Prime Optical might be interrupted by a fixed, 5-minute delay before displaying an L2 topology as *Incomplete*. The fixed, 5-minute delay is a result of the Prime Optical L2 topology discovery algorithm, which takes into account the scattering of NCP events. An incomplete topology appears in the L2 Topology Table (along with its L2 links in the Link table) after the fixed, 5-minute delay has elapsed.

Note Do not create an L2 topology or add a card to the L2 topology in mixed high-level data link control (HDLC) and generic framing procedure (GFP) modes. If you create an L2 topology using cards in different modes, traffic cannot flow through the topology. An L2 topology with cards in mixed modes generates an Encapsulation Mismatch alarm, which indicates that traffic cannot be passed through the ring.

Note Use a fresh barebone configuration file when creating an RPR L2 topology on a card that was initially created with a PTP topology, or when creating a PTP L2 topology on a card that was initially created with an RPR topology. It is always better to create an L2 topology with a fresh barebone configuration file loaded on the card, because Prime Optical does not clear all of the old configuration on the card.

7.10.5 Viewing the Layer 2 Topology Table

In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**. The Layer 2 Topology table opens.

Tip You can also open the Layer 2 Topology table from the CTC-based NE Explorer. In the NE Explorer window, choose **Configuration > L2 Topology Table**.

The Layer 2 Topology table displays all the configured Layer 2 topologies. It also reports the bandwidth settings for each Layer 2 topology. These are set for each Layer 2 topology and added through the Layer 2 topology wizard. The following bandwidth settings are reported:

- SP management bandwidth
- Committed information rate (CIR) bandwidth
- Best-effort (BE) bandwidth
- AVVID_CONTROL
- Multicast priority queuing
- Service classes and bandwidth values for 802.17 RPRs

The following table describes the fields in the Layer 2 Topology table.

Table 7-57 Field Descriptions for the Layer 2 Topology Table

Column	Description
Layer 2 Topology Name	Displays the name of the topology.
Layer 2 Topology Alias	Displays the alias name of the topology.
Description	Displays the user-defined description of the topology.
Layer 2 Topology Type	Displays the topology type (point-to-point, RPR, or RPR_DOT17).
Layer 2 Topology Size	Displays the topology size. When the size of the circuit underneath is not the same, the value is Mixed.

Table 7-57 Field Descriptions for the Layer 2 Topology Table (continued)

Column	Description
Layer 2 Topology State	Displays the topology state (Complete, Incomplete, Complete-Wrapped, Complete-Steering, Incomplete-Wrapped, or Incomplete-Steering). The state of a point-to-point topology is always Complete. A complete RPR is one in which all of the circuits linking the ML-series cards in the RPR are known by Prime Optical. An incomplete RPR is one in which one or more ML-series cards in the RPR are missing. A complete RPR can become incomplete when one or more circuits forming the RPR are deleted by the user in CTC or another external interface. An incomplete RPR can become complete when all of the circuits forming the RPR become known. The topology enters the Complete-Wrapped/Incomplete-Wrapped state if one or more PoS ports related to the topology are shut down or if an RPR Wrapped alarm is generated and captured for any of the ML cards related to the L2 topology. The topology enters the Complete-Steering/Incomplete-Steering state if either the rpr-east or rpr-west ports related to the topology are shut down, or if an RPR Protection Active alarm is generated and captured for any of the ML cards related to the L2 topology. The ML Card table allows you to view additional information on the state of an L2 topology. See 7.10.5.1 Viewing the ML Card Table and Checking VLAN Alignment, page 7-245.
Layer 1 Protection	Displays the L1 protection state, either Fully Protected or Unprotected.
Operational State	Displays the operational states of the circuits underneath. Values include: • In Service (IS)—All circuits are in service. • In Service–Partial (IS–Partial)—One circuit is out of service and the rest are in service. • Out of Service (OOS)—More than two circuits are out of service.

Table 7-57 Field Descriptions for the Layer 2 Topology Table (continued)

Column	Description
Layer 2 Service Resync Status	Displays the Prime Optical status after trying to synchronize the configuration of all the ML-series cards in the topology. Values include: • Sync Failed—A card in the topology cannot resynchronize. • In Progress—Prime Optical is trying to synchronize configuration information for all ML-series cards in the topology. • Complete—The Layer 2 service discovery is complete or the resynchronization is complete. In this state, the Layer 2 service information is synchronized with the NE. • L2Service NotReady—One of the cards in the topology does not have a base card configuration. • Partially Completed—If Prime Optical cannot parse the configuration (for example, the configuration does not exist or is corrupt), the Layer 2 service discovery proceeds without acquiring the information from the ML card that has the problem. At the end of the discovery, the Layer 2 Service Resync Status is partially completed. You must reload the backed-up config file or the barebone config file (myconfig.txt) in the Prime Optical server installation directory/IosConfig. You must reload the backed-up configuration file or the barebone configuration file from a synchronized ML card to the card that is not synchronized. **Note** If the barebone configuration file is loaded in an ML slot, all previous configuration on the card is erased. **Note** When the Prime Optical server reboots and NEs are resynchronized, the Prime Optical database resynchronizes the information related to the ML cards. After resynchronization, the L2 topology moves to the Complete state. This entire process takes some time, which causes the L2 topology to remain in L2Service NotReady or Sync Failed state until the resynchronization is complete.
Service Provider Management Bandwidth	Displays the bandwidth percentage used for the service provider (SP) management traffic class. The sum of the percentage allocation for all traffic classes cannot exceed 99%. The bandwidth range for each traffic type has a minimum of 1% and a maximum of 99%. **Note** In an ML configuration, if the bandwidth is not used, the bandwidth utilization is rebalanced to use the assigned percentage.
Service Provider Management Class of Service	Class of service value for SP management traffic.
Committed Information Rate Bandwidth	Displays the bandwidth percentage used for the committed information rate (CIR) traffic class. The sum of the percentage allocation for all traffic classes cannot exceed 99%. The bandwidth range for each traffic type has a minimum of 1% and a maximum of 99%.
Committed Information Rate Class of Service	Class of service for CIR/PIR traffic.
AVVID Control Bandwidth	Allows you to set the bandwidth percentage used for the AVVID control. The sum of the percentage allocation for all traffic classes cannot exceed 99%. The bandwidth range for each traffic type has a minimum of 1% and a maximum of 99%.
AVVID Control Class of Service	Class of service for AVVID control traffic.
AVVID Voice/Video Bandwidth	Displays the bandwidth percentage used for the AVVID voice/video traffic class.

Table 7-57 Field Descriptions for the Layer 2 Topology Table (continued)

Column	Description
AVVID Voice/Video Class of Service	Class of service for AVVID voice/video traffic.
Best Effort Bandwidth	Displays the bandwidth percentage used for the best-effort traffic class. The sum of the percentage allocation for all traffic classes cannot exceed 99%. The bandwidth range for each traffic type has a minimum of 1% and a maximum of 99%.
CoS Commit	Committed class of service (CoS). This value is set when applying the base card configuration and the value is the same on all the cards in the topology. CoS values below this value are discard eligible.
Topology Bandwidth Utilized	Displays the bandwidth of the topology that is used by the configured Layer 2 services on the topology, in kilobits per second (kb/s).
Topology Bandwidth Available	Displays the bandwidth available for creating the L2 service on the topology, in kb/s. **Note** The available bandwidth is shown as "Over Subscribed" when the available bandwidth is less than the utilized bandwidth.
Multicast Group 1 Bandwidth	Displays the Multicast Group 1 bandwidth percentage.
Multicast Group 1 Class of Service	Displays the class of service for Multicast Group 1.
Multicast Group 2 Bandwidth	Displays the Multicast Group 2 bandwidth percentage.
Multicast Group 2 Class of Service	Displays the class of service for Multicast Group 2.

7.10.5.1 Viewing the ML Card Table and Checking VLAN Alignment

The ML Card table allows you to view information on the state of the ML cards that are part of the L2 topology.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 Select an L2 topology in the Layer 2 Topology table.

Step 3 Choose **Configuration > ML Cards**. The ML Card table opens. Table 7-58 provides descriptions.

Step 4 You can associate a specific ML1000 card in an 802.17 RPR with another ML1000 card as the standby card. Prime Optical configures the redundant interconnect commands in both cards to establish their working role and protect role and their association (through the peer MAC address). Prime Optical automatically replicates the VLAN drop configuration from the active ML card to the standby card. You can check the VLAN alignment between the active and standby cards by selecting a working ML1000 card in the ML Card table and choosing **Configuration > Check VLAN Alignment**. This menu option is dimmed if:

- The working card is not in the "Base card detection complete" configuration state.
- The protect card is not in the "Base card detection complete" configuration state.
- The card is not associated with any protect card.

If the cards are aligned, the following message is displayed:

```
The VLAN information is aligned for working and protect cards.
```

Step 5 If the ML cards are not aligned, you can merge the running configuration on the active card with the standby card (provided the Cisco IOS configuration on the standby card does not conflict with the active ML card). Click **OK** at the following prompt:

```
The VLAN configuration on the standby card differs from the configuration on the active
card. Do you want to force the alignment?
```

A Clone ML Card task is scheduled. The result of the task execution is available in the Job Monitor table.

Note The Check VLAN alignment functionality might not be able to align working and protect cards, even when the Clone ML Card task is successful. This can happen when there are conflicts between the Cisco IOS configurations of the protect and working cards. If the Check VLAN Alignment functionality cannot align working and protect cards, manually align the protect card using the ML Card CLI console.

Note The check VLAN alignment functionality detects only the misalignments between working and protect ML cards that are strictly related to VLAN drops. The following values are not checked for VLAN alignment: Ethernet port attributes (for example, MTU, speed, and flow control), COS accounting, and port enabling/disabling.

Table 7-58 Field Descriptions for the ML Card Table

Field	Description
NE ID	Displays the name of the NE.
Slot Number	Displays the ML card slot number.
Equipment Type	Displays the equipment type that the slot is provisioned for.
Configuration State	Displays information about the configuration state of the port. Values are: • Waiting for synchronization to complete • Synchronization failed • Synchronization completed • Base card configuration is in progress • Base card configuration failed • Base card configuration is complete • Base card detection is in progress • Base card detection failed • Base card detection complete
POS 0	For point-to-point and RPR topologies, displays the POS 0 port state. Values are Enabled or Disabled. For 802.17 RPR topologies, the value is N/A.
POS 1	For point-to-point and RPR topologies, displays the POS 1 port state. Values are Enabled or Disabled. For 802.17 RPR topologies, the value is N/A.

Table 7-58 Field Descriptions for the ML Card Table (continued)

Field	Description
RPR 0	For 802.17 RPR topologies, displays the RPR-IEEE interface on an ML card. Values are Enabled or Disabled. For point-to-point and RPR topologies, the value is N/A.
Additional Information	Displays additional information when the card enters a configuration state from which it cannot recover. Any of the following messages could be displayed when the Configuration State field shows "Base card configuration failed": • CoS Commit value does not match the topology value • The CoS Commit value specified is invalid • Policy Map does not exist • Exception occurred while retrieving bandwidth values • Bandwidth values do not exist for *bandwidth-class-name* • Invalid bandwidth values were found for *bandwidth-class-name* • Bandwidth values do not match *bandwidth-class-name*
Protect Card	For 802.17 RPR topologies with protection, displays the protect ML card.

7.10.6 Creating Layer 2 Topologies

Use the Create Layer 2 Topology wizard to set up a point-to-point, RPR, or 802.17 RPR topology.

Note Prime Optical does not discover Layer 2 topologies when it discovers underlying circuits in the Partial state. If the Layer 2 Topology table does not display a particular topology, check the circuit state in the Circuit table. This is a known problem; Layer 2 topology discovery depends on circuits that are in the Discovered state only.

7.10.6.1 Creating a Point-to-Point Layer 2 Topology

Note You must have the appropriate user privileges to use the Create Layer 2 Topology wizard.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Create L2 Topology** (or click the **Create L2 Topology** icon). The Create Layer 2 Topology wizard opens.

Tip You can also access the Create Layer 2 Topology wizard by choosing **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Create L2 Topology** in the Domain Explorer.

The following table describes the fields in the wizard. Fields shown depend on the type of topology selected.

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard

Field	Description
Navigation Pane	
The navigation pane on the left side of the wizard tells you where you are in the process of creating the L2 topology. The list of tasks shown initially is the default list of all possible tasks. As you move through the topology creation, you are taken to the appropriate task. You can use the navigation pane to jump quickly from one task to the next, or to an already visited task. Using the navigation pane is faster than using the Back and Next buttons, because you can jump over multiple panes in one step versus clicking Back or Next and moving through the panes sequentially. **Tip** As you proceed through the wizard, the panes you have visited are highlighted in white and identified by a number. Panes that are not applicable to the current creation sequence are shown in strikethrough italics.	
Topology Information, Topology Details	
Name	Enter a unique name for the new topology. The topology name is a free-format string, up to 30 ASCII characters.
Alias	Enter a unique alias name for the new topology. The alias name can contain alphanumeric characters. International character sets are also supported.
Description	Enter a description for the new topology, up to 60 ASCII characters.
L2 Topology Type	Select the type of topology you want to create: • Point-to-Point • Resilient Packet Ring • 802.17 Resilient Packet Ring **Note** The contents of subsequent wizard panes depend on the selected topology type.
Topology Information, Circuit Information (for point-to-point topologies)	
Circuit Type	Specify the type of circuit: STS and STS-v for SONET NEs; VC_HO_PATH_VCAT_CIRCUIT, VC_HO-v, VC_LO_PATH_VCAT_CIRCUIT, and VC_LO-v for SDH NEs.
Circuit Size	Specify the size of the circuit. STS circuit sizes are STS-1, STS-3c, STS-6c, STS-9c, STS-12c, and STC-24c. SDH circuit sizes are VC3, VC4, VC4-2c, VC4-3c, VC4-4c, and VC4-8c. **Note** The CE-MR-10 card supports STS-48c, VC4-16c, and VC4-64c circuit sizes.
L1 Protected Drops	This field is visible only if you select point-to-point as the topology type.
Topology Information, L1 Protection Information (for point-to-point topologies, for STS circuits only)	
Revertive	Specify whether traffic is reverted back to its original path when the conditions that diverted the circuit to the protect path are repaired. This field is visible only if you select point-to-point as the topology type.
Reversion Time	Specify the amount of time (in minutes) after which traffic reverts back to the original working path when conditions that caused the switch are cleared. The Cisco default is 5 minutes. This field is visible only if you select point-to-point as the topology type.
SF Threshold	Set the UPSR path-level SF threshold. This field is visible only for point-to-point topologies.
SD Threshold	Set the UPSR path-level SD threshold. This field is visible only for point-to-point topologies.

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
Switch on PDI-P	Specify whether traffic should switch based on a received STS payload defect indication. This field is visible only for point-to-point topologies.
Topology Information, VCAT (for point-to-point topologies, STS-v, VC_HO_PATH_VCAT_CIRCUIT, and VC_LO_PATH_VCAT_CIRCUIT)	
Symmetric	*Display only.* Provisions the same number of members in both directions. Symmetric is the default for STS VCAT circuits. Members use the same set of time slots but in opposite directions.
Member Size	Select a circuit size: • STS-1 • STS-3c • STS-12c • VC-3 • VC-4 • VC-4-4c **Note** See Step 5 and Step 6 of section 7.2.3.2 Creating a Regular or Open-Ended VCAT Circuit, page 7-37 for information on member sizes supported for CE-MR-10 cards.
Number of Members	Select the number of members, as follows: • ML-1000 and ML-1000T cards (supported on ONS 15454 SONET/SDH only), STS-1, STS-3c, STS-12c, VC4, VC4-4c, and VC3 can support two members. VT1.5 is not applicable. • FCMR card (supported on ONS 15454 SONET/SDH only) and STS-3c can support eight members. The FCMR with VC4-4c can support up to 16 members. The FCMR with STS-1 can support up to 48 members. STS-12c, VC3, and VT1.5 are not applicable. • ML-100T-8 card (supported on ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH only) and STS-1 can support one, two, or three members, and VT1.5 can support 1 to 64 members. STS-3c, STS-12c, VC4, VC4-4c, and VC3 are not applicable. • CE-100T-8 card (supported on ONS 15454 SONET only) and STS-1 can support one, two, or three members, and VT1.5 can support 1 to 64 members. STS-3c, STS-12c, VC4, VC4-4c, and VC3 are not applicable. • CE-MR-6 card (supported on ONS 15310 MA SONET and ONS 15310 MA SDH only) can support high-order circuits on STS-1-*n*v, where *n* is 1 to 21; and STS3c-*m*v, where *m* is 1 to 7. The equivalent high-order VC-4 VCAT bandwidth is VC-4-*m*v, where *m* is 1 to 7. For low-order circuits, CE-MR-6 supports VT1.5-*n*v, where *n* is 1 to 64; VC3-*m*v, where *m* is 1 to 21; and VC12-*m*v, where *m* is 1 to 63. **Note** See Step 5 and Step 6 of section 7.2.3.2 Creating a Regular or Open-Ended VCAT Circuit, page 7-37 for information on member sizes supported for CE-MR-10 cards.
Mode	Select the circuit mode using the mode radio buttons (None, SW-LCAS, or LCAS).
Source (for point-to-point topologies)	
NE ID	Select from the list of available nodes to specify the source node.
Subnetwork ID	Displays the subnetwork ID for the selected node.
Slot	Select a source slot from the list.

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
Port	Select a source port from the list.
STS	Select a source STS from the list.
VT	Select a Virtual Tributary (VT) from the list.
Destination (for point-to-point topologies)	
NE ID	Select from the list of available nodes to specify the destination node.
Subnetwork ID	Displays the subnetwork ID for the selected node.
Slot	Select a destination slot from the list.
Port	Select a destination port from the list.
STS	Select a destination STS from the list.
VT	Select a VT from the list.
NE Selection (for RPR Layer 2 and 802.17 RPR topologies)	
Subnetwork ID (Also displays NEs that are connected to NEs in this subnetwork)	Select the subnetwork from the drop-down list. After selecting a subnetwork, the Available NEs list includes all available NEs in that subnetwork as well as NEs that are topologically connected to NEs in that subnetwork.
Available NEs	Select one or more NEs from the list and click **Add** to add them to the Selected NEs field.
Selected NEs	Displays the NEs selected for the Layer 2 topology. Select one or more NEs and click **Remove** to remove them from the Selected NEs list.
Card Selection (for RPR Layer 2 and 802.17 RPR topologies)	
Available Cards	Select one or more cards from the list and click **Add** to add them to the Selected Cards list.
Selected Cards	Displays the cards selected for the Layer 2 topology. Select one or more cards and click **Remove** to remove them from the Selected Cards list.
Add Working	For 802.17 RPR topologies, click this button to add working cards to the Selected Cards list. **Note** Protection is supported only on ML1000-2 cards.
Add Protection	For 802.17 RPR topologies, click this button to add protection cards to the Selected Cards list. **Note** Protection is supported only on ML1000-2 cards.
Source (fields depend on the NE selected and the circuit type)	
Use Secondary Source	(For DRI, open UPSR, and open-ended SNCP circuits) Check to define a secondary source. Then, specify the slot, port, STS, DS-1, or VT for the secondary source.
NE ID	Select from the list of available NE IDs to specify the source NE ID.
Subnetwork ID	*Display only.* Displays the ID of the subnetwork associated with the circuit source.
Slot	Specify the source slot.
Port	Specify the source port.
STS	(For SONET circuits) Specify the source STS.
VC4	(For SDH circuits) Specify the source VC4.
VC3	(For SDH circuits) Specify the source VC3.
Destination (fields depend on the NE selected and the circuit type)	

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
Use Secondary Destination	(For DRI, open UPSR, and open-ended SNCP circuits) Check this check box to define a secondary destination. Then, specify the slot, port, STS, DS-1, or VT for the secondary destination.
NE ID	Select from the list of available TPs to specify the destination TP.
Subnetwork ID	*Display only.* Displays the ID of the subnetwork associated with the circuit destination.
Slot	Specify the destination slot.
Port	Specify the destination port.
STS	(For SONET circuits) Specify the destination STS.
VC4	(For SDH circuits) Specify the destination VC4.
VC3	(For SDH circuits) Specify the destination VC3.
Layer 2 Topology Bandwidth	
Prime Optical allows you to enter multiple CoS values that are the same. This is harmless and is consistent with the ML CLI, which allows the entry of multiple CoS values but sets only one value. The maximum bandwidth for 802.17 RPR topologies per circuit size is: • STS-1: 51840 kb/s • STS-3c: 155520 kb/s • STS-6c: 311040 kb/s • STS-9c: 466560 kb/s • STS-12c: 622080 kb/s • STS-24c: 1244160 kb/s • VC3: 48960 kb/s • VC4: 155520 kb/s • VC4-2c: 311040 kb/s • VC4-3c: 466560 kb/s • VC4-4c: 622080 kb/s • VC4-8c: 1244160 kb/s	
Enable Multicast Group 1 *(not available for 802.17 RPR topologies)*	Check the Enable Multicast Group 1 check box to enable the Multicast Group 1 bandwidth and Class of Service text boxes and display the default values for those text boxes. By default these check boxes are unchecked during topology creation. Only when you choose to enter these values (by selecting any of these check boxes) can you enter values related to bandwidth and CoS for that multicast group. **Note** Multicast Group 2 is enabled only after enabling Multicast Group 1.
Multicast Group 1 *(not available for 802.17 RPR topologies)*	Check the Enable Multicast Group 1 check box to enable the Multicast Group 1 bandwidth field. The default value (1%) is displayed. Edit this value as required. The valid range is from 1 to 95. **Note** The Multicast Group 1 check box is unchecked by default. You must check the Enable Multicast Group 1 check box before you can enter values in the Multicast Group 1 field.

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
Class of Service *(not available for 802.17 RPR topologies)*	Check the Enable Multicast Group 1 check box to enable the Class of Service field. The default value (4) is displayed. Edit this value as required. The valid range is from 0 to 7. **Note** The Enable Multicast Group 1 check box is unchecked by default. You must check the Enable Multicast Group 1 check box before you can enter values in the Class of Service field.
Enable Multicast Group 2 *(not available for 802.17 RPR topologies)*	Check the Enable Multicast Group 2 check box to enable the Multicast Group 2 bandwidth and Class of Service text boxes and display the default values for those text boxes. **Note** Multicast Group 2 is enabled only after enabling Multicast Group 1.
Multicast Group 2 *(not available for 802.17 RPR topologies)*	Check the Enable Multicast Group 2 check box to enable the Multicast Group 2 bandwidth box. The default value (1%) is displayed. Edit this value as required. The valid range is from 1 to 95. **Note** The Enable Multicast Group 2 check box is unchecked by default. You must check the Enable Multicast Group 2 check box before you can enter values in the Multicast Group 2 field.
Class of Service *(not available for 802.17 RPR topologies)*	Check the Enable Multicast Group 2 check box to enable the Class of Service field. The default value (6) is displayed. Edit this value as required. The valid range is from 0 to 7. **Note** The Enable Multicast Group 2 check box is unchecked by default. You must check the Enable Multicast Group 2 check box before you can enter values in the Class of Service field.
Low Latency Queue	Low Latency Queueing (LLQ) is used for latency/delay-sensitive traffic such as voice. On ML-series and CE-series cards, there is no limit on the bandwidth allocation of LLQ at the L2 topology level. It is limited only by input rate limiting of specific ports. Because some ports might be *trusted* (external CoS becomes internal CoS), Prime Optical does not know how much bandwidth might be used by LLQ, so it cannot reduce the calculated available bandwidth by the correct amount for the L2 topology. The actual available bandwidth allocation is the displayed available bandwidth value minus the amount (if any) that will be used for LLQ traffic. For 802.17 RPR topologies, the LLQ value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map low latency queuing to the selected service class. Choose **None** if you do not want to create the class map.
SP Management	Allows you to modify the bandwidth percentage used for the SP management traffic class. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology. For 802.17 RPR topologies, the SP Management value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map SP management to the selected service class. Choose **None** if you do not want to create the class map.
Committed Rate	Allows you to modify the bandwidth percentage used for the CIR traffic class. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology. For 802.17 RPR topologies, the Committed Rate value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map the committed rate to the selected service class. Choose **None** if you do not want to create the class map.

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
AVVID Control	Allows you to set the bandwidth percentage used for the AVVID control. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology. For 802.17 RPR topologies, the AVVID Control value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map the AVVID control to the selected service class. Choose **None** if you do not want to create the class map.
Default Best Effort	Allows you to modify the default bandwidth percentage used for the best-effort traffic class. Values are 0 to 99. By default, Prime Optical does not allow you to proceed if you set this field to 0, and Prime Optical automatically assigns any remaining bandwidth as the best-effort bandwidth. For example, if you enter 0, Prime Optical automatically assigns 99 as the best-effort bandwidth. For 802.17 RPR topologies, the Default Best Effort value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map the default best effort to the selected service class. Choose **None** if you do not want to create the class map.
Available (Excluding LLQ) *(not available for 802.17 RPR topologies)*	Available bandwidth percentage.
CoS Commit (CoS values below this value are discard eligible)	Committed CoS. This value is set when applying the base card configuration and the value is the same on all the cards in the topology.
Class of Service	Class of service for Low Latency Queueing, SP Management, Committed Rate, and AVVID Control types of traffic. The valid range is from 0 to 7. If the SP Management, Committed Rate, and AVVID Control values are 0, this field is disabled.
Class A (*for 802.17 RPR topologies*)	Enter the traffic limit, in Mb/s, for Class A traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Class A1 (*for 802.17 RPR topologies*)	Enter the traffic limit, in Mb/s, for Class A1 traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Class B-CIR (*for 802.17 RPR topologies*)	Enter the traffic limit, in Mb/s, for Class B-CIR traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Fairness Mode (*for 802.17 RPR topologies*)	*Display only.* Aggressive fairness mode is applied on all of the ML cards participating in the 802.17 RPR topology. Aggressive rate fairness is responsive to rate adjustments to requests. Conservative rate fairness is not supported.
Protection Frame (*for 802.17 RPR topologies*)	*Display only.* Jumbo frame support is applied on all of the ML cards participating in the 802.17 RPR topology. Jumbo frame support is set at the ring level and carried in the attribute discovery messages.
RPR Circuit Segment Details (for RPR and 802.17 RPR Layer 2 topologies)	

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
Auto Route Entire RPR	Enable or disable automatic RPR routing. If enabled, Prime Optical automatically determines the route for the RPR. Alternatively, you can choose manual routing and specify all the intermediate hops on a hop-by-hop basis. **Note** Selecting Auto Route Entire RPR disables all specific routing options on this window. Auto Route Entire RPR is enabled only if Apply to All Circuits is selected. When Apply to All Circuits is unchecked, the Auto Route Entire RPR check box is dimmed.
Routing Preferences	
Route Automatically	Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. Alternatively, you can disable automatic route selection and manually route the circuit where you specify all the intermediate hops on a hop-by-hop basis (up to 64 hops per circuit). You can manually route the circuit using either one of the following views: • Graphical—Provides a map view that displays the nodes and links you can use to create the circuits. You can select the nodes and links that you need for your circuit from the map view. • Textual—Provides a text view that lists the nodes and links you can use to create the circuits. **Note** If the source and destination of the circuit are on the same node, automatic routing is enabled.
Using Required Nodes/Links	(Available only if Route Automatically is checked) If checked, Prime Optical automatically routes the circuit through the required nodes and/or links. There are two ways you can specify the required nodes and links. Choose one of the following: • Graphical • Textual
Review Route Before Creation	(Available only if Route Automatically is checked) Check this check box to review the route before it is created.
VT-DS3 Mapped Conversion	(Available only if Route Automatically is checked) If checked, you can route the circuit using the DS3XM12 card. This field does not apply to data cards (ML-series and CE-100T-8 cards). VT-DS3 mapped conversion is for VAP circuits and is automatically selected while creating a VAP circuit using a DS3 port.
Time Slot Restriction	If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks. In case of an RPR, you can set this one at a time, for each circuit segment of the RPR. **Note** This field is disabled when you check the Auto Route Entire RPR and Apply to All Circuits check boxes in the RPR Circuit Segment Details area. It is enabled when you uncheck the Auto Route Entire RPR and Apply to All Circuits check boxes and proceed to automatically route the individual circuit segments. **Note** Time Slot Restriction is not available for OCHCC and OCHNC circuit creation types. **Note** For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
Fully Protected Layer 1	If selected, Prime Optical ensures that the Layer 1 circuit is fully protected. If the circuit must pass across unprotected links, Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications: • Required—Prime Optical ensures that the primary and alternate paths of the path-protected mesh networking (PPMN) portions of the complete circuit path are node-diverse. • Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the PPMN portions of the complete circuit path. • Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the PPMN portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
Node-Diverse Path Required	Prime Optical ensures that the primary and alternate paths of the PPMN portions of the complete circuit path are node-diverse.
Node-Diverse Path Desired	Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the PPMN portions of the complete circuit path.
Node-Diverse Path Don't Care	Prime Optical creates primary and alternate paths that are link-diverse for the PPMN portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
Protection Channel Access	To route the circuit on a BLSR protection channel, if available, uncheck **Fully Protected Path**, and check **Protection Channel Access**.
Dual Ring Interconnect	If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.
Diverse Shared Risk Link Group (SRLG)	If checked, fully protected circuits are routed through working and protected links that do not share risk groups.
Manual Provisioning (available if the Route Automatically check box is unchecked and the Enhanced Graphical radio button is selected)	
VCAT Member Number	(For VCAT circuits) Use the drop-down list to select route constraints for each member circuit.
Map view	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view is used to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default. • Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Include list with the default STS or VC4 value. The Add option applies to manual provisioning across all circuit types.

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
Available Spans	Select a link on the map view (related to the selected node) and its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field. The newly added link appears in blue on the map view.
Selected Spans	Select one or more spans and click **Remove** to remove them from the Selected Spans field. The removed link appears in green to indicate its unselected state. **Note** To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.
Manual Provisioning (available if the Route Automatically check box is unchecked and the Textual radio button is selected)	
Src NE ID	Displays the circuit source NE.
Dest NE ID	Displays the circuit destination NE.
Current NE ID	Displays the currently selected NE.
Adj NE ID	Displays all the NEs that are adjacent to the currently selected NE.
Available Links	Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
Available Spans	After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
Selected Spans	Select one or more spans and click **Remove** to remove them from the Selected Spans field.
Next Hop	Click **Next Hop** to specify the next intermediate hop.
Reset	Click **Reset** to reset all hop information to the default values.
Alternate Route	Click **Alternate Route** to specify hop information for the alternate circuit route.
Route Constraints (applicable only if the Using Required Nodes/Links check box is checked)	
VCAT Member Number	(For VCAT circuits) Use the drop-down list to select route constraints for each member circuit.
Map view	(For graphical manual provisioning) Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view is used for the inclusion and exclusion of links or nodes during the specification of route constraints. The included nodes are shown in blue and the excluded links are shown in magenta. Use the right-click menu options to navigate within the map view: • Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area. • Zoom In—Allows you to zoom in on an object in the map view. • Zoom Out—Allows you to zoom out on the map view. • Reset Zoom—Resets the current zoom level to the default.
Src NE ID	(For textual manual provisioning) Displays the circuit source NE.
Dest NE ID	(For textual manual provisioning) Displays the circuit destination NE.
Nodes	(For textual manual provisioning) Select **Nodes** if you want to add nodes to your circuit route.
Links	(For textual manual provisioning) Select **Links** if you want to add links to your circuit route.
Current NE ID	(For textual manual provisioning) Displays the currently selected NE.

Table 7-59 Field Descriptions for the Create Layer 2 Topology Wizard (continued)

Field	Description
Adj NE ID	(For textual manual provisioning) Displays all the NEs that are adjacent to the currently selected NE.
Available Links	(For textual manual provisioning) Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.
Select Nodes	(For textual manual provisioning) Lists all nodes related to the currently selected NE. Select a node from the list.
Selected Node/Link	Displays the currently selected NE or link.
Included Links/Nodes	Displays the list of links or nodes that are included in the route.
Excluded Links/Nodes	Displays the list of links or nodes that are excluded from the route.
Review Route (applicable only if the Review Route before creation check box is checked)	
VCAT Member Number	(For VCAT circuits) Use the drop-down list to view the route chosen for each member circuit.
Review Route	Displays the NEs that are available in the subnetwork for circuit creation. This pane also indicates the source and destination NEs (and secondary source and destination NEs, if applicable) selected for circuit creation. The map view displays information about the spans selected during autorouting in the subnetwork. The selected spans are shown in blue. When you select a span, its corresponding details are displayed in the Selected Span pane. The circuit summary displays the total hops and the cost for working and protect paths for the routed circuit.
Source NE ID	Displays the ID of the NE selected as the source node.
Destination NE ID	Displays the ID of the NE selected as the destination node.
Included Spans	If you enabled automatic route selection in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.
Selected Span	Displays detailed information about the span selected in the Included Spans list.
Circuit Summary	
Circuit Summary	Summarizes the selections you made in the wizard panes. To change the circuit summary, click **Back** and change your selection(s).

Step 3 In the Topology Information area, complete the following information:

- Name—Enter a unique name for the new topology. The topology name is a free-format string, up to 30 ASCII characters.
- Alias—Enter a unique alias name for the new topology. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a description for the new topology, up to 60 ASCII characters.
- L2 Topology Type—Choose **Point to Point**.
- Circuit Type—Specify the type of circuit: STS and STS-v for SONET NEs; VC_HO_PATH_CIRCUIT, VC_HO-v, VC_LO_PATH_CIRCUIT, and VC_LO-v for SDH NEs.

Note The Circuit Information area displays different fields depending upon the circuit type selected.

- Circuit Size—Specify the size of the circuit. STS circuit sizes are STS-1, STS-3c, STS-6c, STS-9c, STS-12c, and STS-24c. SDH circuit sizes are VC3, VC4, VC4-2c, VC4-3c, VC4-4c, and VC4-8c.
- L1 Protected Drops—Check this check box if you are adding Layer 1 protected drops.
- L1 Protection Information (for STS-type circuits only)—Complete the following information:
  - Revertive—Specify whether traffic is reverted back to its original path when the conditions that diverted the circuit to the protect path are repaired.
  - Reversion Time—Specify the amount of time (in minutes) after which traffic reverts back to the original working path when conditions that caused the switch are cleared. The Cisco default is 5 minutes.
  - SF Threshold—For STS circuits only. Set the UPSR path-level SF.
  - SD Threshold—For STS circuits only. Set the UPSR path-level SD threshold.
  - Switch on PDI-P—For STS circuits only. Specify whether traffic should switch based on a received STS payload defect indication.
- VCAT (for STS-v, VC_HO_PATH_VCAT_CIRCUIT, and VC_LO_PATH_VCAT_CIRCUIT circuits only)—Complete the following information:

Note For SDH nodes, only VC_HO_PATH_VCAT_CIRCUIT is supported on FCMR-4 cards.

  - Symmetric—*Display only.*
  - Member Size—Select a size for each VCAT member.
  - Mode—Select the protection mode for the VCAT circuit.

Step 4 Click **Next**.

Step 5 Specify the following information:

a. In the Source pane, specify the following; then, click **Next**:

- Use Secondary Source—Select to create a secondary source (if required)
- NE ID
- Subnetwork ID—*Display only.*
- Slot
- Port
- STS
- VT

b. In the Destination pane, specify the following; then, click **Next**:

- NE ID
- Subnetwork ID—*Display only.*
- Slot
- Port
- STS (applicable to OC-N cards only)
- VT

Step 6 In the Layer 2 Topology Bandwidth pane, configure the Enable Multicast Group 1 and Enable Multicast Group 2 panes as required. Specify the bandwidth percentage used for each traffic class; then, click **Next**.

Step 7 In the Routing Preferences pane, do the following; then, click **Next**:

a. Route Automatically—Enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. You can manually provision the circuit using one of the following views:

- Graphical
- Textual

b. Using Required Nodes/Links—(Available only if Route Automatically is checked) Check this check box to let Prime Optical automatically route the circuit through the required nodes and links. You can specify the required nodes and links using one of the following views:

- Graphical
- Textual

c. Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created.

d. Time Slot Restriction—If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks.

Note For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

e. Set the circuit path protection as follows:

- To route the circuit on a protected path, leave the **Fully Protected Path** check box checked (default) and proceed to the next substep. A fully protected circuit route is created based on the path diversity option you choose. Fully protected paths might or might not have SNCP path segments with primary and alternate paths. The path diversity options apply only to SNCP path segments, if any exist.
- To create an unprotected circuit, uncheck **Fully Protected Path** and go to Step 8.
- To route the circuit on an MS-SPRing protection channel, uncheck **Fully Protected Path**, check **Protection Channel Access**, and go to Step 8.

f. If you selected **Fully Protected Path**, choose one of the following options:

- Required—Ensures that the primary and alternate paths within the extended SNCP mesh network portions of the complete circuit path are nodally diverse.
- Desired—Specifies that node diversity is preferred; however, if node diversity is not possible, link-diverse paths are created for the extended SNCP mesh network portion of the complete circuit path.
- Don't Care: Link Diverse Only—Specifies that only link-diverse primary and alternate paths for extended SNCP mesh network portions of the complete circuit path are needed.
- Dual Ring Interconnect—Provisions the circuit in a DRI topology. If selected, the other node specifications (Required, Desired, and Don't Care: Link Diverse Only) are disabled.

Step 8 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Graphical radio button is selected), do the following; then, click **Next**:

a. Use the map view to manually route the circuit from the source to the destination specified by the addition of the links selected. Use the right-click menu options to navigate within the map view:
   - Find Node—Opens the Find Node dialog box, which lists all of the nodes displayed in the map view. Select a node from the drop-down list and click **OK**. The selection context in the map view changes to show the selected node highlighted in the visible map area.
   - Zoom In—Allows you to zoom in on an object in the map view.
   - Zoom Out—Allows you to zoom out on the map view.
   - Reset Zoom—Resets the current zoom level to the default.
   - Add—Allows you to add the selected span. Right-click a link and choose **Add** in the right-click menu. The selected link is added to the Available Spans list. The Add option applies to manual provisioning across all circuit types.

b. In the VCAT Member Number list box, select the member for which the route is to be selected.

c. In the circuit display, select the span to use for the next hop.

d. In the Available Spans area, complete the following information:
   - From—Displays the source of the span
   - To—Displays the destination of the span

e. Click **Add**. The span is added to the Selected Spans list.

f. Repeat substeps b to d for each intermediate NE until the destination NE is reached.

g. Repeat substeps a to e for each member until all members are routed.

h. To delete a span from the Selected Spans area, select a span from the Selected Spans list and click **Remove**.

Note To specify a DRI link, double-click the link on the map. The map view displays the link as bidirectional.

i. (For BLSR DRI or MS-SPRing DRI circuits) In the BLSR DRI Nodes or MS-SPRing DRI Nodes tab, click the **Add** button to open the BLSR/MS-SPRing DRI dialog box, which allows you to provide primary and secondary pairs for traditional and nontraditional DRI circuits. Also specify ring and path options for the first and second rings. Click **Remove** to remove a DRI node from the list.

Step 9 In the Manual Provisioning pane (available when Route Automatically is unchecked and the Textual radio button is selected), do the following; then, click **Next**:

a. Specify the following:
   - Src NE ID—*Display only.*
   - Dest NE ID—*Display only.*
   - Current NE ID—*Display only.*
   - Adj NE ID—*Display only.*
   - Available Links—Lists all links between the currently selected and adjacent NEs. Select a link from the drop-down list.

- Available Spans—After you select a link from the Available Links drop-down list, its corresponding details are displayed in the Available Spans pane. Click **Add** to move the spans to the Selected Spans field.
- Selected Spans—Select one or more spans and click **Remove** to remove them from the Selected Spans field.

b. Click **Next Hop** to specify the next intermediate hop; then, repeat substep a.

c. Click **Reset** to reset all hop information to the default values.

d. Click **Alternate Route** to specify hop information for the alternate circuit route.

Step 10 In the VT Options pane (available only if you are creating a VT circuit and Route Automatically is selected), choose one of the following radio buttons; then, click **Next**:

- VT Tunnel on Transit Nodes
- VAP
- None

Step 11 If you created a VT aggregation point, in the VT Grooming Node selection pane, select the following:

- STS Grooming Node
- VT Grooming Node

Step 12 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Graphical radio button is selected), a graphical representation of the circuit is displayed, including source and destination nodes. Specify the spans that will route to the circuit. Prime Optical starts at the source node. The next NE associated with each span is also displayed. Complete the following substeps:

a. In the circuit display, select the node or link. The NE ID or link ID is displayed in the Selected Node/Link field.

b. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

c. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

d. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

e. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

f. Repeat substeps a to e for each node or link that you want to include in the circuit route.

g. (Optional) Repeat substeps a to f for each intermediate NE until the destination NE is reached.

h. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 13 In the Route Constraints pane (available when Route Automatically and Using Required Nodes/Links are enabled and the Textual radio button is selected), specify the nodes or links to include in each hop of the circuit route. Complete the following substeps:

a. Select **Nodes** in the Select Nodes/Links area if you want to add nodes to your circuit route; then, specify the node information in the Select Nodes area.

b. Select **Links** in the Select Nodes/Links area if you want to add links to your circuit route; then, specify the link information in the Select Links area.

c. Click **Add** to add a BLSR-DRI or MS-SPring-DRI to the circuit route.

d. Click **Include** to include the selected node or link in the route. The node or link appears in the Included Links/Nodes list.

e. Click **Exclude** to exclude the selected node or link from the route. The node or link appears in the Excluded Links/Nodes list.

f. Click **Remove** to remove the selected node or link from the Included Links/Nodes or Excluded Links/Nodes lists.

g. Click **Up** or **Down** to set the sequence of the nodes and spans included in the circuit.

h. Repeat substeps a to e for each node or link that you want to include in the circuit route.

i. Click **Finish**, or, if Review Route Before Creation is checked in the Routing Preferences pane, click **Next**.

Step 14 In the Review Route pane (available only if Review Route Before Creation is checked), review the following information; then, click **Finish**:

a. In the circuit display, review the ID of the source and destination NEs.

b. Included Spans—Because automatic route selection is enabled in the Routing Preferences pane, Prime Optical automatically selects spans to route the circuit. This field lists all the spans that the Prime Optical server selected automatically.

c. Selected Span—Displays the following information about the span selected in the Included Spans list:

- From—Span source
- To—Span destination
- Source—Select the source (STS for SONET NEs or VC4 for SDH NEs) from the drop-down list
- VT—Select the VT time slot (SONET NEs only)

Note If you selected VT as the circuit type in the Attributes pane, chose Review Route Before Creation in the Routing Preferences pane, and selected VT Tunnel on Transit Nodes in the VT Options pane, the VT tunnel is created regardless of whether or not you are finished provisioning the circuit. Even if you click the Back button in the Review Route pane and change the VT circuit options, the newly created VT tunnel will not be deleted.

Step 15 In the confirmation dialog box, click **OK**.

Note It might take 10 minutes or more for Prime Optical to resynchronize with the NEs.

Caution It takes several seconds to create a circuit. During that interval, if a new circuit is added with the same name, both circuits might be identified as duplicates. Therefore, be careful not to add a duplicate circuit during the creation of the first circuit.

7.10.6.2 Creating an RPR or 802.17 RPR Layer 2 Topology

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Create L2 Topology**. The Create Layer 2 Topology wizard opens. Table 7-59 on page 7-248 provides descriptions. The fields displayed depend on the type of topology selected.

Tip You can also access the Create Layer 2 Topology wizard by choosing **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Create L2 Topology** in the Domain Explorer.

Note You must have the appropriate user privileges to use the Create Layer 2 Topology wizard.

Step 3 In the Topology Information area, complete the following information:

- Name—Enter a unique name for the new topology. The topology name is a free-format string, up to 30 ASCII characters.
- Alias—Enter a unique alias name for the new topology. The alias name can contain alphanumeric characters. International character sets are also supported.
- Description—Enter a description for the new topology, up to 60 ASCII characters.
- L2 Topology Type—Choose **Resilient Packet Ring** or **802.17 Resilient Packet Ring**.

Note The ML cards must be in 802.17 RPR mode before you can create an 802.17 RPR topology.

Step 4 Click **Next**.

Step 5 In the NE Selection area, complete the following information:

a. Select the subnetwork ID from the drop-down list. After selecting a subnetwork, the Available NEs list includes all available NEs in that subnetwork as well as NEs that are topologically connected to NEs in that subnetwork.

b. Add at least two NEs to the topology by selecting NEs from the Available NEs list and clicking **Add**. Delete an NE from the topology by selecting the NE from the Selected NEs list and clicking **Remove**.

c. Rearrange the sequence of the NEs in the Selected NEs list by clicking the **Up** or **Down** arrows.

Step 6 Click **Next**.

In the Card Selection area, add a card to the topology by selecting a card from the Available Cards list and clicking **Add**. Delete a card from the topology by selecting the card from the Selected Cards list and clicking **Remove**. For 802.17 RPR topologies, click **Add Working** or **Add Protection** to add working or protection cards to the Selected Cards list. Note that protection is supported only on ML1000-2 cards.

Step 7 Click **Next**.

Step 8 In the Layer 2 Topology Bandwidth pane, configure the Enable Multicast Group 1 and Enable Multicast Group 2 panes as required for RPR topologies. Specify the bandwidth percentage (for RPR topologies) or value (for 802.17 RPRs) used for each traffic class; then, click **Next**.

Step 9 In the RPR Circuit Segment Details area, do the following:

a. Route the entire RPR automatically by checking **Auto route entire RPR**.

b. If **Auto route entire RPR** is unchecked, select a circuit segment from the list; then, specify its route type. Select either Auto, for automatic route, or Manual, to manually set the route.

Note The Auto route entire RPR option is available only if the Apply to all Circuits check box is checked.

c. If **Apply to all Circuits** is checked, the circuit type and size are applied to all the circuits in the RPR. If it unchecked, you can select a different circuit type and size for each individual circuit in the RPR.

d. In the Circuit Type field, specify the type of circuit. For the ONS 15454 SONET, select **STS**. For the ONS 15454 SDH, select **VC_HO_PATH_CIRCUIT** or **VC_LO_PATH_CIRCUIT**.

e. In the Circuit Size field, specify the size of the circuit. STS circuit sizes are STS-1, STS-3c, STS-6c, STS-9c, STS-12c, and STS-24c. SDH circuit sizes are VC3, VC4, VC4-2c, VC4-3c, VC4-4c, and VC4-8c.

Step 10 Click **Next**.

Step 11 If you specified the route type for a specific segment as Auto, continue to Step 12. If you specified the route type for a specific segment as Manual, continue to Step 13. If you selected to route the entire RPR automatically, complete the following information:

- Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if the circuit must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:
  - Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
  - Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
  - Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
- Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel. Once you enable PCA, a label reading PCA will appear on the link.

Step 12 If you specified the route type for a specific segment as Manual, continue to Step 13. If you selected to route the entire RPR automatically, continue to Step 14. If you specified the route type for a specific segment as Auto, complete the following information:

a. Using Required Nodes/Links—Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links.

b. Review Route Before Creation—Check this check box to review the route before it is created.

c. Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if the circuit must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

- Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
- Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
- Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.

d. Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel. Once you enable PCA, a label reading PCA will appear on the link.

e. Click **Next** to specify the route constraints (available when Route Automatically and Using Required Nodes/Links are enabled):

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Nodes—Click this radio button if you want to add nodes to the route.
- Links—Click this radio button if you want to add links to the route; then, choose **Current NE ID**, **Adj NE ID**, or **Available Links**.

f. Click **Include** to add the selected node or link to the route constraint, or **Exclude** to remove the selected node or link from the route constraint.

g. If the Review Route Before Creation check box (available when Route Automatically and Review Route before Creation are enabled) is checked and there are more segments for which you need to specify the routing information, click **Next**. RPR circuit segment details are displayed.

Step 13 If you specified the route type for a specific segment as Manual, complete the following information:

a. Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if the circuit must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

- Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
- Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
- Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.

b. Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel. Once you enable PCA, a label reading PCA will appear on the link.

c. Click **Next** to specify the following information:

- Source Node—Displays the source node
- Destination—Displays the destination node
- Current Node—Displays the current node
- Adj NEID—Select the adjacent NE ID from the drop-down list

- Available Links—Select a link from the drop-down list

d. Select the span from the Available Spans area. Span information includes:
   - From—Start point of the span
   - To—Endpoint of the span
   - Source STS

e. Click **Add** to add the span to the Selected Spans list. Click **Remove** to remove spans from the Selected Spans list.

f. Click **Next Hop** to specify links and nodes for the next hop. Complete substeps a through c for each hop.

g. Click **Reset** to reset the link and node information.

h. Click **Alternate Route** to provision an alternate route.

i. If there are more segments for which you need to specify routing information, click **Next**. RPR circuit segment details are displayed.

Step 14 Click **Finish**.

Note
- It might take 10 minutes or more for Prime Optical to resynchronize with the NEs.
- For 802.17 RPRs, the active or standby configuration support is based on the Ring Interconnect feature. A Ring Interconnect switchover can be done only by shutting down the Gigabit or RPR-IEEE interfaces. If one of the cards is unplugged, the Ring Interconnect feature does not work because the peer is unavailable.

7.10.7 Deleting Layer 2 Topologies

You cannot delete a Layer 2 topology if there are VLANs associated with it. Be sure to delete all VLANs associated with the Layer 2 topology before deleting the Layer 2 topology. See 7.5.2 Tracing VLANs, page 7-219.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, select the topology that you want to delete and choose **Configuration > Delete L2 Topology** (or click the **Delete L2 Topology** tool).

Step 3 In the confirmation dialog box, click **Yes**.

7.10.8 Enabling Layer 2 Services

To ensure that provisioning is available for Layer 2 services, the Layer 2 topology attributes must be configured correctly on the underlying optical circuits. A Layer 2 topology can be configured using the TL1 interface, CTC, or Prime Optical. Layer 2 topologies configured using Prime Optical are Layer 2 service-ready. Layer 2 topologies configured using the TL1 interface, CTC, or Prime Optical Create Circuit wizard are not Layer 2 service-ready. Some examples of the latter case are:

- The optical circuit(s) of the Layer 2 topology are provisioned using the TL1 interface for Operations System Modifications for the Integration of Network Elements (OSMINE) compliance.
- You want to resize the optical circuits and instead of deleting the entire Layer 2 topology, you delete each circuit from an existing Layer 2 topology and add a new circuit with the new size until all circuits have been resized. This could result in a service outage.
- You want to add or delete an optical circuit from an existing Layer 2 topology.

Complete the following steps to enable Layer 2 services:

Step 1 Create a point-to-point, RPR, or 802.17 RPR topology with ML-series cards using the TL1 interface, CTC, or the Create Circuit wizard.

Step 2 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**. The Layer 2 Topology table opens. The new topology is listed and its Layer 2 Service Resync Status is *L2Service NotReady*.

Step 3 In the Layer 2 Topology table, choose **Configuration > Enable L2 Service**. Depending on which type of topology you are enabling, one of the following dialog boxes displays: point-to-point and/or RPR (see Table 7-60) or 802.17 RPR (see Table 7-61).

Step 4 After making your selections, click **Apply**.

If circuits forming the RPR are created with names following the CTM naming convention (for example, *cktname.1CTML* or *cktname.2CTML*), the RPR has the name *cktname*. If the CTM naming convention is not followed, the RPR has the name of one of the circuits in the RPR topology.

Table 7-60 Field Descriptions for the Enable L2 Service—Point-to-Point and RPR Bandwidth Tab

Field	Description
Multicast Priority Queuing	
Enable Multicast Group 1	Check to enable the Multicast Group 1 bandwidth and Class of Service text boxes and display the default values for those text boxes. **Note** The Enable Multicast Group 1 check box is checked by default during Layer 2 topology modification if you previously specified the multicast bandwidth parameters for the L2 topology (either during L2 topology creation or during the last modify operation), and you can modify the Multicast Group 1 and Class of Service text boxes. If the Multicast Group 1 and Class of Service text boxes were not configured when the Layer 2 topology was created (and hence these check boxes are unchecked by default), you can check the check box to configure the Multicast Group 1 and Class of Service text boxes for the group if required. To remove the priority multicast command already set for the topology, you can uncheck the check box and the command is removed from the card.
Multicast Group 1 (%)	The default value is 1%. Edit this value as required. The valid range is from 1 to 95.
Class of Service	The default value is 4. Edit this value as required. The valid range is from 0 to 7.

Table 7-60 Field Descriptions for the Enable L2 Service—Point-to-Point and RPR Bandwidth Tab (continued)

Field	Description
Enable Multicast Group 2	Check to enable the Multicast Group 2 bandwidth and Class of Service text boxes and display the default values for those text boxes. **Note** The Enable Multicast Group 2 check box is checked by default during Layer 2 topology modification if you previously specified the multicast bandwidth parameters for the L2 topology (either during L2 topology creation or during the last modify operation), and you can modify the Multicast Group 2 and Class of Service fields. If the Multicast Group 2 and Class of Service fields were not configured when the Layer 2 topology was created (and hence these check boxes are unchecked by default), you can check the check box to configure the Multicast Group 2 and Class of Service fields for the group if required. To remove the priority multicast command already set for the topology, you can uncheck the check box and the command is removed from the card.
Multicast Group 2 (%)	The default value is 1%. Edit this value as required. The valid range is from 1 to 95.
Class of Service	The default value is 6. Edit this value as required. The valid range is from 0 to 7.
Low Latency Queue	Low Latency Queueing (LLQ) is used for latency/delay-sensitive traffic such as voice. On ML-series and CE-series cards, there is no limit on the bandwidth allocation of LLQ at the L2 topology level. It is limited only by input rate limiting of specific ports. Because some ports might be *trusted* (external CoS becomes internal CoS), Prime Optical does not know how much bandwidth might be used by LLQ, so it cannot reduce the calculated available bandwidth by the correct amount for the L2 topology. The actual available bandwidth allocation is the displayed available bandwidth value minus the amount (if any) that will be used for LLQ traffic.
SP Management	Allows you to modify the bandwidth percentage used for the SP management traffic class. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology.
Committed Rate	Allows you to modify the bandwidth percentage used for the CIR traffic class. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology.
AVVID Control	Allows you to set the bandwidth percentage used for the AVVID control. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology.
Default Best Effort	Allows you to modify the default bandwidth percentage used for the best-effort traffic class. Values are 0 to 99. By default, Prime Optical does not allow you to proceed if you set this field to 0, and Prime Optical automatically assigns any remaining bandwidth as the best-effort bandwidth. For example, if you enter 0, Prime Optical automatically assigns 99 as the best-effort bandwidth.
Available (%)	Displays the available bandwidth.
CoS Commit	Committed CoS. This value is set when applying the base card configuration and the value is the same on all the cards in the topology. CoS values below this value are discard eligible.
Class of Service	Class of service for LLQ, SP management, CIR/PIR, and AVVID control types of traffic. The valid range is from 0 to 7.

Table 7-61 Field Descriptions for the Enable L2 Service—802.17 RPR Bandwidth Tab

Field	Description
Class A	Modify the traffic limit, in Mb/s, for Class A traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Class A1	Modify the traffic limit, in Mb/s, for Class A1 traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Class B-CIR	Modify the traffic limit, in Mb/s, for Class B-CIR traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Fairness Mode	*Display only.* Aggressive fairness mode is applied on all of the ML cards participating in the 802.17 RPR topology. Aggressive rate fairness is responsive to rate adjustments to requests. Conservative rate fairness is not supported.
Protection Frame	*Display only.* Jumbo frame support is applied on all of the ML cards participating in the 802.17 RPR topology. Jumbo frame support is set at the ring level and carried in the attribute discovery messages.
Class Map Configuration	
Low Latency Queue	Select **a**, **b**, or **c** from the drop-down list to map low latency queuing to the selected service class. Choose **None** if you do not want to create the class map.
SP Management	Select **a**, **b**, or **c** from the drop-down list to map SP management to the selected service class. Choose **None** if you do not want to create the class map.
Committed Rate	Select **a**, **b**, or **c** from the drop-down list to map the committed rate to the selected service class. Choose **None** if you do not want to create the class map.
AVVID Control	Select **a**, **b**, or **c** from the drop-down list to map the AVVID control to the selected service class. Choose **None** if you do not want to create the class map.
Default Best Effort	Select **a**, **b**, or **c** from the drop-down list to map the default best effort to the selected service class. Choose **None** if you do not want to create the class map.
CoS Commit	Committed CoS. This value is set when applying the base card configuration and the value is the same on all cards in the topology. CoS values below this value are discard eligible.
Class of Service	Class of service for LLQ, SP management, CIR/PIR, and AVVID control types of traffic. The valid range is from 0 to 7.

The maximum bandwidth for 802.17 RPR topologies per circuit size is as follows:

- STS-1: 51840 kb/s
- STS-3c: 155520 kb/s
- STS-6c: 311040 kb/s
- STS-9c: 466560 kb/s
- STS-12c: 622080 kb/s
- STS-24c: 1244160 kb/s
- VC3: 48960 kb/s
- VC4: 155520 kb/s

- VC4-2c: 311040 kb/s
- VC4-3c: 466560 kb/s
- VC4-4c: 622080 kb/s
- VC4-8c: 1244160 kb/s

7.10.9 Modifying Layer 2 Topologies

Note For the Layer 2 topology modification operation, you should wait until the changes are applied and reflected in the Layer 2 Topology table before modifying another Layer 2 topology.

Use the Modify Layer 2 Topology window to modify the parameters of the selected Layer 2 topology. The window has two tabs, General and Bandwidth.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, select the appropriate topology and choose **Configuration > Modify L2 Topology** (or click the **Modify L2 Topology** tool).

Step 3 Click the **General** tab to modify the settings in the following table, as required.

Table 7-62 Field Descriptions for the Modify Layer 2 Topology—General Tab

Field	Description
Modify Layer 2 Topology	
L2 Topology Name	Allows you to modify the name of the topology.
L2 Topology Alias	Allows you to modify the alias name of the topology.
Description	Allows you to modify the user-defined description of the topology.
L2 Topology Type	*Display only.* Displays the topology type (point-to-point, RPR, or 802.17 RPR).
L2 Topology Size	*Display only.* Displays the topology size.

Step 4 Click **Apply** to apply your settings or **Reset** to use the default settings.

Note A progress animator is displayed while the new settings are being applied.

Step 5 Click the **Bandwidth** tab to modify the settings in the following table, as required.

Note Prime Optical allows you to enter multiple CoS values that are the same. This is harmless and is consistent with the ML CLI, which allows the entry of multiple CoS values but sets only one value.

Table 7-63 Field Descriptions for the Modify Layer 2 Topology—Bandwidth Tab

Field	Description
L2 Topology Bandwidth	
The maximum bandwidth for 802.17 RPR topologies per circuit size is: • STS-1: 51840 kb/s • STS-3c: 155520 kb/s • STS-6c: 311040 kb/s • STS-9c: 466560 kb/s • STS-12c: 622080 kb/s • STS-24c: 1244160 kb/s • VC3: 48960 kb/s • VC4: 155520 kb/s • VC4-2c: 311040 kb/s • VC4-3c: 466560 kb/s • VC4-4c: 622080 kb/s • VC4-8c: 1244160 kb/s	
Class A *(for 802.17 RPR topologies)*	Modify the traffic limit, in Mb/s, for Class A traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Class A1 *(for 802.17 RPR topologies)*	Modify the traffic limit, in Mb/s, for Class A1 traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Class B-CIR *(for 802.17 RPR topologies)*	Modify the traffic limit, in Mb/s, for Class B-CIR traffic. The range depends on the topology circuit size. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.
Fairness Mode *(for 802.17 RPR topologies)*	*Display only.* Aggressive fairness mode is applied on all of the ML cards participating in the 802.17 RPR topology. Aggressive rate fairness is responsive to rate adjustments to requests. Conservative rate fairness is not supported.
Protection Frame *(for 802.17 RPR topologies)*	*Display only.* Jumbo frame support is applied on all of the ML cards participating in the 802.17 RPR topology. Jumbo frame support is set at the ring level and carried in the attribute discovery messages.
Enable Multicast Group 1 *(for point-to-point and RPR topologies)*	Check the Enable Multicast Group 1 check box to enable the Multicast Group 1 bandwidth and Class of Service text boxes and display the default values for those text boxes. **Note** The Enable Multicast Group 1 check box is checked by default during Layer 2 topology modification if you previously specified the multicast bandwidth parameters for the L2 topology (either during L2 topology creation or during the last modify operation), and you can modify the Multicast Group 1 and Class of Service text boxes. If the Multicast Group 1 and Class of Service text boxes were not configured when the Layer 2 topology was created (and hence these check boxes are unchecked by default), you can check the check box to configure the Multicast Group 1 and Class of Service text boxes for the group if required. To remove the priority multicast command already set for the topology, you can uncheck the check box and the command is removed from the card.

Table 7-63 Field Descriptions for the Modify Layer 2 Topology—Bandwidth Tab (continued)

Field	Description
Multicast Group 1 *(for point-to-point and RPR topologies)*	Check the Enable Multicast Group 1 check box to enable the Multicast Group 1 bandwidth box. The default value (1%) is displayed. Edit this value as required. The valid range is from 1 to 95.
Class of Service *(for point-to-point and RPR topologies)*	Check the Enable Multicast Group 1 check box to enable the Class of Service box. The default value (4) is displayed. Edit this value as required. The valid range is from 0 to 7.
Enable Multicast Group 2 *(for point-to-point and RPR topologies)*	Check the Enable Multicast Group 2 check box to enable the Multicast Group 2 bandwidth and Class of Service text boxes and display the default values for those text boxes. **Note** The Enable Multicast Group 2 check box is checked by default during Layer 2 topology modification if you previously specified the multicast bandwidth parameters for the L2 topology (either during L2 topology creation or during the last modify operation), and you can modify the Multicast Group 2 and Class of Service fields. If the Multicast Group 2 and Class of Service fields were not configured when the Layer 2 topology was created (and hence these check boxes are unchecked by default), you can check the check box to configure the Multicast Group 2 and Class of Service fields for the group if required. To remove the priority multicast command already set for the topology, you can uncheck the check box and the command is removed from the card.
Multicast Group 2 *(for point-to-point and RPR topologies)*	Check the Enable Multicast Group 2 check box to enable the Multicast Group 2 bandwidth box. The default value (1%) is displayed. Edit this value as required. The valid range is from 1 to 95.
Class of Service *(for point-to-point and RPR topologies)*	Check the Enable Multicast Group 2 check box to enable the Class of Service box. The default value (6) is displayed. Edit this value as required. The valid range is from 0 to 7.
Class Map Configuration	
Low Latency Queue	Low Latency Queueing (LLQ) is used for latency/delay-sensitive traffic such as voice. On ML-series and CE-series cards, there is no limit on the bandwidth allocation of LLQ at the L2 topology level. It is limited only by input rate limiting of specific ports. Because some ports might be *trusted* (external CoS becomes internal CoS), Prime Optical does not know how much bandwidth might be used by LLQ, so it cannot reduce the calculated available bandwidth by the correct amount for the L2 topology. The actual available bandwidth allocation is the displayed available bandwidth value minus the amount (if any) that will be used for LLQ traffic. For 802.17 RPR topologies, the LLQ value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map low latency queuing to the selected service class. Choose **None** if you do not want to create the class map.
SP Management	Allows you to modify the bandwidth percentage used for the SP management traffic class. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology. For 802.17 RPR topologies, the SP Management value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map SP management to the selected service class. Choose **None** if you do not want to create the class map.

Table 7-63 Field Descriptions for the Modify Layer 2 Topology—Bandwidth Tab (continued)

Field	Description
Committed Rate	Allows you to modify the bandwidth percentage used for the CIR traffic class. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology. For 802.17 RPR topologies, the Committed Rate value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map the committed rate to the selected service class. Choose **None** if you do not want to create the class map.
AVVID Control	Allows you to set the bandwidth percentage used for the AVVID control. Values are 0 to 99. If the value is 0, Prime Optical does not set this value in the CLI for the cards participating in the topology. For 802.17 RPR topologies, the AVVID Control value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map the AVVID control to the selected service class. Choose **None** if you do not want to create the class map.
Default Best Effort	Allows you to modify the default bandwidth percentage used for the best-effort traffic class. Values are 0 to 99. By default, Prime Optical does not allow you to proceed if you set this field to 0, and Prime Optical automatically assigns any remaining bandwidth as the best-effort bandwidth. For example, if you enter 0, Prime Optical automatically assigns 99 as the best-effort bandwidth. For 802.17 RPR topologies, the Default Best Effort value is not a percentage but a selectable value. Choose **a**, **b**, or **c** from the drop-down list to map the default best effort to the selected service class. Choose **None** if you do not want to create the class map.
Available (Excluding LLQ) *(for point-to-point and RPR topologies)*	Displays the available bandwidth.
CoS Commit	Committed CoS. This value is set when applying the base card configuration and the value is the same on all the cards in the topology. CoS values below this value are discard eligible.
Class of Service	Class of service for LLQ, SP management, CIR/PIR, and AVVID control types of traffic. The valid range is from 0 to 7.

Step 6 Click **Apply** to apply your settings or **Reset** to use the default settings.

Step 7 Click **Close**.

7.10.10 Filtering the Layer 2 Topology Table

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**. The Layer 2 Topology table opens.

Step 2 Choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog opens.

Step 3 Use the Filter dialog box to filter data according to criteria that you select and to display the results in the Layer 2 Topology table. The following table provides descriptions.

Step 4 After making your selections, click **OK**.

Table 7-64 Field Descriptions for the Layer 2 Topology Table Filter Dialog Box

Tab	Description
L2 Topology Names	Displays the available topologies. Click **Add** and **Remove** to move topologies to and from the selected list. If you want to filter topologies and the name is not important, check the **Ignore Topology Names** check box.
L2 Topology Size	Allows you to filter topologies based on circuit size. Click **All** to include all circuit sizes in the filter.
L2 Topology Type	Allows you to filter topologies based on topology type. Click **All** to include all topology types in the filter.
L2 Topology State	Allows you to filter topologies based on circuit state (Complete or Incomplete). Click **All** to include all circuit states in the filter.

7.10.11 Modifying Ports in Layer 2 Topologies

Use the Modify Ports dialog box to modify Layer 2 topology endpoints.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Modify Ports**. The Modify Ports dialog box opens. The following table provides descriptions.

Step 3 Configure the values in the NE/Slot and Enable/Disable Port areas as required.

Step 4 Click **Apply**. The new values are set on the selected card.

Note A progress animator is displayed while the new values are applied to the selected card.

Table 7-65 Field Descriptions for the Modify Ports Dialog Box

Field	Description
NE/Slot Area	
NE ID	Select an NE from the drop-down list.
Slot	Select an ML card slot number from the drop-down list.
Ether Tab	
Port	Select the port number on the ML card.
State	Choose **Enable** to enable the port or **Disable** to disable the port.
MTU	Enter the maximum transmission unit (MTU) size. The valid range is from 64 to 9000. The default MTU size is 1500.

Table 7-65 Field Descriptions for the Modify Ports Dialog Box (continued)

Field	Description
Speed	Select the speed from the drop-down list. Values are 10, 100, and auto. For an ML1000 card, auto is the only supported option.
Duplex	Select the Duplex value from the drop-down list. Values are full, half, and auto, based on the type of card selected. For example, for an ML1000 card, auto is the only supported option.
Flow Control (send)	Select the Flow Control (send) value from the drop-down list. Values are off, on, and desired. These values are supported by both Fast Ethernet and Gigabit Ethernet ports.
Flow Control (receive)	Select the Flow Control (receive) value from the drop-down list. Values are off, on, and desired. These values are supported by Gigabit Ethernet ports only.
CDP	Choose **Enable** to enable Cisco Discovery Protocol (CDP) on the ML100 or ML1000 card. Choose **Disable** to disable CDP on the ML-series card. The CDP feature enables the ML card to send packets at regular intervals to discover other devices. CDP is used primarily to obtain protocol addresses of neighboring devices and discover the platform of those devices. CDP can also be used to show information about the interfaces that the router uses.
PoS Tab	
Port	Select the port number on the ML card.
State	Choose **Enable** to enable the port or **Disable** to disable the port.
MTU	Enter an MTU size. The valid range is from 64 to 9000. The default MTU size is 1500. **Note** You cannot set the MTU size on a PoS port for an RPR topology. MTU size for the PoS port can only be set for a PTP topology.
SPR Tab	
Note The SPR tab is visible only when the Modify Ports dialog box is launched from an RPR port.	
Port	Select the port number on the ML card.
MTU	Enter an MTU size for a PTP topology for the POS port. The valid range is from 64 to 9000. The default MTU size is 1500. **Note** You cannot set the MTU size for an SPR interface for a PTP topology.

7.10.12 Inserting or Deleting a Card on an RPR Topology

This section describes how to add or remove a card on an existing RPR topology.

Note After an add or remove card operation, the new circuits are listed in the Circuit table and have the system time, rather than CTML2, appended to the circuit name and circuit alias.

7.10.12.1 Inserting a Card into an Existing RPR Topology

Note During the addition or removal of an ML-series card on an RPR topology, the POS interfaces of the circuits being deleted are automatically shut down before deletion. After the new circuits are created, the POS interfaces are automatically re-enabled. Shutting down the POS ports upon card insertion or removal ensures Layer 2 protection, so that traffic between all other cards is not lost.

Note Station IDs uniquely identify ML cards in the RPR ring. While inserting an ML card into an RPR topology (whose resynchronization state is Complete), the inserted ML card is assigned a station ID equal to the highest station ID in the existing RPR topology plus 1 (provided the highest station ID is less than or equal to 254). If the highest station ID is 254, unused station IDs in the topology less than 254 are used. The station ID of the ML card can be viewed in the Cisco IOS config file, within the interface SPR1 command block (applies only to an RPR topology). The following example shows a configuration snippet where the ML card is assigned a station ID of 1:

```
interface SPR1
no ip address
no keepalive
spr station-id 1
hold-queue 150 in
!
```

Step 1 Create a complete RPR topology. See 7.10.6.2 Creating an RPR or 802.17 RPR Layer 2 Topology, page 7-263. The L2 Sync State of the topology must be Complete to add a new ML card.

Step 2 Take note of the card that will be added to the RPR topology.

Step 3 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**. The Layer 2 Topology table opens.

Step 4 In the Layer 2 Topology table, choose the appropriate L2 topology and choose **Configuration > Add/Remove Card**. The Add/Remove Card wizard opens. The following table provides descriptions.

Note The default circuit size for SONET and SDH is STS1 and VC4, respectively. During an add/remove card operation, if the topology size is equal to STS1 or VC4 for the new circuit segments to be provisioned, no warning message displays. However, if the topology size is greater than STS1 or VC4, and if all of the new circuit segments to be provisioned are equal to the default circuit size, a warning message displays.

Table 7-66 Field Descriptions for the Add/Remove Card Wizard

Field	Description
Navigation Pane	
The navigation pane on the left side of the wizard tells you where you are in the process of adding or removing cards. You can use the navigation pane to jump quickly from one task to the next, or to an already visited task. Using the navigation pane is faster than using the Back and Next buttons, because you can jump over multiple panes in one step versus clicking Back or Next and moving through the panes sequentially. **Tip** As you proceed through the wizard, the panes you have visited are highlighted in white and identified by a number.	
Layer 2 Topology Information	
L2 Topology Name	Displays the name of the selected L2 topology.
Description	Enter a description for the new topology.
L2 Topology Type	Select the type of topology you want to create (point-to-point or RPR). **Note** The contents of subsequent wizard panes are dependent on the Topology Type selected.
L2 Topology Size	Select the topology size. When the size of the circuit underneath is not the same, the value is Mixed.
Operation Type Selection	
Add Card	Click this radio button to add a card. **Note** The insertion of a card results in one circuit being deleted from the existing RPR and two new circuits being created.
Remove Card	Click this radio button to remove a card. **Note** The deletion of a card results in two circuits being deleted from the existing RPR and one new circuit being created.
Add Card Selection	
Available Cards	Select a card from the list and click **Add** to add it to the Selected Cards list.
Selected Cards	Displays the card selected for the Layer 2 topology. Select a card and click **Remove** to remove it from the Selected Cards list.
Remove Card Selection	
Configured Cards	Select a card from the list and click **Add** to add it to the Deleted Cards list.
Deleted Cards	Displays the card selected for the Layer 2 topology. Select a card and click **Remove** to remove it from the Deleted Cards list.
Delete Circuit Segment Info	
Src NE	Displays the ID of the NE selected as the source node.
Src Slot	Displays the ID of the source slot.
Src Port	Displays the ID of the source port.
Dest NE	Displays the ID of the NE selected as the destination node.
Dest Slot	Specify the destination slot.
Dest Port	Displays the ID of the destination port.
Circuit Type	Specify the type of circuit: STS and STS-v for SONET NEs; VC_HO_PATH_VCAT_CIRCUIT, VC_HO-v, VC_LO_PATH_VCAT_CIRCUIT, and VC_LO-v for SDH NEs.

Table 7-66 Field Descriptions for the Add/Remove Card Wizard (continued)

Field	Description
Circuit Size	Specify the size of the circuit. STS circuit sizes are STS-1, STS-3c, STS-6c, STS-9c, STS-12c, and STC-24c. SDH circuit sizes are VC3, VC4, VC4-2c, VC4-3c, VC4-4c, and VC4-8c.
Route Type	Select **Auto** to route automatically or **Manual** to route manually.
Status	Displays the circuit segment status information.
Inserted Circuit Segment Info	
Src NE	Displays the ID of the NE selected as the source node.
Src Slot	Displays the ID of the source slot.
Src Port	Displays the ID of the source port.
Dest NE	Displays the ID of the NE selected as the destination node.
Dest Slot	Specify the destination slot.
Dest Port	Displays the ID of the destination port.
Circuit Type	Specify the type of circuit: STS and STS-v for SONET NEs; VC_HO_PATH_VCAT_CIRCUIT, VC_HO-v, VC_LO_PATH_VCAT_CIRCUIT, and VC_LO-v for SDH NEs.
Circuit Size	Specify the size of the circuit. STS circuit sizes are STS-1, STS-3c, STS-6c, STS-9c, STS-12c, and STC-24c. SDH circuit sizes are VC3, VC4, VC4-2c, VC4-3c, VC4-4c, and VC4-8c.
Route Type	Select **Auto** to route automatically or **Manual** to route manually.
Status	Displays the circuit segment status information.
Routing Preferences	
Route Automatically	Allows you to enable or disable automatic route selection. If enabled, Prime Optical automatically determines the route for the circuit. If the source and destination of the circuit are on the same node, automatic routing is enabled. If disabled, you can specify the spans associated with the circuit. Under the Manual Route area, the Graphical radio button is selected by default.
Auto Route	• Using Required Nodes/Links—(Available only if Route Automatically is checked) If checked, Prime Optical automatically routes the circuit through the required nodes and/or links. • Review Route Before Creation—(Available only if Route Automatically is checked) Check this check box to review the route before it is created. • VT-DS3 Mapper Conversion—(Available only if Route Automatically is checked) If checked, you can route the circuit using the DS3XM12 card.
Time Slot Restriction	If checked, you can enter an STS/VC4 value (to be used end-to-end) that Prime Optical uses to automatically determine the route for the circuit. Circuit creation fails if the same STS/VC4 is not available end-to-end. If circuit creation fails, you can try again using different values. The valid range is from 1 to 192 for SONET, or from 1 to 64 for SDH networks. **Note** Time Slot Restriction is not available for OCHCC and OCHNC circuit creation types. **Note** For VCAT circuits, you must enter multiple STS/VC4 values in the Member Preferences table > Time Slot Restriction field. The STS/VC4 values that you enter in the Time Slot Restriction field cannot be identical, or circuit creation will fail with an error message.

Table 7-66 Field Descriptions for the Add/Remove Card Wizard (continued)

Field	Description
Fully Protected Path	If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit in a UPSR DRI topology by checking Dual Ring Interconnect. Alternatively, if the circuit must pass across unprotected links, Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications: • Required—Ensures that the primary and alternate paths of the UPSR portions of the complete circuit path are node-diverse. • Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. • Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
Node-Diverse Path	• Required—Ensures that the primary and alternate paths of the UPSR portions of the complete circuit path are node-diverse. • Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. • Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
Protection Channel Access	To route the circuit on a BLSR protection channel, if available, uncheck the Fully Protected Path check box, and check the Protection Channel Access check box.
Dual Ring Interconnect	If you selected Fully Protected Path and the circuit will be routed on a UPSR DRI, check the Dual Ring Interconnect check box. **Note** For DRI and iDRI manually created circuits, you must double-click the DRI span for it to become DRI. A single-click does not enable the DRI span.
Diverse Shared Risk Link Group (SRLG)	If checked, fully protected circuits are routed through working and protected links that do not share risk groups.
Circuit Summary	Summarizes the selections you made in the wizard panes. To change the circuit summary, click **Back** and change your selection(s).
Manual Provisioning	
Links/Nodes	Selected Node—Select the links/nodes in the graphic to populate the selected node field. **Tip** Use the arrows to expand or reduce the graphical area, if required.
Spans	• Available Spans—Lists the available spans. Span information includes: – From—Start point of the span – To—Endpoint of the span – Source STS – VT – DRI Span • Selected Spans—Click **Add** to add the selected spans to the Selected Spans list or click **Remove** to remove spans from the Selected Spans list.

Step 5 Click the **Add Card** radio button to add a card or click the **Remove Card** radio button to remove a card from the selected L2 topology.

Tip Fields highlighted in white in the Add/Remove Card wizard can be configured; those highlighted in gray cannot be selected or configured.

Step 6 Click **Next**.

Step 7 In the Add Card Selection pane, select a card from the list and click **Add** to add it to the Selected Cards list.

Step 8 Use the **Up** or **Down** arrows to move cards up or down according to the spans.

Step 9 Click **Next**. In the Delete Circuit Segment Info pane, the circuit to be deleted is displayed.

Step 10 Click **Yes** to continue. The Deleting Circuits dialog box opens, confirming that the circuits are being deleted.

The Insert Circuit Segment Info pane opens, displaying the circuits on the L2 topology that will exist after adding or removing the card. Circuits with a white background must be created to complete the add or remove operation.

Note For an IEEE 802.17 RPR, the sizes of the new circuits must be compatible with the values assigned to the A, A1, and B-CIR traffic classes in the base card configuration of the L2 topology. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.

Step 11 Click **Next**. A dialog box opens, confirming POS port shutdown on circuits being deleted and circuit deletion. Click **Yes** to continue.

Step 12 If you specified the route type for a specific segment as Auto, continue to Step 14. If you specified the route type for a specific segment as Manual, continue to Step 15. If you selected to route the entire RPR automatically, complete the following information:

- Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if the circuit must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:
  - Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
  - Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
  - Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.
- Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel.

Step 13 If you specified the route type for a specific segment as Manual, continue to Step 15. If you selected to route the entire RPR automatically, continue to Step 16. If you specified the route type for a specific segment as Auto, complete the following information:

a. Using Required Nodes/Links—Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links.

b. Review Route Before Creation—Check this check box to review the route before it is created.

c. Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if the circuit must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

- Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
- Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
- Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.

d. Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel. Once you enable PCA, a label reading PCA will appear on the link.

e. Click **Next** to specify the route constraints (available when Route Automatically and Using Required Nodes/Links are enabled):

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Nodes—Click this radio button if you want to add nodes to the route.
- Links—Click this radio button if you want to add links to the route; then, choose **Current NE ID**, **Adj NE ID**, or **Available Links**.

f. Click **Include** to add the selected node or link to the route constraint, or **Exclude** to remove the selected node or link from the route constraint.

g. If the Review Route Before Creation check box (available when Route Automatically and Review Route before Creation are enabled) is checked and there are more segments for which you need to specify the routing information, click **Next**. RPR circuit segment details are displayed.

Step 14 If you specified the route type for a specific segment as Manual, complete the following information:

a. Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if the circuit must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

- Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
- Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.

- Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.

b. Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel. Once you enable PCA, a label reading PCA will appear on the link.

c. Click **Next** to specify the following information:

- Source Node—Displays the source node.
- Destination—Displays the destination node.
- Current Node—Displays the current node.
- Adj NEID—Select the adjacent NE ID from the drop-down list.
- Available Links—Select a link from the drop-down list.

d. Select the span from the Available Spans area. Span information includes:

- From—Start point of the span.
- To—Endpoint of the span.
- Source—Select the source (STS for SONET NEs; VC4 for SDH NEs) from the drop-down list.

e. Click **Add** to add the span to the Selected Spans list. Click **Remove** to remove spans from the Selected Spans list.

f. Click **Next Hop** to specify links and nodes for the next hop. Complete substeps a through c for each hop.

g. Click **Reset** to reset link and node information.

h. Click **Alternate Route** to provision an alternate route.

i. If there are more segments for which you need to specify the routing information, click **Next**. The Inserted Circuit Segments Info pane appears.

Step 15 Repeat Step 12 through Step 14 until all required circuits are created.

Step 16 Click **Finish** to add the new card. An Enabling POS Ports confirmation dialog box opens, and a "no shut" is performed on the POS ports, which are shut down and then re-enabled. The Add/Remove Card wizard closes and you are returned to the Layer 2 Topology table.

7.10.12.2 Removing a Card from an Existing RPR Topology

To remove an ML card from a topology, at least two other ML cards must be part of the topology, because a valid topology has endpoints on at least two different NEs. For example, if you have two ML cards on a single NE, an L2 topology cannot be created across the two ML cards. If you have a topology with three ML cards (two cards on one NE and a third card on another NE), removal of the third card from the topology is not a valid operation because it reduces the number of NEs from two to one.

Note During the addition or removal of an ML-series card to or from an RPR topology, the POS interfaces of the circuits being deleted are automatically shut down before deletion. After the new circuits are created, the POS interfaces are automatically re-enabled. Shutting down the POS ports upon card insertion or removal ensures Layer 2 protection, so that traffic between all other cards is not lost.

Step 1 Create a complete RPR topology. See 7.10.6.2 Creating an RPR or 802.17 RPR Layer 2 Topology, page 7-263. The L2 service resynchronization status of the topology must be Complete to remove an ML card.

Step 2 Take note of the card that will be removed from the RPR topology.

Step 3 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**. The Layer 2 Topology table opens.

Step 4 In the Layer 2 Topology table, select the appropriate L2 topology and choose **Configuration > Add/Remove Card**. The Add/Remove Card wizard opens. Table 7-66 on page 7-277 describes the fields in the wizard.

Step 5 Click the **Remove Card** radio button to remove a card from the selected L2 topology.

Tip Fields highlighted in white in the Add/Remove Card wizard can be configured; those highlighted in gray cannot be selected or configured.

Step 6 Click **Next**.

Step 7 In the Remove Card Selection pane, select a card in the list and click **Add** to add it to the Deleted Cards list.

Step 8 Click **Next**. In the Delete Circuit Segment Info pane, the circuit that will be deleted is displayed.

Step 9 Click **Next**.

Step 10 In the Insert Circuit Segments Info pane, make your selections, as required.

Note In case of an IEEE 802.17 RPR, the sizes of the new circuits must be compatible with the values assigned to the class A, class A1, and class B-CIR traffic classes in the base card configuration of the L2 topology. For details, see "IEEE 802.17 RPR Base Card Configuration" in *Cisco Prime Optical 9.6.3 ML Provisioning Methodology*.

Step 11 Click **Next**. A dialog box opens; click **Yes** to confirm circuit deletion. The Deleting Circuits dialog box opens, confirming that the circuits are being deleted.

Step 12 The Insert Circuit Segment Info pane opens, displaying the circuits on the L2 topology that will exist after removing the card. Circuits with a white background must be created to complete the operation. When **Next** is clicked, the POS ports on the circuit are shut down and the circuit is deleted.

Step 13 If you specified the route type for a specific segment as Auto, continue to Step 14. If you specified the route type for a specific segment as Manual, continue to Step 15. If you selected to route the entire RPR automatically, complete the following information:

- Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if it must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

  - Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
  - Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
  - Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.

- Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel.

Step 14 If you specified the route type for a specific segment as Manual, continue to Step 15. If you selected to route the entire RPR automatically, continue to Step 16. If you specified the route type for a specific segment as Auto, complete the following information:

a. Using Required Nodes/Links—Check this check box to let Prime Optical automatically route the circuit through the required nodes and/or links.

b. Review Route Before Creation—Check this check box to review the route before it is created.

c. Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if the circuit must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

- Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
- Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
- Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.

d. Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel.

e. Click **Next** to specify the route constraints (available when Route Automatically and Using Required Nodes/Links are enabled):

- Src NE ID—*Display only.*
- Dest NE ID—*Display only.*
- Nodes—Click this radio button to add nodes to the route.
- Links—Click this radio button to add links to the route; then, choose **Current NE ID**, **Adj NE ID**, or **Available Links**.

f. Click **Include** to add the selected node or link to the route constraint, or **Exclude** to remove the selected node or link from the route constraint.

g. If the Review Route Before Creation check box (available when Route Automatically and Review Route before Creation are enabled) is checked and there are more segments for which you need to specify the routing information, click **Next**. RPR circuit segment details are displayed.

Step 15 If you specified the route type for a specific segment as Manual, complete the following information:

a. Fully Protected Layer 1—If selected, Prime Optical ensures that the circuit is fully protected. You can provision the circuit if the circuit must pass across unprotected links. Prime Optical creates a primary and alternate circuit route (virtual UPSR) based on the following node diversity specifications:

- Required—Prime Optical ensures that the primary and alternate paths within the UPSR portions of the complete circuit path are node-diverse.
- Desired—Prime Optical attempts node diversity. If node diversity is impossible, Prime Optical uses primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path.
- Don't Care: Link Diverse Only—Prime Optical creates primary and alternate paths that are link-diverse for the UPSR portions of the complete circuit path. The paths might be node-diverse, but Prime Optical does not check for node diversity.

b. Protection Channel Access—If Fully Protected Layer 1 is not selected, enable PCA to route the circuit on a BLSR protection channel.

c. Click **Next** to specify the following information:

- Source Node—Displays the source node.
- Destination—Displays the destination node.
- Current Node—Displays the current node.
- Adj NEID—Select the adjacent NE ID from the drop-down list.
- Available Links—Select a link from the drop-down list.

d. Select the span from the Available Spans area. Span information includes:

- From—Start point of the span.
- To—Endpoint of the span.
- Source STS.

e. Click **Add** to add the span to the Selected Spans list. Click **Remove** to remove spans from the Selected Spans list.

f. Click **Next Hop** to specify links and nodes for the next hop. Complete substeps a through c for each hop.

g. Click **Reset** to reset link and node information.

h. Click **Alternate Route** to provision an alternate route.

i. If there are more segments for which you need to specify the routing information, click **Next**. The Inserted Circuit Segments Info pane opens.

Step 16 Click **Finish** to remove the card. An Enabling POS Ports confirmation dialog opens, and a "no shut" is performed on the POS ports, which are shut down and then re-enabled. The Add/Remove Card wizard closes and you are returned to the Layer 2 Topology table.

7.10.13 Layer 2 Service Management Tasks

VLAN service is a collection of bridge groups within a Layer 2 topology. It can span multiple ML-series cards on a particular Layer 2 topology. In a point-to-point topology, no Layer 2 configuration is done on E-series, G-series, ML-100T-8, CE-100T-8, or OC-N cards. In an RPR topology, a VLAN can span the entire ring.

You can configure a VLAN service that consists of multiple service drops (Ethernet drops). Each service drop is classified according to:

- Port type—NNI or UNI
- Connection type—Dot1Q, QinQ, or Untagged

In a VLAN service, the recommended mix of port type and connection type is as follows:

- UNI QinQ and NNI Dot1Q
- UNI Dot1Q, UNI Untagged, and NNI Dot1Q

The following table summarizes the service drop configurations and associated parameters.

Table 7-67 Summary of Service Drop Configurations

Port Type	Connection Type	Port VLAN ID	Layer 2 Tunneling (stp, cdp, vtp)	Mode (Dot1Q tunnel)	Encap (Dot1Q)
UNI	Dot1Q	1–4093	—	—	Yes
NNI	Dot1Q	Service Provider VLAN ID	—	—	Yes
UNI	Untagged	—	—	—	—
UNI	QinQ	—	Yes	Yes	—

Use the following procedures to manage Layer 2 services:

- 7.10.13.1 Creating a Layer 2 Service, page 7-287
- 7.10.13.2 Showing a Layer 2 Service, page 7-297
- 7.10.13.3 Modifying a Layer 2 Service, page 7-297
- 7.10.13.4 Filtering the L2 Services Table, page 7-298
- 7.10.13.5 Deleting a Layer 2 Service, page 7-298
- 7.10.13.6 Showing an IP SLA, page 7-299
- 7.10.13.7 Creating an IP SLA, page 7-299
- 7.10.13.8 Enabling an IP SLA, page 7-300
- 7.10.13.9 Deleting an IP SLA, page 7-300
- 7.10.13.10 Restarting an IP SLA, page 7-301
- 7.10.13.11 Enabling or Disabling PM Data Collection for Each Drop Port, page 7-301
- 7.10.13.12 Viewing the L2 Service Drop Ports Table, page 7-301
- 7.10.13.13 Filtering the L2 Service Drop Ports Table, page 7-302
- 7.10.13.14 Creating L2 Service Drops, page 7-302

- 7.10.13.15 Deleting L2 Service Drops, page 7-308
- 7.10.13.16 Modifying L2 Service Drops, page 7-308
- 7.10.13.17 Viewing the QoS for Layer 2 Service Drop Port Table, page 7-310
- 7.10.13.18 Configuring a Layer 2 Service Resynchronization, page 7-311

7.10.13.1 Creating a Layer 2 Service

Use the Create Layer 2 Service wizard to create a new Layer 2 service.

Note Before creating a Layer 2 service, be sure that the topology state and the Layer 2 service resynchronization state are both Complete in the Layer 2 Topology table. See 7.10.5 Viewing the Layer 2 Topology Table, page 7-242.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**. The Layer 2 Topology table opens.

Step 2 In the Layer 2 Topology table, select the topology on which to create the Layer 2 service.

Step 3 Choose **Configuration > Create L2 Service**. The Create Layer 2 Service wizard opens. The following table provides descriptions.

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard

Field	Description
L2 Service Information	
Layer 2 Topology Name	The name of the topology on which the Layer 2 service is created.
Service Provider VLAN ID	A unique number in a topology that is used to represent the VLAN. The valid range for service provider VLAN IDs is 1 to 4093. By default, the first VLAN number is displayed as 2, because VLAN 1 is an administration VLAN. You can change the default value and create VLAN 1, if it is available.
Managed VLAN	If checked, allows you to create a managed VLAN for an IP SLA.
Customer Information	
Customer ID	The unique identification number of the customer for whom the Layer 2 service is being created.
Service ID	The service identification number of the customer for whom the Layer 2 service is being created.
Layer 2 Service Summary	
—	Summarizes the selections you made in the wizard panes. To change the L2 service summary, click **Back** and change your selection(s).
Selected Drops (Node/Slot/Port)	The drop ports selected in the L2 Service Drop Ports table.
L2 Service Drops Selection	
NE ID	Select the user-defined name of the selected NE.
Available L2 Service Drops	
Slot	The ML-series card slot number.

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard (continued)

Field	Description
Type	The ML-series card type.
Port	The port number on the ML-series card: • If the port number is preceded by C, it refers to the port number of the port channel interface. • If the port number is preceded by P, it refers to the port number of the Ethernet interface.
Port Type	The available port type—UNI, NNI, or Any. If both UNI and NNI port types are available, Any is displayed.
Connection Type	The connection type—QinQ, dot1q, Untagged, or Any. For the UNI port type, connection types are QinQ, dot1q, and Untagged. For the NNI port type, only the dot1q connection type is allowed. If all types are available, this field is shown as *Any*.
Selected L2 Service Drops	
NE ID	The user-defined name of the selected NE.
Slot	The ML-series card slot number.
Type	Displays the ML-series card type—ML100 or ML1000.
Port	The port number on the ML-series card: • If the port number is preceded by C, it refers to the port number of the port channel interface. • If the port number is preceded by P, it refers to the port number of the Ethernet interface.
Port Type	The available port type—UNI, NNI, or Any. If both UNI and NNI port types are available, Any is displayed.
Connection Type	The connection type—QinQ, dot1q, Untagged, or Any. For the UNI port type, connection types are QinQ, dot1q, and Untagged. For the NNI port type, only the dot1q connection type is allowed. If all types are available, this field is shown as *Any*.
Add/Remove	Click **Add** to add the selected drop from the Available Layer 2 Service Drops list to the Selected L2 Service Drops list. Click **Remove** to remove drops from the Selected L2 Service Drops list.
Service Drops Configuration > Service Drops tab	
Apply QoS Parameters to All UNI Ports	When selected, the quality of service (QoS) parameters specified in the QoS Parameters screen are applied to all the drops.
RSTP Enable	When checked, Rapid Spanning Tree Protocol (RSTP) is enabled for the VLAN.
NE ID	The user-defined name of the selected NE.
Slot	The slot number of the ML-series card.
Type	The ML-series card type.
Port	The port number on the ML-series card: • If the port number is preceded by C, it refers to the port number of the port channel interface. • If the port number is preceded by P, it refers to the port number of the Ethernet interface.

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard (continued)

Field	Description
Enable	Used to enable or disable the drop port. When checked, the drop port is enabled.
Port Type	The port type—UNI or NNI.
Connection Type	The connection type. For the UNI port type, the connection type is QinQ, dot1q, or Untagged. For the NNI port type, only the NNI connection type is permitted.
Port VLAN ID	The port VLAN ID used for dot1q drops. By default, the NNI dot1q drop is populated with the SP VLAN ID.
CoS Accounting	When checked, the collection of CoS PM on a VLAN service drop is enabled.
RSTP	When checked, RSTP is enabled. This checkbox is enabled only when you configure a dot1q drop of the VLAN.
QoS Parameters	
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
DSCP Value	Displays the DSCP value.
Match IP	Matches the IP value. The valid range is from 0 to 7.
IP Value	Displays the IP value.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
CoS Value	Displays the CoS value.
AND/OR	Selecting AND/OR indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied to dot1Q and QinQ and untagged (subinterface). For AND and OR criteria, a single value is allowed on CoS, DSCP, and IP Precedence. Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
CIR Type	Displays the CIR type.
Committed Rate	Displays the committed traffic rate value.
Committed Burst Size	Displays the committed burst size.
CIR CoS Type	Committed traffic CoS type (Trust or CoS Marked).
CIR CoS Value	Committed traffic CoS value. The valid range is from 0 to 7.
Excess Action	Excess traffic action type (Discard or Allow).
Peak Rate	Displays the peak traffic rate value.
Peak Burst Size	Displays the peak traffic burst value.
PIR CoS Type	Displays the peak traffic CoS type (Trust or CoS Marked).
PIR CoS Value	Displays the peak traffic CoS value. The valid range is from 0 to 7.
Violate Action	Displays the violate traffic action type (Discard or Allow).
Violate CoS	Displays the violate traffic CoS type (Trust or CoS Marked).

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard (continued)

Field	Description
Violate CoS Value	Displays the violate traffic CoS value. The valid range is from 0 to 7.
Best Effort Type	Displays the best-effort traffic type (Line-Rate or Rate-Limited).
Max Rate	Displays the maximum rate value.
Max Burst Size	Displays the maximum burst value.
Service Drops Configuration > Port Attributes	
NE ID	Select a user-defined NE name from the drop-down lists.
Slot	Select the ML card slot number from the drop-down lists.
Type	Displays the ML-series card type—ML100 or ML1000.
Port	Select the port number on the ML card. The port number is preceded by P, which indicates an Ethernet port.
MTU	Enter an MTU size. The valid range is from 64 to 9000. The default value is 1500.
Speed	Select the speed from the drop-down list. The Speed drop-down list displays three values: 10, 100, and auto. For an ML1000 card, auto is the only supported option.
Duplex	Select the Duplex value from the drop-down list. The Duplex drop-down list displays three values: full, half, and auto, based upon the type of card selected. For example, for an ML1000 card, auto is the only supported option.
Flow Control (send)	Select the Flow Control (send) value from the drop-down list. The Flow Control (send) drop-down box displays three values: off, on, and desired. These values are supported by both the Fast Ethernet and Gigabit Ethernet ports.
Flow Control (receive)	Select the Flow Control (receive) value from the drop-down list. The Flow Control (receive) drop-down box displays three values: off, on, and desired. These values are supported by the Gigabit Ethernet ports only.
Service Drops Configuration > IP SLA	
NE ID	Displays the NE ID.
Slot	Displays the slot number of the ML-series card.
Type	Displays the type of ML-series card.
IP Address	Displays the IP address of the NE.
Subnet	Displays the subnetwork mask ID of the NE.
Protocol	Displays the protocol.
QoS Parameters > Profile	
Load from QoS Profile	Select the QoS profile from the list displayed. See 7.11.3 Creating QoS Profiles, page 7-324 for details on how to create a QoS profile. **Note** The remainder of the QoS parameters displayed on this tab are described earlier in this table.
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
DSCP Value	Displays the DSCP value.
Match IP	Matches the IP value. The valid range is from 0 to 7.

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard (continued)

Field	Description
IP Value	Displays the IP value.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
CoS Value	Displays the CoS value.
AND/OR	Selecting AND/OR indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied to dot1Q and QinQ and untagged (subinterface). For AND and OR criteria, a single value is allowed on CoS, DSCP, and IP Precedence. Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
CIR Type	Displays the CIR type.
Committed Rate	Displays the committed traffic rate value.
Committed Burst Size	Displays the committed burst size.
CIR CoS Type	Committed traffic CoS type (Trust or CoS Marked).
CIR CoS Value	Committed traffic CoS value. The valid range is from 0 to 7.
Excess Action	Excess traffic action type (Discard or Allow).
Peak Rate	Displays the peak traffic rate value.
Peak Burst Size	Displays the peak traffic burst value.
PIR CoS Type	Displays the peak traffic CoS type (Trust or CoS Marked).
PIR CoS Value	Displays the peak traffic CoS value. The valid range is from 0 to 7.
Violate Action	Displays the violate traffic action type (Discard or Allow).
Violate CoS	Displays the violate traffic CoS type (Trust or CoS Marked).
Violate CoS Value	Displays the violate traffic CoS value. The valid range is from 0 to 7.
Best Effort Type	Displays the best-effort traffic type (Line-Rate or Rate-Limited).
Max Rate	Displays the maximum rate value.
Max Burst Size	Displays the maximum burst value.
QoS Parameters > Custom QoS	
Load from QoS Profile	Select the QoS profile from the list displayed. See 7.11.3 Creating QoS Profiles, page 7-324 for details on how to create a QoS profile. **Note** The remainder of the QoS parameters displayed on this tab are described earlier in this table.
Policing > Classification	
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
Match IP Precedence	Matches the IP precedence value. The valid range is from 0 to 7.

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard (continued)

Field	Description
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
AND	Selecting AND indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied only to dot1Q (subinterface). For AND criteria only, a single value is allowed on CoS, DSCP, and IP Precedence.
OR	Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
Policing > Committed Traffic	
Line Rate	Rate and burst of the Ethernet port are applicable.
Rate Limited	User-specified rate and burst limits are applicable.
Committed Rate	Displays the committed rate.
Committed Burst Size	Displays the committed burst size.
Policing > Committed Traffic > Committed CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Excess Traffic	
Discard	Excess traffic action should be set to “drop.”
Allow	Excess traffic with CoS, as marked by the user, is transmitted.
Peak Rate	Peak rate value.
Peak Burst	Peak burst value.
Policing > Excess Traffic > Excess CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Violations	
Discard	Excess traffic action should be set to “drop.”
Allow	Excess traffic with CoS, as marked by the user, is transmitted.
Policing > Violations > Violations CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Best Effort	
Line Rate	Rate and burst of the Ethernet port are applicable.
Rate Limited	User-specified rate and burst limits are applicable.
Max Rate	The maximum rate value.
Max Burst	The maximum burst value.
Policing > Best Effort > Best Effort CoS Marking	

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard (continued)

Field	Description
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Service Drops Configuration > Service Drops > Service Drops area	
Apply QoS Parameters to All UNI Ports	When selected, the QoS parameters specified in the QoS Parameters screen are applied to all the drops.
RSTP Enable	When checked, RSTP is enabled.
NE ID	The user-defined name of the selected NE.
Slot	Information about the slot.
Type	Displays the ML-series card type.
Port	The port number on the ML-series card: • If the port number is preceded by C, it refers to the port number of the port channel interface. • If the port number is preceded by P, it refers to the port number of the Ethernet interface.
Enable	Used to enable or disable the drop port. When checked, the drop port is enabled.
Port Type	The port type—UNI or NNI.
Connection Type	The connection type. For the UNI port type, the connection type is QinQ, dot1q, or Untagged. For the NNI port type, only the NNI connection type is permitted.
Port VLAN ID	The port VLAN ID used for dot1q drops. By default, the NNI dot1q drop is populated with the service provider VLAN ID.
CoS Accounting	When checked, the collection of CoS PM on a VLAN service drop is enabled.
RSTP	When checked, RSTP is enabled. This is enabled only when the you configure a dot1q drop of the VLAN.
PM State	Check this check box to collect PM data for each drop port in an ML-series card. Checking the PM State box sets the Cisco IOS cos accounting command in each appropriate front port.
Service Drops Configuration > Service Drops > QoS Parameters area	
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
DSCP Value	Displays the DSCP value.
Match IP	Matches the IP value. The valid range is from 0 to 7.
IP Value	Displays the IP value.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
CoS Value	Displays the CoS value.

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard (continued)

Field	Description
AND/OR	Selecting AND/OR indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied to dot1Q and QinQ and untagged (subinterface). For AND and OR criteria, a single value is allowed on CoS, DSCP, and IP Precedence. Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
Committed Rate	Displays the committed traffic rate value.
Committed Burst Size	Displays the committed burst size.
CIR CoS Type	Committed traffic CoS type (Trust or CoS Marked).
CIR CoS Value	Committed traffic CoS value. The valid range is from 0 to 7.
Excess Action	Excess traffic action type (Discard or Allow).
Peak Rate	Displays the peak traffic rate value.
Peak Burst Size	Displays the peak traffic burst value.
PIR CoS Type	Displays the peak traffic CoS type (Trust or CoS Marked).
PIR CoS Value	Displays the peak traffic CoS value. The valid range is from 0 to 7.
Violate Action	Displays the violate traffic action type (Discard or Allow).
Violate CoS	Displays the violate traffic CoS type (Trust or CoS Marked).
Violate CoS Value	Displays the violate traffic CoS value. The valid range is from 0 to 7.
Best Effort Type	Displays the best-effort traffic type (Line-Rate or Rate-Limited).
Max Rate	Displays the maximum rate value.
Max Burst Size	Displays the maximum burst value.
Service Drops Configuration > Port Attributes	
NE ID	Select a user-defined NE name from the drop-down lists.
Slot	Select the ML card slot number from the drop-down lists.
Type	Displays the ML-series card type—ML100 or ML1000.
Port	Select the port number on the ML card. The port number is preceded by P, which indicates an Ethernet port.
MTU	Enter an MTU size. The valid range is from 64 to 9000. The default value is 1500.
Speed	Select the speed from the drop-down list. The Speed drop-down list displays three values: 10, 100, and auto. For an ML1000 card, auto is the only supported option.
Duplex	Select the Duplex value from the drop-down list. The Duplex drop-down list displays three values: full, half, and auto, based upon the type of card selected. For example, for an ML1000 card, auto is the only supported option.

Table 7-68 Field Descriptions for the Create Layer 2 Service Wizard (continued)

Field	Description
Flow Control (send)	Select the Flow Control (send) value from the drop-down list. The Flow Control (send) drop-down box displays three values: off, on, and desired. These values are supported by both the Fast Ethernet and Gigabit Ethernet ports.
Flow Control (receive)	Select the Flow Control (receive) value from the drop-down list. The Flow Control (receive) drop-down box displays three values: off, on, and desired. These values are supported by the Gigabit Ethernet ports only.

Step 4 In the L2 Service Information pane, complete the following information:

- L2 Topology Name
- Service Provider VLAN ID
- Managed VLAN
- Customer ID
- Service ID

Step 5 Click **Next**.

Step 6 In the L2 Service Drop Ports Selection pane, complete the following information:

a. Select one of the NEs (from the NE ID drop-down list) on which to configure drops as part of the L2 service being created. After the NE is selected, all the available drops and their capabilities are displayed in the Available Drops area.

b. Select the L2 service drop ports. Click **Add** to add L2 service ports to the Selected L2 Service Drop Ports list. Click **Remove** to remove L2 service ports from the list.

c. Repeat substeps a and b to capture all the drops on different NEs that will be a part of the L2 service.

Note If Managed VLAN is checked, you can only select one drop from each ML-series card.

Step 7 Click **Next**.

Step 8 Configure the drop ports in the Service Drops tab by specifying the following information:

- Apply QoS Parameters to All UNI Ports—Check this check box to apply the QoS parameters to all UNI ports.
- RSTP Enable—Check this check box to enable RSTP.
- NE ID—Displays the user-defined name of the selected NE.
- Slot—Displays the slot where the card is located.
- Type—Displays the type of ML-series card.
- Port—Displays the port number. If the port number is preceded by C, it refers to the port number of the port channel interface. If the port number is preceded by P, it refers to the port number of the Ethernet interface.
- Enable—Check this check box to enable drop port state. Uncheck it to disable the drop port state.
- Port Type—Select the port type from the drop-down list for each of the drops selected in the previous screen.

- Con Type—Select the connection type from the drop-down list for each of the drops selected in the previous screen.
- Port VLAN ID—Specify the port VLAN ID for the dot1q drops.
- PM State—Check this check box to collect PM data for each drop port in an ML-series card. Checking the PM State box sets the Cisco IOS cos accounting command in each appropriate front port.

Step 9 Click the Port Attributes tab. A confirmation window appears. Click **Yes** to continue.

Step 10 Configure the port attributes in the Port Attributes tab. Table 7-68 provides descriptions.

Step 11 Click **Next**.

Note You can select individual drop ports for QoS configuration or check the Apply QoS Parameters to All UNI Ports check box. If you select individual drop ports, you will need to repeat Step 8 through Step 14 for each drop port selected.

Step 12 The QoS Parameters pane opens, displaying the Profile and Custom QoS tabs. QoS parameters are applied to UNI ports. Select the QoS profile to use from the Load from QoS Profile drop-down list.

Step 13 Select the Custom QoS tab. The Custom QoS tab allows you to customize the QoS profile you selected.

Step 14 Configure the fields in the Policing area. Table 7-68 describes the fields in the Custom QoS tab.

Note The tabs displayed in the Policing area are dimmed or available depending on the selection you made from the Load from QoS Profile drop-down list. When Best Effort is selected, the Classification and Best Effort tabs in the Policing area are active and can be configured. When CIR/PIR is selected, the Classification, Committed Traffic, Excess Traffic, and Violations tabs in the Policing area are active and can be configured.

Step 15 Click **Finish** to create the Layer 2 service.

Step 16 In the confirmation dialog box, click **OK**.

Note A progress animator is displayed during this operation.

Note If the status of a Layer 2 topology is Incomplete but all the spans are present, it means that there is a configuration problem in the Layer 2 topology and you cannot add Layer 2 services that use this Layer 2 topology. You must delete the Layer 2 topology and add it again. See 7.10.6 Creating Layer 2 Topologies, page 7-247 or 7.10.7 Deleting Layer 2 Topologies, page 7-266.

Note If you try to provision a Layer 2 service while the server resynchronization is in progress, an error message is displayed. Wait awhile before trying again. Also, there is a VLAN ID assigned for each Layer 2 service provisioning operation. If the same error is encountered, the VLAN ID is not available until the Prime Optical server recovers it.

7.10.13.2 Showing a Layer 2 Service

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**. The L2 Services table opens, displaying all the Layer 2 services that are configured on a Layer 2 topology. The following table provides descriptions.

Table 7-69 Field Descriptions for the L2 Services Table

Column	Description
Service Provider VLAN ID	A unique number in a topology that is used to represent the VLAN. The valid range for service provider VLAN IDs is 1 to 4093. By default, the first VLAN number is displayed as 2, because VLAN 1 is an administration VLAN. You can change the default value and create VLAN 1, if it is available.
Customer ID	Displays the unique identification number of the customer for whom the L2 service is being created.
Service ID	Displays the service identification number of the customer for whom the L2 service is being created.
VLAN Status	Displays the drop sufficiency of the L2 service; valid values are Incomplete and Complete. The VLAN status is Incomplete if there are not sufficient drops for the L2 service. For RPR topologies, if there is not at least one drop per two ML-series cards in the topology, the VLAN status is Incomplete. For point-to-point topologies, the VLAN status is Incomplete if there is not at least one drop per ML card in the topology.
IP SLA Managed VLAN	A value of True means that the circuit is an IP SLA-managed VLAN circuit. A value of False means that the circuit is not an IP SLA-managed VLAN circuit. IP SLA-managed VLAN status can be: • Complete-IP SLA Discovery In Progress—Managed VLAN discovered completely and IP SLA discovery in progress. • Complete-IP SLA Discovery Failed—Managed VLAN discovered completely and IP SLA discovery failed due to an error in retrieving IP SLA data.

7.10.13.3 Modifying a Layer 2 Service

Use the Modify L2 Service dialog box to modify some of the parameters of the selected L2 service.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select a service to modify; then, choose **Configuration > Modify L2 Service**. The Modify L2 Service dialog box opens.

Step 4 In the Modify L2 Service dialog box, modify the information described in the following table, as required.

Table 7-70 Field Descriptions for the Modify L2 Service Dialog Box

Area	Description
Customer ID	Customer identification.
Service ID	Service identification.

Step 5 Click **Apply**.

Step 6 Click **Close**.

7.10.13.4 Filtering the L2 Services Table

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, choose **File > Filter** (or click the **Filter Data** tool). The L2 Service table filter opens. The following table provides descriptions.

Step 4 After making your selections, click **OK**.

Table 7-71 Field Descriptions for the L2 Service Table Filter Dialog Box

Field	Description
Customer ID	Displays a list of available customer IDs. Click **Add** or **Remove** to move customer IDs to and from the Selected Customer IDs list and then run the filter. If you check **Ignore All Customer IDs**, Prime Optical ignores the customer IDs in the filter criteria.
Service ID	Displays a list of available service IDs. Click **Add** or **Remove** to move service IDs to and from the Selected Service IDs list and then run the filter. If you check **Ignore All Service IDs**, Prime Optical ignores the service IDs in the filter criteria.

7.10.13.5 Deleting a Layer 2 Service

Note You cannot delete an IP SLA-managed VLAN if there are IP SLAs associated with it. Be sure to delete all IP SLAs associated with the Layer 2 service before deleting the Layer 2 service.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select one or more services to delete; then, choose **Configuration > Delete L2 Service**.

Step 4 In the confirmation dialog box, click **Yes**.

Note A progress animator is displayed during the deletion operation.

7.10.13.6 Showing an IP SLA

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select an L2 service and choose **Configuration > Show IP SLA**. The IP SLA table opens, displaying all of the IP SLAs that were created for the selected L2 service. The following table provides descriptions.

Table 7-72 Field Descriptions for the IPSLA Table

Field	Description
IP SLA Number	Displays the IP SLA number.
NE ID	Displays the NE ID.
Slot Number	Displays the slot number.
Equipment Type	Displays the equipment type.
Host IP Address	Displays the host IP address.
Destination IP Address	Displays the destination IP address.
Operation Type	Displays the operation type.
Operation Status	Displays the operation status.

7.10.13.7 Creating an IP SLA

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**. The L2 Services table opens.

Step 3 In the L2 Services table, select the L2 service on which to create the IP SLA and choose **Configuration > Create IP SLA**. The Create IPSLA Information wizard opens.

Step 4 Specify the following information:

- Service Provider VLAN ID—*Display only.*
- IP SLA ID—*Display only.*
- Source IP Address—Select the source IP address from drop-down list.
- Destination IP Address—Select the destination IP address from drop-down list.
- Probe Type—Select the probe type from the drop-down list. Values are either Jitter or Echo. If you select Echo, proceed to Step 7.
- Enable IP SLA—Check to enable IP SLA.
- External Destination IP Address—Check to enter the external destination IP address. (The Destination IP Address drop-down list is disabled.)

Step 5 Click **Next**.

Step 6 Specify the following information:

- Destination Port—Specify the destination port. The range is from 1 to 65535.
- No. of Packets—Specify the number of packets. The range is from 1 to 60000.
- Interval—Specify the time interval (in seconds) for collecting information. The range is from 1 to 60000.
- Operation Frequency—Specify the operation frequency. The range is from 1 to 604800.
- TOS—Specify the value that corresponds to the type of service. The range is from 1 to 255.

Step 7 Click **Finish**.

7.10.13.8 Enabling an IP SLA

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select an L2 service and choose **Configuration > Show IP SLA**.

Step 4 In the IP SLA table, select an IP SLA and choose **Configuration > Enable IP SLA**.

7.10.13.9 Deleting an IP SLA

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select an L2 service and choose **Configuration > Show IP SLA**.

Step 4 In the IP SLA table, select an IP SLA to delete and choose **Configuration > Delete IP SLA**.

Step 5 In the confirmation dialog box, click **Yes**.

7.10.13.10 Restarting an IP SLA

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select an L2 service and choose **Configuration > Show IP SLA**.

Step 4 In the IP SLA table, select an IP SLA to restart and choose **Configuration > Restart IP SLA**.

7.10.13.11 Enabling or Disabling PM Data Collection for Each Drop Port

Prime Optical allows you to enable or disable PM data collection for each appropriate drop port in an ML-series card. You can enable or disable PM data collection while:

- Creating a Layer 2 service (see 7.10.13.1 Creating a Layer 2 Service, page 7-287)
- Adding drop ports (see 7.10.13.14 Creating L2 Service Drops, page 7-302)
- Modifying drops (see 7.10.13.16 Modifying L2 Service Drops, page 7-308)

Note The enhanced statistics are only supported in the enhanced (nondefault) microcode image. The barebone configuration file that contains this command is bareboneCLI_Security_Enhanced_Microcode.txt.

7.10.13.12 Viewing the L2 Service Drop Ports Table

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services.**

Step 3 In the L2 Services table, select a service; then, choose **Configuration > Show Drops**. The L2 Service Drop Ports table opens, listing all the drops in the selected service. The following table provides descriptions.

Table 7-73 Field Descriptions for the L2 Service Drop Ports Table

Column	Description
NE ID	User-defined name of the selected NE.
Slot Number	ML card slot number on which the drop is present.
Port	ML card port physical number on which the drop is present.
Port	ML card port physical number on which the drop is present.
Port VLAN ID	Port VLAN ID used for dot1q drops.
Interface Type	Interface type of the ML card. Values are Fast Ethernet, Gigabit Ethernet, or port channel.

Table 7-73 Field Descriptions for the L2 Service Drop Ports Table (continued)

Column	Description
Port Type	Port type. Values are UNI or NNI.
Con Type	Connection type. Values are QinQ, dotq, or Untagged.
QoS Profile Name	Name of the QoS profile. **Note** Due to discrepancies between the ML card CLI and the values stored in the Prime Optical database, the QoS profile name might be shown as "Custom QoS" even though you specified a different QoS profile type. In this scenario, choose **Configuration > Show QoS** to view the QoS table for a particular drop and determine the exact configuration of the QoS profile set on the card for that drop.
Drop Status	Displays whether a drop is shut down or enabled.
CoS PM State	Check this check box to collect PM data for each drop port in an ML-series card. Checking the PM State box sets the Cisco IOS cos accounting command in each appropriate front port.
RSTP	When checked, RSTP is enabled.

7.10.13.13 Filtering the L2 Service Drop Ports Table

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select a service to which to add drops.

Step 4 Choose **Configuration > Show Drops**. The L2 Service Drop Ports table opens.

Step 5 Choose **File > Filter** (or click the **Filter Data** tool). The L2 Service Drop Ports Filter dialog box opens.

Step 6 Use the table filter to filter circuit data according to criteria that you select and to display the results in the table.

Step 7 Click **OK**.

7.10.13.14 Creating L2 Service Drops

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs or CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select a service to which to add drops.

Step 4 Choose **Configuration > Show Drops**. The L2 Service Drop Ports table opens.

Step 5 Choose **Configuration > Add Drops**. The Add L2 Service Drops wizard opens. The following table provides descriptions.

Table 7-74 Field Descriptions for the Add L2 Service Drops Wizard

Field	Description
L2 Service Drop Ports Selection	
NE ID	Displays the user-defined name of the NEs. Select an NE from the drop-down list. After the NE is selected, all the available drops and their capabilities are displayed in the Available L2 Service Drop Ports list.
Available L2 Service Drop Ports	
Select the L2 service drop ports. Click **Add** to add L2 service ports to the Configured L2 Service Drop Ports list. Click **Remove** to remove L2 service ports from the list. Repeat to add or remove all the drops on different NEs that will be a part of the L2 service.	
NE ID	Displays the user-defined name of the NEs. Select an NE from the drop-down list. After the NE is selected, all the available drops and their capabilities are displayed in the Available L2 Service Drop Ports list.
Slot	ML-series card slot number.
Type	ML-series card type—ML100 or ML1000.
Port	Port number on the ML card.
Port Type	Displays the available port type—UNI, NNI, or Any. If both UNI and NNI port types are available, Any is displayed.
Con Type	Connection type can be QinQ, dot1q, Untagged, or Any. For the UNI port type, connection types are QinQ, dot1q, and Untagged. For the NNI port type, only the dot1q connection type is allowed. If all types are available, this field is shown as *Any*.
L2 Service Summary	
L2 Topology Name	Name of the topology on which the Layer 2 service drop is created.
Service Provider VLAN ID	A unique number in a topology that is used to represent the VLAN. The valid range for service provider VLAN IDs is 1 to 4093. By default, the first VLAN number is displayed as 2, because VLAN 1 is an administration VLAN. You can change the default value and create VLAN 1, if it is available.
Customer ID	Displays the unique identification number of the customer for whom the Layer 2 service drop is being created.
Service ID	Displays the service identification number of the customer for whom the Layer 2 service drop is being created.
Selected Drops (Node/Slot/Port)	Displays the drop ports selected in the L2 Service Drop Ports table.
Service Drops Configuration > Service Drops tab	
Apply QoS Parameters to All UNI Ports	When selected, the QoS parameters specified in the QoS Parameters screen are applied to all the drops.
RSTP Enable	When checked, RSTP is enabled.
NE ID	Displays the user-defined name of the selected NE.
Slot	Displays information about the slot.
Type	ML-series card type—ML100 or ML1000.
Port	Port number on the ML card.
Enable	When checked, the drop port is enabled.

Table 7-74 Field Descriptions for the Add L2 Service Drops Wizard (continued)

Field	Description
Port Type	Displays the port type—UNI or NNI.
Con Type	Connection type. For the UNI port type, the connection type can be QinQ, dot1q, or Untagged. For the NNI port type, only NNI is permitted.
Port VLAN ID	Port VLAN ID used for dot1q drops. For NNI dot1q drops, this field is populated by default with the service provider VLAN ID.
PM State	Check this check box to collect PM data for each drop port in an ML-series card. Checking the PM State box sets the Cisco IOS cos accounting command in each appropriate front port.
Service Drops Configuration > Port Attributes tab	
NE ID	Select a user-defined NE name from the drop-down lists.
Slot	Select the ML card slot number from the drop-down lists.
Type	Displays the ML-series card type—ML100 or ML1000.
Port	Select the port number on the ML card.
MTU	Enter an MTU size. The valid range is from 64 to 9000. The default value is 1500.
Speed	Select the speed from the drop-down list. The Speed drop-down list displays three values: 10, 100, and auto. For an ML1000 card, auto is the only supported option.
Duplex	Select the Duplex value from the drop-down list. The Duplex drop-down list displays three values: full, half, and auto, based upon the type of card selected. For example, for an ML1000 card, auto is the only supported option.
Flow Control (send)	Select the Flow Control (send) value from the drop-down list. The Flow Control (send) drop-down box displays three values: off, on, and desired. These values are supported by both the Fast Ethernet and Gigabit Ethernet ports.
Flow Control (receive)	Select the Flow Control (receive) value from the drop-down list. The Flow Control (receive) drop-down box displays three values: off, on, and desired. These values are supported by the Gigabit Ethernet ports only.
QoS Parameters	
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
DSCP Value	Displays the DSCP value.
Match IP	Matches the IP value. The valid range is from 0 to 7.
IP Value	Displays the IP value.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
CoS Value	Displays the CoS value.
AND	Selecting AND indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied only to dot1Q (subinterface). For AND criteria only, a single value is allowed on CoS, DSCP, and IP Precedence.
OR	Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
Committed Rate	Displays the committed traffic rate value.

Table 7-74 Field Descriptions for the Add L2 Service Drops Wizard (continued)

Field	Description
Committed Burst Size	Displays the committed burst size.
CIR CoS	Committed traffic CoS type (Trust or CoS Marked).
CIR CoS Value	Committed traffic CoS value. The valid range is from 0 to 7.
Excess Action	Excess traffic action type (Discard or Allow).
Peak Rate	Displays the peak traffic rate value.
Peak Burst Size	Displays the peak traffic burst value.
PIR CoS	Displays the peak traffic CoS type (Trust or CoS Marked).
PIR CoS Value	Displays the peak traffic CoS value. The valid range is from 0 to 7.
Violate Action	Displays the violate traffic action type (Discard or Allow).
Violate CoS	Displays the violate traffic CoS type (Trust or CoS Marked).
Violate CoS Value	Displays the violate traffic CoS value. The valid range is from 0 to 7.
Best Effort Type	Displays the best-effort traffic type (Line-Rate or Rate-Limited).
Max Rate	Displays the maximum rate value.
Max Burst Size	Displays the maximum burst value.
QoS Parameters > Profile	
Load from QoS Profile	Select the QoS profile from the list displayed. See 7.11.3 Creating QoS Profiles, page 7-324 for details on how to create a QoS profile. **Note** The remainder of the QoS parameters displayed on this tab are described earlier in this table.
QoS Parameters > Custom QoS	
Load from QoS Profile	Select the QoS profile from the list displayed. See 7.11.3 Creating QoS Profiles, page 7-324 for details on how to create a QoS profile. **Note** The remainder of the QoS parameters displayed on this tab are described earlier in this table.
Policing > Classification	
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
Match IP Precedence	Matches the IP precedence value. The valid range is from 0 to 7.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
AND	Selecting AND indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied only to dot1Q (subinterface). For AND criteria only, a single value is allowed on CoS, DSCP, and IP Precedence.
OR	Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
Policing > Committed Traffic	
Line Rate	Rate and burst of the Ethernet port are applicable.

Table 7-74 Field Descriptions for the Add L2 Service Drops Wizard (continued)

Field	Description
Rate Limited	User-specified rate and burst limits are applicable.
Committed Rate	Displays the committed rate.
Committed Burst Size	Displays the committed burst size.
Policing > Committed Traffic > Committed CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Excess Traffic	
Discard	Excess traffic action should be set to “drop.”
Allow	Excess traffic with CoS, as marked by the user, is transmitted.
Peak Rate	Peak rate value.
Peak Burst	Peak burst value.
Policing > Excess Traffic > Excess CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 CoS marked. The valid range is from 0 to 7.
Policing > Violations	
Discard	Excess traffic action should be set to “drop.”
Allow	Excess traffic with CoS, as marked by the user, is transmitted.
Policing > Violations > Violations CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Best Effort	
Line Rate	Rate and burst of the Ethernet port are applicable.
Rate Limited	User-specified rate and burst limits are applicable.
Max Rate	The maximum rate value.
Max Burst	The maximum burst value.
Policing > Best Effort > Best Effort CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Service Drops Configuration (Service Drop)	
Apply QoS Parameters to All UNI Ports	When selected, the QoS parameters specified in the QoS Parameters screen are applied to all the drops.
RSTP Enable	When checked, RSTP is enabled.
NE ID	The user-defined name of the selected NE.
Slot	Information about the slot.
Type	Displays the ML-series card type—ML100 or ML1000.
Port	The port number on the ML card.
Enable	Used to enable or disable the drop port. When checked, the drop port is enabled.

Table 7-74 Field Descriptions for the Add L2 Service Drops Wizard (continued)

Field	Description
Port Type	The port type—UNI or NNI.
Con Type	The connection type. For the UNI port type, the connection type is QinQ, dot1q, or Untagged. For the NNI port type, only the NNI connection type is permitted.
Port VLAN ID	The port VLAN ID used for dot1q drops. By default, the NNI dot1q drop is populated with the service provider VLAN ID.
PM State	Check this check box to collect PM data for each drop port in an ML-series card. Checking the PM State box sets the Cisco IOS cos accounting command in each appropriate front port.
QoS Parameters	The QoS parameters displayed on this screen are described earlier in this table.

Step 6 In the L2 Service Drop Ports Selection section, complete the following information:

a. Select one of the NEs in the NE ID drop-down list. After the NE is selected, all the available drops and their capabilities are displayed in the Available L2 Service Drop Ports list.

b. Select the L2 service drop ports. Click **Add** to add Layer 2 service ports to the Configured L2 Service Drop Ports list. Click **Remove** to remove Layer 2 service ports from the list.

c. Repeat substeps a and b to add or remove all the drops on different NEs that will be a part of the Layer 2 service.

Step 7 Click **Next**.

Step 8 In the Service Drops tab, complete the following information:

- Apply QoS Parameters to All UNI Ports—Check this check box to apply the QoS parameters to all UNI ports.
- Enable RSTP—Check this check box to enable RSTP.
- Enable—Check this check box to enable the drop port state. Uncheck it to disable the drop port state.
- Port Type—Select the port type.
- Con Type—Select the connection type.
- Port VLAN ID—Enter the VLAN ID for the dot1q drops.
- PM State—Check this check box to collect PM data for each drop port in an ML-series card. Checking the PM State box sets the Cisco IOS cos accounting command in each appropriate front port.

Note You can select individual drop ports for QoS configuration or check the Apply QoS Parameters to All UNI Ports check box. If you select individual drop ports, you will need to repeat Step 8 through Step 14 for each drop port selected.

Step 9 Click the Port Attributes tab. A confirmation window appears. Click **Yes** to continue.

Step 10 Configure the port attributes in the Port Attributes tab. Table 7-74 provides descriptions.

Step 11 Click **Next**.

Step 12 Review the QoS parameters and their corresponding values in the QoS Parameters area.

Step 13 Review the Layer 2 service summary in the L2 Service Summary area.

Step 14 Click **Next**.

Step 15 The QoS Parameters pane opens, displaying the Profile and Custom QoS tabs. QoS parameters are applied to UNI ports. Select the QoS profile to use from the Load from QoS Profile drop-down list.

Step 16 Click the **Custom QoS** tab, which allows you to customize the QoS profile you selected.

Step 17 Configure the fields displayed in the Policing area. Table 7-74 provides descriptions.

Note The tabs displayed in the Policing area are dimmed or available depending on the selection you made from the Load from QoS Profile drop-down list. When Best Effort is selected, the Classification and Best Effort tabs in the Policing area are active and can be configured. When CIR/PIR is selected, the Classification, Committed Traffic, Excess Traffic, and Violations tabs in the Policing area are active and can be configured.

Step 18 Click **Finish** to add the Layer 2 service drop.

Step 19 In the confirmation dialog box, click **OK**.

7.10.13.15 Deleting L2 Service Drops

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select a service on which to delete drops.

Step 4 Choose **Configuration > Show Drops**. The L2 Service Drop Ports table opens.

Step 5 Choose **Configuration > Delete Drops**. The Modify L2 Service dialog box opens.

Step 6 In the confirmation dialog box, click **Yes**.

Note A progress animator is displayed while the delete operation is being performed.

7.10.13.16 Modifying L2 Service Drops

Use the Modify L2 Drops window to modify the selected L2 drops.

Note The Ethernet port attributes (for example, MTU, speed, and flow control), COS accounting, and port enabling/disabling values are not automatically mirrored to the standby ML card when modified on the active ML card. These values can be modified manually on the standby cards using NE Explorer.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, choose **Configuration > Show L2 Services**.

Step 3 In the L2 Services table, select a service on which to modify drops.

Step 4 Choose **Configuration > Show Drops**. The L2 Service Drop Ports table opens.

Step 5 Choose **Configuration > Modify Drops**. The Modify L2 Service Drops dialog box opens.

Step 6 Click the **Enable/Disable Drop** tab if you want to enable or disable drops. Check the **Enable** check box to enable the drop port state, and uncheck it to disable the drop port state. Check the **RSTP Enable** check box to enable RSTP.

Step 7 Click the **QoS** tab if you want to enable QoS parameters per drop; then, specify the following QoS parameters:

- CIR/PIR—If selected, specify the following information:
  - Committed information rate—The range is from 1 to 800 Mb/s for Gigabit Ethernet ML-series cards and 1 to 90 Mb/s for FE ML-series cards.
  - Max CIR Burst—Cisco default is 8000 bytes. The range is from 8000 to 64000 bytes.
  - Peak Information Rate—The range is from 96000 to 800000000 bits per second. PIR should be greater than or equal to CIR.
  - Max PIR Burst—Cisco default is 64000 bytes. The range is from 8000 to 64000 bytes. PIR burst should be greater than or equal to CIR burst.
- Best Effort—If selected, the following are set to the default values:
  - Best Effort Max Value—Corresponds to the CIR value. Cisco default is 96000 bits per second.
  - Burst—Corresponds to the Max CIR Burst value. Cisco default is 8000 bytes.

Note The PIR and Max PIR Burst do not need to be set. The card software sets these values to the same values as CIR and Max CIR Burst, respectively.

Step 8 Click the **Performance Monitoring** tab. Check the **PM State** box to collect PM data for each drop port in an ML-series card. Checking the PM State box sets the Cisco IOS cos accounting command in each appropriate front port.

Step 9 Click the **Port Properties** tab. Configure the following information if required:

- NE ID—Select a user-defined NE name from the drop-down lists.
- Slot—Select the ML card slot number from the drop-down lists.
- Type—Displays the ML-series card type: ML100 or ML1000.
- Port—Select the port number on the ML card.
- MTU—Enter an MTU size. The valid range is from 64 to 9000. The default value is 1500.
- Speed—Select the speed from the drop-down list. The Speed drop-down list displays three values: 10, 100, and auto. For an ML1000 card, auto is the only supported option.
- Duplex—Select the Duplex value from the drop-down list. The Duplex drop-down list displays three values: full, half, and auto, based upon the type of card selected. For example, for an ML1000 card, auto is the only supported option.
- Flow Control (send)—Select the Flow Control (send) value from the drop-down list. The Flow Control (send) drop-down box displays three values: off, on, and desired. These values are supported by both the Fast Ethernet and Gigabit Ethernet ports.

- Flow Control (receive)—Select the Flow Control (receive) value from the drop-down list. The Flow Control (receive) drop-down box displays three values: off, on, and desired. These values are supported by the Gigabit Ethernet ports only.

Step 10 Click **Apply** to apply your settings or click **Reset** to use default settings.

Note A progress animator is displayed.

Step 11 Click **Close**.

7.10.13.17 Viewing the QoS for Layer 2 Service Drop Port Table

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**. The Layer 2 Topology table opens.

Step 2 Choose **Configuration > Show L2 Services**. The Layer 2 Services table opens.

Step 3 Choose **Configuration > Show Drops**. The Layer 2 Services Drop Ports table opens.

Step 4 Choose **Configuration > Show QoS**. The QoS for Layer 2 Service Drop Port table opens. The following table provides descriptions.

Table 7-75 Field Descriptions for the QoS for Layer 2 Service Drop Port Table

Column	Description
QoS Class Name	Name of the class map and QoS class of the selected Layer 2 service drop.
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match IP Precedence	Matches the IP precedence value. The valid range is from 0 to 7.
IP Precedence Value	Displays the IP precedence value.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
DSCP Value	Displays the DSCP value.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
AND	Selecting AND indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied only to dot1Q (subinterface). For AND criteria only, a single value is allowed on CoS, DSCP, and IP Precedence.
OR	Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
CoS Value	Displays the CoS value.
CIR Type	Displays the CIR type.
CIR Rate	Committed rate, in bits per second (b/s).

Table 7-75 Field Descriptions for the QoS for Layer 2 Service Drop Port Table (continued)

Column	Description
CIR Burst	Committed burst, in bytes.
CIR CoS Type	Committed traffic CoS type (Trust or CoS Marked).
CIR CoS Value	Committed traffic CoS value. The valid range is from 0 to 7.
Excess Action	Excess traffic action type (Discard or Allow).
PIR Rate	Peak rate, in b/s.
PIR Burst	Peak burst, in bytes.
PIR CoS Type	Displays the peak traffic CoS type (Trust or CoS Marked).
PIR CoS Value	Displays the peak traffic CoS value. The valid range is from 0 to 7.
Violate Action	Displays the violate traffic action type (Discard or Allow).
Violate CoS Value	Displays the violate traffic CoS value. The valid range is from 0 to 7.
Best Effort Type	Displays the best-effort traffic type (Line-Rate or Rate-Limited).
Best Effort Rate	Maximum rate, in b/s.
Best Effort Burst	Maximum burst, in bytes.

7.10.13.18 Configuring a Layer 2 Service Resynchronization

Note

- When configuring Layer 2 service resynchronization, data provisioning is disabled. It is recommended that resynchronization become less frequent on the provisioning server and more frequent on the monitoring server.
- The L2 Service Resync Delay field setting is the same for both SONET and SDH NE services. If you change this value in the Control Panel for CTC-based SONET NEs, the same value is reflected for CTC-based SDH NEs, and vice versa.

Complete the following steps to configure a Layer 2 service resynchronization:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Expand **NE Service**.

Step 3 Select either **CTC-Based SONET NEs** or **CTC-Based SDH NEs**.

Step 4 In the L2 Service Resync Delay field, enter the number of seconds before the Layer 2 service resynchronization resumes. The Cisco default is 600 seconds.

Step 5 Click **Save**.

7.10.14 Resynchronizing Layer 2 Topologies

You can resynchronize Layer 2 topologies that are in the following states:

- Sync Failed
- L2Service NotReady
- Partially Completed
- Complete

Note This feature only restarts the L2 topology resynchronization state. It does not forcefully apply any configuration on the ML-series card to complete the synchronization in the L2 topology.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > L2 Topology Table**.

Step 2 In the Layer 2 Topology table, select the topology that you want to resynchronize and choose **Configuration > Resync L2 Topology**. The Prime Optical server reschedules the Layer 2 topology resynchronization process. After it has completed, Prime Optical performs the following:

- Detect base card configuration
- Discover VLANs
- Update L2 topology state

7.10.15 Discovering Layer 2 Topologies

You can initiate a manual discovery of L2 topologies by triggering events for valid L1 circuits in the database. If the network contains split or incomplete L2 topologies, it is helpful to discover the missing topologies.

Step 1 In the Domain Explorer window, select a group or NE node and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Discover L2 Topologies**.

Step 2 Click **Yes** at the following prompt:

```
Use this command only for split or undiscovered topologies. This command rediscovers the
L2 topologies and causes loss of topology description information. Do you want to
continue?
```

This action initiates a forceful discovery of the RPR and point-to-point topologies that are present under the selection context. During the discovery, topologies are deleted from the Layer 2 Topology table and then rediscovered.

7.10.16 Changing the Framing Mode for ML-Series Cards

This section describes how to change the framing mode for ML-series cards to HDLC, GFP, or RPR 802.17.

7.10.16.1 Changing the Framing Mode from HDLC to GFP

Depending on your configuration, complete one of the following steps for all cards that are involved in the L2 topology:

Step 1 For ONS 15454 ML cards, do the following:

a. Select an ONS 15454 NE in the Domain Explorer and choose **Configuration > NE Explorer**.

b. Click the ML card in the shelf view.

c. Click the **Identification** tab.

d. Change the Card Mode value to **GFP-F**.

e. Click **Apply**.

f. Click **Yes** at the following prompt:

```
This will commit your changes to the NE permanently. Do you want to continue?
```

g. Click **Yes** at the following prompt:

```
Changing the card mode will cause the NE to reboot. Make the change anyway?
```

Step 2 For ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH ML-series cards, do the following:

a. Launch the Cisco IOS CLI to the card.

b. Enter the following CLI commands for all interfaces that are involved in the L2 topology:

```
default46#config
Configuring from terminal, memory, or network [terminal]? t
Enter configuration commands, one per line. End with CNTL/Z.
default46(config)#interface interface-ID-pos0-or-pos1
default46(config-if)#pos mode gfp fcs-disabled
#End
default46#write mem
#show controllers pos0-or-pos1
```

The **show controllers** command returns output that is similar to the following example:

```
default46#show controllers pos 0
Interface POS0
Hardware is Packet Over SONET
Framing Mode: GFP
Concatenation: VCAT
Alarms reportable to CLI: AIS-P LOP-P UNEQ-P TIM-P PLM-P ENCAP-MISMATCH RDI-P PD
I-P SF-P SD-P OOU_TPT-STS LOM-STS SQM-STS
Link state change defects: AIS LOP UNEQ PLM ENCAP RDI PDI LOA LOM SQM
Link state change time: 200 (msec)
```

7.10.16.2 Changing the Framing Mode from GFP to HDLC

Depending on your configuration, complete one of the following steps for all cards that are involved in the L2 topology:

Step 1 For ONS 15454 ML cards, do the following:

a. Select an ONS 15454 NE in the Domain Explorer and choose **Configuration > NE Explorer**.

b. Click the ML card in the shelf view.

c. Click the **Identification** tab.

d. Change the Card Mode value to **HDLC**.

e. Click **Apply**.

f. Click **Yes** at the following prompt:

```
This will commit your changes to the NE permanently. Do you want to continue?
```

g. Click **Yes** at the following prompt:

```
Changing the card mode will cause the NE to reboot. Make the change anyway?
```

Step 2 For ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH ML-series cards, do the following:

a. Launch the Cisco IOS CLI to the card.

b. Enter the following CLI commands for all interfaces that are involved in the L2 topology:

```
default46#config
Configuring from terminal, memory, or network [terminal]? t
Enter configuration commands, one per line. End with CNTL/Z.
default46(config)#interface interface-pos0-or-pos1
default46(config-if)# no pos mode gfp
#End
default46#write mem
#show controllers pos0-or-pos1
```

The **show controllers** command returns output that is similar to the following example:

```
default46#show controllers pos 0
Interface POS0
Hardware is Packet Over SONET
Framing Mode: GFP
Concatenation: VCAT
Alarms reportable to CLI: AIS-P LOP-P UNEQ-P TIM-P PLM-P ENCAP-MISMATCH RDI-P PD
I-P SF-P SD-P OOU_TPT-STS LOM-STS SQM-STS
Link state change defects: AIS LOP UNEQ PLM ENCAP RDI PDI LOA LOM SQM
Link state change time: 200 (msec)
```

7.10.16.3 Changing the Framing Mode to RPR 802.17

RPR 802.17 is supported on the following ONS 15454 cards only:

- ML100T-12
- ML100X-8
- ML1000-2

Complete the following steps to change the framing mode to RPR 802.17 for all cards that are involved in the L2 topology:

Step 1 Select an ONS 15454 NE in the Domain Explorer and choose **Configuration > NE Explorer**.

Step 2 Click the ML card in the shelf view.

Step 3 Click the **Identification** tab.

Step 4 Change the Card Mode value to **RPR 802.17**.

Step 5 Click **Apply**.

Step 6 Click **Yes** at the following prompt:

```
This will commit your changes to the NE permanently. Do you want to continue?
```

Step 7 Click **Yes** at the following prompt:

```
Changing the card mode will cause the NE to reboot. Make the change anyway?
```

Step 8 After changing the card mode to RPR 802.17, you must reload the barebone configuration on the ML card. See 7.10.1 Initializing Layer 2 Cards, page 7-237.

7.10.17 Provisioning ML-Series Cards to Receive SNMP Traps

Note In a gateway NE-end NE (GNE-ENE) setup when the ENEs are not connected to the LAN, the only way that the Prime Optical server can communicate to the ENEs is through the GNE. When configuring the SNMP settings of the GNE, the GNE node must work as the SNMP proxy. The ENE nodes forward the SNMP traps to the Prime Optical server through the GNE. This means that the trap destination for the ENE nodes must be the GNE.

Step 1 In the Domain Explorer tree, select the NE that contains ML-series cards and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab.

Step 3 Click the **SNMP** subtab.

Step 4 If the NE is connected to the LAN-connected NE (LNE) or GNE, do the following:

a. Check the **Allow SNMP Set** check box.

b. If the LNE or GNE is acting as an SNMP proxy to forward traps from the ENE or DCC-connected NE, check the **Allow SNMP Proxy** check box.

c. Click **Apply**.

d. Click **Create**. The Create SNMP Trap Destination dialog box opens.

e. Complete the following fields in the Create SNMP Trap Destination dialog box:

- IP Address—Enter the IP address of the Prime Optical server.
- Community Name—Enter a community name that matches the community name in the node properties pane.
- UDP Port—Enter **162** (Cisco default).
- Trap Version—Choose **SNMPv1** or **SNMPv2c**.

f. Click **OK**.

g. Click **Apply**.

Step 5 If the NE is not connected to the LAN but is DCC-connected to other NEs, do the following:

a. Check the **Allow SNMP Set** and **Allow SNMP Proxy** check boxes on the ENE.

b. Click **Apply**.

c. Click **Create**. The Create SNMP Trap Destination dialog box opens.

d. Complete the following fields in the Create SNMP Trap Destination dialog box:

- IP Address—Create the relay IP address with the IP address of the GNE.
- Community Name—Enter a community name that matches the community name in the node properties pane.
- UDP Port—Enter **391**.
- Trap Version—Choose **SNMPv1** or **SNMPv2c**.
- Relay {A | B | C} IP Address, Relay {A | B | C} Community Name—Enter the relay IP addresses of all intermediate NEs that are part of the relay with the relay community name.

e. Click **OK**.

f. Click **Apply**.

7.10.18 Initializing ML-Series Cards

Initializing the ML-series cards of ONS 15310 CL SONET, ONS 15310 MA SDH, ONS 15310 MA SONET, ONS 15454 SDH, and ONS 15454 SONET NEs involves the following tasks:

- Configuring the card mode
- Downloading the base card configuration (BCC) barebone file

Complete the following steps to initialize the ML-series cards:

Step 1 In the Domain Explorer window, select the Prime Optical domain, group, ONS 15310 CL SONET, ONS 15310 MA SDH, ONS 15310 MA SONET, ONS 15454 SDH, or ONS 15454 SONET NE; then, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Initialize ML Cards**. The Initialize ML Cards wizard opens.

Step 2 Select one or more NEs from the Available NEs list; then, click **Add** to add them to the Selected NEs list. Click **Remove** to remove the NE(s) from the Selected NEs list. The list of available NEs depends on the following conditions:

- If you selected the Prime Optical domain in the Domain Explorer window, the list of available NEs includes ONS 15310 CL SONET, ONS 15310 MA SDH, ONS 15310 MA SONET, ONS 15454 SDH, or ONS 15454 SONET NEs that have at least one ML-series card that is not involved in any L2 topology.
- If you selected a group in the Domain Explorer window, the list of available NEs includes the following:
  - NEs that belong to the group and contain at least one ML-series card that is not involved in any L2 topology.
  - NEs that are linked to the NEs of the group and contain at least one ML-series card that is not involved in any L2 topology.
- If you selected an NE in the Domain Explorer window, the list of available NEs includes the following:

- The selected NE, if it contains at least one ML-series card that is not involved in any L2 topology.
- NEs that are linked to the selected NE and contain at least one ML-series card that is not involved in any L2 topology.

Note The Card Mode operation is disabled if the Selected NEs list contains at least one ONS 15310 CL SONET, ONS 15310 MA SDH, or ONS 15310 MA SONET NE.

Step 3 Click **Next**.

Step 4 In the Card Selection area, select the ML-series card to initialize from the Available Cards list; then, click **Add**. Click **Remove** to remove an ML-series card from the Selected Cards list.

Note Select at least one ML-series card for each NE that you selected in Step 2.

Step 5 To configure the BCC barebone file, do the following:

a. In the ML Parameters area, be sure that the **Configure BCC** check box is checked.

b. In the File to BCC area, select one of the following radio buttons:

- Local—The BCC barebone file is on your local client workstation. Enter the path for the file, or click **Browse** to search for it.
- Server—The BCC barebone file is located on a server. Use the drop-down list to select a server.

Note Be sure that the BCC barebone file that you select is applicable to the NE on which the file will be uploaded.

Step 6 To set the card mode parameter, do the following:

a. In the ML Parameters area, check the **Configure Card Mode** check box.

b. Select **HDLC**, **GFP-F**, or **RPR 802.17** from the Card Mode drop-down list.

Note The Configure Card Mode check box and Card Mode drop-down list are disabled if you selected at least one ONS 15310 CL SONET, ONS 15310 MA SDH, or ONS 15310 MA SONET NE in Step 2.

Step 7 (Optional) In the Job Comments text box, enter comments about the ML-series card initialization.

Step 8 To set a time for the ML-series card initialization, choose one of the following radio buttons:

- Now—Begins the ML-series card initialization immediately.
- At Time—Specifies when to begin the ML-series card initialization.

Step 9 Click **Finish**. The selected ML-series cards are restarted, and a new entry is added to the Job Monitor table with the Task Type parameter set to “Initialize ML cards.” The Audit Log reports any errors.

7.10.19 Managing Port Channel Link Aggregation on ML-Series Cards

ML-series cards offer port channel (also known as *link aggregation*) for Gigabit Ethernet and Fast Ethernet ports.

Port channel is a trunking technology that groups multiple full-duplex, IEEE 802.3 Gigabit Ethernet/Fast Ethernet interfaces to provide fault-tolerant, high-speed links to switches, routers, and servers. Port channel forms a single higher bandwidth routing or bridging endpoint and was designed primarily for host-to-switch connectivity. Port channel provides the following benefits:

- Logical aggregation of bandwidth
- Load balancing
- Fault tolerance

To govern reciprocal peer packet transmission, ML cards support Link Aggregation Control Protocol (LACP) on the aggregated channels. LACP, which is defined as part of the IEEE specification 802.3ad, provides load balancing and automatic creation of port channels by exchanging LACP packets between ports. LACP learns the capabilities of port groups dynamically and informs the other ports. Once LACP identifies correctly matched Ethernet links, it facilitates grouping the links into a port channel.

The following table lists the link aggregation features that Prime Optical supports for ML100T-12, ML100X-8, and ML1000-2 cards on ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH NEs.

Table 7-76 Link Aggregation Features Supported in Prime Optical

Link Aggregation Feature	Supported?
Create, modify, or delete a port channel	Yes
Add or remove members to or from a port channel	Yes
Configure LACP in active, passive, or transparent mode	Yes
Configure LACP port priority	Yes
Configure VLAN on a port channel	Yes
Configure the port channel ID	No
Configure the LACP system priority	No
Configure the port channel IP address	No
Monitor the port channel interface	No
Limit the LACP maximum bundle	No
Configure link aggregation across multiple ML-series cards	N/A
Configure policing on port channel interfaces	N/A
Configure Subnetwork Access Protocol (SNAP) or Interswitch Link (ISL) encapsulated frames	N/A

The following table lists the maximum number of port channels and port channel members that ML-series cards can support.

Table 7-77 Maximum Number of Port Channels and Members per Card

Card Type	Maximum No. of Fast Ethernet and Gigabit Ethernet Channels	Maximum No. of Members
ML1000-2	2	2
ML100T-12	6	4
ML100X-8	4	4

The following sections describe how to create, modify, and delete port channels and port channel members.

7.10.19.1 Creating a Port Channel

Step 1 Select one of the following NEs in the Domain Explorer tree and choose **Configuration > NE Explorer**:

- ONS 15310 CL
- ONS 15310 MA SONET
- ONS 15310 MA SDH
- ONS 15454 SONET
- ONS 15454 SDH

Step 2 In the tree view of the NE Explorer window, select the ML100T-12, ML100X-8, or ML1000-2 card.

Step 3 Click the **Port Channel** tab.

Step 4 In the Port Channel Table area, click the **Create** button. The Create Port Channel ID dialog box opens.

Note The Create button is dimmed if the ML card already contains the maximum number of port channels.

Step 5 Configure the fields described in the following table.

Step 6 Click **Apply**. The new port channel interface is created and appears in the Port Channel Table area.

Table 7-78 Field Descriptions for the Create Port Channel ID Dialog Box

Field	Description
Port Channel ID	*Display only.* The port channel ID identifies the port channel interface. Prime Optical generates the ID automatically; the range is from 1 to 64.
Admin State	Select the status of the port channel interface (Up or Down).

Table 7-78 Field Descriptions for the Create Port Channel ID Dialog Box (continued)

Field	Description
MTU	Enter the maximum transmission unit (MTU) size, which is the largest acceptable packet size configured for the port channel interface. The range is from 64 to 9000 bytes; the Cisco default is 1500 bytes. **Note** For ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH NEs, the MTU field is read-only.
Hold Queue In	Enter the size of the memory packet input queue. The range is from 0 to 4096 bytes. If you check the Auto check box, the value that Prime Optical displays depends on the previous interface settings on the selected ML card. (This behavior is the same as for manual Cisco IOS configurations.)
Hold Queue Out	Enter the size of the memory packet output queue. The range is from 0 to 4096 bytes. If you check the Auto check box, the output queue size is determined automatically, and the Hold Queue Out field is dimmed.

7.10.19.2 Modifying a Port Channel

Step 1 In the Domain Explorer tree, select the NE that contains the aggregate link that you want to modify and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ML100T-12, ML100X-8, or ML1000-2 card.

Step 3 Click the **Port Channel** tab.

Step 4 In the Port Channel Table area, select the port channel interface; then, click the **Modify** button. The Modify Port Channel ID dialog box opens.

Step 5 Modify the fields described in the following table.

Step 6 Click **Apply**. The modified port channel interface appears in the Port Channel Table area.

Table 7-79 Field Descriptions for the Modify Port Channel ID Dialog Box

Field	Description
Port Channel ID	*Display only.* The port channel ID identifies the port channel interface. Prime Optical generates the ID automatically; the range is from 1 to 64.
Admin State	Modify the status of the port channel interface (Up or Down).
MTU	Modify the MTU size, which is the largest acceptable packet size configured for the port channel interface. The range is from 64 to 9000 bytes; the Cisco default is 1500 bytes. **Note** For ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH NEs, the MTU field is read-only.

Table 7-79 Field Descriptions for the Modify Port Channel ID Dialog Box (continued)

Field	Description
Hold Queue In	Modify the size of the memory packet input queue. The range is from 0 to 4096 bytes. If you check the Auto check box, the value that Prime Optical displays depends on the previous interface settings on the selected ML card. (This behavior is the same as for manual Cisco IOS configurations.)
Hold Queue Out	Modify the size of the memory packet output queue. The range is from 0 to 4096 bytes. If you check the Auto check box, the output queue size is determined automatically, and the Hold Queue Out field is dimmed.

7.10.19.3 Deleting a Port Channel

Step 1 In the Domain Explorer tree, select the NE that contains the port channel and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ML100T-12, ML100X-8, or ML1000-2 card.

Step 3 Click the **Port Channel** tab.

Step 4 In the Port Channel Table area, select the port channel interface that you want to delete; then, click the **Delete** button.

Note You cannot delete an aggregate link that contains active members. You must first disaggregate all of the associated members from the port channel, then delete the empty port channel.

Step 5 In the confirmation dialog box, click **OK**. The port channel interface disappears from the Port Channel Table area.

7.10.19.4 Creating a Port Channel Member

Step 1 Select one of the following NEs in the Domain Explorer tree and choose **Configuration > NE Explorer**:

- ONS 15310 CL
- ONS 15310 MA SONET
- ONS 15310 MA SDH
- ONS 15454 SONET
- ONS 15454 SDH NE

Step 2 In the tree view of the NE Explorer window, select the ML100T-12, ML100X-8, or ML1000-2 card.

Step 3 Click the **Port Channel** tab.

Step 4 In the Port Channel Members Table area, click the **Add** button. The Add Port Channel Member on Port Channel ID dialog box opens.

Note The Add button is dimmed if the ML card already contains the maximum number of port channel members.

Step 5 Configure the fields described in the following table.

Step 6 Click **Apply**. The new port channel member is created and appears in the Port Channel Members Table area.

Table 7-80 Field Descriptions for the Add Port Channel Member on Port Channel ID Dialog Box

Field	Description
Ethernet Port	Select the available Ethernet front port, which identifies the port channel member.
LACP Enabled	If checked, Link Aggregation Control Protocol (LACP) is enabled. If unchecked, LACP is disabled, and the LACP Mode and LACP Port Priority fields are dimmed.
LACP Mode	Specify the mode for LACP packet exchange between ports: • Transparent—LACP is disabled. • Active—Places a port into an active negotiating state, in which the port initiates negotiations with remote ports by sending LACP packets. • Passive—Places a port into a passive negotiating state, in which the port responds to LACP packets it receives but does not initiate LACP negotiation. In this mode, the port channel group attaches the interface to the bundle.
LACP Port Priority	Enter the number for LACP to use with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating. The range is from 1 to 65535. If you check the Auto check box, the priority is determined automatically, and the LACP Port Priority field is dimmed.

7.10.19.5 Modifying a Port Channel Member

Step 1 In the Domain Explorer tree, select the NE that contains the port channel member and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ML100T-12, ML100X-8, or ML1000-2 card.

Step 3 Click the **Port Channel** tab.

Step 4 In the Port Channel Members Table area, select the port channel member; then, click the **Modify** button. The Modify Port Channel Member on Port Channel ID dialog box opens.

Step 5 Modify the fields described in the following table.

Step 6 Click **Apply**. The modified port channel member appears in the Port Channel Members Table area.

Table 7-81 Field Descriptions for the Modify Port Channel Member on Port Channel ID Dialog Box

Field	Description
Ethernet Port	*Display only.* The port number identifies the selected Ethernet front port.
LACP Enabled	*Display only.* Once the port member has been added, you cannot change the Link Aggregation Control Protocol (LACP) Enabled value. To change the LACP Enabled value, you must first remove the port channel member; then, you can add a new port channel member with the correct LACP Enabled value.
LACP Mode	*Display only.* Once the port member has been added, you cannot change the LACP mode. To change the LACP mode, you must first remove the port channel member; then, you can add a new port channel member with the correct LACP mode.
LACP Port Priority	Modify the number for LACP to use with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating. The range is from 1 to 65535. If you check the Auto check box, the priority is determined automatically, and the LACP Port Priority field is dimmed.

7.10.19.6 Deleting a Port Channel Member

Step 1 In the Domain Explorer tree, select the NE that contains the port channel member and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the ML100T-12, ML100X-8, or ML1000-2 card.

Step 3 Click the **Port Channel** tab.

Step 4 In the Port Channel Members Table area, select the port channel member that you want to delete; then, click the **Remove** button.

Step 5 In the confirmation dialog box, click **OK**. The port channel member disappears from the Port Channel Members Table area.

7.11 Managing QoS Profiles

QoS profiles provide a flexible and powerful way of specifying a QoS configuration. They allow you to define a number of sets of QoS classes for different types of service requirements. The major advantages of provisioning using QoS profiles are the ability to create similar types of services quickly using the same profile and the flexibility to customize certain values of a selected profile.

Note There is no association between the values of QoS profiles and values of QoS parameters used in an L2 service drop port instance.

Managing the QoS profiles is accomplished from the QoS Profile table.

7.11.1 QoS Profile Management Tasks

Use the following procedures to manage ONS 15454 SONET and ONS 15454 SDH DWDM nodes:

- 7.11.1 QoS Profile Management Tasks, page 7-324
- 7.11.2 Viewing the QoS Profile Table, page 7-324
- 7.11.3 Creating QoS Profiles, page 7-324
- 7.11.4 Modifying QoS Profiles, page 7-326
- 7.11.5 Duplicating QoS Profiles, page 7-328
- 7.11.6 Deleting QoS Profiles, page 7-329
- 7.11.7 Viewing the QoS Classes Table, page 7-329

7.11.2 Viewing the QoS Profile Table

In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > QoS Profile Table**. The QoS Profile table opens. The following table provides descriptions.

Table 7-82 Field Descriptions for the QoS Profile Table

Column Name	Description
Profile Name	Displays the name of the QoS profile.
Profile Type	Displays the QoS profile type.
Profile Description	Displays a description of the selected profile.

7.11.3 Creating QoS Profiles

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > QoS Profile Table**. The QoS Profile table opens.

Step 2 Choose **Configuration > Create QoS Profile** (or click the **Create QoS Profile** icon). The Create QoS Profile dialog box opens. The following table provides descriptions.

Table 7-83 Field Descriptions for the Create QoS Profile Dialog Box

Field	Description
Profile Name	Displays the name of the selected profile.
Profile Type	Allows you to select the type of profile to create. Choose Best Effort, CIR/PIR, or Advanced. • When Best Effort is selected, the Classification and Best Effort tabs in the Policing area are active and can be configured. • When CIR/PIR or Advanced is selected, the Classification, Committed Traffic, Excess Traffic, and Violations tabs in the Policing area are active and can be configured.

Table 7-83 Field Descriptions for the Create QoS Profile Dialog Box (continued)

Field	Description
Description	Enter a description for the profile.
Policing > Classification	
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
Match IP Precedence	Matches the IP precedence value. The valid range is from 0 to 7.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
AND	Selecting AND indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied only to dot1Q (subinterface). For AND criteria only, a single value is allowed on CoS, DSCP, and IP Precedence.
OR	Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
Policing > Committed Traffic	
Line Rate	Rate and burst of the Ethernet port are applicable.
Rate Limited	User-specified rate and burst limits are applicable.
Committed Rate	Displays the committed rate.
Committed Burst Size	Displays the committed burst size.
Policing > Committed Traffic > CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Excess Traffic	
Discard	Excess traffic action should be set to “drop.”
Allow	Excess traffic with CoS, as marked by the user, is transmitted.
Peak Rate	Peak rate value.
Peak Burst	Peak burst value.
Policing > Excess Traffic > Excess CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Violations	
Discard	Violate traffic action should be set to “drop.”
Allow	Excess traffic with CoS, as marked by the user, is transmitted.
Policing > Violations > Violations CoS Marking	
Trust	CoS transmit value set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Best Effort	
Line Rate	Rate and burst of the Ethernet port are applicable.

Table 7-83 Field Descriptions for the Create QoS Profile Dialog Box (continued)

Field	Description
Rate Limited	User-specified rate and burst limits are applicable.
Max Rate	Displays the maximum rate value.
Max Burst	Displays the maximum burst value.
Policing > Best Effort > Best Effort CoS Marking	
Trust	CoS transmit value is set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.

Step 3 Enter a name for the QoS profile in the Profile Name field.

Step 4 Select the type of profile you want to create from the Profile Type drop-down list.

Step 5 Configure the fields in the Classification, Committed Traffic, Excess Traffic, Violations, and Best Effort tabs, as necessary.

Step 6 Click **Add** to add the configuration to the list displayed in the table. Repeat this step to add more than one policing configuration to the QoS profile.

Step 7 Click **Save**.

Step 8 In the confirmation dialog box, click **OK**. The new QoS profile appears in the QoS Profiles table.

7.11.4 Modifying QoS Profiles

The Modify QoS Profile wizard allows you to modify selected QoS profiles.

Note

- The profile name and profile type cannot be changed in the Modify QoS Profile wizard. To change the name or type of QoS profile, you must create a new profile.
- You cannot modify a QoS profile that was created through the Create Layer 2 Service, Add Drops, or Modify Drops wizards. However, you can view an existing QoS profile, customize another QoS profile like it, and apply it to a drop.
- If a customized QoS profile was first applied to a VLAN code drop and then modified, the new values will not be automatically applied to the same VLAN code drop. If the changes need to be applied to the VLAN code drop, Operator users should modify it with a QoS template.

Complete the following steps to modify QoS profiles:

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > QoS Profile Table**. The QoS Profile table opens.

Step 2 Select a profile in the QoS Profile table and choose **Configuration > Modify QoS Profile** (or click the **Modify QoS Profile** icon). The Modify QoS Profile wizard opens. The following table provides descriptions.

Table 7-84 Field Descriptions for the Modify QoS Profile Wizard

Field	Description
Profile Name	*Display only.* Displays the name of the selected profile.
Profile Type	*Display only.* Displays the type of profile (Best Effort, CIR/PIR, or Advanced). • When Best Effort is selected, the Classification and Best Effort tabs in the Policing area are active and can be configured. • When CIR/PIR or Advanced is selected, the Classification, Committed Traffic, Excess Traffic, and Violations tabs in the Policing area are active and can be configured.
Description	Enter a description for the profile.
Policing > Classification	
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
Match IP Precedence	Matches the IP precedence value. The valid range is from 0 to 7.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
AND	Selecting AND indicates Match All and Match Any of the traffic classifications, respectively. The QoS profiles that are created with AND criteria are applied only to dot1Q (subinterface). For AND criteria only, a single value is allowed on CoS, DSCP, and IP Precedence.
OR	Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
Policing > Committed Traffic	
Line Rate	Rate and burst of the Ethernet port are applicable.
Rate Limited	User-specified rate and burst limits are applicable.
Committed Rate	Displays the committed rate.
Committed Burst Size	Displays the committed burst size.
Policing > Committed Traffic > Committed CoS Marking	
Trust	CoS transmit value is set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Excess Traffic	
Discard	Excess traffic action should be set to “drop.”
Allow	Excess traffic with CoS, as marked by the user, is transmitted.
Peak Rate	Peak rate value.
Peak Burst	Peak burst value.
Policing > Excess Traffic > Excess CoS Marking	
Trust	CoS transmit value is set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Violations	
Discard	Excess traffic action should be set to “drop.”

Table 7-84 Field Descriptions for the Modify QoS Profile Wizard (continued)

Field	Description
Allow	Excess traffic with CoS, as marked by the user, is transmitted.
Policing > Violations > Violations CoS Marking	
Trust	CoS transmit value is set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is from 0 to 7.
Policing > Best Effort	
Line Rate	Rate and burst of the Ethernet port are applicable.
Rate Limited	User-specified rate and burst limits are applicable.
Max Rate	The maximum rate value.
Max Burst	The maximum burst value.
Policing > Best Effort > Best Effort CoS Marking	
Trust	CoS transmit value is set to 0.
Mark CoS	The Layer 2 Mark CoS value entered. The valid range is 0 to 7.

Step 3 Configure the parameters displayed in the various tabs, as necessary.

Step 4 Click **Add** to add the configuration to the list displayed in the table. Repeat this step to add more than one policing configuration to the QoS profile.

Step 5 Click **Save**.

Step 6 In the confirmation dialog box, click **OK**. The modified QoS profile appears in the QoS Profiles table.

7.11.5 Duplicating QoS Profiles

Prime Optical allows you to create a new QoS profile by cloning an existing QoS profile.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > QoS Profile Table**. The QoS Profile table opens.

Step 2 Select the QoS profile that you want to duplicate.

Step 3 Choose **Configuration > Duplicate QoS Profile** (or click the **Duplicate QoS Profile** icon). The Duplicate QoS Profile dialog box opens.

Step 4 Enter a name for the new QoS profile.

Step 5 Click **OK** to create the new duplicated QoS profile.

Step 6 In the confirmation dialog box, click **OK**. The new QoS profile appears in the QoS Profile table. You can now modify the new QoS profile if required.

7.11.6 Deleting QoS Profiles

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > QoS Profile Table**. The QoS Profile table opens.

Step 2 Select the QoS profile that you want to delete.

Step 3 Choose **Configuration > Delete QoS Profile** (or click the **Delete QoS Profile** icon).

Step 4 In the confirmation dialog box, click **Yes**.

Step 5 In the subsequent confirmation dialog box, click **OK**. The QoS Profile is deleted from the QoS Profile table.

7.11.7 Viewing the QoS Classes Table

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > QoS Profile Table**. The QoS Profile table opens.

Step 2 Choose **Configuration > Show QoS Profile** (or click the **Show QoS Profile** tool). The QoS Classes table opens. The following table provides descriptions.

Table 7-85 Field Descriptions for the QoS Classes Table

Column	Description
Match Any	Matches all the traffic. When selected, all other fields (DSCP, IP Precedence, and CoS) are disabled.
Match IP Precedence	Matches the IP precedence value. The valid range is from 0 to 7.
IP Precedence Value	Displays the IP precedence value.
Match DSCP	Matches the DSCP value. The valid range is from 0 to 63.
DSCP Value	Displays the DSCP value.
Match CoS	Matches the CoS value. The valid range is from 0 to 7.
CoS Value	Displays the CoS value.
AND	AND indicates Match All or Match Any of the traffic classifications, respectively.
OR	Selecting OR indicates Match Any of the traffic classifications (Match DSCP, Match IP Precedence, or Match CoS), respectively. The QoS profiles that are created with the OR criteria are not applied to dot1Q (subinterface).
Committed Traffic Type	Displays the committed traffic type.
Committed Rate	Displays the committed rate.
Committed Burst	Displays the committed burst size.
Committed CoS Type	Displays the committed CoS type.

Table 7-85 Field Descriptions for the QoS Classes Table (continued)

Column	Description
Committed CoS Value	Displays the committed CoS value.
Excess Action	Excess traffic action type (Discard or Allow).
Peak Rate	Peak rate value.
Peak Burst	Peak burst value.
PIR CoS Type	Displays the peak traffic CoS type (Trust or CoS Marked).
PIR CoS Value	Displays the peak traffic CoS value. The valid range is from 0 to 7.
Violate Action	Displays the violate traffic action type (Discard or Allow).
Violate CoS Value	Displays the violate traffic CoS value. The valid range is from 0 to 7.
Best Effort Type	Displays the best-effort traffic type (Line-Rate or Rate-Limited).
Best Effort Rate	Maximum rate.
Best Effort Burst	Maximum burst.

7.12 Managing DWDM Nodes

Use the tasks described in the following table to manage ONS 15454 SONET and ONS 15454 SDH DWDM nodes.

Note Internal patchcords that involve passive cards can be viewed in Prime Optical, but can only be provisioned in CTC.

Use the following procedures to manage ONS 15454 SONET and ONS 15454 SDH DWDM nodes:

- 7.12.1 Calculating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier, page 7-331
- 7.12.2 Calculating Internal Patchcord Connections—ONS 15454 SONET and ONS 15454 SDH R8.0 and R9.0, page 7-331
- 7.12.3 Creating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier, page 7-332
- 7.12.4 Creating Internal Patchcords—ONS 15454 SONET and ONS 15454 SDH R8.0 and Later, page 7-332
- 7.12.5 Deleting DWDM Connections or Internal Patchcords, page 7-334

7.12.1 Calculating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier

To verify if the DWDM connection matches the connections on the DWDM design plan:

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Connections** subtab.

Step 4 Click **Calculate Connections**. The DWDM connections are displayed with the following information:

- Slot-From
- Unit-From
- Port-From
- Slot-To
- Unit-To
- Port-To
- State

7.12.2 Calculating Internal Patchcord Connections—ONS 15454 SONET and ONS 15454 SDH R8.0 and R9.0

Tip This section applies to NE releases from 8.0 to 9.0. For NE releases 9.1 and later, see 7.12.11.2 Configuring ANS on Release 9.1 and Later NEs, page 7-342.

It is possible for Prime Optical to automatically create an internal patchcord if a node is configured correctly. To calculate internal patchcord connections so the TCC card can create the internal patchcord based on the card provisioned in the node:

Note Internal patchcords that involve passive cards can be viewed but not provisioned in Prime Optical. Provisioning must be done in CTC.

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Connections** subtab.

Step 4 Click **Calculate Connections**. The internal patchcord connections are displayed with the following information:

- From—The unit or port from which the internal patchcord originates.
- To—The unit or port to which the internal patchcord terminates.
- Wavelength—Shows the wavelength value if the internal patchcord is between two channel ports. Otherwise, it shows *N/A*.

7.12.3 Creating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier

Note Internal patchcords that involve passive cards cannot be viewed in Prime Optical for NE releases earlier than 9.3.

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Connections** subtab.

Step 4 Click **Create**. The Create Optical Link dialog box opens.

Step 5 Specify the following information:

- From Slot—Select the slot from which the DWDM connection will originate.
- From Port—Select the port from which the DWDM connection will originate.
- To Slot—Select the slot to which the DWDM connection will terminate.
- To Port—Select the port to which the DWDM connection will terminate.
- Bidirectional—Check if you want the DWDM connection to be bidirectional.

Step 6 Click **OK**.

7.12.4 Creating Internal Patchcords—ONS 15454 SONET and ONS 15454 SDH R8.0 and Later

The following section applies to NE releases from 8.0 to 9.0. On NE release 9.1 and later, the ability to create internal patchcords has been removed from CTM.

Note Internal patchcords that involve passive cards can only be created in CTC.

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Connections** subtab.

Note For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.

Step 4 Click **Create**. The Internal Patchcord wizard opens.

Step 5 Specify the following information:

- Trunk to Trunk (Layer 2)—If this radio button is selected, Prime Optical allows you to create patchcords between the trunk ports of 10GE_XP and GE_XP cards.

  Note The Layer 2 1+1 protection group is created only between client ports on GE_XP or 10GE_XP cards (in L2 over DWDM mode), and only if L2 trunk-to-trunk internal patchcords are created between the cards' trunk ports.

- OTS/OCH to OTS/OCH—If this radio button is selected, Prime Optical allows you to select an OTS or OCH port as the source and destination for the patchcord. For example, you can create OTS patchcords between an amplifier and a MUX, DMX, WSS, or WXC port. You can create OCH patchcords between TXP/MXP OCH ports.
- OCH-Trunk to OCH-Filter—If this radio button is selected, Prime Optical allows you to create patchcords from TXP trunk ports to MUX, DMX, or WSS ports.
- OCHNC Wavelength—*Available if the OCH-Trunk to OCH-Filter radio button is selected*. Specify the OCHNC wavelength.
- Bidirectional—*Available if the OTS/OCH to OTS/OCH radio button is selected.* If checked, it indicates that the patchcord is bidirectional and you need to select the ports for both directions.

Step 6 Click **Next**.

Step 7 Specify the internal patchcord source. Specify the following information; then, click **Next**:

- Shelf
- Slot
- TX port
- Reverse port

Step 8 Specify the internal patchcord destination. Specify the following information; then, click **Next**:

- Shelf
- Slot
- TX port
- Reverse port

Step 9 Review the internal patchcord summary.

Step 10 Click **Finish**.

7.12.5 Deleting DWDM Connections or Internal Patchcords

The following section applies to NE releases 9.0 and earlier. On NE release 9.1 and later, the ability to delete internal patchcords has been removed from Prime Optical.

Note Internal patchcords that involve passive cards can only be deleted in CTC.

If a DWDM connection or an internal patchcord does not match the DWDM design plan, you can delete the DWDM connection or internal patchcord.

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Connections** subtab.

Step 4 Select the DWDM connection or internal patchcord to delete.

Step 5 Click **Delete**.

Step 6 In the confirmation dialog box, click **OK**.

7.12.6 Importing Cisco MetroPlanner Configuration Files—ONS 15454 SONET and ONS 15454 SDH R6.0 and Earlier

If you have a Cisco MetroPlanner configuration file, you can import this file into the DWDM node to configure the node automatically.

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Provisioning** subtab.

Step 4 Click **Import**.

Step 5 Select the configuration file using the Open dialog box; then, click **OK**.

Step 6 Click **Apply**.

7.12.7 Provisioning DWDM Nodes Manually

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Provisioning** subtab.

Step 4 Depending on the optical type of the NE, modify the available parameters for each optical type as shown in the following table. For drop-down lists, select an item from the list. For numerics, double-click the field and type the new number.

Step 5 After making your selections, click **Apply**.

Table 7-86 ONS 15454 SONET and ONS 15454 SDH ANS Parameters—Provisioning Subtab

Parameter	Description	Options
OADM		
Network Type	Defines the DWDM network type.	The network type can be one of the following: • Metro-Core—Channels are equalized. (Cisco default value.) • Metro-Access—Channels are not equalized to minimize the number of amplifiers in the ring.
System Type	Defines the DWDM system type.	The system type can be one of the following: • SMF-28 32 Ch Control Gain (Cisco default value) • SMF-28 32 Ch Control Power • SMF-28 8 Ch Control Power • SMF-28 16 Ch Control Power
P_{in} OADM Stage	Sets the per-channel input power at the OADM stage.	–50 dBm to 30 dBm
P_{out} OADM Stage	Sets the per-channel power out at the OADM stage.	–50 dBm to 30 dBm
P_{out} Band 30.3	Sets the per-band power out for the 30.3 drop band.	–50 dBm to 30 dBm
P_{out} Band 34.2	Sets the per-band power out for the 34.2 drop band.	–50 dBm to 30 dBm
P_{out} Band 38.1	Sets the per-band power out for the 38.1 drop band.	–50 dBm to 30 dBm
P_{out} Band 42.1	Sets the per-band power out for the 42.1 drop band.	–50 dBm to 30 dBm
P_{out} Band 46.1	Sets the per-band power out for the 46.1 drop band.	–50 dBm to 30 dBm
P_{out} Band 50.1	Sets the per-band power out for the 50.1 drop band.	–50 dBm to 30 dBm

Table 7-86 ONS 15454 SONET and ONS 15454 SDH ANS Parameters—Provisioning Subtab (continued)

Parameter	Description	Options
P_{out} Band 54.1	Sets the per-band power out for the 54.1 drop band.	–50 dBm to 30 dBm
P_{out} Band 58.1	Sets the per-band power out for the 58.1 drop band.	–50 dBm to 30 dBm
Hub		
Network Type	Defines the DWDM network type.	The network type can be one of the following: • Metro-Core—Channels are equalized. (Cisco default value.) • Metro-Access—Channels are not equalized to minimize the number of amplifiers in the ring.
System Type	Defines the west-side DWDM fiber type, number of channels, and control mode.	The system type can be one of the following: • SMF-28 32 Ch Control Gain (Cisco default value) • SMF-28 32 Ch Control Power • SMF-28 8 Ch Control Power • SMF-28 16 Ch Control Power
Pdrop	Sets the expected power level on the client interface.	–50 dBm to 30 dBm
Pexpress	Sets the expected per-channel power on the pass-through interface.	–50 dBm to 30 dBm
Pout MUX Stage	Sets the per-channel power out at the multiplexing stage.	–50 dBm to 30 dBm
Terminal		
Network Type	Defines the west-side DWDM fiber type, number of channels, and control mode.	The network type can be one of the following: • SMF-28 32 Ch Control Gain (Cisco default value) • SMF-28 32 Ch Control Power • SMF-28 8 Ch Control Power • SMF-28 16 Ch Control Power
System Type	Defines the west-side DWDM fiber type, number of channels, and control mode.	The system type can be one of the following: • SMF-28 32 Ch Control Gain (Cisco default value) • SMF-28 32 Ch Control Power • SMF-28 8 Ch Control Power • SMF-28 16 Ch Control Power
Pdrop	Sets the expected power level on the client interface.	–50 dBm to 30 dBm
Pout MUX Stage	Sets the west-side per-channel power out at the multiplexing stage.	–50 dBm to 30 dBm

Table 7-86 ONS 15454 SONET and ONS 15454 SDH ANS Parameters—Provisioning Subtab (continued)

Parameter	Description	Options
Line		
Network Type	Defines the DWDM network type.	The network type can be one of the following: • Metro-Core—Channels are equalized. (Cisco default value.) • Metro-Access—Channels are not equalized to minimize the number of amplifiers in the ring.
System Type	Defines the west-side DWDM fiber type, number of channels, and control mode.	The system type can be one of the following: • SMF-28 32 Ch Control Gain (Cisco default value) • SMF-28 32 Ch Control Power • SMF-28 8 Ch Control Power • SMF-28 16 Ch Control Power

7.12.8 Provisioning the Power Level of DWDM Nodes

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Port Status** subtab.

Step 4 Click the **Launch ANS** button.

Step 5 In the confirmation dialog box, click **OK**. The Automatic Node Setup (ANS) adjusts the values of the variable optical attenuators (VOAs) to equalize the per-channel power at the amplifier level.

7.12.9 Checking the Span Loss Between DWDM Nodes

The Span Check subtab allows you to check the span loss between the selected node and the previous node in the chain. The span check is always in reception.

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Span Check** subtab.

Step 4 Click the **Retrieve Span Loss Values** button to run the span loss verification function and retrieve values for the measure span loss column.

Step 5 In the confirmation dialog box, click **OK**.

7.12.10 Managing APC Domains

The APC domain refers to a set of interconnected NEs on which to run the APC.

7.12.10.1 Viewing the APC Domain Table

In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > APC Domain Management**. The APC Domain table opens. The following table provides descriptions.

Table 7-87 Field Description for the APC Domain Table

Field	Description
Domain Name	Displays the APC domain name.
APC State	Displays the actual state of the APC. Possible values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.
APC Admin State	Displays the APC administrative state. Possible values are: • APC free to run—You can run the APC on the APC domain. • APC Force Disable—APC is disabled and you cannot run the APC on the APC domain.
Sides	Lists all the NEs and their sides that belong to the APC domain.

7.12.10.2 Running APC

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > APC Domain Management**.

Step 2 In the APC Domain table, select **Edit > Run APC** (or click the **Run APC** tool).

7.12.10.3 Viewing the APC Results

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > APC Domain Management**.

Step 2 Choose a domain from the APC Domain table and choose **Edit > APC Results** (or click the **APC Results** tool). The APC Results table opens. It contains APC data for the nodes and sides that belong to the selected domain. The following table provides descriptions.

Table 7-88 Field Descriptions for the APC Results Table

Field	Description
NE ID	Displays the ID of the node that belongs to the selected APC domain.
Side	Displays the side that belongs to the selected APC domain.
Parameter	Displays the APC parameter associated with the ports.
Last Modification	Displays the date and time when the power control setpoint was last modified.
Last Check	Displays the date and time when the power control setpoint was last verified.

7.12.10.4 Enabling and Disabling APC

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > APC Domain Management**.

Step 2 In the APC Domain table, do one of the following:

- Select **Edit > Enable APC** (or click the **Enable APC** tool) to enable APC.
- Select **Edit > Disable APC** (or click the **Disable APC** tool) to disable APC.

Caution Disabling APC should be performed only for specific maintenance actions. When APC is disabled, aging compensation calculations are not performed and circuits cannot be activated.

Step 3 Click **Yes** in the confirmation dialog box.

Step 4 Verify that the APC state of the APC domain changes to Disable.

7.12.10.5 Discovering the APC Domain

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > APC Domain Management**.

Step 2 In the APC Domain table, select **Edit > Discover APC Domain** (or click the **Discover APC Domain** tool).

7.12.11 Configuring Automatic Node Setup

You should run the Automatic Node Setup (ANS) wizard based on the input supplied by the Cisco MetroPlanner application. The Cisco MetroPlanner application generates an entire network setup/configuration based on customer requirements. The ANS wizard (launched from the Node Setup subtab) allows you to provision card and ANS parameters based on the content of an XML file that is generated by the Cisco MetroPlanner application. Using the contents of the XML file generated by the Cisco MetroPlanner application ensures that the NE configuration and optical parameters are set correctly.

You would normally run the ANS wizard when an NE has been inserted or discovered in Prime Optical (as long as Cisco MetroPlanner has been used for the customer network).

Preprovisioning is based on the output XML file that you select. The Cisco MetroPlanner application generates an XML configuration file for your network configuration. The Automatic Node Provisioning (ANP) XML file contains information that allows Prime Optical to provision:

- OPT-AMP-L role (booster/preamp)
- ANS provisioning parameters

7.12.11.1 Configuring ANS on Release 9.0 and Earlier NEs

Complete the following steps to run the ANS wizard on release 9.0 and earlier NEs:

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Node Setup** subtab. The following table provides descriptions.

Table 7-89 Field Descriptions for the Node Setup Subtab

Field	Description
XML Settings	
Select XML file	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical automatically checks the XML file you select to verify that the file is formatted correctly.
Log Settings	
Select Log File	Click **Browse** to select a log file where the results of the operations you perform will be saved in ASCII format.
Launch ANS Wizard button	Click the **Launch Wizard** button to launch the ANS wizard.
ANS Node Selection	
Select Node Profile	From the list of available profiles displayed, select the node profile you want to apply to the NE.
ANS Section Selection	
Provision Card Parameters	Check the **Provision Card Parameters** check box to display the Provision Card Parameters window in the wizard. If you do not check this check box, the Provision Card Parameters window does not appear in the wizard.

Table 7-89 Field Descriptions for the Node Setup Subtab (continued)

Field	Description
Provision ANS Parameters	Check the **Provision ANS Parameter**s check box to display the Provision ANS Parameters window in the wizard. If you do not check this check box, the Provision ANS Parameters window does not appear in the wizard.
Provision Card Parameters	
Name	Name of the card parameter being set.
Value	Value of the card parameter being set.
Shelf	Shelf ID where the card is preprovisioned or equipped.
Slot	Slot number where the card is preprovisioned or equipped.
PPM	PPM number the card parameter refers to.
Log	Displays a list of commands Prime Optical executes to preprovision the card parameters.
Provision ANS Parameters	
Parameter	Name of the ANS parameter being set.
Value	Value of the ANS parameter being set.
Log	Displays a list of commands Prime Optical executes to preprovision the card parameters.
Apply button	Click the **Apply** button to begin preprovisioning. Once completed, the Log pane displays the results of the preprovisioning action. Operations that did not succeed are highlighted in red text. **Note** If a preprovisioning action fails while running the ANS wizard, the ANS wizard continues to execute (as CTC does) the remaining preprovisioning actions. Actions that did not succeed are highlighted in red text, detailing the failure and its cause. You can click the **Cancel** button to exit the ANS wizard, resolve the issue that prevented the highlighted action from executing, and then rerun the ANS wizard.
Finish button	Click the **Finish** button to close the wizard.

Note To avoid raising surplus alarms, it is recommended that you change the state of the selected NE to Under Maintenance before you perform any operations through CTC. You must change the state of the NE to Out of Service (OOS) in Prime Optical before launching the node layout preprovisioning from CTC. After the ANS execution completes successfully, you can change the state of the NE back to In Service.

Step 4 Click **Browse** to select the XML configuration file (generated by the Cisco MetroPlanner application) that you want to use to preprovision the NE. Prime Optical automatically examines the selected XML file to verify that the file is formatted correctly.

Step 5 Click **Browse** to select the log file where the results of the operations you perform will be saved.

Step 6 Click the **Launch Wizard** button. The first step of the Automatic Node Setup wizard appears. For an explanation of the fields that appear in the Automatic Node Setup wizard, see Table 7-89.

Step 7 From the list of profiles displayed, select the node profile you want to apply to the NE. The list of node profiles displayed is obtained from the XML configuration file selected in Step 4.

Step 8 Click **Next**. The ANS Selection area appears.

Step 9 Click the appropriate check boxes to select the corresponding windows you want to appear in the wizard:

- Provision Card Parameters—Check this check box to display the Provision Card Parameters window.
- Provision ANS Parameters—Check this check box to display the Provision ANS Parameters window.

Note You can check any of the check boxes displayed in the ANS Selection area as long as the corresponding information is present in the XML file. If you leave a check box unchecked, that selection does not appear in the wizard. For example, if you do not check the Provision Card Parameters check box, the corresponding window does not appear in the wizard.

Step 10 Click **Next**. Go to:

- Step 11 if you selected the Provision Card Parameters check box in Step 9.
- Step 13 if you selected the Provision ANS Parameters check box in Step 9.

Step 11 Click **Apply** to begin preprovisioning the card parameters. Once completed, the Log pane displays the results of the preprovisioning action. Operations that did not succeed are highlighted in red text.

Step 12 Click **Next**. The Provision ANS Parameters window appears if you checked the Provision ANS Parameters check box in Step 9. The name of the board parameter, its value, its shelf number, its slot, and the PPM of the board are displayed on the left side.

Step 13 Click **Apply** to begin preprovisioning the ANS parameters. Once completed, the Log pane displays the results of the preprovisioning actions. Operations that did not succeed are highlighted in red text. The Log pane displays the results of all the preprovisioning actions applied to the NEs.

Step 14 Click **Finish** to close the wizard.

7.12.11.2 Configuring ANS on Release 9.1 and Later NEs

Complete the following steps to run the ANS wizard on release 9.1 and later NEs:

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Node Setup** subtab. The following table provides descriptions.

Table 7-90 Field Descriptions for the Node Setup Subtab

Field	Description
XML Settings	
Select XML file	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical automatically checks the XML file you select to verify that the file is formatted correctly.
Log Settings	
Select Log File	Click **Browse** to select a log file where the results of the operations you perform will be saved in ASCII format.

Table 7-90 Field Descriptions for the Node Setup Subtab (continued)

Field	Description
Launch ANS Wizard button	Click the **Launch Wizard** button to launch the ANS wizard.
ANS Node Selection	
Select Node Profile	From the list of available profiles displayed, select the node profile you want to apply to the NE.
Apply button	Click the **Apply** button to begin preprovisioning. Once completed, the Log pane displays the results of the preprovisioning action. You can view the action status in the Job Monitor table. (For more details, see 4.6.1.1 Viewing the Job Monitor Table, page 4-88.)
Finish button	Click the **Finish** button to close the wizard.

Note To avoid raising surplus alarms, it is recommended that you change the state of the selected NE to Under Maintenance before you perform any operations through CTC. You must change the state of the NE to Out of Service (OOS) in Prime Optical before launching the node layout preprovisioning from CTC. After the ANS execution completes successfully, you can change the state of the NE back to In Service.

Step 4 Click **Browse** to select the XML configuration file (generated by the Cisco MetroPlanner application) that you want to use to preprovision the NE. Prime Optical automatically examines the selected XML file to verify that the file is formatted correctly.

Step 5 Click **Browse** to select the log file where the results of the operations you perform will be saved.

Step 6 Click the **Launch Wizard** button. The first step of the Automatic Node Setup wizard appears. For an explanation of the fields that appear in the Automatic Node Setup wizard, see Table 7-90.

Step 7 From the list of profiles displayed, select the node profile you want to apply to the NE. The list of node profiles displayed is obtained from the XML configuration file selected in Step 4.

Step 8 Click **Apply** to begin preprovisioning the ANS parameters. Once completed, the Log pane displays the results of the preprovisioning action. You can view the action status in the Job Monitor table. (For more details, see 4.6.1.1 Viewing the Job Monitor Table, page 4-88.)

Step 9 Click **Finish** to close the wizard.

7.12.12 Creating Side Objects

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Side** subtab.

Step 4 Click **Create**. The Create Side dialog box opens.

Step 5 Specify the following:

- Side ID—Select a side ID from the drop-down list.
- Line In—Select the receive side of the OTS port from the drop-down list.
- Line Out—Select the transmit side of the OTS port from the drop-down list.

Step 6 Click **OK**.

7.12.13 Modifying Side Objects

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Side** subtab.

Step 4 Select the side to modify; then, click **Modify**. The Modify Side dialog box opens.

Step 5 Change the side ID.

Step 6 Click **OK**.

7.12.14 Deleting Side Objects

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Side** subtab.

Step 4 Select the side to delete; then, click **Delete**.

Step 5 In the confirmation dialog box, click **OK**.

7.12.15 Creating Alien Wavelength

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Alien Wavelength** subtab.

Step 4 Click **Create**. The Create Alien Wavelength dialog box opens.

In Card Selection:

- Type—Select the type of card on which the alien wavelength is configured (optical or passive)

Note Each of these card options is available only if the corresponding card type is available on the network.

- Shelf—Choose the shelf on which the card resides.
- Slot—Choose the slot in which the card resides.

Note Shelf and Slot fields are displayed only for optical cards.

- Port—Choose the card port on which the alien wavelength is configured.
- Lambda—Displays the lambda associated to the optical port.

In Settings:

- Alien Wavelength—Choose the alien wavelength class.
- FEC—Set the FEC mode on the alien wavelength channel. You may change the FEC mode. The available modes are:
  - Disabled
  - Standard
  - Enhanced
  - Enhanced I.4
  - Enhanced I.7

Step 5 Click **OK** to continue the operation, or click **Cancel**.

7.12.16 Editing Alien Wavelength

Step 1 In the Domain Explorer, select an ONS 15454 SONET or ONS 15454 SDH DWDM NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **DWDM** tab.

Step 3 Click the **Alien Wavelength** subtab.

Step 4 Select the alien wavelength to modify; then, click **Edit**.

The Edit Alien Wavelength dialog box opens.

Step 5 Change the alien wavelength class.

Click **OK** to continue the operation, or click **Cancel**.

Managing Security

This chapter describes Cisco Prime Optical security and how to manage users. This includes an overview of security domains and a description of the user security and NE security features available in Prime Optical.

This chapter contains the following sections:

- 8.1 Overview, page 8-1
- 8.2 Login Advisory Message, page 8-2
- 8.3 User Security, page 8-2
- 8.4 NE Security Management, page 8-41
- 8.5 Audit Log, page 8-72
- 8.6 Northbound Gateway Security, page 8-76

8.1 Overview

Why create a security policy?

- To create a baseline of your current security posture
- To set the framework for security implementation
- To define allowed and disallowed behaviors
- To help determine necessary tools and procedures
- To communicate consensus and define roles
- To define how to handle security incidents

The following security domains govern Prime Optical networks:

- Prime Optical client—A Prime Optical client must be created with one of the existing default user profiles or with a new custom user profile with appropriate access privileges. This new user profile should be created and assigned to a user.
- Prime Optical Operations Support System (OSS) users—OSS-to-Prime Optical sessions are configured by the Prime Optical GateWay EMS-to-NMS interface architectural component. See Chapter 12, "Managing Southbound and Northbound Interfaces" for more information about Prime Optical GateWay.

- NE users—An NE user account must be set up so Prime Optical can use it to communicate with the NE. NE user accounts are used to directly access the NE through the NE's craft tool or the command-line interface (CLI).

Prime Optical supports the following security features:

- Login advisory message
- User management and profiles
- NE access control
- Audit Log
- Northbound gateway security

8.2 Login Advisory Message

After logging into the Prime Optical client, a login advisory message is shown. By default, the advisory message reads:

```
NOTICE: This is a private computer system. Unauthorised access or use may lead to
prosecution.
```

Note The login advisory message is not shown if you login to Prime Optical through Prime Central.

You can customize the default advisory message as follows:

Step 1 Log into the Prime Optical server as the root or optusr user.

Step 2 Use a text editor to edit the OpticalPortalProperties.js file in the /opt/CiscoTransportManagerServer/tomcat/webapps/OpticalPortal/lib/xwt/nls directory. Edit the "advisory: property."

The new advisory message can contain up to 1600 characters.

Step 3 Save the changes.

All subsequent users who log into the Prime Optical client will see the new advisory message.

8.3 User Security

This section describes user security and management. This includes procedures on how to add a new user, modify a user's properties, delete a user, and end an active user session. It also includes procedures on how to add, modify, and delete custom profiles and how to perform NE user administration.

8.3.1 Restricting User Access

The **Administration > Users** menu launched from the Domain Explorer window, manages user security. Prime Optical administration allows restricted access logins to enable users to perform tasks based on detailed access privileges. For each action, a user is given read-only, read/write, or no access privileges.

8.3.2 User Privilege Profiles

By default, Prime Optical contains the following user profiles:

- SuperUser—Users who have access to all operations.
- SysAdmin—System administrators who manage Prime Optical access.
- NetworkAdmin—Typically, network operations center (NOC) supervisors who perform daily network NE operations. These operations do not include changing the NE username and password in the NE Authentication tab.
- Provisioner—Users who perform daily network surveillance, provisioning, and PM activities on specific NEs. Each provisioner can have only one active session. Provisioners cannot access administrative information.
- Operator—Users who perform daily network surveillance and PM activities on specific NEs. Each operator can have only one active session. Operators cannot access administrative information.

Prime Optical allows SuperUsers and SysAdmins to generate custom user profiles with certain privileges. Custom user profiles are grouped into categories and each category has a set of operations. After the user profiles are generated, they can be assigned to new Prime Optical users.

Note You must select the privileges for all possible operations, even for privileges related to modules that are not currently installed on the server.

8.3.3 Performing User Administration

This section describes how to perform user administration, including:

- 8.3.3.1 Viewing the Prime Optical Users Table, page 8-13
- 8.3.3.2 Creating a Prime Optical User, page 8-15
- 8.3.3.3 Modifying a Prime Optical User's Properties, page 8-18
- 8.3.3.4 Deleting a Prime Optical User, page 8-21
- 8.3.3.5 Viewing Logged In Prime Optical Users, page 8-22
- 8.3.3.6 Ending an Active Prime Optical User Session, page 8-22
- 8.3.3.7 Viewing a List of Failed Login Attempts, page 8-23
- 8.3.3.8 Locked User Account, page 8-23
- 8.3.3.8 Locked User Account, page 8-23
- 8.3.3.9 Changing Your User Password, page 8-23
- 8.3.3.10 Managing Security Advisory Messages, page 8-25
- 8.3.3.11 Setting User Preferences, page 8-26
- 8.3.3.12 Enabling or Disabling the Continuous Audible Alarm, page 8-29
- 8.3.3.13 Configuring Prime Optical Security Parameters, page 8-29
- 8.3.3.14 Sending Messages to Other Users, page 8-34
- 8.3.3.15 Viewing User Notification Messages, page 8-35

The following table lists the Prime Optical default user profiles and the privileges associated with each profile.

Note The SuperUser profile has access to all operations, and is not specifically listed in a separate column.

Note The NetworkAdmin profile has access to all NEs and groups. The SysAdmin profile has access to no NEs or groups.

8.3.3.1 Viewing the Prime Optical Users Table

The Prime Optical Users table displays basic information about Prime Optical users. The table menu options allow you to create new users, modify users, delete users, and unlock user accounts.

To view the Prime Optical Users table, choose **Administration > Users** in the Domain Explorer window. The following table provides descriptions.

Tip You can click any cell or row in the Prime Optical Users table and then type an alphanumeric character on your keyboard. The selection context jumps to the next username row that starts with that letter or number.

If there are multiple usernames that begin with the same letter or number, the selection context cycles through them. For example, if the Prime Optical Users table contains SuperUser and SysAdmin users, and you press the **s** key multiple times, the selected row toggles between SuperUser and SysAdmin.

Table 8-2 Field Descriptions for the Prime Optical Users Table

Field	Description
Username	Username of the selected Prime Optical user.
CTC Username	CTC username of the selected user. This name is used to launch CTC from Prime Optical.
User Privilege Level	User privilege level (SuperUser, SysAdmin, NetworkAdmin, Provisioner, Operator, or a custom profile).
User Domain Name	Name of the management domain where the username belongs.
Password Set Time (*time zone*)	Last time the password was set.
Locked State	Whether the user's account is locked or unlocked. If the user repeatedly tries unsuccessfully to log into the Prime Optical client (the default maximum is five attempts), the user's account is locked automatically. You can set the maximum number of login attempts a user is allowed before being locked out in the **Control Panel > Security Properties** pane.
Last Login Time (*time zone*)	Last time the user logged in.
Login Failed Attempts	Number of times the user tried to log in, but failed.
Login State	Administrative state (Enabled or Disabled) of the user.
User Description	Description of the user.
Password Change Enabled	Current state (Enabled or Disabled) of the password change option.
Multiple Login Enabled	Whether this user is allowed to perform multiple logins simultaneously.
Auto Disable Account	Number of days of nonuse that will prompt the account to be disabled automatically. The range is from 0 to 365 days, in 1-day increments. The Cisco default is 0 days, meaning the account will not be disabled automatically as a result of inactivity.

8.3.3.2 Creating a Prime Optical User

Note This functionality is disabled when Prime Optical is installed as part of Prime Central.

Use the Create New Prime Optical User wizard to add new Prime Optical users to the domain. Table 8-3 provides descriptions.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Prime Optical Users table, choose **Edit > Create** (or click the **Create a New User** tool).

Step 3 In the Create New User wizard, fill in the following fields:

- Username
- User Password (and confirm password)
- User Privilege
- Domain Name
- Login State
- Password Change
- Description
- Auto Disable Account (days)
- Require Password Change on Next Login check box
- Use Global Settings check box
- Enable check box
- Period

Step 4 Click **Next**. When you are finished adding a new SuperUser, NetworkAdmin, or SysAdmin, click **Finish**.

Step 5 When adding a new Provisioner, Operator, or custom user profile, select the groups and NEs that the Provisioner or Operator will monitor. Selected groups and NEs appear in the Assigned Objects list. (SuperUsers and NetworkAdmins monitor the entire management domain, so there is no need to select groups or NEs when adding one of these users. SysAdmin users do not access any of the NEs.)

a. To assign groups, click the **Groups** radio button. In the Available Objects list, select the groups that will be assigned to the new user and click **Add**.

b. To assign NEs, click the **Network Elements** radio button. In the Available Objects list, select the NEs that will be assigned to the new user and click **Add**.

Note When individual NEs are assigned, these NEs will appear directly under the top level domain for the user in the Domain Explorer. It is possible that a given NE may have already been assigned as part of a group assignment to the user. In such a case, the same NE will appear directly under the top level domain and also within the assigned group. This behavior is consistent with the Domain Explorer's ability to represent the same group or NE within multiple locations of the hierarchy.

c. To remove groups or NEs from the Assigned Objects list, select the group or NE from the Assigned Objects list and click **Remove**.

d. Click **Next** (or **Finish**).

Step 6 When adding a new Provisioner, you can restrict the set of SONET or SDH circuit sizes that the user can provision. The selected SONET or SDH circuit sizes appear in the Assigned Circuit Sizes list.

a. To assign SONET circuits, click the **SONET** radio button. In the Available Circuit Sizes list, select the circuits that will be assigned to the user and click **Add**.

b. To assign SDH circuits, click the **SDH** radio button. In the Available Circuit Sizes list, select the circuits that will be assigned to the user and click **Add**.

c. To remove SONET or SDH circuits from the Assigned Circuit Sizes list, select the circuit size from the Assigned Circuit Sizes list and click **Remove**.

d. Click **Next** (or **Finish**).

Step 7 (Optional) In the CTC/Craft User Properties area, enter the username and password for accessing CTC-based NEs or NEs that support a TL1 interface. Then, confirm the password.

Note If the CTC/Craft User username and password have been defined for a given user, when that user launches a TL1 session to an NE that supports a TL1 interface, Prime Optical logs the user in automatically with the **ACT-USER** command, using the defined craft username and password.

Step 8 Click **Finish**.

The new user is listed in the Prime Optical Users table. For CTC-based NEs, the new user will be mapped to a CTC user but the CTC user will not be created in the NE database. To create a CTC user on the NE database, see 8.4.3 Managing NE User Access, page 8-48.

Table 8-3 Field Descriptions for the Create New Prime Optical User Wizard

Field	Description
User Properties Pane	
Username	Name that the user will use to access the system. The username must contain from three to twelve alphanumeric characters (A–Z, a–z, 0–9). Alphabetic characters are case-sensitive. The username must be unique and cannot contain spaces or special characters. **Note** After the username is set, it cannot be changed without deleting the user.

Table 8-3 Field Descriptions for the Create New Prime Optical User Wizard (continued)

Field	Description
User Password	Login password that the user will use to access the system. The password complexity is configurable in the **Control Panel > Security Properties** pane. By default, the user password must: • Contain at least six characters, but not more than 15 characters. • Contain at least two alphabetic characters (A–Z, a–z). Of the alphabetic characters, at least one must be uppercase and one must be lowercase. • Contain at least one numeric character (0–9). • Contain at least one special character (+ # % , . ; & !). The default special character set is TL1+UNIX. • Allow a special character as the first or last character. • Allow a numeric character as the first or last character. • Not contain the username or any circular shift of the username. An uppercase letter and its corresponding lowercase letter are considered equivalent. For example, if the username is Arthur, the password cannot contain the string arthur, rthura, thurar, hurart, urarth, or rarthu. • Differ from the old password by at least three characters. For example, if the old password is MikeBrady5!, the new password cannot be mikebrady5% because only the last character is different. However, the new password MikeBrady2!99 is acceptable because it differs from MikeBrady5! by three characters. **Note** By default, the minimum time between password changes is 20 days. The new password must differ from the previous password by 3 characters, and the new password is compared against the previous 10 passwords.
Confirm Password	Retype the password to confirm it.
User Privilege	User privilege level.
Domain Name	Domain name. When the user logs into the system, he or she sees all of the devices contained within this domain.
Login State	Permit (enable) or prevent (disable) the user from logging into the system.
Password Change	Permit (enable) or prevent (disable) the user from changing his or her password.
Description	Description of the new user.
Auto Disable Account (days)	Number of days of nonuse that will prompt the account to be disabled automatically. The range is from 0 to 365 days, in 1-day increments. The Cisco default is 0 days, meaning the account will not be disabled automatically as a result of inactivity.
Require Password Change on Next Login	If checked, the user is prompted to change his or her password upon next login to the Prime Optical client. If unchecked, the user is not required to change his or her password upon next login. By default, this option is checked.
Logout	Prime Optical automatically logs the user out of the Prime Optical session after the period in the Period field. Click **Use Global Settings** to use the settings from the Security window. If you do not select Use Global Settings, click **Enable** to activate logout for the selected user. Enter a logout length in the Period field.
User Login Sessions	Select whether to allow single or multiple user logins.
Assign Objects to User Pane (*for Provisioner and Operator users only*)	

Table 8-3 Field Descriptions for the Create New Prime Optical User Wizard (continued)

Field	Description
Select Object Type	Assign groups or NEs to the new user. **Note** The Discovered NEs and Deleted NEs groups cannot be assigned to a Provisioner, Operator, or custom user profile.
Select Objects	Select from the list of available objects that can be assigned to the new user. By clicking the **Add** and **Remove** buttons, you can move objects back and forth between the Available Objects list and the Assigned Objects list.
Assign Circuit Sizes to User Pane (*for Provisioner users only*)	
Select Circuit Size Type	Select the circuit types that are relevant, SONET or SDH.
Select Circuit Sizes	Select valid circuit sizes from the list of available circuit sizes. By clicking the **Add** and **Remove** buttons, you can move objects back and forth between the Available Circuit Sizes list and the Assigned Circuit Sizes list.
CTC/Craft User Properties Pane	
Username	Active username for accessing CTC-based NEs or NEs that support a TL1 interface. The username must contain at least six alphanumeric characters, but not more than 20 characters.
User Password	Login password for accessing CTC-based NEs or NEs that support a TL1 interface. The new password must: • Contain at least 6 alphanumeric characters, but not more than 10. • Contain at least two alphabetic characters (A–Z, a–z). • Contain at least one numeric character (0–9). • Contain at least one special character (+, #, or %).
Confirm Password	Retype the password to confirm it.

8.3.3.3 Modifying a Prime Optical User's Properties

Use the Modify Prime Optical User Properties wizard to modify the properties of an existing Prime Optical user. Table 8-4 provides descriptions.

Note Some fields are read-only when Prime Optical is installed as part of Prime Central.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Prime Optical Users table, select the Prime Optical user whose user properties will be modified.

Step 3 Choose **Edit > View/Modify** (or click the **Modify User Properties** tool). The Modify User Properties wizard opens.

Step 4 Modify the following fields, as needed; then, click **Next**:

- User Password (and confirm password)

Note Regardless of the actual size of the old password, the Password and Confirm Password fields display only a fixed-length string. The fixed-length string contains 15 asterisks (*).

- User Privilege
- Domain Name
- Login State
- Password Change
- Description
- Auto Disable Account
- Require Password Change on Next Login check box
- Use Global Settings check box
- Enable check box
- Period
- User Login Sessions

Step 5 (Optional) For Provisioner, Operator, and custom user profiles, modify the list of assigned objects by adding groups or NEs to the Assigned Objects list or removing groups or NEs from the list. Click **Next**.

Step 6 (Optional) For Provisioners, modify the list of assigned circuit sizes by adding or removing SONET or SDH circuit sizes from the list. Click **Next**.

Step 7 (Optional) Modify the user's CTC/craft username and password for accessing CTC-based NEs or NEs that support a TL1 interface. For username and password constraints, see Table 8-4.

Step 8 Click **Finish**. The user whose properties were modified is listed in the Prime Optical Users table.

Note
- After you change the user privilege level, you receive a message that tells you that the selected user will be logged out. Click **OK**. This activity is reported in the Audit Log.
- The user whose privilege has been changed receives the message "A user with administration privileges has changed the privileges of this user. The application will be closed." The user is then logged out.
- You cannot change the user privilege of the last instance of a SysAdmin user. You must create another SysAdmin user before changing the user privilege level of the other SysAdmin user.

Table 8-4 Field Descriptions for the Modify User Properties Wizard

Field	Description
Cisco Prime Optical User Properties Pane	
Username	*Display only.* Active username for accessing the system. The username must contain from three to twelve alphanumeric characters (A–Z, a–z, 0–9). Alphabetic characters are case-sensitive. The username must be unique and cannot contain spaces or special characters. **Note** After the username is set, it cannot be changed without deleting the user.

Table 8-4 Field Descriptions for the Modify User Properties Wizard (continued)

Field	Description
User Password	Login password used to access the system. The password complexity is configurable in the **Control Panel > Security Properties** pane. By default, the user password must: • Contain at least six characters, but not more than 15 characters. • Contain at least two alphabetic characters (A–Z, a–z). Of the alphabetic characters, at least one must be uppercase and one must be lowercase. • Contain at least one numeric character (0–9). • Contain at least one special character (+ # % , . ; & !). The default special character set is TL1+UNIX. • Allow a special character as the first or last character. • Allow a numeric character as the first or last character. • Not contain the username or any circular shift of the username. An uppercase letter and its corresponding lowercase letter are considered equivalent. For example, if the username is Arthur, the password cannot contain the string arthur, rthura, thurar, hurart, urarth, or rarthu. • Differ from the old password by at least three characters. For example, if the old password is MikeBrady5!, the new password cannot be mikebrady5% because only the last character is different. However, the new password MikeBrady2!99 is acceptable because it differs from MikeBrady5! by three characters. **Note** By default, the minimum time between password changes is 20 days. The new password must differ from the previous password by three characters, and the new password is compared against the previous 10 passwords.
Confirm Password	Retype the password to confirm it.
User Privilege	User's privilege level.
Domain Name	Domain name. When the user logs into the system, he or she sees all the devices contained within this domain.
Login State	Permit (enable) or prevent (disable) the user from logging into the system.
Password Change	Permit (enable) or prevent (disable) the user from changing his or her password.
Description	User description.
Auto Disable Account	Number of days of nonuse that will prompt the account to be disabled automatically. The range is from 0 to 365 days, in 1-day increments. The Cisco default is 0 days, meaning the account will not be disabled automatically as a result of nonuse.
Require Password Change on Next Login	If checked, the user is prompted to change his or her password upon next login to the Prime Optical client. If unchecked, the user is not required to change his or her password upon next login. By default, this option is checked.
Lockout	Prime Optical automatically locks the current session after the number of minutes in the Period field. Click **Use Global Settings** to use the settings from the Security window. If you do not select Use Global Settings, click **Enable** to activate lockout for the selected user. Enter a lockout length in the Period field.
Logout	Prime Optical automatically logs the user out of the Prime Optical session after the number of minutes in the Period field. Click **Use Global Settings** to use the settings from the Security window. If you do not select Use Global Settings, click **Enable** to activate logout for the selected user. Enter a logout length in the Period field.

Table 8-4 Field Descriptions for the Modify User Properties Wizard (continued)

Field	Description
User Login Sessions	Whether to allow single or multiple user login.
Assign Objects to User Pane	
(*for Provisioner and Operator users only*)	
Select Object Type	Assign specific groups and NEs to operator and provisioner users.
Select Objects	Modify the objects that are assigned to operators and provisioners. Click **Add** and **Remove** to move objects back and forth between the Available Objects list and the Assigned Objects list.
Assign Circuit Sizes to User Pane	
(*for Provisioner users only*)	
Select Circuit Size Type	Select the circuit types that are relevant, SONET or SDH.
Select Circuit Sizes	Modify the circuit sizes that are assigned to the user. Click **Add** and **Remove** to move circuit sizes back and forth between the Available Circuit Sizes list and the Assigned Circuit Sizes list.
CTC/Craft User Properties Pane	
Username	Modify the active username for accessing CTC-based NEs or NEs that support a TL1 interface. The username must contain at least six alphanumeric characters, but not more than 20 characters.
User Password	Modify the user's login password. The user password must: • Contain at least 6 alphanumeric characters, but not more than 10. • Contain at least two alphabetic characters (A–Z, a–z). • Contain at least one numeric character (0–9). • Contain at least one special character (+, #, or %).
Confirm Password	Confirm the newly modified password by retyping it.

8.3.3.4 Deleting a Prime Optical User

Note This functionality is disabled when Prime Optical is installed as part of Prime Central.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Prime Optical Users table, select the user to be deleted.

Note A user cannot be deleted from the database until that user logs out. However, an active user session can be ended. See 8.3.3.6 Ending an Active Prime Optical User Session, page 8-22.

Step 3 Choose **Edit > Delete** (or click the **Delete User** tool).

Step 4 Click **OK** to remove the user from the database.

8.3.3.5 Viewing Logged In Prime Optical Users

The Logged In Prime Optical Users table lists the Prime Optical users who are currently logged into the Prime Optical application.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Prime Optical Users table, choose **Administration > Logged In Users** (or click the **Show Logged In Users** tool). The following table provides descriptions.

Table 8-5 Field Descriptions for the Logged In Users Table

Field	Description
Username	Name of the user who is currently logged in.
Logged In At	Date and time when the user logged in.
IP Address	User's IP address.
Session ID	Unique session ID number that the Prime Optical server assigns to each Prime Optical user during login.

8.3.3.6 Ending an Active Prime Optical User Session

Note If you are accessing Prime Optical through Prime Central, the Administration > Users option is disabled.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Prime Optical Users table, choose **Administration > Logged In Users** (or click the **Show Logged In Users** tool).

Step 3 In the Logged In Users table, select the user whose session will be ended and choose **Administration > Log Out User** (or click the **Log Out User** tool).

Note If you are logged in as an Operator, you cannot log out a SuperUser.

Step 4 Click **Yes** at the following prompt:

```
This operation will log out the selected Prime Optical user. The process will take
approximately 1 minute and this Prime Optical client will be unusable until then. Do you
want to continue?
```

Wait while the Prime Optical server logs out the selected Prime Optical client. The Prime Optical GUI is frozen for approximately 1 minute until the request is complete.

8.3.3.7 Viewing a List of Failed Login Attempts

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Prime Optical Users table, choose **Administration > Failed Login Attempts** (or click the **Show Failed Login Attempts** tool). The Failed Login Attempts table opens. The following table provides descriptions.

Step 3 To unlock a locked IP address, select the IP address and choose **Administration > Unlock** (or click the **Unlock User** tool). This re-enables login attempts for the selected IP address. When an IP address is unlocked, the Login Failed Attempts value is reset to zero and the Last Login Failed Time value is set to N/A.

Table 8-6 Field Descriptions for the Failed Login Attempts Table

Field	Description
USERNAME	User name of the user who attempted to log in.
CLIENT ADDRESS	IP address of the user who attempted to log in.
TIMESTAMP	Time at which the user attempted to log into the Prime Optical client and failed.

8.3.3.8 Locked User Account

By default, Prime Optical allows users a maximum of five login attempts from the same IP address within a minute. The user account is locked after the fifth unsuccessful login attempt. The lockout duration is one minute, after which the account is automatically unlocked.

When the Prime Optical Server is shut down, it is possible to configure maximum login attempts and the time interval by modifying the settings in the throttlingContext.xml file located at the following path: PrimeOpticalServer/tomcat/webapps/SSO/WEB-INF/spring-configuration/

8.3.3.9 Changing Your User Password

Note This functionality is disabled when Prime Optical is installed as part of Prime Central.

Prime Optical users can use the Change Password dialog box to change their Prime Optical passwords. The password change applies to the Prime Optical user who is currently logged in. There is an enforced password change request when the default user logs in for the first time. If the user does not change the password, the Prime Optical session is canceled.

Note

- The password complexity is configurable in the **Control Panel > Security Properties** pane.
- It is possible to set up the user account such that the change password function is disabled. See the description of the Password Change field in 8.3.3.2 Creating a Prime Optical User, page 8-15.

Complete the following steps to change your user password:

Step 1 In the Prime Optical web client window, choose **Administration > Change Password**.

Step 2 To change the Prime Optical password:

a. In the Change Password dialog box, enter the current password in the Current Password field.

b. Enter the new password in the New Password field. For password constraints, see Table 8-7.

c. Confirm the new password.

Table 8-7 Field Descriptions for the Change Password Dialog Box

Field	Description
Password	
Current Password	Enter the old user password.
New Password	Enter the new login password. The password complexity is configurable in the **Control Panel > Security Properties** pane. By default, the new password must: • Contain at least six characters, but not more than 15 characters. • Contain at least two alphabetic characters (A–Z, a–z). Of the alphabetic characters, at least one must be uppercase and one must be lowercase. • Contain at least one numeric character (0–9). • Contain at least one special character (+ # % , . ; & !). The default special character set is TL1+UNIX. • Allow a special character as the first or last character. • Allow a numeric character as the first or last character. • Not contain the username or any circular shift of the username. An uppercase letter and its corresponding lowercase letter are considered equivalent. For example, if the username is Arthur, the password cannot contain the string arthur, rthura, thurar, hurart, urarth, or rarthu. • Differ from the old password by at least three characters. For example, if the old password is MikeBrady5!, the new password cannot be mikebrady5% because only the last character is different. However, the new password MikeBrady2!99 is acceptable because it differs from MikeBrady5! by three characters. **Note** By default, the minimum time between password changes is 20 days. The new password must differ from the previous password by 3 characters, and the new password is compared against the previous 10 passwords.
Confirm Password	Retype the password to confirm it.

8.3.3.10 Managing Security Advisory Messages

Use the Security Advisory Message Management wizard to choose a CTC-based NE from which a security advisory message can be loaded. The wizard then provides you with a list of NEs where the user can download this security message. When you click **Finish**, Prime Optical schedules a job for this action, and the security message downloaded to each selected NE is tracked as a separate task on the Job Monitor table.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs > Security Advisory Management**. The Security Advisory Message Management wizard opens. The following table provides descriptions.

Step 2 Select the NE where the security advisory message exists.

Step 3 Click the **Text** tab to view the existing security advisory message on the selected NE. If no message exists, you can use this field to enter a new message.

Step 4 Click **Next**.

Step 5 Use the **Add** and **Remove** buttons to move NEs to or from the Selected NE(s) list.

Step 6 Click **Finish**.

Note You can also use the NE Explorer node view to set the security advisory message for CTC-based NEs. In the node properties pane, click the **Security** tab. In the **Legal Disclaimer** subtab, there is a default advisory message that is noncustomer-specific. Change the text if you want the disclaimer to be specific for your company. In the **Preview** subtab, you can view the advisory message before saving it. Click **Apply**.

Table 8-8 Field Descriptions for the Security Advisory Message Management Wizard

Field	Description
Select an NE to View the Security Advisory Message Pane	
Select NE	NE where the security advisory message exists. **Note** If you opened the Security Advisory Message Management wizard after selecting an NE, only that NE will appear in this list.

Table 8-8 Field Descriptions for the Security Advisory Message Management Wizard (continued)

Field	Description
Text	Security advisory message present on the selected NE. If no message exists, you can use this tab to enter a new message. You can use the following HTML commands to format the text: Begins boldface font Ends boldface font Aligns type in the center of the window Ends the center alignment <font=*n*, where *n* = point size> Changes the font to the new size Ends the font size command <p> Creates a line break _{Begins subscript } Ends subscript ^{Begins superscript } Ends superscript <u> Starts underline </u> Ends underline
Preview	View the advisory message before saving it.
Save the Security Advisory Message Pane	
Available NE(s)	Select one or more NEs in the Available NE(s) list and click **Add** to move them to the Selected NE(s) list. The advisory message is saved for the NEs in the Selected NE(s) list.
Selected NE(s)	Select one or more NEs in the Selected NE(s) list and click **Remove** to move them to the Available NE(s) list.

8.3.3.11 Setting User Preferences

Use the User Preferences dialog box to configure the Prime Optical user interface.

Step 1 In the Domain Explorer window, choose **Edit > User Preferences**. The User Preferences dialog box opens. The following table provides descriptions.

Step 2 After specifying the settings, check the **Save Current Settings** check box to preserve the current settings even after logging out. Users with the appropriate privileges can check the **Save as Default User Template** check box to save the current settings as the default for new users who are added in the future. Current users who have not altered their default settings adopt the new default settings when they log out.

Step 3 Click **OK** to save the settings. After you save the selections, all subsequent views use the saved preferences.

Table 8-9 Field Descriptions for the User Preferences Dialog Box

Field	Description
Event Notification Tab	
Show Notification Dialog For	Select whether an alert popup displays when a specific alarm or event occurs on NEs in your management domain or on the EMS. You can specify the alarm severity that will generate an alert popup, and whether to include cleared alarms. **Note** Selections that apply to NEs are allowed only if you have NEs assigned to you. Selections that apply to the EMS are allowed only if you have the appropriate user privilege.
Play Audible Notification For	Select whether an audible alert sounds when a specific alarm or event occurs on an NE or on the Prime Optical application. You can specify the alarm severity that will generate an audible alert, and whether to include cleared alarms. Check the **Continuous Alarm for Dashboard Notifications** check box to enable continuous audible notification whenever a new update occurs in the Dashboard window. Uncheck this check box to disable continuous audible notifications. **Note** Selections that apply to NEs are allowed only if you have NEs assigned to you. Selections that apply to the EMS are allowed only if you have the appropriate user privilege.
Miscellaneous Tab	
Display Log/15-Min PM Data For	Change the time period used to display time-sensitive data in 15-minute increments. **Note** This field is visible only if you have read permission for the Performance Monitor operation. **Note** If you change the time setting from a shorter time period to a longer time period (for example, from Past 4 Hours to Past 30 Days), you must click **Refresh Data** in the log window to retrieve the data, even if the Auto Refresh feature is enabled. This behavior is by design, because if there are thousands of nodes under management, it takes a long time to retrieve the data. Prime Optical does not begin retrieving the data until you click **Refresh Data** manually.
Display 1-Day PM Data For	Change the time period used to display time-sensitive data in 24-hour increments. **Note** This field is visible only if you have read permission for the Performance Monitor operation.
Table Export Encoding	Change the encoding to use when you export a table to a text file. Options are: • Default—The encoding (that is, the translation from a character to the sequence of 0s and 1s that represent it in byte format) used by default. Default encoding depends on various factors, including the locale and the region of the Operating System (OS) running on the machine. Default encoding can only write characters belonging to that specific locale and region. Default encoding has the advantage that all OS applications can correctly read the text file generated by this encoding. • UTF-8—Unicode Transformation Format-8 (UTF-8) is an octet (8-bit) lossless encoding of unicode characters. It encodes each character as a variable number of 1 to 4 octets, where the number of octets depends on the integer value assigned to the unicode character. UTF-8 is the default encoding for XML. UTF-8 is an encoding independent from OS, locale, and region; is standardized by the Unicode consortium; and can write any unicode character in 1, 2, or 3 bytes, depending on the character itself.

Table 8-9 Field Descriptions for the User Preferences Dialog Box (continued)

Field	Description
Enable Refresh Data Timer	The automatic Refresh Data feature automatically refreshes all data being displayed by Prime Optical. You receive the following prompt: `Refresh Data action suggested. This action will result in closing all windows and might take some time. Do you want to continue? {Yes | No}` In an unstable environment where NEs are synchronizing or NEs change their operational state frequently, you might receive the preceding prompt continuously. To disable the prompt, uncheck the **Enable Refresh Data Timer** check box.
Do Not Display User Profile Creation Warning Messages	Enable or disable the warning dialog box that pops up when you click **Finish** after creating or modifying a user profile. The warnings are still visible in the User Profile table.
Enable NE Aliases	When checked, it allows you to view the alias names for the following attributes: • Node ID • Link name • Circuit name The alias name can be displayed instead of the NE ID in the following windows: • Domain Explorer—Tree and Identification tab of the Network Element Properties pane • Subnetwork Explorer—Tree and Identification tab of the Network Element Properties pane • Network Map
Time Preferences Tab	
Note This functionality is disabled when Prime Optical is installed as part of Prime Central.	
Time Display	Select 12-hour format or 24-hour format for the display of time information. Options are: • 12 Hour—Displays time information in 12-hour format; for example, 01:30 PM. • 24 Hour—Displays time information in 24-hour format; for example, 13:30. • Use System Locale—Displays time information in 12-hour format or 24-hour format, depending on the default for the system locale.
Time Zone for Date	Select the time zone for the date display (*month/day/year* or *day/month/year*). Options are: • Local—Displays the date according to the time zone that is configured on the workstation where the Prime Optical client is running. • GMT—Displays the date according to the GMT time zone (*day/month/year*). • User Defined—Specify a fixed offset from GMT. The offset range is –12 to +13 hours from GMT, in one-hour increments. For offsets other than zero, specify a display string of four characters maximum.
Map Preferences Tab	
Open Network Map in New Window	Within network map views, this setting specifies whether to open subsequent frames in the same window, or open a new window for subsequent map views.
Show Off-View Icons	Within map views, this setting enables or disables the display of off-view icons. If an NE has a link defined to an NE on a different map, the off-view NE is represented by an off-view icon. The off-view icon serves as a hyperlink to the map that contains the NE at the opposite end of the link. Off-view icons are used only for links that terminate on an NE; off-view icons are not used for subnetworks or groups.

Table 8-9 Field Descriptions for the User Preferences Dialog Box (continued)

Field	Description
Minimum Icon Size	Specify a fixed and locked pixel size for icons in network maps. Choices are 8x8, 16x16, 24x24, and 32x32. Regardless of the zoom level, the map icon size does not change when it is set to a fixed size. By default, the icon size is variable based on the zoom level. The icon size setting is saved with the other map settings.
FM Preferences Tab	
Color Entire Row in Table View	Set the Alarm Browser or Alarm Log to full background color for the entire selected row. The color corresponds to the alarm status and severity.
Enable Export of Entire Table	Enable or disable the ability to export the entire contents of the Alarm Browser or the Alarm Log. It might take longer to open the Alarm Browser or Alarm Log with the export entire table feature enabled.

8.3.3.12 Enabling or Disabling the Continuous Audible Alarm

Step 1 In the Domain Explorer window, choose **Edit > User Preferences**. The User Preferences dialog box opens.

Step 2 In the Event Notification tab > Play Audible Notification For area, check the **Continuous Alarm For Dashboard Notifications** check box.

Step 3 Click **OK**.

Step 4 To disable the continuous audible alarm, choose **Fault > Stop Continuous Beep** in the Domain Explorer window.

8.3.3.13 Configuring Prime Optical Security Parameters

Use the Security Properties pane to configure Prime Optical security parameters and password complexity rules. You can also specify usernames and passwords for the ONS 15216 EDFA2, ONS 15216 EDFA3, ONS 15216 OADM, ONS 155xx, ONS 15305 CTC, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, ONS 15600 SDH, CPT 200, CPT 200 SDH, CPT 600, and CPT 600 SDH.

Note

- Passwords that are already in the system are not affected by modifications to the password complexity rules. The password complexity rules are checked when:
  - A privileged user adds a new user to the system
  - A privileged user modifies an existing user's password
  - A user changes his or her own existing password

- Regardless of the actual length of the password, the Password and Confirm Password fields display only a fixed-length string of 15 asterisks (*).

Complete the following steps to configure Prime Optical security properties:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Security Properties** and set the parameters described in the following table. Tabs shown depend on the modules that are installed.

Note If there are many tabs displayed in the properties pane, select the arrow or Show List icons to view all available tabs.

Step 3 Click **Save**.

Table 8-10 Field Descriptions for the Security Properties Pane

Field	Description
Security Tab	
Note This functionality is disabled when Prime Optical is installed as part of Prime Central.	
Password Aging Area	
Password Aging	Number of days before the password expires. The user is prompted to change the password after the specified number of days. The range is from 0 to 3650 days; the Cisco default is 30 days. A value of 0 disables this feature.
Password Expiration Early Notification	Allows you to configure an early warning period for password expiration. Enter the number of days before the warning in the Password Expiration Early Notification field. Prime Optical supports values of 0 to (password aging - 1), with a maximum of 30. For example, if the password aging is configured for 30 days, the maximum early notification value would be 29 days. A value of 0 disables this feature.
Client Inactivity Timer Settings Area	
Logout Enable	If checked, Prime Optical automatically logs the user out of the Prime Optical session after the period in the Logout Period field.
Logout Period	Number of minutes a user's Prime Optical session is inactive before Prime Optical automatically logs the user out. The range is from 1 to 1440 minutes in 1-minute increments.
Prime Optical Password Rules Tab	
Note This functionality is disabled when Prime Optical is installed as part of Prime Central.	
Password Change Rules Area	
Interval Between Password Change	Number of days a user must wait between password changes. The range is from 0 to 99 days; the Cisco default is 1 day. A value of 0 disables this feature.
Differ From Previous Password by *n* Characters	Number of characters by which the new password must differ from the previous one. The range is from 1 to 5 characters; the Cisco default is 3 characters.
Compare Against Previous *n* Passwords	Number of previously used passwords to compare against the new password. The range is from 0 to 15 passwords; the Cisco default is 5 passwords. A value of 0 disables this feature.

Table 8-10 Field Descriptions for the Security Properties Pane (continued)

Field	Description
Password Complexity Rules Area	
Minimum Password Length	Minimum password length. The range is from 2 to 10 characters; the Cisco default is 6 characters.
Maximum Password Length	Maximum password length. The range is from 10 to 15 characters; the Cisco default is 12 characters.
Number of Alphabetic Characters	Minimum number of alphabetic characters that the password must include. The range is from 0 to 2; the Cisco default is 2 alphabetic characters.
Number of Lowercase Alphabetic Characters	Minimum number of lowercase alphabetic characters that the password must include. The range is from 0 to 2; the Cisco default is 1 lowercase character.
Number of Uppercase Alphabetic Characters	Minimum number of uppercase alphabetic characters that the password must include. The range is from 0 to 2; the Cisco default is 1 uppercase character.
Number of Numeric Characters	Minimum number of numeric characters that the password must include. The range is from 0 to 2; the Cisco default is 1 numeric character.
Number of Special Characters	Minimum number of special characters that the password must include. The range is from 0 to 2; the Cisco default is 1 special character.
Special Character Set to Use	Special character set to use: • TL1—Special characters permitted are + # % • UNIX—Special characters permitted are , . ; % & ! • TL1+ UNIX—(Cisco default) Special characters permitted are , . ; % & ! + # • ASCII—Special characters permitted are @ ` ! " # $ % & ' ( ) * : + ; [{ , < \ | - =] } . > ^ ~ / ? _
Allow Special First or Last Character	If checked, a special character is allowed as the first or last character in the password. If unchecked, the first or last character in the password cannot be a special character.
Allow Numeric First or Last Character	If checked, a numeric character is allowed as the first or last character in the password. If unchecked, the first or last character in the password cannot be a number.
Allow User ID Circular Shift	If checked, the user ID or a circular shift of the ID can be used in the password. If unchecked, the user ID or a circular shift of the ID cannot be used in the password.
ONS 15216 EDFA2 Tab	
Username	Username that the Prime Optical server uses to connect to ONS 15216 EDFA2 NEs.
Password	Password to use for Prime Optical server connections to ONS 15216 EDFA2 NEs.
Confirm Password	Re-enter the password to confirm it.
ONS 15216 EDFA3 Tab	
Server - NE Connection Username	Username that the Prime Optical server uses to connect to ONS 15216 EDFA3 NEs. **Note** The ONS 15216 EDFA3 has a TL1 interface and multiple usernames can be defined for authentication. Each username can be used for only one active connection. A second connection with the same username is not allowed. The current user must log out before another user can log in with that username.
Password	Password to use for Prime Optical server connections to ONS 15216 EDFA3 NEs.
Confirm Password	Re-enter the password to confirm it.

Table 8-10 Field Descriptions for the Security Properties Pane (continued)

Field	Description
Prime Optical Server - FTP Connection Username	Username that the Prime Optical server uses to connect to FTP for software download, memory backup, and memory restore. **Caution** An FTP account must already exist on the server in order for the file transfer to work correctly.
Password	Password to use for Prime Optical server connections to FTP.
Confirm Password	Re-enter the password to confirm it.
FTP Directory	Absolute path for the FTP directory, beginning with a forward slash (/).
ONS 15216 OADM Tab	
Server - NE Connection Username	Username that the Prime Optical server uses to connect to ONS 15216 OADM NEs. **Note** The ONS 15216 OADM has a TL1 interface and multiple usernames can be defined for authentication. Each username can be used for only one active connection. A second connection with the same username is not allowed. The current user must log out before another user can log in with that username.
Password	Password to use for Prime Optical server connections to ONS 15216 OADM NEs.
Confirm Password	Re-enter the password to confirm it.
CTC-Based SDH Tab	
Username	Username that the Prime Optical server uses to connect to ONS 15305 CTC, ONS 15310 MA SDH, ONS 15454 SDH, ONS 15600 SDH, CPT 200 SDH, and CPT 600 SDH NEs. By default, NEs are configured with the username *CISCO15*. **Note** The account specified on the NE for Prime Optical to use must be a SuperUser-level account. For the ONS 15310 MA SDH and ONS 15454 SDH, this tab also contains Username fields for Prime Optical server connections to ML-series cards and for Prime Optical server connections to TL1 tunnel NEs. **Note** The default username is configured as *CISCO15* for the ML cards specified in the default Cisco IOS configuration file. The Cisco IOS configuration file is included in the Prime Optical server installation CD (misc/bareboneCLI_Security.txt). By default, the username for all connections is configured as *CISCO15*.
Password	Password to use for Prime Optical server connections. For the ONS 15454 SDH, this is also the password to use for ML-series card and TL1 tunnel NE connections. **Note** The default password is configured as CTM123+ for the ML cards specified in the default Cisco IOS configuration file.
Confirm Password	Re-enter the password to confirm it.
CTC-Based SONET Tab	

Table 8-10 Field Descriptions for the Security Properties Pane (continued)

Field	Description
Username	Username that the Prime Optical server uses to connect to ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, ONS 15600 SONET, CPT 200, and CPT 600 NEs. By default, NEs are configured with the username *CISCO15*. **Note** The account specified on the NE for Prime Optical to use must be a SuperUser-level account. For the ONS 15310 CL, ONS 15310 MA SONET, and ONS 15454 SONET, this tab also contains a Username field for Prime Optical server connections to ML-series cards. For the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, and ONS 15454 SONET, this tab also contains a Username field for Prime Optical server connections to TL1 tunnel NEs.
Password	Password to use for Prime Optical server connections. For the ONS 15310 CL, ONS 15310 MA SONET, and ONS 15454 SONET, this tab also contains a Password field for Prime Optical server connections to ML-series cards. For the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, and ONS 15454 SONET, this tab also contains a Password field for Prime Optical server connections to TL1 tunnel NEs.
Confirm Password	Re-enter the password to confirm it.
CTC-Based SDH and CTC-Based SONET Tabs	
Server - SNMP Connection Area	
Note After changing the field values in the Server - SNMP Connection area, mark the NEs as Out of Service and then In Service.	
SNMPv3	Check this check box to use SNMPv3. If unchecked, Prime Optical uses SNMPv1/v2.
Username	Name of the Prime Optical user who is enabled for SNMPv3 communication.
Authentication Protocol	Select the authentication protocol to use for authenticating the SNMPv3user. Values are None, MD5, or SHA.
Authentication Password	Enter the password used to authenticate the SNMPv3 user. The password must contain: • From 1 to 12 characters • At least one special character other than an apostrophe (') • At least two letters (A-Z, a-z), including at least one uppercase letter • At least one number (0-9) Regardless of the actual length of the password, the Password and Confirm Password fields display only a fixed-length string of 15 asterisks (*).
Confirm Authentication Password	Re-enter the authentication password to confirm it.
Privacy Protocol	Select the privacy protocol for the SNMPv3 user. You can choose one of the following: • NONE—No privacy protocol for the user. • DES—Use Data Encryption Standard (DES) for encryption.
Privacy Password	Enter the password used to decrypt the message payload.
Confirm Privacy Password	Re-enter the privacy password to confirm it.
CRS Tab	
Username	Username that the Prime Optical server uses to connect to CRS NE.

Table 8-10 Field Descriptions for the Security Properties Pane (continued)

Field	Description
Password	Password to use for Prime Optical server connections to CRS NE.
Confirm Password	Re-enter the password to confirm it.

8.3.3.14 Sending Messages to Other Users

Use the Notify Users dialog box to type and send a message to all Prime Optical users, or to all Prime Optical users with the same user privileges. For example, you might want to alert all users before shutting down the Prime Optical server.

The following table provides descriptions.

Step 1 In the Domain Explorer window, choose **File > Notify Users**. The Notify Users dialog box opens.

Step 2 In the Message Targets area, select the recipients of the message.

Step 3 Type the message in the Message area.

- To send the message to the specified recipients, click **Send**.
- To cancel the message and close the dialog box, click **Cancel**.
- To launch the online help for the Notify Users dialog box, click **Help**.

Table 8-11 Field Descriptions for the Notify Users Dialog Box

Field	Description
Message Targets	Select recipients for your message. This list includes the default NetworkAdmin, Operator, Provisioner, SuperUser, and SysAdmin profiles, as well any custom user profile that has been generated. You can select custom and multiple profiles by using the Shift and Control keys while clicking the profile, or click the **All Users** radio button to send your message to all users, regardless of user type.
Message	Type your message. The maximum length is 512 characters. If you enter a message that is longer than 512 characters, only the first 512 characters are sent.

8.3.3.15 Viewing User Notification Messages

The User Notification dialog box pops up on your screen when another user sends a message to a certain user profile or to all Prime Optical users, and you belong to one of those groups. The following table provides descriptions.

Table 8-12 Field Descriptions for the User Notification Dialog Box

Field	Subfield	Description
Message Received	From	Username of the user who sent you the message.
	Time	Date and time when you received the message.
Message	—	Text of the message. The maximum message length is 512 characters.

8.3.4 Managing Prime Optical User Profiles

The following sections describe how to view, add, modify, delete, and duplicate a Prime Optical user profile.

8.3.4.1 Viewing User Profiles

The Prime Optical User Profiles table displays basic information about Prime Optical user profiles. Use the menu options to manage user profiles.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Prime Optical Users table, choose **Administration > User Profiles** (or click the **Launch User Profiles Table** tool). The following table provides descriptions.

Table 8-13 Field Descriptions for the Prime Optical User Profiles Table

Field	Description
User Profile Name	Name of the existing Prime Optical user profiles.
NE Assignment	NE assignment for the selected user profile. NE assignments are: • Assign all NEs—SuperUser, NetAdmin • Assign NEs—Operator, Provisioner • Assign No NEs—SysAdmin
Default Login Sessions	Number of permitted simultaneous logins assigned to the user profile: • 1—Only one user with a given profile can log into a specific Prime Optical server at a time. • 2 to 10—The specified number of users (2 to 10) with a given profile can log into a specific Prime Optical server simultaneously. • Unlimited—An unlimited number of users with a given profile can log into a specific Prime Optical server simultaneously.
User Profile Description	Description of the user profile.

8.3.4.2 Adding a Custom User Profile

Use the Create New User Profile wizard to add Prime Optical user profiles. Table 8-14 provides descriptions.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Cisco Prime Optical Users table, choose **Administration > User Profiles** (or click the **Launch User Profiles Table** tool).

Step 3 In the Cisco Prime Optical User Profiles table, choose **Edit > Create** (or click the **Create a New User Profile** tool).

Step 4 In the Create New User Profile wizard, specify the following:

- User profile name
- NE assignment
- Max user sessions allowed
- Description

Step 5 Click **Next**.

Step 6 Select a user profile category from the Categories area. Operations for each category are displayed on the right side of the Categories area.

Step 7 Specify user capabilities by setting permission or privileges for one or all operations. When setting privileges for each operation, select one of the following radio buttons:

- Read Only
- Read/Write

- No Access

When setting privileges for all operations, select one of the following buttons:

- Set All Read Only
- Set All Read/Write
- Set All No Access

Note The user profile operations displayed on the right side of the Create New User Profile wizard depend on the category selected. You can select the root node to see all the operations for all categories.

Step 8 Click **Finish**.

Step 9 Click **Yes** in the message box. (The message box will not be displayed if it is disabled in the User Preferences dialog box. See 8.3.3.11 Setting User Preferences, page 8-26 for more information.)

Table 8-14 Field Descriptions for the Create New User Profile Wizard

Field	Description
User Profile Name	Enter the name of the new user profile. The profile name must contain from six to twenty alphanumeric characters (A–Z, a–z, 0–9). Alphabetic characters are case-sensitive. The profile name must be unique in Prime Optical and cannot contain spaces or special characters.
NE Assignment	The NE assignment for the new user profile. Values are: • Assign All NEs—SuperUser, NetworkAdmin • Assign NEs—Operator, Provisioner • Assign No NEs—SysAdmin
Max User Sessions Allowed	Select **1** to allow only one user with the selected user profile to log into a specific Prime Optical server. Select a number other than 1 to allow the specified number of users to log into a specific Prime Optical server simultaneously. Select **Unlimited** if you do not want to restrict the number of users with the selected profile from logging into a specific server simultaneously.

Table 8-14 Field Descriptions for the Create New User Profile Wizard (continued)

Field	Description
Description	Enter a description of the new user profile.
User Profile Privileges	Set user privileges for specific Prime Optical categories. Select a category in the left panel to display that category's available operations. Select an operation from the Operations column; then, select a user privilege for the selected operation from the radio buttons in the Privileges column. • Set All Read Only—Specifies that the user can only view information related to all the operations with Read Only privilege listed under the specified category. All other operations will be set to No Access. • Set All Read/Write—Specifies that the user can view and perform any of the operations with Read/Write privilege listed under the specified category. All other operations will be set to Read Only. • Set All No Access—Specifies that the user is not allowed to perform any of the operations with No Access privilege listed under the specified category. All other operations will be set to Read Only. The Warning column lists the dependencies between various operations. After you click **Finish** to create the new user profile, a warning dialog box lists all of the warning messages. If you check the **Don't Display User Profile Creation Warning Messages** check box, the warning dialog box does not appear for subsequent user profile creations in the current client session. If you check the **Don't Display User Profile Creation Warning Messages** check box in the User Preferences dialog box, the warning dialog box is disabled as specified for the current user or as a template for new users.

8.3.4.3 Modifying a User Profile

Use the Modify User Profile wizard to modify Prime Optical user profiles. Table 8-15 provides descriptions.

Note Users created with a certain profile cannot be changed to another profile. To change profiles, the user must be deleted, then recreated with the new profile.

Note Modifying a profile will log out all users who are logged in with that profile.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Cisco Prime Optical Users table, choose **Administration > User Profiles** (or click the **Launch User Profiles Table** tool).

Step 3 In the Cisco Prime Optical User Profiles table, click the profile to modify; then, choose **Edit > View/Modify** (or click the **View/Modify User Profile Properties** tool).

Step 4 In the Modify User Profile wizard, modify the following:

- NE assignment
- Max user sessions allowed
- Description

Step 5 Click **Next**.

Step 6 Select a user profile category from the Categories area. Operations for each category are displayed on the right side of the Categories area.

Step 7 Specify user capabilities by setting permission or privileges on one or all operations. When setting privileges for each operation, select one of the following radio buttons:

- Read Only
- Read/Write
- No Access

When setting privileges for all operations, select one of the following buttons:

- Set All Read Only
- Set All Read/Write
- Set All No Access

Note The user profile operations displayed on the right side of the Modify User Profile wizard depend on the category selected. You can select the root node to see all the operations for all categories.

Step 8 Click **Finish**.

Step 9 Click **Yes** in the message box. (The message box will not be displayed if it is disabled in the User Preferences dialog box. See 8.3.3.11 Setting User Preferences, page 8-26 for more information.)

Table 8-15 Field Descriptions for the Modify User Profile Wizard

Field	Description
User Profile Name	*Display only.* Name of the user profile. The profile name must contain from six to twenty alphanumeric characters (A–Z, a–z, 0–9). Alphabetic characters are case-sensitive. The profile name must be unique in Prime Optical and cannot contain spaces or special characters.
NE Assignment	The NE assignment for the user profile. Values are: • Assign all NEs—SuperUser, NetAdmin • Assign NEs—Operator, Provisioner • Assign No NEs—SysAdmin Only Assign NEs is available for new profiles, meaning that NEs or groups must always be assigned to the new profile.
Max User Sessions Allowed	Select **1** to allow only one user with the selected user profile to log into a specific Prime Optical server. Select a number other than 1 to allow the specified number of users to log into a specific Prime Optical server simultaneously. Select **Unlimited** if you do not want to restrict the number of users with the selected profile from logging into a specific server simultaneously.

Table 8-15 Field Descriptions for the Modify User Profile Wizard (continued)

Field	Description
Description	Modify the description of the user profile.
User Profile Privileges	Modify selected user privileges for specific Prime Optical categories. Select a category in the left panel to display that category's available operations. Select an operation from the Operations column, then select a user privilege for the selected operation from the radio buttons in the Privileges column. • Set All Read Only—Specifies that the user can only view information related to all the operations with Read Only privilege listed under the specified category. All other operations will be set to No Access. • Set All Read/Write—Specifies that the user can view and perform any of the operations with Read/Write privilege listed under the specified category. All other operations will be set to Read Only. • Set All No Access—Specifies that the user is not allowed to perform any of the operations with No Access privilege listed under the specified category. All other operations will be set to Read Only. The Warning column lists the dependencies between various operations. After you click **Finish** to modify the user profile, a warning dialog box lists all of the warning messages. If you check the **Don't Display User Profile Creation Warning Messages** check box, the warning dialog box does not appear for subsequent user profile modifications in the current client session. If you check the **Don't Display User Profile Creation Warning Messages** check box in the User Preferences dialog box, the warning dialog box is disabled as specified for the current user or as a template for new users. **Note** Topology modification is not allowed for custom users.

8.3.4.4 Deleting a User Profile

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Cisco Prime Optical Users table, choose **Administration > User Profiles** (or click the **Launch User Profiles Table** tool).

Step 3 In the Cisco Prime Optical User Profiles table, select the profile you want to delete; then, choose **Edit > Delete** (or click the **Delete User Profile** tool).

Step 4 In the confirmation dialog box, click **OK**.

Note The default user profiles (SuperUser, SysAdmin, NetworkAdmin, Provisioner, and Operator) cannot be deleted. Custom user profiles cannot be deleted if they are assigned to any user. Delete the user with the custom user profile before deleting the user profile. See 8.3.3.4 Deleting a Prime Optical User, page 8-21.

8.3.4.5 Duplicating a User Profile

Use the Create Duplicate Profile window to duplicate an existing Prime Optical user profile.

Step 1 In the Domain Explorer window, choose **Administration > Users**.

Step 2 In the Cisco Prime Optical Users table, choose **Administration > User Profiles** (or click the **Launch User Profiles Table** tool).

Step 3 In the Cisco Prime Optical User Profiles table, select the profile you want to duplicate; then, choose **Edit > Duplicate** (or click the **Duplicate User Profile** tool).

Step 4 In the Create Duplicate Profile dialog box, enter the duplicate profile name. See the following table for name constraints.

Step 5 Click **OK**.

Table 8-16 Field Descriptions for the Create Duplicate Profile Window

Field	Description
Duplicate Profile Name	The name of the duplicate user profile must contain from six to twenty alphanumeric characters (A–Z, a–z, 0–9). Alphabetic characters are case-sensitive. The profile name must be unique in Prime Optical and cannot contain spaces or special characters.

8.4 NE Security Management

This section describes NE security, including setting authentication on an NE, setting up a security policy, using log tables, and managing NE user access.

8.4.1 Setting NE Authentication

Use the NE Authentication dialog box to select the security properties (username and password for each authentication session) for multiple NEs. For each ONS 15000 NE that supports authentication, there is a specific Security tab in the Control Panel window.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs**, **ONS 15216**, **ONS 155XX > NE Authentication**. The NE Authentication dialog box opens. The following table provides descriptions. Fields shown depend on the NE that is selected.

Step 2 Specify the NEs that you will set a username and password authentication for. Click **Add** to add NEs to the Selected NEs list, or click **Remove** to remove NEs from the list.

Step 3 In the Server - NE Connection area, enter the following information:

Note The username and password that you enter must have Superuser privileges on the node to enable full Prime Optical access to the NE.

- Enable—Check the **Enable** check box to set a username and password that the Prime Optical server will use to establish a connection with the selected NEs.
- Username
- Password (and confirm password)

Step 4 In the Server - TL1 Tunnel GNE Connection area, enter the following information:

- Enable—Check the **Enable** check box to set a GNE TL1 target identifier (TID), username, and password that the Prime Optical server will use to establish a connection with the GNE and reach the selected tunnel NE (TNE).
- GNE TID
- Username
- Password (and confirm password)

Step 5 Click **Save**.

Table 8-17 Field Descriptions for the NE Authentication Dialog Box

Field	Description
Network Elements Area	
Available NEs	List of available NEs.
Selected NEs	List of selected NEs.
Server - NE Connection Area	
Enable	If checked, allows a connection between the Prime Optical server and the NE.
Username	Enter a username for the selected NEs. This field is unavailable if the Enable check box is not checked.
Password	Enter the password for the username. This field is unavailable if the Enable check box is not checked.
Confirm Password	Retype the password. This field is unavailable if the Enable check box is not checked.
Server - TL1 Tunnel GNE Connection Area	
Enable	If checked, specifies a GNE TID, username, and password that the Prime Optical server will use to log into the GNE to set up a TL1 tunnel with the selected TNEs.
GNE TID	Enter the TID of the GNE for the selected TNEs. This field is unavailable if the Enable check box is not checked.
Username	Enter a username for the GNE for the selected TNEs. This field is unavailable if the Enable check box is not checked.
Password	Enter the password for the GNE for the selected TNEs. This field is unavailable if the Enable check box is not checked.
Confirm Password	Retype the password. This field is unavailable if the Enable check box is not checked.

Note You can also set the NE authentication username and password in the **Domain Explorer > Network Element Properties** pane **> NE Authentication** tab. When changing the username or password of an NE, mark that NE as Out of Service and then In Service.

Note If the username and password fields in the NE Authentication tab are left blank, Prime Optical uses the username and password defined in the Control Panel.

8.4.2 Setting Up a Security Policy

You can set up a security policy for CTC-based NEs.

Step 1 Select a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the NE node.

Step 3 In the node properties pane of the NE Explorer window, click the **Security** tab.

Step 4 Complete the following information in the **Policy** subtab:

- In the Idle User Timeout area:
  - Retrieve—Set the idle user timeout for a CTC Retrieve user.
  - Maintenance—Set the idle user timeout for a CTC Maintenance user.
  - Provisioner—Set the idle user timeout for a CTC Provisioner user.
  - SuperUser—Set the idle user timeout for a CTC SuperUser.

  Note Idle time can be from zero to 16 hours, 39 minutes (999 minutes). To deactivate the Idle User Timeout, enter zero as the idle time. A user already logged into the node is not affected by a change to the Idle User Timeout policy.

- In the User Lockout area:
  - Manual Unlock By SuperUser—If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
  - Lockout Duration—Set the lockout duration period for locked out CTC users. This field is only enabled if the Manual Unlock by SuperUser check box is unchecked.
  - Failed Logins Allowed—Set the number of failed logins before the CTC user is automatically locked out.
- In the Other area:
  - Single Sessions Per User—If checked, each CTC user can only launch one session at a time.
  - Disable Inactive User—If checked, inactive users will be disabled automatically.
  - Inactive Duration—If Disable Inactive User is checked, specify the inactive duration. The range is from 1 to 99 days; the Cisco default is 45 days.

Step 5 Complete the following information in the **Password** subtab:

- In the Password Change area:
  - Prevent Reusing Last—Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.

- Disable Password Flipping—If checked, users cannot change passwords for the number of days specified in the Can Change Password After field.
- Can Change Password After—Enter the number of days that must elapse before the user can change the password.
- Force Password Change After Assigned—If checked, during the first successful login, the user is forced to change the password.
- Password Difference—Enter the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1. The range is from 1 to 5 characters.

- In the Password Aging Area:
  - Enable Password Aging—Check this check box to enable password aging.
  - Aging Period—Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
  - Warning Period—Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

Step 6 Complete the following information in the **Access** subtab for all CTC-based NEs R5.0 or earlier:

- In the Access area:
  - LAN Access—Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only.

    Note After setting the LAN access to the backplane, the Prime Optical client is unusable for 4 to 5 minutes.

  - Restore Timeout—This time period begins if No LAN Access is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
- In the Shell Access area:
  - Shell Access On—Specify shell access on Telnet or SSH.
  - Telnet Port—This is enabled if you selected the Telnet radio button. Enter the Telnet port number.
  - SSH Port—*Display only.* Indicates the SSH port number that will be used if the SSH radio button is selected.
- In the Other area:
  - PM Clearing Privilege—Select the user privilege that allows clearing PM statistics for the NE.

Step 7 Complete the following information in the **Access** subtab for all CTC-based NEs R6.0 or later:

- In the Access area:
  - LAN Access—Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only.

Note After setting the LAN access to the backplane, the Prime Optical client is unusable for 4 to 5 minutes.

  - Restore Timeout—This time period begins if No LAN Access is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.

- In the Serial Craft Access area:
  - Enable Craft Port—Check this check box to enable the craft port.
- In the Shell Access area:
  - Access State—Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
  - SSH Port—*Display only.* Indicates the SSH port number that will be used.
  - SFTP Port—*Display only.* Indicates the SFTP port number that will be used.
  - Telnet Port—This is enabled if you selected the **Non-secure** access state. Enter the Telnet port number that will be used.
  - Use Standard Telnet Port—Check this check box to indicate that the standard Telnet port will be used.
  - Enable Shell Password—*Display only.* Indicates whether the Shell password is enabled. You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
- In the EMS Access area:
  - Access State—Select the EMS access state from the drop-down list. You can select either Non-secure or Secure. Then, click **OK** at the following warning message:

    ```
    When you change the EMS access mode of the NE, Prime Optical resynchronizes the NE
    connections during the next health poll. If you make provisioning changes to the
    NE before the resynchronization is complete, the changes might not be saved. Wait
    for the resynchronization to complete before making any provisioning changes to
    the NE.
    ```

    Note When you change the state from Secure to Non-secure or vice versa, the NE might reboot or resynchronize to reflect the changes. During this time, if you try to reapply the other state (Secure to Non-secure or vice versa), the changes might not be saved. The operation requires time to execute successfully.

  - CORBA Listener Port—Select the port numbers for the TCC CORBA (IIOP) listener port and the TCC CORBA (SSLIOP) listener port. Select one of the following radio buttons:

    Default-Fixed—Assign a default port number.

    Standard Constant—The port number for the TCC CORBA (IIOP) listener port is 683. The port number for the TCC CORBA (SSLIOP) listener port is 684.

    Other Constant—When selected, enter the port number that will be used.
- In the TL1 Access area:
  - Access State—Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.

- In the SNMP Access area:
  - Access State—Select the SNMP access state from the drop-down. You can select either Disable or Non-secure.
- In the Other area:
  - PM Clearing Privilege—Select the user privilege that allows clearing PM statistics for the NE.

Step 8 Complete the following in the **RADIUS Server** subtab for all CTC-based NEs R6.0 or later:

- Enable RADIUS Authentication—Check this check box if you want to enable RADIUS authentication.
- Enable RADIUS Accounting—Check this check box if you want to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
- Enable the Node as the Final Authenticator When no RADIUS Server is Reachable—Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when no other RADIUS servers can be reached.
- Enable Access Challenge—Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that you are enabling access challenge in the RADIUS server that you selected.

  The following table describes the fields in the RADIUS Servers in Order of Authentication table.

  Click the **Up** and **Down** buttons to reorder the list of RADIUS servers in the table.

  See 8.4.2.1 Managing RADIUS Servers, page 8-46 for information on how to create, modify, and delete RADIUS servers. You can create a maximum of 10 RADIUS server entries.

Step 9 Complete the following in the **Legal Disclaimer** subtab:

- In the **Advisory Message** subtab, there is a default advisory message that is noncustomer-specific. Change the text if you want the disclaimer to be specific for your company.
- In the **Preview** subtab, you can view the advisory message before saving it.

Step 10 Click **Apply**.

Table 8-18 Field Descriptions for the RADIUS Servers in Order of Authentication Table

Field	Description
IP Address	IP address of the RADIUS server.
Shared Secret	Shared secrets are preshared keys that have been allocated to the communicating parties (the NE and the AAA server) prior to the start of the communication process. Transactions between the NE and the AAA server are authenticated through the use of the shared secret.
Authentication Port	Authentication port number.
Accounting Port	Accounting port number.

8.4.2.1 Managing RADIUS Servers

8.4.2.1.1 Creating a RADIUS Server

Step 1 Select a CTC-based NE R6.0 or later and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the NE node.

Step 3 In the properties pane of the NE Explorer window, click the **Security** tab > **RADIUS Server** subtab.

Step 4 Click **Create**.

Step 5 In the Create New RADIUS Server dialog box, enter the following information:

- IP address
- Shared secret
- Authentication port
- Accounting port

Step 6 Click **OK**. The new RADIUS server is added to the RADIUS Servers in Order of Authentication table. You can create a maximum of 10 RADIUS server entries.

8.4.2.1.2 Modifying a RADIUS Server

Step 1 Select a CTC-based NE R6.0 or later and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the NE node.

Step 3 In the properties pane of the NE Explorer window, click the **Security** tab **> RADIUS Server** subtab.

Step 4 From the RADIUS Servers in Order of Authentication table, select a RADIUS server to modify; then, click **Edit**.

Step 5 In the Edit RADIUS Server dialog box, modify the following information:

- IP address
- Shared secret
- Authentication port
- Accounting port

Step 6 Click **OK**. Changes to the RADIUS server appear in the RADIUS Servers in Order of Authentication table.

8.4.2.1.3 Deleting a RADIUS Server

Step 1 Select a CTC-based NE R6.0 or later and choose **Configuration > NE Explorer**.

Step 2 In the tree view of the NE Explorer window, select the NE node.

Step 3 In the properties pane of the NE Explorer window, click the **Security** tab > **RADIUS Server** subtab.

Step 4 From the RADIUS Servers in Order of Authentication table, select a RADIUS server to delete; then, click **Delete**.

Step 5 Click **Yes** in the confirmation dialog box.

8.4.3 Managing NE User Access

You can view, add, modify, and delete user accounts for CTC-based ONS 15216 EDFA3 NEs.

8.4.3.1 Viewing the CTC-Based NE User Access Administration Table

The NE User Access Administration table displays information about the existing users on the NEs that are selected from the Prime Optical domain.

To view the NE User Access Administration table, choose **Administration > CTC-Based NEs > NE User Access Administration**. The following table provides descriptions.

Table 8-19 Field Descriptions for the NE User Access Administration Table

Field	Description
Alias ID	Alias name of the NE.
NE Username	Username of the NE user.
NE User Privilege (*CTC-based NEs only*)	Privilege level of the user. For CTC-based NEs, user privileges are Retrieve, Maintenance, Provisioning, and Superuser.
Lock Out	Whether the NE user is locked out of the NE.
Last Login Time	Time stamp when the NE user most recently logged in.
Failed Login Count	Number of times the NE user failed to log into the NE successfully.
Disabled	Whether the NE user's access to the NE has been disabled.
Password Change on Next Login	Whether the NE user is required to change his or her password upon the next login to the NE.
NE ID	Unique ID representing the NE.

8.4.3.2 Viewing the NE User Access Administration Table—ONS 15216 EDFA3 NEs

The NE User Access Administration table displays information about the existing users on the NEs that are selected from the Prime Optical domain.

To view the NE User Access Administration table, choose **Administration > ONS 15216 > NE User Access Administration**. The following table provides descriptions.

Table 8-20 Field Descriptions for the NE User Access Administration Table

Field	Description
NE ID	Unique ID representing the NE.
NE Username	Username of the NE user.
NE User Privilege	Privilege level of the user. User privileges are Read Only, Read/Write, and Read/Write/Administrative.
Timeout	Length of the timeout period (in minutes) based on the user privilege. When a timeout occurs, the corresponding session is terminated, because no messages were exchanged for a defined period of time. • For Read Only users, the Cisco default timeout is 60 minutes. • For Read/Write users, the Cisco default timeout is 30 minutes. • For Read/Write/Administrative users, the Cisco default timeout is 15 minutes.

8.4.3.3 Filtering NE User Access Administration Table Data

Step 1 In the NE User Access Administration table, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 2 Specify the filter parameters described in the following table.

Step 3 After making your selections, click **OK** to run the filter.

Table 8-21 Field Descriptions for the NE User Access Administration Table Filter

Field	Description
NE ID	Move NEs back and forth between the list of available NEs and selected NEs. The filter runs on the NEs in the Selected NE ID list.
User ID	Move users back and forth between the list of available users and selected users. The filter runs on the users in the Selected User ID list.
User Privilege	Select the user privilege levels for filtering.

8.4.3.4 Adding an NE User

Use the Add NE User wizard to add new users to ONS 15216 EDFA3, or CTC-based NEs. Table 8-22 provides descriptions.

Note Only users with Read/Write/Administrative privileges can add a new user to the ONS 15216 EDFA3.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs** or **ONS 15216 > NE User Access Administration**. The NE User Access Administration table opens.

Step 2 Choose **Edit > Add** (or click the **Create a New User** tool) for CTC-based or ONS 15216 EDFA3 NEs. The Add NE User wizard opens.

Step 3 In the Network Elements area, choose the NEs from the Available NEs list that the new user will have access to and click **Add**. These NEs will appear in the Selected NEs list. If you want to remove NEs that the new user has access to, select the NEs from the Selected NEs list and click **Remove**.

Step 4 Click **Next**.

Step 5 Set the new user account:

- Username
- Password (and verify password)
- Privilege (for CTC-based and ONS 15216 EDFA3 NEs)

Step 6 Click **Add**. Each new user is added in the Selected Users Profile list.

Step 7 To remove a new user from the Selected Users Profile list, select the user profile and click **Remove**.

Step 8 Click **Finish**. The result of this activity can be monitored in the Job Monitor table.

Step 9 In the confirmation dialog box, click **OK**.

Note The addition of an NE user account cannot be scheduled for an NE that is marked as Out of Service. The NE is not available in the list of NEs.

The addition of an NE user account can be scheduled for an NE that is marked as In Service and with a communication state of Unavailable. The job will remain in the Job Monitor table in Waiting status and will be executed once the NE becomes available. This job cannot be canceled while in Waiting status.

Table 8-22 Field Descriptions for the Add NE User Wizard

Field	Description
NE Selection Task	
NE Model	Selected NE model.
Network Elements	List of available and selected NEs. Select one or more NEs from the Available NEs list and click **Add** to add them to the Selected NEs list. Select one or more NEs from the Selected NEs list and click **Remove** to remove them from the Selected NEs list.
User Profile Selection Task	

Table 8-22 Field Descriptions for the Add NE User Wizard (continued)

Field	Description
Username	Username for the new user. • For CTC-based NEs, the username must conform with the username rules specified as the NE defaults. To view the username rules, launch the NE Explorer and click the **NE Defaults** tab. • For ONS 15216 EDFA3 NEs, the username must contain at least 6 but not more than 10 alphanumeric characters. ONS 15216 EDFA3 NEs support only a single TL1 session for each username.
New Password	User password. • For CTC-based NEs, the password must conform with the user password rules specified as the NE defaults. To view the user password rules, launch the NE Explorer and click the **NE Defaults** tab. • For ONS 15216 EDFA3 NEs, the password must contain at least 7 but not more than 10 ASCII characters, where at least two characters are nonalphabetic and at least one character is a special character (+, #, %). For example, *jpasswd#1* is an acceptable password. The password cannot contain the username. For example, if the username is *CISCO15*, the password cannot be *CISCO15#*. The password is case-sensitive.
Verify/Confirm Password	Re-enter the password to confirm it.
Privilege (*for CTC-based and ONS 15216 EDFA3 NEs*)	Privilege level for the new NE user. • For CTC-based NEs, privilege levels are Retrieve, Maintenance, Provisioning, and Superuser. • For ONS 15216 EDFA3 NEs, privilege levels are Read Only (R), Read/Write (RW), and Read/Write/Administrative (RWA). The timeout period is based on the user privilege. When a timeout occurs, the corresponding session is terminated, because no messages were exchanged for a defined period of time. – Read Only: The user can monitor the state of an NE, but cannot issue provisioning commands. The Cisco default timeout is 60 minutes. – Read/Write: The user can receive notifications, read information, and provision the NE. The user cannot carry out system administrative tasks. The Cisco default timeout is 30 minutes. – Read/Write/Administrative: The user can receive notifications, read information, provision the NE, carry out system administrative tasks, and perform user management. The Cisco default timeout is 15 minutes.
Selected Users Profile	List of new NE users. You can click **Remove** to remove the selected NE user.

8.4.3.5 Adding a Predefined User

Use the Add Predefined User wizard to add a predefined Prime Optical user from an NE or from the NE User Access Administration table. Table 8-23 provides descriptions.

Note The Add Predefined User wizard is not available for ONS 15216 EDFA3 NEs.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs > NE User Access Administration**. The NE User Access Administration table opens.

Step 2 For CTC-based NEs, choose **Edit > Add Predefined Users**.

Step 3 In the Add Predefined User wizard, do the following:

a. Select the area from which you will choose the predefined NE user. In the Existing NE User Selection area, click one of the following:

- **From NE**—To choose predefined users of a specific NE.
- **From Prime Optical User Table**—To choose predefined users associated with the Prime Optical user in the Prime Optical User table.
- **From CTC User Profile Table**—To choose predefined users associated with the CTC user in the CTC User Profile table.

b. If you chose to select users from an NE, in the NE Selection area, choose the NE from the **Select NE to pick users from** drop-down list. If you chose to select from the Prime Optical User table, this field is unavailable.

c. If you chose to select users from an NE, specify and verify the password in the Specify User Password area. This password will be applied to all the users selected in the next window. If you chose to select from the Prime Optical User table, you can force a password to the user by checking the **Force Password** check box, then specifying and verifying the password.

d. Specify the user privilege. If you chose to select users from an NE, you can force a privilege to the user by checking the **Force Privilege** check box.

This privilege will be applied to all the users selected in the next window.

Step 4 Click **Next**.

Step 5 Select the predefined users. Use the **Add** and **Remove** buttons to add or remove users in the Selected Users list.

Step 6 Click **Next**.

Step 7 Specify the NEs that the new user will have access to. Use the **Add** and **Remove** buttons to add or remove NEs in the Selected NEs list.

Step 8 Click **Finish**. The result of this activity can be monitored in the Job Monitor table.

Step 9 In the confirmation dialog box, click **OK**.

Table 8-23 Field Descriptions for the Add Predefined User Wizard

Field	Description
Predefined User Property Selection Task	
Existing NE User Selection	Choose whether to add the new user from the selected NE, from the Prime Optical User table, or from the CTC User Profile table.
NE Selection	Select the NE from which to choose a user. **Note** This field is dimmed if you selected From Prime Optical User Table or From CTC User Profile Table in the Existing NE User Selection area.
Force Password	If enabled, forces the predefined user to use a password when logging in. **Note** This field is dimmed if you selected From NE or From CTC User Profile Table in the Existing NE User Selection area.
Password	Enter the login password that the user will use to access the system. For CTC-based NEs, the password must conform with the password rules specified as the NE defaults. To view the password rules, launch the NE Explorer and click the **NE Defaults** tab. **Note** This field is dimmed if you select From CTC User Profile Table in the Existing NE User Selection area.
Confirm Password	Confirm the user password by retyping it.
Force Privilege	If enabled, forces the predefined user to use a specific user privilege level when logging in. **Note** This field is dimmed if you select From Prime Optical User Table or From CTC User Profile Table in the Existing NE User Selection area.
Privilege	Set the appropriate user privilege level. For CTC-based NEs, privilege levels are Retrieve, Maintenance, Provisioning, and Superuser.
Predefined User Selection Task	
Available Users	Select one or more users from the list and click **Add** to add them to the Selected Users list. Only the users in the Selected Users list will be added.
Selected Users	Select one or more users from the list and click **Remove** to remove them from the Selected Users list. Only the users in the Selected Users list will be added.
NE Selection Task	
Available NEs	Select one or more NEs from the list and click **Add** to add them to the Selected NEs list. Users are added only to the NEs in the Selected NEs list.
Selected NEs	Select one or more NEs from the list and click **Remove** to remove them from the Selected NEs list. Users are added only to the NEs in the Selected NEs list.

8.4.3.6 Modifying an NE User Profile

Use the Modify NE User wizard to make changes to existing NE users. Table 8-24 provides descriptions.

Note Only users with Read/Write/Administrative privileges can modify a user's password and privilege level on the ONS 15216 EDFA3.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs** or **ONS 15216 > NE User Access Administration**. The NE User Access Administration table opens.

Step 2 Select a user from the list. Choose **Edit > View/Modify** (or click the **Modify User Properties** tool) for CTC-based and ONS 15216 EDFA3 NEs.

Step 3 In the Modify NE User wizard, modify the following information (as needed). Fields shown depend on the NE selected:

- Username
- Old Password (available only when the selected user is active)
- New Password (and verify password)
- Privilege (for CTC-based and ONS 15216 EDFA3 NEs)
- Lock Out
- Disabled
- Change Password on Next Login
- Modify User on Multiple NEs check box

Note You cannot modify the Privilege, Lock Out, Disabled, and Change Password on Next Login fields if the selected user is active.

Step 4 Do one of the following:

a. If you did not check Modify User on Multiple NEs, proceed to the next step.

b. If you checked Modify User on Multiple NEs, click **Next**. Select the NEs that the modified user can or cannot access.

Step 5 Click **Finish**. The result of this activity can be monitored in the Job Monitor table.

Step 6 In the confirmation dialog box, click **OK**.

Step 7 If you are modifying the profile of a user who is currently logged in, click **OK** in the warning message. Changes to the NE user profile will take effect on the user's next login attempt.

Note

- You cannot modify an existing NE user account for an NE that is marked as Out of Service. You can select the NE's records in the NE User Access Administration table, but when you try to modify the account, you will receive an error message telling you that you cannot perform the operation.
- You can schedule modification of an existing NE user account for an NE that is marked as In Service but is unavailable. The job remains in Waiting status in the Job Monitor table and is executed when the NE becomes available. You cannot cancel the job.

Table 8-24 Field Descriptions for the Modify NE User Wizard

Field	Description
Username	For the ONS 15216 EDFA3, edit the username. **Note** For CTC-based NEs, the username is display only; it cannot be modified without deleting the user.
Old Password	Enter the old user password. This field is available only when the selected user is active.
New Password	Modify the user password. • For CTC-based NEs, the password must conform with the password rules specified as the NE defaults. To view the password rules, launch the NE Explorer and click the **NE Defaults** tab. • For ONS 15216 EDFA3 NEs, the password must contain at least 7 but not more than 10 ASCII characters, where at least two characters are nonalphabetic and at least one character is a special character (+, #, %). For example, *jpasswd#1* is an acceptable password. The password cannot contain the username. For example, if the username is *CISCO15*, the password cannot be *CISCO15#*. The password is case-sensitive.
Verify/Confirm Password	Re-enter the modified password to confirm it.
Privilege (*for CTC-based and ONS 15216 EDFA3 NEs*)	Modify the privilege level of the user. • For CTC-based NEs, privilege levels are Retrieve, Maintenance, Provisioning, and Superuser. • For ONS 15216 EDFA3 NEs, privilege levels are Read Only, Read/Write, and Read/Write/Administrative. **Note** You cannot modify this field if the selected user is active.
Timeout (*for ONS 15216 EDFA3 NEs*)	*Display only.* View the length of the timeout period (in minutes) based on the user privilege. When a timeout occurs, the corresponding session is terminated, because no messages were exchanged for a defined period of time. • For Read Only users, the Cisco default timeout is 60 minutes. • For Read/Write users, the Cisco default timeout is 30 minutes. • For Read/Write/Administrative users, the Cisco default timeout is 15 minutes.
Lock Out	Check this check box to lock out the NE user. **Note** You cannot modify this field if the selected user is active.
Disabled	Check this check box to permanently disable the user from logging back into Prime Optical. **Note** You cannot modify this field if the selected user is active.

Table 8-24 Field Descriptions for the Modify NE User Wizard (continued)

Field	Description
Change Password on Next Login	Check this check box to force the NE user to change his or her password on the next login. **Note** You cannot modify this field if the selected user is active.
Modify User on Multiple NEs	Check this check box to modify the profile for multiple NEs. The NEs are selected in the next panel.

8.4.3.7 Deleting an NE User

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs** or **ONS 15216 > NE User Access Administration**. The NE User Access Administration table opens.

Step 2 Select a user from the list and choose **Edit > Delete** (or click the **Delete User** tool) for CTC-based and ONS 15216 EDFA3 NEs.

Note You cannot delete a user who is currently logged in. For CTC-based NE users, you must first log out the user from the Active NE Users table. See 8.4.3.10 Ending an Active NE User Session, page 8-59. For ONS 15216 EDFA3 NE users, you must wait for the user to log out before deleting that user.

Note Only users with Read/Write/Administrative privileges can delete an ONS 15216 EDFA3 user.

Step 3 Click **Yes** in the confirmation dialog box.

Step 4 Click **OK** in the message box.

Note You cannot delete an existing NE user account for an NE that is marked as Out of Service. You can select the NE's records in the NE User Access Administration table, but when you try to delete the account, you will receive an error message telling you that you cannot perform the operation.

Note You can schedule deletion of an existing NE user account for an NE that is marked as In Service but is unavailable. The job remains in Waiting status in the Job Monitor table and is executed when the NE becomes available. You cannot cancel the job.

8.4.3.8 Viewing Active NE Users

The NE Active Users table displays information about the users who are currently logged into selected NEs in Prime Optical. Table 8-25 provides descriptions. Fields shown depend on the NE selected.

Note The ONS 15216 EDFA3 supports up to 20 user accounts with up to 11 simultaneous Telnet user connections. Each user can open only one connection at a time.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs** or **ONS 15216 > NE User Access Administration**. The NE User Access Administration table opens.

Step 2 For CTC-based and ONS 15216 EDFA3 NEs, choose **Edit > NE Active Users** (or click the **Show NE Active Users** tool). The NE Active Users table opens.

Step 3 For CTC-based NEs, choose **Administration > Retrieve Last Activity Time** (or click the **Retrieve Last Activity Time** tool) to refresh the Last Activity Time field for the current list of active users, if the activity time has changed.

Table 8-25 Field Descriptions for the NE Active Users Table

Field	Description
Alias ID	Alias name of the NE.
NE Username	Name of the user.
Client IP Address (*CTC-based NEs only*)	IP address of the client workstation from which the user has logged in.
Session Type (*CTC-based NEs only*)	Type of active user session (EMS, Telnet, and so on). Prime Optical and CTC sessions are identified as "EMS." This field applies only to the following CTC-based NEs: • ONS 15310 CL R6.0 and later • ONS 15310 MA SDH • ONS 15310 MA SONET R7.0 and later • ONS 15327 R6.0 and later • ONS 15454 SDH R6.0 and later • ONS 15454 SONET R6.0 and later • ONS 15600 SONET R6.0 and later

Table 8-25 Field Descriptions for the NE Active Users Table (continued)

Field	Description
Last Activity Time (*CTC-based NEs only*)	Date and time when the last activity was performed by the active user on the NE. This field applies only to the following CTC-based NEs: • ONS 15310 CL R6.0 and later • ONS 15310 MA SDH • ONS 15310 MA SONET R7.0 and later • ONS 15327 R6.0 and later • ONS 15454 SDH R6.0 and later • ONS 15454 SONET R6.0 and later • ONS 15600 SONET R6.0 and later
Login Time (*CTC-based NEs only*)	Date and time when the active user logged into the NE. This field applies only to the following CTC-based NEs: • ONS 15310 CL R6.0 and later • ONS 15310 MA SDH • ONS 15310 MA SONET R7.0 and later • ONS 15327 R6.0 and later • ONS 15454 SDH R6.0 and later • ONS 15454 SONET R6.0 and later • ONS 15600 SONET R6.0 and later
NE ID	Unique ID number of the NE.

8.4.3.9 Filtering NE Active Users Table Data

Step 1 In the NE Active Users table, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 2 Specify the filter parameters described in the following table.

Step 3 After making your selections, click **OK** to run the filter.

Table 8-26 Field Descriptions for the NE Active Users Table Filter

Field	Description
NE ID	Move NEs back and forth between the list of available NEs and selected NEs. The filter runs on the NEs in the Selected NE ID list.

8.4.3.10 Ending an Active NE User Session

You can use the Log Out User feature to end a user session on CTC-based NEs.

Note The Log Out User feature is not available for ONS 15216 EDFA3 NEs.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs > NE User Access Administration**. The NE User Access Administration table opens.

Step 2 For CTC-based NEs, choose **Edit > NE Active Users** (or click the **Show NE Active Users** tool). The NE Active Users table opens.

Step 3 For CTC-based NEs, choose **Administration > Log Out User** (or click the **Log Out User** tool).

Step 4 Click **Yes**.

8.4.4 Managing CTC User Profiles

You can view, create, modify, and delete CTC user profiles in the Prime Optical database.

8.4.4.1 Viewing the CTC User Profiles Table

The CTC User Profiles table contains a list of predefined CTC user profiles that are available in the Prime Optical database. To view the CTC User Profiles table, choose **Administration > CTC User Profiles** in the Domain Explorer window. The following table provides descriptions.

Table 8-27 Field Descriptions for the CTC User Profiles Table

Field	Description
User ID	CTC username.
User Privilege	CTC user privilege.
Description	Description of the CTC user.

8.4.4.2 Creating a CTC User Profile

Use the Add New CTC User Profile dialog box to add new CTC user profiles to the database. The following table provides descriptions.

Step 1 In the Domain Explorer window, choose **Administration > CTC User Profiles**. The CTC User Profiles table opens.

Step 2 Choose **Edit > Create** (or click the **Create a New CTC User Profile** tool).

Step 3 In the Add New CTC User Profile dialog box, enter the following information:

- User ID
- User password (and confirm password)
- User privilege
- Description

Step 4 Click **OK**.

Table 8-28 Field Descriptions for the Add New CTC User Profile Dialog Box

Field	Description
User ID	Name of the new user profile. The profile name must contain from six to twenty alphanumeric characters (A–Z, a–z, 0–9). Alphabetic characters are case-sensitive. The user profile name cannot contain spaces or special characters. **Note** After the user ID is set, it cannot be changed without deleting the user.
User Password	User password. The new password must contain a minimum of six and a maximum of ten alphanumeric (a–z, A–Z, 0–9) and special characters (+, #,%), where at least two characters are alphabetic, at least one character is numeric, and at least one character is a special character. **Note** Regardless of the actual size of the old password, the Password field displays only a fixed-length string. The fixed-length string contains 15 asterisks (*).
Confirm Password	Retype the password to confirm it.
User Privilege	Access privilege for the new user profile. Privilege levels are Retrieve, Maintenance, Provisioning, and Superuser.
Description	Description of the new user profile.

8.4.4.3 Modifying a CTC User's Properties

Use the Modify CTC User Profile dialog box to make changes to an existing CTC user profile. The following table provides descriptions.

Step 1 In the Domain Explorer window, choose **Administration > CTC User Profiles**. The CTC User Profiles table opens.

Step 2 Choose **Edit > View/Modify** (or click the **Modify CTC User Profile Properties** tool).

Step 3 In the Modify CTC User Profile dialog box, modify the following information, as needed:

- User password (and confirm password)
- User privilege
- Description

Step 4 Click **OK**.

Table 8-29 Field Descriptions for the Modify CTC User Profile Dialog Box

Field	Description
User ID	*Display only.* Name of the user profile. The profile name must contain from six to twenty alphanumeric characters (A–Z, a–z, 0–9). Alphabetic characters are case-sensitive. The user profile name cannot contain spaces or special characters. **Note** After the username is set, it cannot be changed without deleting the user.
User Password	User password. The password must contain a minimum of six and a maximum of ten alphanumeric (a–z, A–Z, 0–9) and special characters (+, #,%), where at least two characters are alphabetic, at least one character is numeric, and at least one character is a special character. **Note** Regardless of the actual size of the old password, the Password field displays only a fixed-length string. The fixed-length string contains 15 asterisks (*).
Confirm Password	Retype the modified password to confirm it.
User Privilege	Access privilege for the user profile. Privilege levels are Retrieve, Maintenance, Provisioning, and Superuser.
Description	Description of the user profile.

8.4.4.4 Deleting a CTC User Profile

Step 1 In the Domain Explorer window, choose **Administration > CTC User Profiles**. The CTC User Profiles table opens.

Step 2 Select the CTC user profile that you want to delete and choose **Edit > Delete** (or click the **Delete CTC User Profile** tool).

Step 3 Click **OK** in the confirmation dialog box.

8.4.5 Managing Cisco IOS Users

You can view, create, modify, and delete Cisco IOS user accounts in the Prime Optical database.

8.4.5.1 Viewing the IOS Users Table

The IOS Users table shows all of the configured Cisco IOS user accounts. You can use the IOS Users table to manage user access to Layer 2 and Layer 3 Cisco IOS cards. Use this table to give users the ability to view or edit the username and password on ML cards in CTC-based NEs.

To view the table, choose **Administration > CTC-Based NEs > IOS Users Table** in the Domain Explorer window. The following table provides descriptions.

Table 8-30 Field Descriptions for the IOS Users Table

Field	Description
Alias ID	Alias of the NE.
Module Name	Name of the selected module.
Physical Location	Location of the selected module.
Username	Username that is provisioned on the Cisco IOS card.
Privilege	Privilege level of the selected user.
NE ID	ID number of the NE.

8.4.5.2 Adding an IOS User

Use the IOS User Creation wizard to add new Cisco IOS users to the domain.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs > IOS Users Table**.

Step 2 In the IOS Users table, choose **Edit > Create** (or click the **Create a New User** tool). The IOS User Creation wizard opens. The following table provides descriptions.

Step 3 In the IOS Card Selection window, complete the following substeps:

a. Select the NE ID on which you want to create a new Cisco IOS user.

b. In the Available IOS Cards list, select the cards that you want the new user to be able to access. Use the **Add** button to move the cards to the Selected IOS Cards list.

c. Click **Next**.

Step 4 In the IOS User Information window, enter the following information:

- Username
- Password (and confirm password)
- User privilege

Step 5 Click **Finish**.

Note A progress animator is displayed while the new user is being added to the IOS Users table.

The new user is listed in the IOS Users table.

Table 8-31 Field Descriptions for the IOS User Creation Wizard

Field	Description
IOS Card Selection Pane	
NE ID	NE ID on which you want to create a new Cisco IOS user.
Available IOS Cards	Available Cisco IOS data cards that the user can access. Click **Add** to move the cards to the Selected IOS Cards list.
Selected IOS Cards	Selected Cisco IOS data cards that the user can access. Click **Remove** to return the cards to the Available IOS Cards list.
IOS User Information Pane	
Username	Name of the Cisco IOS user.
Password	Login password that the Cisco IOS user will use to access ML cards. **Note** Regardless of the actual size of the old password, the Password and Confirm Password fields display only a fixed-length string. The fixed-length string contains 15 asterisks (*).
Confirm Password	Retype the password to confirm it.
User Privilege	User privilege level. Values are from 0 to 15; the Cisco default is 15.

8.4.5.3 Modifying an IOS User

Use the IOS User Modification wizard to modify the password or privilege level of an existing Cisco IOS user.

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs > IOS Users Table**.

Step 2 In the IOS Users table, choose **Edit > Modify** (or click the **Modify User Properties** tool). The IOS User Modification wizard opens. The following table provides descriptions.

Step 3 In the IOS Card Selection window, complete the following substeps:

a. Select the NE ID on which you want to modify the Cisco IOS user password or privilege level.

b. In the Available IOS Cards list, select the cards that you want the modified user to be able to access. Use the **Add** button to move the cards to the Selected IOS Cards list.

c. Click **Next**.

Step 4 In the IOS User Information window, enter the following information:

- Password (and confirm password)
- User privilege

Step 5 Click **Finish**.

Note A progress animator is displayed while the user information is modified.

Table 8-32 Field Descriptions for the IOS User Modification Wizard

Field	Description
IOS Card Selection Pane	
NE ID	NE ID on which you want to modify the Cisco IOS user.
Available IOS Cards	Available Cisco IOS data cards that the user can access. Click **Add** to move the cards to the Selected IOS Cards list.
Selected IOS Cards	Selected Cisco IOS data cards that the user can access. Click **Remove** to return the cards to the Available IOS Cards list.
IOS User Information Pane	
Username	*Display only.* Name of the Cisco IOS user.
Password	Login password that the Cisco IOS user will use to access ML cards.
Confirm Password	Retype the password to confirm it.
User Privilege	User privilege level. Values are from 0 to 15; the Cisco default is 15.

8.4.5.4 Deleting an IOS User

Step 1 In the Domain Explorer window, choose **Administration > CTC-Based NEs > IOS Users Table**.

Step 2 In the IOS Users table, select the user to be deleted.

Step 3 Choose **Edit > Delete** (or click the **Delete User** tool).

Step 4 Click **OK** to remove the user from the database.

Note A progress animator is displayed while the delete operation is performed.

8.4.6 Managing SNMPv3—CTC-Based Release 9.6 NEs

Note SNMPv3 is not supported on ONS 15305, ONS 15305 CTC, and ONS 15327 NEs.

The following cases describe how to configure SNMPv3 on CTC-based NEs:

1. Provision a logical SNMPv3 configuration on CTC-based NEs using the SNMPv3 wizard. See 8.4.6.1 Configuring SNMPv3 Parameters, page 8-65 for information on the SNMPv3 wizard. To verify the SNMPv3 configuration, see case 2.
2. Check the configured SNMPv3 parameters using the SNMPv3 tables. See 8.4.6.2 Viewing SNMPv3 Tables, page 8-67 for instructions on how to open the SNMPv3 tables. The SNMPv3 configuration is correct if the following constraints are verified:
   - The SNMPv3 NE Users table contains the provisioned users for each NE.
   - The SNMPv3 user group is defined in the SNMPv3 NE Groups table for each NE.
   - The SNMPv3 group view is defined in the SNMPv3 NE MIB Views table for each NE.
   - If an NE entry in the SNMPv3 NE Trap Destinations table is associated with a notification filter, the filter is defined in the SNMPv3 NE Notification Filters table for each NE.

   If an NE is a proxy NE or ENE, the following additional constraints are verified:
   - The target address is the GNE IP address and the port number is 161 in the SNMPv3 NE Trap Destinations table.
   - The SNMPv3 NE Proxy Forwarder table of the GNE contains two rows: one for the GET type value and another for the SET type value. Also, the remote NE is the system ID of the ENE, and the remote user is defined in the ENE's SNMPv3 NE Users table.
   - The SNMPv3 NE Proxy Trap Forwarder table of the GNE contains a row for the ENE. Also, the tag references the proxy tags in the SNMPv3 NE Trap Destinations table, and the incoming user is defined in the ENE's SNMPv3 NE Users table.

   If the SNMPv3 tables contain invalid rows, see case 3. If you need to add rows to one or more SNMPv3 tables, see case 4.

Note For more information on SNMPv3 for CTC-based NEs, refer to the NE hardware documentation.

3. Delete rows from the SNMPv3 tables. See 8.4.6.3 Deleting SNMPv3 Users from the SNMPv3 Tables, page 8-71.
4. Provision rows in the SNMPv3 tables. The SNMPv3 wizard also allows you to add entries to one or more SNMPv3 tables. See 8.4.6.1 Configuring SNMPv3 Parameters, page 8-65 for details.

8.4.6.1 Configuring SNMPv3 Parameters

The SNMPv3 wizard allows you to configure parameters in the SNMPv3 tables. You can do one of the following:

- Add entities to one or more SNMPv3 tables. If you choose this option, do not select the Configure Proxy check box in the SNMPv3 wizard.
- Provision the entire SNMPv3 configuration. If you choose this option, select the Configure Proxy check box in the SNMPv3 wizard. The SNMPv3 wizard validates the configuration by verifying that it complies with the constraints listed in 8.4.6 Managing SNMPv3—CTC-Based Release 9.6 NEs, page 8-64. Moreover, the SNMPv3 wizard configures the SNMPv3 proxy for proxy NEs.

Complete the following steps to configure the SNMPv3 parameters:

Step 1 In the Domain Explorer, select a CTC-based NE and choose **Administration > CTC-Based NEs > SNMPv3 Configuration**.

Step 2 In the SNMPv3 wizard, complete the following substeps:

a. Enter the following view information:

- Name—Name of the MIB view.
- Subtler OID—Object identifier that designates a subtree element in the MIB hierarchy.
- Bit Mask—Bit mask that identifies the objects in the subtree.
- Type—Status of the view. Values are Included or Excluded.

b. Click **Add**. The view information appears in the Table Views area. To remove the view information, select the view information from the Table Views area and click **Delete**.

Step 3 Click **Next**.

Step 4 Enter the following group information:

- Group Name—Name of the group.
- Security Level—Security level of the group. Values are authPriv, authNoPriv, and noAuthNoPriv.
- Read View Name—The group's view-for-read access name.
- Notify View Name—The group's view-for-notifications name.
- Allow SNMP Sets—If checked, users who belong to the group can perform the SNMP SET operation on the NE.

Step 5 Click **Next**.

Step 6 Complete the following substeps:

a. Enter the following information in the User area:

- Username—SNMPv3 username.
- Group name—Name of the group to which the user belongs.

b. Enter the following information in the Authentication area:

- Protocol—Protocol used to authenticate the SNMPv3 user.
- Password—Password used to log into the Prime Optical server.
- Confirm Password—Re-enter the password to confirm it.

c. Enter the following information in the Privacy area:

- Protocol—Protocol used for encryption.
- Password—Password used to decrypt the message payload.
- Confirm Password—Re-enter the password to confirm it.

Step 7 Click **Next**.

Step 8 Enter the following notification filter information:

- Profile Name—Filter profile name.
- Subtree OID—Object identifier that designates a subtree element in the MIB hierarchy.
- Bit Mask—Bit mask that identifies the objects in the subtree.
- View Type—Filter type with respect to the subset of the MIB object that is identified by the subtree OID and bitmask fields. Values are Included and Excluded.

Step 9 Click **Next**.

Step 10 Enter the following trap destination information:

- Target Address—IP address of the EMS to which the NE forwards the SNMPv3 traps.
- UDP Port—UDP port number to which the NE forwards the SNMPv3 traps.
- Username—SNMPv3 username.
- Security Level—Security level that the SNMPv3 NE uses. Valid values are authPriv, authNoPriv, and noAuthNoPriv.
- Filter Profile—Filter profile name associated with the trap destination.
- Proxy Trap Only—If selected, the NE that acts as the SNMPv3 proxy uses the entries in the SNMPv3 NE Trap Destinations table to forward traps from other NEs to the target address. The SNMPv3 proxy NE does not send its own traps to the target address.
- Proxy Tags—A string used to identify a set of entries in the SNMPv3 NE Trap Destinations table. This is required for SNMPv3 proxy configuration.

Step 11 Do one of the following:

- If you are adding entries to the SNMPv3 tables, uncheck the **Configure Proxy** check box.
- If you choose automatic proxy configuration, check the **Configure Proxy** check box. If checked, Prime Optical identifies the SNMPv3 proxy for each selected ENE. The ENE and SNMPv3 proxy are configured to enable Prime Optical–SNMPv3 NE connectivity using the parameters you defined in steps 2, 4, 6, 8, and 10.

Step 12 Click **Finish**. A job is scheduled on all NEs on which the SNMPv3 NE configuration wizard was started. The job status is listed in the Job Monitor table (**Administration > Job Monitor**).

8.4.6.2 Viewing SNMPv3 Tables

The SNMPv3 tables are grouped according to the following table types:

- User tables:
  - 8.4.6.2.1 SNMPv3 NE Users Table, page 8-67
  - 8.4.6.2.2 SNMPv3 NE MIB Views Table, page 8-68
  - 8.4.6.2.3 SNMPv3 NE Groups Table, page 8-69
- Trap tables:
  - 8.4.6.2.4 SNMPv3 NE Trap Destinations Table, page 8-69
  - 8.4.6.2.5 SNMPv3 NE Notification Filters Table, page 8-70
- Proxy server tables:
  - 8.4.6.2.6 SNMPv3 NE Proxy Forwarder Table, page 8-70
  - 8.4.6.2.7 SNMPv3 NE Proxy Trap Forwarder Table, page 8-71
  - 8.4.6.2.8 SNMPv3 NE Remote Users Table, page 8-71

8.4.6.2.1 SNMPv3 NE Users Table

The SNMPv3 NE Users table displays information on the SNMPv3 users defined on a selected NE. To view the SNMPv3 NE Users table, choose **Administration > CTC-Based NEs > SNMPv3 Users** in the Domain Explorer window. The following table provides descriptions.

Table 8-33 Field Descriptions for the SNMPv3 NE Users Table

Field	Descriptions
NE ID	SNMPv3 NE ID.
Username	SNMPv3 username.
Group Name	Name of the group to which the user belongs.
Authentication Protocol	Protocol used to authenticate the SNMPv3 user. Valid values are MD5 or SHA.
Privacy Protocol	Protocol used for encryption.

8.4.6.2.2 SNMPv3 NE MIB Views Table

The SNMPv3 NE MIB Views table displays information on the views defined on a selected NE. A view identifies the subset of an object in the MIB. To view the SNMPv3 NE MIB Views table, choose **Administration > CTC-Based NEs > SNMPv3 MIB Views** in the Domain Explorer window. The following table provides descriptions.

Table 8-34 Field Descriptions for the SNMPv3 NE MIB Views Table

Field	Description
NE ID	SNMPv3 NE ID.
View Name	Name of the MIB view.
Subtree OID	Object identifier that designates a subtree element in the MIB hierarchy.
Mask	Bit mask that identifies the objects in the subtree.
Type	Status of the view. Valid values are Included or Excluded.

8.4.6.2.3 SNMPv3 NE Groups Table

The SNMPv3 NE Groups table displays information on the group that is provisioned on a selected NE. To view the SNMPv3 NE Groups table, choose **Administration > CTC-Based NEs > SNMPv3 Group Access** in the Domain Explorer window. The following table provides descriptions.

Table 8-35 Field Descriptions for the SNMPv3 NE Groups Table

Field	Description
NE ID	SNMPv3 NE ID.
Group Name	Name of the group.
Security Level	Security level of the group. Valid values are AuthPriv, AuthNoPriv, and NoAuthNoPriv.
Read View	Displays the group's view-for-read access name. The view name must be present in the SNMPv3 NE MIB Views table.
Allow SNMP Sets	If true, users who belong to the group can perform the SNMP SET operation on the NE.
Notify View	Displays the group's notify-for-notifications name. The view name must be present in the SNMPv3 NE MIB Views table.

8.4.6.2.4 SNMPv3 NE Trap Destinations Table

The SNMPv3 NE Trap Destinations table displays information on the trap destinations provisioned on a selected NE. To view the SNMPv3 NE Trap Destinations table, choose **Administration > CTC-Based NEs > SNMPv3 Trap Destinations** in the Domain Explorer window. The following table provides descriptions.

Table 8-36 Field Descriptions for the SNMPv3 NE Trap Destinations Table

Field	Description
NE ID	SNMPv3 NE ID.
Target Address	IP address of the EMS to which the NE forwards the SNMPv3 traps.
UDP Port	UDP port number to which the NE forwards the SNMPv3 traps.
Username	SNMPv3 username.
Security Level	Security level that the SNMPv3 NE uses. Valid values are AuthPriv, AuthNoPriv, and NoAuthNoPriv.
Filter Profile Name	Filter profile name associated with the trap destination. The filter profile name must be present in the SNMPv3 NE Notification Filters table.
Proxy Traps Only	If true, the NE that acts as the SNMPv3 proxy uses the entries in the SNMPv3 NE Trap Destinations table to forward traps from other NEs to the target address. The SNMPv3 proxy NE does not send its own traps to the target address.
Proxy Tags	A string used to identify a set of entries in this table. This field is required for SNMPv3 proxy configuration and referenced by the SNMPv3 NE Proxy Trap Forwarder table. See 8.4.6.2.7 SNMPv3 NE Proxy Trap Forwarder Table, page 8-71 for more information.

8.4.6.2.5 SNMPv3 NE Notification Filters Table

The SNMPv3 NE Notification Filters table displays information on the notification filters provisioned on a selected NE. To view the SNMPv3 NE Notification Filters table, choose **Administration > CTC-Based NEs > SNMPv3 Notification Filters** in the Domain Explorer window. The following table provides descriptions.

Table 8-37 Field Descriptions for the SNMPv3 NE Notification Filters Table

Field	Description
NE ID	SNMPv3 NE ID.
Filter Profile Name	Filter profile name that identifies the table entry.
Subtree OID	Object identifier that designates a subtree element in the MIB hierarchy.
Bit Mask	Bit mask that identifies the objects in the subtree.
Filter Type	Defines the filter type with respect to the subset of the MIB object that is identified by the subtree OID and bitmask fields. Valid values are Included and Excluded.

8.4.6.2.6 SNMPv3 NE Proxy Forwarder Table

The SNMPv3 NE Proxy Forwarder table displays information on the proxy forwarder entries. The proxy forwarder entries enable SNMPv3 proxying by selected remote NE proxies for GET and SET operations. To view the SNMPv3 NE Proxy Forwarder table, choose **Administration > CTC-Based NEs > SNMPv3 Proxy Forwarder** in the Domain Explorer window. The following table provides descriptions.

Table 8-38 Field Descriptions for the SNMPv3 NE Proxy Forwarder Table

Field	Descriptions
NE ID	SNMPv3 NE ID.
Remote NE	Remote SNMPv3 NE ID.
Context Engine ID	Engine ID of the remote NE.
Target Address	Target IP address of the SNMPv3 NE.
Local User	Local SNMPv3 username.
Remote User	Remote SNMPv3 username.
Proxy Type	Identifies the proxy action. Valid values are Read and Write.
Security Level	Security level that the SNMPv3 NE uses. Valid values are AuthPriv, AuthNoPriv, and NoAuthNoPriv.

8.4.6.2.7 SNMPv3 NE Proxy Trap Forwarder Table

The SNMPv3 NE Proxy Trap Forwarder table displays information on trap forwarder entries. The trap forwarder entries enable SNMPv3 proxying by selected remote NE proxies for the TRAP operation. To view the SNMPv3 NE Proxy Trap Forwarder table, choose **Administration > CTC-Based NEs > SNMPv3 Proxy Trap Forwarder** in the Domain Explorer window. The following table provides descriptions.

Table 8-39 Field Descriptions for the SNMPv3 NE Proxy Trap Forwarder Table

Field	Description
NE ID	SNMPv3 NE ID.
Remote NE	Remote SNMPv3 NE ID.
Context Engine ID	Engine ID of the remote NE.
Tag	A string that identifies one or more rows in the SNMPv3 NE Trap Destinations table. The Tag value references the Proxy Tags column in the SNMPv3 NE Trap Destinations table.
Incoming User	Name of the remote NE user.
Security Level	Security level that the SNMPv3 NE uses. Valid values are AuthPriv, AuthNoPriv, and NoAuthNoPriv.

8.4.6.2.8 SNMPv3 NE Remote Users Table

The SNMPv3 NE Remote Users table displays information on the SNMPv3 remote users defined on a selected NE. To view the SNMPv3 NE Remote Users table, choose **Administration > CTC-Based NEs > SNMPv3 Remote Users** in the Domain Explorer window. The following table provides descriptions.

Table 8-40 Field Descriptions for the SNMPv3 NE Remote Users Table

Field	Descriptions
NE ID	SNMPv3 NE ID.
Remote NE	Remote SNMPv3 NE ID.
Context Engine ID	Engine ID of the remote NE.
Group Name	Name of the group.
Authentication Protocol	Protocol used to authenticate the SNMPv3 user. Valid values are MD5 or SHA.
Privacy Protocol	Protocol used for encryption.

8.4.6.3 Deleting SNMPv3 Users from the SNMPv3 Tables

Step 1 In the Domain Explorer, choose **Administration > CTC-Based NEs >** *SNMPv3 table*. The table opens.

Step 2 Select the user to delete; then, choose **Edit > Delete User** (or click the **Delete User** tool). A job is scheduled on each NE involved in the delete operation. The job status is listed in the Job Monitor table (**Administration > Job Monitor**).

Step 3 If the job succeeds, the Refresh button flashes. Click the **Refresh Data** tool.

8.5 Audit Log

The Audit Log table contains information about significant events that occurred on the Prime Optical server during a specified time period. By default, the Audit Log displays information about significant events that occurred during the last four hours. You can change the default time period in the User Preferences dialog box.

The Audit Log records the following runtime-affecting operations for monitoring purposes:

- Prime Optical client logins and security violations (including successful/unsuccessful client user logins)
- Prime Optical client logouts, including:
  - User-initiated logout
  - Forced logout by an administrator
  - System-initiated logout due to user inactivity (session timeout expires)
- NE or group location changes in the Domain Explorer tree
- Domain Explorer group operations (add, delete, or modify a group)
- Changes in the Domain Explorer properties of an NE
- Write operations from a native Prime Optical NE Explorer
- Changes in the NE Software table
- NE Service, PM Service, and Prime Optical GateWay Service start or stop operations
- Prime Optical user administration (add, delete, or modify user profiles)
- Changes in:
  - UI properties
  - Security settings
  - Recovery settings
  - Database configuration
  - Error Log configuration
  - NE poller parameters
  - NE autobackup parameters
  - NE service parameters
- Job or task cancellation in the Job Monitor table
- Manual memory backup
- Memory restore
- Software download

- Software activation
- Circuit operations (add, delete, modify, or upgrade circuits)
- Link operations (add, delete, or modify links)
- OSS profile changes (TL1 or CORBA)
- VLAN operations
- Addition or deletion of a GateWay/SNMP trap destination
- Addition or deletion of a CTC binary
- BLSR/MS-SPRing operations
- L2 service operations
- Prime Optical GateWay/CORBA client logins/logouts

8.5.1 Viewing the Audit Log

To view the Audit Log, choose **Administration > Audit Log** in the Domain Explorer window. The following table provides descriptions.

Table 8-41 Field Descriptions for the Audit Log

Field	Description
Alias ID	Alias name of the NE.
Username	Name of the user performing the logged event. Events performed by the Prime Optical server are logged under the username *Internal*.
Service Name	Name of the service that generated the Audit Log entry.
Time Stamp (*time zone*)	Date and time when the event occurred on the Prime Optical server.
Category	Name of the category in which the event occurred. Events belong to one of the following categories: Prime Optical server administration, Prime Optical server connectivity, Prime Optical server security, Prime Optical server topology, Prime Optical server circuit, Prime Optical server network, NE provisioning, NE connectivity, BLSR/MS-SPRing, or subnetwork management.
Message	Description of the significant event that occurred.
Source ID	Source of the event. Events performed by the Prime Optical server show *CTM* as the source ID.

8.5.2 Filtering Audit Log Data

Step 1 In the Domain Explorer window, choose **Administration > Audit Log**.

Step 2 In the Audit Log window, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 3 Specify the filter parameters described in the following table.

Step 4 After making your selections, click **OK** to run the filter.

Step 5 To save a filter:

a. Open the Audit Log Filter dialog box.

b. Click the **Category** or **Service** tab.

c. Check the **Save Filter** check box.

d. Click **OK**. In the Audit Log window, the Filter tool changes to red, indicating that a saved filter is present.

Note The Audit Log supports only one saved filter per user.

Step 6 To delete a saved filter, choose **File > Delete Saved Filter** in the Audit Log window. At the following prompt, click **Yes**:

```
The saved filter will be deleted. The current filter will remain applied to the table. Are
you sure you want proceed?
```

When you delete a saved filter, the Filter tool reverts to blue in the Audit Log window.

Table 8-42 Field Descriptions for the Audit Log Filter Dialog Box

Tab	Description
Time Stamp (*time zone*)	Filter Audit Log data for a specified time period, ranging from the past hour to the past 6 months. You can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. If you want to filter Audit Log data and the time period is not important, click **No Time Specified**.
Source ID	Move NEs back and forth between the list of available NEs and selected NEs and then run the filter.

Table 8-42 Field Descriptions for the Audit Log Filter Dialog Box (continued)

Tab	Description

Category	Filter Audit Log data by task.
	Follow these steps to save a filter:
	1. Check the **Save Filter** check box, and click **OK** on the Filter dialog box.
	2. The saved filter is added to the table.
	3. When you choose **File > Apply Saved Filter**, the table populates with the attributes saved for that filter.
	Note An "at" symbol (@) in the Filter indicates that you are viewing a saved filter.
	Follow these steps to delete a filter:
	1. Chose **File > Delete Saved Filter** (or click the **Delete Saved Filter** tool).
	The following message appears in the Delete Filter dialog box:
	`The saved filter will be deleted. The current filter will remain applied to the table. Are you sure you want proceed?`
	2. Click **Yes**.
	3. When you run two parallel Prime Optical client sessions, deleting a saved filter from one session does not reflect any changes on the other. The Apply and Delete buttons remain enabled in the second session.
	The following message appears when you click either of the buttons in the Filter dialog box of the second session:
	`The saved filter no longer exists in the system. The current user might have deleted it in a different Prime Optical client session.`
	4. Click **OK**.
	The Apply and Delete buttons are disabled. The Filter tool reverts to blue, indicating that the filter is not saved.
	Note The menu items **Apply Saved Filter** and **Delete Saved Filter** and the **Delete Saved Filter** tool are enabled only if there is a saved filter for that table.

Table 8-42 Field Descriptions for the Audit Log Filter Dialog Box (continued)

Tab	Description
Username	Move users back and forth between the list of available users and selected users and then run the filter. Events performed by the Prime Optical server are logged under the username *Internal*.

Service	Move services back and forth between the list of available services and selected services and then run the filter.
	Follow these steps to save a filter:
	1. Check the **Save Filter** check box, and click **OK** on the Filter dialog box.
	2. The saved filter is added to the table.
	3. When you choose **File > Apply Saved Filter**, the table populates with the attributes saved for that filter.
	Note An "at" symbol (@) in the Filter indicates that you are viewing a saved filter.
	Follow these steps to delete a filter:
	1. Choose **File > Delete Saved Filter** (or click the **Delete Saved Filter** tool).
	The following message appears in the Delete Filter dialog box:
	`The saved filter will be deleted. The current filter will remain applied to the table. Are you sure you want proceed?`
	2. Click **Yes**.
	3. When you run two parallel Prime Optical client sessions, deleting a saved filter from one session does not reflect any changes on the other. The Apply and Delete buttons remain enabled in the second session.
	The following message appears when you click either of the buttons in the Filter dialog box of the second session:
	`The saved filter no longer exists in the system. The current user might have deleted it in a different Prime Optical client session.`
	4. Click **OK**.
	The Apply and Delete buttons are disabled. The Filter tool reverts to blue, indicating that the filter is not saved.
	Note The menu items **Apply Saved Filter** and **Delete Saved Filter** and the **Delete Saved Filter** tool are enabled only if there is a saved filter for that table.

8.6 Northbound Gateway Security

OSS-to-Prime Optical sessions are configured by the Prime Optical GateWay EMS-to-NMS interface architectural component. See Chapter 12, "Managing Southbound and Northbound Interfaces" for more information about Prime Optical GateWay.

Managing Faults

This chapter describes the process of fault management (FM), and details the options available in Cisco Prime Optical to locate, diagnose, and report network problems.

This chapter includes the following information:

- 9.1 What Is Fault Management?, page 9-1
- 9.2 Where Can I Get Information on Affected Services and Customers?, page 9-3
- 9.3 What Fault Information Can I See?, page 9-14
- 9.4 Is the Service Working?, page 9-15
- 9.5 Where Is the Fault?, page 9-27
- 9.6 How Can I Find the Root Cause of the Fault?, page 9-32
- 9.7 Who Is Responsible for Managing the Fault?, page 9-37
- 9.8 How Can the Fault Be Fixed?, page 9-39

9.1 What Is Fault Management?

Fault management is the process of locating, diagnosing, and reporting network problems. This is important for increasing network reliability and effectiveness, and for increasing the productivity of network users. Fault management is more than just handling emergencies. It provides functions for managing problems with services and handling customer-facing service problems.

Efficient fault management can:

- Save repair costs through efficient fault detection, location, and correction
- Improve customer care through efficient trouble administration
- Improve service availability and equipment reliability through proactive maintenance and through measurement, review, and corrective action

One responsibility of fault management is to detect faults. A piece of equipment, a transmission medium, a software module, or a database is said to be in a fault state if it cannot perform its intended function and meet all of the requirements placed on that function. The onset of a fault is called a *failure event* and is usually signaled by one or more alarm reports. The termination of a fault state is called a *clear event*.

Fault management is responsible for determining, from a variety of information sources, the root cause of a fault, and for its repair. In certain cases, the root cause of a fault might be in a connecting network. In such cases, fault management is responsible for reporting the problem through appropriate channels.

Service assurance is the overall process of ensuring that the purchased level of service is delivered. The Element Management System (EMS) plays a key role in maintaining the health of both NEs and transmission facilities. This is done in conjunction with other systems, typically at the network management layer and service management layer. The EMS can be the primary repository of detailed history of NE-specific faults and events, technician action, and performance data.

The steps for successful fault management are:

1. Identify a problem by gathering data about the state of the network (polling and trap generation).
2. Restore any services that have been lost.
3. Isolate the cause, and decide if the fault should be managed.
4. Correct the fault if possible.

9.1.1 What the NE Provides

Currently deployed, intelligent NEs provide the management system with the following, which are required for effective fault management:

- Detection of the four main types of failure:
  - Equipment failure—Detected through failure detection mechanisms built into the hardware, and through routine exercises and diagnostics.
  - Software failure—Detected through failure of software checks, and through routine audits.
  - Communication failure—Detected through defects in the incoming signal or outgoing signal characteristics. Defects include line coding errors, framing bit errors, parity errors, cyclic redundancy check errors, and addressing errors. Signal characteristics include optical or electrical power, analog signal-to-noise ratio, and deviation from required voltage or wavelength.
  - Environmental failure.
- Notification of failure—NEs notify a management system when a failure occurs by generating an alarm report. The NE can also report a summary of current fault states, or replay its log of historical failures and clears.
- Notification of changes in operational state of the NE components—If a component of the NE is in a fault state, a management system should not receive further alarms, alerts, or scheduled performance data from that component.

Note Prime Optical forwards northbound information and integrates with other third-party management systems to give options that are not directly available in Prime Optical.

9.1.2 Fault Notification and Maintenance

Fault notification and maintenance can be proactive or reactive:

- Proactive notification—Where *X* contacts *Y* to query *Y* on potential problems in *Y*'s domain.
- Reactive maintenance—Where *Y* notifies *X* of a problem regarding a service delivered from *Y* to *X*.

9.1.2.1 Proactive Maintenance

Automated detection tests and surveillance software enable rapid initiation of the repair process, sometimes even before customers have noticed a problem. This is called proactive maintenance and promotes customer satisfaction.

Proactive maintenance consists of functions and processes associated with the detection, analysis, isolation, and resolution of problems by means that are independent of customer trouble reports. The problems might be faults or degradations in equipment or transmission media.

The goals of proactive maintenance are to:

- Detect and fix service quality problems before the customer calls to establish a trouble report, or at least to start the repair process before the customer calls, thereby minimizing the time, as perceived by the customer, before service is restored.
- Maintain the transport network at a high level of quality by identifying the facilities that perform relatively poorly and rehabilitating them.

9.1.2.2 Reactive Maintenance

Reactive maintenance is required when a failure occurs. This type of problem can be time-consuming and costly. It requires accurate administration of trouble reports, rapid analysis and repair of service-affecting faults, and notifications to the customer of restoration of service, all of which also promote customer satisfaction.

9.1.3 Root Cause Analysis

The *root cause* is the most basic reason for an undesirable condition or problem that, if eliminated or corrected, would have prevented the problem from occurring. The outcome of the root cause analysis is not a restatement of the most obvious symptom, but is the result of a methodical analysis of the problem situation, leading to the most basic cause.

Root cause analysis captures additional information about defects for the purpose of identifying preventive actions. Prime Optical includes advanced debugging features that capture additional information about defects.

9.2 Where Can I Get Information on Affected Services and Customers?

The first thing to do in fault management is to identify what services and which customers are affected by the fault. Prime Optical provides a number of options for viewing this information. The following table describes where to obtain information on affected services and customers.

Table 9-1 Obtaining Information on Affected Services and Customers

Where	Description	For More Information, See
Dashboard	Shows useful alarm and NE information in one easily accessible location.	1.5.1 Dashboard, page 1-9
Tooltips	Visible when you position the cursor over a managed object (domain, group, subnetwork, NE, board, link, and so on). The tooltip displays additional information about the selected object.	—
Domain Explorer	Home window; provides a logical view of the network plus alarm, connectivity, and operational status.	1.5.2 Domain Explorer, page 1-11
Subnetwork Explorer	Similar in appearance and function to the Domain Explorer. A key difference is that the Subnetwork Explorer provides a single-level grouping of NEs based on network partitions and subnetworks.	1.5.3 Subnetwork Explorer, page 1-24
Network Map	Displays a geographical layout of the network.	1.5.6 Network Map, page 1-28
Alarm Browser	Displays standing alarms and conditions in the managed domain that are assigned a severity level of critical, major, minor, or warning. It also shows cleared alarms that are not acknowledged.	9.2.1 Viewing the Alarm Browser, page 9-4
Alarm Log	Contains alarms that have transitioned from the Alarm Browser.	9.2.4 Viewing the Alarm Log, page 9-8

9.2.1 Viewing the Alarm Browser

The Alarm Browser displays standing alarms and conditions in the managed domain that are assigned a severity level of critical, major, minor, or warning. It also shows cleared alarms that are not acknowledged. The Alarm Browser and Alarm Log views provide a robust listing of all current and historical alarms and events. See 9.2.4 Viewing the Alarm Log, page 9-8 for information about the Alarm Log.

To display the Alarm Browser, select an NE, group, subnetwork, or domain node from the Domain Explorer, Subnetwork Explorer, Network Map, or NE Explorer; then, choose **Fault > Alarm Browser** (or click the **Open Alarm Browser** tool from the Dashboard).

CRS alarms for DWDM cards are managed by the Alarm Browser.

Note

- No alarms or events are generated in the Alarm Browser if Oracle shuts down.
- Refer to the appropriate NE documentation for a list of alarms supported on each NE. See 1.7.2 Related Cisco NE Documentation, page 1-50.
- Use the toolbar icons to manage the alarm display. See Appendix A, "Icons and Menus Displayed in Prime Optical" for an explanation of each toolbar icon.

The following table describes the fields in the Alarm Browser.

Table 9-2 Field Descriptions for the Alarm Browser Window

Field	Description
Alarm ID	Unique number that the system uses to identify a particular alarm.
Perceived Severity	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Acknowledged	Whether the selected alarm has been acknowledged by the user. Values are Yes and No.
Note	Any notes that were entered for the selected alarm. If you choose Fault > Show Alarm Note (or click the Show Alarm Note tool), you can see the login name of the user who entered the note and the time when the note was entered.
Alias ID	Alias name of the NE.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
Alarm Time Stamp	Date and time when the alarm occurred on the server.
NE Alarm Time Stamp	Date and time when the alarm occurred on the NE.
Service Affecting	Whether the alarm or event is service affecting (SA). Values are: • Yes—The alarm is service affecting • No—The alarm is not service affecting • N/A—No information is provided by the NE
Clear Time Stamp	Date and time when the alarm was cleared on the server.

Table 9-2 Field Descriptions for the Alarm Browser Window (continued)

Field	Description
EMS Clear Alarm Time stamp	Date and time when the alarm was cleared.
NE Clear Time Stamp	Date and time when the alarm was cleared on the NE.
Acknowledged Time Stamp	Date and time when the user acknowledged the selected alarm.
Acknowledged Username	Login name of the user who acknowledged the selected alarm.
Alarm Status	Status of the selected alarm (active or cleared).
Description	Additional information about the selected alarm. If there is no additional information, this field is blank.
Source ID	Name of the NE where the selected alarm occurred.
TL1 Direction	TL1 direction for RTRV-ALM-ALL and RTRV-COND-ALL TL1 commands and REPT^ALM/COND autonomous messages. Values are Receive or Transmit. This field is blank for non-TL1 alarms.
TL1 Location	TL1 location for RTRV-ALM-ALL and RTRV-COND-ALL TL1 commands and REPT^ALM/COND autonomous messages. Values are Near End or Far End. This field is blank for non-TL1 alarms.

9.2.2 Filtering Data in the Alarm Browser

Step 1 In the Alarm Browser window, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 2 Specify the filter parameters described in the following table.

Step 3 After making your selections, click **OK** to run the filter.

Table 9-3 Field Descriptions for the Alarm Browser Filter Dialog Box

Tab	Description
Alarm Time (*time zone*)	Allows you to filter alarm data for a specified time period, ranging from the past hour to the past 6 months. Additionally, you can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be Greenwich Mean Time (GMT), a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. If you want to filter alarms and the time period is not important, click **No Time Specified**. Click **From Now Onward** to set the filter time to start immediately and continue until you change filter parameters.
Source ID	Allows you to move NEs back and forth between the list of available source IDs and selected source IDs and then run the alarm filter. If you have the appropriate user permissions, you can filter Prime Optical EMS alarms by selecting Prime Optical and adding it to the Selected Source ID list. If more than 100 NEs are selected, the Source ID tab dims and all devices are included in the filter criteria you specify. **Note** Use the scroll bars at the bottom and right side of the lists to display all options in the lists.
Module Name	Allows you to specify which module types you want to include in the alarm filter. The modules displayed depend on the NE selection in the Domain Explorer tree when the Alarm Browser is opened. Use the Add and Remove buttons to filter the display to specific modules. The Alarm Browser displays alarms for modules listed under Selected Module Name. **Note** Use the scroll bars at the bottom and right side of the lists to display all options in the lists.
Affected Object	Allows you to specify which objects you want to include in the alarm filter. All objects are displayed regardless of the NE selected in the Domain Explorer tree when the Alarm Browser is opened. Use the Add and Remove buttons to filter the display to specific objects. The Alarm Browser displays alarms for objects listed under Selected Affected Object. To filter NE-specific EMS alarms, include Prime Optical in the Selected Affected Object list. Below the Available Affected Object list is a text field where you can enter characters to search quickly for available objects. The text field accepts an asterisk (*) as a wildcard character. Alarms that do not match the search criteria are not displayed. The text field below the Available Affected Object list allows you to select multiple objects and add them to the Selected Affected Object list. To do so, proceed as follows: 1. Filter the Available Affected Object list with a wildcard or a regular expression. 2. Choose **Ctrl** and select the required items from the Available Affected Object list. 3. Repeat steps 1 and 2, if required, to make additional selections. The selections you make are not visible; they are held in memory until you click the Add button. **Note** You must choose **Ctrl** before selecting objects from the Available Affected Object list. Objects selected are cleared from memory unless you press Ctrl before making your selection. 4. Click **Add**. The items you selected are now listed in the Selected Affected Object list. **Note** Use the scroll bars at the bottom and right side of the lists to display all options in the lists.

Table 9-3 Field Descriptions for the Alarm Browser Filter Dialog Box (continued)

Tab	Description
PS	Allows you to filter alarm data based on perceived severity (Critical, Major, Minor, and Warning) and alarm status (Active and Cleared). You can filter on acknowledged alarms, unacknowledged alarms, or both. You can also filter service-affecting alarms, nonservice-affecting alarms, and/or alarms where the service-affecting status is not known.
Physical Location	Allows you to filter alarm data based on the physical location of an NE or its components. To view the tab, an NE must be selected in the Domain Explorer tree. The filters that are available depend on the NE that is selected when the Alarm Browser is opened. For example, if you select a CTC-based NE, you can filter data by shelf, slot, and port.
ID	Allows you to filter alarm data based on a specific starting and ending alarm ID. Check the **Disregard All Other Filter Criteria** check box to base the filter on only the starting and ending alarm ID.
NE Alarm Time (*time zone*)	Allows you to filter alarm data for a specified time period, ranging from the past hour to the past 6 months. Additionally, you can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. If you want to filter alarms and the time period is not important, click **No Time Specified**. Click **From Now Onward** to set the filter time to start immediately and continue until you change filter parameters.

9.2.3 Adding Alarm Notes

Use the Alarm Note dialog box to read any comments that have been entered for the selected alarm and to enter additional comments. In the Alarm Browser window, select an alarm and choose **Fault > Show Alarm Note** (or click the **Show Alarm Note** tool). The following table provides descriptions.

Table 9-4 Field Descriptions for the Alarm Note Dialog Box

Field	Description
Note	Provides space to type comments about the selected alarm. You can enter up to 1,900 characters in the Note field. To add your comments to the previous comments, click the **Append** radio button. To overwrite the previous comments, click **Replace**. To delete the comments, click **Delete**. **Note** You can enable and disable the ability to overwrite or delete alarm notes in the **Control Panel > UI Properties** pane.
History	Comments that were entered by previous users. This field also shows the login name of the user who entered the note and the time when the note was entered.

9.2.4 Viewing the Alarm Log

The Alarm Log contains alarms that have transitioned from the Alarm Browser. Cleared alarms are transitioned when you acknowledge them or when automatic acknowledgment has been enabled (in the Control Panel > UI Properties pane). In addition, the Alarm Log shows a history of cleared and

acknowledged alarms and all transient conditions (also known as events or autonomous nonalarmed messages). Events are placed directly into the Alarm Log; they do not appear in the Alarm Browser. By default, the Alarm Log shows alarm and event information that occurred during the last 4 hours.

To save a filter, check the **Save Filter** check box, and click **OK** in the Filter dialog box. Upon selecting a saved filter, the Filter tool changes to red.

Note The Alarm Log supports only one saved filter per user.

To delete a filter, choose **File > Delete Saved Filter**. When you delete a saved filter, the Filter tool reverts to blue, indicating that the filter is not saved.

To view the Alarm Log, select a node in the Domain Explorer tree and choose **Fault > Alarm Log** (or click the **Open Alarm Log** tool). The following table provides descriptions.

Table 9-5 Field Descriptions for the Alarm Log Window

Field	Description
ID	Unique number that the system uses to identify a particular alarm or event.
Alias ID	Alias name of the NE.
Affected Object	Name of the object where the selected alarm or event occurred. For NE-specific alarms, the affected object field displays "CTM." For the non-NE specific alarms: • Maximum number of login attempts exceeded alarm—The affected object field displays the user ID associated with the alarm. • Prime Optical self-monitor alarm—The affected object field displays the threshold parameter associated with the alarm.
Module Name	Name of the module where the selected alarm or event occurred.
Physical Location	Physical location of the equipment where the selected alarm or event occurred, such as rack, subrack (shelf), slot, and port numbers.
Probable Cause	Probable cause of the selected alarm or event.
Condition	Error message or condition name that is associated with the alarm or event.
Perceived Severity	Severity of the alarm before it was cleared. Perceived Severity is listed as: • Critical (CR) • Major (MJ) • Minor (MN) • Warning (WR) • Indeterminate (IN) The background color of the column indicates the alarm status, where: • Green = Cleared alarms • Purple = Indeterminate events **Note** Indeterminate events are transient events that do not have a severity indicated by the source NE. Indeterminate events do not have a cleared condition.

Table 9-5 Field Descriptions for the Alarm Log Window (continued)

Field	Description
Service Affecting	Whether the alarm or event is service affecting. Values are: • Yes if the alarm is service affecting • No if the alarm is not service affecting • N/A if no information is provided by the NE
Time Stamp (*time zone*)	Date and time when the alarm or event occurred on the Prime Optical server.
Clear Time (*time zone*)	Date and time when the alarm was cleared on the Prime Optical server.
Duration	Amount of time required to clear an alarm (Prime Optical clear time – Prime Optical time) in *dddd:hh:mm:ss* format.
NE Time Stamp (*time zone*)	Date and time when the alarm or event occurred on the NE.
NE Clear Time (*time zone*)	Date and time when the alarm or event was cleared on the NE.
Description	Brief description of the selected alarm or event. If no description is entered, this field is blank.
Acknowledged Username	Login name of the user who acknowledged the alarm or event. **Note** If the alarm acknowledgement is set to Automatic and you can manually acknowledge an alarm, the Acknowledged Username is not overwritten when the alarm clears.
Acknowledged Time	Date and time when the alarm or event was acknowledged. **Note** If the alarm acknowledgement is set to Automatic and you can manually acknowledge an alarm, the Acknowledged Time is not overwritten when the alarm clears.
Note	Any notes that were entered for the selected alarm or event. This field also shows the login name of the user who entered the note and the time stamp when the note was entered.
Source ID	Name of the NE or EMS where the selected alarm or event occurred.
TL1 Direction	TL1 direction for RTRV-ALM-ALL and RTRV-COND-ALL TL1 commands and REPT^ALM/COND autonomous messages. Values are Receive or Transmit. This field is blank for non-TL1 alarms.
TL1 Location	TL1 location for RTRV-ALM-ALL and RTRV-COND-ALL TL1 commands and REPT^ALM/COND autonomous messages. Values are Near End or Far End. This field is blank for non-TL1 alarms.

9.2.5 Filtering Data in the Alarm Log

By default, the Alarm Log shows alarm and event information that occurred during the last 4 hours. Use the drop-down menu to the right of the time-based Filter Data tool to filter event data for various time periods.

Step 1 In the Alarm Log window, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 2 Specify the filter parameters described in the following table.

Step 3 After making your selections, click **OK** to run the filter.

Step 4 To save a filter:

a. Open the Alarm Log Filter dialog box.

b. Click the **PS** tab.

c. Check the **Save Filter** check box.

d. Click **OK**. In the Alarm Log window, the Filter tool changes to red, indicating that a saved filter is present.

Note The Alarm Log supports only one saved filter per user.

Step 5 To delete a saved filter, choose **File > Delete Saved Filter** in the Alarm Log window. At the following prompt, click **Yes**:

```
The saved filter will be deleted. The current filter will remain applied to the table. Are
you sure you want proceed?
```

When you delete a saved filter, the Filter tool reverts to blue in the Alarm Log window.

Table 9-6 Field Descriptions for the Alarm Log Filter Dialog Box

Tab	Description
Time Stamp (*time zone*)	Allows you to filter alarm and event data for a specified time period, ranging from the past hour to the past 6 months. Additionally, you can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. If you want to filter alarms and events and the time period is not important, click **No Time Specified**. Click **From Now Onward** to set the filter time to start immediately and continue until you change filter parameters.
Source ID	Allows you to move NEs back and forth between the list of available source IDs and selected source IDs and then run the filter. If you have the appropriate user permission, you can filter Prime Optical EMS alarms and events by selecting Prime Optical and adding it to the Selected Source ID list. If more than 100 NEs are selected, the Source ID tab dims and all devices are included in the filter criteria you specify. **Note** Use the scroll bars at the bottom and right side of the lists to display all options in the lists.
Module Name	Allows you to specify which modules you want to include in the filter. The modules displayed depend on the NE selection in the Domain Explorer tree when the Alarm Log is opened. Use the **Add** and **Remove** buttons to filter the display to specific modules. The Alarm Log displays events for modules listed under Selected Module Name. **Note** Use the scroll bars at the bottom and right side of the lists to display all options in the lists.

Table 9-6 Field Descriptions for the Alarm Log Filter Dialog Box (continued)

Tab	Description
Affected Object	Allows you to specify which objects you want to include in the filter. The objects displayed depend on the NE selection in the Domain Explorer tree when the Alarm Log is opened. Use the **Add** and **Remove** buttons to filter the display to specific objects. The Alarm Log displays events for entities listed under Selected Affected Object. To filter NE-specific EMS alarms, select Prime Optical and add it to the Selected Affected Object list. Below the Available Affected Object list is a text field where you can enter characters to search quickly for available objects. The text field accepts an asterisk (*) as a wildcard character. Alarms that do not match the search criteria are not displayed. **Note** Use the scroll bars at the bottom and right side of the lists to display all options in the lists.

PS	Allows you to filter data based on the perceived severity (PS) of the alarm or event. Additionally, you can filter service-affecting alarms and events, nonservice-affecting alarms and events, and/or alarms and events where the service-affecting status is not known.
	
	Follow these steps to save a filter:
	
	1. Check the **Save Filter** check box, and click **OK** in the Filter dialog box.
	2. The saved filter is added to the table.
	3. When you choose **File > Apply Saved Filter**, the table populates with the attributes saved for that filter.
	
	Note An "at" symbol (@) in the Filter indicates that you are viewing a saved filter.
	
	Follow these steps to delete a filter:
	
	1. Choose **File > Delete Saved Filter** (or click the **Delete Saved Filter** tool).
	
	The following message appears in the Delete Filter dialog box:
	
	`The saved filter will be deleted. The current filter will remain applied to the table. Are you sure you want proceed?`
	
	2. Click **Yes**.
	3. When you run two parallel Prime Optical client sessions, deleting a saved filter from one session does not reflect any changes on the other. The Apply and Delete buttons remain enabled in the second session.
	
	The following message appears when you click either of the buttons in the Filter dialog box of the second session:
	
	`The saved filter no longer exists in the system. The current user might have deleted it in a different Prime Optical client session.`
	
	4. Click **OK**.
	
	The Apply and Delete buttons are disabled. The Filter tool reverts to blue, indicating that the filter is not saved.
	
	Note The menu items **Apply Saved Filter** and **Delete Saved Filter** and the **Delete Saved Filter** tool are enabled only if there is a saved filter for that table.

Physical Location	Allows you to filter data based on the physical location of an NE or its components. To view the tab, an NE must be selected in the Domain Explorer tree. The filters that are available depend on the NE selected. For example, if you select a CTC-based NE, you can filter data by shelf, slot, and port.

Table 9-6 Field Descriptions for the Alarm Log Filter Dialog Box (continued)

Tab	Description
ID	Allows you to filter data based on alarm or event ID. Enter a starting ID and an ending ID; then, run the filter to see only the alarms or events that occurred within the specified range of IDs. Check the **Disregard All The Other Filter Criteria** check box to ignore all other filter specifications. In addition, you can filter the view to only alarms, only events, or both alarms and events.
NE Alarm Time (*time zone*)	Allows you to filter alarm data for a specified time period, ranging from the past hour to the past 6 months. Additionally, you can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. If you want to filter alarms and the time period is not important, click **No Time Specified**. Click **From Now Onward** to set the filter time to start immediately and continue until you change filter parameters.

9.2.6 Exporting All Data in the Alarm Log or Alarm Browser

You can export the entire contents of the Alarm Browser or Alarm Log to a text file. You can export all of the data in the Alarm Browser or Alarm Log, as long as the window is not in automatic refresh mode. It might take longer to open the Alarm Browser or Alarm Log with the export entire table feature enabled.

The entire-table export writes the data to a user-specified text file and retains the user-selected table customizations. For example, if you customized the table to make a column invisible, that column does not appear in the exported file.

Step 1 Complete the following substeps to enable the export entire table feature:

a. In the Domain Explorer window, choose **Edit > User Preferences**.

b. In the User Preferences dialog box, click the **FM Preferences** tab.

c. Check the **Enable Export of the Entire Table** check box.

d. Check the **Save current settings** check box.

e. Click **OK**.

Step 2 In the Domain Explorer window, choose **Fault > Alarm Browser** or **Alarm Log**.

Step 3 In the Alarm Browser or Alarm Log window, choose **File > Export**.

Step 4 In the Export dialog box, click the **Entire table (only if Auto Refresh is disabled)** radio button.

Note This option is disabled if the window is in Auto Refresh mode.

Step 5 In the Export Data to File field, specify a location for the exported file. Click **Browse** to change the file location.

Step 6 Click **OK**. A progress bar tracks the export progress.

9.3 What Fault Information Can I See?

An alarm is represented by a notification from a managed NE that a certain condition has just occurred. These alarms usually represent error conditions on NEs. Each alarm is associated with the NE for which it provides notification, and an NE can have a number of alarms related to itself at any time.

Each NE shown in the Domain Explorer tree has a corresponding alarm icon that indicates the highest severity alarm that affects the NE. Management domain nodes and group nodes have alarm icons that reflect the highest alarm condition of the NEs contained in the domain or group.

The user-defined Domain Explorer views have “bubble-up” alarm severity propagation and drill-down capabilities to isolate fault conditions and identify service-delivery impact.

9.3.1 How Are Alarms Displayed?

You can set the Alarm Browser or Alarm Log to display full background color for the entire selected row. The color corresponds to the alarm status and severity. In the Domain Explorer window, choose **Edit > User Preferences**. The User Preferences dialog box opens. On the FM Preferences tab, check the **Color Entire Row in Table View** check box.

In the Dashboard, Map Viewer, Alarm Browser, and Domain Explorer, the color of the border surrounding a component, or the background color, indicates the operational status of the component. When status changes, the border or the background color changes as indicated in the following table.

Table 9-7 Alarm Severity Colors for the Dashboard, Map Viewer, Alarm Browser, and Domain Explorer

Color	Severity	Meaning	Description
Green	Cleared	Component is active.	The component is operating normally.
Yellow	Minor	Minor failure.	The component is down; both administrative and operational values are down. This does not necessarily indicate a fault condition; the component might be disabled.
Orange	Major	Component is down.	Administrative status is up and operational value is down.
Red	Critical	Component failed.	Physical hardware failure.
Cyan (blue-green)	Warning	Interface is dormant.	The interface cannot pass packets, but is in a pending state waiting for some external event to place it in the up state. The interface might have packets to transmit before establishing a connection to a remote system, or a remote system might be establishing a connection to the interface. When the pending event occurs, the interface changes to the up state.

9.3.1.1 Understanding How Prime Optical Displays the Affected Object Field

Prime Optical displays the Affected Object field in the Alarm Browser and Alarm Log windows in the same way as for the Interface field in PM tables. See 10.4.7 Understanding How Prime Optical Displays the Interface Field, page 10-31.

For the ONS 155xx, the Affected Object field can be:

- wavepatch—The alarm is related to the optical client side of the card.
- wave—The alarm is related to the optical connection with the OADM (filter) card.

- The actual interface object, which changes depending on the card. For example, WaveEthernetPhy for a 10 Gb card, EsconPhy for an ESCON card, and so on.

9.3.2 Suppressing Alarms

Alarm suppression is useful when the NE is under maintenance. You can also suppress alarms for a single shelf in an ONS 15454 multishelf NE.

Caution If multiple CTC or TL1 sessions are open, alarms in all other open sessions are also suppressed.

9.3.2.1 Suppressing Alarms at the Card Level—CTC-Based NEs

Step 1 In the Domain Explorer window, select a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the NE Explorer tree, click the specific card.

Step 3 In the card slot property sheet of the NE Explorer window, click the **Identification** tab.

Step 4 Check the **Suppress Alarms** check box.

Step 5 Click **Apply**.

9.3.2.2 Suppressing Alarms at the Node Level—CTC-Based NEs

Step 1 In the Domain Explorer window, select a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the node property sheet of the NE Explorer window, click the **Alarm** tab.

Step 3 Click the **Alarm Behavior** subtab.

Step 4 Check the **Suppress Alarms** check box.

Step 5 Click **Apply**.

9.4 Is the Service Working?

Network devices report symptoms of problems by generating events. An event in this context is a message indicating that a device or application in your network has discovered something of note. The network devices generate many types of events automatically. In addition, you can use thresholds to define or modify the conditions under which events are generated. A *threshold* is a trigger, set up on a continuous data stream, that is a point of interest that generates events when that point is satisfied.

The events generated need to be analyzed to determine whether they represent a fault condition or a problem in your network.

It is important to generate events when there is a problem. It is also important to limit the number of events generated to prevent an excessive load on the network. Prime Optical performs a number of self-monitoring tasks where threshold limits can be set. The threshold limits are set in the Self Monitor table. (See 10.3.12 Using the Self Monitor Table, page 10-15.) If a threshold is crossed, an EMS alarm is generated.

You can obtain information regarding how the system is performing and how long certain tasks are taking to complete by selecting **Administration > Control Panel**, then **Alarm Configuration > Threshold EMS Alarms** or **Alarm Configuration > Nonthreshold EMS Alarms**. (See 9.4.4 Setting Up and Viewing Alarm Configuration Parameters, page 9-18.) By monitoring this data, you can identify potential system problems before they become critical in the operation of the EMS. Associated with each parameter that is monitored are three alarm thresholds. The administrator can set a minor, major, and critical threshold value for each parameter. If any of these thresholds are crossed, then an alarm will be raised to provide notification of the situation.

Threshold alarms are raised when their limit exceeds the value set for critical, major, minor, or warning thresholds. For example, you can set threshold alarms for disk usage for 90%, 80%, 70%, and 60%, meaning a warning alarm is raised when the disk becomes 61% full and a critical alarm is raised when the disk becomes 91% full. The server checks these parameters at every polling interval that is set in the Poll Frequency field.

Nonthreshold alarms do not have an alarm threshold. Instead, nonthreshold alarms occur when a condition occurs, such as loss of connectivity to an NE. Use the Nonthreshold EMS Alarms tab to set the severity level (critical, major, minor, or warning) for which a nonthreshold alarm should be raised when that condition occurs.

Caution Changing the EMS alarm severities can affect the alarm status seen by listeners on the EMS's OSS interfaces.

The following sections provide information on NEs:

- 9.4.1 Locating Alarms, page 9-16
- 9.4.4 Setting Up and Viewing Alarm Configuration Parameters, page 9-18

These tasks allow you to manage the alarm profiles features:

- 9.4.5 Creating Alarm Profiles—CTC-Based NEs, page 9-22
- 9.4.6 Applying Alarm Profiles—CTC-Based NEs, page 9-23
- 9.4.7 Managing Alarm Profiles—CTC-Based NEs, page 9-24

This task allows you to mark a service as critical for process monitoring purposes:

- 9.4.9 Using the Recovery Properties Pane, page 9-27

9.4.1 Locating Alarms

The Alarm Browser has a specific selection context, which means that it displays alarm information that corresponds to the view where it was launched. If you launch the Alarm Browser from the management domain node, the browser shows all NE alarms and all EMS alarms (if you have permission to see EMS alarms). If you launch the Alarm Browser from a group or NE node, the browser shows only NE alarms for that group or NE node. If you launch the Alarm Browser from the Dashboard, the browser shows all NE alarms for the domain.

You can locate the equipment for an existing alarm from the Alarm Browser.

Step 1 In the Domain Explorer, choose **Fault > Alarm Browser** (or click the **Open Alarm Browser** tool).

Step 2 In the Alarm Browser, click an alarm condition and choose **Fault > Locate Alarm/Event** (or click the **Locate Alarm/Event Through NE Explorer** tool). The NE Explorer opens and displays the property sheet of the alarmed equipment.

Note Refer to the appropriate NE documentation for a list of alarms supported on each NE. See 1.7.2 Related Cisco NE Documentation, page 1-50.

9.4.2 Locating Affected Layer 2 Services

You can locate which Layer 2 services are affected by an existing Layer 2 service alarm.

Step 1 In the Domain Explorer, choose **Fault > Alarm Browser** (or click the **Open Alarm Browser** tool).

Step 2 In the Alarm Browser, click a Layer 2 service alarm and choose **Fault > Affected L2 Services**. The Affected L2 Services dialog box opens, listing the Layer 2 services that are affected by the selected alarm.

- To retrieve the affected Layer 2 services on the PT System, go to Step 3.
- To retrieve the affected Layer 2 services on a specific port, go to Step 4.
- To retrieve the affected Layer 2 services on a channel group, go to Step 5.

Step 3 To retrieve the affected Layer 2 services on the PT System:

a. Click the **Packet Transport System** radio button.

b. Select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel) from the Service Type drop-down list.

c. Select the alarm type from the Alarm Type drop-down list. See Table 13-28 on page 13-91 for the list of alarm types.

d. Click **Show**. The affected Layer 2 services on the PT System are displayed in the table.

e. (Optional) Click **Reset** to reset the Service Type and Alarm Type drop-down lists.

Step 4 To retrieve the affected Layer 2 services on a specific port:

a. Click the **Port** radio button.

b. Select the slot from the Slot drop-down list.

c. Select the port from the Port drop-down list.

d. Select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel) from the Service Type drop-down list.

e. Select the alarm type from the Alarm Type drop-down list. See Table 13-28 on page 13-91 for the list of alarm types.

f. Click **Show**. The affected Layer 2 services on the port you selected are displayed in the table.

g. (Optional) Click **Reset** to reset the Service Type and Alarm Type drop-down lists.

Step 5 To retrieve the affected Layer 2 services on a channel group:

a. Click the **Channel Group** radio button.

b. Select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel) from the Service Type drop-down list.

c. Select the alarm type from the Alarm Type drop-down list. See Table 13-28 on page 13-91 for the list of alarm types.

d. Click **Show**. The affected Layer 2 services on the channel group you selected are displayed in the table.

e. (Optional) Click **Reset** to reset the Service Type and Alarm Type drop-down lists.

Step 6 (Optional) To cross-launch the service table from the Affected L2 Services dialog box, click **Service Table** to launch the corresponding service table. For example, if you selected Pseudowire as the service type, the Pseudowire Service table opens.

Step 7 (Optional) To filter the affected Layer 2 services displayed in the table, click the **Filter** button. You can filter by:

- Service ID
- Name
- Description

Step 8 (Optional) To clear the results and run a new query, click **Clear Table**.

9.4.3 Viewing Affected Circuits

You can view the circuits affected by a given alarm.

Step 1 In the Domain Explorer, choose **Fault > Alarm Browser** (or click the **Open Alarm Browser** tool).

Step 2 Select the alarm for which to view affected circuits, and choose **Fault > Affected Circuits**.

The Circuit Table appears, displaying all the circuits affected by the selected alarm.

9.4.4 Setting Up and Viewing Alarm Configuration Parameters

Use the Alarm Configuration pane to configure and view alarm severities for system parameters.

Caution Changing the EMS alarm severities can affect the alarm status seen by users on the EMS's OSS interfaces.

Complete the following steps to set up and view alarm configuration parameters:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Alarm Configuration** to open the Alarm Configuration pane. Table 9-8 provides descriptions.

Step 3 In the Nonthreshold EMS Alarms tab, you can select the severity level that will be assigned to the nonthreshold alarm parameter.

Note Nonthreshold alarms do not have an alarm threshold. These types of alarms occur when an error condition occurs, such as loss of connectivity to an NE. Use the Nonthreshold EMS Alarms tab to set the severity level for which a nonthreshold alarm should be raised when that condition occurs.

Step 4 After making your selections, click **Save**.

Note

- If an alarm is outstanding when you disable it, the system clears the alarm.
- If an alarm has been manually cleared in the Alarm Browser and a clear alarm is sent, the request will still be processed but it will not have any impact on the alarm.
- To recover from an alarm condition, see Appendix G, "Troubleshooting" for information.
- All alarms on an NE are cleared when the NE is marked as Out of Service.

Table 9-8 Field Descriptions for the Alarm Configuration Pane

Field	Description
Threshold EMS Alarms Tab	
Poll Frequency	Threshold alarms are raised when their limit exceeds the value set for critical, major, minor, or warning thresholds. For example, you can set threshold alarms for disk usage for 90%, 80%, 70%, and 60%, meaning a warning alarm is raised when the disk becomes 61% full and a critical alarm is raised when the disk becomes 91% full. The server checks these parameters at every polling interval that is set in the Poll Frequency field. The Poll Frequency value affects only the following parameters: • CPU Usage • Memory Usage RAM • Memory Usage SWAP • Disk Usage

Table 9-8 Field Descriptions for the Alarm Configuration Pane (continued)

Field	Description
Parameter Name	• Base Circuit Creation Time (seconds)—Time it takes to create a base circuit. • CPU Usage (%)—Percentage of CPU time used for executing user, system, and I/O tasks. • Circuit Creation Time Per Hop (seconds)—Time it takes for Prime Optical to create an end-to-end circuit. • Config Resynch Time (seconds)—Time it takes for Prime Optical to collect alarm and inventory information from the NE. • Disk Usage (%)—Percentage of disk space used in a particular partition. Prime Optical database and partitions are monitored separately. • Memory Usage RAM (%)—Percentage of RAM memory used for all system processes. • Memory Usage SWAP (%)—Percentage of SWAP memory used for all system processes. • NE Synch Time (seconds)—Time it takes to synchronize the Prime Optical server with the NEs. • Prune Time 15 min PM (seconds)—Time it takes to prune 15-minute PM data. • Prune Time 1 day PM (seconds)—Time it takes to prune 1-day PM data. • Prune Time Audit Log (seconds)—Time it takes to prune Audit Log data. • Prune Time Audit Trail Log (seconds)—Time it takes to prune Audit Trail Log data. • Prune Time Error Log (seconds)—Time it takes to prune Error Log data. • Prune Time FM (seconds)—Time it takes to prune FM data. • Prune Time Job Monitor (seconds)—Time it takes to prune job monitor data. • Prune Time Purge NE (seconds)—Time it takes to prune NE purge data. • Prune Time Server Monitor (seconds)—Time it takes to prune server monitor data.
Enable	Whether or not the corresponding parameter in the Parameter Name column is enabled (checked) or disabled (unchecked). When checked, it enables monitoring for the selected parameter. If an EMS threshold alarm is outstanding when you disable monitoring, Prime Optical clears the alarm.
Critical	Amount of time, in minutes, that must elapse before triggering a critical alarm.
Major	Amount of time, in minutes, that must elapse before triggering a major alarm.
Minor	Amount of time, in minutes, that must elapse before triggering a minor alarm.

Table 9-8 Field Descriptions for the Alarm Configuration Pane (continued)

Field	Description
Nonthreshold EMS Alarms Tab	
Parameter Name	• A critical process is hanging; server will be shut down in 5 minutes. • A process is hanging or terminated. • Alarm resync unsuccessful—The alarm resynchronization could not be completed on the node. • Communication through secondary IP address. • Config resync unsuccessful—Prime Optical could not synchronize with the node. • Failed authentication by NE—This is a major alarm. An incorrect username or password was provided for login. This alarm applies to CTC-based NEs and is cleared when you provide the correct username or password and mark the NE as Out of Service, then as In Service. • Loss of communication—This is a critical alarm. Prime Optical cannot communicate with the node, possibly because the node was disconnected from the network. This alarm applies to all NEs and is cleared when Prime Optical regains connectivity to the NE. • Maximum login attempts exceeded—Prime Optical raises this alarm when you try to connect to the Prime Optical server several times with the wrong username and password. • Memory auto or manual backup failure—This is a minor alarm. Memory backup on the node failed. This alarm applies to CTC-based NEs and is cleared when a subsequent memory backup succeeds. • NE out of Sync—Prime Optical raises this EMS alarm when the health poll of an NE fails because the server is no longer registered on the node to receive event notifications. This alarm is cleared once the initial poll is executed successfully. • PM fail EMS alarm—This is a warning alarm. Prime Optical cannot retrieve performance statistics from the node even though robust PM data collection is enabled and the node has PM buckets that were not retrieved. This alarm applies to CTC-based NEs and is cleared when a subsequent PM collection cycle succeeds. If PM collection is unsuccessful after subsequent retries, the FAIL alarm is cleared and the PM lost EMS alarm is generated. • PM lost EMS alarm—This is a major alarm. Prime Optical cannot retrieve performance statistics from the node when robust PM data collection is not enabled or when robust PM data collection is enabled but the node has overwritten the PM buckets that were not retrieved. This alarm applies to CTC-based NEs and is cleared when the user clears it manually from the Alarm Browser. • PoS port shut down; L2 topology in wrapped state—This alarm is generated when one or more PoS ports related to an L2 topology are shut down. This alarm is cleared when all the PoS ports related to the topology are enabled. • Template manager event. • Unable to change database password—This alarm is generated after a failed attempt to change the database password in the Control Panel > Database Properties pane.
Enable	Whether or not the corresponding parameter in the Parameter Name column is enabled (checked) or disabled (unchecked). When checked, it enables monitoring for the selected parameter. If an EMS nonthreshold alarm is outstanding when you disable monitoring, Prime Optical clears the alarm.
Severity	Click the appropriate cell and select the alarm severity level from the available options (Critical, Major, Minor, or Warning) for each of the parameters listed in the Parameter Name column. **Note** If an EMS alarm is outstanding when you change its severity level, the outstanding alarm's severity level remains the same and the new severity level takes effect the next time the alarm is raised.

9.4.5 Creating Alarm Profiles—CTC-Based NEs

Use the Create Alarm Profile dialog box to create new alarm profiles for CTC-based NEs.

Step 1 In the Domain Explorer tree, select a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the node properties sheet, click the **Alarm** tab.

Step 3 In the Profile subtab, click the **Create** button. The Create Alarm Profile dialog box opens. The following table provides descriptions.

Step 4 After making your selections, click **OK**.

Table 9-9 Field Descriptions for the Create Alarm Profile Dialog Box

Field	Description
Enter the Profile Name	Enter the name of the new alarm profile.
Condition	Condition of the alarm.
Severity	Select a severity for the new alarm from the list. Alarm severities include: • Not Reported (NR)—A raise or clear of the condition is not sent to clients, but is tracked on the NE. You can retrieve a complete list of all raised conditions, including Not Reported as well as Not Alarmed, Critical, Major, and Minor, by using the RTRV COND TL1 command, or its equivalent. • Not Alarmed (NA)—A raise or clear of the condition is sent to clients as a nonalarmed TL1 message (REPT EVT). The message has no severity and no service affecting flag. • Minor (MN)—The alarm is a minor alarm. • Major (MJ)—The alarm is a major alarm. • Critical (CR)—The alarm is a critical, traffic-affecting alarm. **Note** For critical, major, and minor alarms, a raise or clear of the condition is sent to clients as an alarmed message (REPT ALM). This message includes a service affecting flag, which is On or Off. If a normally service affecting condition is raised in a nonservice affecting situation (for example, the nontraffic-bearing side of a protect pair), the condition is sent as minor even if the profile says major or critical. • UNSET—The value of this alarm corresponds to the value of the default alarm profile on the node. UNSET is useful when transferring alarm profiles between different versions of software. • Inherited—The alarm behaves according to its parent object: – If you set an alarm as Inherited on a port, it uses the card profile. – If you set an alarm as Inherited on a card, it uses the node profile. – If you sent an alarm as Inherited on a node, it uses the default profile.

9.4.6 Applying Alarm Profiles—CTC-Based NEs

The alarm profiles feature allows you to change default alarm severities by creating unique alarm profiles for individual CTC-based NEs. A profile can be applied to any node on the network. Alarm profiles must be stored on a node before they can be applied to a node, card, or port.

The two reserved profiles include the Default profile, which sets severities to standard Telcordia GR-253 settings, and the Inherited profile, which sets all alarm severities to inherited. If an alarm has an Inherited profile, it inherits (copies) its severity from the same alarm at the next level. For example, a card with an Inherited alarm profile copies the severities used by the node that contains the card. The Inherited profile is not available at the node level.

In the card view, the Alarm Behavior subtab displays the alarm profiles of the selected card. In the node view, the Alarm Behavior subtab displays the alarm profiles for the node. Alarms form a hierarchy. A node-level alarm profile applies to all cards in the node, except those that have their own profiles. A card-level alarm profile applies to all ports on the card, except those that have their own profiles.

At the node level, apply profile changes on a card-by-card basis or set a profile for the entire node. At the card level, apply profile changes on a port-by-port basis or set the profiles for all ports on that card simultaneously.

Step 1 In the Domain Explorer window, click a CTC-based NE and choose **Configuration > NE Explorer**.

Step 2 In the node properties sheet, click the **Alarm** tab > **Alarm Behavior** subtab. In the card properties sheet, click the **Alarm Behavior** tab.

Step 3 Click **Update** to view the latest Alarm Profile list.

Step 4 To apply an alarm profile at the card view, click the appropriate row in the Alarm Profile column for the port desired. To apply an alarm at the node view, click the appropriate row in the Profile column for the card desired.

Step 5 Choose the appropriate alarm profile from the drop-down list.

Step 6 Repeat these steps for each port that is being assigned a profile.

Step 7 Click **Apply**.

Note

- In the Alarm Behavior tab > Alarm Profile drop-down list, you can select any profile and click **Force to all ports** to apply this profile to all ports. But when the profile is saved, the Alarm Profile value returns to Inherited. This is expected behavior, because the drop-down list does not represent a value on the NE. After setting the alarm profile value on the ports, the Alarm Profile field returns to the first selectable value in the drop-down list.
- The alarm profile is not applied for ONS 15600 SONET or ONS 15600 SDH NEs if the profile was edited outside of the Alarm Profiles Management wizard.

9.4.7 Managing Alarm Profiles—CTC-Based NEs

Use the Alarm Profiles Management wizard to download an alarm profile from either an NE or from a local file.

Note This feature is available for CTC-based NEs with software release 3.4 or later.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs** or **CTC-Based SDH NEs > Alarm Profiles Management**. The Alarm Profiles Management wizard opens. The following table provides descriptions.

Step 2 Select an available profile from the NE by clicking the **From NE** radio button or from a file by clicking the **From File** radio button.

Step 3 Complete one of the following options:

- If you clicked the **From NE** radio button, select the NE and alarm profile from the lists.
- If you clicked the **From File** radio button, specify the file from a local drive by clicking the **Local** radio button, or from a server by clicking the **Server** radio button.

Step 4 Click **Next**.

Step 5 Edit the alarm severity for each alarm condition by clicking a row in the Alarm Severity column.

Step 6 Click **Next**.

Step 7 Enter the profile name and save the new alarm profile to the NE by clicking the **Save to NE(s)** radio button, or to a file by clicking the **Save to File** radio button.

Step 8 Complete one of the following options:

- If you clicked Save to NE(s), select the NE(s) on which to apply the new alarm profile. Check the **Apply to Selected NE(s)** check box if you want to set the alarm profile as the current profile.

  Note If you clicked the **From File** radio button in Step 2, the Available NE(s) list includes all the NEs that Prime Optical currently manages.

- If you clicked Save to File, you can either save the file locally by clicking the **Local** radio button and specifying the directory path, or save it to a server by clicking the **Server** radio button and specifying the server name.

Step 9 Click **Finish**.

Prime Optical schedules a job for this action. The alarm profile is downloaded to each selected NE and set, if so selected. This is tracked as a separate task in the Job Monitor table.

Table 9-10 Field Descriptions for the Alarm Profiles Management Wizard

Field	Description
Select a Profile	
From NE	Choose **From NE** if the alarm profile is on an NE. If you select From NE, the From File options are not accessible.

Table 9-10 Field Descriptions for the Alarm Profiles Management Wizard (continued)

Field	Description
Select NE	Select the NE where the alarm profile exists.
Select Profile	Select an alarm profile from the list.
From File	Choose **From File** if the alarm profile file is on your PC or a server. If you select From File, the From NE options are not accessible.
Local	Choose **Local** if the alarm profile file is on your PC. Enter the path for the file, or click **Browse** to search for it.
Server	Choose **Server** if the alarm profile file is located on a server. Use the drop-down list to select a server.
Edit the Profile	
Alarm Condition	List of alarm conditions for the selected alarm profile.
Alarm Severity	Click the field to select a new alarm severity for the alarm condition. Severities are: • Not Reported (NR)—A raise or clear of the condition is not sent to clients, but is tracked on the NE. You can retrieve a complete list of all raised conditions, including Not Reported as well as Not Alarmed, Critical, Major, and Minor, by using the RTRV COND TL1 command, or its equivalent. • Not Alarmed (NA)—A raise or clear of the condition is sent to clients as a nonalarmed TL1 message (REPT EVT). The message has no severity and no service affecting flag. • Minor (MN)—The alarm is a minor alarm. • Major (MJ)—The alarm is a major alarm. • Critical (CR)—The alarm is a critical, traffic-affecting alarm. **Note** For critical, major, and minor alarms, a raise or clear of the condition is sent to clients as an alarmed message (REPT ALM). This message includes a service affecting flag, which is On or Off. If a normally service affecting condition is raised in a nonservice affecting situation (for example, the nontraffic-bearing side of a protect pair), the condition is sent as minor even if the profile says major or critical. • Unset—The value of this alarm corresponds to the value of the default alarm profile on the node. Unset is useful when transferring alarm profiles between different versions of software. • Inherited—The alarm behaves according to its parent object: – If you set an alarm as Inherited on a port, it uses the card profile. – If you set an alarm as Inherited on a card, it uses the node profile. – If you sent an alarm as Inherited on a node, it uses the default profile.
Save the Profile	
Profile Name	Name of the selected alarm profile.
Save to NE(s)	To save the alarm profile to one or more NEs, choose **Save to NE(s)**. If you choose Save to NE(s), the Save to File options are not accessible.
Available NE(s)	Select one or more NEs in the Available NE(s) list and click **Add** to move them to the Selected NE(s) list. The contents of the Available NE(s) list depends on the following conditions: • If you selected a profile from a file, the Available NE(s) list includes all the NEs that Prime Optical currently manages.
Selected NE(s)	Select one or more NEs in the Selected NE(s) list and click **Remove** to move them to the Available NE(s) list.

Table 9-10 Field Descriptions for the Alarm Profiles Management Wizard (continued)

Field	Description
Apply to Selected NE(s)	When checked, applies the alarm profile as the node-level alarm profile.
Overwrite the Profile	If a profile of the same name already exists, check this check box to overwrite the profile with the new profile.
Save to File	To save the defaults to a file on your PC or a server, choose **Save to File**. If you choose Save to File, the Save to NE(s) options are not accessible.
Local	Choose **Local** to save the file on your PC. Enter the path for the file, or click **Browse** to search for it.
Server	Choose **Server** to save the file on a server. Enter a server path in the field.

9.4.8 Managing Custom Alarm Types—CTC-Based NEs

You can add up to 50 custom environmental alarms on the following nodes and cards:

- AIC and AIC-I cards on ONS 15454 SONET and ONS 15454 SDH NEs
- CTX-CL600 cards on ONS 15310 CL NEs
- ONS 15600 SONET NEs
- ONS 15600 SDH NEs
- ONS 15310 MA SONET NEs
- ONS 15310 MA SDH NEs
- CRS-1/3 NEs

Custom environmental alarms are reported in the Condition column in the Alarm Log and Alarm Browser windows.

Step 1 In the Domain Explorer window, click one of the CTC-based NEs in the preceding list and choose **Configuration > NE Explorer**.

Step 2 Do one of the following:

- In the node properties sheet, click the **Alarm Extenders** tab > **User-Defined Alarms** subtab.
- In the AIC, AIC-I, or CTX-CL600 card properties sheet, click the **Alarm Extenders** tab > **User-Defined Alarms** subtab.

Step 3 In the Alarm Types area, click **Add**. The Add Alarm Type dialog box opens.

Step 4 In the New Alarm Type field, enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).

Step 5 Click **OK**. The new custom alarm appears in the Alarm Types area.

Step 6 To delete a custom alarm type, select the alarm in the Alarm Types area and click **Delete**. Click **OK** in the confirmation dialog box.

9.4.9 Using the Recovery Properties Pane

You can use the Recovery Properties pane in the Control Panel window to mark a service as critical for process monitoring purposes. If a critical process stops running or fails to poll monitoring services for a long time, the server shuts down and the client generates an alarm.

You can also use the Recovery Properties pane to list the servers that clients will log into if access to the primary server is disrupted.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **Recovery Properties** to open the Recovery Properties pane. The following table provides descriptions.

Step 3 Complete the following substeps to set a process as critical:

a. Click the **Process Monitoring** tab.

b. Check the **Critical** check box beside each service to indicate that the service is critical.

c. Click **Save**.

Field Descriptions for the Recovery Properties Pane

Field	Description
Process Monitoring Tab	
Service Name	Displays the process monitoring service name.
Critical	If checked, the selected service is designated as critical for process monitoring. **Note** CORBA ImR, Oracle Service, and Service Manager are permanently critical. You cannot uncheck the Critical check boxes for these services. The Prime Optical server may take up to 30 minutes to shut down when a critical process stops running or does not respond to poll monitoring.

9.5 Where Is the Fault?

You need to be able to quickly troubleshoot problems in the network, identify when network capacity is being reached, and provide information to management on the number and types of devices in use. If the network goes down, one of the first things you will need to know is what devices are running on the network. You will want to know the names, addresses, and interfaces associated with each device in order to begin troubleshooting the problem. The more information you have in one central place about all of the devices, the easier it is to locate the necessary information, resolve problems quickly, and provide detailed information to interested parties.

9.5.1 Sources of Information

Fault management receives and processes information from the following sources:

- Autonomous reports of failures from NEs
- Trouble reports from customers and peer systems
- Results of diagnostics, exercises, and audits from NEs
- Impairment indications from performance management
- Network configuration data from configuration management

Prime Optical constantly updates the alarm status of the network based on the alarm and event notifications sent by the monitored NEs and generated by the EMS itself. It performs alarm synchronization with the NE each time the connection to the NE is established or re-established and the NE is in service.

9.5.2 Identifying and Monitoring Alarms

To identify and monitor alarms on groups of NEs:

Step 1 In the Domain Explorer tree, select the management domain node or a group node. If it shows a critical, major, minor, or warning alarm icon, it means that one or more NEs within the management domain or group are experiencing an alarm.

Step 2 Select the management domain node or group node and choose **Fault > Alarm Browser** (or right-click the node and choose **Alarm Browser** in the popup menu). This opens the Alarm Browser window, which shows all the NEs in the management domain or group that are experiencing an alarm.

To identify and monitor alarms on a specific NE:

Step 1 Select an in-service NE in the Domain Explorer tree that shows an alarm icon.

Step 2 Choose **Fault > Alarm Browser** (or right-click the NE and choose **Alarm Browser** in the popup menu).

Step 3 For ONS 15216 and CTC-based NEs, you can also choose **Configuration > NE Explorer** to view alarms on the NE or on specific modules. The Module View tab displays a graphic of the module that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms also display when you move the mouse pointer over the graphic.)

9.5.3 Using Visual and Audible Alarm Notifications

Step 1 In the Domain Explorer window, choose **Edit > User Preferences**. The User Preferences dialog box opens.

Step 2 In the Event Notification tab, in the Show Notification Dialog For area, select whether or not an alert popup opens when a specific alarm or informational event occurs on NEs in the management domain or in the application.

The Event Notification dialog box opens whenever a new alarm or event occurs. According to your User Preferences selection, you will receive popup notification about alarms by severity and information on events from the NE or from Prime Optical. The Event Notification popup remains open until one of the following occurs:

- You click OK to close the dialog box.
- It is replaced by an Event Notification dialog box with a higher severity.
- You click Disable on the popup window itself to disable additional popups.

The following table describes the fields in the Event Notification dialog box.

Step 3 In the Play Audible Notification For area, select whether or not an audible alert is sounded when a specific alarm or informational event occurs on the NE or in the application. You can also select whether or not a continuous audible alert is sounded when there is an update in the Dashboard. Check the **Continuous Alarm for Dashboard Notifications** check box.

Note To stop the continuous audible alert, choose **Fault > Stop Continuous Beep** in the Domain Explorer.

Step 4 Check the **Save current settings** check box and click **OK**.

Table 9-11 Field Descriptions for the Event Notification Dialog Box

Field	Description
Source	Name of the source where the alarm or event originated.
Time	Date and time that you received the Event Notification popup.
Category	Category of alarm or event. Alarm categories include Critical, Major, Minor, or Cleared. Event categories include NE event (if the event occurred on an NE) or EMS event (if the event occurred on Prime Optical).
Probable Cause	Probable cause of the alarm or event.
Affected Object	Object that is affected by the alarm or event.
Description	Description of the alarm or event.
Service Affecting	Whether the alarm or event affects service.

9.5.4 Sources of Events

There are two sources of events: EMS-generated alarms and OSS (SNMP, CORBA GateWay, TL1). See Chapter 12, “Managing Southbound and Northbound Interfaces” for information about OSS events.

9.5.4.1 EMS-Generated Alarms

In addition to reporting NE-generated alarms, the EMS monitors and reports alarms and events on the EMS itself; for example, loss of connectivity to NE, and so on.

The EMS monitors and reports the NE-specific alarms and events (see Table 9-12) and non-NE-specific alarms and events (see Table 9-13).

Note NE-specific alarms and events can be viewed and accessed by users who are assigned to the particular NE.

Table 9-12 NE-Specific Alarms and Events

NE-Specific Alarms and Events	Description
Loss of communication to an NE	When the system detects loss of connectivity to an NE, an EMS alarm is generated in the Alarm Browser. This EMS alarm is cleared when the system re-establishes connectivity to the NE or when the NE is marked as Out of Service.
Automatic or manual memory backup failure	If an automatic or manual memory backup job fails, an EMS alarm is generated in the Alarm Browser. An individual EMS alarm is generated for each memory backup failure that occurs. All instances of the backup-related EMS alarms are cleared (for that particular NE) when the memory backup succeeds or when the NE is marked as Out of Service.
Prime Optical-to-NE authentication failure	If the system attempts to log into an NE and fails, an alarm is generated. This alarm indicates that the username and password are no longer valid.
Failed PM data retrieval	For CTC-based NEs, an alarm is generated for every PM data retrieval failure. PM 15-minute retrieval fail alarms are generated if the system has not retrieved 15-minute PM data after the number of times to retrieve PM data has been reached. These alarms can be cleared manually or cleared automatically if a PM lost alarm is generated or if PM data is retrieved (PM collection should be set to 15 Min Robust).
Lost PM data	For CTC-based NEs, an alarm is generated for all PM lost data. A lost PM alarm is generated when: • The EMS cannot collect PM data for 15 minutes or 1 day and the NE's PM collection is set to either 15 Min or 1 Day. • The EMS cannot collect 15-minute PM data after 8 hours or 1-day PM data after 2 days and the NE's PM collection is set to 15 Min Robust or 1 Day Robust. If there are outstanding PM retrieval fail alarms, these alarms are cleared and the PM lost alarm is generated. These alarms can be cleared manually.

Table 9-13 Non-NE-Specific Alarms and Events

Non-NE-Specific Alarms and Events	Description
Maximum number of login attempts exceeded	By default, users have a maximum of five login attempts. The user account is locked after the fifth unsuccessful login attempt and an EMS alarm is generated in the Alarm Browser. The alarm is cleared once the user account is unlocked or the account is deleted.
System self-monitor alarm	Threshold parameters such as CPU usage, memory usage, disk usage, circuit creation time, and resynchronization time are collected and evaluated to monitor the server performance. An alarm is generated if any of these parameters cross their threshold values with their corresponding severity level. The alarms are cleared only after the corresponding parameter value falls below the minor threshold. Subsequent threshold crossings for the same parameter do not generate additional alarms. Only the severity level is changed to indicate the current severity level for the specific parameter. **Note** Alarms associated with circuit creation, configuration resynchronization, NE synchronization, and PM data collection indicate that the load on the system is high. Reduce the load on the system before proceeding. Alarms associated with pruning times also indicate that the load on the system is high. Reschedule pruning at a time when the system has less activity.

9.5.5 Enabling Fault Synchronization—CTC-Based NEs

Fault synchronization allows the system to collect the alarm history of an NE that has been marked as Out of Service for some time and is marked as In Service again. Alarm history is displayed in the Alarm Browser.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel** and expand **NE Service**.

Step 2 Choose **CTC-Based SONET NEs** or **CTC-Based SDH NEs**.

Step 3 In the Robust Fault Synchronization area, check the appropriate check box:

- Enable ONS 15310 CL
- Enable ONS 15310 MA
- Enable ONS 15310 MA SDH
- Enable ONS 15327
- Enable ONS 15454
- Enable ONS 15600
- Enable ONS 15454 SDH
- Enable ONS 15600 SDH
- Enable CPT 200
- Enable CPT 600

Step 4 Click **Save**.

9.6 How Can I Find the Root Cause of the Fault?

Root cause analysis captures additional information about defects for the purpose of identifying preventive actions.

In some cases, the alarm report or set of alarm reports generated by a fault are sufficient to indicate the root cause. But often, the information in the alarm messages must be supplemented or confirmed by information from customer trouble reports, diagnostics and exercises of equipment, audits of software and databases, and testing of circuits. Tests of equipment are called *diagnostics*, which are designed to identify the root cause of a fault; *exercises*, which isolate a unit or subsystem and verify that it can perform its intended function; and *audits*, which verify the integrity of software.

The EMS should correlate events and determine the faults that exist in the network. To correlate events means to look for relationships between them.

9.6.1 Viewing the Error Log

The Error Log shows Prime Optical server error information that is useful for debugging purposes. In most cases, the Error Log is requested by service personnel for debugging a problem on the Prime Optical server. The Error Log captures abnormal and significant events based on severity level.

As the default, the Error Log displays information about significant events that occurred during the last four hours. You can change the default time period in the User Preferences dialog box.

To open the Error Log, choose **Administration > Error Log** in the Domain Explorer. The following table describes the fields in the Error Log.

Table 9-14 Field Descriptions for the Error Log

Column Name	Description
Time Stamp	Date and time when the error occurred on the Prime Optical server.
Module	Name of the module where the error occurred.
Severity	Severity level of the error: • Critical, Major, Minor, or Informational—When set to any of these severity levels, all messages corresponding to critical, major, and minor severity levels are logged to the database and all informational messages are stored in the log file. • Debug or Trace—When set to debug or trace, all informational and higher messages are logged to the database. All debug and trace messages are logged to the log files.
Submodule	Name of the submodule where the error occurred.
Filename	Name of the file where the error occurred. Cisco technical support engineers use this information for troubleshooting.
Line	Exact line where the error occurred. Cisco technical support engineers use this information for troubleshooting.
Message	Text of the error message.

By default, all messages are logged to the following files in the /opt/CiscoTransportManagerServer/log directory:

- CTMServerError.log
- CTMerror.log
- ONS15216NEService-*number-time-stamp*.log
- ONS15305NEService-*number-time-stamp*.log
- ONS1530xPMService-*number-time-stamp*.log
- ONS15454NEService-*number-time-stamp*.log
- ONS15454SDHNEService-*number-time-stamp*.log
- ONS15454SDHPMService-*number-time-stamp*.log
- ONS15454PMService-*number-time-stamp*.log
- ONS155xxNEService-*number-time-stamp*.log
- ONS155xxPMService-*number-time-stamp*.log
- ONS15600SDHPMService-*number-time-stamp*.log
- ONS15600PMService-*number-time-stamp*.log
- UnmanagedNEService-*number-time-stamp*.log
- SMService-0-*time-stamp*.log
- SnmpTrapService-2-*time-stamp*.log
- CORBAGWService-1-*time-stamp*.log

By default, all Syslog Service messages are logged to the SyslogService.log file in the /opt/CiscoTransportManagerServer/log directory.

Note The default directory /opt/CiscoTransportManagerServer might have been changed during installation of the Prime Optical server.

9.6.2 Filtering Data in the Error Log

Step 1 In the Error Log, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 2 Specify the filter parameters described in the following table.

Step 3 After making your selections, click **OK** to run the filter.

Table 9-15 Field Descriptions for the Error Log Filter Dialog Box

Tab	Description
Time Stamp (*time zone*)	Allows you to filter Error Log data for a specified time period, ranging from the past hour to the past 6 months. Click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. If you want to filter Error Log data and the time period is not important, click **No Time Specified**.
Modules	Allows you to filter Error Log data by Prime Optical module.
Submodules	Allows you to select Prime Optical server submodules to filter Error Log data.
Severity	Allows you to filter Error Log data based on severity level: Critical, major, minor, and informational.

9.6.3 Managing the NE Audit Trail—CTC-Based NEs

The Audit Trail table is a security tool used to investigate unauthorized activities after they occur so that proper remedial action can be taken. It displays audit trail information for CTC-based NEs.

Audit trail entries might be missing from the Audit Trail table because of the following reasons:

- There is heavy provisioning activity on the NE that the local audit trail log on the NE might wrap between polling intervals, and records will be missed for collection.
- The server is down or communications to the NE are unavailable for an extended period. There is a greater likelihood that the log on the NE will wrap before the system can collect the records.

Note

- The audit trail collection interval can be set in the applicable NE Service pane in the Control Panel. See 9.6.3.4 Changing the Audit Trail Collection Interval, page 9-36.
- To collect the latest and most reliable audit trail information for a specific NE, the time must be synchronized with the SNTP server. Do not manually set the clock on CTC-based NEs.

9.6.3.1 Viewing the Audit Trail Table

To view the Audit Trail table, choose **Administration > CTC-Based NEs > Audit Trail Table**. The following table provides descriptions.

Table 9-16 Field Descriptions for the Audit Trail Table

Field	Description
Alias ID	Alias name of the NE.
Sequence Number	NE-generated record ID.
NE Username	NE user ID.
Time Stamp	Date and time.
Description of Operation	Description of the audit trail operation.
Status of Operation on NE	Status of the audit trail operation. Statuses are Passed, Failed, and Aborted.
NE ID	ID of the selected NE.

9.6.3.2 Filtering Data in the Audit Trail Table

Step 1 In the Audit Trail table, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 2 Specify the filter parameters described in the following table.

Step 3 After making your selections, click **OK** to run the filter.

Table 9-17 Field Descriptions for the Audit Trail Table Filter Dialog Box

Tab	Description
Time Stamp (*time zone*)	Allows you to filter audit trail data for a specified time period, ranging from the past hour to the past 6 months. Additionally, you can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. Click **No Time Specified** if you want to filter audit trail data and the time period is not important.
NE ID	Allows you to move NEs back and forth between the list of available NEs and selected NEs. The filter runs on the NEs in the Selected NE ID list.
Username	Allows you to move users back and forth between the list of available users and selected users. The filter runs on the users in the Selected Users list.
Sequence Number	Allows you to enter a starting and ending sequence number for filtering. Check the **Disregard All Other Filter Criteria** check box to base the filter on only the starting and ending sequence number. **Note** If the sequence number reaches 59999, Prime Optical collects audit records starting with 1 in the next collection interval.
Operation Status	Select an operation status for filtering. Operation statuses are Passed, Failed, and Aborted.

9.6.3.3 Enabling or Disabling Audit Trail Collection

Step 1 In the Domain Explorer tree, select a CTC-Based NE.

Step 2 In the Network Element Properties pane > Status tab > Audit Trail State field, choose **Enabled** or **Disabled** from the drop-down list.

Note By default, the Audit Trail State field is set to Disabled.

Step 3 Click **Save**.

9.6.3.4 Changing the Audit Trail Collection Interval

Step 1 In the Domain Explorer, choose **Administration > Control Panel**.

Step 2 In the Control Panel, expand **NE Service** and choose **CTC-Based SONET NEs** or **CTC-Based SDH NEs**.

Step 3 In the Status tab > Audit Trail Collection Interval field, enter the collection interval time. The default is 30 minutes.

Step 4 Click **Save**.

9.6.4 Setting Debug Options

In Prime Optical, the debug option gives you information to investigate, diagnose, and fix a problem.

Specifying debug options allows you to choose parameters to display in the Debug Log.

Step 1 In the Domain Explorer, choose **File > Debug Options**.

Step 2 Specify the debug options. The following table provides descriptions.

Step 3 After making your selections, click **Apply**.

Table 9-18 Field Descriptions for the Debug Options Dialog Box

Field	Description
Modules	
Available, Selected	Select modules that will display debug messages. Use the **Add** and **Remove** buttons to move modules to the Selected list or remove modules from the list.

Table 9-18 Field Descriptions for the Debug Options Dialog Box (continued)

Field	Description
Debug Level	
Fatal	Instructs the Debug Log to display messages with a severity level of at least Fatal.
Warning	Instructs the Debug Log to display messages with a severity level of at least Warning.
Info	Instructs the Debug Log to display messages with a severity level of at least Info.
Debug	Instructs the Debug Log to display messages with a severity level of at least Debug. **Caution** Prime Optical performance will degrade if the Debug option is left on. All operations will slow down, and you might lose alarm and event notifications. Use Debug only when troubleshooting with a Cisco customer support engineer.
Trace	Instructs the Debug Log to display messages with a severity level of Trace. **Caution** Prime Optical performance will degrade if the Trace option is left on. All operations will slow down, and you might lose alarm and event notifications. Use Trace only when troubleshooting with a Cisco customer support engineer.
Display Options	
File	Check the **File** check box to write the Debug Log to a specific file. You can click **Browse** to browse for a local client directory for the Debug Log. After you specify the filename, the log is stored in *filename*0.log, and then in *filename*1.log when *filename*0.log reaches its maximum size. By default, the Debug Log is saved at C:\Cisco\TransportManagerClient*version-number*\debug\CTMC-debug0.log or /opt/CiscoTransportManagerClient*version-number*/debug/CTMC-debug0.log. The dialog box shows the filename without the number 0 or 1, which is appended by default by the Java debugging APIs. **Note** *version-number* is replaced by the version number of the installed Prime Optical client.
Max File Size	Enter the maximum file size for the Debug Log, in bytes.
Console	Check the **Console** check box to write the Debug Log to the console.

9.7 Who Is Responsible for Managing the Fault?

To manage faults effectively, you must know who is taking responsibility for managing each case. Prime Optical offers the following options:

- 9.7.1 Acknowledging and Unacknowledging Alarms, page 9-38
- 9.7.2 Configuring Alarm Acknowledgement and Alarm Notes, page 9-38

9.7.1 Acknowledging and Unacknowledging Alarms

The alarm acknowledgement feature acknowledges selected alarms or all alarms with a single click.

Step 1 In the Domain Explorer window, select an NE and choose **Fault > Alarm Browser**. This opens the Alarm Browser window for the selected NE.

The Alarm Browser window lists critical, major, minor, and warning alarms that have not been cleared or cleared alarms that have not been acknowledged.

Step 2 Select the alarms to be acknowledged and choose **Fault > Acknowledge Alarms** (or click the **Acknowledge Selected Alarm(s)** tool). Click **Yes** in the confirmation dialog box. Click the **Refresh Data** tool to see the changes. A check mark icon provides a visual indication of acknowledged alarms.

Step 3 Click the **Acknowledge Selected Alarm(s)** tool again to unacknowledge the selected alarms. Click **Yes** in the confirmation dialog box. Click **Refresh Data** to see the changes. The check mark is removed, indicating that the alarm has been unacknowledged.

Note Alarm unacknowledgement is disabled by default. Make sure to enable the alarm unacknowledgement feature in the Control Panel before unacknowledging an alarm. See 9.7.2 Configuring Alarm Acknowledgement and Alarm Notes, page 9-38 for more information.

Step 4 To acknowledge all alarms in the view, choose **Fault > Acknowledge All Alarms** (or click the **Acknowledge All Alarms** tool). Click **Yes** in the confirmation dialog box.

9.7.2 Configuring Alarm Acknowledgement and Alarm Notes

Use the UI Properties pane to configure alarm acknowledgment and enable or disable the alarm note feature.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel** and click **UI Properties**.

Step 2 In the Fault Management area, select either Manual or Automatic for alarm acknowledgement.

- If you choose **Manual**, alarms must be acknowledged manually. Cleared alarms move from the Alarm Browser to the Alarm Log once they are acknowledged.
- If you choose **Automatic**, the server automatically acknowledges alarms when they are cleared and moves them from the Alarm Browser to the Alarm Log.

Note Active alarms are not automatically acknowledged.

If the alarms are initially set to Manual Alarm Acknowledgement, and then you switch to Automatic Alarm Acknowledgement, all the alarms in the Alarm Browser will be cleared and acknowledged automatically. This might take a while, depending on the number of alarms in the database that have not been acknowledged manually.

You can still acknowledge alarms manually even if Automatic Alarm Acknowledgment is set.

Step 3 Use the Overwrite Alarm Notes option to enable or disable the ability to overwrite alarm notes created by another user.

Step 4 Choose either Enable or Disable for alarm unacknowledgement.

- If you choose **Enable**, you can unacknowledge alarms in the Alarm Browser.
- If you choose **Disable**, alarms cannot be unacknowledged in the Alarm Browser.

Step 5 Click **Save**.

9.8 How Can the Fault Be Fixed?

After receiving an alarm, the EMS or the user must take some sort of action on each of the faults. This can include logging the fault, delivering it to an appropriate tracking application, alerting key personnel to a critical fault, or implementing a repair.

9.8.1 Clearing a Security Violation Alarm—ONS 15305 R3.0, ONS 15327, ONS 15454 SONET, ONS 15454 SDH

Step 1 In the Domain Explorer tree, select an ONS 15305 R3.0, ONS 15327, ONS 15454 SONET, or ONS 15454 SDH NE and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the NE Explorer window, choose **Fault > Clear Security Violation Alarm**. A message appears if there are no security violations or intrusion alarms on the NE or if the operation has been accepted.

Step 3 Click **OK** in the message box.

9.8.2 Performing a System Reset—ONS 15600 SONET and ONS 15600 SDH

Step 1 In the Domain Explorer tree, select the ONS 15600 SONET or ONS 15600 SDH NE for which to view the configuration.

Step 2 Choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 3 In the NE Explorer, choose **File > System Reset**.

9.8.3 Exporting Alarms and Events to a Text File

Use the Event Export Manager to export alarms and events to a text file as they occur. In addition, you can use the Event Export Manager to set various export parameters to refine the export. See 1.6.8 Exporting Alarms and Events, page 1-42.

9.8.4 Configuring Server Logging Properties Using a Remote Debugger

You can configure logging properties in the Cisco Prime Optical Server using a remote debugger. The remote debugger is a debug and diagnostic tool.

Note You must login as a "root" or "optusr" unix user to configure logging properties.

Every Cisco Prime Optical Server's process is in the listening state on a TCP port. It is possible to connect to the Java processes debug port using the **telnet** command.

Note Connections are accepted only from the loopback interface (localhost). Attempts to connect from other workstations are rejected.

To configure a server's logging properties, do the following:

Step 1 Enter the following commands to obtain the TCP port where a process is in the listening state:

```
- cd /temp_CTM
_ ls *.rd
```

Note Every process has an "rd" file containing the port number.

Step 2 Enter the following command to display the port number of SMService:

```
- cat SMService.rd
```

Step 3 Enter the following command in the workstation where the Prime Optical server is running, to connect to the SMService:

```
telnet localhost <rd port>
```

The remote debugger shell displays an interactive menu with monitoring and diagnostic commands that allow you to set the logging properties.

For example, the following commands allow you to set the log levels:

- **loggers**
- **ListLogModules**
- **SetModuleLevel SMService DEBUG**

You can set the log levels to ERROR, WARN, INFO, or DEBUG.

9.8.5 Configuring Server Logging Properties Using the Properties File

The /opt/CiscoTransportManagerServer/cfg/debug directory contains a "properties" file for every Prime Optical server process.You can also configure logging properties using the Properties file.

Note You must login as a "root" or "optusr" unix user to configure logging properties.

You can modify the level of an existing "logger" or add a specific logger.

For example, to set the level to DEBUG, open the log4j-SMService.properties file and modify the log4j.logger.com.cisco attribute as follows:

```
log4j.logger.com.cisco=DEBUG
```

Note Once the properties file is modified, the modified logging properties take effect after a minute.

Managing Performance

This chapter includes the following information:

- 10.1 What Is Performance Management?, page 10-1
- 10.2 What Performance Data Is Available?, page 10-2
- 10.3 How Is Performance Data Collected?, page 10-3
- 10.4 How Do I Query, View, Filter, and Graph PM Data?, page 10-17

Note Appendix E, "Performance Data" contains field descriptions for each PM table.

10.1 What Is Performance Management?

Performance management (PM) in a network is the configuration and measurement of network traffic for the purpose of providing a consistent and predictable level of service. PM involves monitoring the network activity and adjusting the design or the configuration of the network to improve its performance and traffic handling. PM provides network and system performance reporting for determining acute and chronic problems, service level reporting, and performance optimization.

Measuring performance can identify:

- Normal baseline network performance, which can then be compared to abnormal network behavior
- Current or potential utilization problems
- Slow response time
- Application, server, and network availability
- Optimum data transfer times

Performance data is useful for capacity reporting when drafting budgets or considering network redesigns. It can be used to identify congestion and trouble areas in the network that need to be relieved, either through additional equipment or through network reconfiguration. It can also be used to identify devices that are being underutilized or have available chassis slots.

Performance measurement includes:

- Performance monitoring—The collection of performance-related data from network devices. This data is useful for fine-tuning the performance of the device and for monitoring potentially service-affecting problems.

- Performance reporting—The presentation of the collected data, which can then be used to analyze faults, growth, and capacity of the network.

You can set thresholds on the reported performance data. These thresholds generate events that can be used in performance and fault management.

The PM process is as follows:

1. Gather network data and statistics
2. Analyze network performance and identify critical issues
3. Optimize network performance
4. Plan customer capacity
5. Plan network capacity

10.2 What Performance Data Is Available?

The following areas of performance are useful for measurement:

- Availability—The amount of time for which a network system or application is available to the user. From a network perspective, availability is the reliability of the individual components in the network. Accurately measuring availability of a distributed network is difficult and not very practical.
- Response time—The time required for traffic to travel between two points, typically measured for a round trip; the time it takes a packet to reach its destination and for a response to return to the sender. Response time is the best measure of how users perceive the network's performance.
- Accuracy—The amount of interface traffic that does not result in error. Accuracy can be expressed in terms of a percentage that compares the success rate to the total packet rate over a period of time. A decreased accuracy rate should be used to trigger a closer investigation of the network.
- Utilization—Measures the use of a particular resource over time. Utilization is usually expressed as a percentage of a resource's maximum operational capacity. It can be used to identify congestion or potential congestion throughout the network, as well as underutilized resources. Sudden jumps in resource utilization can indicate a fault condition.

Cisco Prime Optical provides the following wizards to query PM data:

- PM Query by NE Model (for non-CTC-based NE models only)
- PM Query by Category

Note PM data collection is not available for the ONS 15216.

Note Make sure that the NE and the Prime Optical server are synchronized. The NE generates PM statistics at 15-minute or 1-day intervals. The server collects 1-day PM data at 00:00 Greenwich Mean Time (GMT), regardless of the NE time or its time zone.

Note When configuring PM data collection, enable it for an NE on only one Prime Optical server. CTC-based NEs do not support simultaneous sessions on HTTP for bulk PM data collection. If you enable PM data collection on multiple Prime Optical servers, one of the servers might time out with the following error

messages:

```
Server Error: 503 Service Unavailable
Operating System Error Nr:3997698: S_objLib_OBJ_UNAVAILABLE
Too many concurrent PM downloads
```

Note An alarm is generated for every piece of lost PM data for CTC-based NEs. A PM lost alarm (15 minutes or 1 day) is generated when Prime Optical cannot collect PM data for 15 minutes or for 1 day when the NE's PM data collection is set to either 15 Min Robust or 1 Day Robust. If there are outstanding PM Retrieval Fail alarms, these alarms are cleared and the PM lost alarm is generated.

10.3 How Is Performance Data Collected?

Performance data collection is the process of collecting performance-related data from network devices and storing them in a database or data file. This information can then be used for locating, diagnosing, and correcting network problems to increase network reliability and effectiveness, and to ensure that fault management can be more than just handling emergencies. The data can also be used to increase the productivity of network users. There are two methods of collecting performance data:

- Active polling—Involves actively obtaining specific management data from network devices. The collected data is then stored in a database and used later for reporting. The advantage of active polling is that as long as a managed device is accessible, data is collected and stored at regular intervals. A disadvantage is that collecting large amounts of data can impact the performance of the managed device or the network. Also, reports might take a long time to generate.
- Event reporting—A managed device or agent generates a trap or event that is received and logged. This method requires that events be generated based only on thresholds, and the EMS assumes that the lack of an event indicates that the item being measured is performing within acceptable ranges. The advantage here is that the potential impact to the network is lessened. The disadvantages of event reporting are that traps are unreliable and you might not be able to determine the start or stop of an event. It can also be difficult to determine the duration and frequency of an event.

This section includes the following information:

- 10.3.1 Viewing Performance Monitoring for an NE, page 10-4
- 10.3.2 Enabling Performance Monitoring, page 10-4
- 10.3.3 Understanding the PM Service Pane, page 10-4
- 10.3.4 Understanding the Individual PM Service Panes, page 10-5
- 10.3.5 Activating or Deactivating Performance Monitoring, page 10-12
- 10.3.6 Enabling or Disabling PM Data Collection on an Individual NE, page 10-12
- 10.3.7 Enabling or Disabling PM Data Collection by PM Category for CTC-Based NEs, page 10-13

- 10.3.11 Viewing the Robust PM Collection Queue, page 10-15
- 10.3.12 Using the Self Monitor Table, page 10-15
- 10.3.13 Filtering the Self Monitor Table, page 10-16

10.3.1 Viewing Performance Monitoring for an NE

To view PM data for an NE, you must first collect the data. To collect the PM data, you need to activate the PM service for your NE and then enable PM collection on that NE. The PM service can be activated either before or after the PM collection is enabled on the NE(s). The PM data is not available until both operations are completed and the first PM collection occurs.

10.3.2 Enabling Performance Monitoring

Performance monitoring is optional, but you must enable it if you want to monitor threshold alarms and performance parameters.

Performance monitoring can be enabled on NEs by using the device CLI. For information about using the CLI, see the relevant hardware documentation.

Note PM data collection is resource intensive in terms of CPU, disk space, and DCN utilization, so you should exercise proper planning and resource monitoring for PM data collection.

10.3.3 Understanding the PM Service Pane

Use the PM Service pane (**Administration > Control Panel**) to activate or deactivate global PM data collection and change NE PM data collection parameters. When you click **Save** to save your change, the change takes effect immediately.

Table 10-1 Field Descriptions for the PM Service Pane

Field	Description
PM Data Storage	PM data storage status. If set to Normal, all performance data collected is displayed in the PM data tables. If set to Optimized, performance data with all zero values and performance data with all invalid flags are not displayed and are not stored in the database.
Robust PM Collection Queue	Number of 15-minute and 1-day outstanding robust PM registers. Click **Clear Robust PM Queue** to clear the queue.
PM 15-Min Retrieval Fail Alarm	Enable or disable a retrieval fail alarm for 15-minute PM data. Check the **Enable** check box; then, enter the number of seconds between each retry, and enter the number of retries to attempt before the alarm is generated.

Table 10-1 Field Descriptions for the PM Service Pane (continued)

Field	Description
PM 1-Day Retrieval Fail Alarm	Enable or disable a retrieval fail alarm for 1-day PM data. Check the **Enable** check box; then, enter the number of minutes between each retry, and enter the number of retries to attempt before the alarm is generated.
Real-Time PM Performance Parameters	When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. The data it returns is stored entirely in transient memory. Use the following fields to limit the scope of the real-time PM session: • Maximum number of concurrent real-time PM sessions—Specify the maximum number of concurrent real-time PM sessions allowed per client. The range is from 1 to 5 sessions; the Cisco default is 5. • Maximum number of polled real-time PM objects—Specify the maximum number of objects that can be polled in a single real-time PM session. The range is from 1 to 100 objects; the Cisco default is 100. • Maximum number of rows held in cache—Specify the maximum number of rows that can be held in the real-time memory buffer per session. When this limit is reached, the oldest rows are removed from the buffer to make room for new rows. The range is from 100 to 5000 rows; the Cisco default is 1000. **Note** Depending on the PM table launch selection criteria, the number of rows displayed might be less than the maximum number of rows specified.

10.3.4 Understanding the Individual PM Service Panes

The PM Service properties pane (**Administration > Control Panel > PM Service**) displays information about the status of performance monitoring for the selected NE. You can also stop or start an individual PM service instance. The individual PM service panes are broken down by NE:

- ONS 15305
- ONS 15310 CL/ONS 15310 MA/ONS 15327/ONS 15454/CPT 600/CPT 200
- ONS 15310 MA SDH/ONS 15454 SDH/CPT 600 SDH/CPT 200 SDH
- ONS 155xx
- ONS 15600
- ONS 15600 SDH

10.3.4.1 ONS 15305

The ONS 15305 PM Service pane displays ONS 15305 NE PM service information. Table 10-2 provides the descriptions.

Table 10-2 Field Descriptions for the ONS 15305 PM Service Pane

Field	Description
Status Tab	
Service Status	Current status of the service: Active or Not Active.
Service Action	Stops or starts a process. Notice that the Service Action button toggles between Activate and Deactivate, and that the Service Status field changes accordingly.
Threshold	Number of NEs that will be serviced by one instance of the PM service.
Debug Tab	
Overall Logging	Click the **Enable** radio button to enable overall debugging and to select debug modules for the PM service. Click the **Disable** radio button to disable overall debugging.
Debug Modules	If overall logging is enabled, lists the modules that can be used for debugging. Select a module from the Available list; then, click the **Add** button to add the module to the Selected list. Use the **Remove** button to return the module to the Available list. Debug logging will be performed on the modules in the Selected list.
PM Service Instance	
Start Service Instance, Stop Service Instance	Allows you to stop or start an individual PM service instance. If you click **Start Service Instance**, the service status changes to *Running*. If you click **Stop Service Instance**, the status changes to *Stopped*.
Dump Cache	Click the **Dump Cache** button to export the PM service cache to the log file related to the selected PM service instance.
Debug Table	Click the **Debug Table** button to open the Prime Optical NE Module Level Debug Table window, which displays the debug state of the selected NEs and lists the modules for which debugging is active.
Overall Logging for the Instance	Click the **Disable** button to disable overall logging for the PM service instance.
Managed NEs	The list of managed NEs shows which NEs are currently being managed by the selected service instance. If you stop the specified service instance, the NEs in the list are no longer managed.

10.3.4.2 ONS 15310 CL/ONS 15310 MA/ONS 15327/ONS 15454/CPT 600/CPT 200

The ONS 15310 CL/ONS 15310 MA/ONS 15327/ONS 15454/CPT 600/CPT 200 PM Service pane displays PM service information for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, CPT 200, and CPT 600 NEs. The following table provides descriptions.

Table 10-3 Field Descriptions for the ONS 15310 CL/ONS 15310 MA/ONS 15327/ONS 15454 PM/CPT 600/CPT 200 Service Pane

Field	Description
PM Collection Parameters Tab	
DS1 PM Collection	Enable or disable DS1 PM data collection.
DS3 PM Collection	Enable or disable DS3 PM data collection.
Physical/Section/Line PM Collection	Enable or disable physical, section, and line PM data collection on OC-N cards.
STS PM Collection	Enable or disable SONET STS Path PM data collection.
VT PM Collection	Enable or disable SONET VT Path PM data collection.

Table 10-3 Field Descriptions for the ONS 15310 CL/ONS 15310 MA/ONS 15327/ONS 15454 PM/CPT 600/CPT 200 Service Pane (continued)

Field	Description
Data PM Collection	Enable or disable data (Ethernet, POS, SAN, 8B10B) PM data collection.
Physical/OTN PM Collection	Enable or disable physical, OTN G.709 Section, OTN G.709 Path, and OTN FEC PM data collection on DWDM cards.
SNMP PM Collection	Enable or disable CoS PM data collection.
E1 PM Collection	Enable or disable E1 PM data collection.
Status Tab	
Service Status	Current status of the service: Active or Not Active.
Service Action	Stops or starts a process. Notice that the Service Action button toggles between Activate and Deactivate, and that the Service Status field changes accordingly.
Threshold	Number of NEs that will be serviced by one instance of the PM service. **Note** Starting with CTM R9.2, one instance of the PM service can handle up to 2000 NEs.
BLSR-Ring Switch Interval	Allows you to set the BLSR switch interval, in seconds. The Cisco default is 60 seconds.
TL1 Tunnel Connection Timeout	Allows you to set the time it takes to set up a TL1 tunnel connection between the Prime Optical server and the tunneled NE (TNE). When a new NE is added using the Add NE wizard, you can connect to the new NE using a TL1 tunnel. The Prime Optical server establishes a TCP/IP connection to a non-Cisco GNE (NGNE), and the NGNE establishes an OSI connection to the TNE. If the Prime Optical server cannot set up the TL1 tunnel connection before the specified TL1 tunnel connection timeout, the Add NE operation fails and the TNE connection state becomes unavailable.
Audit Trail Collection Interval	Allows you to set the audit trail collection interval, in minutes.
L2 Service Resync Delay	Allows you to configure the delay after which Prime Optical performs a Cisco IOS configuration synchronization on ML cards to keep the NE and the Prime Optical Data Provisioning Service synchronized. This operation synchronizes the L2 topology. Full Cisco IOS configuration synchronization is performed automatically by Prime Optical to keep the NE and the Prime Optical Data Provisioning Service synchronized. Full configuration resynchronization might be delayed depending on Prime Optical server usage. For the Prime Optical server deployed as a monitoring server, the recommended value for the delay parameter is 2 minutes (120 seconds). For the Prime Optical server deployed as a provisioning server, the recommended value for the delay parameter is 10 minutes (600 seconds).
ENEs List Poll Interval	Time interval in which all CTC-based GNEs in Prime Optical need to refresh their list of ENEs. The list of ENEs for each GNE is obtained and compared with the existing ENE list. If there are any changes to the ENE list, topology changes are carried out so that the Domain Explorer will reflect the current topology with correct GNE and ENE icons.
Debug Tab	
Overall Logging	Click the **Enable** radio button to enable overall debugging and to select debug modules for the PM service. Click the **Disable** radio button to disable overall debugging.
Debug Modules	If overall logging is enabled, lists the modules that can be used for debugging. Select a module from the Available list; then, click the **Add** button to add the module to the Selected list. Use the **Remove** button to return the module to the Available list. Debug logging will be performed on the modules in the Selected list.

Table 10-3 Field Descriptions for the ONS 15310 CL/ONS 15310 MA/ONS 15327/ONS 15454 PM/CPT 600/CPT 200 Service Pane (continued)

Field	Description
PM Service Instance	
Start Service Instance, Stop Service Instance	Allows you to stop or start an individual PM service instance. If you click **Start Service Instance**, the service status changes to *Running*. If you click **Stop Service Instance**, the status changes to *Stopped*. The list of managed NEs shows which NEs are currently being managed by the selected service instance. If you stop the specified service instance, the NEs in the list are no longer managed.
Dump Cache	Click the **Dump Cache** button to export the PM service cache to the log file related to the selected PM service instance.
Debug Table	Click the **Debug Table** button to open the Prime Optical NE Module Level Debug Table window, which displays the debug state of the selected NEs and lists the modules for which debugging is active.
Overall Logging for the Instance	Click the **Disable** button to disable overall logging for the PM service instance.
Managed NEs	The list of managed NEs shows which NEs are currently being managed by the selected service instance. If you stop the specified service instance, the NEs in the list are no longer managed.

10.3.4.3 ONS 15310 MA SDH/ONS 15454 SDH/CPT 600 SDH/CPT 200 SDH

The ONS 15310 MA SDH/ONS 15454 SDH PM/CPT 600 SDH/CPT 200 SDH Service pane displays PM service information for the ONS 15310 MA SDH, ONS 15454 SDH, CPT 200 SDH, and CPT 600 SDH NEs. The following table provides descriptions.

Table 10-4 Field Descriptions for the ONS 15310 MA SDH/ONS 15454 SDH/CPT 600 SDH/CPT 200 SDH PM Service Pane

Field	Description
PM Collection Parameters Tab	
E1 PM Collection	Enable or disable E1 PM data collection.
E3 PM Collection	Enable or disable E3 PM data collection.
E4 PM Collection	Enable or disable E4 PM data collection.
DS3I PM Collection	Enable or disable DS3I PM data collection.
High Order PM Collection	Enable or disable high order PM data collection.
Low Order PM Collection	Enable or disable low order (VC-3, VC-11, and VC-12) PM data collection.
Data PM Collection	Enable or disable data (Ethernet, POS, SAN, and 8B10B) PM data collection.
Physical/Section PM Collection	Enable or disable physical or section (regenerator section [RS] and multiplex section [MS]) PM data collection on STM-N cards.
Physical/OTN PM Collection	Enable or disable physical, OTN G.709 Section, OTN G.709 Path, and OTN FEC PM data collection on DWDM cards.
SNMP PM Collection	Enable or disable CoS PM data collection.
DS1 PM Collection	Enable or disable DS1 PM data collection.
DS3 PM Collection	Enable or disable DS3 PM data collection.

Table 10-4 Field Descriptions for the ONS 15310 MA SDH/ONS 15454 SDH/CPT 600 SDH/CPT 200 SDH PM Service Pane (continued)

Field	Description
Status Tab	
Service Status	Current status of the service: Active or Not Active.
Service Action	Stops or starts a process. Notice that the Service Action button toggles between Activate and Deactivate, and that the Service Status field changes accordingly.
Threshold	Number of NEs that will be serviced by one instance of the PM service. **Note** Starting from CTM R9.2, one instance of the PM service can handle up to 2000 NEs.
Debug Tab	
Overall Logging	Click the **Enable** radio button to enable overall debugging and to select debug modules for the PM service. Click the **Disable** radio button to disable overall debugging.
Debug Modules	If overall logging is enabled, lists the modules that can be used for debugging. Select a module from the Available list; then, click the **Add** button to add the module to the Selected list. Use the **Remove** button to return the module to the Available list. Debug logging will be performed on the modules in the Selected list.
PM Service Instance	
Start Service Instance, Stop Service Instance	Allows you to stop or start an individual PM service instance. If you click **Start Service Instance**, the service status changes to *Running*. If you click **Stop Service Instance**, the status changes to *Stopped*.
Dump Cache	Click the **Dump Cache** button to export the PM service cache to the log file related to the selected PM service instance.
Debug Table	Click the **Debug Table** button to open the Prime Optical NE Module Level Debug Table window, which displays the debug state of the selected NEs and lists the modules for which debugging is active.
Overall Logging for the Instance	Click the **Disable** button to disable overall logging for the PM service instance.
Managed NEs	The list of managed NEs shows which NEs are currently being managed by the selected service instance. If you stop the specified service instance, the NEs in the list are no longer managed.

10.3.4.4 ONS 155xx

The ONS 155xx PM Service pane displays PM service information for the ONS 155xx NE. The following table provides descriptions.

Table 10-5 Field Descriptions for the ONS 155xx PM Service Pane

Field	Description
Status Tab	
Service Status	Current status of the service: Active or Not Active.
Service Action	Stops or starts a process. Notice that the Service Action button toggles between Activate and Deactivate, and that the Service Status field changes accordingly.
Threshold	Number of NEs that will be serviced by one instance of the PM service.
Debug Tab	

Table 10-5 Field Descriptions for the ONS 155xx PM Service Pane (continued)

Field	Description
Overall Logging	Click the **Enable** radio button to enable overall debugging and to select debug modules for the PM service. Click the **Disable** radio button to disable overall debugging.
Debug Modules	If overall logging is enabled, lists the modules that can be used for debugging. Select a module from the Available list; then, click the **Add** button to add the module to the Selected list. Use the **Remove** button to return the module to the Available list. Debug logging will be performed on the modules in the Selected list.
PM Service Instance	
Start Service Instance, Stop Service Instance	Allows you to stop or start an individual PM service instance. If you click **Start Service Instance**, the service status changes to *Running*. If you click **Stop Service Instance**, the status changes to *Stopped*.
Dump Cache	Click the **Dump Cache** button to export the PM service cache to the log file related to the selected PM service instance.
Debug Table	Click the **Debug Table** button to open the Prime Optical NE Module Level Debug Table window, which displays the debug state of the selected NEs and lists the modules for which debugging is active.
Overall Logging for the Instance	Click the **Disable** button to disable overall logging for the PM service instance.
Managed NEs	The list of managed NEs shows which NEs are currently being managed by the selected service instance. If you stop the specified service instance, the NEs in the list are no longer managed.

10.3.4.5 ONS 15600

The ONS 15600 PM Service pane displays PM service information for the ONS 15600 SONET NEs. The following table provides descriptions.

Table 10-6 Field Descriptions for the ONS 15600 PM Service Pane

Field	Description
PM Collection Parameters Tab	
Physical/Section/Line PM Collection	Enable or disable physical, section, and line PM data collection.
STS PM Collection	Enable or disable SONET STS Path PM data collection.
Data PM Collection	Enable or disable data (Ethernet and POS) PM data collection.
Status Tab	
Service Status	Current status of the service: Active or Not Active.
Service Action	Stops or starts a process. Notice that the Service Action button toggles between Activate and Deactivate, and that the Service Status field changes accordingly.
Threshold	Number of NEs that will be serviced by one instance of the PM service.
Debug Tab	
Overall Logging	Click the **Enable** radio button to enable overall debugging and to select debug modules for the PM service. Click the **Disable** radio button to disable overall debugging.

Table 10-6 Field Descriptions for the ONS 15600 PM Service Pane (continued)

Field	Description
Debug Modules	If overall logging is enabled, lists the modules that can be used for debugging. Select a module from the Available list; then, click the **Add** button to add the module to the Selected list. Use the **Remove** button to return the module to the Available list. Debug logging will be performed on the modules in the Selected list.
PM Service Instance	
Start Service Instance, Stop Service Instance	Allows you to stop or start an individual PM service instance. If you click **Start Service Instance**, the service status changes to *Running*. If you click **Stop Service Instance**, the status changes to *Stopped*. The list of managed NEs shows which NEs are currently being managed by the selected service instance. If you stop the specified service instance, the NEs in the list are no longer managed.

10.3.4.6 ONS 15600 SDH

The ONS 15600 SDH PM Service pane displays PM service information for the ONS 15600 SDH NEs. The following table provides descriptions.

Table 10-7 Field Descriptions for the ONS 15600 SDH PM Service Pane

Field	Description
PM Collection Parameters Tab	
Physical/RS/MS PM Collection	Enable or disable physical, RS, and MS PM data collection.
High Order PM Collection	Enable or disable high-order PM data collection.
Data PM Collection	Enable or disable data PM data collection.
Status Tab	
Service Status	Current status of the service: Active or Not Active.
Service Action	Stops or starts a process. Notice that the Service Action button toggles between Activate and Deactivate, and that the Service Status field changes accordingly.
Threshold	Number of NEs that will be serviced by one instance of the PM service.
Debug Tab	
Overall Logging	Click the **Enable** radio button to enable overall debugging and to select debug modules for the PM service. Click the **Disable** radio button to disable overall debugging.
Debug Modules	If overall logging is enabled, lists the modules that can be used for debugging. Select a module from the Available list; then, click the **Add** button to add the module to the Selected list. Use the **Remove** button to return the module to the Available list. Debug logging will be performed on the modules in the Selected list.
PM Service Instance	
Start Service Instance, Stop Service Instance	Allows you to stop or start an individual PM service instance. If you click **Start Service Instance**, the service status changes to *Running*. If you click **Stop Service Instance**, the status changes to *Stopped*. The list of managed NEs shows which NEs are currently being managed by the selected service instance. If you stop the specified service instance, the NEs in the list are no longer managed.

10.3.5 Activating or Deactivating Performance Monitoring

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, expand **PM Service**.

Step 3 Select an NE type.

Step 4 All the NEs monitored by the server stop collecting PM data if you click the **Deactivate** button in the PM Configuration tab or Status tab > Service Action field. (Notice that the service status toggles to *Not Active*.) Click **Activate** to resume PM data collection.

Note If you need to activate or deactivate the PM Service again, go to the Service Monitor table (**Administration > Service Monitor** in the Domain Explorer) to verify that the service has stopped or started before clicking the Activate or Deactivate button again.

Step 5 Ensure that the PM Service has started. In the Domain Explorer, choose **Administration > Service Monitor**. The Service Monitor table should include an entry for the relevant PM Service.

Note If the PM Service is active and the NE time is changed so that the difference between the Prime Optical server time and the NE time is 30 minutes, the existing PM buckets (for the time stamps corresponding to the next collection interval on the NE, after the time change) collected by Prime Optical are marked as In Maintenance. Prime Optical collects PM buckets again for the same time stamps.

10.3.6 Enabling or Disabling PM Data Collection on an Individual NE

Note See 2.6.1 Selectable Collection of PM Data Parameters, page 2-12 for information on setting PM data collection.

Step 1 In the Domain Explorer or Subnetwork Explorer tree, select the NE node for which to stop or start PM data collection. The Network Element Properties pane opens.

Step 2 In the Status tab > PM Collection area, set the PM data collection state. Options vary by NE type:

- 15 Min—Check this box to enable collection of PM data every 15 minutes. Uncheck to disable PM data collection.
- 1 Day—Check this box to enable collection of PM data every 24 hours. Uncheck to disable PM data collection.
- 15 Min Robust—Check this box to enable collection of PM data every 15 minutes and attempt to fill in gaps in PM data collection should they occur.
- 1 Day Robust—Check this box to enable collection of PM data every 24 hours and attempt to fill in gaps in PM data collection should they occur.

Caution If robust PM data collection is enabled, do not set PM data storage to Optimized.

Note
- You cannot collect robust PM data until at least one 15-minute or one 1-day interval has been collected in normal operation.
- Robust PM data collection applies only to CTC-based NEs and to the ONS 15305, ONS 15530, and ONS 15540. Robust PM data collection is not supported for the ONS 15216.

Step 3 Click **Save** to save changes to the database.

Step 4 In the confirmation dialog box, click **Yes**. The changes take effect immediately.

Note The maximum number of ONS 15305 NEs that can have PM data collection enabled is 10 for a small network, 30 for a medium network, and 50 for a large or high-end network.

10.3.7 Enabling or Disabling PM Data Collection by PM Category for CTC-Based NEs

Note See 2.6.1 Selectable Collection of PM Data Parameters, page 2-12 for information on setting PM data collection.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, expand **PM Service**.

Step 3 Complete one of the following options:
- For the ONS 15305 R3.0, choose **ONS 15305**.
- For the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, or ONS 15454 SONET, choose **ONS 15310 CL/ONS 15310 MA/ONS 15327/ONS 15454**.
- For the ONS 15310 MA SDH or ONS 15454 SDH, choose **ONS 15310 MA SDH/ONS 15454 SDH**.
- For the ONS 15600 SONET, choose **ONS 15600**.
- For the ONS 15600 SDH, choose **ONS 15600 SDH**.

Step 4 Click the **PM Collection Parameters** tab, and enable or disable the various PM parameters. The following tables describe each parameter in detail:
- For the ONS 15305 R3.0, see Table 10-2.
- For the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, and ONS 15454 SONET, see Table 10-3.
- For the ONS 15310 MA SDH and ONS 15454 SDH, see Table 10-4.

- For the ONS 15600 SONET, see Table 10-6.
- For the ONS 15600 SDH, see Table 10-7.

Step 5 After making your selections, click **Save**.

10.3.8 Enabling PM Data Collection for the ONS 15530 and ONS 15540

Before viewing performance data for an ONS 15530 or ONS 15540, enable performance monitoring on the NE in the Domain Explorer or by using the CLI.

Caution If robust PM data collection is enabled, do not set PM data storage to Optimized.

- To enable PM in the Domain Explorer, select an ONS 155xx NE in the Domain Explorer tree; then, set the PM data collection in the Network Element Properties pane to 15 Min, 1 Day, 15 Min Robust, or 1 Day Robust.
- To enable PM through the CLI, log into the NE and enter the **monitor enable** command. For more information, refer to the relevant hardware documentation.

10.3.9 Enabling or Disabling PM Retrieval Fail Alarms for CTC-Based NEs

Enabling the PM retrieval fail alarm allows Prime Optical to monitor failed collection of PM data when PM collection is set to either 15 Min Robust or 1 Day Robust. It lets you set the number of times for Prime Optical to collect PM data before declaring PM data retrieval failure.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **PM Service**. The PM Service pane opens.

Step 3 To enable 15-minute PM retrieval fail alarms, click **Enable** in the PM 15-min Retrieval Fail Alarm area; then, specify the following:

- Seconds between Retries—Wait time between attempts to retrieve PM data. The range is from 5 to 15 seconds; the Cisco default is 5 seconds.
- Number of Retries—Number of times to retrieve PM data. The range is from 1 to 6 retries; the Cisco default is 6 retries.

Step 4 To enable 1-day PM retrieval fail alarms, click **Enable** in the PM 1-day Retrieval Fail Alarm area; then, specify the following:

- Minutes between Retries—Wait time between attempts to retrieve PM data. The range is from 15 to 60 minutes; the Cisco default is 15 minutes.
- Number of Retries—Number of times to retrieve PM data. The range is from 1 to 6 retries; the Cisco default is 6 retries.

Step 5 Click **Save**.

10.3.10 Specifying the PM Data Display

For CTC-based and ONS 155xx NEs, the display of PM data is affected by the PM Data Storage setting in the Control Panel. To specify whether to display PM data in normal or optimized mode for CTC-based and ONS 155xx NEs:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **PM Service**. The PM Service pane opens.

Step 3 In the PM Data Storage area, specify the PM data storage from the drop-down list:

- Normal—All performance data is collected and displayed in the PM data tables.
- Optimized—Performance data with all zero values and performance data with all invalid flags are not displayed and are not stored in the database.

Caution If robust PM data collection is enabled, do not set PM data storage to Optimized.

Step 4 Click **Save**.

10.3.11 Viewing the Robust PM Collection Queue

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **PM Service**. The PM Service pane opens.

Step 3 In the Robust PM Collection Queue area are the following display-only fields:

- Number of 15-Min Registers Outstanding—Number of performance data collections carried out every 15 minutes that are not yet scheduled for collection.
- Number of 1-Day Registers Outstanding—Number of performance data collections carried out every 24 hours that are not yet scheduled for collection.

Step 4 (Optional) Click **Clear Robust PM Queue** to clear the queue. Then, click **Save**.

10.3.12 Using the Self Monitor Table

When Prime Optical comes close to or exceeds the limits of its performance, it might result in a reduction in the response time of the system. In this case, error messages are displayed to tell you to restore normal operation. The Self Monitor table allows you to monitor parameters that help in determining when Prime Optical is close to the limit of its performance.

The Self Monitor table displays information about Prime Optical threshold parameters. These parameters are collected and evaluated based on the NE model types. Self-monitoring can be used for CPU usage, memory usage, and disk usage. You can filter the Self Monitor table on the collection time, the model type, and the parameter name.

To view the Self Monitor table, choose **Administration > Self Monitor** in the Domain Explorer. The following table provides descriptions.

Table 10-8 Field Descriptions for the Self Monitor Table

Column Name	Description
Alias ID	Alias name of the NE.
Parameter Name	Name of the parameter. See the Alarm Configuration pane in the Control Panel for a list of monitored parameters.
Model Type	NE model type. When NE model types are not applicable, “System” is displayed as the model type.
Collection Time (*time zone*)	Time when Prime Optical collected the parameter data.
Value	Total number of seconds to retrieve the information for the name of the parameter.
NE ID	Name of the selected NE. If you open the Self Monitor table without selecting an NE, the NE ID is *CTM*.

10.3.13 Filtering the Self Monitor Table

Step 1 In the Domain Explorer window, choose **Administration > Self Monitor**.

Step 2 In the Self Monitor table, choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 3 Specify the filter parameters described in the following table.

Step 4 After making your selections, click **OK**.

Table 10-9 Field Descriptions for the Self Monitor Table Filter Dialog Box

Tab	Description
Collection Time (*time zone*)	You can filter data for a specified time period, ranging from the past hour to the past 180 days. Additionally, you can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. If you want to filter data and the time period is not important, click **No Time Specified**.
Model Type	You can move NE model types back and forth between the list of available model types and selected model types. The filter runs on the model types in the Selected Model Type list.
Parameter Name	You can move parameters back and forth between the list of available parameter names and selected parameter names. The filter runs on the parameters in the Selected Parameter Names list.

10.4 How Do I Query, View, Filter, and Graph PM Data?

This section describes the tools you use to query, view, filter, and graph the data displayed in PM tables.

10.4.1 Using the PM Table Query

The PM table query opens when you select an NE, group, or domain node in the Domain Explorer and choose **Performance > PM Query by Category** or **PM Query by NE Model**.

- Use the PM Query by Category wizard to filter PM data based on the PM category.
- Use the PM Query by NE Model wizard to filter PM data by NE model.

10.4.1.1 Using the PM Query by Category Wizard

Use the PM Query by Category wizard to view PM data by PM category.

Note The PM Query by Category wizard is not supported for the ONS 155xx.

Note The CPT 200 and CPT 600 NEs support only the Ethernet, SONET, OTN, and Optical categories.

Step 1 In the Domain Explorer tree, select the management domain, group, or NE node for which to view historical performance data, and choose **Performance > PM Query by Category**. Table 10-10 provides descriptions. Fields shown depend on the PM category selected.

Step 2 In the Category area, select the category and type from the drop-down lists.

Step 3 Select the PM data collection interval (15 Minute, 1 Day, or Real-Time).

Note The Real-Time option is disabled if you select a management domain or group node. The Real-Time option is enabled only if you select a single NE in the Domain Explorer tree.

Step 4 (Optional) Click **Next**.

Note Depending on the NE type selected, some of the following screens might not appear. If a screen does not appear, skip the step and move on to the next one.

Step 5 In the Near End/Far End Selection screen, select whether to filter for near- or far-end PM data; then, click **Next**.

Step 6 In the Module Category screen, select the module category from the list; then, click **Next**.

Step 7 In the RPR Type Selection screen, select the type of RPR 802.17 data to display; then, click **Next**.

Step 8 In the Physical Location screen, depending on the NE type, select the rack, subrack (shelf), slot, subslot, and port from the list; then, click **Next**.

Step 9 In the Module Type Selection screen, add or remove module types from the lists; then, click **Next**.

Note For real-time PM data collection, the Module Type Selection screen lists only the module that corresponds to the slot selected in the Physical Location screen.

Historical data might have been collected on a module that is no longer present at the selected physical location. Therefore, for historical PM data collection, the modules are not filtered by physical location.

Step 10 Click **Finish**. The PM table opens. See Appendix E, "Performance Data" for field descriptions for each PM table.

Table 10-10 Field Descriptions for the PM Query by Category Wizard

Field	Description
Category Selection Screen	
Category	Select a PM category from the list. Available categories vary by selected NE.
Type	Select a PM query type for the NE. PM types vary by selected category.
15 Minute	Filters for PM data received in the last 15 minutes. 15-minute PM data can be queried for a range of time from the past hour to the past 30 days.
1 Day	Filters for PM data received in the last day. 1-day PM data can be queried for a range of time from the past 7 days to the past 180 days.
Real-Time (*CTC-based NEs*)	Launches a real-time PM report, which allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. You can view and modify the polling interval for the real-time PM reporting session. You can end a real-time PM session at any time and export the data. **Note** You can also launch a real-time PM session from a selected row in a PM table. This is useful if you want to query on a single physical location (for example, Slot 1, Port 1).
User Specified	Specify exact filter start and end times by date and hour. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue.
Near End/Far End Selection Screen	
Near End	Filters for near-end PM data.
Far End	Filters for far-end PM data.
Module Category Screen	
Module Category	Select a module category from the list. Available categories vary by selected NE. This screen appears only if you select Ethernet as both the category and type in the Category Selection screen.
RPR Type Selection Screen	

Table 10-10 Field Descriptions for the PM Query by Category Wizard (continued)

Field	Description
RPR Type Selection	Filters RPR 802.17 PM data by MIB group: • Span Stats In • Span Stats Out • Client Stats In • Client Stats Out • Error Stats
Physical Location Screen	
Physical Location	Filters PM data by slot, subslot, or port. Use the lists to select the slot, subslot, or port for which you want to display PM data. If you select a CTC-based NE, you can filter fault and performance data by shelf, slot, and port.
Module Type Selection Screen	
Available Modules	List of modules that are available for PM filtering. Select a module and click **Add** to move it to the Selected Modules list.
Selected Modules	List of modules that are selected for PM filtering. Select a module and click **Remove** to remove it from filtering consideration.

The following table shows which PM tables are available for each category.

Table 10-11 PM Tables by Category

Category	PM Tables
SONET	SONET Section PM table
	SONET Line PM table
	SONET STS Path PM table
	SONET VT1.5 Path PM table
	SONET VT2 Path PM table
SDH	SDH Regenerator Section PM table
	SDH Multiplex Section PM table
	SDH Higher Order Virtual Container PM table
	SDH Lower Order VC3 PM table
	SDH Lower Order VC12 PM table
	SDH Lower Order VC11 PM table
DSn	DS1 PM table
	DS3 PM table
	DS3I PM table

Table 10-11 PM Tables by Category (continued)

Category	PM Tables
DWDM	B1 Counters PM table
	FEC Counters PM table
	B1 and FEC Counters PM table
	Ethernet Parameters PM table
Edge SDH	Edge SDH Regeneration Section PM table
	Edge SDH Multiplex Section PM table
	Edge SDH Higher Order VC4 PM table
	Edge SDH Lower Order PM table
Edge Statistics	Edge Statistics DCC PM table
	Edge Statistics LAN PM table
	Edge Statistics WAN PM table
En	E1 PM table
	E3 PM table
Ethernet	Ethernet PM table
	Ethernet POS PM table
	Ethernet CoS PM table
	Ethernet GFP PM table
	Ethernet LEX PM table
IP SLA	IP SLA PM table
OTN	OTN G.709 Section PM table
	OTN G.709 Path PM table
	OTN FEC PM table
Optical	Optical Physical PM table
SAN	SAN PM table
8B10B	8B10B PM table
RPR	RPR 802.17 PM table

10.4.1.2 PM Query by NE Model Wizard

Use the PM Query by NE Model wizard to view PM data by non-CTC-based NE model.

Step 1 Make sure that performance monitoring is enabled on the NE. See 10.3.5 Activating or Deactivating Performance Monitoring, page 10-12.

Step 2 In the Domain Explorer tree, select the management domain, group, or NE node for which to view historical performance data and choose **Performance > PM Query by NE Model**. Table 10-12 provides descriptions. Fields depend on the type of NE and PM selected.

Step 3 In the NE Model area, select the NE model and NE type from the drop-down lists.

Note You can only select non-CTC-based NEs.

Step 4 Select the PM data collection interval (15 Minute, 1 Day, or Real-Time).

Note The Real-Time option is disabled if you select a management domain or group node. The Real-Time option is enabled only if you select a single NE in the Domain Explorer tree.

Step 5 (Optional) Click **Next**.

Note Depending on the NE type selected, some of the following screens might not appear. If a screen does not appear, skip the step and move on to the next one.

Step 6 In the Near End/Far End Selection screen, select whether to filter for near- or far-end PM data; then, click **Next**.

Step 7 In the Module Category screen, select the module category from the list; then, click **Next**.

Step 8 In the RPR Type Selection screen, select the type of RPR 802.17 data to display; then, click **Next**.

Step 9 In the Physical Location screen, depending on the NE type, select the rack, subrack (shelf), slot, subslot, and port from the list; then, click **Next**.

Step 10 In the Module Type Selection screen, add or remove module types from the lists; then, click **Next**.

Note For real-time PM data collection, the Module Type Selection screen lists only the module that corresponds to the slot selected in the Physical Location screen.

Historical data might have been collected on a module that is no longer present at the selected physical location. Therefore, for historical PM data collection, the modules are not filtered by physical location.

Step 11 Click **Finish**. The PM table opens. See Appendix E, "Performance Data" for field descriptions for each PM table.

Table 10-12 Field Descriptions for the PM Query by NE Model Wizard

Field	Description
NE Model Selection Screen	
NE Model	Select a non-CTC-based NE model from the list.
Type	Select a PM query type for the NE. The PM types vary by selected NE model.
15 Minute	Filters for PM data received in the last 15 minutes. 15-minute PM data can be queried for a range of time from the past hour to the past 30 days.
1 Day	Filters for PM data received in the last day. 1-day PM data can be queried for a range of time from the past 7 days to the past 180 days.

Table 10-12 Field Descriptions for the PM Query by NE Model Wizard (continued)

Field	Description
User Specified	Specify exact filter start and end times by date and hour. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue.
Near End/Far End Selection Screen	
Near End	Filters for near-end PM data.
Far End	Filters for far-end PM data.
RPR Type Selection Screen	
RPR Type Selection	Filters RPR 802.17 PM data by MIB group: • Span Stats In • Span Stats Out • Client Stats In • Client Stats Out • Error Stats
Physical Location Screen	
Slot	Filters PM data by slot.
Port	Filters PM data by port.
Shelf	Filters PM data by shelf.
Subslot (*ONS 15530 and ONS 15540 only*)	Filters PM data by subslot.
Module Type Selection Screen	
Available Modules	List of modules that are available for PM filtering. Select a module and click **Add** to move it to the Selected Module list.
Selected Modules	List of modules that are selected for PM filtering. Select a module and click **Remove** to remove it from filtering consideration.
Real-Time PM Attribute Selection Screen	
Interface Name (also Card, Physical Location, and so on)	Select the type of entity to monitor from this list. The label changes depending on the type of PM selected.
Available PM Attributes	List of real-time attributes that are available for PM filtering. Select an attribute and click **Add** to move it to the Selected PM Attributes list.
Selected PM Attributes	List of real-time attributes that are selected for PM filtering. Select an attribute and click **Remove** to remove it from filtering consideration.

The following table shows which PM tables are available for each NE.

Table 10-13 PM Tables by NE Type

NE	Available PM Tables
ONS 15216	—
ONS 15305	— **Note** See Table 10-11, "PM Tables by Category."
ONS 15310 CL	Physical PM table
	SONET Section PM table
	SONET Line PM table
	SONET STS Path PM table
	SONET VT1.5 Path PM table
	DS3 PM table
	DS1 PM table
	POS PM table
	CoS PM table
	Ethernet PM table
	GFP PM table
ONS 15310 MA SONET	Physical PM table
	SONET Section PM table
	SONET Line PM table
	SONET STS Path PM table
	SONET VT1.5 Path PM table
	DS1 PM table
	DS3 PM table
	CoS PM table
	POS PM table
	Ethernet PM table
	GFP PM table

Table 10-13 PM Tables by NE Type (continued)

NE	Available PM Tables
ONS 15310 MA SDH	Physical PM table
	DS3 PM table
	CoS PM table
	POS PM table
	Ethernet PM table
	GFP PM table
	Lower Order VC12 PM table
	Lower Order VC3 PM table
	SDH E1 PM table
	SDH E3 PM table
	SDH RS PM table
	SDH MS PM table
	SDH HO PM table
ONS 15530	SONET Section PM table
	Line PM table
	CDL PM table
	Physical PM table
	FC Port Errors PM table
	Ether History PM table

10.4.2 Configuring PM Collection Settings

Use the PM Collection Settings wizard to configure PM collection settings by NE type.

Step 1 Make sure that performance monitoring is enabled on the NE. See 10.3.5 Activating or Deactivating Performance Monitoring, page 10-12.

Step 2 In the Domain Explorer tree, select the management domain, group, or NE node for which to configure PM collection settings and choose **Performance > PM Collection Settings**. The following table provides descriptions. Fields depend on the type of NE selected.

Step 3 In the NE Selection screen, complete the following substeps:

a. In the NE Model area, select the NE model for PM collection settings from the drop-down list.

b. In the Network Elements area, click the **Add** and **Remove** buttons to move NEs of the selected type to the Selected NEs list. (Use the **Remove** button to remove NEs from the list.) By default, the Selected NEs list contains all of the NEs of the selected type in the Domain Explorer or Subnetwork Explorer when the wizard was launched.

c. Click **Next**.

Step 4 Depending on the NEs selected in the previous step, select the PM data collection intervals in one of the following screens:

- PM Collection Selection (15 Min, 1 Day)—NEs that support 15-minute, 15-minute robust, 1-day, and 1-day robust PM collection (CTC-based NEs, ONS 15310, and ONS 15305).
- PM Collection Selection (15 Min Only)—NEs that support only 15-minute PM collection (ONS 155xx).

Step 5 Click **Finish**.

The PM data collection settings are applied to all of the NEs in the Selected NEs list.

Table 10-14 Field Descriptions for the PM Collection Settings Wizard

Field	Description
NE Selection Screen	
NE Model	Select the NE type for which you want to configure PM collection settings. The type you select determines the NEs that are displayed in the Network Elements area.
Network Elements	Use the **Add** and **Remove** buttons to move the NEs for which you want to configure PM collection settings to the Selected NEs list, or to remove NEs from the list.
PM Collection Selection (15 Min, 1 Day) Screen	
15 Min	If checked, 15-minute PM data collection is configured for the NEs you selected in the NE Selection screen.
1 Day	If checked, 1-day PM data collection is configured for the NEs you selected in the NE Selection screen.
15 Min Robust	(Available only if 15 Min is checked) If checked, 15-minute robust PM data collection is configured for the NEs you selected in the NE Selection screen.
1 Day Robust	(Available only if 1 Day is checked) If checked, 1-day robust PM data collection is configured for the NEs you selected in the NE Selection screen.
PM Collection Selection (15 Min Only) Screen	
15 Min	If checked, 15-minute PM data collection is configured for the NEs you selected in the NE Selection screen.

10.4.3 Launching the PM Table for Layer 3 Links from the Network Map

Step 1 In the Domain Explorer or Subnetwork Explorer tree, click a node and choose **File > Network Map** (or click the **Open Network Map** tool).

Step 2 Right-click a Layer 3 link in the Network Map and choose **Link PM Data** from the right-click menu.

10.4.4 Managing Real-Time PM Data

Prime Optical supports the ability to launch a real-time PM report from the PM Query wizard or from a single row in a PM table. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. You can view and modify the polling interval for the real-time PM reporting session.

Note Real-time PM reporting applies only to CTC-based NEs.

The following real-time PM selection options are available:

- Polling—When selected, Prime Optical periodically polls the selected PM parameter(s) on the selected NE. The polling intervals are 10 to 900 seconds—For CTC-based NEs

  Note You can specify the real-time polling interval in the Real-Time Polling dialog box. See 10.4.4.1 Changing the Real-Time Polling Interval, page 10-27.

- Refresh—Allows you to start polling of real-time attributes if real-time polling is disabled in the Real-Time Polling dialog box.
- Baseline—When selected, the most recently collected data set is saved into a buffer. All new values are recalculated as they arrive based on the saved baseline values.

  Note Not all values can be saved as a baseline. For example, null and string values cannot be saved as baseline values.

- Clear Baseline—Sets the baseline values to zero.
- Clear—Clears the current real-time PM buffer of all values.

Each 15-minute or 1-day PM table has a corresponding real-time PM table. However, not all of the fields in the historical PM tables are shown in the real-time PM tables. The first fields in real-time PM tables are:

- Alias ID—Alias name of the selected NE.
- Module Name—Module for which PM data is displayed.
- Physical Location—Slot and port number for which PM data is displayed.
- Interface—Interface name of the selected NE.
- Time Stamp—Time when the performance statistics were collected.
- Maintenance—Whether the NE was under maintenance when the performance data was collected.

The remaining fields are the actual real-time attributes being polled.

When a real-time PM session is running, it polls CTC-based NEs for *x* number of attributes every 10 to 900 seconds. The data it returns is stored entirely in transient memory. You can use the PM Service properties pane in the Control Panel window to limit the scope of the real-time PM session. See 10.3.3 Understanding the PM Service Pane, page 10-4.

- To launch a real-time PM report from the PM Query wizard, see 10.4.1.1 Using the PM Query by Category Wizard, page 10-17 or 10.4.1.2 PM Query by NE Model Wizard, page 10-20. In the NE Model Selection screen, click the **Real-Time** radio button.

- To launch a real-time PM report from a single row in a PM table, select a row and choose **View > Launch Real-Time Performance Session** (or click the **Launch Real-Time Performance Session** tool).
- To clear the real-time PM counters on the NE, choose **View > Clear PM Counters on NE** (or click the **Clear PM Counters on NE** tool).

Note Use the toolbar icons to manage the real-time display. See Appendix A, "Icons and Menus Displayed in Prime Optical" for an explanation of the icons.

10.4.4.1 Changing the Real-Time Polling Interval

By default, the real-time PM session polls the attributes every 10 seconds for CTC-based NEs. You can configure the polling interval from 10 to 900 seconds.

Step 1 Launch a real-time PM table.

Step 2 Choose **View > Specify Real-Time Polling Interval** (or click the **Specify the Real-Time Polling Interval** tool). The Real-Time Polling dialog box opens.

Step 3 In the Specify Real-Time Polling Interval field, enter a number from 10 to 900 seconds.

Step 4 Complete one of the following options:

- To save the change, click **Apply**.
- To save the most recently collected data set into a buffer, click **Baseline**. All new values are recalculated as they arrive based on the saved baseline values.
- To set the baseline values to zero, click **Clear Baseline**. This disables the baseline set.
- To discard changes and close the dialog box, click **Cancel**.

10.4.4.2 Enabling or Disabling Real-Time Polling

Step 1 Launch a real-time PM table.

Step 2 Choose **View > Specify Real-Time Polling Interval** (or click the **Specify the Real-Time Polling Interval** tool).

Step 3 To disable real-time polling, uncheck the **Enable Real-Time Polling** check box. To enable real-time polling, leave this check box checked. When automatic polling is enabled, you do not need to manually refresh the real-time PM table.

Step 4 Click **Apply**.

10.4.5 Filtering PM Data

Use the Filter dialog box (**File > Filter**) to filter data according to criteria that you select, and then display the results in a table. The following table provides descriptions.

Note The Filter dialog box is not available for real-time PM data.

Table 10-15 Field Descriptions for the PM Table Filter

Tab	Description
Time Stamp (also *Time Period*)	Filters PM data for a specified time period, ranging from the past hour to the past 6 months. Additionally, you can click the **User Specified** radio button to specify exact filter start and end times by date and hour. The time zone used can be GMT, an offset from GMT, or local time, depending on what you specified in the User Preferences dialog box. Use the calendar tool to choose the year, month, and day: • Year—Click the year combo box or the double arrow (<<, >>) at the bottom of the calendar. • Month—Click the month combo box or the single arrow (<, >) at the bottom of the calendar. • Day—Click the day number on the calendar. The current date is shown in blue. If you want to filter events and the time period is not important, click **No Time Specified**.
NE ID (also *Network Elements*)	Filters PM data by NE. PM data will display for NEs in the Selected list. Use the **Add** and **Remove** buttons to select the NEs for which you want to display PM data.
Module Name (also *Managed Entities*; not available for all NEs)	Filters PM data by module. PM data will display for modules in the Selected list. Use the **Add** and **Remove** buttons to select the modules for which you want to display PM data.
Physical Location	Filters PM data by rack, subrack (shelf), slot, subslot, card, or port. (Options depend on the type of NE selected.) Use the drop-down lists to select the entity for which you want to display PM data.

10.4.6 Using PM Data Graphs

PM tables contain a Plot tab that allows you to plot historical or real-time PM data in a graphical view that is stored in the Prime Optical database. You can plot a maximum of three PM parameters at a time per graph. You can select a line or bar graph type and you can display multiple traces on the same set of axes for comparison. Prime Optical automatically scales the graph's Y-axis to best show the values of the measured parameters. You can launch a graph of PM data for the following data types:

- One PM parameter on one board
- Multiple PM parameters on one board

Note Parameters must have similarly scaled ranges, such as errored seconds and severely errored seconds. For example, you cannot plot bit errored rate and errored seconds on the same graph. Instead, these parameters are plotted on separate graphs.

- One PM parameter on multiple boards

Note Boards must all support the selected PM parameter.

Complete the following steps to use PM data graphs:

Step 1 View PM data by PM category (see 10.4.1.1 Using the PM Query by Category Wizard, page 10-17) or non-CTC-based NE Model (see 10.4.1.2 PM Query by NE Model Wizard, page 10-20).

Step 2 From the PM table, select the row of the NE, port, or slot for which you want to view the PM data on a graph.

Step 3 Choose **View > Plot** (or click the **Plot** tool).

Note To plot the graph, you must choose **View > Plot** or click the **Plot** tool. If you simply click the Plot tab (without choosing **View > Plot** or clicking the **Plot** tool), the graph is not filled out.

In the **Plot** tab, the graph is displayed. The graph can plot a maximum of three PM parameters. The graph's status bar displays the selection context in the following format:

```
<NE_ID>:<Module>:<Physical_location>:<Interface>:<Time_stamp [Time_zone]>
```

Note *Physical-location* includes shelf, slot, and port information; for example, Shelf: 1, Slot: 14, Port: 0.

Step 4 Use the plot-specific toolbar buttons to manage the graphical display. Choose **View > Zoom In**, **Zoom Out**, or **Fit in Window** to adjust the zoom level. You can also click the **Zoom In**, **Zoom Out**, or **Fit in Window** tools.

Note If Prime Optical cannot complete samples retrieval in a certain time frame (for example, due to a temporary loss of communication), the PM graph interpolation will be traced from the last sample that was retrieved before the malfunction occurred to the first sample that was retrieved after normal behavior was restored.

10.4.6.1 Configuring a Graph

Use the Graph Parameters Selection dialog box to modify the parameters that are plotted in a graph.

Step 1 From the PM table, select the row for which you want to view the PM data on a graph.

Step 2 Choose **View > Graph Configure** (or click the **Configure Graphing Parameters** tool). The Graph Parameters Selection dialog box opens.

Step 3 For historical PM graphs, select the start and end times in the Time Panel area. Select the date, hour, and minute from the corresponding drop-down lists.

Note Real-time PM graphs do not have a Time Panel area, because a time range does not apply to real-time data.

Step 4 In the Parameter Selection area, select the parameters from the Available Parameters list that you want to plot in the graph. You can generate a maximum of three graphs and each graph can plot a maximum of three parameters.

Step 5 Click the **Add** button that corresponds to the graph where the parameter will be plotted. Selected parameters are listed in the Selected Parameters: Graph *number* list.

Step 6 To remove parameters from the Selected Parameters: Graph *number* list, select parameters and click **Remove**.

Step 7 Click **OK**. The graph is displayed in the Plot tab. The status bar displays the module name, physical location, interface, date range, and time stamp range.

Step 8 You can adjust the zoom level for each graph. Click a graph and choose **View > Zoom In**, **Zoom Out**, or **Fit in Window**. You can also click the **Zoom In**, **Zoom Out**, or **Fit in Window** tools.

Step 9 You can normalize or restore the Y axes values in historical PM graphs. Choose **View > Normalize Y Axes** or **Restore Y Axes** (or click the **Normalize Y Axes** or **Restore Y Axes** tools). The Normalize option allows you to normalize axes values and compare data of the same type (for example, receive versus transmit packets). The Restore option restores axes values to the previous graph visualization.

Note The Normalize and Restore options do not apply to real-time PM graphs.

10.4.6.2 Printing a Graph

Step 1 After viewing PM data on a graph or configuring a graph, choose **File > Print Graph** (or click the **Print Graph** tool). The Print dialog box opens.

Step 2 Select your printer and configure the page setup options, as necessary.

Step 3 Click **OK**.

Note PM graphs might not print completely on some printers with the default page setup settings. In this case, you need to change the printer setup. To do this, click **Properties** in the Print dialog box. Click **Advanced**. Change the scaling to a value that prints the complete graph; for example, 10% or 20%. Click **OK**.

10.4.7 Understanding How Prime Optical Displays the Interface Field

Prime Optical displays the Interface field in PM tables as follows:

- ONS 15305

  Prime Optical representation:

  Interface-type#*Interface-type-number*AUG4-*AUG4-number*/AUG1-*AUG1-number*/TUG3-*TUG3-number*/TUG2-*TUG2-number*/TU12-*TU12-number*

  where:

  - *Interface-type* is the affected interface object
  - *Interface-type-number* is the interface number
  - *AUG4-number* is the AUG4 number (applies to VC-4, VC3, and VC12)
  - *AUG1-number* is the AUG1 number (applies to VC-4, VC3, and VC12)
  - *TUG3-number* is the TUG3 number (applies only to VC3 and VC12 interfaces)
  - *TUG2-number* is the TUG2 number (applies only to VC12 interfaces)
  - *TU12-number* is the TU2 number (applies only to VC12 interfaces)

- SDH

  Prime Optical representation:

  Interface-type#*VC4-number*/VC3-*VC3-number*/TUG2-*TUG2-number*/VC12-*VC12-number*

  where:

  - *Interface-type* is the affected interface object (for example, VC4, VC4-2c, VC3, VC12, and so on)
  - *VC4-number* is the VC4 number in that interface (applies only to VC4, VC3, and VC12 interfaces)
  - *VC3-number* is the VC3 number in that VC4 (applies only to VC3 interfaces)
  - *TUG2-number* is the TUG2 number in that VC3 (applies only to VC12 interfaces)
  - *VC12-number* is the VC12 number in that TUG2 (applies only to VC12 interfaces)

  For example, for alarms on a VC12 interface with VC4-number = 1, VC3-number = 2, TUG2-number = 1, and VC12-number = 2, Prime Optical displays VC12 #1/VC3-2/TUG2-1/VC12-2, where the first field is the affected interface and VC4 number (#*VC4-number*). This example indicates that the alarm is on the VC12 interface with the VC4 number equal to 1 (VC12 #1).

- SONET

  Prime Optical representation:

  Interface-type#*STS-number*/*VT-group-number*-*VT-number-in-group*

  where:

  - *Interface-type* is the affected interface object (for example, STS1, STS3c, VT-1, and so on)
  - *STS-number* is the STS number on that interface (applies only to STS and VT interfaces)
  - *VT-group-number* is the VT group number for that STS number (applies only to VT interfaces)
  - *VT-number-in-group* is the VT number in that VT group (applies only to VT interfaces)

  For example:

- For a VT path-level alarm with STS-number = 1, VT-group-number = 2, and VT-number-in-group = 1, Prime Optical displays VT-1 #1/2-1, where the first field is the affected interface and STS number (#*STS-number*). This example indicates that the alarm is a VT path-level alarm with STS-number = 1 (VT-1 #1).
- For an STS path-level alarm with STS-number = 1, Prime Optical displays STS3c #1, where the first field is the affected interface and STS number (#*STS-number*). This example indicates that the alarm is an STS path-level alarm with STS-number = 1 (STS3c #1).

Managing Inventory

This chapter describes how to manage inventory using Cisco Prime Optical. It contains the following sections:

- 11.1 Overview, page 11-1
- 11.2 Domain NE Table, page 11-2
- 11.3 Equipment Inventory Table, page 11-11

11.1 Overview

Managing inventory involves maintaining a record of all of the network element (NE) resources installed in the network to support the provisioning of services. It should include collecting information about locations, quantities of equipment, model numbers, serial numbers, versions, installation dates, and so on.

Inventory management is one of the fundamental network management functions. When forecasting service growth or even attempting to provision a new service, it is necessary to know the current network inventory. Can the existing inventory support the forecast growth or new service requests, or must additional equipment be ordered and installed onsite? Can your hardware support a new software release? You will need to check the type and revision of hardware to determine the answer. Has a recall been issued by the vendor for a certain hardware revision of a board? Are you affected? You will need to check the inventory again.

Prime Optical allows you to add NEs, and it autodiscovers the details about the NE itself and the contained physical inventory. Prime Optical remains automatically synchronized with changes relating to inventory that might occur in the network. All inventory information is stored in the Prime Optical database and is available at any time.

Inventory management includes the discovery of the NEs from the EMS, and ongoing synchronization with the NEs. It also includes the ability to provide the inventory to a higher-level NMS through a northbound interface.

Prime Optical can quickly capture, display, and store an inventory of the NEs on your network. It allows you to view information about the NEs, installed software, and software licenses. Prime Optical also lets you edit the inventory information for the NEs in your network.

For passive NEs, you can add inventory information manually. You can also add inventory information for unmanaged NEs or for NEs from other vendors.

Prime Optical allows you to export inventory reports to a flat text file with a user-specified delimiter character. This file can be imported easily into a spreadsheet application for further analysis.

Note Japanese characters are supported for inventory reports. When generating a report from the Domain NE table, choose **File > HTML Report** for a report that includes Japanese characters.

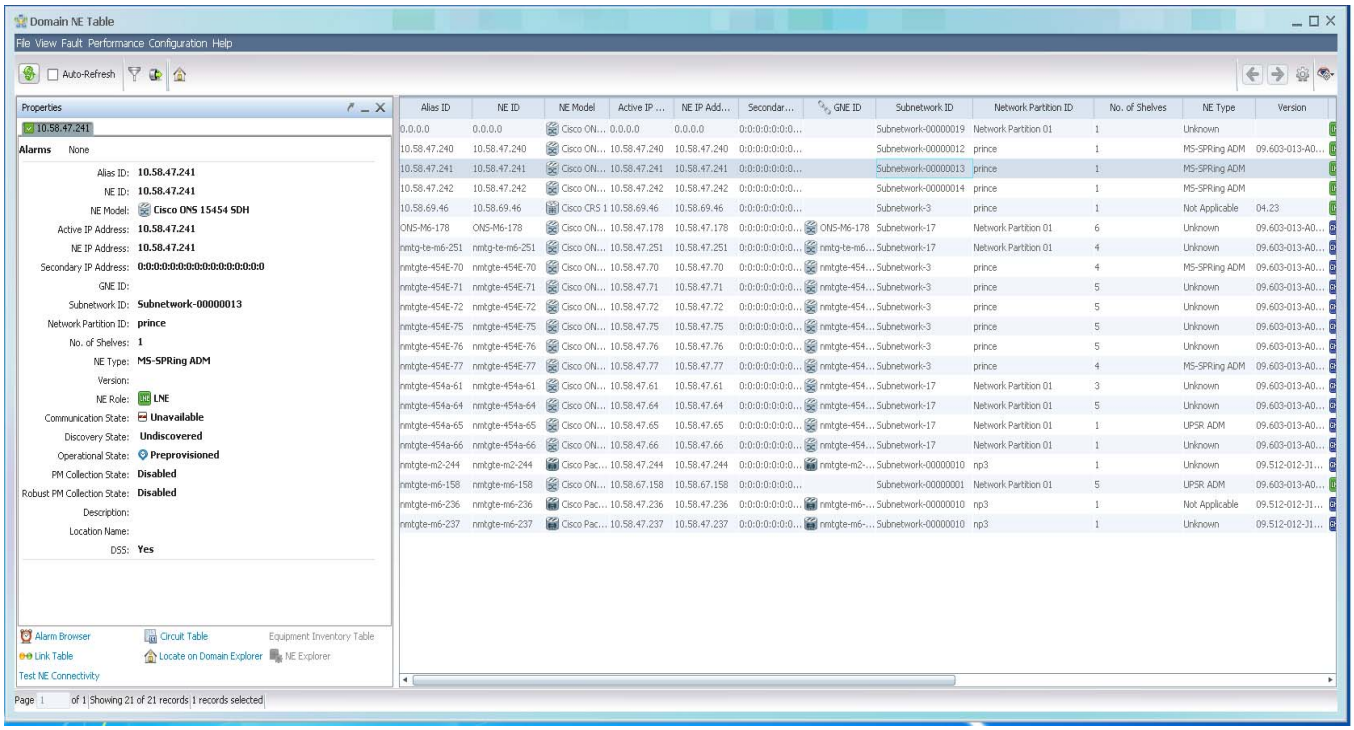
Prime Optical provides two levels of inventory reports:

- A complete list of all the NEs that belong to a specific group or to the entire domain. See 11.2 Domain NE Table, page 11-2.
- A detailed list of cards and modules installed on the NEs. See 11.3 Equipment Inventory Table, page 11-11.

11.2 Domain NE Table

The Domain NE table displays an inventory of all the NEs in the selected Prime Optical domain, group, or subnetwork. Based on your selection criteria, the Domain NE table tells you which NEs are in or out of service, available or unavailable, and so on. The following figure shows an example of the Domain NE table.

Figure 11-1 Domain NE Table



Note See Appendix A, "Icons and Menus Displayed in Prime Optical" for details of all the icons displayed in the window.

You can test NE connectivity, locate an NE on the Domain Explorer, and launch the Alarm Browser from the Domain NE Table. You can also launch the NE Explorer, Equipment Inventory Table, Circuit Report, and Link Table from the **Configuration** menu in the Domain NE Table.

You can also change the state of an NE by selecting the NE and then choosing **Configuration > Change State**. The following options are available:

- Mark In Service
- Mark Out of Service
- Mark Under Maintenance

Note All of the above features can also be launched by right-clicking an NE in the Domain NE table and selecting the appropriate option from the popup menu that appears.

11.2.1 Viewing the Domain NE Table

Select a node in the Domain Explorer or Subnetwork Explorer tree and choose **File > Domain NE Table**. The following table provides descriptions.

Table 11-1 Field Descriptions for the Domain NE Table

Field	Description
Alias ID	Alias name of the NE.
NE ID	Name of the selected NE.
NE Model	Selected NE model: • Cisco ONS 15216 • Cisco ONS 15305 • Cisco ONS 15310 CL • Cisco ONS 15310 MA or Cisco ONS 15310 MA SDH • Cisco ONS 15327 • Cisco ONS 15454 or Cisco ONS 15454 SDH • Cisco ONS 15530 • Cisco ONS 15540 • Cisco ONS 15600 or Cisco ONS 15600 SDH
Active IP Address	IP address of the GNE, in IPv4 or IPv6 format.
NE IP Address	IP address of the NE, in IPv4 or IPv6 format. Prime Optical tries to connect to the NE using an IPv4 address. If the IPv4 address is unreachable, Prime Optical tries to connect to the NE using its IPv6 address, if configured and reachable. **Note** If the node is a gateway network element (GNE) or a LAN-connected network element (LNE), the NE IP address is the same as the active IP address.
Secondary IP Address	Secondary IP address of the NE. If the IPv6 address is unreachable, Prime Optical tries to connect to the NE using its IPv4 address. **Note** If IPv6 is not configured on the NE, the IP address 0:0:0:0:0:0:0:0 is shown.
GNE ID	ID for the GNE on the selected NE's ring.
Subnetwork ID	Name of the subnetwork associated with the selected NE.
Network Partition ID	Name of the network partition to which this NE is associated.

Table 11-1 Field Descriptions for the Domain NE Table (continued)

Field	Description
No. of Shelves	Number of shelves supported by the NE.
NE Type	Type of NE.
Version	NE software version that is running.
NE Role	Role of the selected NE.
Communication State	Connectivity state between Prime Optical and the selected NE: Available, Unavailable, and Initialization Failed.
Discovery State	Discovery state of the selected NE: Initializing or Synch Configuration.
Operational State	Current operational state of the system: In Service, Under Maintenance, or Out of Service.
PM Collection State (*not applicable to ONS 15216*)	Whether performance monitoring collection is enabled or disabled. You can configure the PM collection state in the Domain Explorer > Network Element Properties pane > Status tab.
Robust PM Collection State (*not applicable to all NEs*)	Whether robust PM collection is enabled or disabled. You can configure the robust PM collection state in the Domain Explorer > Network Element Properties pane > Status tab. **Note** You cannot collect robust PM data until at least one 15-minute or one 1-day interval has been collected in normal operation. **Note** Robust PM data collection applies only to CTC-based NEs and to the ONS 15305, ONS 15530, and ONS 15540. Robust PM collection is not supported for the ONS 15216. **Note** You can collect up to 8 hours of 15-minute robust PM data for CTC-based NEs. **Note** You can collect up to the previous day's 1-day robust PM data for CTC-based NEs. **Note** For the ONS 15530 and ONS 15540 ESPx, you can collect up to 24 hours (96 previous missed intervals) of 15-minute robust PM data and up to the previous day's 1-day robust PM data. **Note** For the ONS 15540 ESP, you can collect up to 24 hours (96 previous missed intervals) of 15-minute robust PM data.
Description	Information that a user might have entered to describe the selected NE.
Location Name	Geographic location of the NE.
DSS	Indicates whether or not the selected CTC-based SONET or CTC-based SDH NE serves as a designated SOCKS server (DSS). If so, the NE manages connectivity among other NEs through firewalls. Values for the DSS column are Yes, No, and Not Applicable.

Tip The Dashboard window displays an NE counter icon. This counter lists the total number of NEs in the domain. Click the counter to open the Domain NE table.

11.2.2 Filtering the Domain NE Table

Step 1 Select a node in the Domain Explorer or Subnetwork Explorer tree.

Step 2 Choose **File > Domain NE Table**. The Domain NE table opens. (See Figure 11-1.)

Step 3 Choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 4 Specify the filter criteria to display the results in the Domain NE table. The following table describes the fields in the filter.

Step 5 Click **OK**. The filtered data is displayed in the Domain NE table.

Table 11-2 Field Descriptions for the Domain NE Table Filter

Field	Description
NE ID Tab	
Available NE ID/Selected NE ID	List of available NE IDs. Click **Add** and **Remove** to move NE IDs to and from the Selected NE ID list. **Note** Use the scroll bars at the bottom and right side of the Available NE ID list and the Selected NE ID list to display all options in the lists.
Inventory Tab	
Communication State	Filters NEs according to their communication state (Available, Unavailable, and Initialization Failed).
Operational State	Filters NEs according to their operational state (In Service, Out of Service, Preprovisioned, or Under Maintenance).
PM Collection State	Filters NEs according to their PM collection state (Enabled; 5,10,15 Min Collection; 1 Day Collection; Disabled).
Robust PM Collection State	Filters NEs according to their robust PM data collection state (Enabled, 15 Min Collection, 1 Day Collection, Disabled).
GNE	Filters domain inventory data based on GNE IDs. You can select <ALL> to filter all GNE IDs or you can choose a particular GNE ID from the drop-down list.
NP ID Tab	
Available Network Partitions/Selected Network Partitions	Filters domain inventory data based on network partition. Click **Add** and **Remove** to move network partitions to and from the Selected Network Partitions list. **Note** Use the scroll bars at the bottom and right side of the Available Network Partitions list and the Selected Network Partitions list to display all options in the lists.

11.2.3 Viewing NE Properties from the Domain NE Table

To view NE properties from the Domain NE Table, do the following:

Step 1 From the **Toggle Frames Visibility** drop-down list, select **Properties**. A dockable Properties window displays the following NE properties:

- Alias ID
- NE ID
- NE Model
- Active IP Address
- NE IP Address
- Secondary IP Address
- GNE ID
- Subnetwork ID
- Network Partition ID
- No. of Shelves
- NE Type
- Version
- NE Role
- Communication State
- Discovery State
- Operational State
- PM Collection State (not applicable to ONS 15216)
- Robust PM Collection State (not applicable to all NEs)
- Description
- Location Name
- DSS

The following links are also available at the bottom of the Properties window:

- Alarm Browser—Launches the Alarm Browser for the selected NE.
- Circuit Report—Launches the Circuit Report for the selected NE.
- Equipment Inventory Table—Launches the Equipment Inventory Table for the selected NE.
- Link Table—Launches the Link Table for the selected NE.
- Locate on Domain Explorer—Locates the selected NE on the Domain Explorer.
- NE Explorer—Launches the NE Explorer for the selected NE.
- Test NE Connectivity—Tests connectivity to the selected NE using the community string configured in the Prime Optical client.

11.2.4 Viewing the ENE Devices Table

Use the ENE Devices table to view subtending end network elements (ENEs) that are supported by a given GNE. The GNE-ENE relationship is calculated on a theoretical projection, which does not necessarily equate to a real network situation.

Step 1 Select a GNE node in the Domain Explorer or Subnetwork Explorer tree.

Step 2 Choose **File > ENE Devices**. The ENE Devices table opens.

The fields in the ENE Devices table are identical to the fields in the Domain NE table (see Table 11-1), except that the ENE Devices table shows only those ENEs that are associated with the selected GNE.

11.2.5 Viewing the TNE Devices Table

Use the TNE Devices table to view information about each tunnel NE (TNE) that Prime Optical manages. The Edit menu options allow you to open, close, or modify an individual TL1 tunnel.

Step 1 Select any node in the Domain Explorer or Subnetwork Explorer tree.

Step 2 Choose **File > TNE Devices**. The TNE Devices (Tunnel) table opens. The following table provides descriptions.

Step 3 (Optional) To open, close, or modify a TL1 tunnel, select an individual TNE in the table and choose any of the following menu options:

- **Edit > Open Tunnel**—Opens a TL1 tunnel on the selected TNE. See 11.2.7 Opening a TL1 Tunnel, page 11-8.
- **Edit > Close Tunnel**—Closes the TL1 tunnel on the selected TNE. See 11.2.8 Closing a TL1 Tunnel, page 11-9.
- **Edit > Modify Tunnel**—Allows you to modify the settings of the selected TNE. See 11.2.9 Modifying a TL1 Tunnel, page 11-10.

Table 11-3 Field Descriptions for the TNE Devices Table

Field	Description
TNE ID	ID of the selected tunnel NE.
Alias ID	Alias of the selected tunnel NE.
GNE IP Address	IP address of the non-Cisco GNE.
TL1 Port Number	Port number used by the non-Cisco GNE to support the TL1 tunnel.
Encoding Type	Type of encoding used by the selected tunnel NE. Values are LV + Base64 Payload, LV + Binary Payload, or Raw.
Tunnel Status	Status of the selected TL1 tunnel.

11.2.6 Filtering the TNE Devices Table

Step 1 Select any node in the Domain Explorer or Subnetwork Explorer tree.

Step 2 Choose **File > TNE Devices**. The TNE Devices (Tunnel) table opens.

Step 3 Choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 4 Specify the filter criteria to display the results in the TNE Devices (Tunnel) table. The following table describes the fields in the filter.

Step 5 Click **OK**. The filtered data is displayed in the TNE Devices (Tunnel) table.

Table 11-4 Field Descriptions for the TNE Devices Table Filter

Field	Description
TNE ID Tab	
Available Network Partitions/Selected Network Partitions	Filters TL1 tunnel data based on network partition. Click **Add** and **Remove** to move network partitions to and from the Selected Network Partitions list.
GNE IP Address Tab	
Available Network Partitions/Selected Network Partitions	Filters GNE IP address data based on network partition. Click **Add** and **Remove** to move network partitions to and from the Selected Network Partitions list.
Tunnel Status Tab	
Connection Type	Filters TL1 tunnel data based on the status of the tunnel connection. Check any of the following check boxes: • Open—Filters on open TL1 tunnels. • Close—Filters on closed TL1 tunnels. • Initial—Filters on TL1 tunnels that are initializing.

11.2.7 Opening a TL1 Tunnel

Use the Open TL1 Tunnel dialog box to open a TL1 tunnel on the selected TNE.

Step 1 Select any node in the Domain Explorer or Subnetwork Explorer tree.

Step 2 Choose **File > TNE Devices**. The TNE Devices (Tunnel) table opens.

Step 3 In the TNE Devices table, select an individual TNE and choose **Edit > Open Tunnel** (or click the **Open Tunnel** tool). The Open TL1 Tunnel dialog box opens. The following table provides descriptions.

Note The Open Tunnel menu option and tool are dimmed if the TNE Devices table is empty.

Step 4 After making your selections, click **Finish**. The Job Monitor table (**Administration > Job Monitor**) reports the result of the operation.

Table 11-5 Field Descriptions for the Open TL1 Tunnel Dialog Box

Field	Description
TNE ID	*Display only.* ID of the selected tunnel NE.
Alias ID	*Display only.* Alias of the selected tunnel NE.
GNE IP Address	*Display only.* IP address of the non-Cisco GNE.
Port	*Display only.* Port number used by the non-Cisco GNE to support the TL1 tunnel.
TL1 Encoding	*Display only.* Type of encoding used by the selected tunnel NE. Values are LV + Base64 Payload, LV + Binary Payload, or Raw.
Job Comments	Enter comments about the TL1 tunnel, if needed.
Time (*time zone*)	Set a time to open the TL1 tunnel. Click **Now** to open the tunnel immediately, or click **At Time** and specify when to open the tunnel, in 5-minute increments. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.

11.2.8 Closing a TL1 Tunnel

Use the Close TL1 Tunnel dialog box to close the TL1 tunnel on the selected TNE.

Step 1 Select any node in the Domain Explorer or Subnetwork Explorer tree.

Step 2 Choose **File > TNE Devices**. The TNE Devices (Tunnel) table opens.

Step 3 In the TNE Devices table, select an individual TNE and choose **Edit > Close Tunnel** (or click the **Close Tunnel** tool). The Close TL1 Tunnel dialog box opens. The following table provides descriptions.

Step 4 After making your selections, click **Finish**. A warning message is displayed, alerting you that closing a tunnel will result in loss of connectivity to the selected TNE and all of its ENEs.

The Job Monitor table (**Administration > Job Monitor**) reports the result of the operation.

Table 11-6 Field Descriptions for the Close TL1 Tunnel Dialog Box

Field	Description
TNE ID	*Display only.* ID of the selected tunnel NE.
Alias ID	*Display only.* Alias of the selected tunnel NE.
GNE IP Address	*Display only.* IP address of the non-Cisco GNE.
Port	*Display only.* Port number used by the non-Cisco GNE to support the TL1 tunnel.

Table 11-6 Field Descriptions for the Close TL1 Tunnel Dialog Box (continued)

Field	Description
TL1 Encoding	*Display only.* Type of encoding used by the selected tunnel NE. Values are LV + Base64 Payload, LV + Binary Payload, or Raw.
Job Comments	Enter comments about the TL1 tunnel closure, if needed.
Time (*time zone*)	Set a time for the TL1 tunnel closure. Click **Now** to close the tunnel immediately, or click **At Time** and specify when to close the tunnel, in 5-minute increments. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.

11.2.9 Modifying a TL1 Tunnel

Use the Modify TL1 Tunnel dialog box to modify the settings of an individual TNE.

Step 1 Select any node in the Domain Explorer or Subnetwork Explorer tree.

Step 2 Choose **File > TNE Devices**. The TNE Devices (Tunnel) table opens.

Step 3 In the TNE Devices table, select an individual TNE and choose **Edit > Modify Tunnel** (or click the **Modify Tunnel** tool). The Modify TL1 Tunnel dialog box opens. The following table provides descriptions.

Step 4 After modifying the selections, click **Finish**. The Job Monitor table (**Administration > Job Monitor**) reports the result of the operation.

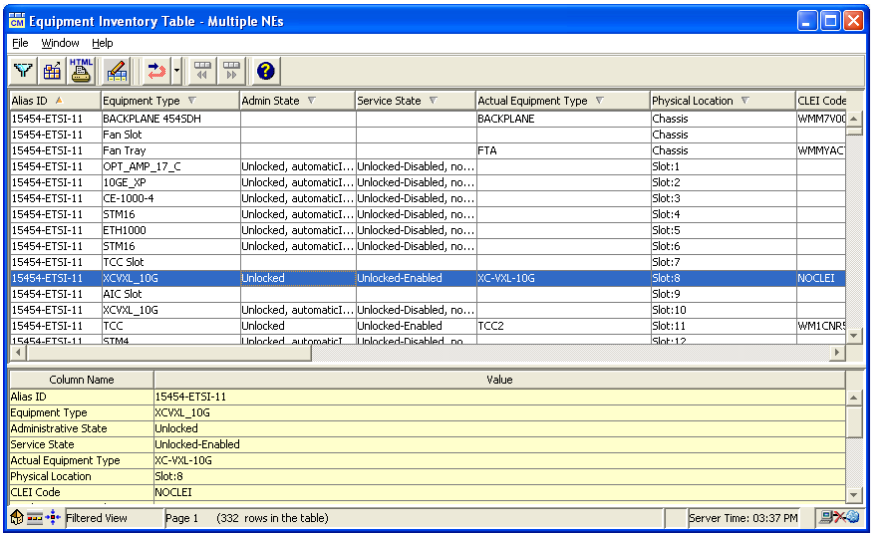
Table 11-7 Field Descriptions for the Modify TL1 Tunnel Dialog Box

Field	Description
TNE ID	*Display only.* ID of the selected tunnel NE.
Alias ID	*Display only.* Alias of the selected tunnel NE.
GNE IP Address	Modify the IP address of the non-Cisco GNE.
Port	Modify the port number used by the non-Cisco GNE to support the TL1 tunnel.
TL1 Encoding	Modify the type of encoding used by the selected tunnel NE. Values are LV + Base64 Payload, LV + Binary Payload, or Raw.
Job Comments	Enter comments about the TL1 tunnel modification, if needed.
Time (*time zone*)	Set a time for the tunnel modification. Click **Now** to begin modification immediately, or click **At Time** and specify when to begin modification, in 5-minute increments. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.

11.3 Equipment Inventory Table

The Equipment Inventory table displays a complete inventory of the components of the selected NE or of the NEs in a group or subnetwork. The following figure shows an example of the Equipment Inventory table.

Figure 11-2 Equipment Inventory Table



Note See Appendix A, "Icons and Menus Displayed in Prime Optical" for details of all the icons displayed in the window.

11.3.1 Viewing an Equipment Inventory Table

Step 1 In the Domain Explorer or Subnetwork Explorer tree, select the NE, group, or subnetwork for which you want to view inventory data, and choose **Configuration**.

Step 2 From the Configuration menu, select the NE model and choose **Equipment Inventory Table**. The Equipment Inventory table for the selected NE model opens.

The following sections provide information about the individual Equipment Inventory tables:

- 11.3.1.1 ONS 15216 Equipment Inventory Table, page 11-12
- 11.3.1.2 ONS 15305 Equipment Inventory Table, page 11-12
- 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13
- 11.3.1.4 ONS 155xx Equipment Inventory Table, page 11-17

Note The Equipment Inventory table is not available for unmanaged NEs.

11.3.1.1 ONS 15216 Equipment Inventory Table

The ONS 15216 Equipment Inventory table displays a complete list of the ONS 15216 system inventory. The following table provides descriptions.

Table 11-8 Field Descriptions for the ONS 15216 Equipment Inventory Table

Field	Description
Alias ID	Alias name of the NE.
Equipment Type	NE model type.
Physical Location	Location where the NE is installed.
Wavelength(s)	Number of wavelengths for this NE.
CLEI Code	CLEI code for the device. CLEI code is an industry-standard code that precisely defines a component.
Product Name	Name of the product.
Serial Number	Serial number of the device.
NE ID	Name of the selected NE.

11.3.1.2 ONS 15305 Equipment Inventory Table

The ONS 15305 Equipment Inventory table displays a complete list of the ONS 15305 system inventory. The following table provides descriptions.

Table 11-9 Field Descriptions for the ONS 15305 Equipment Inventory Table

Field	Description
Alias NE ID	Alias name of the NE.
Module Name	Generic type of card.
Physical Location	Slot number where the card appears.
Install State	Installation state of the card.
Expected Module	Default card for the slot.
Operational State	Operational state of the card. (Not applicable if the slot is empty.)
Software Version	Version of software present on the card. (Not applicable if the slot is empty.)
Board Serial Number	Serial number of the card.
Hardware Version	Hardware version of the card. (Not applicable if the slot is empty.)
NE ID	Name of the selected NE.

11.3.1.3 Equipment Inventory Table for CTC-Based NEs

The Equipment Inventory table for CTC-based NEs displays a complete list of the ONS 15305 R3.0, ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15454-M6, ONS 15454-M2, ONS 15600 SONET, ONS 15600 SDH, CPT 600, or CPT 200 system inventory. This section contains the following tables:

- Field Descriptions for the Equipment Inventory Table—CTC-Based NEs
- Service State and Fault Secondary State Values
- Available Equipment Inventory Fields for Passive Cards

The following table lists common field descriptions for the Equipment Inventory table.

Table 11-10 Field Descriptions for the Equipment Inventory Table—CTC-Based NEs

Field	Description
Alias ID	Alias name of the NE.
Equipment Type	Generic type of card.
Admin State	User-assigned designation that drives whether an entity is in service or out of service. The administrative state is the driver for the service state. For SONET nodes, values are: • IS—In Service. Able to carry traffic. • OOS, DSBLD—Out of Service. Unable to carry traffic. • IS, AINS—Auto In Service. Alarm reporting is suppressed, but traffic is carried. • OOS, MT—Out of Service, Maintenance. Alarm reporting is suppressed, but traffic is carried and loopbacks are allowed. • OOS, OOG—Out of Service, Out of Group. This state is used to place a member circuit out of the group and to stop sending traffic. OOS, OOG applies only to the cross-connects on the end node where the VCAT resides. For intermediate nodes, the cross-connects are OOS, MT. For SDH nodes, corresponding values are: • Unlocked (corresponds to IS) • Locked (corresponds to OOS) • Failed (corresponds to FLT) • Locked Maintenance (corresponds to OOS, MT) • Unlocked Automatic In Service (corresponds to IS, AINS) **Note** If the NE release does not support the administrative state, this field shows *N/A*.

Table 11-10 Field Descriptions for the Equipment Inventory Table—CTC-Based NEs (continued)

Field	Description
Service State	Overall availability of the entity. Values are: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • AINS—Automatic In Service. • DSBLD—Traffic is disabled on the entity. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11. • LPBK—Port or connection has a loopback on it. • MEA—Mismatch of equipment due to invalid equipment insertion. • MT—Maintenance, as per the administrative state change. • SWDL—Software download in progress. • UAS—Unassigned. The entity does not exist, has not been created, or has been deleted. • UEQ—Unequipped. There is nothing in the slot. See Table 11-11 for the Service state–Secondary state possible values. **Note** If the NE release does not support the service state, this field shows *N/A*.
Actual Equipment Type	Specific type of card. This field also shows small form-factor pluggable (SFP) information (such as wavelength, reach, and payload rate), Channel Express (CXP), C Form-Factor Pluggable (CFP), and 10-Gigabit Small Form-Factor Pluggable (XFP) for all line cards and pluggable I/O modules (PIMs) that support pluggable port modules (PPMs). **Note** For the Customer Access Panel2 (CAP2) module on the ONS 15600, Prime Optical displays “CAP” for the Equipment Type and “15600-CAP2” for the Actual Equipment Type.
Physical Location	• Slot number where the card appears. • Unit number of passive units. • FOG number of the PTSA_GE panels. For PPMs, this field contains the slot number and the PPM numbers.
CLEI Code	CLEI code for the card. CLEI code is an industry-standard code that precisely defines a component.
Hardware Part Number	Part number used for the card.
Serial Number	Serial number of the card.
Note	Any user-entered comments relating to the equipment.
Hardware Revision	Hardware revision number of the card.
Firmware Version	Firmware version of the card.

Table 11-10 Field Descriptions for the Equipment Inventory Table—CTC-Based NEs (continued)

Field	Description
Inventory Code	Inventory code of the card.
Application Filename	Name of the file that the card loads from the TCC or XTC flash in order to run its application.
Other Information	Additional information entered by the manufacturer.
Equipment State	Current state of the card. Values are: • Active • Deleted • Empty • Failed • Loading • Mismatch • Not Present • Standby
Product ID	Product ID string of 63 characters maximum. If the card does not support the product ID, the field shows *N/A*.
Version ID	Version ID string in the format *V99_*. The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows *N/A*.
NE ID	Name of the selected NE.

The following table lists the service state and fault secondary state values.

Table 11-11 Service State and Fault Secondary State Values

Service State-Secondary State Possible Values	Initial State Transition	Final State Transition
Equipment		
IS-NR	FLT	OOS-AU, FLT
OOS-AU, FLT	All AE Cleared	IS-NR
OOS-AU, FLT	ED: OOS, MT RMV	OOS-AUMA, FLT & MT
OOS-MA, MT	FLT	OOS-AUMA, FLT & MT
OOS-AUMA	FLT	OOS-AUMA, FLT
OOS-AUMA, FLT & MT	All AE Cleared	OOS-MA
Port		
IS-NR	FLT	OOS-AU, FLT
OOS-AU. FLT	FLT Cleared	IS-NR
OOS-AU, AINS	FLT	OOS-AU, AINS & FLT
OOS-AU, AINS & FLT	FLT Cleared	OOS-AU, AINS
OOS-MA, MT	FLT	OOS-AUMA & FLT & MT
OOAS-AUMA & FLT & MT	FLT Cleared	OOS-MA & MT

Table 11-11 Service State and Fault Secondary State Values (continued)

Service State-Secondary State Possible Values	Initial State Transition	Final State Transition
OOS-AUMA & LPBK & MT	FLT	OOS-MA & LPBK & MT & FLT
OOS-AUMA & LPBK & MT & FLT	FLT Cleared	OOS-MA & LPBK & MT & FLT

Passive units are optical devices that the controller card cannot manage and that are not configurable using software. Passive units can be provisioned only in CTC. The following table lists the field descriptions for passive cards.

Table 11-12 Available Equipment Inventory Fields for Passive Cards

Passive Card Type	Fields
USB-connected	• Equipment Type • Administrative State • Service State • Actual Equipment Type • Physical Location • Equipment State • CLEI Code • HW Part Number • Serial Number • HW Revision
Not USB-connected	• Equipment Type • Administrative State • Service State • Actual Equipment Type • Physical Location • Equipment State

11.3.1.3.1 Adding a Note to the Equipment Inventory Table

The User Note dialog box allows you to view and add user notes to CTC-based equipment that has a valid serial number in the Equipment Inventory table. If a piece of equipment has a note, a User Note tool appears under the Note column. Comments are visible to all users. You can open the User Note dialog box only if you have read/write permissions. These permissions are configurable in the User Profile wizard > NE Configuration Management category > Equipment Inventory row.

Note You can add user notes only for CTC-based NEs.

Step 1 In the Domain Explorer window, choose **Configuration > CTC-Based SONET NEs > Equipment Inventory Table**.

The Equipment Inventory table opens.

Step 2 Select a piece of equipment and choose **Edit > User Note**. The following table describes the fields in the User Note dialog box.

Table 11-13 Field Descriptions for the User Note Dialog Box

Field	Description
Note	Provides space for you to type your comments about the selected equipment. The maximum length of this field is 2048 characters. To add comments to the previous comments, click the **Append** radio button. To overwrite the previous comments, click **Replace**. To delete the comments, click **Delete**. **Note** You cannot enable and disable the Replace and Delete functions in the Control Panel.
History	Displays comments entered by previous users.

11.3.1.4 ONS 155xx Equipment Inventory Table

The ONS 155xx Equipment Inventory table displays a complete list of the system inventory of the selected ONS 15530 or ONS 15540 NE. The following table provides descriptions.

Table 11-14 Field Descriptions for the ONS 155xx Equipment Inventory Table

Field	Description
Alias ID	Alias name of the NE.
Equipment Type	General type of the component.
Name	Name of the ONS 155xx component.
Module Name	Name of the ONS 155xx module.
Physical Location	Physical location for the component in the NE as a slot, subslot, and port number.
CLEI Code	CLEI code, an industry-standard code that precisely defines a component.
Serial Number	Serial number of the NE.
Hardware Version	Hardware revision of the NE.
Firmware Version	Firmware revision of the NE.
Software Version	Software revision of the NE.
Manufacturer Name	Name of the manufacturer of the NE.
Product Name	Vendor-specific model name; for example, the part number.
Alias	Alias specified for the component by the network manager.
Asset ID	Asset tracking identifier specified for the component by the network manager.
Description	Description of the component.
NE ID	Name of the selected ONS 155xx NE.

11.3.2 Exporting Equipment Inventory Table Data

You can schedule the export of Equipment Inventory table data to a flat file.

The Export Equipment Inventory Table dialog box allows you to export the data as comma-separated values (CSVs) or tab-separated values (TSVs), which are formats commonly used to import data into spreadsheet and database applications for further analysis and manipulation. You can also select a user-specified character as a separator.

Tip If you export data to Microsoft Excel, save the exported file with ".csv" as the filename extension.

To open the Export dialog box, open the Equipment Inventory table for the NE(s); then, click the **Export Data to File** tool (or choose **File > Export**). The following table provides descriptions. After making your selections, click **OK** to export the data.

Table 11-15 Field Descriptions for the Export Equipment Inventory Table Dialog Box

Field	Description
Field Separator	
Comma separated	If selected, the data is exported as comma-separated values.
Tab separated	If selected, the data is exported as tab-separated values.
Other	If selected, the data is exported with the separator that you specify in the Other text field. **Note** If you specify a character as a separator and your data contains the same character, the character in the data is automatically enclosed in double quotes. This allows the spreadsheet or database application to understand that the character is part of your data. Regardless of whether you select Comma separated, Tab separated, or Other, Prime Optical automatically encloses text in double quotes if it has a separator.
Export	
Selected row(s)	If selected, only the selected rows in the current page are exported.
All rows in current page	If selected, all rows in the current page are exported.
Export Data	
Local (file)	If selected, data is exported to a local file on your system. Specify the path directory and the filename. With the Local option, you can export selected rows or all rows in the Equipment Inventory table. By default, exported data is stored in the C:\Cisco\TransportManagerClient*version*\exports file.
Server (dir)	If selected, data is exported to a directory on the server. The directory path is a fixed, display-only string. With the Server option, you can export all rows in the Equipment Inventory table; you cannot export selected rows. By default, exported data is stored in the /opt/CiscoTransportManagerServer/export directory.
Time	

Table 11-15 Field Descriptions for the Export Equipment Inventory Table Dialog Box (continued)

Field	Description
Time (*time zone*)	Set a time for the export. Click **Now** to begin exporting immediately, or click **At Time** and specify when to begin exporting, in 5-minute increments. For local exports, you can only select **Now**. For server exports, you can select **Now** or **At Time**. **Note** The time zone can be GMT, a user-defined offset from GMT, or local time, depending on what is specified in the User Preferences dialog box.
Repeat	
Once	If selected, the export of inventory data to the server occurs once.
Daily	If selected, the export of inventory data to the server occurs daily.
Weekly	If selected, the export of inventory data to the server occurs weekly.
Monthly	If selected, the export of inventory data to the server occurs monthly.
Job Comments	
Job Comments	Enter comments about the export. The comments will be attached to the scheduled job.

11.3.3 Filtering the Equipment Inventory Table

Step 1 Select a node in the Domain Explorer or Subnetwork Explorer tree.

Step 2 Choose **Configuration > CTC-Based SONET NEs > Equipment Inventory Table**. The Equipment Inventory table opens. (See Figure 11-2.)

Step 3 Choose **File > Filter** (or click the **Filter Data** tool). The Filter dialog box opens.

Step 4 Specify the filter criteria to display the results in the table. The following table describes the fields in the filter.

Step 5 Click **OK**. The filtered data is displayed in the Equipment Inventory table.

Table 11-16 Field Descriptions for the Equipment Inventory Table Filter

Field	Description
NE ID Tab	
Available NE ID/Selected NE ID	List of available NE IDs. Click **Add** and **Remove** to move NE IDs to and from the Selected NE ID list. **Note** Use the scroll bars at the bottom and right side of the Available NE ID list and the Selected NE ID list to display all options in the lists.
Other Tab	
Disregard All Other Filter Criteria	Check this check box to ignore all other filter criteria.
Exclude out of service NEs	Check this check box to exclude any NEs that are marked Out of Service.
Actual Equipment Type	NE model type.
HW Part Number	Part number used for the card.

Table 11-16 Field Descriptions for the Equipment Inventory Table Filter (continued)

Field	Description
Hardware Version	Hardware version of the card. (Not applicable if the slot is empty.)
Firmware Version	Firmware version of the card.
CLEI Code	CLEI code for the device. CLEI code is an industry-standard code that precisely defines a component.

Managing Southbound and Northbound Interfaces

Cisco Prime Optical uses protocols such as CORBA, SNMP, and HTTP to provide southbound and northbound interfaces to communicate with NEs and operations support systems (OSSs).

This chapter contains the following information:

- 12.1 How Do I Manage Southbound Interfaces?, page 12-1
- 12.2 How Do I Manage Northbound Interfaces?, page 12-3

12.1 How Do I Manage Southbound Interfaces?

The Prime Optical server communicates with NEs through the data communications network (DCN) by using several protocols (CORBA, SNMP, HTTP, and so on).

You can access NEs in Prime Optical through:

- NE Explorer—Provides detailed rack, shelf, and card-level views of an NE. Detailed NE attributes and parameters are viewable and configurable.
- Craft Interface—Depending on the NE model, Prime Optical provides access to NE craft interfaces such as CTC, Cisco Edge Craft, web browsers, and the command line interface (CLI). Table 2-4 on page 2-8 lists the available craft interfaces by NE model.

Note A CLI session might not have a scroll bar, depending on the operating system you are using. To enable the scroll bar on Solaris, hold down the Ctrl key, click the middle button of your mouse, and choose **enable scroll bar**.

12.1.1 Southbound Port Details

This section explains the ports that Prime Optical uses to communicate with NEs. For more information, see, Southbound Port Details.

12.1.2 Using a Static CORBA Listener Port on the Prime Optical Server

See 4.5.3.6 CTC IIOP Port Configuration, page 4-75.

12.1.3 Client-Server Communication Protocols

This section explains the protocols that Prime Optical uses for client-server communication. For more information, see Client-Server Communication Protocols.

12.1.4 Changing the Prime Optical Server Port

Normally, users do not change the Prime Optical server port. In cases where the Prime Optical server port is used for other applications, use the NE Service pane to change the TCP port number of the Prime Optical server. All Prime Optical clients use the JMOCO port to connect to the Prime Optical server.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **NE Service** to open the NE Service pane. Click the **NE Poller** tab.

Step 3 In the Prime Optical Server Port field, change the server port. The server port in the Active column displays the current port. The server port in the After Restart column displays the port that is active after the server is restarted.

Step 4 Click **Save**. Changes to this parameter take effect only after the server is restarted.

12.1.5 Changing the HTTP Server Port

If other applications use the HTTP server port, you can change the default port. Complete the following steps:

Step 1 Open a shell on the Prime Optical server workstation and enter the following command to shut down the Prime Optical server:

```
opticalctl stop
```

Step 2 Enter the following commands to change directories to the HTTP server directory and create a copy of the configuration file:

```
cd /Apache/conf
cp httpd.conf httpd.conf.ori
```

Step 3 Locate the following lines in the httpd.conf file:

```
Listen IP-address:8051
Listen 127.0.0.1:8051
ServerName IP-address:8051
```

In each of these lines, replace the default port 8051 with the new HTTP server port.

Step 4 Enter the following command to start the Prime Optical server:

```
opticalctl start
```

Step 5 On each Prime Optical client, locate the following line in the *Prime Optical-client-installation-directory*/config/ems_client.cfg:

```
Apache_port=\:8051
```

Replace 8051 with the new HTTP server port.

Caution Be sure to repeat this change on each Prime Optical client.

Step 6 Launch the Prime Optical client. To verify that the HTTP services are working, choose **Help > Current Window** in the Domain Explorer.

12.2 How Do I Manage Northbound Interfaces?

Prime Optical GateWay is an architectural component that provides northbound EMS-to-NMS interface mediation. Prime Optical GateWay allows service providers to integrate Prime Optical with their OSSs by using open, standard interfaces.

Prime Optical supports three gateway modules that provide northbound EMS-to-NMS interface mediation. Not all NE types are supported by each module. Table 2-2 on page 2-3 shows the NE types supported by each gateway module. This section contains the following information:

- 12.2.1 Managing Prime Optical GateWay/SNMP, page 12-3
- 12.2.2 Managing Prime Optical GateWay/CORBA, page 12-11

12.2.1 Managing Prime Optical GateWay/SNMP

SNMP is a network management protocol used almost exclusively in TCP/IP networks. SNMP allows you to monitor and control network devices, manage configurations, collect statistics, check performance, and monitor security.

Prime Optical's GateWay/SNMP feature provides an SNMP trap forwarding service, where any trap generated or received by the server workstation will be forwarded to the set of defined trap destinations. Traps are autonomous notifications sent by an SNMP agent to an SNMP manager, such as HP Open View. Prime Optical GateWay/SNMP does not support southbound SNMP relaying (SNMP SET, GET, and GETNEXT).

The primary advantage of Prime Optical GateWay/SNMP is to limit the amount of traffic on the wide-area DCN. Imagine NEs deployed over a wide geographic area and a centralized network operations center where the management systems are located. If there are five OSs required to receive NE traps, instead of having each NE send five traps over the wide area to each OS, send a single trap to Prime Optical, which can then relay the trap locally in the NOC to the other OSs. NE configuration is also simpler because only one trap destination needs to be configured on each NE.

Prime Optical GateWay/SNMP supports SNMPv1, SNMPv2c, and SNMPv3 traps. SNMPv2c traps contain the Prime Optical host IP address in the source address of the IP packet.

SNMPv3 traps contain the OSS username, authentication protocol, authentication password, privacy protocol, and privacy password.

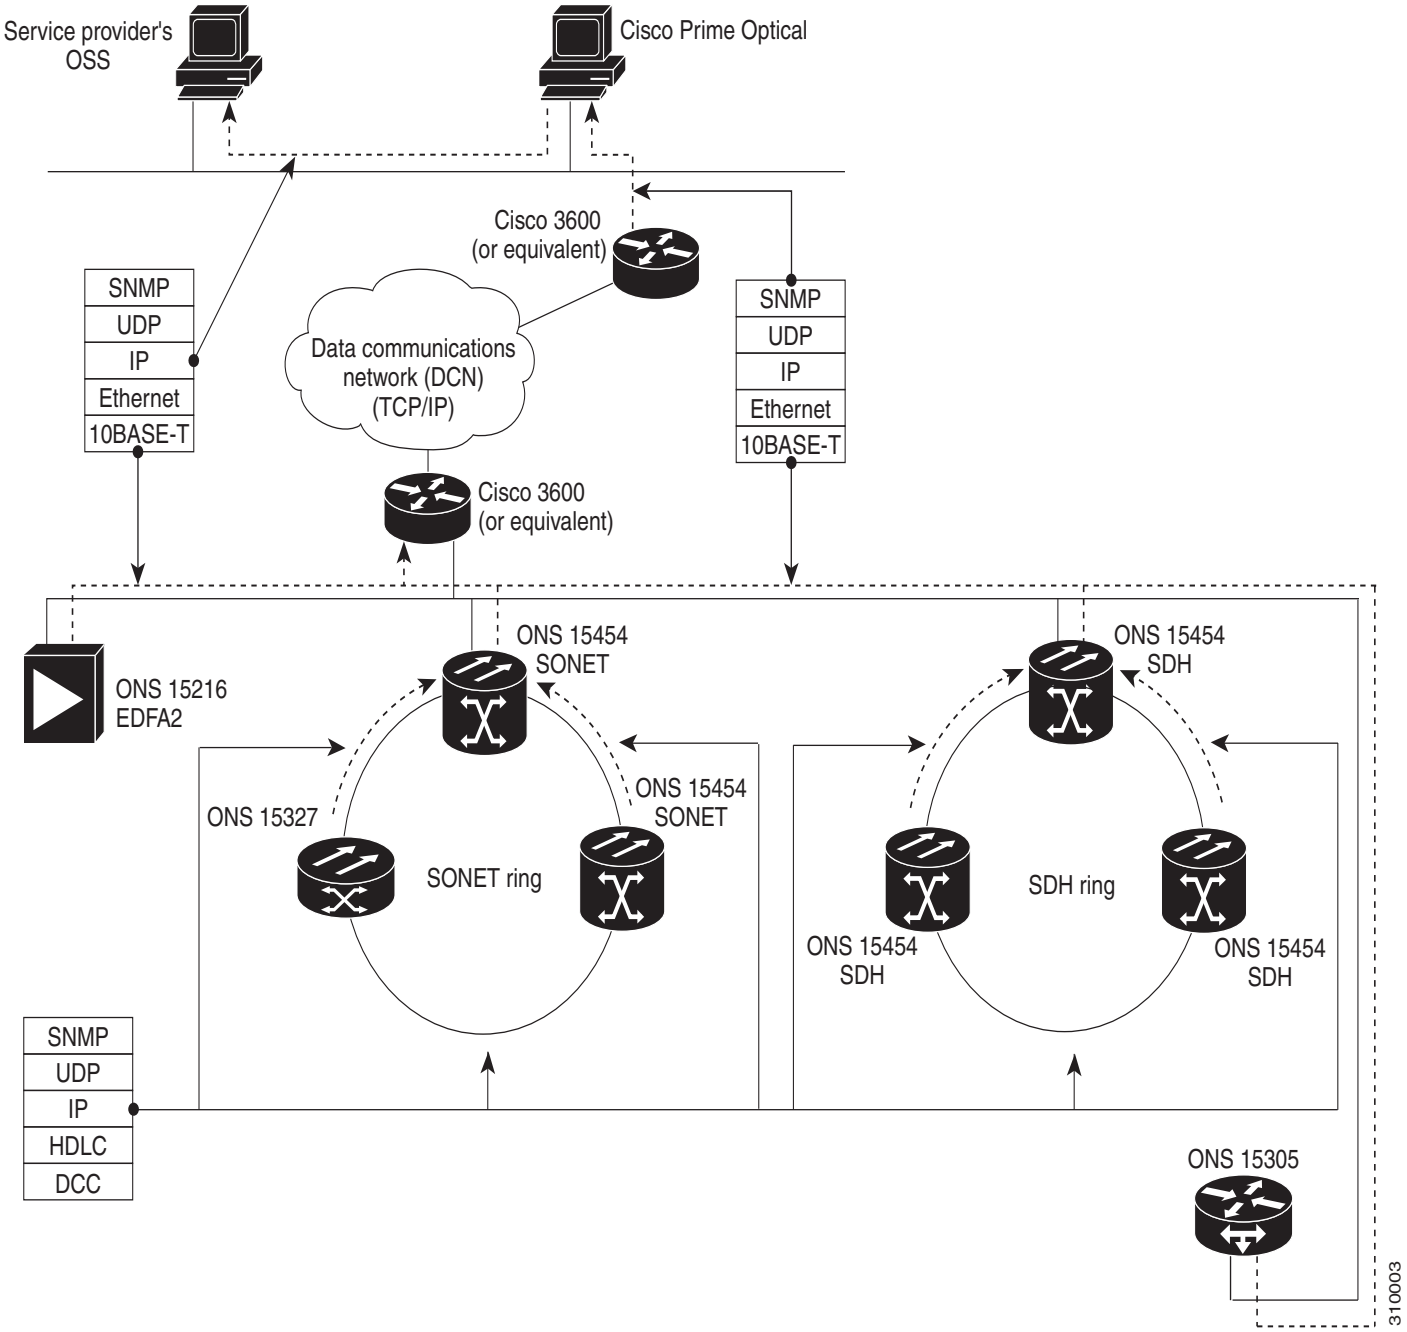
To enable the OS to determine which NE sent the trap, the trap must be defined with a variable binding that indicates the source NE.

Prime Optical GateWay/SNMP applies to any NE with an SNMP interface.

Note Table 2-2 on page 2-3 shows the NEs that support Prime Optical GateWay/SNMP.

The following figure shows the Prime Optical GateWay/SNMP communications architecture within a service provider's OSS environment.

Figure 12-1 Prime Optical GateWay/SNMP Communications Architecture



12.2.1.1 Starting and Stopping the Prime Optical GateWay/SNMP Service

Prime Optical GateWay/SNMP is a Prime Optical process that can be separately started and stopped through the Control Panel. NEs must be configured with the Prime Optical server IP address as a trap destination for traps to be sent from the NEs to Prime Optical.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **GateWay/SNMP Service**. Table 12-1 provides descriptions.

Step 3 In the Status area, click the **Start** button to start Prime Optical GateWay/SNMP. Notice that the service status toggles to *Active*.

Step 4 Click **Stop** to stop the service. The service status toggles to *Not Active*.

Note The Prime Optical GateWay/SNMP Service can take up to 60 seconds to initialize after the GUI status has changed to indicate that the service is up. The status is an indication of the successful initiation of the service startup, not successful initialization. To avoid problems with the service hanging, wait at least 60 seconds after starting or stopping the service before restarting it.

12.2.1.2 Adding and Removing a Prime Optical GateWay/SNMPv1 or Prime Optical GateWay/SNMPv2 Host

You can configure up to 16 SNMP trap destination hosts for Prime Optical GateWay/SNMP. Prime Optical enforces a duplication check error to ensure that you do not enter duplicate OSS IP addresses.

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, click **GateWay/SNMP Service**. The following table provides descriptions.

Step 3 In the SNMP Hosts field, enter a valid IP address or hostname for the SNMP forwarding host; then, click **Add**. To remove an SNMP host, select the IP address or hostname of the host and click **Remove**.

Step 4 Repeat for each host to be added or removed; then, click **Save**.

Table 12-1 Field Descriptions for the GateWay/SNMP Service Pane

Field	Description
Service Status	Displays the current status of the service: Active or Not Active.
Service Action	Allows you to stop or start the Prime Optical GateWay/SNMP service. Notice that the Service Action button toggles between Stop or Start and the Service Status field changes accordingly.

Table 12-1 Field Descriptions for the GateWay/SNMP Service Pane (continued)

Field	Description
Engine ID	Displays the unique identifier for the given Prime Optical GateWay/SNMP application that Prime Optical is communicating with. The engine ID is used to configure the OSS application to receive traps from Prime Optical GateWay/SNMP. The engine ID is generated the first time you install the Prime Optical server.
SNMP Hosts	Displays the IP address or hostname of the host where each SNMP trap will be forwarded. You can enter up to 16 valid IP addresses or hostnames. Use the **Add** and **Remove** buttons to add or remove IP addresses or hostnames.

12.2.1.3 Configuring Northbound OSS SNMPv3 Users—Optical NEs

You can use the OSS SNMPv3 Users table to add, modify, or delete OSS SNMPv3 users.

This section contains the following procedures:

- 12.2.1.3.1 Viewing the OSS SNMPv3 Users Table, page 12-7
- 12.2.1.3.2 Adding an OSS SNMPv3 User, page 12-8
- 12.2.1.3.3 Modifying an OSS SNMPv3 User, page 12-9
- 12.2.1.3.4 Deleting an OSS SNMPv3 User, page 12-9

12.2.1.3.1 Viewing the OSS SNMPv3 Users Table

To view the OSS SNMPv3 Users table, choose **Administration > GateWay/SNMP Users** in the Domain Explorer window. The following table provides descriptions.

Table 12-2 Field Descriptions for the OSS SNMPv3 Users Table

Column Name	Description
Username	Name of the user who authenticates the SNMPv3 trap. The name must contain from 6 to 53 alphanumeric characters. The name cannot contain spaces or special characters.
Authentication Protocol	Type of encryption used to authenticate the SNMPv3 user.
IP Address	IP address to which to forward the SNMPv3 trap.
Privacy Protocol	Privacy protocol set for the SNMPv3 user.
SNMP Port	OSS destination port number. The default port number is 162.
SNMP Version	SNMP version number.
Engine ID	Unique identifier for the given Prime Optical GateWay/SNMP application that Prime Optical is communicating with. The engine ID is used to configure the OSS application to receive traps from Prime Optical GateWay/SNMP. The engine ID is generated the first time you install the Prime Optical server.

12.2.1.3.2 Adding an OSS SNMPv3 User

SNMPv3 user profiles are stored in the OSS SNMPv3 Users table.

Step 1 In the Domain Explorer window, choose **Administration > GateWay/SNMP Users**. The OSS SNMPv3 Users table opens.

Step 2 Choose **Edit > Add** (or click the **Create a New User** tool). The Add OSS SNMPv3 User dialog box opens. The following table provides descriptions.

Step 3 After providing the required information, click **OK**.

Table 12-3 Field Descriptions for the Add/Modify OSS SNMPv3 User Dialog Box

Field	Description
OSS IP Address	Enter the IP address to which to forward the SNMPv3 trap.
Username	Enter a unique name for the new user. The name must contain from 6 to 53 alphanumeric characters. The name cannot contain spaces or special characters.
SNMP Port	Enter the OSS destination port number.
Authentication Protocol	Authentication protocol for the OSS SNMPv3 user. Choose the authentication protocol to use for authenticating the user. Values are No Auth, MD5 (the default), or SHA.
Authentication Password	Enter the password used to authenticate the SNMPv3 user. The password must contain: • From 1 to 12 characters • At least one special character other than an apostrophe (') • At least two letters (A-Z, a-z), including at least one uppercase letter • At least one number (0-9) **Note** Regardless of the actual length of the password, the Password and Confirm Password fields display only a fixed-length string of 15 asterisks (*).
Confirm Authentication Password	Re-enter the password to confirm it.
Privacy Protocol	Select the privacy protocol set for the SNMPv3 user. You can choose one of the following: • NoPriv—No privacy protocol for the user. **Note** The Privacy Protocol can be set to No Priv only when the Authentication Protocol is set to No Auth. • DES—Use Data Encryption Standard (DES) for encryption.
Privacy Password	Enter the password used to decrypt the message payload.
Confirm Privacy Password	Re-enter the privacy password to confirm it.

12.2.1.3.3 Modifying an OSS SNMPv3 User

Step 1 In the Domain Explorer window, choose **Administration > GateWay/SNMP Users**. The OSS SNMPv3 Users table opens.

Step 2 Select the SNMPv3 user to modify; then, choose **Edit > View/Modify** (or click the **Modify User Properties** tool). The Modify OSS SNMPv3 User dialog box opens. Table 12-3 provides descriptions.

Step 3 Modify the fields described in Table 12-3.

Note The IP Address and Username fields are read-only.

Step 4 Click **OK**. The updated user profile is listed in the OSS SNMPv3 Users table.

12.2.1.3.4 Deleting an OSS SNMPv3 User

Step 1 In the Domain Explorer window, choose **Administration > GateWay/SNMP Users**. The OSS SNMPv3 Users table opens.

Step 2 Select the SNMPv3 user to delete; then, choose **Edit > Delete** (or click the **Delete User** tool).

Step 3 Click **OK** in the confirmation dialog box.

12.2.1.4 Configuring SNMP on Optical NEs

SNMP must be configured for each NE that uses Prime Optical GateWay/SNMP. This section contains the following procedures:

- 12.2.1.4.1 Configuring SNMP for the ONS 15216 EDFA2 and EDFA3, page 12-10
- 12.2.1.4.2 Configuring SNMP for the ONS 15305, page 12-10
- 12.2.1.4.3 Configuring SNMP for CTC-Based NEs, page 12-10
- 12.2.1.4.4 Configuring SNMP for the ONS 15530 and ONS 15540, page 12-11

For additional information, refer to the NE user documentation.

Note

- When configuring SNMP on NEs, make sure that no other SNMP daemon is running on the designated Prime Optical server host.
- If you enter the **opticalctl status** command after configuring SNMP, Prime Optical GateWay/SNMP is not shown. This is because the **opticalctl status** command shows all of the Prime Optical processes and Prime Optical GateWay/SNMP is not a separate process. Use the Service Monitor table to view the status of Prime Optical GateWay/SNMP.

12.2.1.4.1 Configuring SNMP for the ONS 15216 EDFA2 and EDFA3

For the ONS 15216 EDFA2 and EDFA3, SNMP trap entries are added automatically when the NE is added to Prime Optical. See 5.3.9 Using SNMP, page 5-15 for more information.

12.2.1.4.2 Configuring SNMP for the ONS 15305

For information on how to configure SNMP for the ONS 15305, see the *Cisco ONS 15305 Installation and Operations Guide*.

12.2.1.4.3 Configuring SNMP for CTC-Based NEs

Note This section details how to configure SNMP v1/v2 from the NE to the server. For information on configuring SNMPv3 for CTC-based NEs, see 8.4.6.2.4 SNMPv3 NE Trap Destinations Table, page 8-69.

Step 1 Select a CTC-based NE in the Domain Explorer tree and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the node properties pane, click the **Network** tab; then, click the **SNMP** subtab.

Step 3 (Not applicable to the ONS 15600) To allow SNMP proxy, check the **Allow SNMP Proxy** check box.

Step 4 (Not applicable to the ONS 15600) To use the SNMP management software with the NE, check the **Allow SNMP Set** check box.

Step 5 (Not applicable to the ONS 15600) Click **Apply**.

Step 6 Click **Create**. The Create SNMP Trap Destination dialog box opens. The following table provides descriptions.

Step 7 After making your selections, click **OK**.

Step 8 Click **Apply**.

Table 12-4 Field Descriptions for the Create SNMP Trap Destination Dialog Box

Field	Description
IP Address	Enter the IP address of your NMS.
Community Name	Enter the SNMP community name. For a description of SNMP community names, refer to the SNMP information in the NE reference guide. **Note** The community name is a form of authentication and access control. The community name assigned to the ONS 15600 is case-sensitive and must match the community name of the NMS.
UDP Port	Set the UDP port for SNMP. The default port is 162. Allowed UDP port values are 162, 391, and values between 1024 and 65535.

Table 12-4 Field Descriptions for the Create SNMP Trap Destination Dialog Box (continued)

Field	Description
Trap Version	Set the Trap Version field for either SNMPv1 or SNMPv2. See your NMS documentation to determine whether to use SNMPv1 or SNMPv2.
Max Traps per Second *(not applicable to the ONS 15600)*	Enter the maximum number of traps per second that will be sent to the SNMP manager. A zero value indicates that there is no maximum and all traps are sent to the SNMP manager.

12.2.1.4.4 Configuring SNMP for the ONS 15530 and ONS 15540

Configuring SNMP on ONS 15530 and ONS 15540 NEs is a prerequisite for adding an NE to Prime Optical. If SNMP is not configured on the NE, refer to the instructions in the relevant hardware configuration guide.

12.2.2 Managing Prime Optical GateWay/CORBA

Note This section provides a high-level overview of Prime Optical GateWay/CORBA. For detailed information about Prime Optical GateWay/CORBA, including how to enable username and password encryption, set the heartbeat event, and create OSS clients, refer to the *Cisco Prime Optical 9.6.3 GateWay/CORBA User Guide and Programmer Manual*.

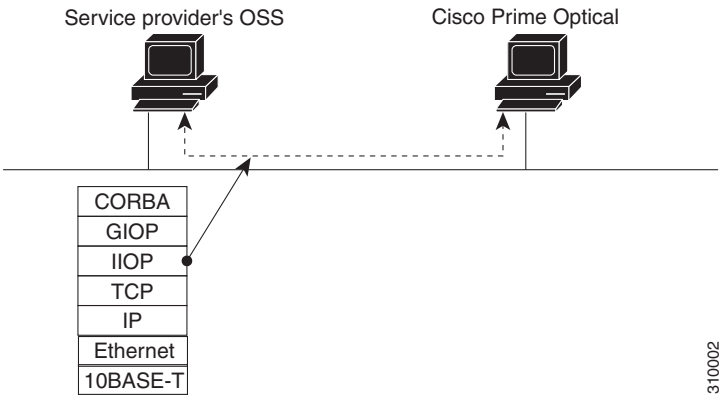
The Common Object Request Broker Architecture (CORBA) is a middleware platform defined by the Object Management Group (OMG). The Prime Optical GateWay/CORBA option is a CORBA-based interface that provides higher-layer management systems with fault, inventory, performance, configuration, Layer 1 circuit provisioning, and Layer 2 VLAN management information for NEs. The Prime Optical GateWay/CORBA option is based on the TeleManagement Forum (TMF) standards for the NMS-to-EMS interface.

Because it is CORBA-based, Prime Optical GateWay/CORBA is independent of the hardware that the integrated OSS is running. This independence allows service providers to easily add Prime Optical as a building block of their management environment.

Note Table 2-2 on page 2-3 shows the NEs that support Prime Optical GateWay/CORBA.

The following figure shows the Prime Optical GateWay/CORBA communications architecture within a service provider's OSS environment.

Figure 12-2 Prime Optical GateWay/CORBA Communications Architecture



Prime Optical GateWay/CORBA is based on the following TMF standards:

- TMF513 v3.0: Multi-Technology Network Management Business Agreement
- TMF608 v3.0: Multi-Technology Network Management Information Agreement
- TMF814 v3.0: Multi-Technology Network Management Solution Set

12.2.2.1 Configuring the CORBA Timeout

The CORBA timeout determines the number of seconds that the Prime Optical server has to process a CORBA call and return it to the Prime Optical client. If the Prime Optical server does not return a response in time, CORBA automatically times out.

Step 1 Open the ems-client.cfg file.

By default, the ems-client.cfg file is located in the following directory:

- Windows: C:\Cisco\TransportManagerClient\config
- Sun Solaris: /opt/CiscoTransportManagerClient/config

Step 2 Set the CORBA_Call_Timeout_Seconds parameter to the desired value. The default timeout is 120 seconds; the recommended range is from 120 to 300 seconds.

Note If the NE is busy or if the Prime Optical server is processing many requests, you might need to increase the CORBA timeout parameter accordingly.

Step 3 Save and close the ems-client.cfg file.

12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 Click **GateWay/CORBA Service** to open the GateWay/CORBA Service pane.

Step 3 In the **Global** tab > **Status** area, click the **Start** button to start GateWay/CORBA or the **Stop** button to stop the service.

Note The Prime Optical GateWay/CORBA Service can take up to 60 seconds to initialize after the GUI status has changed to indicate that the service is up. The status is an indication of the successful initiation of the service startup, not successful initialization. To avoid problems with the service hanging, wait at least 60 seconds after starting or stopping the service before restarting it.

12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane

Use the Prime Optical GateWay/CORBA Service pane to start and stop the Prime Optical GateWay/CORBA service and configure CORBA ports and parameters. The following table provides descriptions.

Note In CTM R9.2, Prime Optical server ports can be configured from the Ports Configuration tab. Unless otherwise noted, all port configuration changes require a Prime Optical GateWay/CORBA restart.

Table 12-5 Field Descriptions for GateWay/CORBA Service Pane

Field	Description
Global Tab	
Service Status	Displays the current status of the service: Active, Not Active, or Not Installed.
Service Action	Allows you to stop or start a process. Notice that the Service Action button toggles between Stop and Start, and the Service Status field changes accordingly. This field is not available if the Service Status is Not Installed.
Enable Encryption for Username and Password	When checked, usernames and passwords are transmitted between the EMS server and the OSS in encrypted format. The maximum encryption length is 53 bytes. If this check box is unchecked, Prime Optical GateWay/CORBA usernames and passwords are transmitted without encryption. By default, encryption is disabled at installation.
Heartbeat for Notification Channel	Notifies the OSS if a failure in the notification service has occurred. The heartbeat is measured in minutes; the range is 0 to 999 minutes. A zero value implies that the heartbeat is disabled.
Maximum Number of Simultaneous Sessions	Specifies the number of Prime Optical GateWay/CORBA sessions that can be active at the same time. The range is from 4 to 25; the default is 4.

Table 12-5 Field Descriptions for GateWay/CORBA Service Pane (continued)

Field	Description
Maximum Events per Consumer	Sets the MaxEventsPerConsumer administrative quality of service (QoS) parameter on the notification channel. The notification server uses this property to bound the maximum number of events in a given channel allowed to queue at any one time. The default value is 0, meaning that the notification server does not limit the maximum number of events that can be queued. If no limits are imposed on the queue, the notification server might run out of memory, because the server must keep all events in memory until they are consumed by all registered consumers. ⚠ **Caution** Any change to this value should be done with extreme caution. If you set the value too low, the NMS cannot receive all notifications. If you set the value too high, the Prime Optical notification server runs out of memory. The current value can handle alarm bursts of 10,000 events per minute.
Notification Service Name	Defines the service name used by the resolve_initial_reference function to get a reference to the notification service. The Prime Optical GateWay/CORBA installation installs the notification service. However, if you want to use your own notification service, you can modify this parameter. **Note** You do not need to modify this parameter if you plan to use the notification service that is bundled with Prime Optical GateWay/CORBA.
Notification Service Naming Context	Defines the naming context of the notification service. This property is used when the resolve_initial_reference function fails to resolve the notification service. Prime Optical GateWay/CORBA contacts the naming service to resolve the name context defined in this property. The value of this property must match the value published by your notification server. **Note** You do not need to modify this parameter if you plan to use the notification service that is bundled with Prime Optical GateWay/CORBA.
Notification Service Factory IOR Filename	Enter the notification service factory Information Object Repository (IOR) filename located in the /opt/CiscoTransportManagerServer/openfusion/domains/OpenFusion/localhost/NotificationService/NotificationSingleton/NotificationService.ior directory. The FactoryIORFile property defines the path to a text file that contains the IOR of the notification service. This property is used only after the resolve_initial_reference function and the naming service both fail. Prime Optical GateWay/CORBA opens the file as defined by the URL format in this property and retrieves the IOR. This parameter allows you to run your notification service on a different host to improve performance. **Note** You do not need to modify this parameter if you plan to use the notification service that is bundled with Prime Optical GateWay/CORBA.
Name Service Server List	Defines where the name servers are running. Accepts a comma-separated list of hostnames.
Name Service Root IOR	Defines the path to find the naming service's IOR on each host defined on the server list. The complete path is constructed as <http://<item>_of_ServerList><RootIORLoc>.

Table 12-5 Field Descriptions for GateWay/CORBA Service Pane (continued)

Field	Description
Error Level	Defines the error level of messages to log. Error levels are: • Critical • Major • Minor • Informational • Debug • Trace
Port Configuration Tab	
Enable IMR checkbox	IMR is always disabled. This allows you to configure Prime Optical GateWay/CORBA to use static ports. This is a read-only option.
Name Service	Enter the port that the name service uses to listen for incoming requests. The default value is 14005. **Note** This option requires a server restart.
Notification Service	Enter the port that the notification service uses to listen for incoming requests. The default value is 20001.
EMS Session	Enter the EMS session port value. The default value is 20100.
Event Notification (min)	Enter the minimum Event Notification port value. The default value is 20001.
Event Notification (max)	Enter the maximum Event Notification port value. The default value is 20099.
Server-to-Client (min)	Enter the minimum Server-to-Client port value. The default value is 20101.
Server-to-Client (max)	Enter the maximum Server-to-Client port value. The default value is 20199.
Debug Tab	
Dump Cache button	Exports the cache (memory) information of the selected Prime Optical GateWay/CORBA service instance to a log file.
Overall Logging	Click the **Enable** radio button to enable overall debugging and to select debug modules for the PM service. Click the **Disable** radio button to disable overall debugging.
Debug Modules	If overall logging is enabled, lists the modules that can be used for debugging. Select a module from the Available list; then, click the **Add** button to add the module to the Selected list. Use the **Remove** button to return the module to the Available list. Debug logging will be performed on the modules in the Selected list.

12.2.2.4 Viewing the Prime Optical GateWay/CORBA Users Table

The Prime Optical GateWay/CORBA Users table displays information about OSS CORBA client properties. To launch the table, choose **Administration > GateWay/CORBA Users** in the Domain Explorer window. The following table provides descriptions. Use the toolbar icons to create, modify, or delete OSS client users.

Tip You can also launch the GateWay/CORBA Users table from the Control Panel. In the Domain Explorer window, choose **Administration > Control Panel**. In the Control Panel window, choose **Administration > GateWay/CORBA Users**.

Table 12-6 Field Descriptions for the GateWay/CORBA Users Table

Column Name	Description
OSS Profile Name	Displays the name of the selected OSS client.

12.2.2.5 Adding a Prime Optical GateWay/CORBA User

OSS client profiles are stored in the GateWay/CORBA Users table.

Step 1 In the Domain Explorer window, choose **Administration > GateWay/CORBA Users**. The GateWay/CORBA Users table opens.

Step 2 Choose **Edit > Add** (or click the **Create a New User** tool). The Add GateWay/CORBA User dialog box opens. The following table provides descriptions.

Step 3 After making your selections, click **OK**. The new profile is visible when the GateWay/CORBA Users table is refreshed.

Table 12-7 Field Descriptions for Add/Modify GateWay/CORBA User Dialog Box

Field	Description
OSS Profile Name	Enter a unique name for the new OSS profile. The name must contain from 6 to 53 alphanumeric characters. The name cannot contain spaces or special characters.
Password	Enter the password that the OSS client uses to log into the Prime Optical server. The password must contain: • From 1 to 12 characters • At least one special character other than an apostrophe (') • At least two letters (A-Z, a-z), including at least one uppercase letter • At least one number (0-9) **Note** Regardless of the actual length of the password, the Password and Confirm Password fields display only a fixed-length string of 15 asterisks (*).
Confirm Password	Re-enter the password to confirm it.

12.2.2.6 Modifying a Prime Optical GateWay/CORBA User's Properties

Step 1 In the Domain Explorer window, choose **Administration > GateWay/CORBA Users**. The GateWay/CORBA Users table opens.

Step 2 Select the CORBA user profile to modify; then, choose **Edit > View/Modify** (or click the **Modify User Properties** tool). The Modify GateWay/CORBA User dialog box opens. Table 12-7 provides descriptions.

Step 3 After making any necessary modifications, click **OK**. The updated profile is visible when the GateWay/CORBA Users table is refreshed.

12.2.2.7 Deleting a Prime Optical GateWay/CORBA User

Step 1 In the Domain Explorer window, choose **Administration > GateWay/CORBA Users**. The GateWay/CORBA Users table opens.

Step 2 Select the CORBA user profile to delete; then, choose **Edit > Delete** (or click the **Delete User** tool).

Step 3 Click **OK** in the confirmation dialog box.

Note Prime Optical GateWay/CORBA does not allow an OSS profile to be deleted if there are active users logged in using that OSS profile.

12.2.2.8 Viewing Logged-In Prime Optical GateWay/CORBA Users

Step 1 In the Domain Explorer window, choose **Administration > GateWay/CORBA Users**. The GateWay/CORBA Users table opens.

Step 2 Choose **Administration > Logged In GateWay CORBA Users** (or click the **Show Logged In GateWay CORBA Users** tool). The Active GateWay/CORBA Users table opens. The following table provides descriptions.

Table 12-8 Field Descriptions for Active GateWay/CORBA Users Table

Field	Description
OSS Profile Name	Name of the OSS profile. Each client has a unique alphanumeric name.
OSS IP Address	IP address of the OSS client that is authenticated by Prime Optical GateWay/CORBA during the initial connection request made by the OSS.
Login Time (*time zone*)	Time stamp when the CORBA user logged in.

12.2.2.9 Ending an Active GateWay/CORBA User Session

Step 1 In the Domain Explorer window, choose **Administration > GateWay/CORBA Users**. The GateWay/CORBA Users opens.

Step 2 Choose **Administration > Logged In GateWay CORBA Users** (or click the **Show Logged In GateWay CORBA Users** tool). The Active GateWay/CORBA Users table opens.

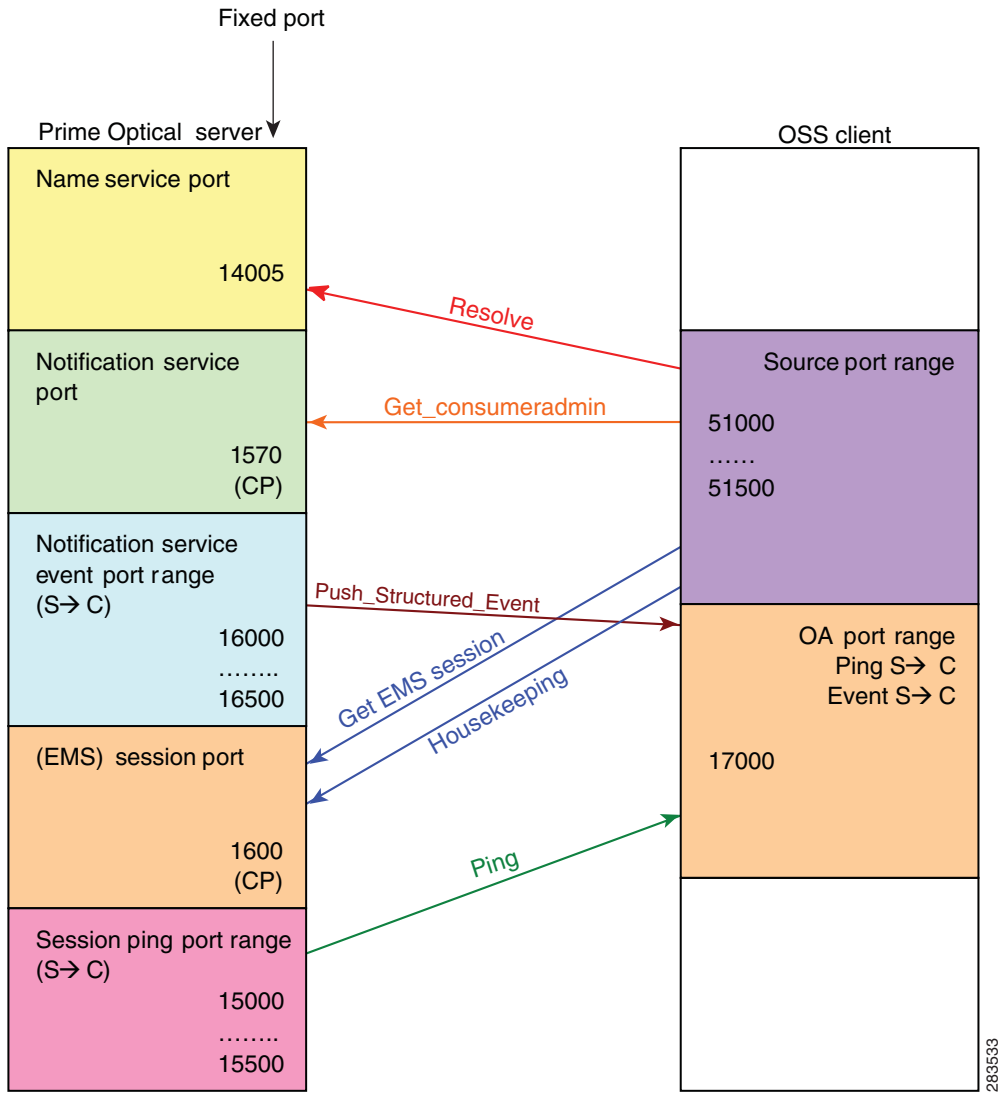
Step 3 In the Active GateWay/CORBA Users table, select the user whose session will be ended and choose **Administration > Log Out GateWay CORBA User** (or click the **Log Out GateWay CORBA User** tool).

12.2.2.10 Changing the Default Settings of Prime Optical Server and OSS CORBA Client Ports

For each connected OSS, JacORB uses several ports that have the following functions, as illustrated in Figure 12-3:

- Session port—The main channel used for handshakes between the OSS and the CORBA gateway. The CORBA gateway assigns this port to a random value between free ports in the system.
- Notification service port—The channel used to receive notifications from the CORBA gateway.
- Name service port—The port used to request a new session. The value is always fixed; the default port number is 14005.
- Session ping port—The channel used to establish a keep-alive handshake between the gateway and the OSS. The CORBA gateway assigns this port to a random value between free ports in the system.
- Notification service event port—A second port range used to push alarms or events from the CORBA gateway to the OSS. This port is a keep-alive channel like the previous association to the notification channel.

Figure 12-3 Sample CORBA Gateway Static Port Settings



CP : Settable through the Control Panel
S→ C: Server to client

Caution Errors resulting from changing the Prime Optical server ports or the OSS CORBA client ports can cause unpredictable system behavior.

Note

- It is recommended that you back up the current configuration files before changing the default settings.
- You can change the default settings only for OSS CORBA client ports that use JacORB.

You can change the default values of the following ports:

- OSS CORBA client ports:
  - 12.2.2.10.1 Object Adapter Port, page 12-20
  - 12.2.2.10.2 Source Port Range, page 12-21
  - 12.2.2.10.3 NAT Between the Prime Optical Server and OSS CORBA Client, page 12-21
- Prime Optical server ports:
  - 12.2.2.10.4 NameService Port, page 12-21
  - 12.2.2.10.5 NotificationService Port, page 12-21
  - 12.2.2.10.6 EMSSession Port, page 12-22
  - 12.2.2.10.7 Ping Server-to-Client Port Range, page 12-22
  - 12.2.2.10.8 Notification Event Port Range, page 12-23

Note You can also set Prime Optical server port values from the **Prime Optical GateWay/CORBA Service pane > Port Configuration tab**. For more information, see 12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane, page 12-13.

To set static values for CORBA gateway ports, it is strongly recommended that you follow these steps:

Step 1 With the Prime Optical server running, use the Control Panel to set the notification service port and the session port. See 12.2.2.10.5 NotificationService Port, page 12-21 and 12.2.2.10.6 EMSSession Port, page 12-22.

Step 2 Enter the following command to stop the Prime Optical server:

```
opticalctl stop
```

Step 3 Disable IMR. See 12.2.2.10.9 Disabling IMR, page 12-23.

Step 4 Set the session ping port range. See 12.2.2.10.7 Ping Server-to-Client Port Range, page 12-22.

Step 5 Set the name service port. See 12.2.2.10.4 NameService Port, page 12-21.

Step 6 Set the notification service event port range. See 12.2.2.10.8 Notification Event Port Range, page 12-23.

Step 7 Enter the following command to start the Prime Optical server:

```
opticalctl start
```

Step 8 Whenever you establish a new CORBA gateway session, use the **netstat** command to verify the actual ports in use and compare them to the newly added session.

12.2.2.10.1 Object Adapter Port

If you want to use a fixed port for the OSS CORBA client, change the value of the –DOAPort property. The –DOAPort property should be added to the file that launches the OSS CORBA client application. If there are two client instances running on the same machine, there should be two different port settings.

12.2.2.10.2 Source Port Range

Step 1 Open the jacorb.properties file from the OSS CORBA client directory.

Step 2 Change the value of the following properties:

```
jacorb.net.socket_factory=org.jacorb.orb.factory.PortRangeSocketFactory
jacorb.net.socket_factory.port.min=xxx
jacorb.net.socket_factory.port.max=yyy
```

12.2.2.10.3 NAT Between the Prime Optical Server and OSS CORBA Client

If Network Address Translation (NAT) exists between the Prime Optical server and OSS CORBA client, configure the jacorb.ior_proxy_host=*xxx.xx.xx.xxx* property from the jacorb.properties file to receive Prime Optical server callback messages and server-to-client pings. The *xxx.xx.xx.xxx* variable is the IP address of **NAT inside global address**.

12.2.2.10.4 NameService Port

Note You can also set the Name Service port value from the **Prime Optical GateWay/CORBA Service pane > Port Configuration tab**. For more information, see 12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane, page 12-13.

Step 1 Enter the following command to stop the Prime Optical server:

```
opticalctl stop
```

Step 2 Open the NameService.xml file from the /opt/*Prime Optical-server-directory*/openfusion/domains/localhost/NameService directory.

Step 3 Change the value of the *Port* property to the desired value. The default value is 14005.

Step 4 Enter the following command to stop the Prime Optical server:

```
opticalctl start
```

Step 5 Complete the following substeps to verify the new value of the port:

a. Enter the following command in the /opt/CiscoTransportManagerServer/openfusion/bin directory:

```
./manager
```

b. Choose **Domains > OpenFusion > localhost > NameService** in the Object Hierarchy tree.

c. Click the **CORBA** tab in the right pane. The Server Port property displays the new port value.

12.2.2.10.5 NotificationService Port

Note You can also set the Notification Service port value from the Prime Optical GateWay/CORBA Service pane > Port Configuration tab. For more information, see 12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane, page 12-13.

Step 1 Stop the Prime Optical GateWay/CORBA service. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

Step 2 Change the value of **Notification Service Listening Port Number** to the desired value.

Step 3 Restart the Prime Optical GateWay/CORBA service. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

Step 4 Complete the following substeps to verify the new value of the port:

a. Enter the following command in the /opt/CiscoTransportManagerServer/openfusion/bin directory:

```
./manager
```

b. Choose **Domains > OpenFusion > localhost > NotificationService** in the Object Hierarchy tree.

c. Click the **CORBA** tab in the right pane. The Server Port property displays the new port value.

12.2.2.10.6 EMSSession Port

Note You can also set the EMS Session port value from the **Prime Optical GateWay/CORBA Service pane > Port Configuration tab**. For more information, see 12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane, page 12-13.

Step 1 Stop the Prime Optical GateWay/CORBA service. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

Step 2 Change the value of **Session Port Number** to the desired value.

Step 3 Restart the Prime Optical GateWay/CORBA service. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

12.2.2.10.7 Ping Server-to-Client Port Range

Note You can also set the Server-to-Client port values from the **Prime Optical GateWay/CORBA Service pane > Port Configuration tab**. For more information, see 12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane, page 12-13.

Step 1 Stop the Prime Optical GateWay/CORBA service. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

Step 2 Open the jacorb.properties file from the /opt/*Prime Optical-server-directory*/openfusion/classes directory.

Step 3 Do the following in the **Socket Factories** section:

a. Uncomment the .jacorb.net.socket_factory=org.jacorb.orb.factory.PortRangeSocketFactory row.

b. Change the .jacorb.net.socket_factory.port.min value to the desired minimum range value.

c. Change the .jacorb.net.socket_factory.port.max value to the desired maximum range value.

Step 4 Restart the Prime Optical GateWay/CORBA service. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

12.2.2.10.8 Notification Event Port Range

Note You can also set the Notification Event port range from the **Prime Optical GateWay/CORBA Service pane > Port Configuration tab**. For more information, see 12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane, page 12-13.

Step 1 Stop the Prime Optical GateWay/CORBA service. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

Step 2 Open the NotificationService.xml file from the /opt/*Prime Optical-server-directory*/openfusion/domains/localhost/NotificationService directory.

Step 3 Change the value of the JVMFlags property to the following:

```
<PropertyValue>-Dosgi.parentClassloader=ext
-Djacorb.net.socket_factory=org.jacorb.orb.factory.PortRangeSocketFactory
-Djacorb.net.socket_factory.port.min=xxx
-Djacorb.net.socket_factory.port.max=yyy</PropertyValue>
```

Note Do not use carriage returns when entering the new value of the JVMFlags property. The new value must be entered on the existing row.

Step 4 Restart the Prime Optical GateWay/CORBA service. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

12.2.2.10.9 Disabling IMR

By default, IMR is disabled. To enable IMR, you must manually edit the jacorb.properties file.

Step 1 Make a backup copy of the jacorb.properties file located in the *Prime Optical-server-installation-directory*/openfusion/classes directory.

Step 2 In the jacorb.properties file, configure the following properties to “off”:

```
jacorb.use_imr=off
jacorb.use_imr_endpoint=off
```

12.2.2.11 Changing the Prime Optical GateWay/CORBA Client Ports

In CTM R9.0 and earlier releases, Prime Optical GateWay/CORBA was installed and configured to use random ports and did not support a firewall between the OSS client and the Prime Optical server. Starting from CTM R9.1, you can install and configure Prime Optical GateWay/CORBA to use static ports, which facilitates the use of a firewall between the OSS client and the Prime Optical server.

12.2.2.11.1 Installation

When you install Prime Optical GateWay/CORBA, all of the ports are configured with default fixed values. See Table 12-9 for the list of default fixed values.

Note To configure Prime Optical GateWay/CORBA to use static ports, you must disable IMR. See 12.2.2.11.2 Configuration, page 12-24.

Table 12-9 List of Parameters and Fixed Values

Parameters	Default Fixed Values
EMS Session Port	20100
Name Service Port	14005
Notification Service Port	20001
Session Ping Port range	20101–20199
Event Notification Port range	20002–20099
IMR	Off
Proxy Host Address	Not set

Note It is recommended that you change the default fixed values after the Prime Optical GateWay/CORBA installation is complete. If you change the values while installing Prime Optical GateWay/CORBA, the installation might fail.

12.2.2.11.2 Configuration

Note
- You can also configure Prime Optical server ports from the **Prime Optical GateWay/CORBA Service pane > Port Configuration tab**. For more information, see 12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane, page 12-13.
- Prime Optical GateWay/CORBA must be stopped in order to configure ports.

Step 1 Log into the Prime Optical server as the root user.

Step 2 Invoke the manageCTMCorbaPorts.sh file from the *Prime Optical-server-installation-directory*/bin directory.

Note If Prime Optical GateWay/CORBA is running, you only have the option to read port configuration settings.

The following appears:

```
-------------------------------------------------
 Manage CTM GateWay/CORBA Ports Utility
-------------------------------------------------
  1. Read Configuration Set
  2. Read Configuration Running
```

```
  3. Restore All Default Values
  4. Change All Settings
  5. Change Name Service Port
  6. Change Proxy Host Address
  7. Change Notification Service Port
  8. Change EMS Session Port
  9. Change S->C Ping Port Range
 10. Change Notification Event Port Range
  0. Exit
-------------------------------------------------
```

Step 3 Select an item from the menu.

For example, enter **1** to select Read Configuration Set.

For more information on these menu items, see the *Cisco Prime Optical 9.6.3 GateWay/CORBA User Guide and Programmer Manual*.

Note If you select a menu item that changes the configuration, you will be prompted to restart either Prime Optical GateWay/CORBA or the Prime Optical server. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 for instructions.

Configuring MPLS-TP Using the CPT System

This chapter describes how to configure Multiprotocol Label Switching Transport Profile (MPLS-TP) services using the Carrier Packet Transport (CPT) System. It contains the following sections:

- 13.1 Understanding Common Terms, page 13-2
- 13.2 Understanding User Privileges and Tasks, page 13-11
- 13.3 Unsupported Features, page 13-14
- 13.4 MPLS-TP Tunnels, page 13-14
  - 13.4.1 How Do I Create an MPLS-TP Tunnel?, page 13-14
  - 13.4.2 Understanding the TP Tunnel Service Table, page 13-20
  - 13.4.3 How Do I View or Modify an MPLS-TP Tunnel?, page 13-20
  - 13.4.4 How Do I Delete an MPLS-TP Tunnel?, page 13-23
  - 13.4.5 How Do I Trace an MPLS-TP Tunnel?, page 13-23
- 13.5 Pseudowires, page 13-29
  - 13.5.1 How Do I Create a Pseudowire?, page 13-29
  - 13.5.2 Understanding the PW Service Table, page 13-34
  - 13.5.3 How Do I View or Modify a Pseudowire?, page 13-35
  - 13.5.4 How Do I Delete a Pseudowire?, page 13-37
  - 13.5.5 How Do I Trace a Pseudowire?, page 13-37
- 13.6 EVCs, page 13-38
  - 13.6.1 How Do I Create an EVC?, page 13-38
  - 13.6.2 Understanding the EVC Service Table, page 13-42
  - 13.6.3 How Do I View or Modify an EVC?, page 13-43
  - 13.6.4 How Do I Delete an EVC?, page 13-47
  - 13.6.5 How Do I Trace an EVC?, page 13-47
- 13.7 Understanding Advanced Troubleshooting Options, page 13-50
  - 13.7.1 Understanding the MPLS-TP Tunnel Cross-Connections Table, page 13-51
  - 13.7.2 Understanding the Pseudowire Cross-Connections Table, page 13-52
  - 13.7.3 Understanding the EVC Cross-Connections Table, page 13-54
  - 13.7.4 Understanding the Refresh L2 Service Data Discovery Option, page 13-55

- 13.8 CPT System QoS, page 13-55
  - 13.8.1 How Do I Create and Manage QoS Objects?, page 13-55
  - 13.8.2 How Do I Provision QoS Objects in the CPT System?, page 13-66
- 13.9 CPT System, page 13-68
  - 13.9.1 Understanding CPT Cards, page 13-68
  - 13.9.2 Overview of the CPT System Property Sheet, page 13-69
  - 13.9.3 Understanding the CPT System Alarms, page 13-87

13.1 Understanding Common Terms

This section describes the common terms used in MPLS-TP and the CPT System. It includes:

- 13.1.1 What Is MPLS?, page 13-2
- 13.1.2 What Is MPLS-TP?, page 13-3
- 13.1.3 What Is the CPT System?, page 13-3
- 13.1.4 What Is Pseudowire?, page 13-4
- 13.1.5 What Is an EVC?, page 13-6
- 13.1.6 What Is CPT System QoS?, page 13-7
- 13.1.7 What Is an LSP?, page 13-7
- 13.1.8 What Is BFD?, page 13-8
- 13.1.9 What Is an EFP?, page 13-8
- 13.1.10 What Is a Bridge Domain?, page 13-9
- 13.1.11 What Is IGMP Snooping?, page 13-9
- 13.1.12 What Is MVR?, page 13-10
- 13.1.13 What Is LACP?, page 13-11

13.1.1 What Is MPLS?

Multiprotocol Label Switching (MPLS) is the technology that scales IP networks for service providers. MPLS is a technique that allows the forwarding of packets based on labels. In a normal IP network, the packets are switched based on the destination IP address. In an MPLS network, the packets are switched based on labels.

MPLS provides mechanisms for IP Quality of Service (QoS) and IP traffic engineering (TE). MPLS is the industry standard on which label switching is based. The label identifies where to forward the packets and instructs the routers and switches in the network. Forwarding of MPLS packets is based on pre-established IP routing information.

MPLS enables service providers to offer additional services, including VPNs, improved TE, QoS, Layer 2 tunneling, and multiprotocol support, to their enterprise customers. There are two ways to set up an MPLS infrastructure:

- LDP

- MPLS-TE

LDP differs from MPLS-TE in terms of the protocol used to distribute the labels along the path. LDP uses Label Distribution Protocol (LDP) whereas MPLS-TE uses Resource Reservation Protocol-Traffic Engineering (RSVP-TE) to distribute the labels. LDP and RSVP-TE uses Open Shortest Path First (OSPF) as the routing protocol.

13.1.2 What Is MPLS-TP?

MPLS-TP is a carrier-grade packet transport technology that enables the move from SONET and SDH time-division multiplexing (TDM) to packet switching. MPLS-TP enables MPLS to be deployed in a transport network and to operate similarly to existing transport technologies. MPLS-TP enables MPLS to support packet transport services with a degree of predictability that is similar to the existing transport networks.

The goal of MPLS-TP is to provide connection-oriented transport for packet and TDM services over optical networks leveraging the widely deployed MPLS technology. Operations, administration, and maintenance (OAM) and resiliency features are defined and implemented in MPLS-TP to ensure:

- Scalable operations
- High availability
- Performance monitoring
- Multidomain support
- Carrier-grade packet transport networks

MPLS-TP can be carried over the existing transport network infrastructure. MPLS-TP defines a profile of MPLS targeted at transport applications and networks. This profile specifies the MPLS characteristics and extensions required to meet the transport requirements.

The following topics describe related Prime Optical features and options:

- 13.4.1 How Do I Create an MPLS-TP Tunnel?, page 13-14
- 13.4.2 Understanding the TP Tunnel Service Table, page 13-20
- 13.4.3 How Do I View or Modify an MPLS-TP Tunnel?, page 13-20
- 13.4.4 How Do I Delete an MPLS-TP Tunnel?, page 13-23
- 13.4.5 How Do I Trace an MPLS-TP Tunnel?, page 13-23
- 13.4.6 How Do I Launch the Pseudowire Service Table from the TP Tunnel Service Table?, page 13-24
- 13.7.1 Understanding the MPLS-TP Tunnel Cross-Connections Table, page 13-51

13.1.3 What Is the CPT System?

The CPT System is the first Packet-Optical Transport System (P-OTS) built on standards-based MPLS-TP technology. The CPT System unifies both packet and transport technologies, giving a strong foundation for next-generation transport. The CPT System is designed to support transport applications so that service providers can continue to offer existing transport services while enabling new packet services.

The existing transport networks must be migrated from TDM networks to packet transport networks because the packet-based services dominate the overall network traffic. Next-generation transport networks enable and support new mesh, multipoint, and multidirectional services. By deploying packet transport networks, you can benefit from:

- Statistical multiplexing
- Dynamic bandwidth allocation
- QoS

Note CPT System is displayed as "PT System" in the Prime Optical user interface.

The CPT System provides the following benefits:

- Ensures a smooth and efficient transition from TDM networks to packet transport networks
- Enables you to deploy new packet transport networks
- Provides architectural flexibility with support for:
  - MPLS-TP
  - IP/MPLS
  - Carrier Ethernet transport
- Provides data plane and control plane flexibility in network deployments
- Enables service providers to provide the following for residential and business customers:
  - Mobile back-haul
  - Ethernet services
  - TDM services

The following topics describe related Prime Optical features and options:

- 13.9.1 Understanding CPT Cards, page 13-68
- 13.9.2 Overview of the CPT System Property Sheet, page 13-69
- 13.9.3 Understanding the CPT System Alarms, page 13-87

13.1.4 What Is Pseudowire?

A pseudowire (PW) is an emulation of a Layer 2 point-to-point, connection-oriented service over a packet-switching network (PSN).

Cisco Prime Optical 9.3.1 supports only the forwarding of the Ethernet frames from customer networks under Any Transport over MPLS (AToM).

Pseudowire is the technique used to transport these types of frames. It is the emulation of a native service over the MPLS network.

The following topics describe related Prime Optical features and options:

- 13.5.1 How Do I Create a Pseudowire?, page 13-29
- 13.5.2 Understanding the PW Service Table, page 13-34
- 13.5.3 How Do I View or Modify a Pseudowire?, page 13-35

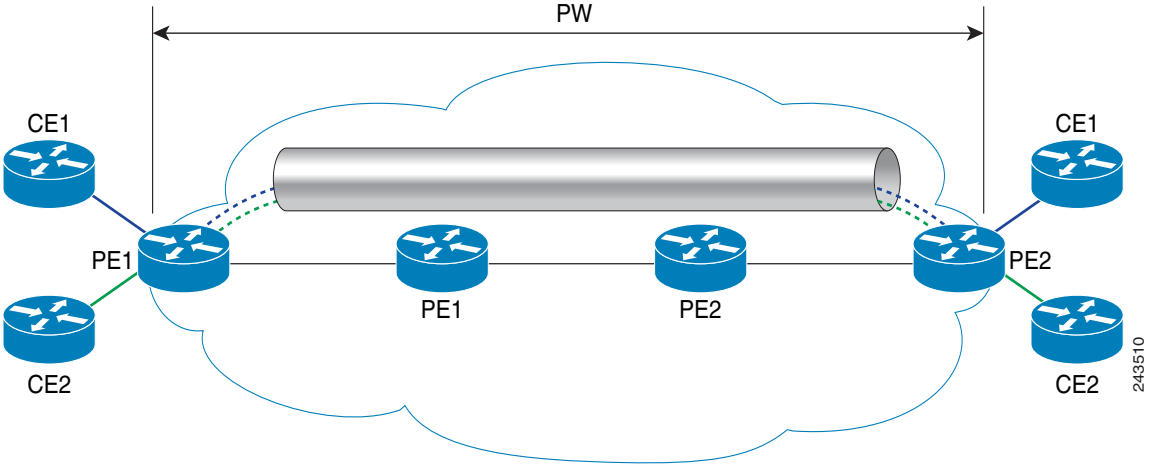
- 13.5.4 How Do I Delete a Pseudowire?, page 13-37
- 13.5.5 How Do I Trace a Pseudowire?, page 13-37
- 13.7.2 Understanding the Pseudowire Cross-Connections Table, page 13-52

13.1.4.1 What Is an L2VPN Pseudowire?

A Layer 2 VPN (L2VPN) pseudowire is a tunnel established between two provider edge (PE) routers across the core carrying the Layer 2 payload encapsulated as MPLS data, as shown in Figure 13-1. This architecture helps the carriers migrate from Layer 2 networks such as Ethernet over MPLS (EoMPLS) to an MPLS core.

Dual-homed pseudowire is a pseudowire-protected circuit on which the destination point is split into two different nodes.

Figure 13-1 L2VPN Pseudowire

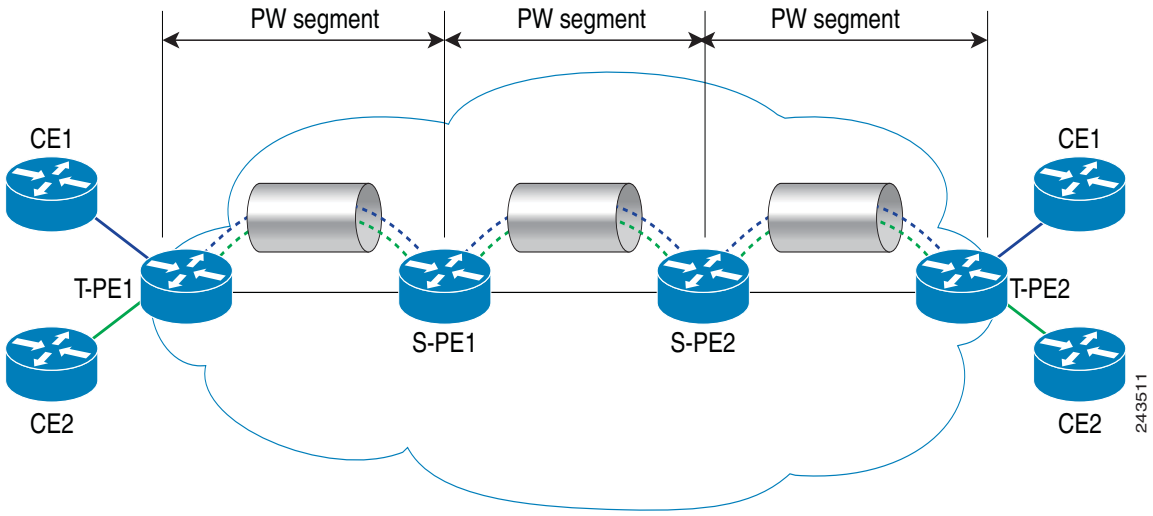


13.1.4.2 What Is L2VPN Multisegment Pseudowire?

An L2VPN multisegment pseudowire (MS-PW) is a collection of two or more PW segments that function as a single PW. It is also known as switched pseudowire. MS-PWs span multiple cores or autonomous systems of the same or different carrier networks. An L2VPN MS-PW can include up to 254 PW segments.

The L2VPN MS-PWs feature enables you to configure two or more Layer 2 pseudowire segments that function as a single pseudowire. The end routers are called terminating provider edge routers (T-PEs) and the switching routers are called switching provider edge routers (S-PEs). The S-PE router terminates the tunnels of the preceding and succeeding PW segments in an MS-PW. The S-PE router can switch the control and data planes of the preceding and succeeding PW segments of the MS-PW. An MS-PW is declared to be up when all single-segment PWs are up.

Figure 13-2 Multisegment Pseudowire



13.1.5 What Is an EVC?

An Ethernet Virtual Circuit (EVC) is a logical relationship between Ethernet User-Network Interfaces (UNIs) in a provider-based Ethernet service. An EVC is the service offered and is carried through the service provider network. Each EVC is configured by its unique name across the service provider network.

An EVC is an end-to-end representation of a single instance of a Layer 2 service that a service provider offers and represents the different parameters based on which the service is offered. An EVC prevents data transfer between sites that are not part of the same EVC. The instance of a specific EVC service on the physical interface of each network device through which the EVC passes is called an Ethernet Flow Point (EFP).

An EVC is the A-Z circuit that enables you to pass customer VLANs from one port on a node to another port on another node in the network. In the CPT System, an EVC represents a Carrier Ethernet service and is an entity that provides an end-to-end connection between two or more customer endpoints.

The global EVC attributes are:

- EVC ID—EVC ID is the associated EVC which the EFP is part of.
- EVC Type—E-Line, E-LAN, or E-Tree.
- List of associated EFPs that belong to an EVC.

The following topics describe related Prime Optical features and options:

- 13.6.1 How Do I Create an EVC?, page 13-38
- 13.6.2 Understanding the EVC Service Table, page 13-42
- 13.6.3 How Do I View or Modify an EVC?, page 13-43
- 13.6.4 How Do I Delete an EVC?, page 13-47
- 13.6.5 How Do I Trace an EVC?, page 13-47
- 13.7.3 Understanding the EVC Cross-Connections Table, page 13-54

13.1.6 What Is CPT System QoS?

CPT System QoS classifies each packet in the network based on one of the following:

- Ethernet Class of Service (CoS)
- IP precedence
- IP Differentiated Services Code Point (DSCP)
- MPLS experiment (MPLS EXP) bits.

After the packets are classified into class flows, additional QoS functions can be applied to each packet as it traverses the CPT System.

Policing provided by the CPT System ensures that the attached equipment does not submit more than a predefined amount of bandwidth into the network. The policing feature can be used to enforce the committed information rate (CIR) and the peak information rate (PIR) available to a customer at an interface. The policing action is applied per classification.

Marking can set the Ethernet CoS, IP precedence, or IP DSCP bits when packets enter the CPT System. For MPLS traffic, marking sets MPLS EXP bits when the packets leave the system. The marking feature operates on the outer IEEE 802.1p tag, IP precedence, or IP DSCP bits and provides a mechanism for tagging packets at the ingress. The subsequent NEs can provide QoS based only on this QoS indicator.

Per-class queuing allows various queuing applications to support service-level agreements. The CPT System uses a combination of Strict Priority Queuing (SPQ) and Weighted Round Robin (WRR) scheduling to guarantee throughput and latency requirements and to provide fair access to excess network bandwidth.

The following topics describe related Prime Optical features and options:

- 13.8.1 How Do I Create and Manage QoS Objects?, page 13-55
- 13.8.2 How Do I Provision QoS Objects in the CPT System?, page 13-66

13.1.7 What Is an LSP?

A Label Switched Path (LSP) is the path that a label takes to pass through a network. An LSP consists of a unidirectional sequence of hops in which a packet travels from one network device to another by means of label switching mechanisms. LSPs can be established statically and dynamically.

In Prime Optical 9.6.3, only static LSP can be established.

The following topics describe related Prime Optical features and options:

- 13.4.1 How Do I Create an MPLS-TP Tunnel?, page 13-14
- 13.4.2 Understanding the TP Tunnel Service Table, page 13-20
- 13.4.6.1 How Do I Add an LSP?, page 13-25
- 13.4.6.2 How Do I Modify an LSP?, page 13-26
- 13.4.6.3 How Do I Trace an LSP?, page 13-27

13.1.8 What Is BFD?

Bidirectional Forwarding Detection (BFD) is a path-failure detection protocol that provides a low-overhead, short-duration method of detecting failures in the forwarding path between two adjacent routers. BFD is enabled at the interface level; it detects failures on interfaces, data links, and forwarding planes and notifies the MPLS-TP server. Prime Optical supports BFD asynchronous mode, which depends on sending BFD control packets between two systems to activate and maintain BFD neighbor sessions between routers.

To create a BFD session, you must configure BFD on both systems (or BFD peers). After you enable BFD on the interfaces:

- A BFD session is created.
- BFD timers are negotiated.
- BFD peers begin sending BFD control packets to each other at the negotiated interval.

BFD provides continuity checks to enable MPLS-TP LSPs to detect forwarding failures between two adjacent routers. When BFD is enabled on the MPLS-TP tunnel interface, the MPLS-TP client creates separate BFD sessions for working and protect LSPs. A single set of BFD timers is configured on the tunnel that applies to both the working and protect LSPs.

The following topics describe related Prime Optical features and options:

- 13.4.1 How Do I Create an MPLS-TP Tunnel?, page 13-14
- 13.9.2.6 Pseudowire Class, page 13-74

13.1.9 What Is an EFP?

Traffic for a service must pass through several switches in the service provider network to connect customer sites across that network. An instance of a specific EVC service on the physical interface of each network device through which the EVC passes is called an Ethernet Flow Point (EFP). An EFP is a logical demarcation point of an EVC within a node on an interface, and it can be associated with a bridge domain.

The main purpose of configuring an EFP is to recognize the traffic belonging to a specific EVC on an interface. Configuring the EFP also applies forwarding behavior and features specific to that EVC, because multiple EVCs can pass through one physical interface.

The CPT System can have EFPs on all ports of the PTF_10GE_4 card, PT_10GE_4 card, or PTSA_GE panel. The EFP administrative state (Up or Down) maps to the EFP administrative state in the Cisco IOS Software.

The key attributes of an EFP are:

- Encapsulation string—Defines the classification criteria for an incoming packet.
- Forwarding operation—Defines the forwarding operation to be applied on frames that belong to the EFP.
- Ingress rewrite operation—Defines the rewrites to be performed on the frames that belong to the EFP before proceeding with the forwarding operation.
- Egress rewrite operation (outgoing encapsulation)—Defines the rewrites to be performed on the frames being transmitted out of the EFP.

The following topics describe related Prime Optical features and options:

- 13.5.1 How Do I Create a Pseudowire?, page 13-29
- 13.5.1.1 How Do I Configure an EFP?, page 13-33
- 13.6.1 How Do I Create an EVC?, page 13-38
- 13.6.3 How Do I View or Modify an EVC?, page 13-43
- 13.6.5.1 How Do I Add a Drop?, page 13-48

13.1.10 What Is a Bridge Domain?

A bridge domain is an Ethernet broadcast domain internal to a device. The bridge domain enables you to decouple a VLAN from a broadcast domain. The bridge domain has one-to-many mapping with EFPs. All EFPs in a node for a specific EVC are grouped using the bridge domain. If EFPs belong to the same bridge domain and have the same bridge domain number, the EFPs receive traffic even if they have different VLAN numbers.

The bridge domain number is local to the node. Different nodes of an EVC can have the same or a different bridge domain number. However, the bridge domain number is unique for an EVC within a node. For an EVC, the bridge domain number range is from 1 to 16384.

The following topic describes related Prime Optical features and options:

- 13.6.3 How Do I View or Modify an EVC?, page 13-43

13.1.11 What Is IGMP Snooping?

As networks increase in size, multicast routing becomes critically important as a means to determine which segments require multicast traffic and which do not. IP multicasting enables IP traffic to be propagated from one source to a number of destinations or from many sources to many destinations. Rather than one packet being sent to each destination, one packet is sent to the multicast group identified by a single IP destination group address.

Internet Group Management Protocol (IGMP) snooping restricts flooding of multicast traffic by sending multicast traffic only to the interfaces that are subscribed to a particular multicast group. The CPT System can use IGMP snooping to constrain the flooding of multicast traffic by dynamically configuring Layer 2 interfaces, so that multicast traffic is forwarded to only those interfaces associated with the IP multicast devices. IGMP snooping requires the CPT System to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports.

When the CPT System receives an IGMP report from a host for a particular multicast group, the CPT System adds the host port number to the forwarding table entry. When it receives an IGMP leave group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.

The CPT System forwards periodic general queries received from the multicast router in the bridge domain where IGMP snooping is enabled. All hosts interested in this multicast group send join requests and are added to the forwarding table entry. The CPT System creates one entry per bridge domain in the IGMP snooping IP multicast forwarding table for each group from which it receives an IGMP join request.

The IP multicast groups learned through IGMP snooping are dynamic. If a port interface, EFP, or bridge domain state changes, the IGMP snooping-learned multicast groups from this port, EFP, or bridge domain are deleted.

The following topic describes related Prime Optical features and options:

- 13.6.3 How Do I View or Modify an EVC?, page 13-43

13.1.12 What Is MVR?

Multicast VLAN Registration (MVR) is a Layer 2 IP network protocol that enables multicast traffic from a source VLAN to be shared with subscriber VLANs. MVR is designed for applications using wide-scale deployment of multicast traffic across an Ethernet ring-based service provider network; for example, the broadcast of multiple television channels over a service provider network. MVR allows a subscriber on a port to subscribe to (and unsubscribe from) a multicast stream on a network-wide multicast bridge domain. It allows the single multicast bridge domain to be shared over the network while subscribers remain in separate bridge domains.

MVR provides the ability to continuously send multicast streams to subscribers on the multicast bridge domain. It also isolates the streams from the subscriber bridge domains for bandwidth and security reasons. MVR assumes that the subscriber ports subscribe (join) and unsubscribe (leave) these multicast streams by sending out IGMP join and leave messages. These messages can originate from an IGMP version 1-, version 2-, or version 3-compatible host with an Ethernet connection. Although MVR operates on the underlying mechanism of IGMP snooping, the two features operate independently of each other. One feature can be enabled or disabled without affecting the behavior of the other feature. However, if IGMP snooping and MVR are both enabled, MVR reacts only to join and leave messages from multicast groups configured under MVR. IGMP snooping manages join and leave messages from all other multicast groups.

The CPT System identifies the MVR IP multicast streams and their associated IP multicast group in the forwarding table. It intercepts the IGMP messages and modifies the forwarding table to include or exclude the subscriber as a receiver of the multicast stream, even though the receivers might be in a different bridge domain from the source. This forwarding behavior selectively allows traffic to cross between different bridge domains.

The CPT System supports the dynamic mode of MVR operation. In the dynamic mode, multicast data received by MVR source EFPs on the CPT System is forwarded only to those MVR receiver EFPs that have joined through IGMP reports. You must configure EFPs as MVR receiver and source EFPs. Receiver EFPs and source EFPs can be on different CPT cards. Multicast data sent on the multicast bridge domain is forwarded to all MVR receiver EFPs across the CPT System. By default, a CPT System has no source or receiver EFP. If a CPT card fails or is removed, only those receiver EFPs belonging to that CPT card will not receive the multicast data. All other receiver EFPs on other CPT cards continue to receive the multicast data.

The following topic describes related Prime Optical features and options:

- 13.6.3 How Do I View or Modify an EVC?, page 13-43

13.1.13 What Is LACP?

Link Aggregation Control Protocol (LACP) is a control protocol over link aggregation (LAG) that enables checking for LAG misconfigurations. LACP is part of the IEEE 802.3ad standard that enables you to bundle several physical ports together to form a single logical channel. LACP enables a network device, such as a switch, to negotiate an automatic bundling of links by sending LACP packets to the peer device.

LACP enables you to form a single Layer 2 link automatically from two or more Ethernet links. This protocol ensures that both ends of the Ethernet link are functional and agree to be members of the aggregation group. To be operational, LACP must be enabled at both ends of the link.

The following topics describe related Prime Optical features and options:

- 13.9.2.2 Channel Groups, page 13-70
- 13.9.2.10.1 How Do I Configure Channel Group Using LACP?, page 13-79

13.2 Understanding User Privileges and Tasks

This section describes the user privileges and the MPLS-TP and the CPT System tasks and new UI options.

The following table describes the Prime Optical default user profiles and the privileges associated with each profile.

Table 13-1 User Privileges

Role	Privileges
SuperUser	• Tasks—Allowed to perform all the tasks listed in Table 13-2. • UI Options—All the UI options are visible.
NetworkAdmin	• Tasks—Allowed to perform all the tasks listed in Table 13-2. • UI Options—All the UI options are visible.
SysAdmin	• Tasks—Cannot perform any of the tasks listed in Table 13-2. • UI Options—None of the UI options are visible.
Provisioner	• Tasks—Cannot perform the advanced troubleshooting tasks, but can perform the other tasks listed in Table 13-2. • UI Options—The Advanced Troubleshooting options are not visible.
Operator	• Tasks—Allowed to perform only the following tasks: – View Layer 2 services from the TP Tunnel Service table, PW Service table, and EVC Service table. – Trace Layer 2 services from the TP Tunnel Service table, PW Service table, and EVC Service table. • UI Options—Only the View and Trace options are visible. Other UI options are either disabled or not visible.

The following table describes the MPLS-TP and the CPT System tasks and UI options.

Note CPT System is displayed as "PT System" in the Prime Optical user interface.

Table 13-2 MPLS-TP and CPT System Tasks and UI Options

Task	Navigation	For More Information, See...
Creating an MPLS-TP tunnel	**Configuration > PT System > Provision > Create TP Tunnel**	13.4.1 How Do I Create an MPLS-TP Tunnel?, page 13-14
Viewing and modifying TP tunnels	**Configuration > PT System > Display > TP Tunnel Table** You can launch the following wizards from the TP Tunnel Service table: • Modify TP Tunnel • Add LSP • Modify LSP	• 13.4.2 Understanding the TP Tunnel Service Table, page 13-20 • 13.4.3 How Do I View or Modify an MPLS-TP Tunnel?, page 13-20 • 13.4.6.1 How Do I Add an LSP?, page 13-25 • 13.4.6.2 How Do I Modify an LSP?, page 13-26
Troubleshooting MPLS-TP tunnels	**Configuration > PT System > Advanced Troubleshooting > TP Tunnel Cross-Connections Table**	13.7.1 Understanding the MPLS-TP Tunnel Cross-Connections Table, page 13-51
Creating a pseudowire	**Configuration > PT System > Provision > Create Pseudowire** You can launch the following wizards from the Create Pseudowire wizard: • Configure EFP • Configure QoS	• 13.5.1 How Do I Create a Pseudowire?, page 13-29 • 13.5.1.1 How Do I Configure an EFP?, page 13-33 • 13.5.1.2 How Do I Configure QoS?, page 13-34
Viewing and modifying pseudowires	**Configuration > PT System > Display > Pseudowire Table** You can launch the Modify Pseudowire wizard from the PW Service table.	• 13.5.2 Understanding the PW Service Table, page 13-34 • 13.5.3 How Do I View or Modify a Pseudowire?, page 13-35
Troubleshooting pseudowires	**Configuration > PT System > Advanced Troubleshooting > Pseudowire Cross-Connections Table**	13.7.2 Understanding the Pseudowire Cross-Connections Table, page 13-52
Creating an EVC	**Configuration > PT System > Provision > Create EVC**	13.6.1 How Do I Create an EVC?, page 13-38
Viewing and modifying EVCs	**Configuration > PT System > Display > EVC Table** You can launch the following wizards from the EVC Service table: • Modify EVC • Add Drop	• 13.6.2 Understanding the EVC Service Table, page 13-42 • 13.6.3 How Do I View or Modify an EVC?, page 13-43 • 13.6.5.1 How Do I Add a Drop?, page 13-48
Troubleshooting EVCs	**Configuration > PT System > Advanced Troubleshooting > EVC Cross-Connections Table**	13.7.3 Understanding the EVC Cross-Connections Table, page 13-54

Table 13-2 MPLS-TP and CPT System Tasks and UI Options (continued)

Task	Navigation	For More Information, See...
Provisioning QoS objects	**Configuration > PT System > Provision > QoS Provisioning**	13.8.2 How Do I Provision QoS Objects in the CPT System?, page 13-66
Managing QoS objects	**Configuration > PT System > Provision > QoS Editor**	13.8.1 How Do I Create and Manage QoS Objects?, page 13-55
Refreshing Layer 2 services	**Configuration > PT System > Advanced Troubleshooting > Refresh L2 Service Data Discovery**	13.7.4 Understanding the Refresh L2 Service Data Discovery Option, page 13-55
Creating and modifying channel groups	**NE Explorer > PT System > Provisioning > Channel Groups** You can launch the following wizards from the Channel Groups property: • LACP Configuration • Layer 2 Action Configuration	• 13.9.2.10 How Do I Create Channel Groups?, page 13-78 • 13.9.2.11 How Do I Modify Channel Groups?, page 13-82 • 13.9.2.10.1 How Do I Configure Channel Group Using LACP?, page 13-79 • 13.9.2.10.2 How Do I Configure Actions for Each Layer 2 Protocol?, page 13-79
Configuring manual load balancing	**NE Explorer > PT System > Provisioning > Channel Groups**	13.9.2.10.3 How Do I Configure Manual Load Balancing?, page 13-80
Modifying manual load balancing configuration	**NE Explorer > PT System > Provisioning > Channel Groups**	13.9.2.10.4 How Do I Modify Manual Load Balancing Configuration?, page 13-81
Viewing the PT System configuration mode	**NE Explorer > PT System > Provisioning > Configuration Mode**	13.9.2.3 Configuration Mode, page 13-72
Launching CPT IOS CLI	**NE Explorer > PT System > Provisioning > IOS CLI**	13.9.2.4 IOS CLI, page 13-72
Configuring global settings and creating and modifying BFD templates	**NE Explorer > PT System > Provisioning > MPLS-TP**	• 13.9.2.5 MPLS-TP, page 13-73 • 13.9.2.14 How Do I Create a BFD Template?, page 13-85 • 13.9.2.15 How Do I Edit a BFD Template?, page 13-86
Creating and modifying a pseudowire class	**NE Explorer > PT System > Provisioning > Pseudowire Class**	• 13.9.2.12 How Do I Create a Pseudowire Class?, page 13-83 • 13.9.2.13 How Do I Modify a Pseudowire Class?, page 13-84
Viewing QoS objects from the PT System	**NE Explorer > PT System > Provisioning > QoS**	13.9.2.7 QoS, page 13-75
Retrieving service alarms	**NE Explorer > PT System > Provisioning > Service Alarm**	13.9.2.8 Service Alarm, page 13-75
Configuring SyncE ports	**NE Explorer > PT System > Provisioning > Timing**	13.9.2.9 Timing, page 13-77

13.3 Unsupported Features

The CPT 200 and CPT 600 NEs do not support the following:

- Creating a server trail
- Managing VLANs
- Creating and managing BLSR
- ML cards
- Creating and managing SVLANs
- Viewing the IOS Users table
- Launching the L2 Topology table from the NE Explorer

13.4 MPLS-TP Tunnels

This section describes the following:

- 13.4.1 How Do I Create an MPLS-TP Tunnel?, page 13-14
- 13.4.2 Understanding the TP Tunnel Service Table, page 13-20
- 13.4.3 How Do I View or Modify an MPLS-TP Tunnel?, page 13-20
- 13.4.4 How Do I Delete an MPLS-TP Tunnel?, page 13-23
- 13.4.5 How Do I Trace an MPLS-TP Tunnel?, page 13-23

13.4.1 How Do I Create an MPLS-TP Tunnel?

For descriptions of MPLS-TP, BFD, and LSP, see the following sections:

- 13.1.2 What Is MPLS-TP?, page 13-3
- 13.1.8 What Is BFD?, page 13-8
- 13.1.7 What Is an LSP?, page 13-7

MPLS-TP tunnels are provisioned manually at their endpoints across the network. An MPLS-TP tunnel consists of a pair of unidirectional tunnels providing a bidirectional LSP. Each unidirectional tunnel can be protected with a protect LSP that activates automatically upon failure.

Create an MPLS-TP tunnel using the Create MPLS-TP Tunnel Circuit wizard. The following table describes the launch points and the expected behavior for the Create MPLS-TP Tunnel Circuit wizard.

Table 13-3 Create MPLS-TP Tunnel Circuit Wizard Launch Points and Expected Behavior

Launch Points	Expected Behavior
Source NE node in the Domain Explorer or Subnetwork Explorer	Select the source ONS 15454 NE in the Domain Explorer or Subnetwork Explorer and choose **Configuration > PT System > Provision > Create TP Tunnel**. The Create MPLS-TP Tunnel Circuit wizard opens. The source NE is preset to the selected source.
Source and destination NE nodes in the Domain Explorer or Subnetwork Explorer	Select the source ONS 15454 NE in the Domain Explorer or Subnetwork Explorer, right-click the NE, and choose **Create L2 Service > Create TP Tunnel**. The pointer changes to a plus (+) symbol; select the destination NE. The destination NE must be in the same network partition as the source. The Create MPLS-TP Tunnel Circuit wizard opens. Source and destination NEs are preset to the selected source and destination. **Note** If you press the **Esc** key while the plus symbol is enabled, the operation is canceled and the plus symbol returns to a pointer.
Source and destination NE nodes in the Network Map	Select **Layer 2** as the layer rate from the drop-down list in the Network Map toolbar. Select the source ONS 15454 NE in the Network Map, right-click the NE, and choose **Create L2 Service > Create TP Tunnel**. The pointer displays a line extending from the source NE; select the destination NE. The Create MPLS-TP Tunnel Circuit wizard opens. Source and destination NEs are preset to the selected source and destination NE nodes in the Network Map.

To create an MPLS-TP tunnel:

Step 1 Select a node for which to create an MPLS-TP tunnel and open the Create MPLS-TP Tunnel Circuit wizard. For an explanation of wizard launch points, see Table 13-3 on page 13-15.

Step 2 In the Info View pane:

a. In the Tunnel Details area, do the following:

- In the TP Tunnel Name field, enter the TP tunnel name. The TP tunnel name is a free-format string of up to 48 ASCII characters.
- In the TP Tunnel Description field, enter a TP tunnel description of up to 48 characters.
- From the State drop-down list, select a state to apply: Up and Down.
- Check the **Protection** check box if you want the TP tunnel path to be protected.

b. In the Bandwidth area, do the following:

- In the Bandwidth Tx field, enter the bandwidth to be transmitted and click the appropriate radio button.
- In the Bandwidth Rx field, enter the bandwidth to be received and click the appropriate radio button.

c. Click **Next**.

Step 3 In the Source pane:

a. Node—Displays a list of available NEs. From the drop-down list, select the source NE.

b. Shelf—Displays the shelf number, which is automatically retrieved from the NE. This field is enabled only if one or more possible options are available.

c. Slot—Displays the slot number, which is automatically retrieved from the NE. This field is enabled only if one or more possible options are available.

d. BFD—Displays the BFD template, which is automatically retrieved from the NE. From the drop-down list, select **None** to provision the TP tunnel without a BFD template.

e. Node ID—*Display only.* Displays the node ID.

f. Tunnel Number—A free number; however, the number you enter must not be used by any other tunnel on the specified node. By default, the first available free number is displayed. Valid values are from 0 to 999.

g. Working LSP—Displays the working LSP number. The default value is 0. Valid values are 0 or a number from 2 to 65535.

h. Protected LSP—Enabled only if you checked the Protection check box in the Info View pane. This field displays the protect LSP number. The default value is 1. Valid values are from 1 to 65535.

i. Click **Next**.

Step 4 In the Destination pane:

a. Node—Displays a list of available NEs. From the drop-down list, select the destination NE.

b. Shelf—Displays the shelf number, which is automatically retrieved from the NE. This field is enabled only if one or more possible options are available.

c. Slot—Displays the slot number, which is automatically retrieved from the NE. This field is enabled only if one or more possible options are available.

d. BFD—Displays the BFD template, which is automatically retrieved from the NE. From the drop-down list, select **None** to provision the TP tunnel without a BFD template.

e. Node ID—*Display only.* Displays the node ID.

f. Tunnel Number—A free number; however the number you enter must not be used by any other tunnel on the specified node. By default, the first available free number is displayed. Valid values are from 0 to 999.

g. Working LSP—Displays the working LSP number. The default value is 0. Valid values are 0 or a number from 2 to 65535.

h. Protected LSP—Enabled only if you checked the Protection check box in the Info View pane. This field displays the protect LSP number. The default value is 1. Valid values are from 1 to 65535.

i. Click **Next**.

Step 5 In the Routing Preferences pane:

a. In the Routing Details area, confirm the details and perform actions where allowed:

Note The Automatic Routing and Use Required Nodes/Spans options are mutually exclusive.

- Check the **Automatic Routing** check box if you want the route to be calculated by the system.
- Check the **Use Required Nodes/Spans** check box to manually select the route. Include or exclude NEs and links from the path.
- *Display only.* By default, the Review Labels check box is checked.
- *Display only.* If you checked the Protection check box in the Info View pane, the Protected Path check box is checked. If you unchecked the Protection check box in the Info View pane, the Protected Path check box is unchecked.

b. Select one of the following radio buttons from the Node and Link Diversity Options area if the path is protected and if you want the working LSPs and protect LSPs to be routed using paths that traverse different NEs:

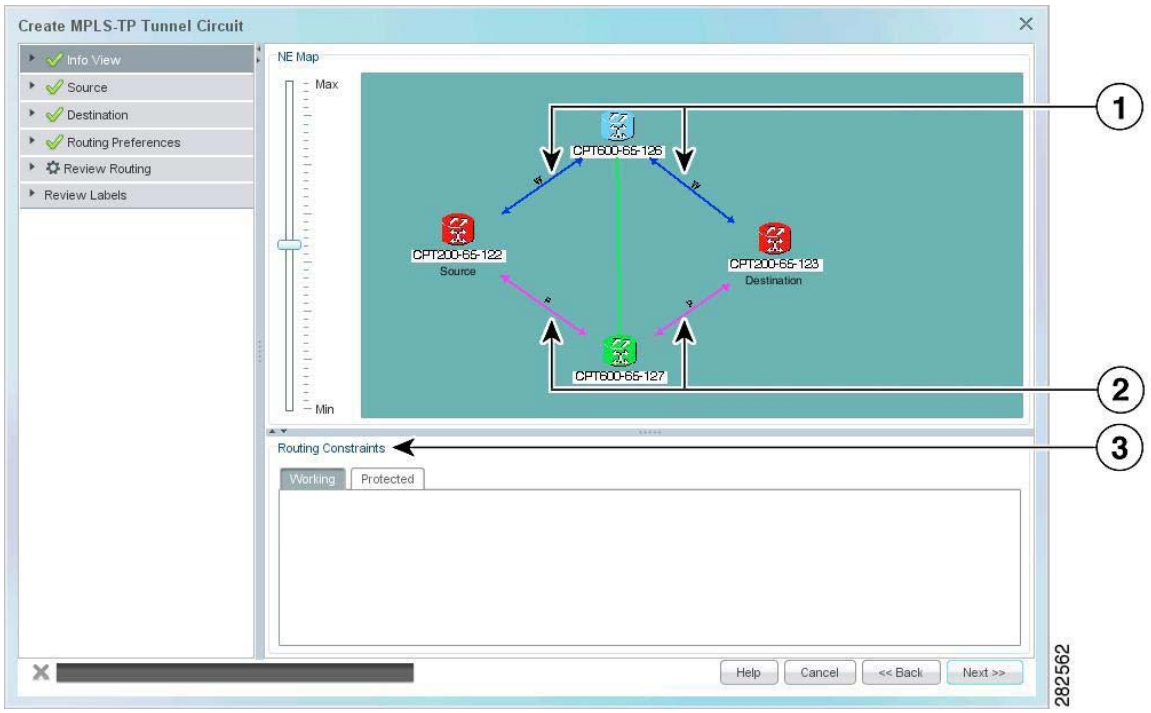
- **Node Diversity Required**—Select if the working LSPs and protect LSPs must be routed on different nodes.
- **Node Diversity Desired**—Select if you prefer the working LSPs and protect LSPs to be routed on different nodes.
- **Link Diversity Only**—Select if you want the working LSPs and protect LSPs to be routed on different links.

c. Click **Next**.

If you checked the Automatic Routing check box in the Routing Preferences pane, go to Step 6. If you checked the Use Required Nodes/Spans check box in the Routing Preferences pane, go to Step 7.

Step 6 In the Review Routing pane, confirm the details and perform actions where allowed:

Figure 13-3 Automatic Routing Review



1	Working LSPs	**2**	Protect LSPs
3	Routing Constraints area		

a. NE Map—Displays the working LSPs (blue links) and protect LSPs (purple links).

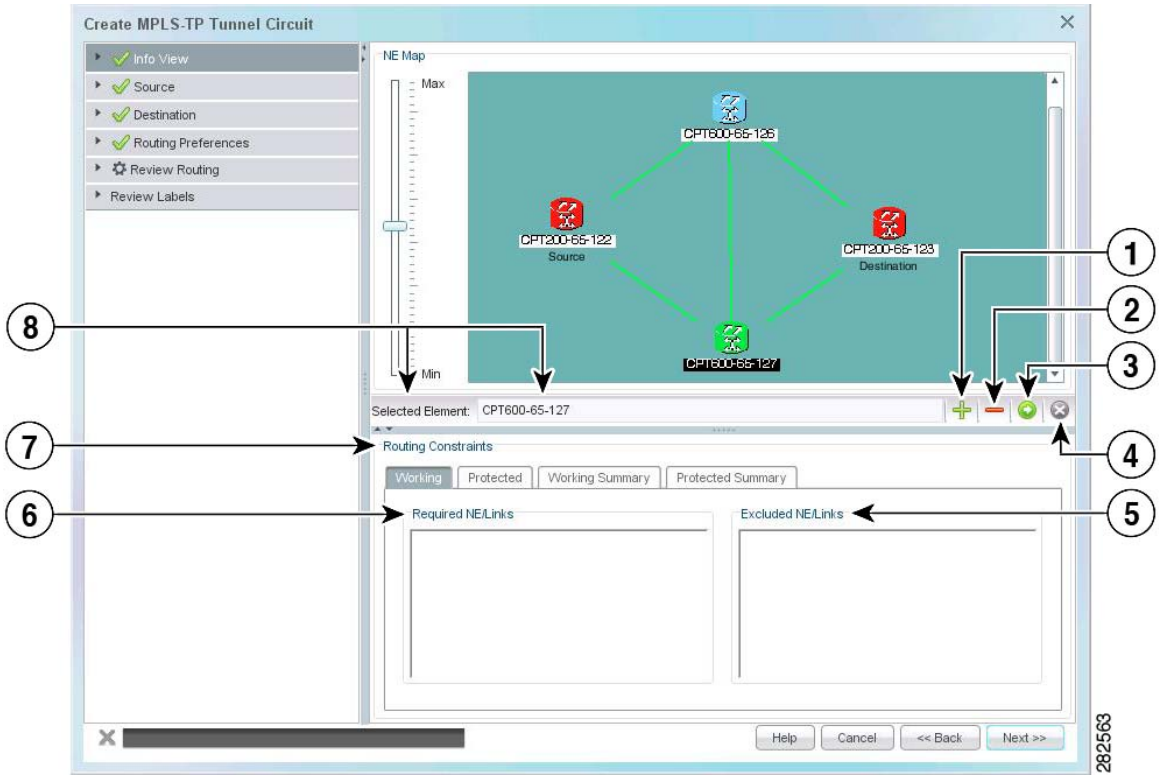
b. Routing Constraints—The Routing Constraints area has two tabs:

- Working—Displays the working spans and provides a summary of the links and ports used by the Layer 2 service.
- Protected—Displays the protected spans and provides a summary of the links and ports used by the Layer 2 service.

c. Click **Next**. Go to Step 8.

Step 7 In the Review Routing pane, confirm the details and perform actions where allowed:

Figure 13-4 Manual Routing Review



1	Insert Node/Link option	**2**	Exclude Node/Link option
3	Calculate Routing option	**4**	Clear Routing Constraints option
5	Excluded NE/Links area	**6**	Required NE/Links area
7	Routing Constraints area	**8**	Selected NE

a. NE Map—Displays the working LSPs and protect LSPs. Add and remove NEs and links using the following options:

- Insert Node/Link—Select the NE or link from the NE map and click **Insert Node/Link**. The selected NE or link is added and displayed in the Required NE/Links section.
- Exclude Node/Link—Select the NE or link from the NE map and click **Exclude Node/Link**. The selected NE or link is excluded and displayed in the Excluded NE/Links section.
- Calculate Routing—The working LSPs and protect LSPs have independent routing constraints. Click **Calculate Routing** to calculate the routing.
- Clear—Click **Clear** to clear the routing constraints.

b. Routing Constraints—The Routing Constraints area has four tabs:

- Working—Displays the working NEs and links added using the Insert Node/Link option and the working NEs and links excluded using the Exclude Node/Link option. To delete an NE or link, right-click the NE or link and click **Delete**.
- Protected—Displays the protected NEs and links added using the Insert Node/Link option and the protected NEs and links excluded using the Exclude Node/Link option. To delete an NE or link, right-click the NE or link and click **Delete**.

- Working Summary—Displays the working spans and provides a summary of the links and ports used by the Layer 2 service.
- Protected Summary—Displays the protected spans and provides a summary of the links and ports used by the Layer 2 service.

c. Click **Next**.

Step 8 In the Review Labels pane, review or modify the label settings that are automatically calculated by the system. The following details are displayed in a table:

- NE—*Display only.* Displays the NE ID.
- Endpoint—*Display only.* Displays the following details of the endpoint:
  - Shelf number
  - Slot number
  - Port number
- Link Number—*Display only.* Displays the link number.
- LSP Number—*Display only.* Displays the LSP number.
- Local Label—Displays the local label number assigned to the LSP. Click the cell to edit the value and click **Apply** to save the changes.
- Out Label—Displays the out label number assigned to the LSP. Click the cell to edit the value and click **Apply** to save the changes.
- Path—*Display only.* Displays the path, which can be Forward Path or Reverse Path, depending on the tunnel protection.

Step 9 Click **Provision**. An MPLS-TP tunnel is created and the details are displayed in the TP Tunnel Service table. If the details are not displayed in the TP Tunnel Service table, refresh the table.

For more information about the TP Tunnel Service table, see 13.4.2 Understanding the TP Tunnel Service Table, page 13-20. For more information about troubleshooting MPLS-TP tunnels, see 13.7.1 Understanding the MPLS-TP Tunnel Cross-Connections Table, page 13-51.

13.4.2 Understanding the TP Tunnel Service Table

For a description of MPLS-TP, see 13.1.2 What Is MPLS-TP?, page 13-3.

Manage MPLS-TP tunnels from the TP Tunnel Service table, which lists the MPLS-TP tunnels created. To launch the table, select an NE or a group and choose **Configuration > PT System > Display > TP Tunnel Table**.

The following topics describe what you can do in the TP Tunnel Service table:

- 13.4.3 How Do I View or Modify an MPLS-TP Tunnel?, page 13-20
- 13.4.4 How Do I Delete an MPLS-TP Tunnel?, page 13-23
- 13.4.5 How Do I Trace an MPLS-TP Tunnel?, page 13-23
- 13.4.6 How Do I Launch the Pseudowire Service Table from the TP Tunnel Service Table?, page 13-24

The following table describes the fields in the TP Tunnel Service table.

Table 13-4 Field Descriptions for the TP Tunnel Service Table

Field	Description
